  `pCopyImageToBufferInfo` must be a valid pointer to a valid `VkCopyImageToBufferInfo2` structure

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- **VUID-vkCmdCopyImageToBuffer2-renderpass**
  This command must only be called outside of a render pass instance
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

The `VkCopyImageToBufferInfo2` structure is defined as:

```c
typedef struct VkCopyImageToBufferInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkBuffer dstBuffer;
    uint32_t regionCount;
    const VkBufferImageCopy2* pRegions;
} VkCopyImageToBufferInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyImageToBufferInfo2 VkCopyImageToBufferInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the copy.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferImageCopy2` structures specifying the regions to copy.
Valid Usage

- **VUID-VkCopyImageToBufferInfo2-pRegions-04566**
  The image region specified by each element of `pRegions` **must** be contained within the specified `imageSubresource` of `srcImage`.

- **VUID-VkCopyImageToBufferInfo2-pRegions-00183**
  `dstBuffer` **must** be large enough to contain all buffer locations that are accessed according to Buffer and Image Addressing, for each element of `pRegions`.

- **VUID-VkCopyImageToBufferInfo2-pRegions-00184**
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory.

- **VUID-VkCopyImageToBufferInfo2-srcImage-00186**
  `srcImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag.

- **VUID-VkCopyImageToBufferInfo2-srcImage-01998**
  The format features of `srcImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`.

- **VUID-VkCopyImageToBufferInfo2-dstBuffer-00191**
  `dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag.

- **VUID-VkCopyImageToBufferInfo2-dstBuffer-00192**
  If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkCopyImageToBufferInfo2-srcImageLayout-00189**
  `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

- **VUID-VkCopyImageToBufferInfo2-srcImageLayout-01397**
  `srcImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL`.

- **VUID-VkCopyImageToBufferInfo2-srcImage-07966**
  If `srcImage` is non-sparse then the image or the specified disjoint plane **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkCopyImageToBufferInfo2-imageSubresource-07967**
  The `imageSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created.

- **VUID-VkCopyImageToBufferInfo2-imageSubresource-07968**
  `imageSubresource.baseArrayLayer + imageSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

- **VUID-VkCopyImageToBufferInfo2-srcImage-07973**
  `srcImage` **must** have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`.

- **VUID-VkCopyImageToBufferInfo2-srcImage-07979**
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `imageOffset.y` **must** be 0 and `imageExtent.height` **must** be 1.
For each element of `pRegions`, `imageOffset.z` and \((imageExtent.depth + imageOffset.z)\) must both be greater than or equal to 0 and less than or equal to the depth of the specified `imageSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `imageOffset.z` must be 0 and `imageExtent.depth` must be 1.

For each element of `pRegions`, `imageOffset.x` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `imageOffset.y` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `imageOffset.z` must be a multiple of the texel block extent depth of the `VkFormat` of `srcImage`.

For each element of `pRegions`, if the sum of `imageOffset.x` and `extent.width` does not equal the width of the subresource specified by `srcSubresource`, `extent.width` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`.

For each element of `pRegions`, if the sum of `imageOffset.y` and `extent.height` does not equal the height of the subresource specified by `srcSubresource`, `extent.height` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`.

For each element of `pRegions`, if the sum of `imageOffset.z` and `extent.depth` does not equal the depth of the subresource specified by `srcSubresource`, `extent.depth` must be a multiple of the texel block extent depth of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `imageSubresource.aspectMask` must specify aspects present in `srcImage`.

If `srcImage` has a multi-planar image format, then for each element of `pRegions`, `imageSubresource.aspectMask` must be a single valid multi-planar aspect mask bit.

If `srcImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `imageSubresource.baseArrayLayer` must be 0 and `imageSubresource.layerCount` must be 1.

For each element of `pRegions`, `bufferRowLength` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `bufferImageHeight` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`.

910
For each element of \texttt{pRegions}, \texttt{bufferRowLength} divided by the \textit{texel block extent width} and then multiplied by the \textit{texel block size} of \texttt{srcImage} must be less than or equal to \(2^{31}-1\).

If \texttt{srcImage} does not have either a depth/stencil format or a \textit{multi-planar format}, then for each element of \texttt{pRegions}, \texttt{bufferOffset} must be a multiple of the \textit{texel block size}.

If \texttt{srcImage} has a \textit{multi-planar format}, then for each element of \texttt{pRegions}, \texttt{bufferOffset} must be a multiple of the element size of the compatible format for the format and the \texttt{aspectMask} of the \texttt{imageSubresource} as defined in \textit{Compatible Formats of Planes of Multi-Planar Formats}.

If \texttt{srcImage} has a depth/stencil format, the \texttt{bufferOffset} member of any element of \texttt{pRegions} must be a multiple of 4.

For each element of \texttt{pRegions} not containing \texttt{VkCopyCommandTransformInfoQCOM} in its \texttt{pNext} chain, \texttt{imageOffset.x} and \((\texttt{imageExtent.width} + \texttt{imageOffset.x})\) must both be greater than or equal to 0 and less than or equal to the width of the specified \texttt{imageSubresource} of \texttt{srcImage}.

For each element of \texttt{pRegions} not containing \texttt{VkCopyCommandTransformInfoQCOM} in its \texttt{pNext} chain, \texttt{imageOffset.y} and \((\texttt{imageExtent.height} + \texttt{imageOffset.y})\) must both be greater than or equal to 0 and less than or equal to the height of the specified \texttt{imageSubresource} of \texttt{srcImage}.

\textbf{Valid Usage (Implicit)}

- \texttt{VkCopyImageToBufferInfo2-sType} \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_COPY_IMAGE_TO_BUFFER_INFO_2}
- \texttt{VkCopyImageToBufferInfo2-pNext} \texttt{pNext} must be NULL
- \texttt{VkCopyImageToBufferInfo2-srcImage} \texttt{srcImage} must be a valid \texttt{VkImage} handle
- \texttt{VkCopyImageToBufferInfo2-srcImageLayout} \texttt{srcImageLayout} must be a valid \texttt{VkImageLayout} value
- \texttt{VkCopyImageToBufferInfo2-dstBuffer} \texttt{dstBuffer} must be a valid \texttt{VkBuffer} handle
- \texttt{VkCopyImageToBufferInfo2-pRegions} \texttt{pRegions} must be a valid pointer to an array of \texttt{regionCount} valid \texttt{VkBufferImageCopy2} structures
- \texttt{VkCopyImageToBufferInfo2-regionCount} \texttt{regionCount} must be greater than 0
- \texttt{VkCopyImageToBufferInfo2-commonparent}
Both of \texttt{dstBuffer}, and \texttt{srcImage} must have been created, allocated, or retrieved from the same \texttt{VkDevice}

For both \texttt{vkCmdCopyBufferToImage2KHR} and \texttt{vkCmdCopyImageToBuffer2KHR}, each element of \texttt{pRegions} is a structure defined as:

typedef struct \texttt{VkBufferImageCopy2} {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize bufferOffset;
    uint32_t bufferRowLength;
    uint32_t bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} \texttt{VkBufferImageCopy2};

or the equivalent

// Provided by VK_KHR_copy_commands2
typedef \texttt{VkBufferImageCopy2} \texttt{VkBufferImageCopy2KHR};

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is NULL or a pointer to a structure extending this structure.
- \texttt{bufferOffset} is the offset in bytes from the start of the buffer object where the image data is copied from or to.
- \texttt{bufferRowLength} and \texttt{bufferImageHeight} specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the \texttt{imageExtent}.
- \texttt{imageSubresource} is a \texttt{VkImageSubresourceLayers} used to specify the specific image subresources of the image used for the source or destination image data.
- \texttt{imageOffset} selects the initial \(x, y, z\) offsets in texels of the sub-region of the source or destination image data.
- \texttt{imageExtent} is the size in texels of the image to copy in width, height and depth.

This structure is functionally identical to \texttt{VkBufferImageCopy}, but adds \texttt{sType} and \texttt{pNext} parameters, allowing it to be more easily extended.

**Valid Usage**

- VUID-VkBufferImageCopy2-bufferRowLength-09101
  \texttt{bufferRowLength} must be 0, or greater than or equal to the width member of \texttt{imageExtent}
• VUID-VkBufferImageCopy2-bufferImageHeight-09102
  bufferImageHeight must be 0, or greater than or equal to the height member of imageExtent

• VUID-VkBufferImageCopy2-aspectMask-09103
  The aspectMask member of imageSubresource must only have a single bit set

• VUID-VkBufferImageCopy2-imageExtent-06659
  imageExtent.width must not be 0

• VUID-VkBufferImageCopy2-imageExtent-06660
  imageExtent.height must not be 0

• VUID-VkBufferImageCopy2-imageExtent-06661
  imageExtent.depth must not be 0

Valid Usage (Implicit)

• VUID-VkBufferImageCopy2-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_IMAGE_COPY_2

• VUID-VkBufferImageCopy2-pNext-pNext
  pNext must be NULL

• VUID-VkBufferImageCopy2-imageSubresource-parameter
  imageSubresource must be a valid VkImageSubresourceLayers structure

19.4. Image Copies With Scaling

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBlitImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageBlit* pRegions,
    VkFilter filter);
```

• commandBuffer is the command buffer into which the command will be recorded.
• srcImage is the source image.
• srcImageLayout is the layout of the source image subresources for the blit.
• dstImage is the destination image.
• dstImageLayout is the layout of the destination image subresources for the blit.
• **regionCount** is the number of regions to blit.
• **pRegions** is a pointer to an array of **VkImageBlit** structures specifying the regions to blit.
• **filter** is a **VkFilter** specifying the filter to apply if the blits require scaling.

**vkCmdBlitImage** must not be used for multisampled source or destination images. Use **vkCmdResolveImage** for this purpose.

As the sizes of the source and destination extents can differ in any dimension, texels in the source extent are scaled and filtered to the destination extent. Scaling occurs via the following operations:

• For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in **unnormalized to integer conversion**:

  \[
  u_{base} = i + \frac{1}{2} \\
  v_{base} = j + \frac{1}{2} \\
  w_{base} = k + \frac{1}{2}
  \]

• These base coordinates are then offset by the first destination offset:

  \[
  u_{offset} = u_{base} - x_{dst0} \\
  v_{offset} = v_{base} - y_{dst0} \\
  w_{offset} = w_{base} - z_{dst0}
  \]

  \[
  a_{offset} = a - baseArrayCount_{dst}
  \]

• The scale is determined from the source and destination regions, and applied to the offset coordinates:

  \[
  scale_u = (x_{src1} - x_{src0}) / (x_{dst1} - x_{dst0}) \\
  scale_v = (y_{src1} - y_{src0}) / (y_{dst1} - y_{dst0}) \\
  scale_w = (z_{src1} - z_{src0}) / (z_{dst1} - z_{dst0})
  \]
Finally the source offset is added to the scaled coordinates, to determine the final unnormalized coordinates used to sample from \textit{srcImage}:

\begin{align*}
u & = u_{scaled} + x_{src0} \\
v & = v_{scaled} + y_{src0} \\
w & = w_{scaled} + z_{src0}
\end{align*}

\[ q = \text{mipLevel} \]

\[ a = a_{offset} + \text{baseArrayCount}_{src} \]

These coordinates are used to sample from the source image, as described in \textit{Image Operations} chapter, with the filter mode equal to that of \textit{filter}, a mipmap mode of \textit{VK_SAMPLER_MIPMAP_MODE_NEAREST} and an address mode of \textit{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE}. Implementations must clamp at the edge of the source image, and may additionally clamp to the edge of the source region.

Note

Due to allowable rounding errors in the generation of the source texture coordinates, it is not always possible to guarantee exactly which source texels will be sampled for a given blit. As rounding errors are implementation-dependent, the exact results of a blitting operation are also implementation-dependent.

Blits are done layer by layer starting with the \textit{baseArrayLayer} member of \textit{srcSubresource} for the source and \textit{dstSubresource} for the destination. \textit{layerCount} layers are blitted to the destination image.

When blitting 3D textures, slices in the destination region bounded by \textit{dstOffsets[0].z} and \textit{dstOffsets[1].z} are sampled from slices in the source region bounded by \textit{srcOffsets[0].z} and \textit{srcOffsets[1].z}. If the \textit{filter} parameter is \textit{VK_FILTER_LINEAR} then the value sampled from the source image is taken by doing linear filtering using the interpolated \textit{z} coordinate represented by \textit{w} in the previous equations. If the \textit{filter} parameter is \textit{VK_FILTER_NEAREST} then the value sampled from the source image is taken from the single nearest slice, with an implementation-dependent arithmetic.
rounding mode.

The following filtering and conversion rules apply:

- Integer formats can only be converted to other integer formats with the same signedness.
- No format conversion is supported between depth/stencil images. The formats must match.
- Format conversions on unorm, snorm, scaled and packed float formats of the copied aspect of the image are performed by first converting the pixels to float values.
- For sRGB source formats, nonlinear RGB values are converted to linear representation prior to filtering.
- After filtering, the float values are first clamped and then cast to the destination image format. In case of sRGB destination format, linear RGB values are converted to nonlinear representation before writing the pixel to the image.

Signed and unsigned integers are converted by first clamping to the representable range of the destination format, then casting the value.

### Valid Usage

- VUID-vkCmdBlitImage-commandBuffer-01834
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image
- VUID-vkCmdBlitImage-commandBuffer-01835
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image
- VUID-vkCmdBlitImage-commandBuffer-01836
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image
- VUID-vkCmdBlitImage-pRegions-00215
  The source region specified by each element of `pRegions` must be a region that is contained within `srcImage`
- VUID-vkCmdBlitImage-pRegions-00216
  The destination region specified by each element of `pRegions` must be a region that is contained within `dstImage`
- VUID-vkCmdBlitImage-pRegions-00217
  The union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory with any texel that may be sampled during the blit operation
- VUID-vkCmdBlitImage-srcImage-01999
  The format features of `srcImage` must contain `VK_FORMAT_FEATURE_BLIT_SRC_BIT`
- VUID-vkCmdBlitImage-srcImage-06421
  `srcImage` must not use a format that requires a sampler Y′C₈C₉ conversion
- VUID-vkCmdBlitImage-srcImage-00219
  `srcImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag
If `srcImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

`srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

`srcImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`

The format features of `dstImage` must contain `VK_FORMAT_FEATURE_BLIT_DST_BIT`

`dstImage` **must** not use a format that requires a sampler Y′C′B′C′R conversion

`dstImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag

If `dstImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

`dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

`dstImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`

If either of `srcImage` or `dstImage` was created with a signed integer `VkFormat`, the other **must** also have been created with a signed integer `VkFormat`

If either of `srcImage` or `dstImage` was created with an unsigned integer `VkFormat`, the other **must** also have been created with an unsigned integer `VkFormat`

If either of `srcImage` or `dstImage` was created with a depth/stencil format, the other **must** have exactly the same format

If `srcImage` was created with a depth/stencil format, `filter` **must** be `VK_FILTER_NEAREST`

`srcImage` **must** have been created with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`

`dstImage` **must** have been created with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`

If `filter` is `VK_FILTER_LINEAR`, then the format features of `srcImage` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
If `filter` is `VK_FILTER_CUBIC_EXT`, then the format features of `srcImage` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

If `filter` is `VK_FILTER_CUBIC_EXT`, `srcImage` must be of type `VK_IMAGE_TYPE_2D`.

The `srcSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created.

The `dstSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created.

`srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

`dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

If either `srcImage` or `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` and `dstSubresource.baseArrayLayer` must each be 0, and `srcSubresource.layerCount` and `dstSubresource.layerCount` must each be 1.

For each element of `pRegions`, `srcSubresource.aspectMask` must specify aspects present in `srcImage`.

For each element of `pRegions`, `dstSubresource.aspectMask` must specify aspects present in `dstImage`.

For each element of `pRegions`, `srcOffsets[0].x` and `srcOffsets[1].x` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`.

For each element of `pRegions`, `srcOffsets[0].y` and `srcOffsets[1].y` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffsets[0].y` must be 0 and `srcOffsets[1].y` must be 1.

For each element of `pRegions`, `srcOffsets[0].z` and `srcOffsets[1].z` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.
If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffsets[0].z` must be 0 and `srcOffsets[1].z` must be 1

For each element of `pRegions, dstOffsets[0].x` and `dstOffsets[1].x` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`

For each element of `pRegions, dstOffsets[0].y` and `dstOffsets[1].y` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`

If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions, dstOffsets[0].y` must be 0 and `dstOffsets[1].y` must be 1

For each element of `pRegions, dstOffsets[0].z` and `dstOffsets[1].z` must both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`

If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions, dstOffsets[0].z` must be 0 and `dstOffsets[1].z` must be 1

**Valid Usage (Implicit)**

- `commandBuffer` must be a valid `VkCommandBuffer` handle
- `srcImage` must be a valid `VkImage` handle
- `srcImageLayout` must be a valid `VkImageLayout` value
- `dstImage` must be a valid `VkImage` handle
- `dstImageLayout` must be a valid `VkImageLayout` value
- `pRegions` must be a valid pointer to an array of `regionCount` valid `VkImageBlit` structures
- `filter` must be a valid `VkFilter` value
- `commandBuffer` must be in the recording state
• VUID-vkCmdBlitImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdBlitImage-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdBlitImage-regionCount-arraylength
  regionCount must be greater than 0

• VUID-vkCmdBlitImage-commonparent
  Each of commandBuffer, dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkImageBlit structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageBlit {
  VkImageSubresourceLayers srcSubresource;
  VkOffset3D srcOffsets[2];
  VkImageSubresourceLayers dstSubresource;
  VkOffset3D dstOffsets[2];
} VkImageBlit;
```

• srcSubresource is the subresource to blit from.

• srcOffsets is a pointer to an array of two VkOffset3D structures specifying the bounds of the source region within srcSubresource.

• dstSubresource is the subresource to blit into.

• dstOffsets is a pointer to an array of two VkOffset3D structures specifying the bounds of the destination region within dstSubresource.
For each element of the pRegions array, a blit operation is performed for the specified source and destination regions.

**Valid Usage**

- VUID-VkImageBlit-aspectMask-00238
  The aspectMask member of srcSubresource and dstSubresource must match

- VUID-VkImageBlit-layerCount-08800
  The layerCount members of srcSubresource or dstSubresource must match

**Valid Usage (Implicit)**

- VUID-VkImageBlit-srcSubresource-parameter
  srcSubresource must be a valid VkImageSubresourceLayers structure

- VUID-VkImageBlit-dstSubresource-parameter
  dstSubresource must be a valid VkImageSubresourceLayers structure

A more extensible version of the blit image command is defined below.

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```c
// Provided by VK_KHR_copy_commands2
void vkCmdBlitImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkBlitImageInfo2* pBlitImageInfo);
```

- commandBuffer is the command buffer into which the command will be recorded.
- pBlitImageInfo is a pointer to a VkBlitImageInfo2 structure describing the blit parameters.

This command is functionally identical to vkCmdBlitImage, but includes extensible sub-structures that include sType and pNext parameters, allowing them to be more easily extended.

**Valid Usage**

- VUID-vkCmdBlitImage2-commandBuffer-01834
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, srcImage must not be a protected image

- VUID-vkCmdBlitImage2-commandBuffer-01835
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, dstImage must not be a protected image

- VUID-vkCmdBlitImage2-commandBuffer-01836
  If commandBuffer is a protected command buffer and protectedNoFault is not supported,
**Valid Usage (Implicit)**

- VUID-vkCmdBlitImage2-commandBuffer-parameter
  - `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdBlitImage2-pBlitImageInfo-parameter
  - `pBlitImageInfo` must be a valid pointer to a valid `VkBlitImageInfo2` structure
- VUID-vkCmdBlitImage2-commandBuffer-recording
  - `commandBuffer` must be in the recording state
- VUID-vkCmdBlitImage2-commandBuffer-cmdpool
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdBlitImage2-renderpass
  - This command must only be called outside of a render pass instance

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

The `VkBlitImageInfo2` structure is defined as:

```c
typedef struct VkBlitImageInfo2 {
    VkStructureType   sType;
    const void*       pNext;
    VkImage           srcImage;
    VkImageLayout     srcImageLayout;
    VkImage           dstImage;
    VkImageLayout     dstImageLayout;
    uint32_t          regionCount;
    const VkImageBlit2* pRegions;
    VkFilter          filter;
} VkBlitImageInfo2;
```
or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkBlitImageInfo2 VkBlitImageInfo2KHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the blit.
- **dstImage** is the destination image.
- **dstImageLayout** is the layout of the destination image subresources for the blit.
- **regionCount** is the number of regions to blit.
- **pRegions** is a pointer to an array of VkImageBlit2 structures specifying the regions to blit.
- **filter** is a VkFilter specifying the filter to apply if the blits require scaling.

### Valid Usage

- **VUID-VkBlitImageInfo2-pRegions-00215**
  The source region specified by each element of **pRegions** must be a region that is contained within **srcImage**

- **VUID-VkBlitImageInfo2-pRegions-00216**
  The destination region specified by each element of **pRegions** must be a region that is contained within **dstImage**

- **VUID-VkBlitImageInfo2-pRegions-00217**
  The union of all destination regions, specified by the elements of **pRegions**, must not overlap in memory with any texel that may be sampled during the blit operation

- **VUID-VkBlitImageInfo2-srcImage-01999**
  The format features of **srcImage** must contain VK_FORMAT_FEATURE_BLIT_SRC_BIT

- **VUID-VkBlitImageInfo2-srcImage-06421**
  **srcImage** must not use a format that requires a sampler Y’CbCr conversion

- **VUID-VkBlitImageInfo2-srcImage-00219**
  **srcImage** must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag

- **VUID-VkBlitImageInfo2-srcImage-00220**
  If **srcImage** is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-VkBlitImageInfo2-srcImageLayout-00221**
  **srcImageLayout** must specify the layout of the image subresources of **srcImage** specified in **pRegions** at the time this command is executed on a VkDevice
• VUID-VkBlitImageInfo2-srcImageLayout-01398
  srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR,
  VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

• VUID-VkBlitImageInfo2-dstImage-02000
  The format features of dstImage must contain VK_FORMAT_FEATURE_BLIT_DST_BIT

• VUID-VkBlitImageInfo2-dstImage-06422
  dstImage must not use a format that requires a sampler YCbCr conversion

• VUID-VkBlitImageInfo2-dstImage-00224
  dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag

• VUID-VkBlitImageInfo2-dstImage-00225
  If dstImage is non-sparse then it must be bound completely and contiguously to a single
  VkDeviceMemory object

• VUID-VkBlitImageInfo2-dstImageLayout-00226
  dstImageLayout must specify the layout of the image subresources of dstImage specified in
  pRegions at the time this command is executed on a VkDevice

• VUID-VkBlitImageInfo2-dstImageLayout-01399
  dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR,
  VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

• VUID-VkBlitImageInfo2-srcImage-00229
  If either of srcImage or dstImage was created with a signed integer VkFormat, the other
  must also have been created with a signed integer VkFormat

• VUID-VkBlitImageInfo2-srcImage-00230
  If either of srcImage or dstImage was created with an unsigned integer VkFormat, the other
  must also have been created with an unsigned integer VkFormat

• VUID-VkBlitImageInfo2-srcImage-00231
  If either of srcImage or dstImage was created with a depth/stencil format, the other must
  have exactly the same format

• VUID-VkBlitImageInfo2-srcImage-00232
  If srcImage was created with a depth/stencil format, filter must be VK_FILTER_NEAREST

• VUID-VkBlitImageInfo2-srcImage-00233
  srcImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

• VUID-VkBlitImageInfo2-dstImage-00234
  dstImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

• VUID-VkBlitImageInfo2-filter-02001
  If filter is VK_FILTER_LINEAR, then the format features of srcImage must contain
  VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-VkBlitImageInfo2-filter-02002
  If filter is VK_FILTER_CUBIC_EXT, then the format features of srcImage must contain
  VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

• VUID-VkBlitImageInfo2-filter-00237
  If filter is VK_FILTER_CUBIC_EXT, srcImage must be of type VK_IMAGE_TYPE_2D
The `srcSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created.

The `dstSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created.

`srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

`dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

If either `srcImage` or `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` and `dstSubresource.baseArrayLayer` must each be 0, and `srcSubresource.layerCount` and `dstSubresource.layerCount` must each be 1.

For each element of `pRegions`, `srcSubresource.aspectMask` must specify aspects present in `srcImage`.

For each element of `pRegions`, `dstSubresource.aspectMask` must specify aspects present in `dstImage`.

For each element of `pRegions`, `srcOffsets[0].x` and `srcOffsets[1].x` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`.

For each element of `pRegions`, `srcOffsets[0].y` and `srcOffsets[1].y` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffsets[0].y` must be 0 and `srcOffsets[1].y` must be 1.

For each element of `pRegions`, `srcOffsets[0].z` and `srcOffsets[1].z` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffsets[0].z` must be 0 and `srcOffsets[1].z` must be 1.
For each element of \( \text{pRegions} \), \( \text{dstOffsets}[0].x \) and \( \text{dstOffsets}[1].x \) must both be greater than or equal to 0 and less than or equal to the width of the specified \( \text{dstSubresource} \) of \( \text{dstImage} \)

- **VUID-VkBlitImageInfo2-dstOffset-00249**
  For each element of \( \text{pRegions} \), \( \text{dstOffsets}[0].y \) and \( \text{dstOffsets}[1].y \) must both be greater than or equal to 0 and less than or equal to the height of the specified \( \text{dstSubresource} \) of \( \text{dstImage} \)

- **VUID-VkBlitImageInfo2-dstImage-00250**
  If \( \text{dstImage} \) is of type \( \text{VK_IMAGE_TYPE_1D} \), then for each element of \( \text{pRegions} \), \( \text{dstOffsets}[0].y \) must be 0 and \( \text{dstOffsets}[1].y \) must be 1

- **VUID-VkBlitImageInfo2-dstOffset-00251**
  For each element of \( \text{pRegions} \), \( \text{dstOffsets}[0].z \) and \( \text{dstOffsets}[1].z \) must both be greater than or equal to 0 and less than or equal to the depth of the specified \( \text{dstSubresource} \) of \( \text{dstImage} \)

- **VUID-VkBlitImageInfo2-dstImage-00252**
  If \( \text{dstImage} \) is of type \( \text{VK_IMAGE_TYPE_1D} \) or \( \text{VK_IMAGE_TYPE_2D} \), then for each element of \( \text{pRegions} \), \( \text{dstOffsets}[0].z \) must be 0 and \( \text{dstOffsets}[1].z \) must be 1

**Valid Usage (Implicit)**

- **VUID-VkBlitImageInfo2-sType-sType**
  \( sType \) must be \( \text{VK_STRUCTURE_TYPE_BLIT_IMAGE_INFO_2} \)

- **VUID-VkBlitImageInfo2-pNext-pNext**
  \( pNext \) must be \( \text{NULL} \)

- **VUID-VkBlitImageInfo2-srcImage-parameter**
  \( srcImage \) must be a valid \( \text{VkImage} \) handle

- **VUID-VkBlitImageInfo2-srcImageLayout-parameter**
  \( srcImageLayout \) must be a valid \( \text{VkImageLayout} \) value

- **VUID-VkBlitImageInfo2-dstImage-parameter**
  \( dstImage \) must be a valid \( \text{VkImage} \) handle

- **VUID-VkBlitImageInfo2-dstImageLayout-parameter**
  \( dstImageLayout \) must be a valid \( \text{VkImageLayout} \) value

- **VUID-VkBlitImageInfo2-pRegions-parameter**
  \( pRegions \) must be a valid pointer to an array of \( \text{regionCount} \) valid \( \text{VkImageBlit2} \) structures

- **VUID-VkBlitImageInfo2-filter-parameter**
  \( filter \) must be a valid \( \text{VkFilter} \) value

- **VUID-VkBlitImageInfo2-regionCount-arraylength**
  \( \text{regionCount} \) must be greater than 0

- **VUID-VkBlitImageInfo2-commonparent**
  Both of \( \text{dstImage} \), and \( \text{srcImage} \) must have been created, allocated, or retrieved from the same \( \text{VkDevice} \)
The `VkImageBlit2` structure is defined as:

```c
typedef struct VkImageBlit2 {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffsets[2];
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffsets[2];
} VkImageBlit2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkImageBlit2 VkImageBlit2KHR;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `srcSubresource` is the subresource to blit from.
• `srcOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the source region within `srcSubresource`.
• `dstSubresource` is the subresource to blit into.
• `dstOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the destination region within `dstSubresource`.

For each element of the `pRegions` array, a blit operation is performed for the specified source and destination regions.

### Valid Usage

- VUID-VkImageBlit2-aspectMask-00238
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must match
- VUID-VkImageBlit2-layerCount-08800
  The `layerCount` members of `srcSubresource` or `dstSubresource` must match

### Valid Usage (Implicit)

- VUID-VkImageBlit2-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_BLIT_2`
- VUID-VkImageBlit2-pNext-pNext
  `pNext` must be `NULL`
- VUID-VkImageBlit2-srcSubresource-parameter
srcSubresource must be a valid VkImageSubresourceLayers structure

- VUID-VkImageBlit2-dstSubresource-parameter
dstSubresource must be a valid VkImageSubresourceLayers structure

# 19.5. Resolving Multisample Images

To resolve a multisample color image to a non-multisample color image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdResolveImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageResolve* pRegions);
```

- commandBuffer is the command buffer into which the command will be recorded.
- srcImage is the source image.
- srcImageLayout is the layout of the source image subresources for the resolve.
- dstImage is the destination image.
- dstImageLayout is the layout of the destination image subresources for the resolve.
- regionCount is the number of regions to resolve.
- pRegions is a pointer to an array of VkImageResolve structures specifying the regions to resolve.

During the resolve the samples corresponding to each pixel location in the source are converted to a single sample before being written to the destination. If the source formats are floating-point or normalized types, the sample values for each pixel are resolved in an implementation-dependent manner. If the source formats are integer types, a single sample's value is selected for each pixel.

srcOffset and dstOffset select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data. extent is the size in texels of the source image to resolve in width, height and depth. Each element of pRegions must be a region that is contained within its corresponding image.

Resolves are done layer by layer starting with baseArrayLayer member of srcSubresource for the source and dstSubresource for the destination. layerCount layers are resolved to the destination image.

## Valid Usage

- VUID-vkCmdResolveImage-commandBuffer-01837
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported,
srcImage must not be a protected image

- VUID-vkCmdResolveImage-commandBuffer-01838
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, dstImage must not be a protected image

- VUID-vkCmdResolveImage-commandBuffer-01839
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, dstImage must not be an unprotected image

- VUID-vkCmdResolveImage-pRegions-00255
  The union of all source regions, and the union of all destination regions, specified by the elements of pRegions, must not overlap in memory

- VUID-vkCmdResolveImage-srcImage-00256
  If srcImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdResolveImage-srcImage-00257
  srcImage must have a sample count equal to any valid sample count value other than VK_SAMPLE_COUNT_1_BIT

- VUID-vkCmdResolveImage-dstImage-00258
  If dstImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdResolveImage-dstImage-00259
  dstImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

- VUID-vkCmdResolveImage-srcImageLayout-00260
  srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice

- VUID-vkCmdResolveImage-srcImageLayout-01400
  srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- VUID-vkCmdResolveImage-dstImageLayout-00262
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice

- VUID-vkCmdResolveImage-dstImageLayout-01401
  dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- VUID-vkCmdResolveImage-dstImage-02003
  The format features of dstImage must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-vkCmdResolveImage-srcImage-01386
  srcImage and dstImage must have been created with the same image format

- VUID-vkCmdResolveImage-srcSubresource-01709
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

- VUID-vkCmdResolveImage-dstSubresource-01710
The `dstSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created.

- **VUID-vkCmdResolveImage-srcSubresource-01711**
  `srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

- **VUID-vkCmdResolveImage-dstSubresource-01712**
  `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

- **VUID-vkCmdResolveImage-srcImage-04446**
  If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.layerCount` **must** be 1.

- **VUID-vkCmdResolveImage-srcImage-04447**
  If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstSubresource.baseArrayLayer` **must** be 0 and `dstSubresource.layerCount` **must** be 1.

- **VUID-vkCmdResolveImage-srcOffset-00269**
  For each element of `pRegions`, `srcOffset.x` and `(extent.width + srcOffset.x)` **must** both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`.

- **VUID-vkCmdResolveImage-srcOffset-00270**
  For each element of `pRegions`, `srcOffset.y` and `(extent.height + srcOffset.y)` **must** both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`.

- **VUID-vkCmdResolveImage-srcImage-00271**
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` **must** be 0 and `extent.height` **must** be 1.

- **VUID-vkCmdResolveImage-srcOffset-00272**
  For each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` **must** both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

- **VUID-vkCmdResolveImage-srcImage-00273**
  If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffset.z` **must** be 0 and `extent.depth` **must** be 1.

- **VUID-vkCmdResolveImage-dstOffset-00274**
  For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` **must** both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`.

- **VUID-vkCmdResolveImage-dstOffset-00275**
  For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` **must** both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`.

- **VUID-vkCmdResolveImage-dstImage-00276**
If \textit{dstImage} is of type \texttt{VK\_IMAGE\_TYPE\_1D}, then for each element of \texttt{pRegions}, \textit{dstOffset.y} must be 0 and \textit{extent.height} must be 1

- VUID-vkCmdResolveImage-dstOffset-00277
  For each element of \texttt{pRegions}, \textit{dstOffset.z} and \((\text{extent.depth} + \textit{dstOffset.z})\) must both be greater than or equal to 0 and less than or equal to the depth of the specified \textit{dstSubresource} of \textit{dstImage}

- VUID-vkCmdResolveImage-dstImage-00278
  If \textit{dstImage} is of type \texttt{VK\_IMAGE\_TYPE\_1D} or \texttt{VK\_IMAGE\_TYPE\_2D}, then for each element of \texttt{pRegions}, \textit{dstOffset.z} must be 0 and \textit{extent.depth} must be 1

- VUID-vkCmdResolveImage-srcImage-06762
  \textit{srcImage} must have been created with \texttt{VK\_IMAGE\_USAGE\_TRANSFER\_SRC\_BIT} usage flag

- VUID-vkCmdResolveImage-srcImage-06763
  The \textit{format features} of \textit{srcImage} must contain \texttt{VK\_FORMAT\_FEATURE\_TRANSFER\_SRC\_BIT}

- VUID-vkCmdResolveImage-dstImage-06764
  \textit{srcImage} must have been created with \texttt{VK\_IMAGE\_USAGE\_TRANSFER\_DST\_BIT} usage flag

- VUID-vkCmdResolveImage-dstImage-06765
  The \textit{format features} of \textit{dstImage} must contain \texttt{VK\_FORMAT\_FEATURE\_TRANSFER\_DST\_BIT}

\section{Valid Usage (Implicit)}

- VUID-vkCmdResolveImage-commandBuffer-parameter
  \textit{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdResolveImage-srcImage-parameter
  \textit{srcImage} must be a valid \texttt{VkImage} handle

- VUID-vkCmdResolveImage-srcImageLayout-parameter
  \textit{srcImageLayout} must be a valid \texttt{VkImageLayout} value

- VUID-vkCmdResolveImage-dstImage-parameter
  \textit{dstImage} must be a valid \texttt{VkImage} handle

- VUID-vkCmdResolveImage-dstImageLayout-parameter
  \textit{dstImageLayout} must be a valid \texttt{VkImageLayout} value

- VUID-vkCmdResolveImage-pRegions-parameter
  \texttt{pRegions} must be a valid pointer to an array of \texttt{regionCount} valid \texttt{VkImageResolve} structures

- VUID-vkCmdResolveImage-commandBuffer-recording
  \textit{commandBuffer} must be in the \texttt{recording state}

- VUID-vkCmdResolveImage-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \textit{commandBuffer} was allocated from must support graphics operations

- VUID-vkCmdResolveImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdResolveImage-regionCount-arraylength
**regionCount** must be greater than 0

- VUID-vkCmdResolveImage-commonparent
  Each of `commandBuffer`, `dstImage`, and `srcImage` must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkImageResolve` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageResolve {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageResolve;
```

- `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.
- `srcOffset` and `dstOffset` select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the source image to resolve in width, height and depth.

### Valid Usage

- VUID-VkImageResolve-aspectMask-00266
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must only contain `VK_IMAGE_ASPECT_COLOR_BIT`
The `layerCount` member of `srcSubresource` and `dstSubresource` must match.

### Valid Usage (Implicit)

- **VUID-VkImageResolve-layerCount-08803**
  The `layerCount` member of `srcSubresource` and `dstSubresource` must match.

- **VUID-VkImageResolve-srcSubresource-parameter**
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure.

- **VUID-VkImageResolve-dstSubresource-parameter**
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure.

A more extensible version of the resolve image command is defined below.

To resolve a multisample image to a non-multisample image, call:

```c
// Provided by VK_KHR_copy_commands2
void vkCmdResolveImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkResolveImageInfo2* pResolveImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pResolveImageInfo` is a pointer to a `VkResolveImageInfo2` structure describing the resolve parameters.

This command is functionally identical to `vkCmdResolveImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- **VUID-vkCmdResolveImage2-commandBuffer-01837**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image.

- **VUID-vkCmdResolveImage2-commandBuffer-01838**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image.

- **VUID-vkCmdResolveImage2-commandBuffer-01839**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image.

### Valid Usage (Implicit)

- **VUID-vkCmdResolveImage2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.
- **VUID-vkCmdResolveImage2-pResolveImageInfo-parameter**
  `pResolveImageInfo` must be a valid pointer to a valid `VkResolveImageInfo2` structure.

- **VUID-vkCmdResolveImage2-commandBuffer-recording**
  `commandBuffer` must be in the **recording state**.

- **VUID-vkCmdResolveImage2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdResolveImage2-renderpass**
  This command must only be called outside of a render pass instance.

---

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

---

### Command Properties

<table>

The `VkResolveImageInfo2` structure is defined as:

```c
typedef struct VkResolveImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageResolve2* pRegions;
} VkResolveImageInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkResolveImageInfo2 VkResolveImageInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `srcImage` is the source image.

• `srcImageLayout` is the layout of the source image subresources for the resolve.

• `dstImage` is the destination image.

• `dstImageLayout` is the layout of the destination image subresources for the resolve.

• `regionCount` is the number of regions to resolve.

• `pRegions` is a pointer to an array of `VkImageResolve2` structures specifying the regions to resolve.

---

### Valid Usage

- **VUID-VkResolveImageInfo2-pRegions-00255**
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory

- **VUID-VkResolveImageInfo2-srcImage-00256**
  If `srcImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkResolveImageInfo2-srcImageLayout-00257**
  `srcImage` **must** have a sample count equal to any valid sample count value other than `VK_SAMPLE_COUNT_1_BIT`

- **VUID-VkResolveImageInfo2-dstImage-00258**
  If `dstImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkResolveImageInfo2-dstImageLayout-00259**
  `dstImage` **must** have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`

- **VUID-VkResolveImageInfo2-srcImageLayout-01400**
  `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-VkResolveImageInfo2-dstImageLayout-01401**
  `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`

- **VUID-VkResolveImageInfo2-srcImage-01386**
  `srcImage` and `dstImage` **must** have been created with the same image format

---

935
The `srcSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created.

The `dstSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created.

`srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

`dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.layerCount` must be 1.

If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstSubresource.baseArrayLayer` must be 0 and `dstSubresource.layerCount` must be 1.

For each element of `pRegions`, `srcOffset.x` and `(extent.width + srcOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`.

For each element of `pRegions`, `srcOffset.y` and `(extent.height + srcOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` must be 0 and `extent.height` must be 1.

For each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffset.z` must be 0 and `extent.depth` must be 1.

For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`.
For each element of \( pRegions, dstOffset.y \) and \((extent.height + dstOffset.y)\) must both be greater than or equal to 0 and less than or equal to the height of the specified dstSubresource of dstImage.

- **VUID-VkResolveImageInfo2-dstImage-00276**
  If \( dstImage \) is of type \( VK_IMAGE_TYPE_1D \), then for each element of \( pRegions, dstOffset.y \) must be 0 and \( extent.height \) must be 1

- **VUID-VkResolveImageInfo2-dstOffset-00277**
  For each element of \( pRegions, dstOffset.z \) and \((extent.depth + dstOffset.z)\) must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage.

- **VUID-VkResolveImageInfo2-dstImage-00278**
  If \( dstImage \) is of type \( VK_IMAGE_TYPE_1D \) or \( VK_IMAGE_TYPE_2D \), then for each element of \( pRegions, dstOffset.z \) must be 0 and \( extent.depth \) must be 1

- **VUID-VkResolveImageInfo2-srcImage-06762**
  \( srcImage \) must have been created with \( VK_IMAGE_USAGE_TRANSFER_SRC_BIT \) usage flag

- **VUID-VkResolveImageInfo2-srcImage-06763**
  The format features of \( srcImage \) must contain \( VK_FORMAT_FEATURE_TRANSFER_SRC_BIT \)

- **VUID-VkResolveImageInfo2-dstImage-06764**
  \( dstImage \) must have been created with \( VK_IMAGE_USAGE_TRANSFER_DST_BIT \) usage flag

- **VUID-VkResolveImageInfo2-dstImage-06765**
  The format features of \( dstImage \) must contain \( VK_FORMAT_FEATURE_TRANSFER_DST_BIT \)

**Valid Usage (Implicit)**

- **VUID-VkResolveImageInfo2-sType-sType**
  \( sType \) must be \( VK_STRUCTURE_TYPE_RESOLVE_IMAGE_INFO_2 \)

- **VUID-VkResolveImageInfo2-pNext-pNext**
  \( pNext \) must be NULL

- **VUID-VkResolveImageInfo2-srcImage-parameter**
  \( srcImage \) must be a valid \( VkImage \) handle

- **VUID-VkResolveImageInfo2-srcImageLayout-parameter**
  \( srcImageLayout \) must be a valid \( VkImageLayout \) value

- **VUID-VkResolveImageInfo2-dstImage-parameter**
  \( dstImage \) must be a valid \( VkImage \) handle

- **VUID-VkResolveImageInfo2-dstImageLayout-parameter**
  \( dstImageLayout \) must be a valid \( VkImageLayout \) value

- **VUID-VkResolveImageInfo2-pRegions-parameter**
  \( pRegions \) must be a valid pointer to an array of \( regionCount \) valid \( VkImageResolve2 \) structures

- **VUID-VkResolveImageInfo2-regionCount-arraylength**
  \( regionCount \) must be greater than 0
Both of `dstImage`, and `srcImage` must have been created, allocated, or retrieved from the same `VkDevice`.

The `VkImageResolve2` structure is defined as:

```c
typedef struct VkImageResolve2 {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageResolve2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkImageResolve2 VkImageResolve2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.
- `srcOffset` and `dstOffset` select the initial `x`, `y`, and `z` offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the source image to resolve in `width`, `height` and `depth`.

**Valid Usage**

- VUID-VkImageResolve2-aspectMask-00266
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must only contain `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-VkImageResolve2-layerCount-08803
  The `layerCount` member of `srcSubresource` and `dstSubresource` must match

**Valid Usage (Implicit)**

- VUID-VkImageResolve2-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_RESOLVE_2`
19.6. Object Refreshes

Safety critical applications may need to contend with single event upsets (SEUs). For a Vulkan object explicitly backed by device memory, such as a VkImage or VkBuffer, an application can bind its backing memory to a SEU-safe heap with the VK_MEMORY_HEAP_SEU_SAFE_BIT bit set. Alternatively, an application can also periodically reload the non-SEU-safe device memory contents from a known SEU-safe portion of host memory, or otherwise periodically regenerate or refresh the contents of non-SEU-safe device memory.

However, an implementation may store implementation-specific internal object data in non-SEU-safe memory, and Base Vulkan provides no method to determine which object types this applies to or how to refresh their data. An application can query the list of object types that have implementation internal object data stored in non-SEU-safe memory using vkGetPhysicalDeviceRefreshableObjectTypesKHR, and can instruct the implementation to refresh the internal data of specific objects from a backup in SEU-safe memory using the vkCmdRefreshObjectsKHR command.

To refresh a list of objects as a pipelined operation, call:

```c
// Provided by VK_KHR_object_refresh
void vkCmdRefreshObjectsKHR(
    VkCommandBuffer commandBuffer,
    const VkRefreshObjectListKHR* pRefreshObjects);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pRefreshObjects` is a pointer to a VkRefreshObjectListKHR structure specifying the list of objects to refresh.

The access scope for object refreshes falls under the VK_ACCESS_TRANSFER_WRITE_BIT, and the pipeline stages for identifying the synchronization scope must include VK_PIPELINE_STAGE_TRANSFER_BIT.

**Note**

If an implementation does not store a supplied object's internal data in SEU-susceptible memory, it may ignore the refresh command for that object.

**Valid Usage (Implicit)**

- VUID-vkCmdRefreshObjectsKHR-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdRefreshObjectsKHR-pRefreshObjects-parameter
  pRefreshObjects must be a valid pointer to a valid VkRefreshObjectListKHR structure

- VUID-vkCmdRefreshObjectsKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdRefreshObjectsKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, or transfer operations

- VUID-vkCmdRefreshObjectsKHR-renderpass
  This command must only be called outside of a render pass instance

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
<tr>

<td>Transfer</td>
<td></td>
</tr>
</tbody>
</table>

The VkRefreshObjectListKHR structure is defined as:

```c
// Provided by VK_KHR_object_refresh
typedef struct VkRefreshObjectListKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t objectCount;
    const VkRefreshObjectKHR* pObjects;
} VkRefreshObjectListKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- objectCount is the number of objects to refresh.
- pObjects is a pointer to an array of VkRefreshObjectKHR structures, defining the objects to refresh.
Valid Usage (Implicit)

- VUID-VkRefreshObjectListKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_REFRESH_OBJECT_LIST_KHR

- VUID-VkRefreshObjectListKHR-pNext-pNext
  pNext must be NULL

- VUID-VkRefreshObjectListKHR-pObjects-parameter
  pObjects must be a valid pointer to an array of objectCount valid VkRefreshObjectKHR structures

- VUID-VkRefreshObjectListKHR-objectCount-arraylength
  objectCount must be greater than 0

The VkRefreshObjectKHR structure is defined as:

```c
// Provided by VK_KHR_object_refresh
typedef struct VkRefreshObjectKHR {
    VkObjectType objectType;
    uint64_t objectHandle;
    VkRefreshObjectFlagsKHR flags;
} VkRefreshObjectKHR;
```

- `objectType` is a VkObjectType specifying the type of the object to refresh.
- `objectHandle` is the object to refresh.
- `flags` is a bitmask of VkRefreshObjectFlagsKHR.

Valid Usage

- VUID-VkRefreshObjectKHR-objectHandle-05069
  objectHandle must be a valid Vulkan handle of the type associated with objectType as defined in the VkObjectType and Vulkan Handle Relationship table

- VUID-VkRefreshObjectKHR-objectType-05070
  objectType must not be VK_OBJECT_TYPE_UNKNOWN

Valid Usage (Implicit)

- VUID-VkRefreshObjectKHR-objectType-parameter
  objectType must be a valid VkObjectType value

- VUID-VkRefreshObjectKHR-flags-zerobitmask
  flags must be 0
Host Synchronization

- Host access to `objectHandle` must be externally synchronized

// Provided by VK_KHR_object_refresh
typedef enum VkRefreshObjectFlagBitsKHR {
} VkRefreshObjectFlagBitsKHR;

// Provided by VK_KHR_object_refresh
typedef VkFlags VkRefreshObjectFlagsKHR;

`VkRefreshObjectFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.
Chapter 20. Drawing Commands

Drawing commands (commands with Draw in the name) provoke work in a graphics pipeline. Drawing commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound graphics pipeline. A graphics pipeline must be bound to a command buffer before any drawing commands are recorded in that command buffer.

Each draw is made up of zero or more vertices and zero or more instances, which are processed by the device and result in the assembly of primitives. Primitives are assembled according to the pInputAssemblyState member of the VkGraphicsPipelineCreateInfo structure, which is of type VkPipelineInputAssemblyStateCreateInfo:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineInputAssemblyStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineInputAssemblyStateCreateFlags flags;
    VkPrimitiveTopology topology;
    VkBool32 primitiveRestartEnable;
} VkPipelineInputAssemblyStateCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **topology** is a VkPrimitiveTopology defining the primitive topology, as described below.
- **primitiveRestartEnable** controls whether a special vertex index value is treated as restarting the assembly of primitives. This enable only applies to indexed draws (vkCmdDrawIndexed, and vkCmdDrawIndexedIndirect), and the special index value is either 0xFFFFFFFF when the indexType parameter of vkCmdBindIndexBuffer is equal to VK_INDEX_TYPE_UINT32, 0xFF when indexType is equal to VK_INDEX_TYPE_UINT8_EXT, or 0xFFFF when indexType is equal to VK_INDEX_TYPE_UINT16. Primitive restart is not allowed for “list” topologies.

Restarting the assembly of primitives discards the most recent index values if those elements formed an incomplete primitive, and restarts the primitive assembly using the subsequent indices, but only assembling the immediately following element through the end of the originally specified elements. The primitive restart index value comparison is performed before adding the vertexOffset value to the index value.

**Valid Usage**

- **VUID-VkPipelineInputAssemblyStateCreateInfo-topology-06252**
  If topology is VK_PRIMITIVE_TOPOLOGY_POINT_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY, or VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY, primitiveRestartEnable must be
If `topology` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, `primitiveRestartEnable` must be `VK_FALSE`.

If the `geometryShader` feature is not enabled, `topology` must not be any of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`.

If the `tessellationShader` feature is not enabled, `topology` must not be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO`.
- `pNext` must be `NULL`.
- `flags` must be `0`.
- `topology` must be a valid `VkPrimitiveTopology` value.

```c
typedef VkFlags VkPipelineInputAssemblyStateCreateFlags;
```

`VkPipelineInputAssemblyStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To `dynamically control` whether a special vertex index value is treated as restarting the assembly of primitives, call:

```c
void vkCmdSetPrimitiveRestartEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 primitiveRestartEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. It behaves in the same way as `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable`.
This command sets the primitive restart enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetPrimitiveRestartEnable-None-08970
  At least one of the following must be true:
  - the extendedDynamicState2 feature is enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>

<td></td>
</tr>
</tbody>
</table>

**20.1. Primitive Topologies**

*Primitive topology* determines how consecutive vertices are organized into primitives, and determines the type of primitive that is used at the beginning of the graphics pipeline. The effective topology for later stages of the pipeline is altered by tessellation or geometry shading (if either is in use) and depends on the execution modes of those shaders.
The primitive topologies defined by `VkPrimitiveTopology` are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPrimitiveTopology {
    VK_PRIMITIVE_TOPOLOGY_POINT_LIST = 0,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST = 1,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP = 2,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST = 3,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP = 4,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN = 5,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY = 6,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY = 7,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY = 8,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY = 9,
    VK_PRIMITIVE_TOPOLOGY_PATCH_LIST = 10,
} VkPrimitiveTopology;
```

- `VK_PRIMITIVE_TOPOLOGY_POINT_LIST` specifies a series of separate point primitives.
- `VK_PRIMITIVE_TOPOLOGY_LINE_LIST` specifies a series of separate line primitives.
- `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP` specifies a series of connected line primitives with consecutive lines sharing a vertex.
- `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST` specifies a series of separate triangle primitives.
- `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP` specifies a series of connected triangle primitives with consecutive triangles sharing an edge.
- `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN` specifies a series of connected triangle primitives with all triangles sharing a common vertex.
- `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY` specifies a series of separate line primitives with adjacency.
- `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY` specifies a series of connected line primitives with adjacency, with consecutive primitives sharing three vertices.
- `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` specifies a series of separate triangle primitives with adjacency.
- `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY` specifies connected triangle primitives with adjacency, with consecutive triangles sharing an edge.
- `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` specifies separate patch primitives.

Each primitive topology, and its construction from a list of vertices, is described in detail below with a supporting diagram, according to the following key:

<table>
<thead>
<tr>
<th>Vertex</th>
<th>A point in 3-dimensional space. Positions chosen within the diagrams are arbitrary and for illustration only.</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Vertex Number</td>
</tr>
<tr>
<td>Provoking Vertex</td>
<td>Provoking vertex within the main primitive. The tail is angled towards the relevant primitive. Used in flat shading.</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Primitive Edge</td>
<td>An edge connecting the points of a main primitive.</td>
</tr>
<tr>
<td>Adjacency Edge</td>
<td>Points connected by these lines do not contribute to a main primitive, and are only accessible in a geometry shader.</td>
</tr>
<tr>
<td>Winding Order</td>
<td>The relative order in which vertices are defined within a primitive, used in the facing determination. This ordering has no specific start or endpoint.</td>
</tr>
</tbody>
</table>

The diagrams are supported with mathematical definitions where the vertices \((v)\) and primitives \((p)\) are numbered starting from 0; \(v_0\) is the first vertex in the provided data and \(p_0\) is the first primitive in the set of primitives defined by the vertices and topology.

To **dynamically set** primitive topology, call:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetPrimitiveTopologyEXT(
    VkCommandBuffer commandBuffer,  
    VkPrimitiveTopology primitiveTopology);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveTopology` specifies the primitive topology to use for drawing.

This command sets the primitive topology for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineInputAssemblyStateCreateInfo::topology` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetPrimitiveTopology-None-08971
  At least one of the following **must** be true:
  - the `extendedDynamicState` feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetPrimitiveTopology-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetPrimitiveTopology-primitiveTopology-parameter
  `primitiveTopology` **must** be a valid `VkPrimitiveTopology` value

- VUID-vkCmdSetPrimitiveTopology-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 20.1.1. Topology Class

The primitive topologies are grouped into the following topology classes:

**Table 26. Topology classes**

<table>
<thead>
<tr>
<th>Topology Class</th>
<th>Primitive Topology</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td><code>VK_PRIMITIVE_TOPOLOGY_POINT_LIST</code></td>
</tr>
<tr>
<td>Line</td>
<td><code>VK_PRIMITIVE_TOPOLOGY_LINE_LIST</code>, <code>VK_PRIMITIVE_TOPOLOGY_LINE_STRIP</code>, <code>VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY</code>, <code>VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY</code></td>
</tr>
<tr>
<td>Triangle</td>
<td><code>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST</code>, <code>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP</code>, <code>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN</code>, <code>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY</code>, <code>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY</code></td>
</tr>
<tr>
<td>Patch</td>
<td><code>VK_PRIMITIVE_TOPOLOGY_PATCH_LIST</code></td>
</tr>
</tbody>
</table>

### 20.1.2. Point Lists

When the topology is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, each consecutive vertex defines a single point primitive, according to the equation:
\[ p_i = \{v_i\} \]

As there is only one vertex, that vertex is the provoking vertex. The number of primitives generated is equal to \( \text{vertexCount} \).

20.1.3. Line Lists

When the primitive topology is \texttt{VK_PRIMITIVE_TOPOLOGY_LINE_LIST}, each consecutive pair of vertices defines a single line primitive, according to the equation:

\[ p_i = \{v_{2i}, v_{2i+1}\} \]

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/2 \rfloor \).

The provoking vertex for \( p_i \) is \( v_{2i} \).

20.1.4. Line Strips

When the primitive topology is \texttt{VK_PRIMITIVE_TOPOLOGY_LINE_STRIP}, one line primitive is defined by each vertex and the following vertex, according to the equation:

\[ p_i = \{v_i, v_{i+1}\} \]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-1) \).

The provoking vertex for \( p_i \) is \( v_i \).
20.1.5. Triangle Lists

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, each consecutive set of three vertices defines a single triangle primitive, according to the equation:

\[ p_i = \{v_{3i}, v_{3i+1}, v_{3i+2}\} \]

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/3 \rfloor \).

The provoking vertex for \( p_i \) is \( v_{3i} \).

20.1.6. Triangle Strips

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, one triangle primitive is defined by each vertex and the two vertices that follow it, according to the equation:

\[ p_i = \{v_i, v_{i+(1+i\%2)}, v_{i+(2-i\%2)}\} \]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-2) \).

The provoking vertex for \( p_i \) is \( v_i \).

![Diagram of Triangle Strips]

**Note**

The ordering of the vertices in each successive triangle is reversed, so that the winding order is consistent throughout the strip.

20.1.7. Triangle Fans

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`, triangle primitives are defined around a shared common vertex, according to the equation:
\[ p_i = \{v_{i-1}, v_{i+2}, v_0\} \]

The number of primitives generated is equal to \( \max(0, \text{vertexCount} - 2) \).

The provoking vertex for \( p_i \) is \( v_{i+1} \).

**20.1.8. Line Lists With Adjacency**

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, each consecutive set of four vertices defines a single line primitive with adjacency, according to the equation:

\[ p_i = \{v_{4i}, v_{4i+1}, v_{4i+2}, v_{4i+3}\} \]

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a geometry shader.

The number of primitives generated is equal to \( \left\lfloor \text{vertexCount}/4 \right\rfloor \).

The provoking vertex for \( p_i \) is \( v_{4i+1} \).

**20.1.9. Line Strips With Adjacency**

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`, one line primitive with adjacency is defined by each vertex and the following vertex, according to the equation:

\[ p_i = \{v_i, v_{i+1}, v_{i+2}, v_{i+3}\} \]

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a geometry shader.
The number of primitives generated is equal to \(\max(0, \text{vertexCount}-3)\).

The provoking vertex for \(p_i\) is \(v_{i+1}\).

20.1.10. Triangle Lists With Adjacency

When the primitive topology is \texttt{VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY}, each consecutive set of six vertices defines a single triangle primitive with adjacency, according to the equations:

\[ p_i = \{v_{6i}, v_{6i+1}, v_{6i+2}, v_{6i+3}, v_{6i+4}, v_{6i+5}\} \]

A triangle primitive is described by the first, third, and fifth vertices of the total primitive, with the remaining three vertices only accessible in a \texttt{geometry shader}.

The number of primitives generated is equal to \(\lfloor \text{vertexCount}/6 \rfloor\).

The provoking vertex for \(p_i\) is \(v_{6i}\).

20.1.11. Triangle Strips With Adjacency

When the primitive topology is \texttt{VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY}, one triangle primitive with adjacency is defined by each vertex and the following 5 vertices.

The number of primitives generated, \(n\), is equal to \(\lfloor \max(0, \text{vertexCount} - 4)/2 \rfloor\).

If \(n=1\), the primitive is defined as:

\[ p = \{v_0, v_1, v_2, v_4, v_3\} \]

If \(n>1\), the total primitive consists of different vertices according to where it is in the strip:

\[ p_i = \{v_{2i}, v_{2i+1}, v_{2i+2}, v_{2i+6}, v_{2i+4}, v_{2i+3}\} \text{ when } i=0 \]
\[ p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+6}, v_{2i+2}, v_{2i-2}\} \text{ when } i>0, i<n-1, \text{ and } i \% 2=1 \]

\[ p_i = \{v_{2i}, v_{2i+2}, v_{2i+6}, v_{2i+4}, v_{2i+3}\} \text{ when } i>0, i<n-1, \text{ and } i \% 2=0 \]

\[ p_i = \{v_{2i}, v_{2i+3}, v_{2i+5}, v_{2i+2}, v_{2i+3}\} \text{ when } i=n-1 \text{ and } i \% 2=1 \]

\[ p_i = \{v_{2i}, v_{2i+2}, v_{2i+5}, v_{2i+4}, v_{2i+3}\} \text{ when } i=n-1 \text{ and } i \% 2=0 \]

A triangle primitive is described by the first, third, and fifth vertices of the total primitive in all cases, with the remaining three vertices only accessible in a geometry shader.

**Note**

The ordering of the vertices in each successive triangle is altered so that the winding order is consistent throughout the strip.

The provoking vertex for \( p_i \) is always \( v_{2i} \).
20.1.12. Patch Lists

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, each consecutive set of m vertices defines a single patch primitive, according to the equation:

\[ p_i = \{ v_{m_i}, v_{m_i+1}, \ldots, v_{m_i+(m-2)}, v_{m_i+(m-1)} \} \]

where m is equal to `VkPipelineTessellationStateCreateInfo::patchControlPoints`.

Patch lists are never passed to vertex post-processing, and as such no provoking vertex is defined for patch primitives. The number of primitives generated is equal to \( \lfloor \text{vertexCount}/m \rfloor \).

The vertices comprising a patch have no implied geometry, and are used as inputs to tessellation shaders and the fixed-function tessellator to generate new point, line, or triangle primitives.

20.2. Primitive Order

Primitives generated by drawing commands progress through the stages of the graphics pipeline in primitive order. Primitive order is initially determined in the following way:

1. Submission order determines the initial ordering
2. For indirect drawing commands, the order in which accessed instances of the `VkDrawIndirectCommand` are stored in buffer, from lower indirect buffer addresses to higher addresses.
3. If a drawing command includes multiple instances, the order in which instances are executed, from lower numbered instances to higher.
4. The order in which primitives are specified by a drawing command:
   - For non-indexed draws, from vertices with a lower numbered `vertexIndex` to a higher numbered `vertexIndex`.
   - For indexed draws, vertices sourced from a lower index buffer addresses to higher addresses.

   Within this order implementations further sort primitives:

5. If tessellation shading is active, by an implementation-dependent order of new primitives generated by tessellation.
6. If geometry shading is active, by the order new primitives are generated by geometry shading.
7. If the polygon mode is not `VK_POLYGON_MODE_FILL`, by an implementation-dependent ordering of the new primitives generated within the original primitive.

Primitive order is later used to define rasterization order, which determines the order in which fragments output results to a framebuffer.
20.3. Programmable Primitive Shading

Once primitives are assembled, they proceed to the vertex shading stage of the pipeline. If the draw includes multiple instances, then the set of primitives is sent to the vertex shading stage multiple times, once for each instance.

It is implementation-dependent whether vertex shading occurs on vertices that are discarded as part of incomplete primitives, but if it does occur then it operates as if they were vertices in complete primitives and such invocations can have side effects.

Vertex shading receives two per-vertex inputs from the primitive assembly stage - the vertexIndex and the instanceIndex. How these values are generated is defined below, with each command.

Drawing commands fall roughly into two categories:

- Non-indexed drawing commands present a sequential vertexIndex to the vertex shader. The sequential index is generated automatically by the device (see Fixed-Function Vertex Processing for details on both specifying the vertex attributes indexed by vertexIndex, as well as binding vertex buffers containing those attributes to a command buffer). These commands are:
  - vkCmdDraw
  - vkCmdDrawIndirect
  - vkCmdDrawIndirectCount

- Indexed drawing commands read index values from an index buffer and use this to compute the vertexIndex value for the vertex shader. These commands are:
  - vkCmdDrawIndexed
  - vkCmdDrawIndexedIndirect
  - vkCmdDrawIndexedIndirectCount

To bind an index buffer to a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindVertexBuffer(
  VkCommandBuffer commandBuffer,  // Provided by VK_VERSION_1_0
  VkBuffer buffer,  // Provided by VK_VERSION_1_0
  VkDeviceSize offset,  // Provided by VK_VERSION_1_0
  VkIndexType indexType);  // Provided by VK_VERSION_1_0
```

- commandBuffer is the command buffer into which the command is recorded.
- buffer is the buffer being bound.
- offset is the starting offset in bytes within buffer used in index buffer address calculations.
- indexType is a VkIndexType value specifying the size of the indices.
Valid Usage

- VUID-vkCmdBindIndexBuffer-offset-08782
  offset must be less than the size of buffer

- VUID-vkCmdBindIndexBuffer-offset-08783
  The sum of offset and the base address of the range of VkDeviceMemory object that is backing buffer, must be a multiple of the size of the type indicated by indexType

- VUID-vkCmdBindIndexBuffer-buffer-08784
  buffer must have been created with the VK_BUFFER_USAGE_INDEX_BUFFER_BIT flag

- VUID-vkCmdBindIndexBuffer-buffer-08785
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBindIndexBuffer-indexType-08787
  If indexType is VK_INDEX_TYPE_UINT8_EXT, the indexTypeUint8 feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdBindIndexBuffer-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBindIndexBuffer-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-vkCmdBindIndexBuffer-indexType-parameter
  indexType must be a valid VkIndexType value

- VUID-vkCmdBindIndexBuffer-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBindIndexBuffer-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBindIndexBuffer-commonparent
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Possible values of `vkCmdBindIndexBuffer::indexType`, specifying the size of indices, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkIndexType {
    VK_INDEX_TYPE_UINT16 = 0,
    VK_INDEX_TYPE_UINT32 = 1,
    // Provided by VK_EXT_index_type_uint8
    VK_INDEX_TYPE_UINT8_EXT = 1000265000,
} VkIndexType;
```

- `VK_INDEX_TYPE_UINT16` specifies that indices are 16-bit unsigned integer values.
- `VK_INDEX_TYPE_UINT32` specifies that indices are 32-bit unsigned integer values.
- `VK_INDEX_TYPE_UINT8_EXT` specifies that indices are 8-bit unsigned integer values.

The parameters for each drawing command are specified directly in the command or read from buffer memory, depending on the command. Drawing commands that source their parameters from buffer memory are known as *indirect* drawing commands.

All drawing commands interact with the `robustBufferAccess` feature.

To record a non-indexed draw, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDraw(
    VkCommandBuffer commandBuffer, // Provided by VK_VERSION_1_0
    uint32_t vertexCount,          // Provided by VK_VERSION_1_0
    uint32_t instanceCount,        // Provided by VK_VERSION_1_0
    uint32_t firstVertex,          // Provided by VK_VERSION_1_0
    uint32_t firstInstance);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `vertexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstVertex` is the index of the first vertex to draw.
- `firstInstance` is the instance ID of the first instance to draw.
When the command is executed, primitives are assembled using the current primitive topology and `vertexCount` consecutive vertex indices with the first `vertexIndex` value equal to `firstVertex`. The primitives are drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

### Valid Usage

- **VUID-vkCmdDraw-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDraw-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDraw-aspectMask-06478**
  If a `VkImageView` is sampled with depth comparison, the image view must have been created with an aspectMask that contains `VK_IMAGE_ASPECT_DEPTH_BIT`.

- **VUID-vkCmdDraw-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDraw-None-07888**
  If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

- **VUID-vkCmdDraw-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdDraw-None-02693**
  If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

- **VUID-vkCmdDraw-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDraw-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of
either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDraw-None-08600
  For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDraw-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDraw-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by a bound shader

- VUID-vkCmdDraw-None-08606
  A valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdDraw-None-08608
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDraw-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdDraw-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- VUID-vkCmdDraw-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdDraw-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the
descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDraw-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDraw-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by **bound shaders** **must** not be a protected resource

- **VUID-vkCmdDraw-None-06550**
  If a **bound shader** accesses a `VkSampler` or `VkImageView` object that enables `sampler Y’C_b` conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdDraw-ConstOffset-06551**
  If a **bound shader** accesses a `VkSampler` or `VkImageView` object that enables `sampler Y’C_b` conversion, that object **must** not use the `ConstOffset` and `Offset` operands

- **VUID-vkCmdDraw-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view’s `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdDraw-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view’s `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match

- **VUID-vkCmdDraw-OpImageWrite-08795**
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view’s `format`

- **VUID-vkCmdDraw-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view’s `format`

- **VUID-vkCmdDraw-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- **VUID-vkCmdDraw-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- **VUID-vkCmdDraw-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

Any shader invocation executed by this command must terminate.

The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set.

If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it must be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

Input attachment views accessed in a subpass must be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.

Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment by this command.

If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set.

If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it must be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

Input attachment views accessed in a subpass must be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.

Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment by this command.
If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDraw-None-09002
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDraw-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command must not write to that image subresource as an attachment

- VUID-vkCmdDraw-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled

- VUID-vkCmdDraw-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP

- VUID-vkCmdDraw-None-07831
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT dynamic state enabled then vkCmdSetViewport must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07832
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR dynamic state enabled then vkCmdSetScissor must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07833
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state enabled then vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07834
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state enabled then vkCmdSetDepthBias must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07835
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic state enabled then vkCmdSetBlendConstants must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07836
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic state enabled, and if the current depthBoundsTestEnable state is VK_TRUE, then vkCmdSetDepthBounds must have been called in the current command buffer prior to this drawing command
• VUID-vkCmdDraw-None-07837
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilCompareMask` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07838
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilWriteMask` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07839
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilReference` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.

• VUID-vkCmdDraw-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

• VUID-vkCmdDraw-None-06666
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07840
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled then `vkCmdSetCullModeEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07841
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled then `vkCmdSetFrontFaceEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07843
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthTestEnableEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07844
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE dynamic state enabled then
vkCmdSetDepthWriteEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07845
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_COMPARE_OP dynamic state enabled then
  vkCmdSetDepthCompareOpEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07846
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE dynamic state enabled then
  vkCmdSetDepthBoundsTestEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07847
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE dynamic state enabled then
  vkCmdSetStencilTestEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-07848
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_OP dynamic state enabled then
  vkCmdSetStencilOpEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then
  vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the VkPipelineViewportStateCreateInfo::scissorCount of the pipeline

- VUID-vkCmdDraw-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then
  vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCountEXT must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDraw-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCountEXT and vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the scissorCount parameter of
vkCmdSetScissorWithCountEXT

- VUID-vkCmdDraw-None-04876
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC\_STATE\_RASTERIZER\_DISCARD\_ENABLE} dynamic state enabled then \texttt{vkCmdSetRasterizerDiscardEnableEXT} must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDraw-None-04877
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC\_STATE\_DEPTH\_BIAS\_ENABLE} dynamic state enabled then \texttt{vkCmdSetDepthBiasEnableEXT} must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDraw-logicOp-04878
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC\_STATE\_LOGIC\_OP\_EXT} dynamic state enabled then \texttt{vkCmdSetLogicOpEXT} must have been called in the current command buffer prior to this drawing command and the logicOp must be a valid \texttt{VkLogicOp} value.

- VUID-vkCmdDraw-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the \texttt{primitiveFragmentShadingRateWithMultipleViewports} limit is not supported, the bound graphics pipeline was created with the \texttt{VK_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the \texttt{PrimitiveShadingRateKHR} built-in, then \texttt{vkCmdSetViewportWithCountEXT} must have been called in the current command buffer prior to this drawing command, and the \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCountEXT} must be 1.

- VUID-vkCmdDraw-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's \texttt{format features} do not contain \texttt{VK\_FORMAT\_FEATURE\_COLOR\_ATTACHMENT\_BLEND\_BIT}, then the blendEnable member of the corresponding element of the \texttt{pAttachments} member of \texttt{pColorBlendState} must be \texttt{VK\_FALSE}.

- VUID-vkCmdDraw-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline,

  then \texttt{rasterizationSamples} for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments.

- VUID-vkCmdDraw-maxFragmentDualSrcAttachments-09239
  If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments.

- VUID-vkCmdDraw-commandBuffer-02712
  If \texttt{commandBuffer} is a protected command buffer and \texttt{protectedNoFault} is not supported, any resource written to by the \texttt{VkPipeline} object bound to the pipeline bind point used by this command must not be an unprotected resource.

- VUID-vkCmdDraw-commandBuffer-02713
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command **must** not write to any resource.

- **VUID-vkCmdDraw-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have either valid or `VK_NULL_HANDLE` buffers bound.

- **VUID-vkCmdDraw-None-04008**
  If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** not be `VK_NULL_HANDLE`.

- **VUID-vkCmdDraw-None-02721**
  For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#).

- **VUID-vkCmdDraw-None-07842**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-dynamicPrimitiveTopologyUnrestricted-07500**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` **must** be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

- **VUID-vkCmdDraw-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDraw-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but without the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffer2EXT` **must** have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffer2EXT` **must** not be `NULL`.

- **VUID-vkCmdDraw-None-04914**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDraw-Input-07939**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then all variables with the
Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint must contain a location in VkVertexInputAttributeDescription2EXT::location

- VUID-vkCmdDraw-Input-08734
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription2EXT::format

- VUID-vkCmdDraw-format-08936
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then the scalar width associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be 64-bit

- VUID-vkCmdDraw-format-08937
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription2EXT::format must have a 64-bit component

- VUID-vkCmdDraw-None-09203
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then all Input variables at the corresponding Location in the Vertex Execution Model OpEntryPoint must not use components that are not present in the format

- VUID-vkCmdDraw-None-04875
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-04879
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE dynamic state enabled then vkCmdSetPrimitiveRestartEnableEXT must have been called in the current command buffer prior to this drawing command

---

**Valid Usage (Implicit)**

- VUID-vkCmdDraw-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDraw-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDraw-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdDraw-renderpass
  This command must only be called inside of a render pass instance

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

To record an indexed draw, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexed(
    VkCommandBuffer commandBuffer,
    uint32_t indexCount,
    uint32_t instanceCount,
    uint32_t firstIndex,
    int32_t vertexOffset,
    uint32_t firstInstance);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
- `firstInstance` is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and `indexCount` vertices whose indices are retrieved from the index buffer. The index buffer is treated as an array of tightly packed unsigned integers of size defined by the `vkCmdBindIndexBuffer` `indexType` parameter with which the buffer was bound.

The first vertex index is at an offset of `firstIndex × indexSize + offset` within the bound index buffer.
buffer, where offset is the offset specified by \texttt{vkCmdBindIndexBuffer} and indexSize is the byte size of the type specified by \texttt{indexType}. Subsequent index values are retrieved from consecutive locations in the index buffer. Indices are first compared to the primitive restart value, then zero extended to 32 bits (if the \texttt{indexType} is \texttt{VK_INDEX_TYPE_UINT8_EXT} or \texttt{VK_INDEX_TYPE_UINT16}) and have vertexOffset added to them, before being supplied as the vertexIndex value.

The primitives are drawn \texttt{instanceCount} times with \texttt{instanceIndex} starting with \texttt{firstInstance} and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

### Valid Usage

- **VUID-vkCmdDrawIndexed-magFilter-04553**
  
  If a \texttt{VkSampler} created with \texttt{magFilter} or \texttt{minFilter} equal to \texttt{VK_FILTER_LINEAR} and \texttt{compareEnable} equal to \texttt{VK_FALSE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT}

- **VUID-vkCmdDrawIndexed-mipmapMode-04770**
  
  If a \texttt{VkSampler} created with \texttt{mipmapMode} equal to \texttt{VK_SAMPLER_MIPMAP_MODE_LINEAR} and \texttt{compareEnable} equal to \texttt{VK_FALSE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT}

- **VUID-vkCmdDrawIndexed-aspectMask-06478**
  
  If a \texttt{VkImageView} is sampled with depth comparison, the image view must have been created with an aspectMask that contains \texttt{VK_IMAGE_ASPECT_DEPTH_BIT}

- **VUID-vkCmdDrawIndexed-None-02691**
  
  If a \texttt{VkImageView} is accessed using atomic operations as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT}

- **VUID-vkCmdDrawIndexed-None-07888**
  
  If a \texttt{VkImageView} is sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT}

- **VUID-vkCmdDrawIndexed-None-02692**
  
  If the \texttt{VK_EXT_filter_cubic} extension is not enabled and any \texttt{VkImageView} is sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command, it must not have a \texttt{VkImageViewType} of \texttt{VK_IMAGE_VIEW_TYPE_3D}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE}, or \texttt{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY}

- **VUID-vkCmdDrawIndexed-filterCubic-02694**
  
  Any \texttt{VkImageView} being sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command must have a \texttt{VkImageViewType} and format that supports cubic filtering, as specified by \texttt{VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic} returned by
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by a bound shader.

A valid pipeline must be bound to the pipeline bind point used by this command.

There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

A valid pipeline must be bound to the pipeline bind point used by this command.
If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexed-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexed-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` **must** not be a protected resource.

- **VUID-vkCmdDrawIndexed-ConstOffset-06551**
  If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'CBCR` conversion, that object **must** not use the `ConstOffset` and `Offset` operands.

- **VUID-vkCmdDrawIndexed-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view's `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in *Instruction/Sampler/Image View Validation*.

- **VUID-vkCmdDrawIndexed-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match.

- **VUID-vkCmdDrawIndexed-OpImageWrite-08795**
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's `format`.

- **VUID-vkCmdDrawIndexed-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's `format`.

- **VUID-vkCmdDrawIndexed-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64.

- **VUID-vkCmdDrawIndexed-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32.

- **VUID-vkCmdDrawIndexed-SampledType-04472**
If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

- **VUID-vkCmdDrawIndexed-SampledType-04473**
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

- **VUID-vkCmdDrawIndexed-sparseImageInt64Atomics-04474**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- **VUID-vkCmdDrawIndexed-sparseImageInt64Atomics-04475**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- **VUID-vkCmdDrawIndexed-None-07288**
  Any shader invocation executed by this command must terminate.

- **VUID-vkCmdDrawIndexed-renderPass-02684**
  The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-vkCmdDrawIndexed-subpass-02685**
  The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-vkCmdDrawIndexed-None-07748**
  If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set.

- **VUID-vkCmdDrawIndexed-OpTypeImage-07468**
  If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it must be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

- **VUID-vkCmdDrawIndexed-None-07469**
  Input attachment views accessed in a subpass must be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass’ `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.

- **VUID-vkCmdDrawIndexed-None-06537**
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

- **VUID-vkCmdDrawIndexed-None-09000**
  If a color attachment is written by any prior command in this subpass or by the load,
store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexed-None-09001
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexed-None-09002
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexed-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command **must** not write to that image subresource as an attachment

- VUID-vkCmdDrawIndexed-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must** be disabled

- VUID-vkCmdDrawIndexed-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back **writeMask** are not zero, and stencil test is enabled, **all stencil ops must** be **VK_STENCIL_OP_KEEP**

- VUID-vkCmdDrawIndexed-None-07831
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT** dynamic state enabled then **vkCmdSetViewport** must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07832
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR** dynamic state enabled then **vkCmdSetScissor** must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07833
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_LINE_WIDTH** dynamic state enabled then **vkCmdSetLineWidth** must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07834
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_DEPTH_BIAS** dynamic state enabled then **vkCmdSetDepthBias** must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07835
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_BLEND_CONSTANTS** dynamic state enabled then **vkCmdSetBlendConstants** must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07836
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_DEPTH_BOUNDS**
• VUID-vkCmdDrawIndexed-None-07837
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK dynamic state enabled, and if the current
StencilTestEnable state is VK_TRUE, then vkCmdSetStencilCompareMask must have been
called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-07838
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_STENCIL_WRITE_MASK dynamic state enabled, and if the current
StencilTestEnable state is VK_TRUE, then vkCmdSetStencilWriteMask must have been
called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-07839
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_STENCIL_REFERENCE dynamic state enabled, and if the current
StencilTestEnable state is VK_TRUE, then vkCmdSetStencilReference must have been
called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-maxMultiviewInstanceIndex-02688
If the draw is recorded in a render pass instance with multiview enabled, the maximum
instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

• VUID-vkCmdDrawIndexed-sampleLocationsEnable-02689
If the bound graphics pipeline was created with
VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and
the current subpass has a depth/stencil attachment, then that attachment must have been
created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

• VUID-vkCmdDrawIndexed-None-06666
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled then
vkCmdSetSampleLocationsEXT must have been called in the current command buffer
prior to this drawing command

• VUID-vkCmdDrawIndexed-None-07840
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_CULL_MODE
dynamic state enabled then vkCmdSetCullModeEXT must have been called in the current
command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-07841
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_FRONT_FACE
dynamic state enabled then vkCmdSetFrontFaceEXT must have been called in the current
command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-07843
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE dynamic state enabled then
vkCmdSetDepthTestEnableEXT must have been called in the current command buffer
prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07844
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled then `vkCmdSetDepthWriteEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07845
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled then `vkCmdSetDepthCompareOpEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07846
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthBoundsTestEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07847
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then `vkCmdSetStencilTestEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-viewportCount-03417
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- VUID-vkCmdDrawIndexed-scissorCount-03418
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- VUID-vkCmdDrawIndexed-viewportCount-03419
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCountEXT` and
vkCmdSetScissorWithCountEXT must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must match the scissorCount parameter of vkCmdSetScissorWithCountEXT.

- VUID-vkCmdDrawIndexed-None-04876
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then vkCmdSetRasterizerDiscardEnableEXT must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndexed-None-04877
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then vkCmdSetDepthBiasEnableEXT must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndexed-logicOp-04878
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this drawing command and the logicOp must be a valid VkLogicOp value.

- VUID-vkCmdDrawIndexed-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCountEXT must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCountEXT must be 1.

- VUID-vkCmdDrawIndexed-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE.

- VUID-vkCmdDrawIndexed-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline, then rasterizationSamples for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments.

- VUID-vkCmdDrawIndexed-maxFragmentDualSrcAttachments-09239
  If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments.

- VUID-vkCmdDrawIndexed-commandBuffer-02712
  If commandBuffer is a protected command buffer and protectedNoFault is not supported,
any resource written to by the VkPipeline object bound to the pipeline bind point used by this command must not be an unprotected resource

- VUID-vkCmdDrawIndexed-commandBuffer-02713
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, pipeline stages other than the framebuffer-space and compute stages in the VkPipeline object bound to the pipeline bind point used by this command must not write to any resource

- VUID-vkCmdDrawIndexed-None-04007
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must have either valid or VK_NULL_HANDLE buffers bound

- VUID-vkCmdDrawIndexed-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be VK_NULL_HANDLE

- VUID-vkCmdDrawIndexed-None-02721
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- VUID-vkCmdDrawIndexed-None-07842
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled then vkCmdSetPrimitiveTopologyEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-dynamicPrimitiveTopologyUnrestricted-07500
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled then the primitiveTopology parameter of vkCmdSetPrimitiveTopologyEXT must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state

- VUID-vkCmdDrawIndexed-None-04912
  If the bound graphics pipeline was created with both the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT and VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic states enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndexed-pStrides-04913
  If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, but without the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdBindVertexBuffers2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL

- VUID-vkCmdDrawIndexed-None-04914
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then all variables with the Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint must contain a location in VkVertexInputAttributeDescription2EXT::location.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription2EXT::format.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then the scalar width associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be 64-bit.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription2EXT::format must have a 64-bit component.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then all Input variables at the corresponding Location in the Vertex Execution Model OpEntryPoint must not use components that are not present in the format.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE dynamic state enabled then vkCmdSetPrimitiveRestartEnableEXT must have been called in the current command buffer prior to this drawing command.

An index buffer must be bound.

If robustBufferAccess2 is not enabled, \((\text{indexSize} \times (\text{firstIndex} + \text{indexCount}) + \text{offset})\) must be less than or equal to the size of the bound index buffer, with indexSize being based on the type specified by indexType, where the index buffer, indexType, and offset are
specified via `vkCmdBindIndexBuffer`

- VUID-vkCmdDrawIndexed-robustBufferAccess2-08798
  If `robustBufferAccess2` is not enabled, \((\text{indexSize} \times (\text{firstIndex} + \text{indexCount}) + \text{offset})\) must be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer`

---

**Valid Usage (Implicit)**

- VUID-vkCmdDrawIndexed-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdDrawIndexed-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdDrawIndexed-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdDrawIndexed-renderpass
  This command must only be called inside of a render pass instance

---

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

---

**Command Properties**

<table>

To record a non-indexed indirect drawing command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    uint32_t drawCount,
```
uint32_t stride);

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and can be zero.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirect` behaves similarly to `vkCmdDraw` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndirectCommand` structures. If `drawCount` is less than or equal to one, `stride` is ignored.

### Valid Usage

- VUID-vkCmdDrawIndirect-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawIndirect-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawIndirect-aspectMask-06478
  If a `VkImageView` is sampled with depth comparison, the image view must have been created with an `aspectMask` that contains `VK_IMAGE_ASPECT_DEPTH_BIT`

- VUID-vkCmdDrawIndirect-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdDrawIndirect-None-07888
  If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer’s `format features` must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- VUID-vkCmdDrawIndirect-None-02692
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- VUID-vkCmdDrawIndirect-None-02693
  If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with
VK_FILTER_CUBIC_EXT as a result of this command, it must not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- VUID-vkCmdDrawIndirect-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawIndirect-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawIndirect-None-08600
  For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndirect-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndirect-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by a bound shader

- VUID-vkCmdDrawIndirect-None-08606
  A valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawIndirect-None-08608
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawIndirect-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdDrawIndirect-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage
If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource.

If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y′C_bC_R conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y′C_bC_R conversion, that object must not use the ConstOffset and Offset operands.

If a VkImageView is accessed as a result of this command, then the image view's viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation.

If a VkImageView is accessed as a result of this command, then the numeric type of the image view's format and the Sampled Type operand of the OpTypeImage must match.

If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format.

If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format.

If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.
If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

Any shader invocation executed by this command must terminate.

The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set.

If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it must be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

Input attachment views accessed in a subpass must be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass’ `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.
• VUID-vkCmdDrawIndirect-None-06537
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

• VUID-vkCmdDrawIndirect-None-09000
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment by this command.

• VUID-vkCmdDrawIndirect-None-09001
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment by this command.

• VUID-vkCmdDrawIndirect-None-09002
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment by this command.

• VUID-vkCmdDrawIndirect-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command must not write to that image subresource as an attachment.

• VUID-vkCmdDrawIndirect-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled.

• VUID-vkCmdDrawIndirect-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP.

• VUID-vkCmdDrawIndirect-None-07831
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT dynamic state enabled then vkCmdSetViewport must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-07832
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR dynamic state enabled then vkCmdSetScissor must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-07833
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state enabled then vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-07834
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state enabled then vkCmdSetDepthBias must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-07835
If the bound graphics pipeline state was created with the
**VK_DYNAMIC_STATE_BLEND_CONSTANTS** dynamic state enabled then **vkCmdSetBlendConstants** must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect,None-07836**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_DEPTH_BOUNDS** dynamic state enabled, and if the current `depthBoundsTestEnable` state is **VK_TRUE**, then **vkCmdSetDepthBounds** must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect,None-07837**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK** dynamic state enabled, and if the current `stencilTestEnable` state is **VK_TRUE**, then **vkCmdSetStencilCompareMask** must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect,None-07838**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** dynamic state enabled, and if the current `stencilTestEnable` state is **VK_TRUE**, then **vkCmdSetStencilWriteMask** must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect,None-07839**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_STENCIL_REFERENCE** dynamic state enabled, and if the current `stencilTestEnable` state is **VK_TRUE**, then **vkCmdSetStencilReference** must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to **VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex**

- **VUID-vkCmdDrawIndirect-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with **VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable** set to **VK_TRUE** and the current subpass has a depth/stencil attachment, then that attachment must have been created with the **VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT** bit set

- **VUID-vkCmdDrawIndirect,None-06666**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** dynamic state enabled then **vkCmdSetSampleLocationsEXT** must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect,None-07840**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_CULL_MODE** dynamic state enabled then **vkCmdSetCullModeEXT** must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect,None-07841**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_FRONT_FACE** dynamic state enabled then **vkCmdSetFrontFaceEXT** must have been called in the current
command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07843
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE dynamic state enabled then
vkCmdSetDepthTestEnableEXT must have been called in the current command buffer
prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07844
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE dynamic state enabled then
vkCmdSetDepthWriteEnableEXT must have been called in the current command buffer
prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07845
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_DEPTH_COMPARE_OP dynamic state enabled then
vkCmdSetDepthCompareOpEXT must have been called in the current command buffer
prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07846
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE dynamic state enabled then
vkCmdSetDepthBoundsTestEnableEXT must have been called in the current command
buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07847
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE dynamic state enabled then
vkCmdSetStencilTestEnableEXT must have been called in the current command buffer
prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07848
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_STENCIL_OP dynamic state enabled then
vkCmdSetStencilOpEXT must have been called in the current command buffer prior to this
drawing command

• VUID-vkCmdDrawIndirect-viewportCount-03417
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then
vkCmdSetViewportWithCountEXT must have been called in the current command buffer
prior to this drawing command, and the viewportCount parameter of
vkCmdSetViewportWithCountEXT must match the VkPipelineViewportStateCreateInfo
::viewportCount of the pipeline

• VUID-vkCmdDrawIndirect-scissorCount-03418
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then
vkCmdSetScissorWithCountEXT must have been called in the current command buffer
prior to this drawing command, and the scissorCount parameter of
vkCmdSetScissorWithCountEXT must match the VkPipelineViewportStateCreateInfo
::scissorCount of the pipeline
viewportCount of the pipeline

- **VUID-vkCmdDrawIndirect.viewportCount-03419**
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled, then both `vkCmdSetViewportWithCountEXT` and `vkCmdSetScissorWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must match the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT`.

- **VUID-vkCmdDrawIndirect.None-04876**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled, then `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirect.None-04877**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled, then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirect.logicOp-04878**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled, then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

- **VUID-vkCmdDrawIndirect.primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1.

- **VUID-vkCmdDrawIndirect.blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be VK_FALSE.

- **VUID-vkCmdDrawIndirect.multisampledRenderToSingleSampled-07284**
  If rasterization is not disabled in the bound graphics pipeline, then `rasterizationSamples` for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDrawIndirect.maxFragmentDualSrcAttachments-09239**
  If blending is enabled for any attachment where either the source or destination blend
factors for that attachment must use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments

• VUID-vkCmdDrawIndirect-None-04007
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must have either valid or VK_NULL_HANDLE buffers bound

• VUID-vkCmdDrawIndirect-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be VK_NULL_HANDLE

• VUID-vkCmdDrawIndirect-None-02721
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

• VUID-vkCmdDrawIndirect-None-07842
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled then vkCmdSetPrimitiveTopologyEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-dynamicPrimitiveTopologyUnrestricted-07500
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled then the primitiveTopology parameter of vkCmdSetPrimitiveTopologyEXT must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state

• VUID-vkCmdDrawIndirect-None-04912
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT and VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic states enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command

• VUID-vkCmdDrawIndirect-pStrides-04913
  If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, but without the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdBindVertexBuffers2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL

• VUID-vkCmdDrawIndirect-None-04914
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command

• VUID-vkCmdDrawIndirect-Input-07939
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then all variables with the Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint
must contain a location in VkVertexInputAttributeDescription2EXT::location

• VUID-vkCmdDrawIndirect-Input-08734
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then the numeric type
  associated with all Input variables of the corresponding Location in the Vertex Execution
  Model OpEntryPoint must be the same as VkVertexInputAttributeDescription2EXT::format

• VUID-vkCmdDrawIndirect-format-08936
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and
  VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then the scalar
  width associated with all Input variables of the corresponding Location in the Vertex
  Execution Model OpEntryPoint must be 64-bit

• VUID-vkCmdDrawIndirect-format-08937
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and the scalar width associated
  with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-
  bit, then the corresponding VkVertexInputAttributeDescription2EXT::format must have a
  64-bit component

• VUID-vkCmdDrawIndirect-None-09203
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and
  VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then all Input
  variables at the corresponding Location in the Vertex Execution Model OpEntryPoint must
  not use components that are not present in the format

• VUID-vkCmdDrawIndirect-None-04875
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then
  vkCmdSetPatchControlPointsEXT must have been called in the current command buffer
  prior to this drawing command

• VUID-vkCmdDrawIndirect-None-04879
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE dynamic state enabled then
  vkCmdSetPrimitiveRestartEnableEXT must have been called in the current command
  buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-buffer-02708
  If buffer is non-sparse then it must be bound completely and contiguously to a single
  VkDeviceMemory object

• VUID-vkCmdDrawIndirect-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdDrawIndirect-offset-02710
  offset must be a multiple of 4

• VUID-vkCmdDrawIndirect-commandBuffer-02711
  commandBuffer must not be a protected command buffer
• VUID-vkCmdDrawIndirect-drawCount-02718
If the multiDrawIndirect feature is not enabled, drawCount must be 0 or 1

• VUID-vkCmdDrawIndirect-drawCount-02719
drawCount must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

• VUID-vkCmdDrawIndirect-drawCount-00476
If drawCount is greater than 1, stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndirectCommand)

• VUID-vkCmdDrawIndirect-drawCount-00487
If drawCount is equal to 1, (offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

• VUID-vkCmdDrawIndirect-drawCount-00488
If drawCount is greater than 1, (stride \times (drawCount - 1) + offset + sizeof (VkDrawIndirectCommand)) must be less than or equal to the size of buffer

Valid Usage (Implicit)

• VUID-vkCmdDrawIndirect-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdDrawIndirect-buffer-parameter
buffer must be a valid VkBuffer handle

• VUID-vkCmdDrawIndirect-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdDrawIndirect-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdDrawIndirect-renderpass
This command must only be called inside of a render pass instance

• VUID-vkCmdDrawIndirect-commonparent
Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>

<td></td>
</tr>
</tbody>
</table>

The `VkDrawIndirectCommand` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndirectCommand {
    uint32_t vertexCount;
    uint32_t instanceCount;
    uint32_t firstVertex;
    uint32_t firstInstance;
} VkDrawIndirectCommand;
```

- `vertexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstVertex` is the index of the first vertex to draw.
- `firstInstance` is the instance ID of the first instance to draw.

The members of `VkDrawIndirectCommand` have the same meaning as the similarly named parameters of `vkCmdDraw`.

## Valid Usage

- **VUID-VkDrawIndirectCommand-None-00500**
  For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#).

- **VUID-VkDrawIndirectCommand-firstInstance-00501**
  If the `drawIndirectFirstInstance` feature is not enabled, `firstInstance` **must** be 0

To record a non-indexed draw call with a draw call count sourced from a buffer, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdDrawIndirectCount(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
);```
• `commandBuffer` is the command buffer into which the command is recorded.
• `buffer` is the buffer containing draw parameters.
• `offset` is the byte offset into `buffer` where parameters begin.
• `countBuffer` is the buffer containing the draw count.
• `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
• `maxDrawCount` specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.
• `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirectCount` behaves similarly to `vkCmdDrawIndirect` except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.

### Valid Usage

- **VUID-vkCmdDrawIndirectCount-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndirectCount-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndirectCount-aspectMask-06478**
  If a `VkImageView` is sampled with `depth comparison`, the image view **must** have been created with an `aspectMask` that contains `VK_IMAGE_ASPECT_DEPTH_BIT`

- **VUID-vkCmdDrawIndirectCount-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDrawIndirectCount-None-07888**
  If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- **VUID-vkCmdDrawIndirectCount-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it **must** not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

- **VUID-vkCmdDrawIndirectCount-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndirectCount-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndirectCount-None-08600**
  For each set `n` that is statically used by a bound shader, a descriptor set **must** have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#).

- **VUID-vkCmdDrawIndirectCount-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#).

- **VUID-vkCmdDrawIndirectCount-None-08114**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid as described by descriptor validity if they are statically used by a bound shader.

- **VUID-vkCmdDrawIndirectCount-None-08606**
  A valid pipeline **must** be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndirectCount-None-08608**
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDrawIndirectCount-None-08609**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDrawIndirectCount-None-08610**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with
ImplicitLod, Dref or Proj in their name, in any shader stage

- VUID-vkCmdDrawIndirectCount-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdDrawIndirectCount-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawIndirectCount-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawIndirectCount-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

- VUID-vkCmdDrawIndirectCount-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'CBR conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- VUID-vkCmdDrawIndirectCount-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'CBR conversion, that object must not use the ConstOffset and Offset operands

- VUID-vkCmdDrawIndirectCount-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view's viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

- VUID-vkCmdDrawIndirectCount-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view's format and the Sampled Type operand of the OpTypeImage must match

- VUID-vkCmdDrawIndirectCount-OpImageWrite-08795
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format

- VUID-vkCmdDrawIndirectCount-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format

- VUID-vkCmdDrawIndirectCount-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a
result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDrawIndirectCount-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDrawIndirectCount-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDrawIndirectCount-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDrawIndirectCount-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDrawIndirectCount-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDrawIndirectCount-None-07288
  Any shader invocation executed by this command must terminate

- VUID-vkCmdDrawIndirectCount-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndirectCount-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndirectCount-None-07748
  If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set

- VUID-vkCmdDrawIndirectCount-OpTypeImage-07468
  If any shader executed by this pipeline accesses an OpTypeImage variable with a Dim operand of SubpassData, it must be decorated with an InputAttachmentIndex that corresponds to a valid input attachment in the current subpass

- VUID-vkCmdDrawIndirectCount-None-07469
  Input attachment views accessed in a subpass must be created with the same VkFormat as the corresponding subpass definition, and be created with a VkImageView that is compatible with the attachment referenced by the subpass' pInputAttachments
In the currently bound VkFramebuffer as specified by Fragment Input Attachment Compatibility

- VUID-vkCmdDrawIndirectCount-None-06537
  Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirectCount-None-09000
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirectCount-None-09001
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirectCount-None-09002
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirectCount-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command **must** not write to that image subresource as an attachment

- VUID-vkCmdDrawIndirectCount-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must** be disabled

- VUID-vkCmdDrawIndirectCount-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, **all stencil ops must** be VK_STENCIL_OP_KEEP

- VUID-vkCmdDrawIndirectCount-None-07831
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT dynamic state enabled then **vkCmdSetViewport** must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07832
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR dynamic state enabled then **vkCmdSetScissor** must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07833
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state enabled then **vkCmdSetLineWidth** must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07834
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state enabled then **vkCmdSetDepthBias** must have been called in the current
command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07835**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled then `vkCmdSetBlendConstants` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07836**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, and if the current `depthBoundsTestEnable` state is `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07837**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilCompareMask` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07838**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilWriteMask` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07839**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilReference` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- **VUID-vkCmdDrawIndirectCount-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- **VUID-vkCmdDrawIndirectCount-None-06666**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07840**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled then `vkCmdSetCullModeEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07841**
If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_FRONT\_FACE} dynamic state enabled then \texttt{vkCmdSetFrontFaceEXT} must have been called in the current command buffer prior to this drawing command.

- \texttt{VUID-vkCmdDrawIndirectCount-None-07843}

If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_DEPTH\_TEST\_ENABLE} dynamic state enabled then \texttt{vkCmdSetDepthTestEnableEXT} must have been called in the current command buffer prior to this drawing command.

- \texttt{VUID-vkCmdDrawIndirectCount-None-07844}

If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_DEPTH\_WRITE\_ENABLE} dynamic state enabled then \texttt{vkCmdSetDepthWriteEnableEXT} must have been called in the current command buffer prior to this drawing command.

- \texttt{VUID-vkCmdDrawIndirectCount-None-07845}

If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_DEPTH\_COMPARE\_OP} dynamic state enabled then \texttt{vkCmdSetDepthCompareOpEXT} must have been called in the current command buffer prior to this drawing command.

- \texttt{VUID-vkCmdDrawIndirectCount-None-07846}

If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_DEPTH\_BOUNDS\_TEST\_ENABLE} dynamic state enabled then \texttt{vkCmdSetDepthBoundsTestEnableEXT} must have been called in the current command buffer prior to this drawing command.

- \texttt{VUID-vkCmdDrawIndirectCount-None-07847}

If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_STENCIL\_TEST\_ENABLE} dynamic state enabled then \texttt{vkCmdSetStencilTestEnableEXT} must have been called in the current command buffer prior to this drawing command.

- \texttt{VUID-vkCmdDrawIndirectCount-None-07848}

If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_STENCIL\_OP} dynamic state enabled then \texttt{vkCmdSetStencilOpEXT} must have been called in the current command buffer prior to this drawing command.

- \texttt{VUID-vkCmdDrawIndirectCount-viewportCount-03417}

If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} dynamic state enabled, but not the \texttt{VK\_DYNAMIC\_STATE\_SCISSOR\_WITH\_COUNT} dynamic state enabled, then \texttt{vkCmdSetViewportWithCountEXT} must have been called in the current command buffer prior to this drawing command, and the \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCountEXT} must match the \texttt{VkPipelineViewportStateCreateInfo::scissorCount} of the pipeline.

- \texttt{VUID-vkCmdDrawIndirectCount-scissorCount-03418}

If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_SCISSOR\_WITH\_COUNT} dynamic state enabled, but not the \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} dynamic state enabled, then \texttt{vkCmdSetScissorWithCountEXT} must have been called in the current command buffer.
prior to this drawing command, and the \texttt{scissorCount} parameter of \texttt{vkCmdSetScissorWithCountEXT} must match the \texttt{VkPipelineViewportStateCreateInfo}::\texttt{viewportCount} of the pipeline.

- \textbf{VUID-vkCmdDrawIndirectCount-viewportCount-03419}
  If the bound graphics pipeline state was created with both the \texttt{VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT} and \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT} dynamic states enabled then both \texttt{vkCmdSetViewportWithCountEXT} and \texttt{vkCmdSetScissorWithCountEXT} must have been called in the current command buffer prior to this drawing command, and the \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCountEXT} must match the \texttt{scissorCount} parameter of \texttt{vkCmdSetScissorWithCountEXT}.

- \textbf{VUID-vkCmdDrawIndirectCount-None-04876}
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE} dynamic state enabled then \texttt{vkCmdSetRasterizerDiscardEnableEXT} must have been called in the current command buffer prior to this drawing command.

- \textbf{VUID-vkCmdDrawIndirectCount-None-04877}
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE} dynamic state enabled then \texttt{vkCmdSetDepthBiasEnableEXT} must have been called in the current command buffer prior to this drawing command.

- \textbf{VUID-vkCmdDrawIndirectCount-logicOp-04878}
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LOGIC_OP_EXT} dynamic state enabled then \texttt{vkCmdSetLogicOpEXT} must have been called in the current command buffer prior to this drawing command and the \texttt{logicOp} must be a valid \texttt{VkLogicOp} value.

- \textbf{VUID-vkCmdDrawIndirectCount-primitiveFragmentShadingRateWithMultipleViewports-04552}
  If the \texttt{primitiveFragmentShadingRateWithMultipleViewports} limit is not supported, the bound graphics pipeline was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT} dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the \texttt{PrimitiveShadingRateKHR} built-in, then \texttt{vkCmdSetViewportWithCountEXT} must have been called in the current command buffer prior to this drawing command, and the \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCountEXT} must be \texttt{1}.

- \textbf{VUID-vkCmdDrawIndirectCount-blendEnable-04727}
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s \texttt{format features} do not contain \texttt{VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT}, then the \texttt{blendEnable} member of the corresponding element of the \texttt{pAttachments} member of \texttt{pColorBlendState} must be \texttt{VK_FALSE}.

- \textbf{VUID-vkCmdDrawIndirectCount-multisampledRenderToSingleSampled-07284}
  If rasterization is not disabled in the bound graphics pipeline,

  \begin{verbatim}
  then rasterizationSamples for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments
  \end{verbatim}
If **blending** is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of **Location** for any output attachment **statically used** in the **Fragment Execution Model** executed by this command **must** be less than **maxFragmentDualSrcAttachments**.

All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface **must** have either valid or **VK_NULL_HANDLE** buffers bound.

If the **nullDescriptor** feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface **must** not be **VK_NULL_HANDLE**.

For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in **Vertex Input Description**.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY** dynamic state enabled then **vkCmdSetPrimitiveTopologyEXT** **must** have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY** dynamic state enabled then the **primitiveTopology** parameter of **vkCmdSetPrimitiveTopologyEXT** **must** be of the same **topology class** as the pipeline **VkPipelineInputAssemblyStateCreateInfo::topology** state.

If the bound graphics pipeline was created with both the **VK_DYNAMIC_STATE_VERTEX_INPUT_EXT** and **VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT** dynamic states enabled, then **vkCmdSetVertexInputEXT** **must** have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline was created with the **VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT** dynamic state enabled, but without the **VK_DYNAMIC_STATE_VERTEX_INPUT_EXT** dynamic state enabled, then **vkCmdBindVertexBuffers2EXT** **must** have been called in the current command buffer prior to this draw command, and the **pStrides** parameter of **vkCmdBindVertexBuffers2EXT** **must** not be **NULL**.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VERTEX_INPUT_EXT** dynamic state enabled then **vkCmdSetVertexInputEXT** **must** have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then all variables with the Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint must contain a location in VkVertexInputAttributeDescription2EXT::location

• VUID-vkCmdDrawIndirectCount-Input-08734
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription2EXT::format

• VUID-vkCmdDrawIndirectCount-format-08936
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then the scalar width associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be 64-bit

• VUID-vkCmdDrawIndirectCount-format-08937
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription2EXT::format must have a 64-bit component

• VUID-vkCmdDrawIndirectCount-None-09203
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then all Input variables at the corresponding Location in the Vertex Execution Model OpEntryPoint must not use components that are not present in the format

• VUID-vkCmdDrawIndirectCount-None-04875
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectCount-None-04879
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE dynamic state enabled then vkCmdSetPrimitiveRestartEnableEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectCount-buffer-02708
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdDrawIndirectCount-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdDrawIndirectCount-offset-02710
  offset must be a multiple of 4
• VUID-vkCmdDrawIndirectCount-commandBuffer-02711
  commandBuffer must not be a protected command buffer

• VUID-vkCmdDrawIndirectCount-countBuffer-02714
  If countBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdDrawIndirectCount-countBuffer-02715
  countBuffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdDrawIndirectCount-countBufferOffset-02716
  countBufferOffset must be a multiple of 4

• VUID-vkCmdDrawIndirectCount-countBuffer-02717
  The count stored in countBuffer must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

• VUID-vkCmdDrawIndirectCount-countBufferOffset-04129
  (countBufferOffset + sizeof(uint32_t)) must be less than or equal to the size of countBuffer

• VUID-vkCmdDrawIndirectCount-None-04445
  If drawIndirectCount is not enabled this function must not be used

• VUID-vkCmdDrawIndirectCount-stride-03110
  stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndirectCommand)

• VUID-vkCmdDrawIndirectCount-maxDrawCount-03111
  If maxDrawCount is greater than or equal to 1, (stride × (maxDrawCount - 1) + offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

• VUID-vkCmdDrawIndirectCount-countBuffer-03121
  If the count stored in countBuffer is equal to 1, (offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

• VUID-vkCmdDrawIndirectCount-countBuffer-03122
  If the count stored in countBuffer is greater than 1, (stride × (drawCount - 1) + offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

Valid Usage (Implicit)

• VUID-vkCmdDrawIndirectCount-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdDrawIndirectCount-buffer-parameter
  buffer must be a valid VkBuffer handle

• VUID-vkCmdDrawIndirectCount-countBuffer-parameter
  countBuffer must be a valid VkBuffer handle

• VUID-vkCmdDrawIndirectCount-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdDrawIndirectCount-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics
operations

• VUID-vkCmdDrawIndirectCount-renderpass
  This command must only be called inside of a render pass instance

• VUID-vkCmdDrawIndirectCount-commonparent
  Each of buffer, commandBuffer, and countBuffer must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

To record an indexed indirect drawing command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexedIndirect(
  VkCommandBuffer commandBuffer,
  VkBuffer buffer,
  VkDeviceSize offset,
  uint32_t drawCount,
  uint32_t stride);
```

• `commandBuffer` is the command buffer into which the command is recorded.

• `buffer` is the buffer containing draw parameters.

• `offset` is the byte offset into buffer where parameters begin.

• `drawCount` is the number of draws to execute, and can be zero.

• `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndexedIndirect` behaves similarly to `vkCmdDrawIndexed` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndexedIndirectCommand` structures. If `drawCount` is less than or equal to one, `stride` is
Valid Usage

- **VUID-vkCmdDrawIndexedIndirect-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndexedIndirect-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndexedIndirect-aspectMask-06478**
  If a `VkImageView` is sampled with depth comparison, the image view **must** have been created with an `aspectMask` that contains `VK_IMAGE_ASPECT_DEPTH_BIT`.

- **VUID-vkCmdDrawIndexedIndirect-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDrawIndexedIndirect-None-07888**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the storage texel buffer's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

- **VUID-vkCmdDrawIndexedIndirect-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdDrawIndexedIndirect-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndexedIndirect-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by
For each set $n$ that is statically used by a bound shader, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a VkPipelineLayout that is compatible for set $n$, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by a bound shader.

A valid pipeline must be bound to the pipeline bind point used by this command.

There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled,
that stage must not access values outside of the range of the buffer as specified in the
descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawIndexedIndirect-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported,
  any resource accessed by bound shaders must not be a protected resource

- VUID-vkCmdDrawIndexedIndirect-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'C_a conversion,
  that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- VUID-vkCmdDrawIndexedIndirect-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'C_a conversion,
  that object must not use the ConstOffset and Offset operands

- VUID-vkCmdDrawIndexedIndirect-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view's viewType
  must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

- VUID-vkCmdDrawIndexedIndirect-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the
  image view's format and the Sampled Type operand of the OpTypeImage must match

- VUID-vkCmdDrawIndexedIndirect-OpImageWrite-08795
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the
  Type of the Texel operand of that instruction must have at least as many components as
  the image view's format

- VUID-vkCmdDrawIndexedIndirect-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the
  Type of the Texel operand of that instruction must have at least as many components as
  the buffer view's format

- VUID-vkCmdDrawIndexedIndirect-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a
  result of this command, the SampledType of the OpTypeImage operand of that instruction
  must have a Width of 64

- VUID-vkCmdDrawIndexedIndirect-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is
  accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction
  must have a Width of 32

- VUID-vkCmdDrawIndexedIndirect-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a
  result of this command, the SampledType of the OpTypeImage operand of that instruction
  must have a Width of 64

- VUID-vkCmdDrawIndexedIndirect-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is
  accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction
  must have a Width of 32
If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

Any shader invocation executed by this command must terminate.

The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set.

If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it must be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

Input attachment views accessed in a subpass must be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.

Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment by this command.

If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment by this command.

...
If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexedIndirect-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command must not write to that image subresource as an attachment

- VUID-vkCmdDrawIndexedIndirect-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled

- VUID-vkCmdDrawIndexedIndirect-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP

- VUID-vkCmdDrawIndexedIndirect-None-07831
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT dynamic state enabled then vkCmdSetViewport must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07832
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR dynamic state enabled then vkCmdSetScissor must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07833
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state enabled then vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07834
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state enabled then vkCmdSetDepthBias must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07835
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic state enabled then vkCmdSetBlendConstants must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07836
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic state enabled, and if the current depthBoundsTestEnable state is VK_TRUE, then vkCmdSetDepthBounds must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07837
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilCompareMask must have been called in the current command buffer prior to this drawing command
If the bound graphics pipeline state was created with the 
`VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, and if the current 
`stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilWriteMask` must have been 
called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the 
`VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, and if the current 
`stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilReference` must have been 
called in the current command buffer prior to this drawing command.

If the draw is recorded in a render pass instance with multiview enabled, the maximum 
instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties` 
`:maxMultiviewInstanceIndex`.

If the bound graphics pipeline was created with 
`VkPipelineSampleLocationsStateCreateInfoEXT`::`sampleLocationsEnable` set to `VK_TRUE` and 
the current subpass has a depth/stencil attachment, then that attachment must have been 
created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

If the bound graphics pipeline state was created with the 
`VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then 
`vkCmdSetSampleLocationsEXT` must have been called in the current command buffer 
prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CULL_MODE` 
dynamic state enabled then `vkCmdSetCullModeEXT` must have been called in the current 
command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_FRONT_FACE` 
dynamic state enabled then `vkCmdSetFrontFaceEXT` must have been called in the current 
command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` 
dynamic state enabled then `vkCmdSetDepthTestEnableEXT` must have been called in the current 
command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` 
dynamic state enabled then `vkCmdSetDepthWriteEnableEXT` must have been called in the current 
command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled then `vkCmdSetDepthCompareOpEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07846**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthBoundsTestEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07847**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then `vkCmdSetStencilTestEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07848**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled then `vkCmdSetStencilOpEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

- **VUID-vkCmdDrawIndexedIndirect-scissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT` must match the `viewportCount` parameter of `VkPipelineViewportStateCreateInfo`.

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-03419**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCountEXT` and `vkCmdSetScissorWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must match the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT`.

- **VUID-vkCmdDrawIndexedIndirect-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this drawing command.
buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-04877
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndexedIndirect-logicOp-04878
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

• VUID-vkCmdDrawIndexedIndirect-primitiveFragmentShadingRateWithMultipleViewports-04552
If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_Count` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1.

• VUID-vkCmdDrawIndexedIndirect-blendEnable-04727
If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

• VUID-vkCmdDrawIndexedIndirect-multisampledRenderToSingleSampled-07284
If rasterization is not disabled in the bound graphics pipeline,

then `rasterizationSamples` for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments.

• VUID-vkCmdDrawIndexedIndirect-maxFragmentDualSrcAttachments-09239
If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of `Location` for any output attachment statically used in the Fragment Execution Model executed by this command must be less than `maxFragmentDualSrcAttachments`.

• VUID-vkCmdDrawIndexedIndirect-None-04007
All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or `VK_NULL_HANDLE` buffers bound.

• VUID-vkCmdDrawIndexedIndirect-None-04008
If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be `VK_NULL_HANDLE`.

• VUID-vkCmdDrawIndexedIndirect-None-02721
For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- **VUID-vkCmdDrawIndexedIndirect-None-07842**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-dynamicPrimitiveTopologyUnrestricted-07500**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state

- **VUID-vkCmdDrawIndexedIndirect-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawIndexedIndirect-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but without the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be NULL

- **VUID-vkCmdDrawIndexedIndirect-Input-07939**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then all variables with the `Input` storage class decorated with `Location` in the `Vertex Execution Model OpEntryPoint` must contain a location in `VkVertexInputAttributeDescription2EXT::location`

- **VUID-vkCmdDrawIndexedIndirect-Input-08734**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then the numeric type associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must be the same as `VkVertexInputAttributeDescription2EXT::format`

- **VUID-vkCmdDrawIndexedIndirect-format-08936**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then the scalar width associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must be 64-bit
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and the scalar width associated with a `Location` decorated `Input` variable in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription2EXT::format` must have a 64-bit component.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must not use components that are not present in the format.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command.

If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

`buffer` must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

`offset` must be a multiple of 4.

`commandBuffer` must not be a protected command buffer.

If the `multiDrawIndirect` feature is not enabled, `drawCount` must be 0 or 1.

`drawCount` must be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`.

An index buffer must be bound.

If `robustBufferAccess2` is not enabled, 

\[(\text{indexSize} \times (\text{firstIndex} + \text{indexCount}) + \text{offset})\] must be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer`. 
• VUID-vkCmdDrawIndexedIndirect-drawCount-00528
  If drawCount is greater than 1, stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndexedIndirectCommand)

• VUID-vkCmdDrawIndexedIndirect-drawCount-00539
  If drawCount is equal to 1, (offset + sizeof(VkDrawIndexedIndirectCommand)) must be less than or equal to the size of buffer

• VUID-vkCmdDrawIndexedIndirect-drawCount-00540
  If drawCount is greater than 1, (stride × (drawCount - 1) + offset + sizeof (VkDrawIndexedIndirectCommand)) must be less than or equal to the size of buffer

Valid Usage (Implicit)

• VUID-vkCmdDrawIndexedIndirect-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdDrawIndexedIndirect-buffer-parameter
  buffer must be a valid VkBuffer handle

• VUID-vkCmdDrawIndexedIndirect-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdDrawIndexedIndirect-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdDrawIndexedIndirect-renderpass
  This command must only be called inside of a render pass instance

• VUID-vkCmdDrawIndexedIndirect-commonparent
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

The `VkDrawIndexedIndirectCommand` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndexedIndirectCommand {
    uint32_t indexCount;
    uint32_t instanceCount;
    uint32_t firstIndex;
    int32_t vertexOffset;
    uint32_t firstInstance;
} VkDrawIndexedIndirectCommand;
```

- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
- `firstInstance` is the instance ID of the first instance to draw.

The members of `VkDrawIndexedIndirectCommand` have the same meaning as the similarly named parameters of `vkCmdDrawIndexed`.

### Valid Usage

- **VUID-VkDrawIndexedIndirectCommand-robustBufferAccess2-08798**
  If `robustBufferAccess2` is not enabled, \((\text{indexSize} \times (\text{firstIndex} + \text{indexCount}) + \text{offset})\) must be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer`

- **VUID-VkDrawIndexedIndirectCommand-None-00552**
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in *Vertex Input Description*

- **VUID-VkDrawIndexedIndirectCommand-firstInstance-00554**
  If the `drawIndirectFirstInstance` feature is not enabled, `firstInstance` must be 0

To record an indexed draw call with a draw call count sourced from a buffer, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdDrawIndexedIndirectCount(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```
• **commandBuffer** is the command buffer into which the command is recorded.
• **buffer** is the buffer containing draw parameters.
• **offset** is the byte offset into **buffer** where parameters begin.
• **countBuffer** is the buffer containing the draw count.
• **countBufferOffset** is the byte offset into **countBuffer** where the draw count begins.
• **maxDrawCount** specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in **countBuffer** and **maxDrawCount**.
• **stride** is the byte stride between successive sets of draw parameters.

**vkCmdDrawIndexedIndirectCount** behaves similarly to **vkCmdDrawIndexedIndirect** except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from **countBuffer** located at **countBufferOffset** and use this as the draw count.

### Valid Usage

- **VUID-vkCmdDrawIndexedIndirectCount-magFilter-04553**
  If a **VkSampler** created with **magFilter** or **minFilter** equal to **VK_FILTER_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view's format features **must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDrawIndexedIndirectCount-mipmapMode-04770**
  If a **VkSampler** created with **mipmapMode** equal to **VK_SAMPLER_MIPMAP_MODE_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view's format features **must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDrawIndexedIndirectCount-aspectMask-06478**
  If a **VkImageView** is sampled with depth comparison, the image view **must** have been created with an **aspectMask** that contains **VK_IMAGE_ASPECT_DEPTH_BIT**

- **VUID-vkCmdDrawIndexedIndirectCount-None-02691**
  If a **VkImageView** is accessed using atomic operations as a result of this command, then the image view's format features **must** contain **VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT**

- **VUID-vkCmdDrawIndexedIndirectCount-None-07888**
  If a **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER** descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features **must** contain **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT**

- **VUID-vkCmdDrawIndexedIndirectCount-None-02692**
  If a **VkImageView** is sampled with **VK_FILTER_CUBIC_EXT** as a result of this command, then the image view's format features **must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT**

- **VUID-vkCmdDrawIndexedIndirectCount-None-02693**
  If the **VK_EXT_filter_cubic** extension is not enabled and any **VkImageView** is sampled with...
as a result of this command, it **must** not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

- **VUID-vkCmdDrawIndexedIndirectCount-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndexedIndirectCount-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08600**
  For each set `n` that is statically used by a bound shader, a descriptor set **must** have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in **Pipeline Layout Compatibility**.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in **Pipeline Layout Compatibility**.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08114**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid as described by descriptor validity if they are statically used by a bound shader.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08606**
  A valid pipeline **must** be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08608**
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08609**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08610**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.
• VUID-vkCmdDrawIndexedIndirectCount-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

• VUID-vkCmdDrawIndexedIndirectCount-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

• VUID-vkCmdDrawIndexedIndirectCount-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

• VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource.

• VUID-vkCmdDrawIndexedIndirectCount-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C aC b conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

• VUID-vkCmdDrawIndexedIndirectCount-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C aC b conversion, that object must not use the ConstOffset and Offset operands.

• VUID-vkCmdDrawIndexedIndirectCount-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation.

• VUID-vkCmdDrawIndexedIndirectCount-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match.

• VUID-vkCmdDrawIndexedIndirectCount-OpImageWrite-08795
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

• VUID-vkCmdDrawIndexedIndirectCount-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

• VUID-vkCmdDrawIndexedIndirectCount-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.
• VUID-vkCmdDrawIndexedIndirectCount-SampledType-04471 If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32

• VUID-vkCmdDrawIndexedIndirectCount-SampledType-04472 If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64

• VUID-vkCmdDrawIndexedIndirectCount-SampledType-04473 If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32

• VUID-vkCmdDrawIndexedIndirectCount-sparseImageInt64Atomics-04474 If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

• VUID-vkCmdDrawIndexedIndirectCount-sparseImageInt64Atomics-04475 If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

• VUID-vkCmdDrawIndexedIndirectCount-None-07288 Any shader invocation executed by this command must terminate

• VUID-vkCmdDrawIndexedIndirectCount-renderPass-02684 The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

• VUID-vkCmdDrawIndexedIndirectCount-subpass-02685 The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

• VUID-vkCmdDrawIndexedIndirectCount-None-07748 If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set

• VUID-vkCmdDrawIndexedIndirectCount-OpTypeImage-07468 If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it must be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass

• VUID-vkCmdDrawIndexedIndirectCount-None-07469 Input attachment views accessed in a subpass must be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass’ `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility
• VUID-vkCmdDrawIndexedIndirectCount-None-06537
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexedIndirectCount-None-09000
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexedIndirectCount-None-09001
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexedIndirectCount-None-09002
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexedIndirectCount-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command must not write to that image subresource as an attachment

• VUID-vkCmdDrawIndexedIndirectCount-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled

• VUID-vkCmdDrawIndexedIndirectCount-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP

• VUID-vkCmdDrawIndexedIndirectCount-None-07831
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT dynamic state enabled then vkCmdSetViewport must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07832
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR dynamic state enabled then vkCmdSetScissor must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07833
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state enabled then vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07834
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state enabled then vkCmdSetDepthBias must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07835
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled then `vkCmdSetBlendConstants` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-07836**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, and if the current `depthBoundsTestEnable` state is `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-07837**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilCompareMask` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-07838**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilWriteMask` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-07839**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilReference` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- **VUID-vkCmdDrawIndexedIndirectCount-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- **VUID-vkCmdDrawIndexedIndirectCount-None-06666**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-07840**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled then `vkCmdSetCullModeEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-07841**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled then `vkCmdSetFrontFaceEXT` must have been called in the current
command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-07843**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthTestEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-07844**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled then `vkCmdSetDepthWriteEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-07845**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled then `vkCmdSetDepthCompareOpEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-07846**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthBoundsTestEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-07847**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then `vkCmdSetStencilTestEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-07848**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled then `vkCmdSetStencilOpEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must match the `VkPipelineViewportStateCreateInfo::scissorCount` of the pipeline.

- **VUID-vkCmdDrawIndexedIndirectCount-scissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.
If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCountEXT` and `vkCmdSetScissorWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must match the `scissorCount` parameter of `vkCmdSetScissorWithCountEXT`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCountEXT` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCountEXT` must be 1.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

If rasterization is not disabled in the bound graphics pipeline, then `rasterizationSamples` for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments.

If rasterization is not disabled in the bound graphics pipeline, then `rasterizationSamples` for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments.
If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments

- VUID-vkCmdDrawIndexedIndirectCount-None-04007
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound

- VUID-vkCmdDrawIndexedIndirectCount-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be VK_NULL_HANDLE

- VUID-vkCmdDrawIndexedIndirectCount-None-02721
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- VUID-vkCmdDrawIndexedIndirectCount-None-07842
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled then vkCmdSetPrimitiveTopologyEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-dynamicPrimitiveTopologyUnrestricted-07500
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled then the primitiveTopology parameter of vkCmdSetPrimitiveTopologyEXT must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state

- VUID-vkCmdDrawIndexedIndirectCount-None-04912
  If the bound graphics pipeline was created with both the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT and VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic states enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndexedIndirectCount-pStrides-04913
  If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, but without the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdBindVertexBuffers2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL

- VUID-vkCmdDrawIndexedIndirectCount-None-04914
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndexedIndirectCount-Input-07939
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then all variables with the
Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint must contain a location in VkVertexInputAttributeDescription2EXT::location

- VUID-vkCmdDrawIndexedIndirectCount-Input-08734
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription2EXT::format

- VUID-vkCmdDrawIndexedIndirectCount-format-08936
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then the scalar width associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be 64-bit

- VUID-vkCmdDrawIndexedIndirectCount-format-08937
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription2EXT::format must have a 64-bit component

- VUID-vkCmdDrawIndexedIndirectCount-None-09203
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then all Input variables at the corresponding Location in the Vertex Execution Model OpEntryPoint must not use components that are not present in the format

- VUID-vkCmdDrawIndexedIndirectCount-None-04875
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-04879
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE dynamic state enabled then vkCmdSetPrimitiveRestartEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-buffer-02708
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdDrawIndexedIndirectCount-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDrawIndexedIndirectCount-offset-02710
  offset must be a multiple of 4

- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-02711
commandBuffer must not be a protected command buffer

- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02714
  If countBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02715
  countBuffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDrawIndexedIndirectCount-countBufferOffset-02716
  countBufferOffset must be a multiple of 4

- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02717
  The count stored in countBuffer must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

- VUID-vkCmdDrawIndexedIndirectCount-countBufferOffset-04129
  (countBufferOffset + sizeof(uint32_t)) must be less than or equal to the size of countBuffer

- VUID-vkCmdDrawIndexedIndirectCount-None-04445
  If drawIndirectCount is not enabled this function must not be used

- VUID-vkCmdDrawIndexedIndirectCount-None-07312
  An index buffer must be bound

- VUID-vkCmdDrawIndexedIndirectCount-robustBufferAccess2-07825
  If robustBufferAccess2 is not enabled, (indexSize × (firstIndex + indexCount) + offset) must be less than or equal to the size of the bound index buffer, with indexSize being based on the type specified by indexType, where the index buffer, indexType, and offset are specified via vkCmdBindIndexBuffer

- VUID-vkCmdDrawIndexedIndirectCount-stride-03142
  stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndexedIndirectCommand)

- VUID-vkCmdDrawIndexedIndirectCount-maxDrawCount-03143
  If maxDrawCount is greater than or equal to 1, (stride × (maxDrawCount - 1) + offset + sizeof(VkDrawIndexedIndirectCommand)) must be less than or equal to the size of buffer

- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-offset-03153
  If count stored in countBuffer is equal to 1, (offset + sizeof(VkDrawIndexedIndirectCommand)) must be less than or equal to the size of buffer

- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-offset-03154
  If count stored in countBuffer is greater than 1, (stride × (drawCount - 1) + offset + sizeof(VkDrawIndexedIndirectCommand)) must be less than or equal to the size of buffer

Valid Usage (Implicit)

- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDrawIndexedIndirectCount-buffer-parameter
  buffer must be a valid VkBuffer handle
• **VUID-vkCmdDrawIndexedIndirectCount-countBuffer-parameter**
  countBuffer **must** be a valid VkBuffer handle

• **VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-recording**
  commandBuffer **must** be in the recording state

• **VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations

• **VUID-vkCmdDrawIndexedIndirectCount-renderpass**
  This command **must** only be called inside of a render pass instance

• **VUID-vkCmdDrawIndexedIndirectCount-commonparent**
  Each of buffer, commandBuffer, and countBuffer **must** have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

• Host access to commandBuffer **must** be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

---

Chapter 21. Fixed-Function Vertex Processing

Vertex fetching is controlled via configurable state, as a logically distinct graphics pipeline stage.

21.1. Vertex Attributes

Vertex shaders can define input variables, which receive vertex attribute data transferred from one or more VkBuffer(s) by drawing commands. Vertex shader input variables are bound to buffers via an indirect binding where the vertex shader associates a vertex input attribute number with each variable, vertex input attributes are associated to vertex input bindings on a per-pipeline basis, and vertex input bindings are associated with specific buffers on a per-draw basis via the vkCmdBindVertexBuffers command. Vertex input attribute and vertex input binding descriptions also contain format information controlling how data is extracted from buffer memory and converted to the format expected by the vertex shader.

There are VkPhysicalDeviceLimits::maxVertexInputAttributes number of vertex input attributes and VkPhysicalDeviceLimits::maxVertexInputBindings number of vertex input bindings (each referred to by zero-based indices), where there are at least as many vertex input attributes as there are vertex input bindings. Applications can store multiple vertex input attributes interleaved in a single buffer, and use a single vertex input binding to access those attributes.

In GLSL, vertex shaders associate input variables with a vertex input attribute number using the location layout qualifier. The Component layout qualifier associates components of a vertex shader input variable with components of a vertex input attribute.

**GLSL example**

```glsl
// Assign location M to variableName
layout (location=M, component=2) in vec2 variableName;

// Assign locations [N,N+L) to the array elements of variableNameArray
layout (location=N) in vec4 variableNameArray[L];
```

In SPIR-V, vertex shaders associate input variables with a vertex input attribute number using the Location decoration. The Component decoration associates components of a vertex shader input variable with components of a vertex input attribute. The Location and Component decorations are specified via the OpDecorate instruction.

**SPIR-V example**

```spirv
...%1 = OpExtInstImport "GLSL.std.450"
...
OpName %9 "variableName"
OpName %15 "variableNameArray"
OpDecorate %18 BuiltIn VertexIndex
```
21.1.1. Attribute Location and Component Assignment

The Location decoration specifies which vertex input attribute is used to read and interpret the data that a variable will consume.

When a vertex shader input variable declared using a 16- or 32-bit scalar or vector data type is assigned a Location, its value(s) are taken from the components of the input attribute specified with the corresponding VkVertexInputAttributeDescription::location. The components used depend on the type of variable and the Component decoration specified in the variable declaration, as identified in Input attribute components accessed by 16-bit and 32-bit input variables. Any 16-bit or 32-bit scalar or vector input will consume a single Location. For 16-bit and 32-bit data types, missing components are filled in with default values as described below.

If an implementation supports storageInputOutput16, vertex shader input variables can have a width of 16 bits.

Table 27. Input attribute components accessed by 16-bit and 32-bit input variables

<table>
<thead>
<tr>
<th>16-bit or 32-bit data type</th>
<th>Component decoration</th>
<th>Components consumed</th>
</tr>
</thead>
<tbody>
<tr>
<td>scalar</td>
<td>0 or unspecified</td>
<td>(x, o, o, o)</td>
</tr>
<tr>
<td>scalar</td>
<td>1</td>
<td>(o, y, o, o)</td>
</tr>
<tr>
<td>scalar</td>
<td>2</td>
<td>(o, o, z, o)</td>
</tr>
<tr>
<td>scalar</td>
<td>3</td>
<td>(o, o, o, w)</td>
</tr>
<tr>
<td>two-component vector</td>
<td>0 or unspecified</td>
<td>(x, y, o, o)</td>
</tr>
<tr>

<td>1</td>
<td>(o, y, z, w)</td>
</tr>
<tr>
<td>four-component vector</td>
<td>0 or unspecified</td>
<td>(x, y, z, w)</td>
</tr>
</tbody>
</table>

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a 32-bit floating point matrix type is assigned a Location $i$, its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. Such matrices are treated as an array of column vectors with values taken from the input attributes identified in **Table 28. Input attributes accessed by 32-bit input matrix variables**. The `VkVertexInputAttributeDescription::format` must be specified with a `VkFormat` that corresponds to the appropriate type of column vector. The **Component decoration** must not be used with matrix types.

**Table 28. Input attributes accessed by 32-bit input matrix variables**

<table>
<thead>
<tr>
<th>Data type</th>

</tr>
<tr>
<td>mat4</td>
<td>four-component vector</td>
<td>i, i+1, i+2, i+3</td>
<td>(x, y, z, w), (x, y, z, w), (x, y, z, w), (x, y, z, w)</td>
</tr>
</tbody>
</table>

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a scalar or vector 64-bit data type is assigned a Location $i$, its values are taken from consecutive input attributes starting with the corresponding
VkVertexInputAttributeDescription::location. The Location slots and Component words used depend on the type of variable and the Component decoration specified in the variable declaration, as identified in Input attribute locations and components accessed by 64-bit input variables. For 64-bit data types, no default attribute values are provided. Input variables must not use more components than provided by the attribute.

Table 29. Input attribute locations and components accessed by 64-bit input variables

</tbody>
</table>
Components indicated by “o” are available for use by other input variables which are sourced from the same attribute. Components indicated by “-” are not available for input variables as there are no default values provided for 64-bit data types, and there is no data provided by the input format.

When a vertex shader input variable declared using a 64-bit floating-point matrix type is assigned a Location $i$, its values are taken from consecutive input attribute locations. Such matrices are treated as an array of column vectors with values taken from the input attributes as shown in Input attribute locations and components accessed by 64-bit input variables. Each column vector starts at the Location immediately following the last Location of the previous column vector. The number of attributes and components assigned to each matrix is determined by the matrix dimensions and ranges from two to eight locations.

When a vertex shader input variable declared using an array type is assigned a location, its values are taken from consecutive input attributes starting with the corresponding VkVertexInputAttributeDescription::location. The number of attributes and components assigned to each element are determined according to the data type of the array elements and Component decoration (if any) specified in the declaration of the array, as described above. Each element of the array, in order, is assigned to consecutive locations, but all at the same specified component within each location.

Only input variables declared with the data types and component decorations as specified above are supported. Two variables are allowed to share the same Location slot only if their Component words do not overlap. If multiple variables share the same Location slot, they must all have the same SPIR-V floating-point component type or all have the same width scalar type components.

### 21.2. Vertex Input Description

Applications specify vertex input attribute and vertex input binding descriptions as part of graphics pipeline creation by setting the VkGraphicsPipelineCreateInfo::pVertexInputState pointer to a VkPipelineVertexInputStateCreateInfo structure. Alternatively, if the graphics pipeline is created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then the vertex input attribute and vertex input binding descriptions are specified dynamically with vkCmdSetVertexInputEXT, and the VkGraphicsPipelineCreateInfo::pVertexInputState pointer is ignored.

The VkPipelineVertexInputStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineVertexInputStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineVertexInputStateCreateFlags flags;
    uint32_t vertexBindingDescriptionCount;
    const VkVertexInputBindingDescription* pVertexBindingDescriptions;
    uint32_t vertexAttributeDescriptionCount;
    const VkVertexInputAttributeDescription* pVertexAttributeDescriptions;
} VkPipelineVertexInputStateCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **flags** is reserved for future use.

• **vertexBindingDescriptionCount** is the number of vertex binding descriptions provided in **pVertexBindingDescriptions**.

• **pVertexBindingDescriptions** is a pointer to an array of **VkVertexInputBindingDescription** structures.

• **vertexAttributeDescriptionCount** is the number of vertex attribute descriptions provided in **pVertexAttributeDescriptions**.

• **pVertexAttributeDescriptions** is a pointer to an array of **VkVertexInputAttributeDescription** structures.

### Valid Usage

- VUID-VkPipelineVertexInputStateCreateInfo-vertexBindingDescriptionCount-00613
  - **vertexBindingDescriptionCount** must be less than or equal to **VkPhysicalDeviceLimits::maxVertexInputBindings**

- VUID-VkPipelineVertexInputStateCreateInfo-vertexAttributeDescriptionCount-00614
  - **vertexAttributeDescriptionCount** must be less than or equal to **VkPhysicalDeviceLimits::maxVertexInputAttributes**

- VUID-VkPipelineVertexInputStateCreateInfo-binding-00615
  - For every binding specified by each element of **pVertexAttributeDescriptions**, a **VkVertexInputBindingDescription** must exist in **pVertexBindingDescriptions** with the same value of **binding**

- VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-00616
  - All elements of **pVertexBindingDescriptions** must describe distinct binding numbers

- VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-00617
  - All elements of **pVertexAttributeDescriptions** must describe distinct attribute locations

### Valid Usage (Implicit)

- VUID-VkPipelineVertexInputStateCreateInfo-sType-sType
  - **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO**

- VUID-VkPipelineVertexInputStateCreateInfo-pNext-pNext
  - **pNext** must be **NULL** or a pointer to a valid instance of **VkPipelineVertexInputDivisorStateCreateInfoEXT**

- VUID-VkPipelineVertexInputStateCreateInfo-sType-unique
  - The **sType** value of each struct in the **pNext** chain must be unique

- VUID-VkPipelineVertexInputStateCreateInfo-flags-zerobitmask
  - **flags** must be **0**

- VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-parameter
  - If **vertexBindingDescriptionCount** is not **0**, **pVertexBindingDescriptions** must be a valid
pointer to an array of `vertexBindingDescriptionCount` valid `VkVertexInputBindingDescription` structures

- **VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-parameter** If `vertexAttributeDescriptionCount` is not 0, `pVertexAttributeDescriptions` **must** be a valid pointer to an array of `vertexAttributeDescriptionCount` valid `VkVertexInputAttributeDescription` structures

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineVertexInputStateCreateFlags;
```

`VkPipelineVertexInputStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

Each vertex input binding is specified by the `VkVertexInputBindingDescription` structure, defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputBindingDescription {
    uint32_t binding;
    uint32_t stride;
    VkVertexInputRate inputRate;
} VkVertexInputBindingDescription;
```

- **binding** is the binding number that this structure describes.
- **stride** is the byte stride between consecutive elements within the buffer.
- **inputRate** is a `VkVertexInputRate` value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.

**Valid Usage**

- **VUID-VkVertexInputBindingDescription-binding-00618**
  
  `binding` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-VkVertexInputBindingDescription-stride-00619**
  
  `stride` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`

**Valid Usage (Implicit)**

- **VUID-VkVertexInputBindingDescription-inputRate-parameter**
  
  `inputRate` **must** be a valid `VkVertexInputRate` value

Possible values of `VkVertexInputBindingDescription::inputRate`, specifying the rate at which vertex attributes are pulled from buffers, are:
• **VK_VERTEX_INPUT_RATE_VERTEX** specifies that vertex attribute addressing is a function of the vertex index.

• **VK_VERTEX_INPUT_RATE_INSTANCE** specifies that vertex attribute addressing is a function of the instance index.

Each vertex input attribute is specified by the `VkVertexInputAttributeDescription` structure, defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputAttributeDescription {
    uint32_t location;
    uint32_t binding;
    VkFormat format;
    uint32_t offset;
} VkVertexInputAttributeDescription;
```

- **location** is the shader input location number for this attribute.
- **binding** is the binding number which this attribute takes its data from.
- **format** is the size and type of the vertex attribute data.
- **offset** is a byte offset of this attribute relative to the start of an element in the vertex input binding.

**Valid Usage**

- VUID-VkVertexInputAttributeDescription-location-00620
  
  `location` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- VUID-VkVertexInputAttributeDescription-binding-00621
  
  `binding` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkVertexInputAttributeDescription-offset-00622
  
  `offset` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributeOffset`

- VUID-VkVertexInputAttributeDescription-format-00623
  
  The **format features** of `format` **must** contain `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT`
To **dynamically set** the vertex input attribute and vertex input binding descriptions, call:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
define vkCmdSetVertexInputEXT(
    VkCommandBuffer commandBuffer,
    uint32_t vertexBindingDescriptionCount,
    const VkVertexInputBindingDescription2EXT* pVertexBindingDescriptions,
    uint32_t vertexAttributeDescriptionCount,
    const VkVertexInputAttributeDescription2EXT* pVertexAttributeDescriptions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `vertexBindingDescriptionCount` is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.
- `pVertexBindingDescriptions` is a pointer to an array of `VkVertexInputBindingDescription2EXT` structures.
- `vertexAttributeDescriptionCount` is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.
- `pVertexAttributeDescriptions` is a pointer to an array of `VkVertexInputAttributeDescription2EXT` structures.

This command sets the vertex input attribute and vertex input binding descriptions state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkGraphicsPipelineCreateInfo::pVertexInputState` values used to create the currently active pipeline.

If the bound pipeline state object was also created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` can be used instead of `vkCmdSetVertexInputEXT` to dynamically set the stride.

---

### Valid Usage (Implicit)

- VUID-VkVertexInputAttributeDescription-format-parameter
  `format` must be a valid `VkFormat` value

---

### Valid Usage

- VUID-vkCmdSetVertexInputEXT-None-04790
  The `vertexInputDynamicState` feature must be enabled

- VUID-vkCmdSetVertexInputEXT-vertexBindingDescriptionCount-04791
  `vertexBindingDescriptionCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdSetVertexInputEXT-vertexAttributeDescriptionCount-04792
vertexAttributeDescriptionCount must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputAttributes

• VUID-vkCmdSetVertexInputEXT-binding-04793
  For every binding specified by each element of pVertexAttributeDescriptions, a VkVertexInputBindingDescription2EXT must exist in pVertexBindingDescriptions with the same value of binding

• VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-04794
  All elements of pVertexBindingDescriptions must describe distinct binding numbers

• VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-04795
  All elements of pVertexAttributeDescriptions must describe distinct attribute locations

Valid Usage (Implicit)

• VUID-vkCmdSetVertexInputEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-parameter
  If vertexBindingDescriptionCount is not 0, pVertexBindingDescriptions must be a valid pointer to an array of vertexBindingDescriptionCount valid VkVertexInputBindingDescription2EXT structures

• VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-parameter
  If vertexAttributeDescriptionCount is not 0, pVertexAttributeDescriptions must be a valid pointer to an array of vertexAttributeDescriptionCount valid VkVertexInputAttributeDescription2EXT structures

• VUID-vkCmdSetVertexInputEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetVertexInputEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkVertexInputBindingDescription2EXT` structure is defined as:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputBindingDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t binding;
    uint32_t stride;
    VkVertexInputRate inputRate;
    uint32_t divisor;
} VkVertexInputBindingDescription2EXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `binding` is the binding number that this structure describes.
- `stride` is the byte stride between consecutive elements within the buffer.
- `inputRate` is a `VkVertexInputRate` value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.
- `divisor` is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. This member can be set to a value other than 1 if the `vertexAttributeInstanceRateDivisor` feature is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of `divisor` is implementation-dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`. A value of 0 can be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.

### Valid Usage

- VUID-VkVertexInputBindingDescription2EXT-binding-04796
  `binding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkVertexInputBindingDescription2EXT-stride-04797
  `stride` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`

- VUID-VkVertexInputBindingDescription2EXT-divisor-04798
  If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, `divisor` must not be
If the `vertexAttributeInstanceRateDivisor` feature is not enabled, `divisor` must be 1.

`divisor` must be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`, inclusive.

If `divisor` is not 1 then `inputRate` must be of type `VK_VERTEX_INPUT_RATE_INSTANCE`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_VERTEX_INPUT_BINDING_DESCRIPTION_2_EXT`.
- `inputRate` must be a valid `VkVertexInputRate` value.

The `VkVertexInputAttributeDescription2EXT` structure is defined as:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputAttributeDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t location;
    uint32_t binding;
    VkFormat format;
    uint32_t offset;
} VkVertexInputAttributeDescription2EXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `location` is the shader input location number for this attribute.
- `binding` is the binding number which this attribute takes its data from.
- `format` is the size and type of the vertex attribute data.
- `offset` is a byte offset of this attribute relative to the start of an element in the vertex input binding.

Valid Usage

- `location` must be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`.
- `binding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`.
offset must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputAttributeOffset

The format features of format must contain VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT

Valid Usage (Implicit)

sType must be VK_STRUCTURE_TYPE_VERTEX_INPUT_ATTRIBUTE_DESCRIPTION_2_EXT

format must be a valid VkFormat value

To bind vertex buffers to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindVertexBuffers(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command is recorded.
    uint32_t firstBinding,          // firstBinding is the index of the first vertex input binding whose state is updated by the command.
    uint32_t bindingCount,          // bindingCount is the number of vertex input bindings whose state is updated by the command.
    const VkBuffer* pBuffers,       // pBuffers is a pointer to an array of buffer handles.
    const VkDeviceSize* pOffsets);  // pOffsets is a pointer to an array of buffer offsets.
```

The values taken from elements i of pBuffers and pOffsets replace the current state for the vertex input binding firstBinding + i, for i in [0, bindingCount). The vertex input binding is updated to start at the offset indicated by pOffsets[i] from the start of the buffer pBuffers[i]. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the nullDescriptor feature is enabled, elements of pBuffers can be VK_NULL_HANDLE, and can be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is VK_NULL_HANDLE, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with (0,0,1).

Valid Usage

firstBinding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings
The sum of `firstBinding` and `bindingCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`.

All elements of `pOffsets` must be less than the size of the corresponding element in `pBuffers`.

All elements of `pBuffers` must have been created with the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` flag.

Each element of `pBuffers` that is non-sparse must be bound completely and contiguously to a single `VkDeviceMemory` object.

If the `nullDescriptor` feature is not enabled, all elements of `pBuffers` must not be `VK_NULL_HANDLE`.

If an element of `pBuffers` is `VK_NULL_HANDLE`, then the corresponding element of `pOffsets` must be zero.

**Valid Usage (Implicit)**

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pBuffers` must be a valid pointer to an array of `bindingCount` valid or `VK_NULL_HANDLE` `VkBuffer` handles.
- `pOffsets` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
- `bindingCount` must be greater than 0.
- Both of `commandBuffer`, and the elements of `pBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.
Host Synchronization

- Host access to commandBuffer must be externally synchronized.
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Alternatively, to bind vertex buffers, along with their sizes and strides, to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdBindVertexBuffers2EXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes,
    const VkDeviceSize* pStrides);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first vertex input binding whose state is updated by the command.
- `bindingCount` is the number of vertex input bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is NULL or a pointer to an array of the size in bytes of vertex data bound from `pBuffers`.
- `pStrides` is NULL or a pointer to an array of buffer strides.

The values taken from elements i of `pBuffers` and `pOffsets` replace the current state for the vertex input binding `firstBinding + i`, for i in [0, `bindingCount`). The vertex input binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. If `pSizes` is not NULL then `pSizes[i]` specifies the bound size of the vertex buffer starting from the corresponding elements of `pBuffers[i]` plus `pOffsets[i]`. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the nullDescriptor feature is enabled, elements of `pBuffers` can be VK_NULL_HANDLE, and can be used
by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is
VK_NULL_HANDLE, the values taken from memory are considered to be zero, and missing G, B, or
A components are filled with (0, 0, 1).

This command also dynamically sets the byte strides between consecutive elements within buffer
pBuffers[i] to the corresponding pStrides[i] value when the graphics pipeline is created with
VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE set in VkPipelineDynamicStateCreateInfo
::pDynamicStates. Otherwise, strides are specified by the VkVertexInputBindingDescription::stride
values used to create the currently active pipeline.

If the bound pipeline state object was also created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT
dynamic state enabled then vkCmdSetVertexInputEXT can be used instead of
vkCmdBindVertexBuffers2EXT to set the stride.

**Note**
Unlike the static state to set the same, pStrides must be between 0 and the
maximum extent of the attributes in the binding. vkCmdSetVertexInputEXT does
not have this restriction so can be used if other stride values are desired.

---

**Valid Usage**

- **VUID-vkCmdBindVertexBuffers2-firstBinding-03355**
  firstBinding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings

- **VUID-vkCmdBindVertexBuffers2-firstBinding-03356**
  The sum of firstBinding and bindingCount must be less than or equal to
  VkPhysicalDeviceLimits::maxVertexInputBindings

- **VUID-vkCmdBindVertexBuffers2-pOffsets-03357**
  If pSizes is not NULL, all elements of pOffsets must be less than the size of the
  corresponding element in pBuffers

- **VUID-vkCmdBindVertexBuffers2-pSizes-03358**
  If pSizes is not NULL, all elements of pOffsets plus pSizes must be less than or equal to
  the size of the corresponding element in pBuffers

- **VUID-vkCmdBindVertexBuffers2-pBuffers-03359**
  All elements of pBuffers must have been created with the
  VK_BUFFER_USAGE_VERTEX_BUFFER_BIT flag

- **VUID-vkCmdBindVertexBuffers2-pBuffers-03360**
  Each element of pBuffers that is non-sparse must be bound completely and contiguously
to a single VkDeviceMemory object

- **VUID-vkCmdBindVertexBuffers2-pBuffers-04111**
  If the nullDescriptor feature is not enabled, all elements of pBuffers must not be
  VK_NULL_HANDLE

- **VUID-vkCmdBindVertexBuffers2-pBuffers-04112**
  If an element of pBuffers is VK_NULL_HANDLE, then the corresponding element of

  *commandBuffer* must be in the *recording state*

• VUID-vkCmdBindVertexBuffers2-commandBuffer-cmdpool
  The *VkCommandPool* that *commandBuffer* was allocated from must support graphics operations

• VUID-vkCmdBindVertexBuffers2-bindingCount-arraylength
  If any of *pSizes*, or *pStrides* are not NULL, *bindingCount* must be greater than 0

• VUID-vkCmdBindVertexBuffers2-commonparent
  Both of *commandBuffer*, and the elements of *pBuffers* that are valid handles of non-ignored
  parameters must have been created, allocated, or retrieved from the same *VkDevice*

---

**Host Synchronization**

• Host access to *commandBuffer* must be externally synchronized

• Host access to the *VkCommandPool* that *commandBuffer* was allocated from must be externally
  synchronized
21.3. Vertex Attribute Divisor in Instanced Rendering

If the `vertexAttributeInstanceRateDivisor` feature is enabled and the `pNext` chain of `VkPipelineVertexInputStateCreateInfo` includes a `VkPipelineVertexInputDivisorStateCreateInfoEXT` structure, then that structure controls how vertex attributes are assigned to an instance when instanced rendering is enabled.

The `VkPipelineVertexInputDivisorStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkPipelineVertexInputDivisorStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t vertexBindingDivisorCount;
    const VkVertexInputBindingDivisorDescriptionEXT* pVertexBindingDivisors;
} VkPipelineVertexInputDivisorStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexBindingDivisorCount` is the number of elements in the `pVertexBindingDivisors` array.
- `pVertexBindingDivisors` is a pointer to an array of `VkVertexInputBindingDivisorDescriptionEXT` structures specifying the divisor value for each binding.

Valid Usage (Implicit)

- VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_EXT`
- VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-pVertexBindingDivisors-parameter `pVertexBindingDivisors` must be a valid pointer to an array of `vertexBindingDivisorCount` `VkVertexInputBindingDivisorDescriptionEXT` structures
- VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-vertexBindingDivisorCount-arraylength `vertexBindingDivisorCount` must be greater than 0
The individual divisor values per binding are specified using theVKVertexInputBindingDivisorDescriptionEXT structure which is defined as:

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkVertexInputBindingDivisorDescriptionEXT {
    uint32_t binding;
    uint32_t divisor;
} VkVertexInputBindingDivisorDescriptionEXT;
```

- **binding** is the binding number for which the divisor is specified.
- **divisor** is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of divisor is implementation-dependent and can be queried using VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor. A value of \(0\) can be used for the divisor if the vertexAttributeInstanceRateZeroDivisor feature is enabled. In this case, the same vertex attribute will be applied to all instances.

If this structure is not used to define a divisor value for an attribute, then the divisor has a logical default value of 1.

### Valid Usage

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-binding-01869**
  binding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-vertexAttributeInstanceRateZeroDivisor-02228**
  If the vertexAttributeInstanceRateZeroDivisor feature is not enabled, divisor must not be \(0\)

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-vertexAttributeInstanceRateDivisor-02229**
  If the vertexAttributeInstanceRateDivisor feature is not enabled, divisor must be \(1\)

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-divisor-01870**
  divisor must be a value between \(0\) and VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor, inclusive

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-inputRate-01871**
  VkVertexInputBindingDescription::inputRate must be of type VK_VERTEX_INPUT_RATE_INSTANCE for this binding

## 21.4. Vertex Input Address Calculation

The address of each attribute for each vertexIndex and instanceIndex is calculated as follows:

- Let `attribDesc` be the member of VkPipelineVertexInputStateCreateInfo
::pVertexAttributeDescriptions with VkVertexInputAttributeDescription::location equal to the vertex input attribute number.

- Let bindingDesc be the member of VkPipelineVertexInputStateCreateInfo ::pVertexBindingDescriptions with VkVertexInputAttributeDescription::binding equal to attribDesc.binding.

- Let vertexIndex be the index of the vertex within the draw (a value between firstVertex and firstVertex+vertexCount for vkCmdDraw, or a value taken from the index buffer plus vertexOffset for vkCmdDrawIndexed), and let instanceIndex be the instance number of the draw (a value between firstInstance and firstInstance+instanceCount).

- Let offset be an array of offsets into the currently bound vertex buffers specified during vkCmdBindVertexBuffers or vkCmdBindVertexBuffers2EXT with pOffsets.

- Let divisor be the member of VkPipelineVertexInputDivisorStateCreateInfoEXT ::pVertexBindingDivisors with VkVertexInputBindingDivisorDescriptionEXT::binding equal to attribDesc.binding.

```c
bufferBindingAddress = buffer[binding].baseAddress + offset[binding];

if (bindingDesc.inputRate == VK_VERTEX_INPUT_RATE_VERTEX)
    effectiveVertexOffset = vertexIndex * bindingDesc.stride;
else
    if (divisor == 0)
        effectiveVertexOffset = firstInstance * bindingDesc.stride;
    else
        effectiveVertexOffset = (firstInstance + ((instanceIndex - firstInstance) / divisor)) * bindingDesc.stride;

attribAddress = bufferBindingAddress + effectiveVertexOffset + attribDesc.offset;
```

### 21.4.1. Vertex Input Extraction

For each attribute, raw data is extracted starting at attribAddress and is converted from the VkVertexInputAttributeDescription's format to either floating-point, unsigned integer, or signed integer based on the numeric type of format. The numeric type of format must match the numeric type of the input variable in the shader. The input variable in the shader must be declared as a 64-bit data type if and only if format is a 64-bit data type. If format is a packed format, attribAddress must be a multiple of the size in bytes of the whole attribute data type as described in Packed Formats. Otherwise, attribAddress must be a multiple of the size in bytes of the component type indicated by format (see Formats). For attributes that are not 64-bit data types, each component is converted to the format of the input variable based on its type and size (as defined in the Format Definition section for each VkFormat), using the appropriate equations in 16-Bit Floating-Point Numbers, Unsigned 11-Bit Floating-Point Numbers, Unsigned 10-Bit Floating-Point Numbers, Fixed-Point Data Conversion, and Shared Exponent to RGB. Signed integer components smaller than 32 bits are sign-extended. Attributes that are not 64-bit data types are expanded to four components in the same way as described in conversion to RGBA. The number of components in the vertex shader input variable need not exactly match the number of components in the format. If the vertex shader has fewer components, the extra components are discarded.
Chapter 22. Tessellation

Tessellation involves three pipeline stages. First, a tessellation control shader transforms control points of a patch and can produce per-patch data. Second, a fixed-function tessellator generates multiple primitives corresponding to a tessellation of the patch in (u,v) or (u,v,w) parameter space. Third, a tessellation evaluation shader transforms the vertices of the tessellated patch, for example to compute their positions and attributes as part of the tessellated surface. The tessellator is enabled when the pipeline contains both a tessellation control shader and a tessellation evaluation shader.

22.1. Tessellator

If a pipeline includes both tessellation shaders (control and evaluation), the tessellator consumes each input patch (after vertex shading) and produces a new set of independent primitives (points, lines, or triangles). These primitives are logically produced by subdividing a geometric primitive (rectangle or triangle) according to the per-patch outer and inner tessellation levels written by the tessellation control shader. These levels are specified using the built-in variables TessLevelOuter and TessLevelInner, respectively. This subdivision is performed in an implementation-dependent manner. If no tessellation shaders are present in the pipeline, the tessellator is disabled and incoming primitives are passed through without modification.

The type of subdivision performed by the tessellator is specified by an OpExecutionMode instruction using one of the Triangles, Quads, or IsoLines execution modes. This instruction may be specified in either the tessellation evaluation or tessellation control shader. Other tessellation-related execution modes can also be specified in either the tessellation control or tessellation evaluation shaders.

Any tessellation-related modes specified in both the tessellation control and tessellation evaluation shaders must be the same.

Tessellation execution modes include:

- **Triangles, Quads, and IsoLines.** These control the type of subdivision and topology of the output primitives. One mode must be set in at least one of the tessellation shader stages.
- **VertexOrderCw** and **VertexOrderCcw.** These control the orientation of triangles generated by the tessellator. One mode must be set in at least one of the tessellation shader stages.
- **PointMode.** Controls generation of points rather than triangles or lines. This functionality defaults to disabled, and is enabled if either shader stage includes the execution mode.
- **SpacingEqual, SpacingFractionalEven, and SpacingFractionalOdd.** Controls the spacing of segments on the edges of tessellated primitives. One mode must be set in at least one of the tessellation shader stages.
- **OutputVertices.** Controls the size of the output patch of the tessellation control shader. One value must be set in at least one of the tessellation shader stages.

For triangles, the tessellator subdivides a triangle primitive into smaller triangles. For quads, the tessellator subdivides a rectangle primitive into smaller triangles. For isolines, the tessellator subdivides a rectangle primitive into a collection of line segments arranged in strips stretching...
across the rectangle in the u dimension (i.e. the coordinates in `TessCoord` are of the form (0,x) through (1,x) for all tessellation evaluation shader invocations that share a line).

Each vertex produced by the tessellator has an associated (u,v,w) or (u,v) position in a normalized parameter space, with parameter values in the range [0,1], as illustrated in figures `Domain parameterization for tessellation primitive modes (upper-left origin)` and `Domain parameterization for tessellation primitive modes (lower-left origin)`. The domain space can have either an upper-left or lower-left origin, selected by the `domainOrigin` member of `VkPipelineTessellationDomainOriginStateCreateInfo`.

*Figure 11. Domain parameterization for tessellation primitive modes (upper-left origin)*
Figure 12. Domain parameterization for tessellation primitive modes (lower-left origin)

Caption

In the domain parameterization diagrams, the coordinates illustrate the value of TessCoord at the corners of the domain. The labels on the edges indicate the inner (IL0 and IL1) and outer (OL0 through OL3) tessellation level values used to control the number of subdivisions along each edge of the domain.

For triangles, the vertex's position is a barycentric coordinate \((u,v,w)\), where \(u + v + w = 1.0\), and indicates the relative influence of the three vertices of the triangle on the position of the vertex. For quads and isolines, the position is a \((u,v)\) coordinate indicating the relative horizontal and vertical position of the vertex relative to the subdivided rectangle. The subdivision process is explained in more detail in subsequent sections.

22.2. Tessellator Patch Discard

A patch is discarded by the tessellator if any relevant outer tessellation level is less than or equal to zero.

Patches will also be discarded if any relevant outer tessellation level corresponds to a floating-point
NaN (not a number) in implementations supporting NaN.

No new primitives are generated and the tessellation evaluation shader is not executed for patches that are discarded. For Quads, all four outer levels are relevant. For Triangles and Isolines, only the first three or two outer levels, respectively, are relevant. Negative inner levels will not cause a patch to be discarded; they will be clamped as described below.

### 22.3. Tessellator Spacing

Each of the tessellation levels is used to determine the number and spacing of segments used to subdivide a corresponding edge. The method used to derive the number and spacing of segments is specified by an OpExecutionMode in the tessellation control or tessellation evaluation shader using one of the identifiers SpacingEqual, SpacingFractionalEven, or SpacingFractionalOdd.

If SpacingEqual is used, the floating-point tessellation level is first clamped to \([1, \text{maxLevel}]\), where maxLevel is the implementation-dependent maximum tessellation level (VkPhysicalDeviceLimits::maxTessellationGenerationLevel). The result is rounded up to the nearest integer \(n\), and the corresponding edge is divided into \(n\) segments of equal length in \((u,v)\) space.

If SpacingFractionalEven is used, the tessellation level is first clamped to \([2, \text{maxLevel}]\) and then rounded up to the nearest even integer \(n\). If SpacingFractionalOdd is used, the tessellation level is clamped to \([1, \text{maxLevel} - 1]\) and then rounded up to the nearest odd integer \(n\). If \(n\) is one, the edge will not be subdivided. Otherwise, the corresponding edge will be divided into \(n - 2\) segments of equal length, and two additional segments of equal length that are typically shorter than the other segments. The length of the two additional segments relative to the others will decrease monotonically with \(n - f\), where \(f\) is the clamped floating-point tessellation level. When \(n - f\) is zero, the additional segments will have equal length to the other segments. As \(n - f\) approaches 2.0, the relative length of the additional segments approaches zero. The two additional segments must be placed symmetrically on opposite sides of the subdivided edge. The relative location of these two segments is implementation-dependent, but must be identical for any pair of subdivided edges with identical values of \(f\).

When tessellating triangles or quads using point mode with fractional odd spacing, the tessellator may produce interior vertices that are positioned on the edge of the patch if an inner tessellation level is less than or equal to one. Such vertices are considered distinct from vertices produced by subdividing the outer edge of the patch, even if there are pairs of vertices with identical coordinates.

### 22.4. Tessellation Primitive Ordering

Few guarantees are provided for the relative ordering of primitives produced by tessellation, as they pertain to primitive order.

- The output primitives generated from each input primitive are passed to subsequent pipeline stages in an implementation-dependent order.

- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.
22.5. Tessellator Vertex Winding Order

When the tessellator produces triangles (in the Triangles or Quads modes), the orientation of all triangles is specified with an OpExecutionMode of VertexOrderCw or VertexOrderCcw in the tessellation control or tessellation evaluation shaders. If the order is VertexOrderCw, the vertices of all generated triangles will have clockwise ordering in (u,v) or (u,v,w) space. If the order is VertexOrderCcw, the vertices will have counter-clockwise ordering in that space.

If the tessellation domain has an upper-left origin, the vertices of a triangle have counter-clockwise ordering if

$$a = u_0 v_1 - u_1 v_0 + u_1 v_2 - u_2 v_1 + u_2 v_0 - u_0 v_2$$

is negative, and clockwise ordering if a is positive. u_i and v_i are the u and v coordinates in normalized parameter space of the i-th vertex of the triangle. If the tessellation domain has a lower-left origin, the vertices of a triangle have counter-clockwise ordering if a is positive, and clockwise ordering if a is negative.

Note
The value a is proportional (with a positive factor) to the signed area of the triangle.

In Triangles mode, even though the vertex coordinates have a w value, it does not participate directly in the computation of a, being an affine combination of u and v.

22.6. Triangle Tessellation

If the tessellation primitive mode is Triangles, an equilateral triangle is subdivided into a collection of triangles covering the area of the original triangle. First, the original triangle is subdivided into a collection of concentric equilateral triangles. The edges of each of these triangles are subdivided, and the area between each triangle pair is filled by triangles produced by joining the vertices on the subdivided edges. The number of concentric triangles and the number of subdivisions along each triangle except the outermost is derived from the first inner tessellation level. The edges of the outermost triangle are subdivided independently, using the first, second, and third outer tessellation levels to control the number of subdivisions of the u = 0 (left), v = 0 (bottom), and w = 0 (right) edges, respectively. The second inner tessellation level and the fourth outer tessellation level have no effect in this mode.

If the first inner tessellation level and all three outer tessellation levels are exactly one after clamping and rounding, only a single triangle with (u,v,w) coordinates of (0,0,1), (1,0,0), and (0,1,0) is generated. If the inner tessellation level is one and any of the outer tessellation levels is greater than one, the inner tessellation level is treated as though it were originally specified as $1 + \varepsilon$ and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the triangle.
If any tessellation level is greater than one, tessellation begins by producing a set of concentric inner triangles and subdividing their edges. First, the three outer edges are temporarily subdivided using the clamped and rounded first inner tessellation level and the specified tessellation spacing, generating n segments. For the outermost inner triangle, the inner triangle is degenerate—a single point at the center of the triangle—if n is two. Otherwise, for each corner of the outer triangle, an inner triangle corner is produced at the intersection of two lines extended perpendicular to the corner's two adjacent edges running through the vertex of the subdivided outer edge nearest that corner. If n is three, the edges of the inner triangle are not subdivided and it is the final triangle in the set of concentric triangles. Otherwise, each edge of the inner triangle is divided into n - 2 segments, with the n - 1 vertices of this subdivision produced by intersecting the inner edge with lines perpendicular to the edge running through the n - 1 innermost vertices of the subdivision of the outer edge. Once the outermost inner triangle is subdivided, the previous subdivision process repeats itself, using the generated triangle as an outer triangle. This subdivision process is illustrated in Inner Triangle Tessellation.

Figure 13. Inner Triangle Tessellation

Caption

In the Inner Triangle Tessellation diagram, inner tessellation levels of (a) four and (b) five are shown (not to scale). Solid black circles depict vertices along the edges of the concentric triangles. The edges of inner triangles are subdivided by intersecting the edge with segments perpendicular to the edge passing through each inner vertex of the subdivided outer edge. Dotted lines depict edges connecting corresponding vertices on the inner and outer triangle edges.

Once all the concentric triangles are produced and their edges are subdivided, the area between each pair of adjacent inner triangles is filled completely with a set of non-overlapping triangles. In this subdivision, two of the three vertices of each triangle are taken from adjacent vertices on a subdivided edge of one triangle; the third is one of the vertices on the corresponding edge of the other triangle. If the innermost triangle is degenerate (i.e., a point), the triangle containing it is subdivided into six triangles by connecting each of the six vertices on that triangle with the center point. If the innermost triangle is not degenerate, that triangle is added to the set of generated triangles as-is.
After the area corresponding to any inner triangles is filled, the tessellator generates triangles to cover the area between the outermost triangle and the outermost inner triangle. To do this, the temporary subdivision of the outer triangle edge above is discarded. Instead, the \( u = 0 \), \( v = 0 \), and \( w = 0 \) edges are subdivided according to the first, second, and third outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the first inner triangle is retained. The area between the outer and first inner triangles is completely filled by non-overlapping triangles as described above. If the first (and only) inner triangle is degenerate, a set of triangles is produced by connecting each vertex on the outer triangle edges with the center point.

After all triangles are generated, each vertex in the subdivided triangle is assigned a barycentric \((u,v,w)\) coordinate based on its location relative to the three vertices of the outer triangle.

The algorithm used to subdivide the triangular domain in \((u,v,w)\) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is consistent across the domain as described in Tessellator Vertex Winding Order.

### 22.7. Quad Tessellation

If the tessellation primitive mode is Quads, a rectangle is subdivided into a collection of triangles covering the area of the original rectangle. First, the original rectangle is subdivided into a regular mesh of rectangles, where the number of rectangles along the \( u = 0 \) and \( u = 1 \) (vertical) and \( v = 0 \) and \( v = 1 \) (horizontal) edges are derived from the first and second inner tessellation levels, respectively. All rectangles, except those adjacent to one of the outer rectangle edges, are decomposed into triangle pairs. The outermost rectangle edges are subdivided independently, using the first, second, third, and fourth outer tessellation levels to control the number of subdivisions of the \( u = 0 \) (left), \( v = 0 \) (bottom), \( u = 1 \) (right), and \( v = 1 \) (top) edges, respectively. The area between the inner rectangles of the mesh and the outer rectangle edges are filled by triangles produced by joining the vertices on the subdivided outer edges to the vertices on the edge of the inner rectangle mesh.

If both clamped inner tessellation levels and all four clamped outer tessellation levels are exactly one, only a single triangle pair covering the outer rectangle is generated. Otherwise, if either clamped inner tessellation level is one, that tessellation level is treated as though it was originally specified as \( 1 + \varepsilon \) and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the rectangle.

If any tessellation level is greater than one, tessellation begins by subdividing the \( u = 0 \) and \( u = 1 \) edges of the outer rectangle into \( m \) segments using the clamped and rounded first inner tessellation level and the tessellation spacing. The \( v = 0 \) and \( v = 1 \) edges are subdivided into \( n \) segments using the second inner tessellation level. Each vertex on the \( u = 0 \) and \( v = 0 \) edges are joined with the corresponding vertex on the \( u = 1 \) and \( v = 1 \) edges to produce a set of vertical and horizontal lines that divide the rectangle into a grid of smaller rectangles. The primitive generator emits a pair of
non-overlapping triangles covering each such rectangle not adjacent to an edge of the outer rectangle. The boundary of the region covered by these triangles forms an inner rectangle, the edges of which are subdivided by the grid vertices that lie on the edge. If either \( m \) or \( n \) is two, the inner rectangle is degenerate, and one or both of the rectangle’s edges consist of a single point. This subdivision is illustrated in Figure Inner Quad Tessellation.

![Figure 14. Inner Quad Tessellation](image)

Caption

In the Inner Quad Tessellation diagram, inner quad tessellation levels of (a) (4,2) and (b) (7,4) are shown. The regions highlighted in red in figure (b) depict the 10 inner rectangles, each of which will be subdivided into two triangles. Solid black circles depict vertices on the boundary of the outer and inner rectangles, where the inner rectangle of figure (a) is degenerate (a single line segment). Dotted lines depict the horizontal and vertical edges connecting corresponding vertices on the inner and outer rectangle edges.

After the area corresponding to the inner rectangle is filled, the tessellator must produce triangles to cover the area between the inner and outer rectangles. To do this, the subdivision of the outer rectangle edge above is discarded. Instead, the \( u = 0 \), \( v = 0 \), \( u = 1 \), and \( v = 1 \) edges are subdivided according to the first, second, third, and fourth outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the inner rectangle is retained. The area between the outer and inner rectangles is completely filled by non-overlapping triangles. Two of the three vertices of each triangle are adjacent vertices on a subdivided edge of one rectangle; the third is one of the vertices on the corresponding edge of the other rectangle. If either edge of the innermost rectangle is degenerate, the area near the corresponding outer edges is filled by connecting each vertex on the outer edge with the single vertex making up the inner edge.

The algorithm used to subdivide the rectangular domain in \((u,v)\) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is
consistent across the domain as described in Tessellator Vertex Winding Order.

### 22.8. Isoline Tessellation

If the tessellation primitive mode is *Isolines*, a set of independent horizontal line segments is drawn. The segments are arranged into connected strips called *isolines*, where the vertices of each isoline have a constant v coordinate and u coordinates covering the full range \([0, 1]\). The number of isolines generated is derived from the first outer tessellation level; the number of segments in each isoline is derived from the second outer tessellation level. Both inner tessellation levels and the third and fourth outer tessellation levels have no effect in this mode.

As with quad tessellation above, isoline tessellation begins with a rectangle. The \(u = 0\) and \(u = 1\) edges of the rectangle are subdivided according to the first outer tessellation level. For the purposes of this subdivision, the tessellation spacing mode is ignored and treated as equal_spacing. An isoline is drawn connecting each vertex on the \(u = 0\) rectangle edge to the corresponding vertex on the \(u = 1\) rectangle edge, except that no line is drawn between \((0, 1)\) and \((1, 1)\). If the number of isolines on the subdivided \(u = 0\) and \(u = 1\) edges is \(n\), this process will result in \(n\) equally spaced lines with constant v coordinates of \(0, \frac{1}{n}, \frac{2}{n}, ..., \frac{n-1}{n}\).

Each of the \(n\) isolines is then subdivided according to the second outer tessellation level and the tessellation spacing, resulting in \(m\) line segments. Each segment of each line is emitted by the tessellator. These line segments are generated with a topology similar to line lists, except that the order in which each line is generated, and the order in which the vertices are generated for each line segment, are implementation-dependent.

### 22.9. Tessellation Point Mode

For all primitive modes, the tessellator is capable of generating points instead of lines or triangles. If the tessellation control or tessellation evaluation shader specifies the *OpExecutionMode PointMode*, the primitive generator will generate one point for each distinct vertex produced by tessellation, rather than emitting triangles or lines. Otherwise, the tessellator will produce a collection of line segments or triangles according to the primitive mode. These points are generated with a topology similar to point lists, except the order in which the points are generated for each input primitive is undefined.

### 22.10. Tessellation Pipeline State

The `pTessellationState` member of `VkGraphicsPipelineCreateInfo` is a pointer to a `VkPipelineTessellationStateCreateInfo` structure.

The `VkPipelineTessellationStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineTessellationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineTessellationStateCreateFlags flags;
} VkPipelineTessellationStateCreateInfo;
```

```c
uint32_t patchControlPoints;
}
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **patchControlPoints** is the number of control points per patch.

### Valid Usage

- VUID-VkPipelineTessellationStateCreateInfo-patchControlPoints-01214
  
  `patchControlPoints` must be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

### Valid Usage (Implicit)

- VUID-VkPipelineTessellationStateCreateInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO`

- VUID-VkPipelineTessellationStateCreateInfo-pNext-pNext
  
  `pNext` must be **NULL** or a pointer to a valid instance of `VkPipelineTessellationDomainOriginStateCreateInfo`

- VUID-VkPipelineTessellationStateCreateInfo-sType-unique
  
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkPipelineTessellationStateCreateInfo-flags-zerobitmask
  
  `flags` must be 0

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineTessellationStateCreateFlags;
```

`VkPipelineTessellationStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkPipelineTessellationDomainOriginStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPipelineTessellationDomainOriginStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkTessellationDomainOrigin domainOrigin;
} VkPipelineTessellationDomainOriginStateCreateInfo;
```

- **sType** is a *VkStructureType* value identifying this structure.
• \texttt{pNext} is NULL or a pointer to a structure extending this structure.

• \texttt{domainOrigin} is a \texttt{VkTessellationDomainOrigin} value controlling the origin of the tessellation domain space.

If the \texttt{VkPipelineTessellationDomainOriginStateCreateInfo} structure is included in the \texttt{pNext} chain of \texttt{VkPipelineTessellationStateCreateInfo}, it controls the origin of the tessellation domain. If this structure is not present, it is as if \texttt{domainOrigin} was \texttt{VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT}.

### Valid Usage (Implicit)

- \texttt{VUID-VkPipelineTessellationDomainOriginStateCreateInfo-sType-sType} \texttt{sType must be VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_DOMAIN_ORIGIN_STATE_CREATE_INFO}
- \texttt{VUID-VkPipelineTessellationDomainOriginStateCreateInfo-domainOrigin-parameter} \texttt{domainOrigin must be a valid \texttt{VkTessellationDomainOrigin} value}

The possible tessellation domain origins are specified by the \texttt{VkTessellationDomainOrigin} enumeration:

```c
// Provided by VK_VERSION_1_1
typedef enum VkTessellationDomainOrigin {
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT = 0,
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT = 1,
} VkTessellationDomainOrigin;
```

- \texttt{VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT} specifies that the origin of the domain space is in the upper left corner, as shown in figure Domain parameterization for tessellation primitive modes (upper-left origin).
- \texttt{VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT} specifies that the origin of the domain space is in the lower left corner, as shown in figure Domain parameterization for tessellation primitive modes (lower-left origin).

This enum affects how the \texttt{VertexOrderCw} and \texttt{VertexOrderCcw} tessellation execution modes are interpreted, since the winding is defined relative to the orientation of the domain.
Chapter 23. Geometry Shading

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive. Geometry shading is enabled when a geometry shader is included in the pipeline.

23.1. Geometry Shader Input Primitives

Each geometry shader invocation has access to all vertices in the primitive (and their associated data), which are presented to the shader as an array of inputs.

The input primitive type expected by the geometry shader is specified with an `OpExecutionMode` instruction in the geometry shader, and must match the incoming primitive type specified by either the pipeline's primitive topology if tessellation is inactive, or the tessellation mode if tessellation is active, as follows:

- An input primitive type of `InputPoints` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, or with a tessellation shader specifying `PointMode`. The input arrays always contain one element, as described by the point list topology or tessellation in point mode.

- An input primitive type of `InputLines` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, or with a tessellation shader specifying `IsoLines` that does not specify `PointMode`. The input arrays always contain two elements, as described by the line list topology or line strip topology, or by isoline tessellation.

- An input primitive type of `InputLinesAdjacency` must only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`. The input arrays always contain four elements, as described by the line list with adjacency topology or line strip with adjacency topology.

- An input primitive type of `Triangles` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`; or with a tessellation shader specifying `Quads` or `Triangles` that does not specify `PointMode`. The input arrays always contain three elements, as described by the triangle list topology, triangle strip topology, or triangle fan topology, or by triangle or quad tessellation. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order.

- An input primitive type of `InputTrianglesAdjacency` must only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`. The input arrays always contain six elements, as described by the triangle list with adjacency topology or triangle strip with adjacency topology. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order, and the vertices making up the main primitive must still occur at the first, third, and fifth index.
23.2. Geometry Shader Output Primitives

A geometry shader generates primitives in one of three output modes: points, line strips, or triangle strips. The primitive mode is specified in the shader using an OpExecutionMode instruction with the OutputPoints, OutputLineStrip or OutputTriangleStrip modes, respectively. Each geometry shader must include exactly one output primitive mode.

The vertices output by the geometry shader are assembled into points, lines, or triangles based on the output primitive type and the resulting primitives are then further processed as described in Rasterization. If the number of vertices emitted by the geometry shader is not sufficient to produce a single primitive, vertices corresponding to incomplete primitives are not processed by subsequent pipeline stages. The number of vertices output by the geometry shader is limited to a maximum count specified in the shader.

The maximum output vertex count is specified in the shader using an OpExecutionMode instruction with the mode set to OutputVertices and the maximum number of vertices that will be produced by the geometry shader specified as a literal. Each geometry shader must specify a maximum output vertex count.

23.3. Multiple Invocations of Geometry Shaders

Geometry shaders can be invoked more than one time for each input primitive. This is known as geometry shader instancing and is requested by including an OpExecutionMode instruction with mode specified as Invocations and the number of invocations specified as an integer literal.

In this mode, the geometry shader will execute at least \( n \) times for each input primitive, where \( n \) is the number of invocations specified in the OpExecutionMode instruction. The instance number is available to each invocation as a built-in input using InvocationId.

23.4. Geometry Shader Primitive Ordering

Limited guarantees are provided for the relative ordering of primitives produced by a geometry shader, as they pertain to primitive order.

- For instanced geometry shaders, the output primitives generated from each input primitive are passed to subsequent pipeline stages using the invocation number to order the primitives, from least to greatest.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.
Chapter 24. Fixed-Function Vertex Post-Processing

After pre-rasterization shader stages, the following fixed-function operations are applied to vertices of the resulting primitives:

- Flat shading (see Flat Shading).
- Primitive clipping, including client-defined half-spaces (see Primitive Clipping).
- Shader output attribute clipping (see Clipping Shader Outputs).
- Perspective division on clip coordinates (see Coordinate Transformations).
- Viewport mapping, including depth range scaling (see Controlling the Viewport).
- Front face determination for polygon primitives (see Basic Polygon Rasterization).

Next, rasterization is performed on primitives as described in chapter Rasterization.

24.1. Flat Shading

Flat shading a vertex output attribute means to assign all vertices of the primitive the same value for that output. The output values assigned are those of the provoking vertex of the primitive. Flat shading is applied to those vertex attributes that match fragment input attributes which are decorated as Flat.

If neither geometry nor tessellation shading is active, the provoking vertex is determined by the primitive topology defined by VkPipelineInputAssemblyStateCreateInfo:topology used to execute the drawing command.

If geometry shading is active, the provoking vertex is determined by the primitive topology defined by the OutputPoints, OutputLineStrip, or OutputTriangleStrip execution mode.

If tessellation shading is active but geometry shading is not, the provoking vertex may be any of the vertices in each primitive.

24.2. Primitive Clipping

Primitives are culled against the cull volume and then clipped to the clip volume. In clip coordinates, the view volume is defined by:

\[-w_c \leq x_c \leq w_c \\
-w_c \leq y_c \leq w_c \\
z_m \leq z_c \leq w_c\]

where \(z_m\) is equal to zero.

This view volume can be further restricted by as many as VkPhysicalDeviceLimits::maxClipDistances client-defined half-spaces.

1061
The cull volume is the intersection of up to \( \text{VkPhysicalDeviceLimits::maxCullDistances} \) client-defined half-spaces (if no client-defined cull half-spaces are enabled, culling against the cull volume is skipped).

A shader **must** write a single cull distance for each enabled cull half-space to elements of the \text{CullDistance} array. If the cull distance for any enabled cull half-space is negative for all of the vertices of the primitive under consideration, the primitive is discarded. Otherwise the primitive is clipped against the clip volume as defined below.

The clip volume is the intersection of up to \( \text{VkPhysicalDeviceLimits::maxClipDistances} \) client-defined half-spaces with the view volume (if no client-defined clip half-spaces are enabled, the clip volume is the view volume).

A shader **must** write a single clip distance for each enabled clip half-space to elements of the \text{ClipDistance} array. Clip half-space \( i \) is then given by the set of points satisfying the inequality

\[
c_i(P) \geq 0
\]

where \( c_i(P) \) is the clip distance \( i \) at point \( P \). For point primitives, \( c(P) \) is simply the clip distance for the vertex in question. For line and triangle primitives, per-vertex clip distances are interpolated using a weighted mean, with weights derived according to the algorithms described in sections \text{Basic Line Segment Rasterization} and \text{Basic Polygon Rasterization}, using the perspective interpolation equations.

The number of client-defined clip and cull half-spaces that are enabled is determined by the explicit size of the built-in arrays \text{ClipDistance} and \text{CullDistance}, respectively, declared as an output in the interface of the entry point of the final shader stage before clipping.

If \text{VkPipelineRasterizationDepthClipStateCreateInfoEXT} is present in the graphics pipeline state then depth clipping is disabled if \text{VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable} is \text{VK_FALSE}. Otherwise, if \text{VkPipelineRasterizationDepthClipStateCreateInfoEXT} is not present, depth clipping is disabled when \text{VkPipelineRasterizationStateCreateInfo::depthClampEnable} is \text{VK_TRUE}.

When depth clipping is disabled, the plane equation

\[
z_m \leq z_c \leq w_c
\]

(see the clip volume definition above) is ignored by view volume clipping (effectively, there is no near or far plane clipping).

If the primitive under consideration is a point or line segment, then clipping passes it unchanged if its vertices lie entirely within the clip volume.

Possible values of \text{VkPhysicalDevicePointClippingProperties::pointClippingBehavior}, specifying clipping behavior of a point primitive whose vertex lies outside the clip volume, are:

```
// Provided by VK_VERSION_1_1
```

1062
typedef enum VkPointClippingBehavior {
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES = 0,
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY = 1,
} VkPointClippingBehavior;

- **VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES** specifies that the primitive is discarded if the vertex lies outside any clip plane, including the planes bounding the view volume.
- **VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY** specifies that the primitive is discarded only if the vertex lies outside any user clip plane.

If either of a line segment’s vertices lie outside of the clip volume, the line segment may be clamped, with new vertex coordinates computed for each vertex that lies outside the clip volume. A clipped line segment endpoint lies on both the original line segment and the boundary of the clip volume.

This clipping produces a value, \(0 \leq t \leq 1\), for each clipped vertex. If the coordinates of a clipped vertex are \(P\) and the unclipped line segment’s vertex coordinates are \(P_1\) and \(P_2\), then \(t\) satisfies the following equation

\[
P = tP_1 + (1-t)P_2.
\]

\(t\) is used to clip vertex output attributes as described in **Clipping Shader Outputs**.

If the primitive is a polygon, it passes unchanged if every one of its edges lies entirely inside the clip volume, and is either clipped or discarded otherwise. If the edges of the polygon intersect the boundary of the clip volume, the intersecting edges are reconnected by new edges that lie along the boundary of the clip volume - in some cases requiring the introduction of new vertices into a polygon.

If a polygon intersects an edge of the clip volume’s boundary, the clipped polygon must include a point on this boundary edge.

Primitives rendered with user-defined half-spaces must satisfy a complementarity criterion. Suppose a series of primitives is drawn where each vertex i has a single specified clip distance \(d_i\) (or a number of similarly specified clip distances, if multiple half-spaces are enabled). Next, suppose that the same series of primitives are drawn again with each such clip distance replaced by \(-d_i\) (and the graphics pipeline is otherwise the same). In this case, primitives must not be missing any pixels, and pixels must not be drawn twice in regions where those primitives are cut by the clip planes.

### 24.3. Clipping Shader Outputs

Next, vertex output attributes are clipped. The output values associated with a vertex that lies within the clip volume are unaffected by clipping. If a primitive is clipped, however, the output values assigned to vertices produced by clipping are clipped.

Let the output values assigned to the two vertices \(P_1\) and \(P_2\) of an unclipped edge be \(c_1\) and \(c_2\). The value of \(t\) (see **Primitive Clipping**) for a clipped point \(P\) is used to obtain the output value associated with \(P\) as
\[ \mathbf{c} = t \, \mathbf{c}_1 + (1-t) \, \mathbf{c}_2. \]

(Multiplying an output value by a scalar means multiplying each of \(x, y, z,\) and \(w\) by the scalar.)

Since this computation is performed in clip space before division by \(w_c\), clipped output values are perspective-correct.

Polygon clipping creates a clipped vertex along an edge of the clip volume’s boundary. This situation is handled by noting that polygon clipping proceeds by clipping against one half-space at a time. Output value clipping is done in the same way, so that clipped points always occur at the intersection of polygon edges (possibly already clipped) with the clip volume’s boundary.

For vertex output attributes whose matching fragment input attributes are decorated with \texttt{NoPerspective}, the value of \(t\) used to obtain the output value associated with \(P\) will be adjusted to produce results that vary linearly in framebuffer space.

Output attributes of integer or unsigned integer type \texttt{must} always be flat shaded. Flat shaded attributes are constant over the primitive being rasterized (see \texttt{Basic Line Segment Rasterization} and \texttt{Basic Polygon Rasterization}), and no interpolation is performed. The output value \(\mathbf{c}\) is taken from either \(\mathbf{c}_1\) or \(\mathbf{c}_2\), since flat shading has already occurred and the two values are identical.

### 24.4. Coordinate Transformations

Clip coordinates for a vertex result from shader execution, which yields a vertex coordinate \texttt{Position}.

Perspective division on clip coordinates yields \texttt{normalized device coordinates}, followed by a \texttt{viewport} transformation (see \texttt{Controlling the Viewport}) to convert these coordinates into \texttt{framebuffer coordinates}.

If a vertex in clip coordinates has a position given by

\[
\begin{pmatrix}
x_c \\
y_c \\
z_c \\
w_c
\end{pmatrix}
\]

then the vertex’s normalized device coordinates are

\[
\begin{pmatrix}
x_d \\
y_d \\
z_d
\end{pmatrix} = \begin{pmatrix}
x_c \\
y_c \\
z_c \\
w_c
\end{pmatrix}
\]
24.5. Controlling the Viewport

The viewport transformation is determined by the selected viewport's width and height in pixels, \( p_x \) and \( p_y \), respectively, and its center \( (o_x, o_y) \) (also in pixels), as well as its depth range min and max determining a depth range scale value \( p_z \) and a depth range bias value \( o_z \) (defined below). The vertex's framebuffer coordinates \( (x_f, y_f, z_f) \) are given by

\[
\begin{align*}
    x_f &= (p_x / 2) x_d + o_x \\
    y_f &= (p_y / 2) y_d + o_y \\
    z_f &= p_z \times z_d + o_z
\end{align*}
\]

Multiple viewports are available, numbered zero up to \( \text{VkPhysicalDeviceLimits::maxViewports} \) minus one. The number of viewports used by a pipeline is controlled by the \text{viewportCount} member of the \text{VkPipelineViewportStateCreateInfo} structure used in pipeline creation.

\( x_f \) and \( y_f \) have limited precision, where the number of fractional bits retained is specified by \( \text{VkPhysicalDeviceLimits::subPixelPrecisionBits} \). When rasterizing line segments, the number of fractional bits is specified by \( \text{VkPhysicalDeviceLineRasterizationPropertiesEXT::lineSubPixelPrecisionBits} \).

The \text{VkPipelineViewportStateCreateInfo} structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineViewportStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportStateCreateFlags flags;
    uint32_t viewportCount;
    const VkViewport* pViewports;
    uint32_t scissorCount;
    const VkRect2D* pScissors;
} VkPipelineViewportStateCreateInfo;
```

- \text{sType} is a \text{VkStructureType} value identifying this structure.
- \text{pNext} is NULL or a pointer to a structure extending this structure.
- \text{flags} is reserved for future use.
- \text{viewportCount} is the number of viewports used by the pipeline.
- \text{pViewports} is a pointer to an array of \text{VkViewport} structures, defining the viewport transforms. If the viewport state is dynamic, this member is ignored.
- \text{scissorCount} is the number of \text{scissors} and must match the number of viewports.
- \text{pScissors} is a pointer to an array of \text{VkRect2D} structures defining the rectangular bounds of the
scissor for the corresponding viewport. If the scissor state is dynamic, this member is ignored.

Valid Usage

- VUID-VkPipelineViewportStateCreateInfo-viewportCount-01216
  If the multiViewport feature is not enabled, viewportCount must not be greater than 1

- VUID-VkPipelineViewportStateCreateInfo-scissorCount-01217
  If the multiViewport feature is not enabled, scissorCount must not be greater than 1

- VUID-VkPipelineViewportStateCreateInfo-viewportCount-01218
  viewportCount must be less than or equal to VkPhysicalDeviceLimits::maxViewports

- VUID-VkPipelineViewportStateCreateInfo-scissorCount-01219
  scissorCount must be less than or equal to VkPhysicalDeviceLimits::maxViewports

- VUID-VkPipelineViewportStateCreateInfo-x-02821
  The x and y members of offset member of any element of pScissors must be greater than or equal to 0

- VUID-VkPipelineViewportStateCreateInfo-offset-02822
  Evaluation of (offset.x + extent.width) must not cause a signed integer addition overflow for any element of pScissors

- VUID-VkPipelineViewportStateCreateInfo-offset-02823
  Evaluation of (offset.y + extent.height) must not cause a signed integer addition overflow for any element of pScissors

- VUID-VkPipelineViewportStateCreateInfo-scissorCount-04134
  If scissorCount and viewportCount are both not dynamic, then scissorCount and viewportCount must be identical

- VUID-VkPipelineViewportStateCreateInfo-viewportCount-04135
  If the graphics pipeline is being created with VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT set then viewportCount must be 0, otherwise viewportCount must be greater than 0

- VUID-VkPipelineViewportStateCreateInfo-scissorCount-04136
  If the graphics pipeline is being created with VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT set then scissorCount must be 0, otherwise scissorCount must be greater than 0

Valid Usage (Implicit)

- VUID-VkPipelineViewportStateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO

- VUID-VkPipelineViewportStateCreateInfo-pNext-pNext
  pNext must be NULL

- VUID-VkPipelineViewportStateCreateInfo-flags-zerobitmask
  flags must be 0

To dynamically set the viewport count and viewports, call:
```c
void vkCmdSetViewportWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t viewportCount,
    const VkViewport* pViewports);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `viewportCount` specifies the viewport count.
- `pViewports` specifies the viewports to use for drawing.

This command sets the viewport count and viewports state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::viewportCount` and `pViewports` values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetViewportWithCount-None-08971
  At least one of the following **must** be true:
  - the `extendedDynamicState` feature is enabled

- VUID-vkCmdSetViewportWithCount-viewportCount-03394
  `viewportCount` **must** be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- VUID-vkCmdSetViewportWithCount-viewportCount-03395
  If the `multiViewport` feature is not enabled, `viewportCount` **must** be 1

### Valid Usage (Implicit)

- VUID-vkCmdSetViewportWithCount-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetViewportWithCount-pViewports-parameter
  `pViewports` **must** be a valid pointer to an array of `viewportCount` valid `VkViewport` structures

- VUID-vkCmdSetViewportWithCount-commandBuffer-recording
  `commandBuffer` **must** be in the `recording state`

- VUID-vkCmdSetViewportWithCount-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetViewportWithCount-viewportCount-arraylength
  `viewportCount` **must** be greater than 0
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To **dynamically set** the scissor count and scissor rectangular bounds, call:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetScissorWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `scissorCount` specifies the scissor count.
- `pScissors` specifies the scissors to use for drawing.

This command sets the scissor count and scissor rectangular bounds state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::scissorCount` and `pScissors` values used to create the currently active pipeline.

Valid Usage

- **VUID-vkCmdSetScissorWithCount-None-08971**
  At least one of the following must be true:
  - the `extendedDynamicState` feature is enabled

- **VUID-vkCmdSetScissorWithCount-scissorCount-03397**
  `scissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- **VUID-vkCmdSetScissorWithCount-scissorCount-03398**
  If the `multiViewport` feature is not enabled, `scissorCount` must be 1

- **VUID-vkCmdSetScissorWithCount-x-03399**
The $x$ and $y$ members of offset member of any element of $pScissors$ must be greater than or equal to 0

- VUID-vkCmdSetScissorWithCount-offset-03400 Evaluation of $(offset.x + extent.width)$ must not cause a signed integer addition overflow for any element of $pScissors$

- VUID-vkCmdSetScissorWithCount-offset-03401 Evaluation of $(offset.y + extent.height)$ must not cause a signed integer addition overflow for any element of $pScissors$

**Valid Usage (Implicit)**

- VUID-vkCmdSetScissorWithCount-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetScissorWithCount-pScissors-parameter $pScissors$ must be a valid pointer to an array of $scissorCount$ VkRect2D structures

- VUID-vkCmdSetScissorWithCount-commandBuffer-recording commandBuffer must be in the recording state

- VUID-vkCmdSetScissorWithCount-VkCommandPool-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetScissorWithCount-scissorCount-arraylength $scissorCount$ must be greater than 0

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>

</tbody>
</table>

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineViewportStateCreateFlags;
VkPipelineViewportStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

A pre-rasterization shader stage can direct each primitive to one of several viewports. The destination viewport for a primitive is selected by the last active pre-rasterization shader stage that has an output variable decorated with ViewportIndex. The viewport transform uses the viewport corresponding to the value assigned to ViewportIndex, and taken from an implementation-dependent vertex of each primitive. If ViewportIndex is outside the range zero to viewportCount minus one for a primitive, or if the last active pre-rasterization shader stage did not assign a value to ViewportIndex for all vertices of a primitive due to flow control, the values resulting from the viewport transformation of the vertices of such primitives are undefined. If the last pre-rasterization shader stage does not have an output decorated with ViewportIndex, the viewport numbered zero is used by the viewport transformation.

A single vertex can be used in more than one individual primitive, in primitives such as VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP. In this case, the viewport transformation is applied separately for each primitive.

To dynamically set the viewport transformation parameters, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetViewport(
    VkCommandBuffer commandBuffer,  // Provided by VK_VERSION_1_0
    uint32_t firstViewport,         // Provided by VK_VERSION_1_0
    uint32_t viewportCount,         // Provided by VK_VERSION_1_0
    const VkViewport* pViewports);  // Provided by VK_VERSION_1_0
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstViewport` is the index of the first viewport whose parameters are updated by the command.
- `viewportCount` is the number of viewports whose parameters are updated by the command.
- `pViewports` is a pointer to an array of `VkViewport` structures specifying viewport parameters.

This command sets the viewport transformation parameters state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportStateCreateInfo::pViewports` values used to create the currently active pipeline.

The viewport parameters taken from element `i` of `pViewports` replace the current state for the viewport index `firstViewport + i`, for `i` in `[0, viewportCount)).

### Valid Usage

- **VUID-vkCmdSetViewport-firstViewport-01223**
  The sum of `firstViewport` and `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive.

- **VUID-vkCmdSetViewport-firstViewport-01224**
If the `multiViewport` feature is not enabled, `firstViewport` must be 0

- VUID-vkCmdSetViewport-viewportCount-01225
  If the `multiViewport` feature is not enabled, `viewportCount` must be 1

### Valid Usage (Implicit)

- VUID-vkCmdSetViewport-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetViewport-pViewports-parameter
  `pViewports` must be a valid pointer to an array of `viewportCount` valid `VkViewport` structures

- VUID-vkCmdSetViewport-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetViewport-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetViewport-viewportCount-arraylength
  `viewportCount` must be greater than 0

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Both `VkPipelineViewportStateCreateInfo` and `vkCmdSetViewport` use `VkViewport` to set the viewport transformation parameters.

The `VkViewport` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkViewport {
    float x;
    float y;
};
```
float width;
float height;
float minDepth;
float maxDepth;
} VkViewport;

• x and y are the viewport's upper left corner (x,y).
• width and height are the viewport's width and height, respectively.
• minDepth and maxDepth are the depth range for the viewport.

Note
Despite their names, minDepth can be less than, equal to, or greater than maxDepth.

The framebuffer depth coordinate \( z_f \) may be represented using either a fixed-point or floating-point representation. However, a floating-point representation must be used if the depth/stencil attachment has a floating-point depth component. If an m-bit fixed-point representation is used, we assume that it represents each value \( \frac{k}{2^m-1} \), where \( k \in \{0, 1, \ldots, 2^m-1\} \), as \( k \) (e.g. 1.0 is represented in binary as a string of all ones).

The viewport parameters shown in the above equations are found from these values as

\[
o_x = x + \frac{\text{width}}{2}
\]
\[
o_y = y + \frac{\text{height}}{2}
\]
\[
o_z = \text{minDepth}
\]
\[
p_x = \text{width}
\]
\[
p_y = \text{height}
\]
\[
p_z = \text{maxDepth} - \text{minDepth}
\]

The application can specify a negative term for height, which has the effect of negating the y coordinate in clip space before performing the transform. When using a negative height, the application should also adjust the y value to point to the lower left corner of the viewport instead of the upper left corner. Using the negative height allows the application to avoid having to negate the y component of the Position output from the last pre-rasterization shader stage.

The width and height of the implementation-dependent maximum viewport dimensions must be greater than or equal to the width and height of the largest image which can be created and
attached to a framebuffer.

The floating-point viewport bounds are represented with an implementation-dependent precision.

Valid Usage

- **VUID-VkViewport-width-01770**
  
  width must be greater than 0.0

- **VUID-VkViewport-width-01771**
  
  width must be less than or equal to VkPhysicalDeviceLimits::maxViewportDimensions[0]

- **VUID-VkViewport-height-01773**
  
  The absolute value of height must be less than or equal to VkPhysicalDeviceLimits::maxViewportDimensions[1]

- **VUID-VkViewport-x-01774**
  
  x must be greater than or equal to viewportBoundsRange[0]

- **VUID-VkViewport-x-01232**
  
  (x + width) must be less than or equal to viewportBoundsRange[1]

- **VUID-VkViewport-y-01775**
  
  y must be greater than or equal to viewportBoundsRange[0]

- **VUID-VkViewport-y-01776**
  
  y must be less than or equal to viewportBoundsRange[1]

- **VUID-VkViewport-y-01777**
  
  (y + height) must be greater than or equal to viewportBoundsRange[0]

- **VUID-VkViewport-y-01233**
  
  (y + height) must be less than or equal to viewportBoundsRange[1]

- **VUID-VkViewport-minDepth-01234**
  
  If the VK_EXT_depth_range_unrestricted extension is not enabled, minDepth must be between 0.0 and 1.0, inclusive

- **VUID-VkViewport-maxDepth-01235**
  
  If the VK_EXT_depth_range_unrestricted extension is not enabled, maxDepth must be between 0.0 and 1.0, inclusive
Chapter 25. Rasterization

Rasterization is the process by which a primitive is converted to a two-dimensional image. Each discrete location of this image contains associated data such as depth, color, or other attributes.

Rasterizing a primitive begins by determining which squares of an integer grid in framebuffer coordinates are occupied by the primitive, and assigning one or more depth values to each such square. This process is described below for points, lines, and polygons.

A grid square, including its (x,y) framebuffer coordinates, z (depth), and associated data added by fragment shaders, is called a fragment. A fragment is located by its upper left corner, which lies on integer grid coordinates.

Rasterization operations also refer to a fragment’s sample locations, which are offset by fractional values from its upper left corner. The rasterization rules for points, lines, and triangles involve testing whether each sample location is inside the primitive. Fragments need not actually be square, and rasterization rules are not affected by the aspect ratio of fragments. Display of non-square grids, however, will cause rasterized points and line segments to appear fatter in one direction than the other.

We assume that fragments are square, since it simplifies antialiasing and texturing. After rasterization, fragments are processed by fragment operations.

Several factors affect rasterization, including the members of VkPipelineRasterizationStateCreateInfo and VkPipelineMultisampleStateCreateInfo.

The VkPipelineRasterizationStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineRasterizationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateCreateFlags flags;
    VkBool32 depthClampEnable;
    VkBool32 rasterizerDiscardEnable;
    VkPolygonMode polygonMode;
    VkCullModeFlags cullMode;
    VkFrontFace frontFace;
    float depthBiasEnable;
    float depthBiasConstantFactor;
    float depthBiasClamp;
    float depthBiasSlopeFactor;
    float lineWidth;
} VkPipelineRasterizationStateCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
• **depthClampEnable** controls whether to clamp the fragment’s depth values as described in *Depth Test*. If the pipeline is not created with the `VkPipelineRasterizationDepthClipStateCreateInfoEXT` present then enabling depth clamp will also disable clipping primitives to the z planes of the frustrum as described in *Primitive Clipping*. Otherwise depth clipping is controlled by the state set in `VkPipelineRasterizationDepthClipStateCreateInfoEXT`.

• **rasterizerDiscardEnable** controls whether primitives are discarded immediately before the rasterization stage.

• **polygonMode** is the triangle rendering mode. See `VkPolygonMode`.

• **cullMode** is the triangle facing direction used for primitive culling. See `VkCullModeFlagBits`.

• **frontFace** is a `VkFrontFace` value specifying the front-facing triangle orientation to be used for culling.

• **depthBiasEnable** controls whether to bias fragment depth values.

• **depthBiasConstantFactor** is a scalar factor controlling the constant depth value added to each fragment.

• **depthBiasClamp** is the maximum (or minimum) depth bias of a fragment.

• **depthBiasSlopeFactor** is a scalar factor applied to a fragment’s slope in depth bias calculations.

• **lineWidth** is the width of rasterized line segments.

---

**Valid Usage**

- VUID-VkPipelineRasterizationStateCreateInfo-depthClampEnable-00782
  If the depthClamp feature is not enabled, `depthClampEnable` must be `VK_FALSE`

- VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01507
  If the fillModeNonSolid feature is not enabled, `polygonMode` must be `VK_POLYGON_MODE_FILL`

---

**Valid Usage (Implicit)**

- VUID-VkPipelineRasterizationStateCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO`

- VUID-VkPipelineRasterizationStateCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineRasterizationConservativeStateCreateInfoEXT`, `VkPipelineRasterizationDepthClipStateCreateInfoEXT`, or `VkPipelineRasterizationLineStateCreateInfoEXT`

- VUID-VkPipelineRasterizationStateCreateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkPipelineRasterizationStateCreateInfo-flags-zerobitmask
  `flags` must be 0

- VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-parameter
  `polygonMode` must be a valid `VkPolygonMode` value
The `VkPipelineRasterizationDepthClipStateCreateInfoEXT` structure is defined as:

```cpp
// Provided by VK_EXT_depth_clip_enable
typedef struct VkPipelineRasterizationDepthClipStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationDepthClipStateCreateFlagsEXT flags;
    VkBool32 depthClipEnable;
} VkPipelineRasterizationDepthClipStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `depthClipEnable` controls whether depth clipping is enabled as described in `Primitive Clipping`.

### Valid Usage (Implicit)

- `VkPipelineRasterizationDepthClipStateCreateInfoEXT-sType-sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_DEPTH_CLIP_STATE_CREATE_INFO_EXT`
- `VkPipelineRasterizationDepthClipStateCreateInfoEXT-flags-zerobitmask` flags must be `0`

VkPipelineRasterizationDepthClipStateCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

If the `pNext` chain of `VkPipelineRasterizationStateCreateInfo` includes a `VkPipelineRasterizationDepthClipStateCreateInfoEXT` structure, then that structure controls whether depth clipping is enabled or disabled.
currently reserved for future use.

The `VkPipelineMultisampleStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineMultisampleStateCreateInfo {
    VkStructureType             sType;
    const void*                 pNext;
    VkPipelineMultisampleStateCreateFlags flags;
    VkSampleCountFlagBits       rasterizationSamples;
    VkBool32                    sampleShadingEnable;
    float                       minSampleShading;
    const VkSampleMask*         pSampleMask;
    VkBool32                    alphaToCoverageEnable;
    VkBool32                    alphaToOneEnable;
} VkPipelineMultisampleStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `rasterizationSamples` is a `VkSampleCountFlagBits` value specifying the number of samples used in rasterization.
- `sampleShadingEnable` can be used to enable Sample Shading.
- `minSampleShading` specifies a minimum fraction of sample shading if `sampleShadingEnable` is set to `VK_TRUE`.
- `pSampleMask` is a pointer to an array of `VkSampleMask` values used in the sample mask test.
- `alphaToCoverageEnable` controls whether a temporary coverage value is generated based on the alpha component of the fragment’s first color output as specified in the Multisample Coverage section.
- `alphaToOneEnable` controls whether the alpha component of the fragment’s first color output is replaced with one as described in Multisample Coverage.

Each bit in the sample mask is associated with a unique sample index as defined for the coverage mask. Each bit b for mask word w in the sample mask corresponds to sample index i, where i = 32 × w + b. `pSampleMask` has a length equal to \( \lceil \frac{\text{rasterizationSamples}}{32} \rceil \) words.

If `pSampleMask` is `NULL`, it is treated as if the mask has all bits set to 1.

### Valid Usage

- **VUID-VkPipelineMultisampleStateCreateInfo-sampleShadingEnable-00784**
  If the `sampleRateShading` feature is not enabled, `sampleShadingEnable` must be `VK_FALSE`

- **VUID-VkPipelineMultisampleStateCreateInfo-alphaToOneEnable-00785**
  If the `alphaToOne` feature is not enabled, `alphaToOneEnable` must be `VK_FALSE`
• VUID-VkPipelineMultisampleStateCreateInfo-minSampleShading-00786
  minSampleShading must be in the range [0,1]

Valid Usage (Implicit)

• VUID-VkPipelineMultisampleStateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO

• VUID-VkPipelineMultisampleStateCreateInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of
  VkPipelineSampleLocationsStateCreateInfoEXT

• VUID-VkPipelineMultisampleStateCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkPipelineMultisampleStateCreateInfo-flags-zerobitmask
  flags must be 0

• VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-parameter
  rasterizationSamples must be a valid VkSampleCountFlagBits value

• VUID-VkPipelineMultisampleStateCreateInfo-pSampleMask-parameter
  If pSampleMask is not NULL, pSampleMask must be a valid pointer to an array of
  VkSampleMask values

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineMultisampleStateCreateFlags;

VkPipelineMultisampleStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The elements of the sample mask array are of type VkSampleMask, each representing 32 bits of coverage information:

// Provided by VK_VERSION_1_0
typedef uint32_t VkSampleMask;

Rasterization only generates fragments which cover one or more pixels inside the framebuffer. Pixels outside the framebuffer are never considered covered in the fragment. Fragments which would be produced by application of any of the primitive rasterization rules described below but which lie outside the framebuffer are not produced, nor are they processed by any later stage of the pipeline, including any of the fragment operations.

Surviving fragments are processed by fragment shaders. Fragment shaders determine associated data for fragments, and can also modify or replace their assigned depth values.
25.1. Discarding Primitives Before Rasterization

Primitives are discarded before rasterization if the `rasterizerDiscardEnable` member of `VkPipelineRasterizationStateCreateInfo` is enabled. When enabled, primitives are discarded after they are processed by the last active shader stage in the pipeline before rasterization.

To **dynamically enable** whether primitives are discarded before the rasterization stage, call:

```c
void vkCmdSetRasterizerDiscardEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 rasterizerDiscardEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizerDiscardEnable` controls whether primitives are discarded immediately before the rasterization stage.

This command sets the discard enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::rasterizerDiscardEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetRasterizerDiscardEnable-None-08970
  - At least one of the following **must** be true:
    - the `extendedDynamicState2` feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-parameter
  - `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-recording
  - `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-cmdpool
  - The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally
25.2. Rasterization Order

Within a subpass of a render pass instance, for a given (x,y,layer,sample) sample location, the following operations are guaranteed to execute in rasterization order, for each separate primitive that includes that sample location:

1. Fragment operations, in the order defined
2. Blending, logic operations, and color writes

Execution of these operations for each primitive in a subpass occurs in primitive order.

25.3. Multisampling

Multisampling is a mechanism to antialias all Vulkan primitives: points, lines, and polygons. The technique is to sample all primitives multiple times at each pixel. Each sample in each framebuffer attachment has storage for a color, depth, and/or stencil value, such that per-fragment operations apply to each sample independently. The color sample values can be later resolved to a single color (see Resolving Multisample Images and the Render Pass chapter for more details on how to resolve multisample images to non-multisample images).

Vulkan defines rasterization rules for single-sample modes in a way that is equivalent to a multisample mode with a single sample in the center of each fragment.

Each fragment includes a coverage mask with a single bit for each sample in the fragment, and a number of depth values and associated data for each sample.

It is understood that each pixel has rasterizationSamples locations associated with it. These locations are exact positions, rather than regions or areas, and each is referred to as a sample point. The sample points associated with a pixel must be located inside or on the boundary of the unit square that is considered to bound the pixel. Furthermore, the relative locations of sample points may be identical for each pixel in the framebuffer, or they may differ.

If the current pipeline includes a fragment shader with one or more variables in its interface decorated with Sample and Input, the data associated with those variables will be assigned independently for each sample. The values for each sample must be evaluated at the location of the sample. The data associated with any other variables not decorated with Sample and Input need not
be evaluated independently for each sample.

A coverage mask is generated for each fragment, based on which samples within that fragment are determined to be within the area of the primitive that generated the fragment.

Single pixel fragments have one set of samples. Multi-pixel fragments defined by setting the fragment shading rate have one set of samples per pixel. Each set of samples has a number of samples determined by `VkPipelineMultisampleStateCreateInfo::rasterizationSamples`. Each sample in a set is assigned a unique sample index $i$ in the range $[0, \text{rasterizationSamples})$.

Each sample in a fragment is also assigned a unique coverage index $j$ in the range $[0, n \times \text{rasterizationSamples})$, where $n$ is the number of sets in the fragment. If the fragment contains a single set of samples, the coverage index is always equal to the sample index.

If the fragment shading rate is set, the coverage index $j$ is determined as a function of the pixel index $p$, the sample index $i$, and the number of rasterization samples $r$ as:

$$j = i + r \times ((f_w \times f_h) - 1 - p)$$

where the pixel index $p$ is determined as a function of the pixel’s framebuffer location $(x, y)$ and the fragment size $(f_w, f_h)$:

$$p_x = x \mod f_w$$

$$p_y = y \mod f_h$$

$$p = p_x + (p_y \times f_w)$$

The table below illustrates the pixel index for multi-pixel fragments:

*Table 30. Pixel indices - 1 wide*
Table 31. Pixel indices - 2 wide

Table 32. Pixel indices - 4 wide

The coverage mask includes B bits packed into W words, defined as:

\[ B = n \times \text{rasterizationSamples} \]
\[ W = \lceil B/32 \rceil \]

Bit \( b \) in coverage mask word \( w \) is 1 if the sample with coverage index \( j = 32 \times w + b \) is covered, and 0 otherwise.

If the \texttt{standardSampleLocations} member of \texttt{VkPhysicalDeviceLimits} is \texttt{VK_TRUE}, then the sample counts \texttt{VK_SAMPLE_COUNT_1_BIT}, \texttt{VK_SAMPLE_COUNT_2_BIT}, \texttt{VK_SAMPLE_COUNT_4_BIT}, \texttt{VK_SAMPLE_COUNT_8_BIT}, and \texttt{VK_SAMPLE_COUNT_16_BIT} have sample locations as listed in the following table, with the \( i \)th entry in the table corresponding to sample index \( i \). \texttt{VK_SAMPLE_COUNT_32_BIT} and \texttt{VK_SAMPLE_COUNT_64_BIT} do not have standard sample locations. Locations are defined relative to an origin in the upper left corner of the fragment.

<td><img src="image5.png" alt="Diagram" /></td>
</tr>
</tbody>
</table>
25.4. Custom Sample Locations

Applications can also control the sample locations used for rasterization.

If the pNext chain of the VkPipelineMultisampleStateCreateInfo structure specified at pipeline creation time includes a VkPipelineSampleLocationsStateCreateInfoEXT structure, then that structure controls the sample locations used when rasterizing primitives with the pipeline.

The VkPipelineSampleLocationsStateCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkPipelineSampleLocationsStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 sampleLocationsEnable;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkPipelineSampleLocationsStateCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- sampleLocationsEnable controls whether custom sample locations are used. If sampleLocationsEnable is VK_FALSE, the default sample locations are used and the values specified in sampleLocationsInfo are ignored.
- sampleLocationsInfo is the sample locations to use during rasterization if sampleLocationsEnable is VK_TRUE and the graphics pipeline is not created with VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT.

Valid Usage (Implicit)

- VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_SAMPLE_LOCATIONS_STATE_CREATE_INFO_EXT
- VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sampleLocationsInfo-parameter
  sampleLocationsInfo must be a valid VkSampleLocationsInfoEXT structure

The VkSampleLocationsInfoEXT structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationsInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSampleCountFlagBits sampleLocationsPerPixel;
    VkExtent2D sampleLocationGridSize;
    uint32_t sampleLocationsCount;
    const VkSampleLocationEXT* pSampleLocations;
} VkSampleLocationsInfoEXT;
```
• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **sampleLocationsPerPixel** is a `VkSampleCountFlagBits` value specifying the number of sample locations per pixel.
• **sampleLocationGridSize** is the size of the sample location grid to select custom sample locations for.
• **sampleLocationsCount** is the number of sample locations in **pSampleLocations**.
• **pSampleLocations** is a pointer to an array of **sampleLocationsCount** `VkSampleLocationEXT` structures.

This structure can be used either to specify the sample locations to be used for rendering or to specify the set of sample locations an image subresource has been last rendered with for the purposes of layout transitions of depth/stencil images created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT`.

The sample locations in **pSampleLocations** specify **sampleLocationsPerPixel** number of sample locations for each pixel in the grid of the size specified in **sampleLocationGridSize**. The sample location for sample i at the pixel grid location (x,y) is taken from `pSampleLocations[(x + y × sampleLocationGridSize.width) × sampleLocationsPerPixel + i]`.

---

### Valid Usage

- VUID-VkSampleLocationsInfoEXT-sampleLocationsPerPixel-01526: **sampleLocationsPerPixel** must be a bit value that is set in `VkPhysicalDeviceSampleLocationsPropertiesEXT::sampleLocationSampleCounts`
- VUID-VkSampleLocationsInfoEXT-sampleLocationsCount-01527: **sampleLocationsCount** must equal **sampleLocationsPerPixel** × **sampleLocationGridSize.width** × **sampleLocationGridSize.height**

### Valid Usage (Implicit)

- VUID-VkSampleLocationsInfoEXT-sType-sType: **sType** must be `VK_STRUCTURE_TYPE_SAMPLE_LOCATIONS_INFO_EXT`
- VUID-VkSampleLocationsInfoEXT-pSampleLocations-parameter: If **sampleLocationsCount** is not 0, **pSampleLocations** must be a valid pointer to an array of **sampleLocationsCount** `VkSampleLocationEXT` structures

The `VkSampleLocationEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationEXT {
    float x;
    float y;
};
```
• \( x \) is the horizontal coordinate of the sample’s location.
• \( y \) is the vertical coordinate of the sample’s location.

The domain space of the sample location coordinates has an upper-left origin within the pixel in framebuffer space.

The values specified in a `VkSampleLocationEXT` structure are always clamped to the implementation-dependent sample location coordinate range \([\text{sampleLocationCoordinateRange}[0], \text{sampleLocationCoordinateRange}[1]]\) that can be queried using `VkPhysicalDeviceSampleLocationsPropertiesEXT`.

To **dynamically set** the sample locations used for rasterization, call:

```c
// Provided by VK_EXT_sample_locations
void vkCmdSetSampleLocationsEXT(
    VkCommandBuffer commandBuffer,
    const VkSampleLocationsInfoEXT* pSampleLocationsInfo);
```

• `commandBuffer` is the command buffer into which the command will be recorded.
• `pSampleLocationsInfo` is the sample locations state to set.

This command sets the custom sample locations for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and when the `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` property of the bound graphics pipeline is `VK_TRUE`. Otherwise, this state is specified by the `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsInfo` values used to create the currently active pipeline.

**Valid Usage**

• VUID-vkCmdSetSampleLocationsEXT-variableSampleLocations-01530
If `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE` then the current render pass must have been begun by specifying a `VkRenderPassSampleLocationsBeginInfoEXT::pDynamicStates` structure whose `pPostSubpassSampleLocations` member contains an element with a `subpassIndex` matching the current subpass index and the `sampleLocationsInfo` member of that element must match the sample locations state pointed to by `pSampleLocationsInfo`

**Valid Usage (Implicit)**

• VUID-vkCmdSetSampleLocationsEXT-commandBuffer-parameter
`commandBuffer` must be a valid `VkCommandBuffer` handle
• **VUID-vkCmdSetSampleLocationsEXT-pSampleLocationsInfo-parameter**
  pSampleLocationsInfo must be a valid pointer to a valid VkSampleLocationsInfoEXT structure

• **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-recording**
  commandBuffer must be in the recording state

• **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

---

### Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

### Command Properties

### 25.5. Fragment Shading Rates

The features advertised by VkPhysicalDeviceFragmentShadingRateFeaturesKHR allow an application to control the shading rate of a given fragment shader invocation.

The fragment shading rate strongly interacts with Multisampling, and the set of available rates for an implementation may be restricted by sample rate.

To query available shading rates, call:

```cpp
// Provided by VK_KHR_fragment_shading_rate
VkResult vkGetPhysicalDeviceFragmentShadingRatesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pFragmentShadingRateCount,
    VkPhysicalDeviceFragmentShadingRateKHR* pFragmentShadingRates);
```

• `physicalDevice` is the handle to the physical device whose properties will be queried.

• `pFragmentShadingRateCount` is a pointer to an integer related to the number of fragment shading rates available or queried, as described below.

• `pFragmentShadingRates` is either NULL or a pointer to an array of
If `pFragmentShadingRates` is NULL, then the number of fragment shading rates available is returned in `pFragmentShadingRateCount`. Otherwise, `pFragmentShadingRateCount` must point to a variable set by the user to the number of elements in the `pFragmentShadingRates` array, and on return the variable is overwritten with the number of structures actually written to `pFragmentShadingRates`. If `pFragmentShadingRateCount` is less than the number of fragment shading rates available, at most `pFragmentShadingRateCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available fragment shading rates were returned.

The returned array of fragment shading rates must be ordered from largest `fragmentSize.width` value to smallest, and each set of fragment shading rates with the same `fragmentSize.width` value must be ordered from largest `fragmentSize.height` to smallest. Any two entries in the array must not have the same `fragmentSize` values.

For any entry in the array, the following rules also apply:

- The value of `fragmentSize.width` must be less than or equal to `maxFragmentSize.width`.
- The value of `fragmentSize.width` must be greater than or equal to 1.
- The value of `fragmentSize.width` must be a power-of-two.
- The value of `fragmentSize.height` must be less than or equal to `maxFragmentSize.height`.
- The value of `fragmentSize.height` must be greater than or equal to 1.
- The value of `fragmentSize.height` must be a power-of-two.
- The highest sample count in `sampleCounts` must be less than or equal to `maxFragmentShadingRateRasterizationSamples`.
- The product of `fragmentSize.width`, `fragmentSize.height`, and the highest sample count in `sampleCounts` must be less than or equal to `maxFragmentShadingRateCoverageSamples`.

Implementations must support at least the following shading rates:

<table>
<thead>
<tr>
<th>sampleCounts</th>
<th>fragmentSize</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SAMPLE_COUNT_1_BIT</td>
<td>VK_SAMPLE_COUNT_4_BIT {2,2}</td>
</tr>
<tr>
<td>VK_SAMPLE_COUNT_1_BIT</td>
<td>VK_SAMPLE_COUNT_4_BIT {2,1}</td>
</tr>
<tr>
<td>~0</td>
<td>{1,1}</td>
</tr>
</tbody>
</table>

If `framebufferColorSampleCounts` includes `VK_SAMPLE_COUNT_2_BIT`, the required rates must also include `VK_SAMPLE_COUNT_2_BIT`.

Note

Including the {1,1} fragment size is done for completeness; it has no actual effect on the support of rendering without setting the fragment size. All sample counts are supported for this rate.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceFragmentShadingRatesKHR` must not return `VK_ERROR_OUT_OF_HOST_MEMORY`. 
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRateCount-parameter pFragmentShadingRateCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRates-parameter If the value referenced by pFragmentShadingRateCount is not 0, and pFragmentShadingRates is not NULL, pFragmentShadingRates must be a valid pointer to an array of pFragmentShadingRateCount VkPhysicalDeviceFragmentShadingRateKHR structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY

The VkPhysicalDeviceFragmentShadingRateKHR structure is defined as

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateKHR {
    VkStructureType sType;
    void* pNext;
    VkSampleCountFlags sampleCounts;
    VkExtent2D fragmentSize;
} VkPhysicalDeviceFragmentShadingRateKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `sampleCounts` is a bitmask of sample counts for which the shading rate described by `fragmentSize` is supported.
- `fragmentSize` is a VkExtent2D describing the width and height of a supported shading rate.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShadingRateKHR-sType-sType sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_KHR
Fragment shading rates can be set at three points, with the three rates combined to determine the final shading rate.

25.5.1. Pipeline Fragment Shading Rate

The pipeline fragment shading rate can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via vkCmdSetFragmentShadingRateKHR.

The VkPipelineFragmentShadingRateStateCreateInfoKHR structure is defined as:

```c
typedef struct VkPipelineFragmentShadingRateStateCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExtent2D fragmentSize;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateStateCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `fragmentSize` specifies a VkExtent2D structure containing the fragment size used to define the pipeline fragment shading rate for drawing commands using this pipeline.
- `combinerOps` specifies a VkFragmentShadingRateCombinerOpKHR value determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the `pNext` chain of VkGraphicsPipelineCreateInfo includes a VkPipelineFragmentShadingRateStateCreateInfoKHR structure, then that structure includes parameters controlling the pipeline fragment shading rate.

If this structure is not present, fragmentSize is considered to be equal to (1,1), and both elements of combinerOps are considered to be equal to VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR.

Valid Usage (Implicit)

- VUID-VkPipelineFragmentShadingRateStateCreateInfoKHR-sType-sType
  
  `sType` must be VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_STATE_CREATE_INFO_KHR

To dynamically set the pipeline fragment shading rate and combiner operation, call:

```c
void vkCmdSetFragmentShadingRateKHR(
```
• `commandBuffer` is the command buffer into which the command will be recorded.
• `pFragmentSize` specifies the pipeline fragment shading rate for subsequent drawing commands.
• `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by subsequent drawing commands.

This command sets the pipeline fragment shading rate and combiner operation for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineFragmentShadingRateStateCreateInfoKHR` values used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04507
  If `pipelineFragmentShadingRate` is not enabled, `pFragmentSize->width` must be 1
- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04508
  If `pipelineFragmentShadingRate` is not enabled, `pFragmentSize->height` must be 1
- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04509
  One of `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or `attachmentFragmentShadingRate` must be enabled
- VUID-vkCmdSetFragmentShadingRateKHR-primitiveFragmentShadingRate-04510
  If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`
- VUID-vkCmdSetFragmentShadingRateKHR-attachmentFragmentShadingRate-04511
  If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`
- VUID-vkCmdSetFragmentShadingRateKHR-fragmentSizeNonTrivialCombinerOps-04512
  If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps` must be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04513
  `pFragmentSize->width` must be greater than or equal to 1
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04514
  `pFragmentSize->height` must be greater than or equal to 1
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04515
  `pFragmentSize->width` must be a power-of-two value
**Valid Usage (Implicit)**

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-parameter
  pFragmentSize must be a valid pointer to a valid VkExtent2D structure
- VUID-vkCmdSetFragmentShadingRateKHR-combinerOps-parameter
  Each element of combinerOps must be a valid VkFragmentShadingRateCombinerOpKHR value
- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### 25.5.2. Primitive Fragment Shading Rate

The primitive fragment shading rate can be set via the PrimitiveShadingRateKHR built-in in the last active pre-rasterization shader stage. The rate associated with a given primitive is sourced from the value written to PrimitiveShadingRateKHR by that primitive's provoking vertex.
25.5.3. Attachment Fragment Shading Rate

The attachment shading rate can be set by including `VkFragmentShadingRateAttachmentInfoKHR` in a subpass to define a fragment shading rate attachment. Each pixel in the framebuffer is assigned an attachment fragment shading rate by the corresponding texel in the fragment shading rate attachment, according to:

\[
x' = \text{floor}(x / \text{region}_x)
\]

\[
y' = \text{floor}(y / \text{region}_y)
\]

where \(x'\) and \(y'\) are the coordinates of a texel in the fragment shading rate attachment, \(x\) and \(y\) are the coordinates of the pixel in the framebuffer, and \(\text{region}_x\) and \(\text{region}_y\) are the size of the region each texel corresponds to, as defined by the `shadingRateAttachmentTexelSize` member of `VkFragmentShadingRateAttachmentInfoKHR`.

If multiview is enabled and the shading rate attachment has multiple layers, the shading rate attachment texel is selected from the layer determined by the `ViewIndex` built-in. If multiview is disabled, and both the shading rate attachment and the framebuffer have multiple layers, the shading rate attachment texel is selected from the layer determined by the `Layer` built-in. Otherwise, the texel is unconditionally selected from the first layer of the attachment.

The fragment size is encoded into the first component of the identified texel as follows:

\[
\text{size}_w = 2^{((\text{texel} / 4) & 3)}
\]

\[
\text{size}_h = 2^{(\text{texel} & 3)}
\]

where texel is the value in the first component of the identified texel, and \(\text{size}_w\) and \(\text{size}_h\) are the width and height of the fragment size, decoded from the texel.

If no fragment shading rate attachment is specified, this size is calculated as \(\text{size}_w = \text{size}_h = 1\). Applications must not specify a width or height greater than 4 by this method.

The Fragment Shading Rate enumeration in SPIR-V adheres to the above encoding.

25.5.4. Combining the Fragment Shading Rates

The final rate \((C_{xy}')\) used for fragment shading must be one of the rates returned by `vkGetPhysicalDeviceFragmentShadingRatesKHR` for the sample count used by rasterization.

If any of the following conditions are met, \(C_{xy}'\) must be set to \(\{1,1\}\):

- If Sample Shading is enabled.
- The `fragmentShadingRateWithSampleMask` limit is not supported, and `VkPipelineMultisampleStateCreateInfo::pSampleMask` contains a zero value in any bit used by...
fragment operations.

- The `fragmentShadingRateWithShaderSampleMask` is not supported, and the fragment shader has `SampleMask` in the input or output interface.

- The `fragmentShadingRateWithShaderDepthStencilWrites` limit is not supported, and the fragment shader declares the `FragDepth` or `FragStencilRefEXT` built-in.

- The `fragmentShadingRateWithConservativeRasterization` limit is not supported, and `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode` is not `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`.

- The `fragmentShadingRateWithFragmentShaderInterlock` limit is not supported, and the fragment shader declares any of the `fragment shader interlock` execution modes.

- The `fragmentShadingRateWithCustomSampleLocations` limit is not supported, and `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` is `VK_TRUE`.

Otherwise, each of the specified shading rates are combined and then used to derive the value of $C_{xy}$. As there are three ways to specify shading rates, two combiner operations are specified - between the pipeline and primitive shading rates, and between the result of that and the attachment shading rate.

The equation used for each combiner operation is defined by `VkFragmentShadingRateCombinerOpKHR`:

```cpp
// Provided by VK_KHR_fragment_shading_rate
typedef enum VkFragmentShadingRateCombinerOpKHR {
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR = 0,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR = 1,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR = 2,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR = 3,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR = 4,
} VkFragmentShadingRateCombinerOpKHR;
```

- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` specifies a combiner operation of $combine(A_{xy}, B_{xy}) = A_{xy}$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR` specifies a combiner operation of $combine(A_{xy}, B_{xy}) = B_{xy}$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR` specifies a combiner operation of $combine(A_{xy}, B_{xy}) = \min(A_{xy}, B_{xy})$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR` specifies a combiner operation of $combine(A_{xy}, B_{xy}) = \max(A_{xy}, B_{xy})$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR` specifies a combiner operation of $combine(A_{xy}, B_{xy}) = A_{xy} \times B_{xy}$.

where $combine(A_{xy}, B_{xy})$ is the combine operation, and $A_{xy}$ and $B_{xy}$ are the inputs to the operation.

If `fragmentShadingRateStrictMultiplyCombiner` is `VK_FALSE`, using `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR` with values of 1 for both A and B in the same dimension results in the value 2 being produced for that dimension. See the definition of
See \texttt{fragmentShadingRateStrictMultiplyCombiner} for more information.

These operations are performed in a component-wise fashion.

This is used to generate a combined fragment area using the equation:

\[
C_{xy} = \text{combine}(A_{xy}, B_{xy})
\]

where \(C_{xy}\) is the combined fragment area result, and \(A_{xy}\) and \(B_{xy}\) are the fragment areas of the fragment shading rates being combined.

Two combine operations are performed, first with \(A_{xy}\) equal to the pipeline fragment shading rate and \(B_{xy}\) equal to the primitive fragment shading rate, with the combine() operation selected by combinerOps[0]. A second combination is then performed, with \(A_{xy}\) equal to the result of the first combination and \(B_{xy}\) equal to the attachment fragment shading rate, with the combine() operation selected by combinerOps[1]. The result of the second combination is used as the final fragment shading rate, reported via the \texttt{ShadingRateKHR built-in}.

Implementations \textbf{should} clamp the inputs to the combiner operations \(A_{xy}\) and \(B_{xy}\), and \textbf{must} clamp the result of the second combiner operation.

A fragment shading rate \(R_{xy}\) representing any of \(A_{xy}\), \(B_{xy}\) or \(C_{xy}\) is clamped as follows. If \(R_{xy}\) is one of the rates returned by \texttt{vkGetPhysicalDeviceFragmentShadingRatesKHR} for the sample count used by rasterization, the clamped shading rate \(R'_{xy}\) is \(R_{xy}\). Otherwise, the clamped shading rate is selected from the rates returned by \texttt{vkGetPhysicalDeviceFragmentShadingRatesKHR} for the sample count used by rasterization. From this list of supported rates, the following steps are applied in order, to select a single value:

1. Keep only rates where \(R'_{x} \leq R_{x}\) and \(R'_{y} \leq R_{y}\).
   - Implementations \textbf{may} also keep rates where \(R'_{x} \leq R_{y}\) and \(R'_{y} \leq R_{x}\).
2. Keep only rates with the highest area \((R'_{x} \times R'_{y})\).
3. Keep only rates with the lowest aspect ratio \((R'_{x} + R'_{y})\).
4. In cases where a wide (e.g. 4x1) and tall (e.g. 1x4) rate remain, the implementation \textbf{may} choose either rate. However, it \textbf{must} choose this rate consistently for the same shading rates, and combiner operations for the lifetime of the \texttt{VkDevice}.

### 25.6. Sample Shading

Sample shading \textbf{can} be used to specify a minimum number of unique samples to process for each fragment. If sample shading is enabled, an implementation \textbf{must} invoke the fragment shader at least \(\text{max}(\lceil \text{VkPipelineMultisampleStateCreateInfo.minSampleShading} \times \text{VkPipelineMultisampleStateCreateInfo.rasterizationSamples} \rceil, 1)\) times per fragment. If \texttt{VkPipelineMultisampleStateCreateInfo.sampleShadingEnable} is set to \texttt{VK_TRUE}, sample shading is enabled.

If a fragment shader entry point \textbf{statically uses} an input variable decorated with a \texttt{BuiltIn} of \texttt{SampleId} or \texttt{SamplePosition}, sample shading is enabled and a value of \(1.0\) is used instead of...
**minSampleShading.** If a fragment shader entry point statically uses an input variable decorated with `Sample`, sample shading may be enabled and a value of 1.0 will be used instead of `minSampleShading` if it is.

**Note**

If a shader decorates an input variable with `Sample` and that value meaningfully impacts the output of a shader, sample shading will be enabled to ensure that the input is in fact interpolated per-sample. This is inherent to the specification and not spelled out here - if an application simply declares such a variable it is implementation-defined whether sample shading is enabled or not. It is possible to see the effects of this by using atomics in the shader or using a pipeline statistics query to query the number of fragment invocations, even if the shader itself does not use any per-sample variables.

If there are fewer fragment invocations than covered samples, implementations may include those samples in fragment shader invocations in any manner as long as covered samples are all shaded at least once, and each invocation that is not a helper invocation covers at least one sample.

### 25.7. Points

A point is drawn by generating a set of fragments in the shape of a square centered around the vertex of the point. Each vertex has an associated point size controlling the width/height of that square. The point size is taken from the (potentially clipped) shader built-in `PointSize` written by:

- the geometry shader, if active;
- the tessellation evaluation shader, if active and no geometry shader is active;
- the vertex shader, otherwise

and clamped to the implementation-dependent point size range `[pointSizeRange[0], pointSizeRange[1]]`. The value written to `PointSize` must be greater than zero.

Not all point sizes need be supported, but the size 1.0 must be supported. The range of supported sizes and the size of evenly-spaced gradations within that range are implementation-dependent. The range and gradations are obtained from the `pageSizeRange` and `pointSizeGranularity` members of `VkPhysicalDeviceLimits`. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional point sizes may also be supported. There is no requirement that these sizes be equally spaced. If an unsupported size is requested, the nearest supported size is used instead.

#### 25.7.1. Basic Point Rasterization

Point rasterization produces a fragment for each fragment area group of framebuffer pixels with one or more sample points that intersect a region centered at the point’s \((x_f, y_f)\). This region is a square with side equal to the current point size. Coverage bits that correspond to sample points that intersect the region are 1, other coverage bits are 0. All fragments produced in rasterizing a point are assigned the same associated data, which are those of the vertex corresponding to the point. However, the fragment shader built-in `PointCoord` contains point sprite texture coordinates. The s
and t point sprite texture coordinates vary from zero to one across the point horizontally left-to-right and vertically top-to-bottom, respectively. The following formulas are used to evaluate s and t:

\[
\begin{align*}
    s &= \frac{1}{2} + \frac{(x_p - x_f)}{\text{size}} \\
    t &= \frac{1}{2} + \frac{(y_p - y_f)}{\text{size}}
\end{align*}
\]

where size is the point's size; \((x_p, y_p)\) is the location at which the point sprite coordinates are evaluated - this may be the framebuffer coordinates of the fragment center, or the location of a sample; and \((x_f, y_f)\) is the exact, unrounded framebuffer coordinate of the vertex for the point.

### 25.8. Line Segments

Line segment rasterization options are controlled by the `VkPipelineRasterizationLineStateCreateInfoEXT` structure.

The `VkPipelineRasterizationLineStateCreateInfoEXT` structure is defined as:

```c
typedef struct VkPipelineRasterizationLineStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkLineRasterizationModeEXT lineRasterizationMode;
    VkBool32 stippledLineEnable;
    uint32_t lineStippleFactor;
    uint16_t lineStipplePattern;
} VkPipelineRasterizationLineStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `lineRasterizationMode` is a `VkLineRasterizationModeEXT` value selecting the style of line rasterization.
- `stippledLineEnable` enables stippled line rasterization.
- `lineStippleFactor` is the repeat factor used in stippled line rasterization.
- `lineStipplePattern` is the bit pattern used in stippled line rasterization.

If `stippledLineEnable` is `VK_FALSE`, the values of `lineStippleFactor` and `lineStipplePattern` are ignored.

**Valid Usage**

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02768
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT`, then the `rectangularLines` feature must be enabled
If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`, then the `bresenhamLines` feature must be enabled.

If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then the `smoothLines` feature must be enabled.

If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT`, then the `stippledRectangularLines` feature must be enabled.

If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`, then the `stippledBresenhamLines` feature must be enabled.

If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then the `stippledSmoothLines` feature must be enabled.

If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT`, then the `stippledRectangularLines` feature must be enabled and `VkPhysicalDeviceLimits::strictLines must be VK_TRUE`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_EXT`.
- `lineRasterizationMode` must be a valid `VkLineRasterizationModeEXT` value.

Possible values of `VkPipelineRasterizationLineStateCreateInfoEXT::lineRasterizationMode` are:

```c
typedef enum VkLineRasterizationModeEXT {
    VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT = 0,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT = 1,
    VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT = 2,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT = 3,
} VkLineRasterizationModeEXT;
```

- `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT` is equivalent to `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT` if `VkPhysicalDeviceLimits::strictLines` is `VK_TRUE`, otherwise lines are drawn as non-strictLines parallelograms. Both of these modes are defined
in Basic Line Segment Rasterization.

- **VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT** specifies lines drawn as if they were rectangles extruded from the line

- **VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT** specifies lines drawn by determining which pixel diamonds the line intersects and exits, as defined in Bresenham Line Segment Rasterization.

- **VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT** specifies lines drawn if they were rectangles extruded from the line, with alpha falloff, as defined in Smooth Lines.

To dynamically set the line width, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetLineWidth(  
    VkCommandBuffer commandBuffer,  
    float lineWidth);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `lineWidth` is the width of rasterized line segments.

This command sets the line width for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_WIDTH` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::lineWidth` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetLineWidth-lineWidth-00788**
  If the `wideLines` feature is not enabled, `lineWidth` must be 1.0

### Valid Usage (Implicit)

- **VUID-vkCmdSetLineWidth-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetLineWidth-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetLineWidth-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally
Not all line widths need be supported for line segment rasterization, but width 1.0 antialiased segments must be provided. The range and gradations are obtained from the lineWidthRange and lineWidthGranularity members of VkPhysicalDeviceLimits. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional line widths may also be supported. There is no requirement that these widths be equally spaced. If an unsupported width is requested, the nearest supported width is used instead.

25.8.1. Basic Line Segment Rasterization

If the lineRasterizationMode member of VkPipelineRasterizationLineStateCreateInfoEXT is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT, rasterized line segments produce fragments which intersect a rectangle centered on the line segment. Two of the edges are parallel to the specified line segment; each is at a distance of one-half the current width from that segment in directions perpendicular to the direction of the line. The other two edges pass through the line endpoints and are perpendicular to the direction of the specified line segment. Coverage bits that correspond to sample points that intersect the rectangle are 1, other coverage bits are 0.

Next we specify how the data associated with each rasterized fragment are obtained. Let \( \mathbf{p}_r = (x_a, y_a) \) be the framebuffer coordinates at which associated data are evaluated. This may be the center of a fragment or the location of a sample within the fragment. When rasterizationSamples is VK_SAMPLE_COUNT_1_BIT, the fragment center must be used. Let \( \mathbf{p}_a = (x_a, y_a) \) and \( \mathbf{p}_b = (x_b, y_b) \) be initial and final endpoints of the line segment, respectively. Set

\[
 t = \frac{(\mathbf{p}_r - \mathbf{p}_a) \cdot (\mathbf{p}_b - \mathbf{p}_a)}{\| \mathbf{p}_b - \mathbf{p}_a \|^2}
\]

(Note that \( t = 0 \) at \( \mathbf{p}_a \) and \( t = 1 \) at \( \mathbf{p}_b \). Also note that this calculation projects the vector from \( \mathbf{p}_a \) to \( \mathbf{p}_r \) onto the line, and thus computes the normalized distance of the fragment along the line.)

If strictLines is VK_TRUE, line segments are rasterized using perspective or linear interpolation.

Perspective interpolation for a line segment interpolates two values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the line segment’s clip coordinates. An interpolated value \( f \) can be determined by

\[
 f = \frac{(1-t)f_a + tf_b}{(1-t) + t/w_b}
\]
where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively; \( w_a \) and \( w_b \) are the clip \( w \) coordinates of the starting and ending endpoints of the segment, respectively.

*Linear interpolation* for a line segment directly interpolates two values, and an interpolated value \( f \) can be determined by

\[
f = (1 - t) f_a + t f_b
\]

where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively.

The clip coordinate \( w \) for a sample is determined using perspective interpolation. The depth value \( z \) for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by Interpolation decorations.

The above description documents the preferred method of line rasterization, and *must* be used when `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT`.

When `strictLines` is `VK_FALSE`, and when the `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT`, the edges of the lines are generated as a parallelogram surrounding the original line. The major axis is chosen by noting the axis in which there is the greatest distance between the line start and end points. If the difference is equal in both directions then the X axis is chosen as the major axis. Edges 2 and 3 are aligned to the minor axis and are centered on the endpoints of the line as in Non strict lines, and each is `lineWidth` long. Edges 0 and 1 are parallel to the line and connect the endpoints of edges 2 and 3. Coverage bits that correspond to sample points that intersect the parallelogram are 1, other coverage bits are 0.

Samples that fall exactly on the edge of the parallelogram follow the polygon rasterization rules.

Interpolation occurs as if the parallelogram was decomposed into two triangles where each pair of vertices at each end of the line has identical attributes.
Only when strictLines is VK_FALSE implementations may deviate from the non-strict line algorithm described above in the following ways:

- Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization using the original line segment endpoints.
- Rasterization of non-antialiased non-strict line segments may be performed using the rules defined in Bresenham Line Segment Rasterization.

25.8.2. Bresenham Line Segment Rasterization

If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT, then the following rules replace the line rasterization rules defined in Basic Line Segment Rasterization.

Non-strict lines may also follow these rasterization rules for non-antialiased lines.

Line segment rasterization begins by characterizing the segment as either x-major or y-major. x-major line segments have slope in the closed interval [-1,1]; all other line segments are y-major (slope is determined by the segment’s endpoints). We specify rasterization only for x-major segments except in cases where the modifications for y-major segments are not self-evident.

Ideally, Vulkan uses a diamond-exit rule to determine those fragments that are produced by rasterizing a line segment. For each fragment \( f \) with center at framebuffer coordinates \( x_f \) and \( y_f \), define a diamond-shaped region that is the intersection of four half planes:

\[
R_f = \{(x, y) | |x - x_f| + |y - y_f| \leq \frac{1}{2}\}
\]

Essentially, a line segment starting at \( p_a \) and ending at \( p_b \) produces those fragments \( f \) for which the segment intersects \( R_o \) except if \( p_b \) is contained in \( R_o \).
To avoid difficulties when an endpoint lies on a boundary of $R_f$ we (in principle) perturb the supplied endpoints by a tiny amount. Let $p_a$ and $p_b$ have framebuffer coordinates $(x_a, y_a)$ and $(x_b, y_b)$, respectively. Obtain the perturbed endpoints $p'_a$ given by $(x_a, y_a) - (\epsilon, \epsilon^2)$ and $p'_b$ given by $(x_b, y_b) - (\epsilon, \epsilon^2)$. Rasterizing the line segment starting at $p_a$ and ending at $p_b$ produces those fragments $f$ for which the segment starting at $p'_a$ and ending on $p'_b$ intersects $R_f$, except if $p'_b$ is contained in $R_f$. $\epsilon$ is chosen to be so small that rasterizing the line segment produces the same fragments when $\delta$ is substituted for $\epsilon$ for any $0 < \delta \leq \epsilon$.

When $p_a$ and $p_b$ lie on fragment centers, this characterization of fragments reduces to Bresenham’s algorithm with one modification: lines produced in this description are “half-open”, meaning that the final fragment (corresponding to $p_b$) is not drawn. This means that when rasterizing a series of connected line segments, shared endpoints will be produced only once rather than twice (as would occur with Bresenham’s algorithm).

Implementations may use other line segment rasterization algorithms, subject to the following rules:

- The coordinates of a fragment produced by the algorithm must not deviate by more than one unit in either $x$ or $y$ framebuffer coordinates from a corresponding fragment produced by the diamond-exit rule.
- The total number of fragments produced by the algorithm must not differ from that produced by the diamond-exit rule by more than one.
- For an $x$-major line, two fragments that lie in the same framebuffer-coordinate column must not be produced (for a $y$-major line, two fragments that lie in the same framebuffer-coordinate row must not be produced).
• If two line segments share a common endpoint, and both segments are either x-major (both left-to-right or both right-to-left) or y-major (both bottom-to-top or both top-to-bottom), then rasterizing both segments must not produce duplicate fragments. Fragments also must not be omitted so as to interrupt continuity of the connected segments.

The actual width \( w \) of Bresenham lines is determined by rounding the line width to the nearest integer, clamping it to the implementation-dependent `lineWidthRange` (with both values rounded to the nearest integer), then clamping it to be no less than 1.

Bresenham line segments of width other than one are rasterized by offsetting them in the minor direction (for an x-major line, the minor direction is y, and for a y-major line, the minor direction is x) and producing a row or column of fragments in the minor direction. If the line segment has endpoints given by \((x_0, y_0)\) and \((x_1, y_1)\) in framebuffer coordinates, the segment with endpoints \((x_0 - \frac{w-1}{2}, y_0 - \frac{w-1}{2})\) and \((x_1 - \frac{w-1}{2}, y_1 - \frac{w-1}{2})\) is rasterized, but instead of a single fragment, a column of fragments of height \( w \) (a row of fragments of length \( w \) for a y-major segment) is produced at each \( x \) (y for y-major) location. The lowest fragment of this column is the fragment that would be produced by rasterizing the segment of width 1 with the modified coordinates.

The preferred method of attribute interpolation for a wide line is to generate the same attribute values for all fragments in the row or column described above, as if the adjusted line was used for interpolation and those values replicated to the other fragments, except for \texttt{FragCoord} which is interpolated as usual. Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization, using the original line segment endpoints.

When Bresenham lines are being rasterized, sample locations may all be treated as being at the pixel center (this may affect attribute and depth interpolation).

\[\textbf{Note}\]

The sample locations described above are not used for determining coverage, they are only used for things like attribute interpolation. The rasterization rules that determine coverage are defined in terms of whether the line intersects pixels, as opposed to the point sampling rules used for other primitive types. So these rules are independent of the sample locations. One consequence of this is that Bresenham lines cover the same pixels regardless of the number of rasterization samples, and cover all samples in those pixels (unless masked out or killed).

25.8.3. Line Stipple

If the \texttt{stippledLineEnable} member of \texttt{VkPipelineRasterizationLineStateCreateInfoEXT} is \texttt{VK_TRUE}, then lines are rasterized with a line stipple determined by \texttt{lineStippleFactor} and \texttt{lineStipplePattern}. \texttt{lineStipplePattern} is an unsigned 16-bit integer that determines which fragments are to be drawn or discarded when the line is rasterized. \texttt{lineStippleFactor} is a count that is used to modify the effective line stipple by causing each bit in \texttt{lineStipplePattern} to be used \texttt{lineStippleFactor} times.

Line stippling discards certain fragments that are produced by rasterization. The masking is achieved using three parameters: the 16-bit line stipple pattern \( p \), the line stipple factor \( r \), and an integer stipple counter \( s \). Let
Then a fragment is produced if the $b$’th bit of $p$ is 1, and discarded otherwise. The bits of $p$ are numbered with 0 being the least significant and 15 being the most significant.

The initial value of $s$ is zero. For \texttt{VK\_LINE\_RASTERIZATION\_MODE\_BRESENHAM\_EXT} lines, $s$ is incremented after production of each fragment of a line segment (fragments are produced in order, beginning at the starting point and working towards the ending point). For \texttt{VK\_LINE\_RASTERIZATION\_MODE\_RECTANGULAR\_EXT} and \texttt{VK\_LINE\_RASTERIZATION\_MODE\_RECTANGULAR\_SMOOTH\_EXT} lines, the rectangular region is subdivided into adjacent unit-length rectangles, and $s$ is incremented once for each rectangle. Rectangles with a value of $s$ such that the $b$’th bit of $p$ is zero are discarded. If the last rectangle in a line segment is shorter than unit-length, then the remainder may carry over to the next line segment in the line strip using the same value of $s$ (this is the preferred behavior, for the stipple pattern to appear more consistent through the strip).

$s$ is reset to 0 at the start of each strip (for line strips), and before every line segment in a group of independent segments.

If the line segment has been clipped, then the value of $s$ at the beginning of the line segment is implementation-dependent.

To dynamically set the line stipple state, call:

```c
// Provided by VK_EXT_line_rasterization
void vkCmdSetLineStippleEXT(
    VkCommandBuffer commandBuffer,
    uint32_t lineStippleFactor,
    uint16_t lineStipplePattern);
```

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.
- \texttt{lineStippleFactor} is the repeat factor used in stippled line rasterization.
- \texttt{lineStipplePattern} is the bit pattern used in stippled line rasterization.

This command sets the line stipple state for subsequent drawing commands when the graphics pipeline is created with \texttt{VK\_DYNAMIC\_STATE\_LINE\_STIPPLE\_EXT} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. Otherwise, this state is specified by the \texttt{VkPipelineRasterizationLineStateCreateInfoEXT::lineStippleFactor} and \texttt{VkPipelineRasterizationLineStateCreateInfoEXT::lineStipplePattern} values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLineStippleEXT-lineStippleFactor-02776 \texttt{lineStippleFactor} must be in the range $[1,256]$
Valid Usage (Implicit)

- **VUID-vkCmdSetLineStippleEXT-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetLineStippleEXT-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdSetLineStippleEXT-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

25.8.4. Smooth Lines

If the `lineRasterizationMode` member of `VkPipelineRasterizationLineStateCreateInfoEXT` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then lines are considered to be rectangles using the same geometry as for `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT` lines. The rules for determining which pixels are covered are implementation-dependent, and may include nearby pixels where no sample locations are covered or where the rectangle does not intersect the pixel at all. For each pixel that is considered covered, the fragment computes a coverage value that approximates the area of the intersection of the rectangle with the pixel square, and this coverage value is multiplied into the color location 0’s alpha value after fragment shading, as described in Multisample Coverage.

**Note**

The details of the rasterization rules and area calculation are left intentionally vague, to allow implementations to generate coverage and values that are aesthetically pleasing.
25.9. Polygons

A polygon results from the decomposition of a triangle strip, triangle fan or a series of independent triangles. Like points and line segments, polygon rasterization is controlled by several variables in the `VkPipelineRasterizationStateCreateInfo` structure.

25.9.1. Basic Polygon Rasterization

The first step of polygon rasterization is to determine whether the triangle is back-facing or front-facing. This determination is made based on the sign of the (clipped or unclipped) polygon’s area computed in framebuffer coordinates. One way to compute this area is:

\[ a = -\frac{1}{2} \sum_{i=0}^{n-1} x_i^i y_{i+1} - x_{i+1}^i y_i^i \]

where \( x_i^i \) and \( y_i^i \) are the x and y framebuffer coordinates of the \( i \)th vertex of the \( n \)-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and \( i \oplus 1 \) is \( (i + 1) \mod n \).

The interpretation of the sign of \( a \) is determined by the `VkPipelineRasterizationStateCreateInfo`::`frontFace` property of the currently active pipeline. Possible values are:

- `VK_FRONT_FACE_COUNTER_CLOCKWISE` specifies that a triangle with positive area is considered front-facing.
- `VK_FRONT_FACE_CLOCKWISE` specifies that a triangle with negative area is considered front-facing.

Any triangle which is not front-facing is back-facing, including zero-area triangles.

To dynamically set the front face orientation, call:

```c
void vkCmdSetFrontFaceEXT(
    VkCommandBuffer commandBuffer,
    VkFrontFace face);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `face` is a `VkFrontFace` value specifying the front-facing triangle orientation to be used for culling.

This command sets the front face orientation for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_FRONT_FACE` set in
VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineRasterizationStateCreateInfo::frontFace value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetFrontFace-None-08971
  At least one of the following must be true:
  - the extendedDynamicState feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetFrontFace-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetFrontFace-frontFace-parameter
  frontFace must be a valid VkFrontFace value
- VUID-vkCmdSetFrontFace-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetFrontFace-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

Once the orientation of triangles is determined, they are culled according to the VkPipelineRasterizationStateCreateInfo::cullMode property of the currently active pipeline. Possible values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCullModeFlagBits {
```
VK_CULL_MODE_NONE = 0,
VK_CULL_MODE_FRONT_BIT = 0x00000001,
VK_CULL_MODE_BACK_BIT = 0x00000002,
VK_CULL_MODE_FRONT_AND_BACK = 0x00000003,
} VkCullModeFlagBits;

- **VK_CULL_MODE_NONE** specifies that no triangles are discarded
- **VK_CULL_MODE_FRONT_BIT** specifies that front-facing triangles are discarded
- **VK_CULL_MODE_BACK_BIT** specifies that back-facing triangles are discarded
- **VK_CULL_MODE_FRONT_AND_BACK** specifies that all triangles are discarded.

Following culling, fragments are produced for any triangles which have not been discarded.

// Provided by VK_VERSION_1_0
typedef VkFlags VkCullModeFlags;

**VkCullModeFlags** is a bitmask type for setting a mask of zero or more **VkCullModeFlagBits**.

To **dynamically set** the cull mode, call:

// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetCullModeEXT(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **cullMode** specifies the cull mode property to use for drawing.

This command sets the cull mode for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_CULL_MODE** set in **VkPipelineDynamicStateCreateInfo**::pDynamicStates. Otherwise, this state is specified by the **VkPipelineRasterizationStateCreateInfo**::cullMode value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetCullMode-None-08971
  At least one of the following **must** be true:
  - the extendedDynamicState feature is enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetCullMode-commandBuffer-parameter
  **commandBuffer** **must** be a valid **VkCommandBuffer** handle
• VUID-vkCmdSetCullMode-cullMode-parameter
cullMode must be a valid combination of VkCullModeFlagBits values

• VUID-vkCmdSetCullMode-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdSetCullMode-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics operations

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The rule for determining which fragments are produced by polygon rasterization is called point sampling. The two-dimensional projection obtained by taking the x and y framebuffer coordinates of the polygon's vertices is formed. Fragments are produced for any fragment area groups of pixels for which any sample points lie inside of this polygon. Coverage bits that correspond to sample points that satisfy the point sampling criteria are 1, other coverage bits are 0. Special treatment is given to a sample whose sample location lies on a polygon edge. In such a case, if two polygons lie on either side of a common edge (with identical endpoints) on which a sample point lies, then exactly one of the polygons must result in a covered sample for that fragment during rasterization. As for the data associated with each fragment produced by rasterizing a polygon, we begin by specifying how these values are produced for fragments in a triangle.

*Barycentric coordinates* are a set of three numbers, a, b, and c, each in the range [0,1], with a + b + c = 1. These coordinates uniquely specify any point p within the triangle or on the triangle’s boundary as

\[ p = a \, p_a + b \, p_b + c \, p_c \]

where \( p_a, p_b, \) and \( p_c \) are the vertices of the triangle. a, b, and c are determined by:

\[ a = \frac{A(pp_bp_c)}{A(p_dp_bp_c)}, \quad b = \frac{A(pp_dp_c)}{A(p_dp_bp_c)}, \quad c = \frac{A(pp_dp_b)}{A(p_dp_bp_c)}. \]
where \( A(lmn) \) denotes the area in framebuffer coordinates of the triangle with vertices \( l, m, \) and \( n. \)

Denote an associated datum at \( p_a, p_b, \) or \( p_c \) as \( f_a, f_b, \) or \( f_c, \) respectively.

**Perspective interpolation** for a triangle interpolates three values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the triangle’s clip coordinates. An interpolated value \( f \) can be determined by

\[
f = \frac{af_a / w_a + bf_b / w_b + cf_c / w_c}{a / w_a + b / w_b + c / w_c}
\]

where \( w_a, w_b, \) and \( w_c \) are the clip \( w \) coordinates of \( p_a, p_b, \) and \( p_c \), respectively. \( a, b, \) and \( c \) are the barycentric coordinates of the location at which the data are produced.

**Linear interpolation** for a triangle directly interpolates three values, and an interpolated value \( f \) can be determined by

\[
f = a f_a + b f_b + c f_c
\]

where \( f_a, f_b, \) and \( f_c \) are the data associated with \( p_a, p_b, \) and \( p_c, \) respectively.

The clip coordinate \( w \) for a sample is determined using perspective interpolation. The depth value \( z \) for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by **Interpolation decorations**.

For a polygon with more than three edges, such as are produced by clipping a triangle, a convex combination of the values of the datum at the polygon’s vertices **must** be used to obtain the value assigned to each fragment produced by the rasterization algorithm. That is, **must** be the case that at every fragment

\[
f = \sum_{i=1}^{n} a_i f_i
\]

where \( n \) is the number of vertices in the polygon and \( f_i \) is the value of \( f \) at vertex \( i. \) For each \( i, 0 \leq a_i \leq 1 \) and \( \sum_{i=1}^{n} a_i = 1. \) The values of \( a_i \) **may** differ from fragment to fragment, but at vertex \( i, a_i = 1 \) and \( a_j = 0 \) for \( j \neq i. \)

**Note**

One algorithm that achieves the required behavior is to triangulate a polygon (without adding any vertices) and then treat each triangle individually as already discussed. A scan-line rasterizer that linearly interpolates data along each edge and then linearly interpolates data across each horizontal span from edge to edge also satisfies the restrictions (in this case the numerator and denominator of **perspective interpolation** are iterated independently, and a division is performed for each fragment).
25.9.2. Polygon Mode

Possible values of the VkPipelineRasterizationStateCreateInfo::polygonMode property of the currently active pipeline, specifying the method of rasterization for polygons, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPolygonMode {
    VK_POLYGON_MODE_FILL = 0,
    VK_POLYGON_MODE_LINE = 1,
    VK_POLYGON_MODE_POINT = 2,
} VkPolygonMode;
```

- **VK_POLYGON_MODE_POINT** specifies that polygon vertices are drawn as points.
- **VK_POLYGON_MODE_LINE** specifies that polygon edges are drawn as line segments.
- **VK_POLYGON_MODE_FILL** specifies that polygons are rendered using the polygon rasterization rules in this section.

These modes affect only the final rasterization of polygons: in particular, a polygon’s vertices are shaded and the polygon is clipped and possibly culled before these modes are applied.

The point size of the final rasterization of polygons when polygon mode is **VK_POLYGON_MODE_POINT** is implementation-dependent, and the point size may either be PointSize or 1.0.

25.9.3. Depth Bias

The depth values of all fragments generated by the rasterization of a polygon can be biased (offset) by a single depth bias value \( \delta \) that is computed for that polygon.

**Depth Bias Enable**

The depth bias computation is enabled by the depthBiasEnable set with vkCmdSetDepthBiasEnableEXT and vkCmdSetDepthBiasEnableEXT, or the corresponding VkPipelineRasterizationStateCreateInfo::depthBiasEnable value used to create the currently active pipeline. If the depth bias enable is **VK_FALSE**, no bias is applied and the fragment's depth values are unchanged.

To dynamically enable whether to bias fragment depth values, call:

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetDepthBiasEnableEXT(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    VkBool32 depthBiasEnable);      // depthBiasEnable controls whether to bias fragment depth values.
```

This command sets the depth bias enable for subsequent drawing commands when the graphics
pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` set in
`VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the
`VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active
pipeline.

### Valid Usage

- VUID-vkCmdSetDepthBiasEnable-None-08970
  At least one of the following **must** be true:
  - the `extendedDynamicState2` feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthBiasEnable-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBiasEnable-commandBuffer-recording
  `commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetDepthBiasEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics
  operations

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally
  synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Depth Bias Computation

The depth bias depends on three parameters:

- `depthBiasSlopeFactor` scales the maximum depth slope $m$ of the polygon
- `depthBiasConstantFactor` scales the parameter $r$ of the depth attachment
- the scaled terms are summed to produce a value which is then clamped to a minimum or
maximum value specified by $\text{depthBiasClamp}$

$\text{depthBiasSlopeFactor}$, $\text{depthBiasConstantFactor}$, and $\text{depthBiasClamp}$ can each be positive, negative, or zero. These parameters are set as described for $\text{vkCmdSetDepthBias}$ below.

The maximum depth slope $m$ of a triangle is

$$m = \sqrt{\left(\frac{\partial z_f}{\partial x_f}\right)^2 + \left(\frac{\partial z_f}{\partial y_f}\right)^2}$$

where $(x_f, y_f, z_f)$ is a point on the triangle. $m$ may be approximated as

$$m = \max\left(\left|\frac{\partial z_f}{\partial x_f}\right|, \left|\frac{\partial z_f}{\partial y_f}\right|\right).$$

$r$ is the minimum resolvable difference that depends on the depth attachment representation. It is the smallest difference in framebuffer coordinate $z$ values that is guaranteed to remain distinct throughout polygon rasterization and in the depth attachment. All pairs of fragments generated by the rasterization of two polygons with otherwise identical vertices, but $z_f$ values that differ by $r$, will have distinct depth values.

For fixed-point depth attachment representations, $r$ is constant throughout the range of the entire depth attachment.

Its value is implementation-dependent but must be at most

$$r = 2 \times 2^n$$

where $n$ is the number of bits used for the depth aspect.

For floating-point depth attachment, there is no single minimum resolvable difference. In this case, the minimum resolvable difference for a given polygon is dependent on the maximum exponent, $e$, in the range of $z$ values spanned by the primitive. If $n$ is the number of bits in the floating-point mantissa, the minimum resolvable difference, $r$, for the given primitive is defined as

$$r = 2^{e-n}$$

If no depth attachment is present, $r$ is undefined.

The bias value $o$ for a polygon is

$$o = \text{dbclamp}(m \times \text{depthBiasSlopeFactor} + r \times \text{depthBiasConstantFactor})$$

where $\text{dbclamp}(x) = \begin{cases} x & \text{depthBiasClamp} = 0 \text{ or } NaN \\ \min(x, \text{depthBiasClamp}) & \text{depthBiasClamp} > 0 \\ \max(x, \text{depthBiasClamp}) & \text{depthBiasClamp} < 0 \end{cases}$

$m$ is computed as described above. If the depth attachment uses a fixed-point representation, $m$ is a
function of depth values in the range \([0,1]\), and \(o\) is applied to depth values in the same range.

Depth bias is applied to triangle topology primitives received by the rasterizer regardless of polygon mode. Depth bias may also be applied to line and point topology primitives received by the rasterizer.

To dynamically set the depth bias parameters, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBias(
    VkCommandBuffer commandBuffer,
    float depthBiasConstantFactor,
    float depthBiasClamp,
    float depthBiasSlopeFactor);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasConstantFactor` is a scalar factor controlling the constant depth value added to each fragment.
- `depthBiasClamp` is the maximum (or minimum) depth bias of a fragment.
- `depthBiasSlopeFactor` is a scalar factor applied to a fragment's slope in depth bias calculations.

This command sets the depth bias parameters for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineRasterizationStateCreateInfo::depthBiasConstantFactor`, `depthBiasClamp`, and `depthBiasSlopeFactor` values used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetDepthBias-depthBiasClamp-00790
  If the `depthBiasClamp` feature is not enabled, `depthBiasClamp` must be 0.0

**Valid Usage (Implicit)**

- VUID-vkCmdSetDepthBias-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBias-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthBias-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

</tbody>
</table>

25.9.4. Conservative Rasterization

If the `pNext` chain of `VkPipelineRasterizationStateCreateInfo` includes a `VkPipelineRasterizationConservativeStateCreateInfoEXT` structure, then that structure includes parameters controlling conservative rasterization.

`VkPipelineRasterizationConservativeStateCreateInfoEXT` is defined as:

```cpp
// Provided by VK_EXT_conservative_rasterization
typedef struct VkPipelineRasterizationConservativeStateCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkPipelineRasterizationConservativeStateCreateFlagsEXT flags;
    VkConservativeRasterizationModeEXT conservativeRasterizationMode;
    float                     extraPrimitiveOverestimationSize;
} VkPipelineRasterizationConservativeStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `conservativeRasterizationMode` is the conservative rasterization mode to use.
- `extraPrimitiveOverestimationSize` is the extra size in pixels to increase the generating primitive during conservative rasterization at each of its edges in X and Y equally in screen space beyond the base overestimation specified in `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize`. If `conservativeRasterizationMode` is not `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, this value is ignored.

If this structure is not included in the `pNext` chain, `conservativeRasterizationMode` is considered to be
Polygon rasterization can be made conservative by setting `conservativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` or `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` in `VkPipelineRasterizationConservativeStateCreateInfoEXT`.

Note
If `conservativePointAndLineRasterization` is supported, conservative rasterization can be applied to line and point primitives, otherwise it must be disabled.

Valid Usage

- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-extraPrimitiveOverestimationSize-01769
  `extraPrimitiveOverestimationSize` must be in the range of 0.0 to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::maxExtraPrimitiveOverestimationSize` inclusive.

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_CONSERVATIVE_STATE_CREATE_INFO_EXT`.
- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-flags-zerobitmask
  `flags` must be 0.
- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-conservativeRasterizationMode-parameter
  `conservativeRasterizationMode` must be a valid `VkConservativeRasterizationModeEXT` value.

```
// Provided by VK_EXT_conservative_rasterization
typedef VkFlags VkPipelineRasterizationConservativeStateCreateInfoEXTcreateFlagsEXT;
```

`VkPipelineRasterizationConservativeStateCreateInfoEXTcreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode`, specifying the conservative rasterization mode are:

```
// Provided by VK_EXT_conservative_rasterization
typedef enum VkConservativeRasterizationModeEXT {
    VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT = 0,
    VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT = 1,
};
```
VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT = 2,
} VkConservativeRasterizationModeEXT;

- **VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT** specifies that conservative rasterization is disabled and rasterization proceeds as normal.

- **VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT** specifies that conservative rasterization is enabled in overestimation mode.

- **VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT** specifies that conservative rasterization is enabled in underestimation mode.

When overestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made whether any portion of the pixel (including its edges and corners) is covered by the primitive. If any portion of the pixel is covered, then all bits of the **coverage mask** for the fragment corresponding to that pixel are enabled.

For the purposes of evaluating which pixels are covered by the primitive, implementations can increase the size of the primitive by up to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize` pixels at each of the primitive edges. This may increase the number of fragments generated by this primitive and represents an overestimation of the pixel coverage.

This overestimation size can be increased further by setting the `extraPrimitiveOverestimationSize` value above 0.0 in steps of `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSizeGranularity` up to and including `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSize`. This may further increase the number of fragments generated by this primitive.

The actual precision of the overestimation size used for conservative rasterization may vary between implementations and produce results that only approximate the `primitiveOverestimationSize` and `extraPrimitiveOverestimationSizeGranularity` properties.

For triangles if **VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT** is enabled, fragments will be generated if the primitive area covers any portion of any pixel inside the fragment area, including their edges or corners. The tie-breaking rule described in **Basic Polygon Rasterization** does not apply during conservative rasterization and coverage is set for all fragments generated from shared edges of polygons. Degenerate triangles that evaluate to zero area after rasterization, even for pixels containing a vertex or edge of the zero-area polygon, will be culled if `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateTrianglesRasterized` is **VK_FALSE** or will generate fragments if `degenerateTrianglesRasterized` is **VK_TRUE**. The fragment input values for these degenerate triangles take their attribute and depth values from the provoking vertex. Degenerate triangles are considered back-facing and the application can enable backface culling if desired. Triangles that are zero area before rasterization may be culled regardless.

For lines if **VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT** is enabled, and the implementation sets `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization` to **VK_TRUE**, fragments will be generated if the line covers any portion of any pixel inside the fragment area, including their edges or corners. Degenerate lines that evaluate to zero length after rasterization will be culled if `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateLinesRasterized` is **VK_FALSE** or
will generate fragments if `degenerateLinesRasterized` is `VK_TRUE`. The fragments input values for these degenerate lines take their attribute and depth values from the provoking vertex. Lines that are zero length before rasterization may be culled regardless.

For points if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, and the implementation sets `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization` to `VK_TRUE`, fragments will be generated if the point square covers any portion of any pixel inside the fragment area, including their edges or corners.

When underestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made whether all of the pixel (including its edges and corners) is covered by the primitive. If the entire pixel is covered, then a fragment is generated with all bits of its coverage mask corresponding to the pixel enabled, otherwise the pixel is not considered covered even if some portion of the pixel is covered. The fragment is discarded if no pixels inside the fragment area are considered covered.

For triangles, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if any pixel inside the fragment area is fully covered by the generating primitive, including its edges and corners.

For lines, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will be generated if any pixel inside the fragment area, including its edges and corners, are entirely covered by the line.

For points, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if the point square covers the entirety of any pixel square inside the fragment area, including its edges or corners.

For both overestimate and underestimate conservative rasterization modes a fragment has all of its pixel squares fully covered by the generating primitive must set `FullyCoveredEXT` to `VK_TRUE` if the implementation enables the `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::fullyCoveredFragmentShaderInputVariable` feature.

When setting the fragment shading rate results in fragments covering multiple pixels, coverage for conservative rasterization is still evaluated on a per-pixel basis and may result in fragments with partial coverage. For fragment shader inputs decorated with `FullyCoveredEXT`, a fragment is considered fully covered if and only if all pixels in the fragment are fully covered by the generating primitive.
Chapter 26. Fragment Operations

Fragments produced by rasterization go through a number of operations to determine whether or how values produced by fragment shading are written to the framebuffer.

The following fragment operations adhere to rasterization order, and are typically performed in this order:

1. Discard rectangles test
2. Scissor test
3. Sample mask test
4. Certain Fragment shading operations:
   - Sample Mask Accesses
   - Depth Replacement
   - Stencil Reference Replacement
   - Interlocked Operations
5. Multisample coverage
6. Depth bounds test
7. Stencil test
8. Depth test
9. Sample counting
10. Coverage reduction

The coverage mask generated by rasterization describes the initial coverage of each sample covered by the fragment. Fragment operations will update the coverage mask to add or subtract coverage where appropriate. If a fragment operation results in all bits of the coverage mask being 0, the fragment is discarded, and no further operations are performed. Fragments can also be programmatically discarded in a fragment shader by executing one of:

- OpTerminateInvocation
- OpDemoteToHelperInvocationEXT
- OpKill.

When one of the fragment operations in this chapter is described as “replacing” a fragment shader output, that output is replaced unconditionally, even if no fragment shader previously wrote to that output.

If there is a fragment shader and it declares the PostDepthCoverage execution mode, the sample mask test is instead performed after the depth test.

If there is a fragment shader and it declares the EarlyFragmentTests execution mode, fragment shading and multisample coverage operations should instead be performed after sample counting, and sample mask test may instead be performed after sample counting.
For a pipeline with the following properties:

- a fragment shader is specified
- the fragment shader does not write to storage resources;
- the fragment shader specifies the DepthReplacing execution mode; and
- either
  - the fragment shader specifies the DepthUnchanged execution mode;
  - the fragment shader specifies the DepthLess execution mode and the pipeline uses a `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` of `VK_COMPARE_OP_GREATER` or `VKCOMPARE_OP_GREATER_OR_EQUAL`; or
  - the fragment shader specifies the DepthGreater execution mode and the pipeline uses a `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` of `VK_COMPARE_OP_LESS` or `VKCOMPARE_OP_LESS_OR_EQUAL`

the implementation may perform depth bounds test before fragment shading and perform an additional depth test immediately after that using the interpolated depth value generated by rasterization.

Once all fragment operations have completed, fragment shader outputs for covered color attachment samples pass through framebuffer operations.

### 26.1. Discard Rectangles Test

The discard rectangle test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a set of discard rectangles.

Each discard rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineDiscardRectangleStateCreateInfoEXT` structure during pipeline creation, or dynamically by the `vkCmdSetDiscardRectangleEXT` command.

A given sample is considered inside a discard rectangle if the \(x_f\) is in the range \([VkRect2D::offset.x, VkRect2D::offset.x + VkRect2D::extent.x]\) and \(y_f\) is in the range \([VkRect2D::offset.y, VkRect2D::offset.y + VkRect2D::extent.y]\). If the test is set to be inclusive, samples that are not inside any of the discard rectangles will have their coverage set to 0. If the test is set to be exclusive, samples that are inside any of the discard rectangles will have their coverage set to 0.

If no discard rectangles are specified, the coverage mask is unmodified by this operation.

The `VkPipelineDiscardRectangleStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_discard_rectangles
typedef struct VkPipelineDiscardRectangleStateCreateInfoEXT {
  VkStructureType sType;
  const void* pNext;
  VkPipelineDiscardRectangleStateCreateFlagsEXT flags;
  VkDiscardRectangleModeEXT discardRectangleMode;
  uint32_t discardRectangleCount;
} VkPipelineDiscardRectangleStateCreateInfoEXT;
```
• sType is a **VkStructureType** value identifying this structure.
• pNext is **NULL** or a pointer to a structure extending this structure.
• flags is reserved for future use.
• discardRectangleMode is a **VkDiscardRectangleModeEXT** value determining whether the discard rectangle test is inclusive or exclusive.
• discardRectangleCount is the number of discard rectangles to use.
• pDiscardRectangles is a pointer to an array of **VkRect2D** structures defining discard rectangles.

If the **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT** dynamic state is enabled for a pipeline, the pDiscardRectangles member is ignored. If the **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT** dynamic state is not enabled for the pipeline the presence of this structure in the **VkGraphicsPipelineCreateInfo** chain, and a discardRectangleCount greater than zero, implicitly enables discard rectangles in the pipeline, otherwise discard rectangles **must** enabled or disabled by **vkCmdSetDiscardRectangleEnableEXT**. If the **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT** dynamic state is enabled for the pipeline, the discardRectangleMode member is ignored, and the discard rectangle mode **must** be set by **vkCmdSetDiscardRectangleModeEXT**.

When this structure is included in the pNext chain of **VkGraphicsPipelineCreateInfo**, it defines parameters of the discard rectangle test. If the **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT** dynamic state is not enabled, and this structure is not included in the pNext chain, it is equivalent to specifying this structure with a discardRectangleCount of 0.

### Valid Usage

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleCount-00582
  ```
  discardRectangleCount **must** be less than or equal to
  VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles
  ```

### Valid Usage (Implicit)

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-sType-sType
  ```
  sType **must** be **VK_STRUCTURE_TYPE_PIPELINE_DISCARD_RECTANGLE_STATE_CREATE_INFO_EXT**
  ```

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-flags-zeroibitmask
  ```
  flags **must** be 0
  ```

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleMode-parameter
  ```
  discardRectangleMode **must** be a valid **VkDiscardRectangleModeEXT** value
  ```

// Provided by VK_EXT_discard_rectangles
typedef VkFlags VkPipelineDiscardRectangleStateCreateFlagsEXT;
 VkPipelineDiscardRectangleStateCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

 VkDiscardRectangleModeEXT values are:

```c
// Provided by VK_EXT_discard_rectangles
typedef enum VkDiscardRectangleModeEXT {
    VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT = 0,
    VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT = 1,
} VkDiscardRectangleModeEXT;
```

- **VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT** specifies that the discard rectangle test is inclusive.
- **VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT** specifies that the discard rectangle test is exclusive.

To dynamically set the discard rectangles, call:

```c
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstDiscardRectangle,
    uint32_t discardRectangleCount,
    const VkRect2D* pDiscardRectangles);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **firstDiscardRectangle** is the index of the first discard rectangle whose state is updated by the command.
- **discardRectangleCount** is the number of discard rectangles whose state are updated by the command.
- **pDiscardRectangles** is a pointer to an array of VkRect2D structures specifying discard rectangles.

The discard rectangle taken from element i of **pDiscardRectangles** replace the current state for the discard rectangle at index **firstDiscardRectangle + i**, for i in [0, **discardRectangleCount**).

This command sets the discard rectangles for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT** set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineDiscardRectangleStateCreateInfoEXT::pDiscardRectangles values used to create the currently active pipeline.

**Valid Usage**

- **VUID-vkCmdSetDiscardRectangleEXT-firstDiscardRectangle-00585**
  The sum of **firstDiscardRectangle** and **discardRectangleCount** must be less than or equal to **VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles**
- **VUID-vkCmdSetDiscardRectangleEXT-x-00587**
The $x$ and $y$ member of offset in each VkRect2D element of pDiscardRectangles must be greater than or equal to 0

- VUID-vkCmdSetDiscardRectangleEXT-offset-00588
  Evaluation of $(offset.x + extent.width)$ in each VkRect2D element of pDiscardRectangles must not cause a signed integer addition overflow

- VUID-vkCmdSetDiscardRectangleEXT-offset-00589
  Evaluation of $(offset.y + extent.height)$ in each VkRect2D element of pDiscardRectangles must not cause a signed integer addition overflow

### Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetDiscardRectangleEXT-pDiscardRectangles-parameter
  pDiscardRectangles must be a valid pointer to an array of discardRectangleCount VkRect2D structures

- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetDiscardRectangleEXT-discardRectangleCount-arraylength
  discardRectangleCount must be greater than 0

### Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

To dynamically set whether discard rectangles are enabled, call:

```c
// Provided by VK_EXT_discard_rectangles
```
```c
void vkCmdSetDiscardRectangleEnableEXT(
    VkCommandBuffer commandBuffer, 
    VkBool32 discardRectangleEnable);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **discardRectangleEnable** specifies whether discard rectangles are enabled or not.

This command sets the discard rectangle enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is implied by the `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount` value used to create the currently active pipeline, where a non-zero `discardRectangleCount` implicitly enables discard rectangles, otherwise they are disabled.

### Valid Usage

- VUID-vkCmdSetDiscardRectangleEnableEXT-specVersion-07851
  The `VK_EXT_discard_rectangles` extension must be enabled, and the implementation must support at least `specVersion 2` of this extension

### Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary, Secondary</td>
<td>Both</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>
To dynamically set the discard rectangle mode, call:

```c
// Provided by VK_EXT_discard_rectangles
do
void vkCmdSetDiscardRectangleModeEXT(
    VkCommandBuffer commandBuffer,
    VkDiscardRectangleModeEXT discardRectangleMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `discardRectangleMode` specifies the discard rectangle mode for all discard rectangles, either inclusive or exclusive.

This command sets the discard rectangle mode for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleMode` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDiscardRectangleModeEXT-specVersion-07852**
  The `VK_EXT_discard_rectangles` extension must be enabled, and the implementation must support at least `specVersion` 2 of this extension

### Valid Usage (Implicit)

- **VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetDiscardRectangleModeEXT-discardRectangleMode-parameter**
  `discardRectangleMode` must be a valid `VkDiscardRectangleModeEXT` value

- **VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
26.2. Scissor Test

The scissor test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a scissor rectangle at the index equal to the fragment's `ViewportIndex`.

Each scissor rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineViewportStateCreateInfo` structure during pipeline creation, or dynamically by the `vkCmdSetScissor` command.

A given sample is considered inside a scissor rectangle if \(x_f\) is in the range \([VkRect2D::offset.x, VkRect2D::offset.x + VkRect2D::extent.x)\), and \(y_f\) is in the range \([VkRect2D::offset.y, VkRect2D::offset.y + VkRect2D::extent.y)\). Samples with coordinates outside the scissor rectangle at the corresponding `ViewportIndex` will have their coverage set to 0.

To dynamically set the scissor rectangles, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetScissor(
    VkCommandBuffer commandBuffer,
    uint32_t firstScissor,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstScissor` is the index of the first scissor whose state is updated by the command.
- `scissorCount` is the number of scissors whose rectangles are updated by the command.
- `pScissors` is a pointer to an array of `VkRect2D` structures defining scissor rectangles.

The scissor rectangles taken from element \(i\) of `pScissors` replace the current state for the scissor index \(firstScissor + i\), for \(i\) in \([0, scissorCount)\).

This command sets the scissor rectangles for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR` set in `VkPipelineDynamicStateCreateInfo ::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportStateCreateInfo ::pScissors` values used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetScissor-firstScissor-00592
  The sum of firstScissor and scissorCount must be between 1 and VkPhysicalDeviceLimits::maxViewports, inclusive

- VUID-vkCmdSetScissor-firstScissor-00593
  If the multiViewport feature is not enabled, firstScissor must be 0

- VUID-vkCmdSetScissor-scissorCount-00594
  If the multiViewport feature is not enabled, scissorCount must be 1

- VUID-vkCmdSetScissor-x-00595
  The x and y members of offset member of any element of pScissors must be greater than or equal to 0

- VUID-vkCmdSetScissor-offset-00596
  Evaluation of (offset.x + extent.width) must not cause a signed integer addition overflow for any element of pScissors

- VUID-vkCmdSetScissor-offset-00597
  Evaluation of (offset.y + extent.height) must not cause a signed integer addition overflow for any element of pScissors

Valid Usage (Implicit)

- VUID-vkCmdSetScissor-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetScissor-pScissors-parameter
  pScissors must be a valid pointer to an array of scissorCount VkRect2D structures

- VUID-vkCmdSetScissor-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetScissor-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetScissor-scissorCount-arraylength
  scissorCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
26.3. Sample Mask Test

The sample mask test compares the coverage mask for a fragment with the sample mask defined by VkPipelineMultisampleStateCreateInfo::pSampleMask.

Each bit of the coverage mask is associated with a sample index as described in the rasterization chapter. If the bit in VkPipelineMultisampleStateCreateInfo::pSampleMask which is associated with that same sample index is set to 0, the coverage mask bit is set to 0.

26.4. Fragment Shading

Fragment shaders are invoked for each fragment, or as helper invocations.

Most operations in the fragment shader are not performed in rasterization order, with exceptions called out in the following sections.

For fragment shaders invoked by fragments, the following rules apply:

- A fragment shader must not be executed if a fragment operation that executes before fragment shading discards the fragment.
- A fragment shader may not be executed if:
  - An implementation determines that another fragment shader, invoked by a subsequent primitive in primitive order, overwrites all results computed by the shader (including writes to storage resources).
  - Any other fragment operation discards the fragment, and the shader does not write to any storage resources.
- Otherwise, at least one fragment shader must be executed.
  - If sample shading is enabled and multiple invocations per fragment are required, additional invocations must be executed as specified.
  - Each covered sample must be included in at least one fragment shader invocation.

If no fragment shader is included in the pipeline, no fragment shader is executed, and undefined values may be written to all color attachment outputs during this fragment operation.

Note

Multiple fragment shader invocations may be executed for the same fragment for any number of implementation-dependent reasons. When there is more than one
fragment shader invocation per fragment, the association of samples to
invocations is implementation-dependent. Stores and atomics performed by these
additional invocations have the normal effect.

For example, if the subpass includes multiple views in its view mask, a fragment
shader may be invoked separately for each view.

26.4.1. Sample Mask

Reading from the SampleMask built-in in the Input storage class will return the coverage mask for the
current fragment as calculated by fragment operations that executed prior to fragment shading.

If sample shading is enabled, fragment shaders will only see values of 1 for samples being shaded -
other bits will be 0.

Each bit of the coverage mask is associated with a sample index as described in the rasterization
chapter. If the bit in SampleMask which is associated with that same sample index is set to 0, that
coverage mask bit is set to 0.

Values written to the SampleMask built-in in the Output storage class will be used by the multisample
coverage operation, with the same encoding as the input built-in.

26.4.2. Depth Replacement

Writing to the FragDepth built-in will replace the fragment's calculated depth values for each sample
in the input SampleMask. Depth testing performed after the fragment shader for this fragment will
use this new value as z_f.

26.4.3. Stencil Reference Replacement

Writing to the FragStencilRefEXT built-in will replace the fragment's stencil reference value for each
sample in the input SampleMask. Stencil testing performed after the fragment shader for this
fragment will use this new value as s_r.

26.4.4. Interlocked Operations

OpBeginInvocationInterlockEXT and OpEndInvocationInterlockEXT define a section of a fragment
shader which imposes additional ordering constraints on operations performed within them. These
operations are defined as interlocked operations. How interlocked operations are ordered against
other fragment shader invocations depends on the specified execution modes.

If the ShadingRateInterlockOrderedEXT execution mode is specified, any interlocked operations in a
fragment shader must happen before interlocked operations in fragment shader invocations that
execute later in rasterization order and cover at least one sample in the same fragment area, and
must happen after interlocked operations in a fragment shader that executes earlier in
rasterization order and cover at least one sample in the same fragment area.

If the ShadingRateInterlockUnorderedEXT execution mode is specified, any interlocked operations in a
fragment shader must happen before or after interlocked operations in fragment shader
invocations that execute earlier or later in rasterization order and cover at least one sample in the same fragment area.

If the PixelInterlockOrderedEXT execution mode is specified, any interlocked operations in a fragment shader must happen before interlocked operations in fragment shader invocations that execute later in rasterization order and cover at least one sample in the same pixel, and must happen after interlocked operations in a fragment shader that executes earlier in rasterization order and cover at least one sample in the same pixel.

If the PixelInterlockUnorderedEXT execution mode is specified, any interlocked operations in a fragment shader must happen before or after interlocked operations in fragment shader invocations that execute earlier or later in rasterization order and cover at least one sample in the same pixel.

If the SampleInterlockOrderedEXT execution mode is specified, any interlocked operations in a fragment shader must happen before interlocked operations in fragment shader invocations that execute later in rasterization order and cover at least one of the same samples, and must happen after interlocked operations in a fragment shader that executes earlier in rasterization order and cover at least one of the same samples.

If the SampleInterlockUnorderedEXT execution mode is specified, any interlocked operations in a fragment shader must happen before or after interlocked operations in fragment shader invocations that execute earlier or later in rasterization order and cover at least one of the same samples.

26.5. Multisample Coverage

If a fragment shader is active and its entry point's interface includes a built-in output variable decorated with SampleMask, the coverage mask is ANDed with the bits of the SampleMask built-in to generate a new coverage mask. If sample shading is enabled, bits written to SampleMask corresponding to samples that are not being shaded by the fragment shader invocation are ignored. If no fragment shader is active, or if the active fragment shader does not include SampleMask in its interface, the coverage mask is not modified.

Next, the fragment alpha value and coverage mask are modified based on the line coverage factor if the lineRasterizationMode member of the VkPipelineRasterizationStateCreateInfo structure is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT, and the alphaToCoverageEnable and alphaToOneEnable members of the VkPipelineMultisampleStateCreateInfo structure.

All alpha values in this section refer only to the alpha component of the fragment shader output that has a Location and Index decoration of zero (see the Fragment Output Interface section). If that shader output has an integer or unsigned integer type, then these operations are skipped.

If the lineRasterizationMode member of the VkPipelineRasterizationStateCreateInfo structure is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT and the fragment came from a line segment, then the alpha value is replaced by multiplying it by the coverage factor for the fragment computed during smooth line rasterization.

If alphaToCoverageEnable is enabled, a temporary coverage mask is generated where each bit is
determined by the fragment's alpha value, which is ANDed with the fragment coverage mask.

No specific algorithm is specified for converting the alpha value to a temporary coverage mask. It is intended that the number of 1's in this value be proportional to the alpha value (clamped to [0,1]), with all 1's corresponding to a value of 1.0 and all 0's corresponding to 0.0. The algorithm may be different at different framebuffer coordinates.

\[ \text{Note} \]
Using different algorithms at different framebuffer coordinates \textit{may} help to avoid artifacts caused by regular coverage sample locations.

Finally, if \textit{alphaToOneEnable} is enabled, each alpha value is replaced by the maximum representable alpha value for fixed-point color attachments, or by 1.0 for floating-point attachments. Otherwise, the alpha values are not changed.

### 26.6. Depth and Stencil Operations

Pipeline state controlling the depth bounds tests, stencil test, and depth test is specified through the members of the \texttt{VkPipelineDepthStencilStateCreateInfo} structure.

The \texttt{VkPipelineDepthStencilStateCreateInfo} structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDepthStencilStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDepthStencilStateCreateFlags flags;
    VkBool32 depthTestEnable;
    VkBool32 depthWriteEnable;
    VkCompareOp depthCompareOp;
    VkBool32 depthBoundsTestEnable;
    VkBool32 stencilTestEnable;
    VkStencilOpState front;
    VkStencilOpState back;
    float minDepthBounds;
    float maxDepthBounds;
} VkPipelineDepthStencilStateCreateInfo;
```

- \textit{sType} is a \texttt{VkStructureType} value identifying this structure.
- \textit{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \textit{flags} is reserved for future use.
- \textit{depthTestEnable} controls whether depth testing is enabled.
- \textit{depthWriteEnable} controls whether depth writes are enabled when \textit{depthTestEnable} is \texttt{VK_TRUE}. Depth writes are always disabled when \textit{depthTestEnable} is \texttt{VK_FALSE}.
- \textit{depthCompareOp} is a \texttt{VkCompareOp} value specifying the comparison operator to use in the Depth Comparison step of the depth test.
• depthBoundsTestEnable controls whether depth bounds testing is enabled.
• stencilTestEnable controls whether stencil testing is enabled.
• front and back are VkStencilOpState values controlling the corresponding parameters of the stencil test.
• minDepthBounds is the minimum depth bound used in the depth bounds test.
• maxDepthBounds is the maximum depth bound used in the depth bounds test.

Valid Usage

• VUID-VkPipelineDepthStencilStateCreateInfo-depthBoundsTestEnable-00598
  If the depthBounds feature is not enabled, depthBoundsTestEnable must be VK_FALSE

Valid Usage (Implicit)

• VUID-VkPipelineDepthStencilStateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO

• VUID-VkPipelineDepthStencilStateCreateInfo-pNext-pNext
  pNext must be NULL

• VUID-VkPipelineDepthStencilStateCreateInfo-flags-zeroBitmask
  flags must be 0

• VUID-VkPipelineDepthStencilStateCreateInfo-depthCompareOp-parameter
  depthCompareOp must be a valid VkCompareOp value

• VUID-VkPipelineDepthStencilStateCreateInfo-front-parameter
  front must be a valid VkStencilOpState structure

• VUID-VkPipelineDepthStencilStateCreateInfo-back-parameter
  back must be a valid VkStencilOpState structure

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDepthStencilStateCreateFlags;

VkPipelineDepthStencilStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

26.7. Depth Bounds Test

The depth bounds test compares the depth value $z_i$ in the depth/stencil attachment at each sample’s framebuffer coordinates $(x_f, y_f)$ and sample index $i$ against a set of depth bounds.

The depth bounds are determined by two floating point values defining a minimum (minDepthBounds) and maximum (maxDepthBounds) depth value. These values are either set by the VkPipelineDepthStencilStateCreateInfo structure during pipeline creation, or dynamically by
vkCmdSetDepthBoundsTestEnableEXT and vkCmdSetDepthBounds.

A given sample is considered within the depth bounds if \( z_a \) is in the range \([\text{minDepthBounds}, \text{maxDepthBounds}]\). Samples with depth attachment values outside of the depth bounds will have their coverage set to 0.

If the depth bounds test is disabled, or if there is no depth attachment, the coverage mask is unmodified by this operation.

To dynamically enable or disable the depth bounds test, call:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthBoundsTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBoundsTestEnable);
```

- \textit{commandBuffer} is the command buffer into which the command will be recorded.
- \textit{depthBoundsTestEnable} specifies if the depth bounds test is enabled.

This command sets the depth bounds enable for subsequent drawing commands when the graphics pipeline is created with \texttt{VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. Otherwise, this state is specified by the \texttt{VkPipelineDepthStencilStateCreateInfo::depthBoundsTestEnable} value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetDepthBoundsTestEnable-None-08971
  At least one of the following \textbf{must} be true:
  - the extendedDynamicState feature is enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-parameter
  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-recording
  \texttt{commandBuffer} \textbf{must} be in the recording state

- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support graphics operations

**Host Synchronization**

- Host access to \texttt{commandBuffer} \textbf{must} be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the depth bounds range, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBounds(
    VkCommandBuffer commandBuffer,
    float minDepthBounds,
    float maxDepthBounds);
```

• commandBuffer is the command buffer into which the command will be recorded.
• minDepthBounds is the minimum depth bound.
• maxDepthBounds is the maximum depth bound.

This command sets the depth bounds range for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_DEPTH_BOUNDS set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo::minDepthBounds and VkPipelineDepthStencilStateCreateInfo::maxDepthBounds values used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetDepthBounds-minDepthBounds-00600
  If the VK_EXT_depth_range_unrestricted extension is not enabled minDepthBounds must be between 0.0 and 1.0, inclusive

• VUID-vkCmdSetDepthBounds-maxDepthBounds-00601
  If the VK_EXT_depth_range_unrestricted extension is not enabled maxDepthBounds must be between 0.0 and 1.0, inclusive

Valid Usage (Implicit)

• VUID-vkCmdSetDepthBounds-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetDepthBounds-commandBuffer-recording

1136
commandBuffer must be in the recording state

- VUID-vkCmdSetDepthBounds-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

26.8. Stencil Test

The stencil test compares the stencil attachment value \( s_a \) in the depth/stencil attachment at each sample’s framebuffer coordinates \((x_f, y_f)\) and sample index \(i\) against a stencil reference value.

If the stencil test is not enabled, as specified by `vkCmdSetStencilTestEnableEXT` or `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable`, or if there is no stencil attachment, the coverage mask is unmodified by this operation.

The stencil test is controlled by one of two sets of stencil-related state, the front stencil state and the back stencil state. Stencil tests and writes use the back stencil state when processing fragments generated by back-facing polygons, and the front stencil state when processing fragments generated by front-facing polygons or any other primitives.

The comparison operation performed is determined by the `VkCompareOp` value set by `vkCmdSetStencilOpEXT::compareOp`, or by `VkStencilOpState::compareOp` during pipeline creation.

The compare mask \( s_c \) and stencil reference value \( s_r \) of the front or the back stencil state set determine arguments of the comparison operation. \( s_c \) is set by the `VkPipelineDepthStencilStateCreateInfo` structure during pipeline creation, or by the `vkCmdSetStencilCompareMask` command. \( s_r \) is set by `VkPipelineDepthStencilStateCreateInfo` or by `vkCmdSetStencilReference`.

\( s_c \) and \( s_r \) are each independently combined with \( s_a \) using a bitwise AND operation to create masked reference and attachment values \( s'_r \) and \( s'_a \). \( s'_r \) and \( s'_a \) are used as the reference and test values, respectively, in the operation specified by the `VkCompareOp`.
If the comparison evaluates to false, the coverage for the sample is set to 0.

A new stencil value \( s_g \) is generated according to a stencil operation defined by \( \text{VkStencilOp} \) parameters set by \( \text{vkCmdSetStencilOpEXT} \) or \( \text{VkPipelineDepthStencilStateCreateInfo} \). If the stencil test fails, \( \text{failOp} \) defines the stencil operation used. If the stencil test passes however, the stencil op used is based on the depth test - if it passes, \( \text{VkPipelineDepthStencilStateCreateInfo}::\text{passOp} \) is used, otherwise \( \text{VkPipelineDepthStencilStateCreateInfo}::\text{depthFailOp} \) is used.

The stencil attachment value \( s_a \) is then updated with the generated stencil value \( s_g \) according to the write mask \( s_w \) defined by \text{writeMask} in \( \text{VkPipelineDepthStencilStateCreateInfo}::\text{front} \) and \( \text{VkPipelineDepthStencilStateCreateInfo}::\text{back} \) as:

\[
s_a = (s_a \& \neg s_w) \mid (s_g \& s_w)
\]

To dynamically enable or disable the stencil test, call:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetStencilTestEnableEXT(
    VkCommandBuffer commandBuffer,    commandBuffer,
    VkBool32 stencilTestEnable);       stencilTestEnable);
```

- \text{commandBuffer} is the command buffer into which the command will be recorded.
- \text{stencilTestEnable} specifies if the stencil test is enabled.

This command sets the stencil test enable for subsequent drawing commands when the graphics pipeline is created with \text{VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE} set in \( \text{VkPipelineDynamicStateCreateInfo}::\text{pDynamicStates} \). Otherwise, this state is specified by the \( \text{VkPipelineDepthStencilStateCreateInfo}::\text{stencilTestEnable} \) value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetStencilTestEnable-None-08971
  At least one of the following \textbf{must} be true:
  - the \text{extendedDynamicState} feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetStencilTestEnable-commandBuffer-parameter
  \text{commandBuffer} \textbf{must} be a valid \text{VkCommandBuffer} handle

- VUID-vkCmdSetStencilTestEnable-commandBuffer-recording
  \text{commandBuffer} \textbf{must} be in the \text{recording state}

- VUID-vkCmdSetStencilTestEnable-commandBuffer-cmdpool
  The \text{VkCommandPool} that \text{commandBuffer} was allocated from \textbf{must} support graphics
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the stencil operation, call:

```cpp
// Provided by VK_EXT_extended_dynamic_state
def void vkCmdSetStencilOpEXT(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    VkStencilOp failOp,
    VkStencilOp passOp,
    VkStencilOp depthFailOp,
    VkCompareOp compareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the stencil operation.
- `failOp` is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- `passOp` is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
- `depthFailOp` is a `VkStencilOp` value specifying the action performed on samples that pass the stencil test and fail the depth test.
- `compareOp` is a `VkCompareOp` value specifying the comparison operator used in the stencil test.

This command sets the stencil operation for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineDepthStencilStateCreateInfo::failOp, passOp, depthFailOp, and compareOp` values used to create the currently active pipeline, for both front and back faces.
Valid Usage

• VUID-vkCmdSetStencilOp-None-08971
  At least one of the following **must** be true:
  ◦ the `extendedDynamicState` feature is enabled

Valid Usage (Implicit)

• VUID-vkCmdSetStencilOp-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

• VUID-vkCmdSetStencilOp-faceMask-parameter
  `faceMask` **must** be a valid combination of `VkStencilFaceFlagBits` values

• VUID-vkCmdSetStencilOp-faceMask-required bitmask
  `faceMask` **must** not be 0

• VUID-vkCmdSetStencilOp-failOp-parameter
  `failOp` **must** be a valid `VkStencilOp` value

• VUID-vkCmdSetStencilOp-passOp-parameter
  `passOp` **must** be a valid `VkStencilOp` value

• VUID-vkCmdSetStencilOp-depthFailOp-parameter
  `depthFailOp` **must** be a valid `VkStencilOp` value

• VUID-vkCmdSetStencilOp-compareOp-parameter
  `compareOp` **must** be a valid `VkCompareOp` value

• VUID-vkCmdSetStencilOp-commandBuffer-recording
  `commandBuffer` **must** be in the `recording state`

• VUID-vkCmdSetStencilOp-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

Host Synchronization

• Host access to `commandBuffer` **must** be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>

The `VkStencilOpState` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkStencilOpState {
    VkStencilOp failOp;
    VkStencilOp passOp;
    VkStencilOp depthFailOp;
    VkCompareOp compareOp;
    uint32_t compareMask;
    uint32_t writeMask;
    uint32_t reference;
} VkStencilOpState;
```

- `failOp` is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- `passOp` is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
- `depthFailOp` is a `VkStencilOp` value specifying the action performed on samples that pass the stencil test and fail the depth test.
- `compareOp` is a `VkCompareOp` value specifying the comparison operator used in the stencil test.
- `compareMask` selects the bits of the unsigned integer stencil values participating in the stencil test.
- `writeMask` selects the bits of the unsigned integer stencil values updated by the stencil test in the stencil framebuffer attachment.
- `reference` is an integer stencil reference value that is used in the unsigned stencil comparison.

### Valid Usage (Implicit)

- VUID-VkStencilOpState-failOp-parameter
  - `failOp must be` a valid `VkStencilOp` value
- VUID-VkStencilOpState-passOp-parameter
  - `passOp must be` a valid `VkStencilOp` value
- VUID-VkStencilOpState-depthFailOp-parameter
  - `depthFailOp must be` a valid `VkStencilOp` value
- VUID-VkStencilOpState-compareOp-parameter
  - `compareOp must be` a valid `VkCompareOp` value
To **dynamically set** the stencil compare mask, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilCompareMask(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t compareMask);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **faceMask** is a bitmask of **VkStencilFaceFlagBits** specifying the set of stencil state for which to update the compare mask.
- **compareMask** is the new value to use as the stencil compare mask.

This command sets the stencil compare mask for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkStencilOpState::compareMask** value used to create the currently active pipeline, for both front and back faces.

### Valid Usage (Implicit)

- VUID-vkCmdSetStencilCompareMask-commandBuffer-parameter: **commandBuffer** **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdSetStencilCompareMask-faceMask-parameter: **faceMask** **must** be a valid combination of **VkStencilFaceFlagBits** values
- VUID-vkCmdSetStencilCompareMask-faceMask-required bitmask: **faceMask** **must not** be **0**
- VUID-vkCmdSetStencilCompareMask-commandBuffer-recording: **commandBuffer** **must** be in the **recording state**
- VUID-vkCmdSetStencilCompareMask-commandBuffer-cmdpool: The **VkCommandPool** that **commandBuffer** was allocated from **must** support graphics operations

### Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized
**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>

</tbody>
</table>

**VkStencilFaceFlagBits** values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilFaceFlagBits {
    VK_STENCIL_FACE_FRONT_BIT = 0x00000001,
    VK_STENCIL_FACE_BACK_BIT = 0x00000002,
    VK_STENCIL_FACE_FRONT_AND_BACK = 0x00000003,
} VkStencilFaceFlagBits;
```

- **VK_STENCIL_FACE_FRONT_BIT** specifies that only the front set of stencil state is updated.
- **VK_STENCIL_FACE_BACK_BIT** specifies that only the back set of stencil state is updated.
- **VK_STENCIL_FACE_FRONT_AND_BACK** is the combination of **VK_STENCIL_FACE_FRONT_BIT** and **VK_STENCIL_FACE_BACK_BIT**, and specifies that both sets of stencil state are updated.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkStencilFaceFlags;
```

**VkStencilFaceFlags** is a bitmask type for setting a mask of zero or more **VkStencilFaceFlagBits**.

To **dynamically set** the stencil write mask, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilWriteMask(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    VkStencilFaceFlags faceMask,    // faceMask is a bitmask of **VkStencilFaceFlagBits** specifying the set of stencil state for which to update the write mask, as described above for **vkCmdSetStencilCompareMask**.
    uint32_t writeMask);            // writeMask is the new value to use as the stencil write mask.
```

This command sets the stencil write mask for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **writeMask** value used to create the currently active pipeline, for both...
VkPipelineDepthStencilStateCreateInfo::front and VkPipelineDepthStencilStateCreateInfo::back faces.

### Valid Usage (Implicit)

- VUID-vkCmdSetStencilWriteMask-commandBuffer-parameter
  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetStencilWriteMask-faceMask-parameter
  
  `faceMask` **must** be a valid combination of `VkStencilFaceFlagBits` values

- VUID-vkCmdSetStencilWriteMask-faceMask-requiredbitmask
  
  `faceMask` **must** not be 0

- VUID-vkCmdSetStencilWriteMask-commandBuffer-recording
  
  `commandBuffer` **must** be in the **recording state**

- VUID-vkCmdSetStencilWriteMask-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>

To **dynamically set** the stencil reference value, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilReference(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t reference);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the reference value, as described above for `vkCmdSetStencilCompareMask`. 
• reference is the new value to use as the stencil reference value.

This command sets the stencil reference value for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_STENCIL_REFERENCE set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo::reference value used to create the currently active pipeline, for both front and back faces.

Valid Usage (Implicit)

• VUID-vkCmdSetStencilReference-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetStencilReference-faceMask-parameter faceMask must be a valid combination of VkStencilFaceFlagBits values

• VUID-vkCmdSetStencilReference-faceMask-requiredbitmask faceMask must not be 0

• VUID-vkCmdSetStencilReference-commandBuffer-recording commandBuffer must be in the recording state

• VUID-vkCmdSetStencilReference-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>

Possible values of the failOp, passOp, and depthFailOp members of VkStencilOpState, specifying what happens to the stored stencil value if this or certain subsequent tests fail or pass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilOp {
    VK_STENCIL_OP_KEEP = 0,
    VK_STENCIL_OP_ZERO = 1,
};
```
For purposes of increment and decrement, the stencil bits are considered as an unsigned integer.

### 26.9. Depth Test

The depth test compares the depth value \( z_a \) in the depth/stencil attachment at each sample’s framebuffer coordinates \((x_f, y_f)\) and sample index \(i\) against the sample’s depth value \( z_f \). If there is no depth attachment then the depth test is skipped.

The depth test occurs in three stages, as detailed in the following sections.

#### 26.9.1. Depth Clamping and Range Adjustment

If \( VkPipelineRasterizationStateCreateInfo::depthClampEnable \) is enabled, \( z_t \) is clamped to \([z_{\text{min}}, z_{\text{max}}]\), where \( z_{\text{min}} = \min(n, f) \), \( z_{\text{max}} = \max(n, f) \), and \( n \) and \( f \) are the \( \text{minDepth} \) and \( \text{maxDepth} \) depth range values of the viewport used by this fragment, respectively.

Following depth clamping:

- If \( z_t \) is not in the range \([z_{\text{min}}, z_{\text{max}}]\), then \( z_t \) is undefined following this step.
- If the depth attachment has a fixed-point format and \( z_t \) is not in the range \([0, 1]\), then \( z_t \) is undefined following this step.

#### 26.9.2. Depth Comparison

If the depth test is not enabled, as specified by \( vkCmdSetDepthTestEnableEXT \) or
VkPipelineDepthStencilStateCreateInfo::depthTestEnable, then this step is skipped.

The comparison operation performed is determined by the VkCompareOp value set by vkCmdSetDepthCompareOpEXT, or by VkPipelineDepthStencilStateCreateInfo::depthCompareOp during pipeline creation. $z_t$ and $z_a$ are used as the reference and test values, respectively, in the operation specified by the VkCompareOp.

If the comparison evaluates to false, the coverage for the sample is set to 0.

### 26.9.3. Depth Attachment Writes

If depth writes are enabled, as specified by vkCmdSetDepthWriteEnableEXT or VkPipelineDepthStencilStateCreateInfo::depthWriteEnable, and the comparison evaluated to true, the depth attachment value $z_a$ is set to the sample's depth value $z_f$. If there is no depth attachment, no value is written.

To **dynamically enable or disable** the depth test, call:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthTestEnableEXT(
    VkCommandBuffer commandBuffer,   // Provided by VK_EXT_extended_dynamic_state
    VkBool32 depthTestEnable);       // Provided by VK_EXT_extended_dynamic_state
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthTestEnable` specifies if the depth test is enabled.

This command sets the depth test enable for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo::depthTestEnable value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetDepthTestEnable-None-08971
  At least one of the following must be true:
  - the extendedDynamicState feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthTestEnable-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthTestEnable-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetDepthTestEnable-commandBuffer-cmdpool
  commandBuffer must be in the recording state
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

**Host Synchronization**
- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>

To dynamically set the depth compare operator, call:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthCompareOpEXT(
    VkCommandBuffer commandBuffer,
    VkCompareOp depthCompareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthCompareOp` is a `VkCompareOp` value specifying the comparison operator used for the Depth Comparison step of the depth test.

This command sets the depth comparison operator for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTHCOMPARE_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` value used to create the currently active pipeline.

**Valid Usage**
- VUID-vkCmdSetDepthCompareOp-None-08971
  At least one of the following must be true:
  - the `extendedDynamicState` feature is enabled.
Valid Usage (Implicit)

- VUID-vkCmdSetDepthCompareOp-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetDepthCompareOp-depthCompareOp-parameter
depthCompareOp must be a valid VkCompareOp value

- VUID-vkCmdSetDepthCompareOp-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdSetDepthCompareOp-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

26.10. Sample Counting

Occlusion queries use query pool entries to track the number of samples that pass all the per-fragment tests. The mechanism of collecting an occlusion query value is described in Occlusion Queries.

The occlusion query sample counter increments by one for each sample with a coverage value of 1 in each fragment that survives all the per-fragment tests, including scissor, sample mask, alpha to coverage, stencil, and depth tests.
26.11. Coverage Reduction

Coverage reduction takes the coverage information for a fragment and converts that to a boolean coverage value for each color sample in each pixel covered by the fragment.

26.11.1. Pixel Coverage

Coverage for each pixel is first extracted from the total fragment coverage mask. This consists of \( \text{rasterizationSamples} \) unique coverage samples for each pixel in the fragment area, each with a unique sample index. If the fragment only contains a single pixel, coverage for the pixel is equivalent to the fragment coverage.

If the fragment shading rate is set, and the fragment covers multiple pixels, each pixel’s coverage consists of the coverage samples with a pixel index matching that pixel, and each sample retains its unique sample index \( i \).

26.11.2. Color Sample Coverage

Once pixel coverage is determined, coverage for each individual color sample corresponding to that pixel is determined.

The number of \( \text{rasterizationSamples} \) is identical to the number of samples in the color attachments. A color sample is covered if the pixel coverage sample with the same sample index \( i \) is covered.
Chapter 27. The Framebuffer

27.1. Blending

Blending combines the incoming source fragment’s R, G, B, and A values with the destination R, G, B, and A values of each sample stored in the framebuffer at the fragment’s \((x_f, y_f)\) location. Blending is performed for each color sample covered by the fragment, rather than just once for each fragment.

Source and destination values are combined according to the blend operation, quadruplets of source and destination weighting factors determined by the blend factors, and a blend constant, to obtain a new set of R, G, B, and A values, as described below.

Blending is computed and applied separately to each color attachment used by the subpass, with separate controls for each attachment.

Prior to performing the blend operation, signed and unsigned normalized fixed-point color components undergo an implied conversion to floating-point as specified by Conversion from Normalized Fixed-Point to Floating-Point. Blending computations are treated as if carried out in floating-point, and basic blend operations are performed with a precision and dynamic range no lower than that used to represent destination components. Advanced blending operations are performed with a precision and dynamic range no lower than the smaller of that used to represent destination components or that used to represent 16-bit floating-point values.

Note

Blending is only defined for floating-point, UNORM, SNORM, and sRGB formats. Within those formats, the implementation may only support blending on some subset of them. Which formats support blending is indicated by VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT.

The pipeline blend state is included in the VkPipelineColorBlendStateCreateInfo structure during graphics pipeline creation:

The VkPipelineColorBlendStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineColorBlendStateCreateFlags flags;
    VkBool32 logicOpEnable;
    VkLogicOp logicOp;
    uint32_t attachmentCount;
    const VkPipelineColorBlendAttachmentState* pAttachments;
    float blendConstants[4];
} VkPipelineColorBlendStateCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `logicOpEnable` controls whether to apply Logical Operations.
• `logicOp` selects which logical operation to apply.
• `attachmentCount` is the number of `VkPipelineColorBlendAttachmentState` elements in `pAttachments`.
• `pAttachments` is a pointer to an array of `VkPipelineColorBlendAttachmentState` structures defining blend state for each color attachment.
• `blendConstants` is a pointer to an array of four values used as the R, G, B, and A components of the blend constant that are used in blending, depending on the blend factor.

Valid Usage

• VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-00605
  If the independentBlend feature is not enabled, all elements of `pAttachments` must be identical

• VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00606
  If the `logicOp` feature is not enabled, `logicOpEnable` must be `VK_FALSE`

• VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00607
  If `logicOpEnable` is `VK_TRUE`, `logicOp` must be a valid `VkLogicOp` value

• VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-07353
  If `attachmentCount` is not 0 `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkPipelineColorBlendAttachmentState` structures

Valid Usage (Implicit)

• VUID-VkPipelineColorBlendStateCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO`

• VUID-VkPipelineColorBlendStateCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineColorBlendAdvancedStateCreateInfoEXT` or `VkPipelineColorWriteCreateInfoEXT`

• VUID-VkPipelineColorBlendStateCreateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

• VUID-VkPipelineColorBlendStateCreateInfo-flags-zerobitmask
  `flags` must be 0

• VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-parameter
  If `attachmentCount` is not 0, and `pAttachments` is not `NULL`, `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkPipelineColorBlendAttachmentState` structures
\texttt{VkPipelineColorBlendStateCreateFlags} is a bitmask type for setting a mask, but is currently reserved for future use.

The \texttt{VkPipelineColorBlendAttachmentState} structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendAttachmentState {
    VkBool32 blendEnable;
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
    VkColorComponentFlags colorWriteMask;
} VkPipelineColorBlendAttachmentState;
```

- \texttt{blendEnable} controls whether blending is enabled for the corresponding color attachment. If blending is not enabled, the source fragment's color for that attachment is passed through unmodified.
- \texttt{srcColorBlendFactor} selects which blend factor is used to determine the source factors \((S_r, S_g, S_b)\).
- \texttt{dstColorBlendFactor} selects which blend factor is used to determine the destination factors \((D_r, D_g, D_b)\).
- \texttt{colorBlendOp} selects which blend operation is used to calculate the RGB values to write to the color attachment.
- \texttt{srcAlphaBlendFactor} selects which blend factor is used to determine the source factor \(S_a\).
- \texttt{dstAlphaBlendFactor} selects which blend factor is used to determine the destination factor \(D_a\).
- \texttt{alphaBlendOp} selects which blend operation is used to calculate the alpha values to write to the color attachment.
- \texttt{colorWriteMask} is a bitmask of \texttt{VkColorComponentFlagBits} specifying which of the R, G, B, and/or A components are enabled for writing, as described for the Color Write Mask.

**Valid Usage**

- **VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-00608**
  If the dualSrcBlend feature is not enabled, \texttt{srcColorBlendFactor} must not be \texttt{VK_BLEND_FACTOR_SRC1_COLOR}, \texttt{VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR}, \texttt{VK_BLEND_FACTOR_SRC1_ALPHA}, or \texttt{VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA}.

- **VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-00609**
  If the dualSrcBlend feature is not enabled, \texttt{dstColorBlendFactor} must not be...
VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-00610
  If the dualSrcBlend feature is not enabled, srcAlphaBlendFactor must not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-00611
  If the dualSrcBlend feature is not enabled, dstAlphaBlendFactor must not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-01406
  If either of colorBlendOp or alphaBlendOp is an advanced blend operation, then colorBlendOp must equal alphaBlendOp

- VUID-VkPipelineColorBlendAttachmentState-advancedBlendIndependentBlend-01407
  If VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend is VK_FALSE and colorBlendOp is an advanced blend operation, then colorBlendOp must be the same for all attachments

- VUID-VkPipelineColorBlendAttachmentState-advancedBlendIndependentBlend-01408
  If VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend is VK_FALSE and alphaBlendOp is an advanced blend operation, then alphaBlendOp must be the same for all attachments

- VUID-VkPipelineColorBlendAttachmentState-advancedBlendAllOperations-01409
27.1.1. Blend Factors

The source and destination color and alpha blending factors are selected from the enum:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBlendFactor {
    VK_BLEND_FACTOR_ZERO = 0,
    VK_BLEND_FACTOR_ONE = 1,
    VK_BLEND_FACTOR_SRC_COLOR = 2,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR = 3,
    VK_BLEND_FACTOR_DST_COLOR = 4,
    VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR = 5,
    VK_BLEND_FACTOR_SRC_ALPHA = 6,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA = 7,
    VK_BLEND_FACTOR_DST_ALPHA = 8,
    VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA = 9,
    VK_BLEND_FACTOR_CONSTANT_COLOR = 10,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR = 11,
    VK_BLEND_FACTOR_CONSTANT_ALPHA = 12,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA = 13,
    VK_BLEND_FACTOR_SRC_ALPHA_SATURATE = 14,
    VK_BLEND_FACTOR_SRC1_COLOR = 15,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR = 16,
    VK_BLEND_FACTOR_SRC1_ALPHA = 17,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA = 18,
} VkBlendFactor;
```

The semantics of the enum values are described in the table below:

Table 34. Blend Factors
### RGB Blend Factors

<table>
<thead>
<tr>
<th>VkBlendFactor</th>

<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA</td>
<td>((1-A_{s1},1-A_{s1},1-A_{s1}))</td>
<td>(1-A_{s1})</td>
</tr>
</tbody>
</table>

In this table, the following conventions are used:

- \(R_{s0},G_{s0},B_{s0}\) and \(A_{s0}\) represent the first source color \(R, G, B,\) and \(A\) components, respectively, for the fragment output location corresponding to the color attachment being blended.

- \(R_{s1},G_{s1},B_{s1}\) and \(A_{s1}\) represent the second source color \(R, G, B,\) and \(A\) components, respectively, used in dual source blending modes, for the fragment output location corresponding to the color attachment being blended.

- \(R_{d},G_{d},B_{d}\) and \(A_{d}\) represent the \(R, G, B,\) and \(A\) components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.

- \(R_{c},G_{c},B_{c}\) and \(A_{c}\) represent the blend constant \(R, G, B,\) and \(A\) components, respectively.

To **dynamically set and change** the blend constants, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetBlendConstants(
```
VkCommandBuffer commandBuffer, 
const float blendConstants[4]);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `blendConstants` is a pointer to an array of four values specifying the $R_c$, $G_c$, $B_c$, and $A_c$ components of the blend constant color used in blending, depending on the blend factor.

This command sets blend constants for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_BLEND_CONSTANTS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::blendConstants` values used to create the currently active pipeline.

### Valid Usage (Implicit)

- VUID-vkCmdSetBlendConstants-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetBlendConstants-commandBuffer-recording `commandBuffer` must be in the recording state
- VUID-vkCmdSetBlendConstants-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>

### 27.1.2. Dual-Source Blending

Blend factors that use the secondary color input $(R_{s1}, G_{s1}, B_{s1}, A_{s1})$ (`VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, and `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`) may consume implementation resources that could otherwise be used for rendering to multiple color attachments. Therefore, the number of color attachments that can be used in a framebuffer may be lower when using dual-source blending.
Dual-source blending is only supported if the dualSrcBlend feature is enabled.

The maximum number of color attachments that can be used in a subpass when using dual-source blending functions is implementation-dependent and is reported as the maxFragmentDualSrcAttachments member of VkPhysicalDeviceLimits.

Color outputs can be bound to the first and second inputs of the blender using the Index decoration, as described in Fragment Output Interface. If the second color input to the blender is not written in the shader, or if no output is bound to the second input of a blender, the value of the second input is undefined.

27.1.3. Blend Operations

Once the source and destination blend factors have been selected, they along with the source and destination components are passed to the blending operations. RGB and alpha components can use different operations. Possible values of VkBlendOp, specifying the operations, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBlendOp {
    VK_BLEND_OP_ADD = 0,
    VK_BLEND_OP_SUBTRACT = 1,
    VK_BLEND_OP_REVERSE_SUBTRACT = 2,
    VK_BLEND_OP_MIN = 3,
    VK_BLEND_OP_MAX = 4,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_ZERO_EXT = 1000148000,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_EXT = 1000148001,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_EXT = 1000148002,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_OVER_EXT = 1000148003,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_OVER_EXT = 1000148004,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_IN_EXT = 1000148005,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_IN_EXT = 1000148006,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_ATOP_EXT = 1000148009,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_ATOP_EXT = 1000148010,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_XOR_EXT = 1000148011,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_MULTIPLY_EXT = 1000148012,
};
```
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_SCREEN_EXT = 1000148013,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_OVERLAY_EXT = 1000148014,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_DARKEN_EXT = 1000148015,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LIGHTEN_EXT = 1000148016,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_COLORDOODGE_EXT = 1000148017,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_COLORBURN_EXT = 1000148018,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HARDLIGHT_EXT = 1000148019,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_VIVIDLIGHT_EXT = 1000148027,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARLIGHT_EXT = 1000148028,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PINLIGHT_EXT = 1000148029,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HARDMIX_EXT = 1000148030,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_HUE_EXT = 1000148031,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_SATURATION_EXT = 1000148032,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_COLOR_EXT = 1000148033,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_LUMINOSITY_EXT = 1000148034,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_EXT = 1000148035,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_CLAMPED_EXT = 1000148036,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_CLAMPED_ALPHA_EXT = 1000148037,
VK_BLEND_OP_PLUS_DARKER_EXT = 1000148038,
  // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_MINUS_EXT = 1000148039,
  // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_MINUS_CLAMPED_EXT = 1000148040,
  // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_CONTRAST_EXT = 1000148041,
  // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_OVG_EXT = 1000148042,
  // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_RED_EXT = 1000148043,
  // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_GREEN_EXT = 1000148044,
  // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_BLUE_EXT = 1000148045,
} VkBlendOp;
The semantics of the basic blend operations are described in the table below:

Table 35. Basic Blend Operations

<table>
<thead>
<tr>
<th>VkBlendOp</th>
<th>RGB Components</th>
<th>Alpha Component</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BLEND_OP_ADD</td>
<td>( R = R_s \times S_r + R_d \times D_r )</td>

<td></td>
<td>( G = G_s - G_d \times D_g )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = B_s - B_d \times D_b )</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_REVERSE_SUBTRACT</td>
<td>( R = D_r \times D_r - R_s \times S_r )</td>
<td>( A = A_d \times S_a \times S_s )</td>
</tr>
<tr>
<td></td>
<td>( G = D_g \times D_g - G_s \times S_s )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = D_b \times D_b - B_s \times S_s )</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_MIN</td>
<td>( R = \min(R_s, R_d) )</td>
<td>( A = \min(A_s, A_d) )</td>
</tr>
<tr>
<td></td>
<td>( G = \min(G_s, G_d) )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = \min(B_s, B_d) )</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_MAX</td>
<td>( R = \max(R_s, R_d) )</td>
<td>( A = \max(A_s, A_d) )</td>
</tr>
<tr>
<td></td>
<td>( G = \max(G_s, G_d) )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = \max(B_s, B_d) )</td>
<td></td>
</tr>
</tbody>
</table>

In this table, the following conventions are used:

- \( R_s, G_s, B_s \) and \( A_s \) represent the first source color R, G, B, and A components, respectively.
- \( R_d, G_d, B_d \) and \( A_d \) represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- \( S_r, S_g, S_b \) and \( S_a \) represent the source blend factor R, G, B, and A components, respectively.
- \( D_r, D_g, D_b \) and \( D_a \) represent the destination blend factor R, G, B, and A components, respectively.

The blending operation produces a new set of values R, G, B, and A, which are written to the framebuffer attachment. If blending is not enabled for this attachment, then R, G, B, and A are assigned \( R_s, G_s, B_s \) and \( A_s \), respectively.

If the color attachment is fixed-point, the components of the source and destination values and blend factors are each clamped to \([0,1]\) or \([-1,1]\) respectively for an unsigned normalized or signed normalized color attachment prior to evaluating the blend operations. If the color attachment is floating-point, no clamping occurs.

If the numeric format of a framebuffer attachment uses sRGB encoding, the R, G, and B destination color values (after conversion from fixed-point to floating-point) are considered to be encoded for the sRGB color space and hence are linearized prior to their use in blending. Each R, G, and B component is converted from nonlinear to linear as described in the “sRGB EOTF” section of the Khronos Data Format Specification. If the format is not sRGB, no linearization is performed.

If the numeric format of a framebuffer attachment uses sRGB encoding, then the final R, G, and B values are converted into the nonlinear sRGB representation before being written to the framebuffer attachment as described in the “sRGB EOTF” section of the Khronos Data Format.
Specification.

If the numeric format of a framebuffer color attachment is not sRGB encoded then the resulting $c_i$ values for R, G and B are unmodified. The value of A is never sRGB encoded. That is, the alpha component is always stored in memory as linear.

If the framebuffer color attachment is `VK_ATTACHMENT_UNUSED`, no writes are performed through that attachment. Writes are not performed to framebuffer color attachments greater than or equal to the `VkSubpassDescription::colorAttachmentCount` or `VkSubpassDescription2::colorAttachmentCount` value.

27.1.4. Advanced Blend Operations

The advanced blend operations are those listed in tables `f/X/Y/Z Advanced Blend Operations`, `Hue-Saturation-Luminosity Advanced Blend Operations`, and `Additional RGB Blend Operations`.

If the `pNext` chain of `VkPipelineColorBlendStateCreateInfo` includes a `VkPipelineColorBlendAdvancedStateCreateInfoEXT` structure, then that structure includes parameters that affect advanced blend operations.

The `VkPipelineColorBlendAdvancedStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPipelineColorBlendAdvancedStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 srcPremultiplied;
    VkBool32 dstPremultiplied;
    VkBlendOverlapEXT blendOverlap;
} VkPipelineColorBlendAdvancedStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcPremultiplied` specifies whether the source color of the blend operation is treated as premultiplied.
- `dstPremultiplied` specifies whether the destination color of the blend operation is treated as premultiplied.
- `blendOverlap` is a `VkBlendOverlapEXT` value specifying how the source and destination sample's coverage is correlated.

If this structure is not present, `srcPremultiplied` and `dstPremultiplied` are both considered to be `VK_TRUE`, and `blendOverlap` is considered to be `VK_BLEND_OVERLAP_UNCORRELATED_EXT`.

Valid Usage

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-srcPremultiplied-01424
  If the non-premultiplied source color property is not supported, `srcPremultiplied` must be
**Valid Usage (Implicit)**

- **VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-sType-sType**
  
  *sType* must be *VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_ADVANCED_STATE_CREATE_INFO_EXT*

- **VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-blendOverlap-parameter**
  
  *blendOverlap* must be a valid *VkBlendOverlapEXT* value

When using one of the operations in table f/X/Y/Z Advanced Blend Operations or Hue-Saturation-Luminosity Advanced Blend Operations, blending is performed according to the following equations:

\[
R = f(R_s', R_d') \times p_0(A_s, A_d) + Y \times R_s' \times p_1(A_s, A_d) + Z \times R_d' \times p_2(A_s, A_d) \\
G = f(G_s', G_d') \times p_0(A_s, A_d) + Y \times G_s' \times p_1(A_s, A_d) + Z \times G_d' \times p_2(A_s, A_d) \\
B = f(B_s', B_d') \times p_0(A_s, A_d) + Y \times B_s' \times p_1(A_s, A_d) + Z \times B_d' \times p_2(A_s, A_d) \\
A = X \times p_0(A_s, A_d) + Y \times p_1(A_s, A_d) + Z \times p_2(A_s, A_d)
\]

where the function *f* and terms *X*, *Y*, and *Z* are specified in the table. The *R*, *G*, and *B* components of the source color used for blending are derived according to *srcPremultiplied*. If *srcPremultiplied* is set to *VK_TRUE*, the fragment color components are considered to have been premultiplied by the *A* component prior to blending. The base source color \((R_s', G_s', B_s')\) is obtained by dividing through by the *A* component:

\[
(R_s', G_s', B_s') = \begin{cases} 
(0, 0, 0) & \text{if } A_s = 0 \\
\left( \frac{R_s}{A_s}, \frac{G_s}{A_s}, \frac{B_s}{A_s} \right) & \text{otherwise}
\end{cases}
\]

If *srcPremultiplied* is *VK_FALSE*, the fragment color components are used as the base color:

\[
(R_s', G_s', B_s') = (R_s, G_s, B_s)
\]

The *R*, *G*, and *B* components of the destination color used for blending are derived according to *dstPremultiplied*. If *dstPremultiplied* is set to *VK_TRUE*, the destination components are considered to have been premultiplied by the *A* component prior to blending. The base destination color \((R_d', G_d', B_d')\) is obtained by dividing through by the *A* component:

\[
(R_d', G_d', B_d') = \left( \frac{R_d}{A_s}, \frac{G_d}{A_s}, \frac{B_d}{A_s} \right)
\]
If `dstPremultiplied` is `VK_FALSE`, the destination color components are used as the base color:

\[
(R_d', G_d', B_d') = \begin{cases}
(0, 0, 0) & A_d = 0 \\
\left( \frac{R_d}{A_d}, \frac{G_d}{A_d}, \frac{B_d}{A_d} \right) & \text{otherwise}
\end{cases}
\]

When blending using advanced blend operations, we expect that the R, G, and B components of premultiplied source and destination color inputs be stored as the product of non-premultiplied R, G, and B component values and the A component of the color. If any R, G, or B component of a premultiplied input color is non-zero and the A component is zero, the color is considered ill-formed, and the corresponding component of the blend result is undefined.

All of the advanced blend operation formulas in this chapter compute the result as a premultiplied color. If `dstPremultiplied` is `VK_FALSE`, that result color’s R, G, and B components are divided by the A component before being written to the framebuffer. If any R, G, or B component of the color is non-zero and the A component is zero, the result is considered ill-formed, and the corresponding component of the blend result is undefined. If all components are zero, that value is unchanged.

If the A component of any input or result color is less than zero, the color is considered ill-formed, and all components of the blend result are undefined.

The weighting functions \( p_0, p_1, \) and \( p_2 \) are defined in table `Advanced Blend Overlap Modes`. In these functions, the A components of the source and destination colors are taken to indicate the portion of the pixel covered by the fragment (source) and the fragments previously accumulated in the pixel (destination). The functions \( p_0, p_1, \) and \( p_2 \) approximate the relative portion of the pixel covered by the intersection of the source and destination, covered only by the source, and covered only by the destination, respectively.

Possible values of `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap`, specifying the blend overlap functions, are:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef enum VkBlendOverlapEXT {
    VK_BLEND_OVERLAP_UNCORRELATED_EXT = 0,
    VK_BLEND_OVERLAP_DISJOINT_EXT = 1,
    VK_BLEND_OVERLAP_CONJOINT_EXT = 2,
} VkBlendOverlapEXT;
```

- `VK_BLEND_OVERLAP_UNCORRELATED_EXT` specifies that there is no correlation between the source and destination coverage.
- `VK_BLEND_OVERLAP_CONJOINT_EXT` specifies that the source and destination coverage are considered to have maximal overlap.
- `VK_BLEND_OVERLAP_DISJOINT_EXT` specifies that the source and destination coverage are considered to have minimal overlap.

</tbody>
</table>
When using one of the HSL blend operations in table **Hue-Saturation-Luminosity Advanced Blend Operations** as the blend operation, the RGB color components produced by the function $f$ are effectively obtained by converting both the non-premultiplied source and destination colors to the HSL (hue, saturation, luminosity) color space, generating a new HSL color by selecting H, S, and L components from the source or destination according to the blend operation, and then converting the result back to RGB. In the equations below, a blended RGB color is produced according to the following pseudocode:

```plaintext
float minv3(vec3 c) {
    return min(min(c.r, c.g), c.b);
}
float maxv3(vec3 c) {
    return max(max(c.r, c.g), c.b);
}
float lumv3(vec3 c) {
    return dot(c, vec3(0.30, 0.59, 0.11));
}
float satv3(vec3 c) {
    return maxv3(c) - minv3(c);
}

// If any color components are outside [0,1], adjust the color to
// get the components in range.
vec3 ClipColor(vec3 color) {
    float lum = lumv3(color);
    float mincol = minv3(color);
```
float maxcol = maxv3(color);
if (mincol < 0.0) {
    color = lum + ((color-lum)*lum) / (lum-mincol);
} else if (maxcol > 1.0) {
    color = lum + ((color-lum)*(1-lum)) / (maxcol-lum);
} return color;

// Take the base RGB color <cbase> and override its luminosity
// with that of the RGB color <clum>.
vec3 SetLum(vec3 cbase, vec3 clum) {
    float lbase = lumv3(cbase);
    float llum = lumv3(clum);
    float ldiff = llum - lbase;
    vec3 color = cbase + vec3(ldiff);
    return ClipColor(color);
}

// Take the base RGB color <cbase> and override its saturation with
// that of the RGB color <csat>. The override the luminosity of the
// result with that of the RGB color <clum>.
vec3 SetLumSat(vec3 cbase, vec3 csat, vec3 clum) {
    float minbase = minv3(cbase);
    float sbase = satv3(cbase);
    float ssat = satv3(csat);
    vec3 color;
    if (sbase > 0) {
        // Equivalent (modulo rounding errors) to setting the
        // smallest (R,G,B) component to 0, the largest to <ssat>,
        // and interpolating the "middle" component based on its
        // original value relative to the smallest/largest.
        color = (cbase - minbase) * ssat / sbase;
    } else {
        color = vec3(0.0);
    }
    return SetLum(color, clum);
}

When using one of the operations in Table 39. Additional RGB Blend Operations as the blend operation, the source and destination colors used by these blending operations are interpreted according to srcPremultiplied and dstPremultiplied. The blending operations below are evaluated where the RGB source and destination color components are both considered to have been premultiplied by the corresponding A component.

\[
(R_s', G_s', B_s') = \begin{cases} 
(R_s, G_s, B_s) & \text{if srcPremultiplied is VK_TRUE} \\
(R_sA_s, G_sA_s, B_sA_s) & \text{if srcPremultiplied is VK_FALSE}
\end{cases}
\]

\[
(R_d', G_d', B_d') = \begin{cases} 
(R_d, G_d, B_d) & \text{if dstPremultiplied is VK_TRUE} \\
(R_dA_d, G_dA_d, B_dA_d) & \text{if dstPremultiplied is VK_FALSE}
\end{cases}
\]
### Logical Operations

The application can enable a logical operation between the fragment’s color values and the existing value in the framebuffer attachment. This logical operation is applied prior to updating the framebuffer attachment. Logical operations are applied only for signed and unsigned integer and normalized integer framebuffers. Logical operations are not applied to floating-point or sRGB format color attachments.

Logical operations are controlled by the `logicOpEnable` and `logicOp` members of `VkPipelineColorBlendStateCreateInfo`. The `logicOp` state can also be controlled by `vkCmdSetLogicOpEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. If `logicOpEnable` is `VK_TRUE`, then a logical operation selected by `logicOp` is applied between each color attachment and the fragment’s corresponding output value, and blending of all attachments is treated as if it were disabled. Any attachments using color formats for which logical operations are not supported simply pass through the color values unmodified. The logical operation is applied independently for each of the red, green, blue, and alpha components. The `logicOp` is selected from the following operations:

// Provided by VK_VERSION_1_0

typedef enum VkLogicOp {
    VK_LOGIC_OP_CLEAR = 0,
    VK_LOGIC_OP_AND = 1,
    VK_LOGIC_OP_AND_REVERSE = 2,
    VK_LOGIC_OP_COPY = 3,
    VK_LOGIC_OP_AND_INVERTED = 4,
    VK_LOGIC_OP_NO_OP = 5,
    VK_LOGIC_OP_XOR = 6,
    VK_LOGIC_OP_OR = 7,
    VK_LOGIC_OP_NOR = 8,
    VK_LOGIC_OP_EQUIVALENT = 9,
    VK_LOGIC_OP_INVERT = 10,
    VK_LOGIC_OP_OR_REVERSE = 11,
}
VK_LOGIC_OP_COPY_INVERTED = 12,
VK_LOGIC_OP_OR_INVERTED = 13,
VK_LOGIC_OP_NAND = 14,
VK_LOGIC_OP_SET = 15,
} VkLogicOp;
The logical operations supported by Vulkan are summarized in the following table in which

- \( \neg \) is bitwise invert,
- \( \& \) is bitwise and,
- \( \lor \) is bitwise or,
- \( \oplus \) is bitwise exclusive or,
- \( s \) is the fragment’s \( R_{s0}, G_{s0}, B_{s0} \) or \( A_{s0} \) component value for the fragment output corresponding to the color attachment being updated, and
- \( d \) is the color attachment’s \( R, G, B \) or \( A \) component value:

<table>

<td>all 1s</td>
</tr>
</tbody>
</table>

The result of the logical operation is then written to the color attachment as controlled by the component write mask, described in Blend Operations.

To dynamically set the logical operation to apply for blend state, call:

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetLogicOpEXT(
    VkCommandBuffer commandBuffer,
    VkLogicOp logicOp);
```
• `commandBuffer` is the command buffer into which the command will be recorded.
• `logicOp` specifies the logical operation to apply for blend state.

This command sets the logical operation for blend state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOp` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLogicOpEXT-None-09422
  At least one of the following **must** be true:
  - The `extendedDynamicState2LogicOp` feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetLogicOpEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLogicOpEXT-logicOp-parameter
  `logicOp` **must** be a valid `VkLogicOp` value
- VUID-vkCmdSetLogicOpEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetLogicOpEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary, Secondary</td>
<td>Both</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>
27.3. Color Write Mask

Bits which can be set in `VkPipelineColorBlendAttachmentState::colorWriteMask`, determining whether the final color values R, G, B and A are written to the framebuffer attachment, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkColorComponentFlagBits {
    VK_COLOR_COMPONENT_R_BIT = 0x00000001,
    VK_COLOR_COMPONENT_G_BIT = 0x00000002,
    VK_COLOR_COMPONENT_B_BIT = 0x00000004,
    VK_COLOR_COMPONENT_A_BIT = 0x00000008,
} VkColorComponentFlagBits;
```

- **VK_COLOR_COMPONENT_R_BIT** specifies that the R value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- **VK_COLOR_COMPONENT_G_BIT** specifies that the G value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- **VK_COLOR_COMPONENT_B_BIT** specifies that the B value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- **VK_COLOR_COMPONENT_A_BIT** specifies that the A value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.

The color write mask operation is applied regardless of whether blending is enabled.

The color write mask operation is applied only if **Color Write Enable** is enabled for the respective attachment. Otherwise the color write mask is ignored and writes to all components of the attachment are disabled.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkColorComponentFlags;
```

`VkColorComponentFlags` is a bitmask type for setting a mask of zero or more `VkColorComponentFlagBits`.

27.4. Color Write Enable

The `VkPipelineColorWriteCreateInfoEXT` structure is defined as:

```cpp
// Provided by VK_EXT_color_write_enable
typedef struct VkPipelineColorWriteCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentCount;
    const VkBool32* pColorWriteEnables;
};
```
VkPipelineColorWriteCreateInfoEXT

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **attachmentCount** is the number of `VkBool32` elements in `pColorWriteEnables`.
- **pColorWriteEnables** is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

When this structure is included in the `pNext` chain of `VkPipelineColorBlendStateCreateInfo`, it defines per-attachment color write state. If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with `attachmentCount` equal to the `attachmentCount` member of `VkPipelineColorBlendStateCreateInfo`, and `pColorWriteEnables` pointing to an array of as many `VK_TRUE` values.

If the `colorWriteEnable` feature is not enabled on the device, all `VkBool32` elements in the `pColorWriteEnables` array must be `VK_TRUE`.

Color Write Enable interacts with the Color Write Mask as follows:

- If `colorWriteEnable` is `VK_TRUE`, writes to the attachment are determined by the `colorWriteMask`.
- If `colorWriteEnable` is `VK_FALSE`, the `colorWriteMask` is ignored and writes to all components of the attachment are disabled. This is equivalent to specifying a `colorWriteMask` of 0.

**Valid Usage**

- VUID-VkPipelineColorWriteCreateInfoEXT-pAttachments-04801
  If the `colorWriteEnable` feature is not enabled, all elements of `pColorWriteEnables` must be `VK_TRUE`.

- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-07608
  `attachmentCount` must be equal to the `attachmentCount` member of the `VkPipelineColorBlendStateCreateInfo` structure specified during pipeline creation.

- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-06655
  `attachmentCount` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

**Valid Usage (Implicit)**

- VUID-VkPipelineColorWriteCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_WRITE_CREATE_INFO_EXT`.

- VUID-VkPipelineColorWriteCreateInfoEXT-pColorWriteEnables-parameter
  If `attachmentCount` is not 0, `pColorWriteEnables` must be a valid pointer to an array of `attachmentCount` `VkBool32` values.

To dynamically enable or disable writes to a color attachment, call:
// Provided by VK_EXT_color_write_enable

```c
void vkCmdSetColorWriteEnableEXT(
    VkCommandBuffer commandBuffer,
    uint32_t attachmentCount,
    const VkBool32* pColorWriteEnables);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `attachmentCount` is the number of `VkBool32` elements in `pColorWriteEnables`.
- `pColorWriteEnables` is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

This command sets the color write enables for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorWriteCreateInfoEXT::pColorWriteEnables` values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetColorWriteEnableEXT-None-04803
  The `colorWriteEnable` feature must be enabled

- VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-06656
  `attachmentCount` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`

### Valid Usage (Implicit)

- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetColorWriteEnableEXT-pColorWriteEnables-parameter
  `pColorWriteEnables` must be a valid pointer to an array of `attachmentCount` `VkBool32` values

- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-arraylength
  `attachmentCount` must be greater than 0
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Chapter 28. Dispatching Commands

Dispatching commands (commands with Dispatch in the name) provoke work in a compute pipeline. Dispatching commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound compute pipeline. A compute pipeline must be bound to a command buffer before any dispatching commands are recorded in that command buffer.

To record a dispatch, call:

```cpp
// Provided by VK_VERSION_1_0
void vkCmdDispatch(
    VkCommandBuffer commandBuffer,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of \( \text{groupCountX} \times \text{groupCountY} \times \text{groupCountZ} \) local workgroups is assembled.

Valid Usage

- VUID-vkCmdDispatch-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatch-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatch-aspectMask-06478
  If a `VkImageView` is sampled with depth comparison, the image view must have been created with an `aspectMask` that contains `VK_IMAGE_ASPECT_DEPTH_BIT`

- VUID-vkCmdDispatch-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

For each set \(n\) that is statically used by a bound shader, a descriptor set must have been bound to \(n\) at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set \(n\), with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by a bound shader.

A valid pipeline must be bound to the pipeline bind point used by this command.

There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.
If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- **VUID-vkCmdDispatch-None-08610**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- **VUID-vkCmdDispatch-None-08611**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDispatch-uniformBuffers-06935**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatch-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatch-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

- **VUID-vkCmdDispatch-None-06550**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y′CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- **VUID-vkCmdDispatch-ConstOffset-06551**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y′CbCr conversion, that object must not use the ConstOffset and Offset operands

- **VUID-vkCmdDispatch-viewType-07752**
  If a VkImageView is accessed as a result of this command, then the image view's viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdDispatch-format-07753**
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view's format and the Sampled Type operand of the OpTypeImage must match

- **VUID-vkCmdDispatch-OpImageWrite-08795**
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the
Type of the Texel operand of that instruction must have at least as many components as the image view’s format

- VUID-vkCmdDispatch-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

- VUID-vkCmdDispatch-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDispatch-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDispatch-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDispatch-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDispatch-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDispatch-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDispatch-None-07288
  Any shader invocation executed by this command must terminate

- VUID-vkCmdDispatch-commandBuffer-02712
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, any resource written to by the VkPipeline object bound to the pipeline bind point used by this command must not be an unprotected resource

- VUID-vkCmdDispatch-commandBuffer-02713
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, pipeline stages other than the framebuffer-space and compute stages in the VkPipeline object bound to the pipeline bind point used by this command must not write to any resource

- VUID-vkCmdDispatch-groupCountX-00386
  groupCountX must be less than or equal to VkPhysicalDeviceLimits
Valid Usage (Implicit)

- VUID-vkCmdDispatch-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdDispatch-commandBuffer-recording
commandBuffer must be in the recording state
- VUID-vkCmdDispatch-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support compute operations
- VUID-vkCmdDispatch-renderpass
This command must only be called outside of a render pass instance

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>

To record an indirect dispatching command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatchIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset);
```
• **commandBuffer** is the command buffer into which the command will be recorded.
• **buffer** is the buffer containing dispatch parameters.
• **offset** is the byte offset into **buffer** where parameters begin.

**vkCmdDispatchIndirect** behaves similarly to **vkCmdDispatch** except that the parameters are read by the device from a buffer during execution. The parameters of the dispatch are encoded in a **VkDispatchIndirectCommand** structure taken from **buffer** starting at **offset**.

### Valid Usage

- **VUID-vkCmdDispatchIndirect-magFilter-04553**
  If a **VkSampler** created with **magFilter** or **minFilter** equal to **VK_FILTER_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view’s format features must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDispatchIndirect-mipmapMode-04770**
  If a **VkSampler** created with **mipmapMode** equal to **VK_SAMPLER_MIPMAP_MODE_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view’s format features must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDispatchIndirect-aspectMask-06478**
  If a **VkImageView** is sampled with depth comparison, the image view must have been created with an **aspectMask** that contains **VK_IMAGE_ASPECT_DEPTH_BIT**

- **VUID-vkCmdDispatchIndirect-None-02691**
  If a **VkImageView** is accessed using atomic operations as a result of this command, then the image view’s format features must contain **VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT**

- **VUID-vkCmdDispatchIndirect-None-07888**
  If a **VkDescriptorType** storage texel buffer descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer’s format features must contain **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT**

- **VUID-vkCmdDispatchIndirect-None-02692**
  If a **VkImageView** is sampled with **VK_FILTER_CUBIC_EXT** as a result of this command, then the image view’s format features must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT**

- **VUID-vkCmdDispatchIndirect-None-02693**
  If the **VK_EXT_filter_cubic** extension is not enabled and any **VkImageView** is sampled with **VK_FILTER_CUBIC_EXT** as a result of this command, it must not have a **VkImageViewType** of **VK_IMAGE_VIEW_TYPE_3D**, **VK_IMAGE_VIEW_TYPE_CUBE**, or **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**

- **VUID-vkCmdDispatchIndirect-filterCubic-02694**
  Any **VkImageView** being sampled with **VK_FILTER_CUBIC_EXT** as a result of this command must have a **VkImageViewType** and format that supports cubic filtering, as specified by **VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic** returned by **vkGetPhysicalDeviceImageFormatProperties2**
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

For each set $n$ that is statically used by a bound shader, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set $n$, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by a bound shader.

A valid pipeline must be bound to the pipeline bind point used by this command.

There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this...
command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchIndirect-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchIndirect-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

- VUID-vkCmdDispatchIndirect-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler YC aC bC conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- VUID-vkCmdDispatchIndirect-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler YC aC bC conversion, that object must not use the ConstOffset and Offset operands

- VUID-vkCmdDispatchIndirect-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view's viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

- VUID-vkCmdDispatchIndirect-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view's format and the Sampled Type operand of the OpTypeImage must match

- VUID-vkCmdDispatchIndirect-OpImageWrite-08795
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format

- VUID-vkCmdDispatchIndirect-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format

- VUID-vkCmdDispatchIndirect-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDispatchIndirect-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDispatchIndirect-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a
result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDispatchIndirect-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDispatchIndirect-None-07288
  Any shader invocation executed by this command must terminate

- VUID-vkCmdDispatchIndirect-buffer-02708
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdDispatchIndirect-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDispatchIndirect-offset-02710
  offset must be a multiple of 4

- VUID-vkCmdDispatchIndirect-commandBuffer-02711
  commandBuffer must not be a protected command buffer

- VUID-vkCmdDispatchIndirect-offset-00407
  The sum of offset and the size of VkDispatchIndirectCommand must be less than or equal to the size of buffer

Valid Usage (Implicit)

- VUID-vkCmdDispatchIndirect-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDispatchIndirect-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-vkCmdDispatchIndirect-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDispatchIndirect-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdDispatchIndirect-renderpass
This command **must** only be called outside of a render pass instance

- **VUID-vkCmdDispatchIndirect-commonparent**
  Both of `buffer`, and `commandBuffer **must**` have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer **must**` be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>

</tbody>
</table>

The `VkDispatchIndirectCommand` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDispatchIndirectCommand {
    uint32_t  x;
    uint32_t  y;
    uint32_t  z;
} VkDispatchIndirectCommand;
```

- `x` is the number of local workgroups to dispatch in the X dimension.
- `y` is the number of local workgroups to dispatch in the Y dimension.
- `z` is the number of local workgroups to dispatch in the Z dimension.

The members of `VkDispatchIndirectCommand` have the same meaning as the corresponding parameters of `vkCmdDispatch`.

### Valid Usage

- **VUID-VkDispatchIndirectCommand-x-00417**
  `x **must**` be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`
- **VUID-VkDispatchIndirectCommand-y-00418**
  `y **must**` be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`
- **VUID-VkDispatchIndirectCommand-z-00419**
must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]

To record a dispatch using non-zero base values for the components of WorkgroupId, call:

```c
// Provided by VK_VERSION_1_1
void vkCmdDispatchBase(
    VkCommandBuffer commandBuffer,
    uint32_t baseGroupX,
    uint32_t baseGroupY,
    uint32_t baseGroupZ,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `baseGroupX` is the start value for the X component of WorkgroupId.
- `baseGroupY` is the start value for the Y component of WorkgroupId.
- `baseGroupZ` is the start value for the Z component of WorkgroupId.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of \(\text{groupCountX} \times \text{groupCountY} \times \text{groupCountZ}\) local workgroups is assembled, with WorkgroupId values ranging from \((\text{baseGroup}* + \text{groupCount}*)\) in each component. `vkCmdDispatch` is equivalent to `vkCmdDispatchBase(0,0,0,\text{groupCountX},\text{groupCountY},\text{groupCountZ})`.

### Valid Usage

- **VUID-vkCmdDispatchBase-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to VK_FILTER_LINEAR and `compareEnable` equal to VK_FALSE is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDispatchBase-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and `compareEnable` equal to VK_FALSE is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDispatchBase-aspectMask-06478**
  If a `VkImageView` is sampled with `depth comparison`, the image view must have been created with an `aspectMask` that contains `VK_IMAGE_ASPECT_DEPTH_BIT`.

- **VUID-vkCmdDispatchBase-None-02691**
If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDispatchBase-None-07888**
  If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- **VUID-vkCmdDispatchBase-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdDispatchBase-None-02693**
  If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`

- **VUID-vkCmdDispatchBase-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDispatchBase-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDispatchBase-None-08600**
  For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchBase-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchBase-None-08114**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by a bound shader

- **VUID-vkCmdDispatchBase-None-08606**
  A valid pipeline must be bound to the pipeline bind point used by this command

- **VUID-vkCmdDispatchBase-None-08608**
  There must not have been any calls to dynamic state setting commands for any state not
specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDispatchBase-None-08609**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- **VUID-vkCmdDispatchBase-None-08610**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- **VUID-vkCmdDispatchBase-None-08611**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDispatchBase-uniformBuffers-06935**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

- **VUID-vkCmdDispatchBase-ConstOffset-06550**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C_aC conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- **VUID-vkCmdDispatchBase-ConstOffset-06551**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C_aC conversion, that object must not use the ConstOffset and Offset operands

- **VUID-vkCmdDispatchBase-viewType-07752**
  If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdDispatchBase-format-07753**
  If a VkImageView is accessed as a result of this command, then the numeric type of the
image view's format and the Sampled Type operand of the OpTypeImage must match

• VUID-vkCmdDispatchBase-OpImageWrite-08795
If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format

• VUID-vkCmdDispatchBase-OpImageWrite-04469
If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format

• VUID-vkCmdDispatchBase-SampledType-04470
If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

• VUID-vkCmdDispatchBase-SampledType-04471
If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

• VUID-vkCmdDispatchBase-SampledType-04472
If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

• VUID-vkCmdDispatchBase-SampledType-04473
If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

• VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04474
If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

• VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04475
If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

• VUID-vkCmdDispatchBase-None-07288
Any shader invocation executed by this command must terminate
resource

- VUID-vkCmdDispatchBase-baseGroupX-00421
  baseGroupX must be less than VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]

- VUID-vkCmdDispatchBase-baseGroupY-00422
  baseGroupY must be less than VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]

- VUID-vkCmdDispatchBase-baseGroupZ-00423
  baseGroupZ must be less than VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]

- VUID-vkCmdDispatchBase-groupCountX-00424
  groupCountX must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] minus baseGroupX

- VUID-vkCmdDispatchBase-groupCountY-00425
  groupCountY must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] minus baseGroupY

- VUID-vkCmdDispatchBase-groupCountZ-00426
  groupCountZ must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] minus baseGroupZ

- VUID-vkCmdDispatchBase-baseGroupX-00427
  If any of baseGroupX, baseGroupY, or baseGroupZ are not zero, then the bound compute pipeline must have been created with the VK_PIPELINE_CREATE_DISPATCH_BASE flag

Valid Usage (Implicit)

- VUID-vkCmdDispatchBase-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDispatchBase-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDispatchBase-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdDispatchBase-renderpass
  This command must only be called outside of a render pass instance

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Chapter 29. Sparse Resources

As documented in Resource Memory Association, VkBuffer and VkImage resources in Vulkan must be bound completely and contiguously to a single VkDeviceMemory object. This binding must be done before the resource is used, and the binding is immutable for the lifetime of the resource.

Sparse resources relax these restrictions and provide these additional features:

- Sparse resources can be bound non-contiguously to one or more VkDeviceMemory allocations.
- Sparse resources can be re-bound to different memory allocations over the lifetime of the resource.
- Sparse resources can have descriptors generated and used orthogonally with memory binding commands.

Sparse resources are not supported in Vulkan SC, due to complexity and the necessity of being able to update page table mappings at runtime [SCID-8]. However, the sparse resource features, properties, resource creation flags, and definitions have been retained for completeness and compatibility.

All sparse resource physical device features must not be advertised as supported, and the related physical device sparse properties and physical device limits must be reported accordingly.

29.1. Sparse Resource Features

Sparse resources have several features that must be enabled explicitly at resource creation time. The features are enabled by including bits in the flags parameter of VkImageCreateInfo or VkBufferCreateInfo. Each feature also has one or more corresponding feature enables specified in VkPhysicalDeviceFeatures.

- The sparseBinding feature is the base, and provides the following capabilities:
  - Resources can be bound at some defined (sparse block) granularity.
  - The entire resource must be bound to memory before use regardless of regions actually accessed.
  - No specific mapping of image region to memory offset is defined, i.e. the location that each texel corresponds to in memory is implementation-dependent.
  - Sparse buffers have a well-defined mapping of buffer range to memory range, where an offset into a range of the buffer that is bound to a single contiguous range of memory corresponds to an identical offset within that range of memory.
  - Requested via the VK_IMAGE_CREATE_SPARSE_BINDING_BIT and VK_BUFFER_CREATE_SPARSE_BINDING_BIT bits.
  - A sparse image created using VK_IMAGE_CREATE_SPARSE_BINDING_BIT (but not VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT) supports all formats that non-sparse usage supports, and supports both VK_IMAGE_TILING_OPTIMAL and VK_IMAGE_TILING_LINEAR tiling.

- Sparse Residency builds on (and requires) the sparseBinding feature. It includes the following
capabilities:

- Resources do not have to be completely bound to memory before use on the device.
- Images have a prescribed sparse image block layout, allowing specific rectangular regions of the image to be bound to specific offsets in memory allocations.
- Consistency of access to unbound regions of the resource is defined by the absence or presence of `VkPhysicalDeviceSparseProperties::residencyNonResidentStrict`. If this property is present, accesses to unbound regions of the resource are well defined and behave as if the data bound is populated with all zeros; writes are discarded. When this property is absent, accesses are considered safe, but reads will return undefined values.
- Requested via the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` and `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bits.
- Sparse residency support is advertised on a finer grain via the following features:
  - The `sparseResidencyBuffer` feature provides support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidencyImage2D` feature provides support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidencyImage3D` feature provides support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency2Samples` feature provides support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency4Samples` feature provides support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency8Samples` feature provides support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency16Samples` feature provides support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

Implementations supporting `sparseResidencyImage2D` are only required to support sparse 2D, single-sampled images. Support for sparse 3D and MSAA images is optional and can be enabled via `sparseResidencyImage3D`, `sparseResidency2Samples`, `sparseResidency4Samples`, `sparseResidency8Samples`, and `sparseResidency16Samples`.

- A sparse image created using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` supports all non-compressed color formats with power-of-two element size that non-sparse usage supports. Additional formats may also be supported and can be queried via `vkGetPhysicalDeviceSparseImageFormatProperties`. `VK_IMAGE_TILING_LINEAR` tiling is not supported.
  - The `sparseResidencyAliased` feature provides the following capability that can be enabled per resource:

    Allows physical memory ranges to be shared between multiple locations in the same sparse resource or between multiple sparse resources, with each binding of a memory location observing a consistent interpretation of the memory contents.
29.2. Sparse Resource API

The APIs related to sparse resources are grouped into the following categories:

- Physical Device Features
- Physical Device Sparse Properties

29.2.1. Physical Device Features

Some sparse-resource related features are reported and enabled in `VkPhysicalDeviceFeatures`. These features **must** be supported and enabled on the `VkDevice` object before applications **can** use them. See Physical Device Features for information on how to get and set enabled device features, and for more detailed explanations of these features.

**Sparse Physical Device Features**

- `sparseBinding`: Support for creating `VkBuffer` and `VkImage` objects with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` and `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` flags, respectively.
- `sparseResidencyBuffer`: Support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag.
- `sparseResidencyImage2D`: Support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidencyImage3D`: Support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency2Samples`: Support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency4Samples`: Support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency8Samples`: Support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency16Samples`: Support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidencyAliased`: Support for creating `VkBuffer` and `VkImage` objects with the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flags, respectively.

29.2.2. Physical Device Sparse Properties

Some features of the implementation are not possible to disable, and are reported to allow applications to alter their sparse resource usage accordingly. These read-only capabilities are reported in the `VkPhysicalDeviceProperties::sparseProperties` member, which is a `VkPhysicalDeviceSparseProperties` structure.

The `VkPhysicalDeviceSparseProperties` structure is defined as:

```cpp
// Provided by VK_VERSION_1_0
```
typedef struct VkPhysicalDeviceSparseProperties {
    VkBool32 residencyStandard2DBlockShape;
    VkBool32 residencyStandard2DMultisampleBlockShape;
    VkBool32 residencyStandard3DBlockShape;
    VkBool32 residencyAlignedMipSize;
    VkBool32 residencyNonResidentStrict;
} VkPhysicalDeviceSparseProperties;

• residencyStandard2DBlockShape **must** be VK_FALSE in Vulkan SC [SCID-8].
• residencyStandard2DMultisampleBlockShape **must** be VK_FALSE in Vulkan SC [SCID-8].
• residencyStandard3DBlockShape **must** be VK_FALSE in Vulkan SC [SCID-8].
• residencyAlignedMipSize **must** be VK_FALSE in Vulkan SC [SCID-8].
• residencyNonResidentStrict **must** be VK_FALSE in Vulkan SC [SCID-8].
Chapter 30. Window System Integration (WSI)

This chapter discusses the window system integration (WSI) between the Vulkan API and the various forms of displaying the results of rendering to a user. Since the Vulkan API can be used without displaying results, WSI is provided through the use of optional Vulkan extensions. This chapter provides an overview of WSI. See the appendix for additional details of each WSI extension, including which extensions must be enabled in order to use each of the functions described in this chapter.

30.1. WSI Platform

A platform is an abstraction for a window system, OS, etc. Some examples include MS Windows, Android, and Wayland. The Vulkan API may be integrated in a unique manner for each platform.

The Vulkan API does not define any type of platform object. Platform-specific WSI extensions are defined, each containing platform-specific functions for using WSI. Use of these extensions is guarded by preprocessor symbols as defined in the Window System-Specific Header Control appendix.

In order for an application to be compiled to use WSI with a given platform, it must either:

- #define the appropriate preprocessor symbol prior to including the vulkan_sc.h header file, or
- include vulkan_sc_core.h and any native platform headers, followed by the appropriate platform-specific header.

The preprocessor symbols and platform-specific headers are defined in the Window System Extensions and Headers table.

Each platform-specific extension is an instance extension. The application must enable instance extensions with vkCreateInstance before using them.

30.2. WSI Surface

Native platform surface or window objects are abstracted by surface objects, which are represented by VkSurfaceKHR handles:

```cpp
// Provided by VK_KHR_surface
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSurfaceKHR)
```

The VK_KHR_surface extension declares the VkSurfaceKHR object, and provides a function for destroying VkSurfaceKHR objects. Separate platform-specific extensions each provide a function for creating a VkSurfaceKHR object for the respective platform. From the application's perspective this is an opaque handle, just like the handles of other Vulkan objects.
On certain platforms, the Vulkan loader and ICDs may have conventions that treat the handle as a pointer to a structure containing the platform-specific information about the surface. This will be described in the documentation for the loader-ICD interface, and in the `vk.icd.h` header file of the LoaderAndTools source-code repository. This does not affect the loader-layer interface; layers may wrap VkSurfaceKHR objects.

### 30.2.1. Platform-Independent Information

Once created, VkSurfaceKHR objects can be used in this and other extensions, in particular the VK_KHR_swapchain extension.

Several WSI functions return VK_ERROR_SURFACE_LOST_KHR if the surface becomes no longer available. After such an error, the surface (and any child swapchain, if one exists) should be destroyed, as there is no way to restore them to a not-lost state. Applications may attempt to create a new VkSurfaceKHR using the same native platform window object, but whether such re-creation will succeed is platform-dependent and may depend on the reason the surface became unavailable. A lost surface does not otherwise cause devices to be lost.

To destroy a VkSurfaceKHR object, call:

```c
// Provided by VK_KHR_surface
void vkDestroySurfaceKHR(  
    VkInstance instance,  
    VkSurfaceKHR surface,  
    const VkAllocationCallbacks* pAllocator);
```

- `instance` is the instance used to create the surface.
- `surface` is the surface to destroy.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

Destroying a VkSurfaceKHR merely severs the connection between Vulkan and the native surface, and does not imply destroying the native surface, closing a window, or similar behavior.

### Valid Usage

### Valid Usage (Implicit)

- `VUID-vkDestroySurfaceKHR-instance-parameter`  
  `instance` must be a valid VkInstance handle

- `VUID-vkDestroySurfaceKHR-surface-parameter`  
  If `surface` is not VK_NULL_HANDLE, `surface` must be a valid VkSurfaceKHR handle

- `VUID-vkDestroySurfaceKHR-pAllocator-null`
pAllocator must be NULL

- VUID-vkDestroySurfaceKHR-surface-parent
  If surface is a valid handle, it must have been created, allocated, or retrieved from instance.

Host Synchronization

- Host access to surface must be externally synchronized.

30.3. Presenting Directly to Display Devices

In some environments applications can also present Vulkan rendering directly to display devices without using an intermediate windowing system. This can be useful for embedded applications, or implementing the rendering/presentation backend of a windowing system using Vulkan. The VK_KHR_display extension provides the functionality necessary to enumerate display devices and create VkSurfaceKHR objects that target displays.

30.3.1. Display Enumeration

Displays are represented by VkDisplayKHR handles:

```c
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayKHR)
```

Various functions are provided for enumerating the available display devices present on a Vulkan physical device. To query information about the available displays, call:

```c
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPropertiesKHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either NULL or a pointer to an array of VkDisplayPropertiesKHR structures.

If `pProperties` is NULL, then the number of display devices available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display devices for `physicalDevice`, at most `pPropertyCount` structures will be written, and
VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available properties were returned.

If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE, vkGetPhysicalDeviceDisplayPropertiesKHR must not return VK_ERROR_OUT_OF_HOST_MEMORY.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-Properties-Properties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayPropertiesKHR structures

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayPropertiesKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPropertiesKHR {
    VkDisplayKHR display;
    const char* displayName;
    VkExtent2D physicalDimensions;
    VkExtent2D physicalResolution;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkBool32 planeReorderPossible;
    VkBool32 persistentContent;
} VkDisplayPropertiesKHR;
```

- display is a handle that is used to refer to the display described here. This handle will be valid for the lifetime of the Vulkan instance.
- displayName is NULL or a pointer to a null-terminated UTF-8 string containing the name of the display. Generally, this will be the name provided by the display’s EDID. If NULL, no suitable name is available. If not NULL, the string pointed to must remain accessible and unmodified as
long as display is valid.

- **physicalDimensions** describes the physical width and height of the visible portion of the display, in millimeters.
- **physicalResolution** describes the physical, native, or preferred resolution of the display.

**Note**
For devices which have no natural value to return here, implementations should return the maximum resolution supported.

- **supportedTransforms** is a bitmask of VkSurfaceTransformFlagBitsKHR describing which transforms are supported by this display.
- **planeReorderPossible** tells whether the planes on this display can have their z order changed. If this is VK_TRUE, the application can re-arrange the planes on this display in any order relative to each other.
- **persistentContent** tells whether the display supports self-refresh/internal buffering. If this is true, the application can submit persistent present operations on swapchains created against this display.

**Note**
Persistent presents may have higher latency, and may use less power when the screen content is updated infrequently, or when only a portion of the screen needs to be updated in most frames.

To query information about the available displays, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayProperties2KHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayProperties2KHR* pProperties);
```

- **physicalDevice** is a physical device.
- **pPropertyCount** is a pointer to an integer related to the number of display devices available or queried, as described below.
- **pProperties** is either NULL or a pointer to an array of VkDisplayProperties2KHR structures.

vkGetPhysicalDeviceDisplayProperties2KHR behaves similarly to vkGetPhysicalDeviceDisplayPropertiesKHR, with the ability to return extended information via chained output structures.

If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE, vkGetPhysicalDeviceDisplayProperties2KHR must not return VK_ERROR_OUT_OF_HOST_MEMORY.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pPropertyCount-parameter
  pPropertyCount must be a valid pointer to a uint32_t value

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayProperties2KHR structures

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayProperties2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPropertiesKHR displayProperties;
} VkDisplayProperties2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `displayProperties` is a VkDisplayPropertiesKHR structure.

Valid Usage (Implicit)

- VUID-VkDisplayProperties2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR

- VUID-VkDisplayProperties2KHR-pNext-pNext
  pNext must be NULL
Acquiring and Releasing Displays

On some platforms, access to displays is limited to a single process or native driver instance. On such platforms, some or all of the displays may not be available to Vulkan if they are already in use by a native windowing system or other application.

To release a previously acquired display, call:

```c
// Provided by VK_EXT_direct_mode_display
VkResult vkReleaseDisplayEXT(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display);
```

- `physicalDevice` The physical device the display is on.
- `display` The display to release control of.

Valid Usage (Implicit)

- VUID-vkReleaseDisplayEXT-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkReleaseDisplayEXT-display-parameter `display` must be a valid `VkDisplayKHR` handle
- VUID-vkReleaseDisplayEXT-display-parent `display` must have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success

- `VK_SUCCESS`

Display Planes

Images are presented to individual planes on a display. Devices must support at least one plane on each display. Planes can be stacked and blended to composite multiple images on one display. Devices may support only a fixed stacking order and fixed mapping between planes and displays, or they may allow arbitrary application specified stacking orders and mappings between planes and displays. To query the properties of device display planes, call:

```c
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPlanePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPlanePropertiesKHR* pProperties);
```
• `physicalDevice` is a physical device.

• `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.

• `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlanePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display planes available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display planes for `physicalDevice`, at most `pPropertyCount` structures will be written.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` must not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

---

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pProperties-parameter If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPlanePropertiesKHR` structures

---

**Return Codes**

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlanePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlanePropertiesKHR {
    VkDisplayKHR     currentDisplay;
    uint32_t         currentStackIndex;
} VkDisplayPlanePropertiesKHR;
```
• `currentDisplay` is the handle of the display the plane is currently associated with. If the plane is not currently attached to any displays, this will be `VK_NULL_HANDLE`.

• `currentStackIndex` is the current z-order of the plane. This will be between 0 and the value returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` in `pPropertyCount`.

To query the properties of a device’s display planes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayPlaneProperties2KHR(
    VkPhysicalDevice physicalDevice,           
    uint32_t* pPropertyCount,                 
    VkDisplayPlaneProperties2KHR* pProperties);
```

• `physicalDevice` is a physical device.

• `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.

• `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlaneProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayPlaneProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`, with the ability to return extended information via chained output structures.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceDisplayPlaneProperties2KHR` must not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-physicalDevice-parameter
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pPropertyCount-parameter
  - `pPropertyCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pProperties-parameter
  - If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPlaneProperties2KHR` structures

**Return Codes**

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
The `VkDisplayPlaneProperties2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlanePropertiesKHR displayPlaneProperties;
} VkDisplayPlaneProperties2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **displayPlaneProperties** is a `VkDisplayPlanePropertiesKHR` structure.

**Valid Usage (Implicit)**

- VUID-VkDisplayPlaneProperties2KHR-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR`
- VUID-VkDisplayPlaneProperties2KHR-pNext-pNext
  - `pNext` must be `NULL`

To determine which displays a plane is usable with, call

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneSupportedDisplaysKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t planeIndex,
    uint32_t* pDisplayCount,
    VkDisplayKHR* pDisplays);
```

- **physicalDevice** is a physical device.
- **planeIndex** is the plane which the application wishes to use, and **must** be in the range `[0, physical device plane count - 1]`.
- **pDisplayCount** is a pointer to an integer related to the number of displays available or queried, as described below.
- **pDisplays** is either `NULL` or a pointer to an array of `VkDisplayKHR` handles.

If `pDisplays` is `NULL`, then the number of displays usable with the specified `planeIndex` for `physicalDevice` is returned in `pDisplayCount`. Otherwise, `pDisplayCount` **must** point to a variable set by the user to the number of elements in the `pDisplays` array, and on return the variable is overwritten with the number of handles actually written to `pDisplays`. If the value of `pDisplayCount` is less than the number of usable display-plane pairs for `physicalDevice`, at most `pDisplayCount`
handles will be written, and \texttt{VK_INCOMPLETE} will be returned instead of \texttt{VK_SUCCESS}, to indicate that not all the available pairs were returned.

If \texttt{VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations} is \texttt{VK_TRUE}, \texttt{vkGetDisplayPlaneSupportedDisplaysKHR} must not return \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}.

### Valid Usage

- \texttt{VUID-vkGetDisplayPlaneSupportedDisplaysKHR-planeIndex-01249} \texttt{planeIndex} must be less than the number of display planes supported by the device as determined by calling \texttt{vkGetPhysicalDeviceDisplayPlanePropertiesKHR}

### Valid Usage (Implicit)

- \texttt{VUID-vkGetDisplayPlaneSupportedDisplaysKHR-physicalDevice-parameter} \texttt{physicalDevice} must be a valid \texttt{VkPhysicalDevice} handle
- \texttt{VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplayCount-parameter} \texttt{pDisplayCount} must be a valid pointer to a \texttt{uint32_t} value
- \texttt{VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplays-parameter} If the value referenced by \texttt{pDisplayCount} is not \texttt{0}, and \texttt{pDisplays} is not \texttt{NULL}, \texttt{pDisplays} must be a valid pointer to an array of \texttt{pDisplayCount} \texttt{VkDisplayKHR} handles

### Return Codes

**Success**
- \texttt{VK_SUCCESS}
- \texttt{VK_INCOMPLETE}

**Failure**
- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}

Additional properties of displays are queried using specialized query functions.

### Display Modes

Display modes are represented by \texttt{VkDisplayModeKHR} handles:

```c
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayModeKHR)
```

Each display has one or more supported modes associated with it by default. These built-in modes are queried by calling:
// Provided by VK_KHR_display

VkResult vkGetDisplayModePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    uint32_t* pPropertyCount,
    VkDisplayModePropertiesKHR* pProperties);

• physicalDevice is the physical device associated with display.
• display is the display to query.
• pPropertyCount is a pointer to an integer related to the number of display modes available or queried, as described below.
• pProperties is either NULL or a pointer to an array of VkDisplayModePropertiesKHR structures.

If pProperties is NULL, then the number of display modes available on the specified display for physicalDevice is returned in pPropertyCount. Otherwise, pPropertyCount must point to a variable set by the user to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If the value of pPropertyCount is less than the number of display modes for physicalDevice, at most pPropertyCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available display modes were returned.

If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE, vkGetDisplayModePropertiesKHR must not return VK_ERROR_OUT_OF_HOST_MEMORY.

Valid Usage (Implicit)

• VUID-vkGetDisplayModePropertiesKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
• VUID-vkGetDisplayModePropertiesKHR-display-parameter display must be a valid VkDisplayKHR handle
• VUID-vkGetDisplayModePropertiesKHR-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value
• VUID-vkGetDisplayModePropertiesKHR-pProperties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayModePropertiesKHR structures
• VUID-vkGetDisplayModePropertiesKHR-display-parent display must have been created, allocated, or retrieved from physicalDevice

Return Codes

Success
• VK_SUCCESS
The `VkDisplayModePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModePropertiesKHR {
    VkDisplayModeKHR displayMode;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModePropertiesKHR;
```

- `displayMode` is a handle to the display mode described in this structure. This handle will be valid for the lifetime of the Vulkan instance.
- `parameters` is a `VkDisplayModeParametersKHR` structure describing the display parameters associated with `displayMode`.

`VkDisplayModeCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To query the properties of a device’s built-in display modes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayModeProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    uint32_t* pPropertyCount,
    VkDisplayModeProperties2KHR* pProperties);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModeProperties2KHR` structures.

`vkGetDisplayModeProperties2KHR` behaves similarly to `vkGetDisplayModePropertiesKHR`, with the ability to return extended information via chained output structures.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`,...
vkGetDisplayModeProperties2KHR must not return VK_ERROR_OUT_OF_HOST_MEMORY.

Valid Usage (Implicit)

- VUID-vkGetDisplayModeProperties2KHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetDisplayModeProperties2KHR-display-parameter display must be a valid VkDisplayKHR handle
- VUID-vkGetDisplayModeProperties2KHR-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value
- VUID-vkGetDisplayModeProperties2KHR-pProperties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayModeProperties2KHR structures
- VUID-vkGetDisplayModeProperties2KHR-display-parent display must have been created, allocated, or retrieved from physicalDevice

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayModeProperties2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayModeProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayModePropertiesKHR displayModeProperties;
} VkDisplayModeProperties2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `displayModeProperties` is a VkDisplayModePropertiesKHR structure.
Valid Usage (Implicit)

- VUID-VkDisplayModeProperties2KHR-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR**

- VUID-VkDisplayModeProperties2KHR-pNext-pNext
  
  **pNext** must be **NULL**

The **VkDisplayModeParametersKHR** structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModeParametersKHR {
    VkExtent2D             visibleRegion;
    uint32_t               refreshRate;
} VkDisplayModeParametersKHR;
```

- **visibleRegion** is the 2D extents of the visible region.
- **refreshRate** is a **uint32_t** that is the number of times the display is refreshed each second multiplied by 1000.

**Note**

For example, a 60Hz display mode would report a **refreshRate** of 60,000.

Valid Usage

- VUID-VkDisplayModeParametersKHR-width-01990
  
  The **width** member of **visibleRegion** must be greater than 0

- VUID-VkDisplayModeParametersKHR-height-01991
  
  The **height** member of **visibleRegion** must be greater than 0

- VUID-VkDisplayModeParametersKHR-refreshRate-01992
  
  **refreshRate** must be greater than 0

Additional modes may also be created by calling:

```c
// Provided by VK_KHR_display
VkResult vkCreateDisplayModeKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    const VkDisplayModeCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDisplayModeKHR* pMode);
```

- **physicalDevice** is the physical device associated with **display**.
• **display** is the display to create an additional mode for.

• **pCreateInfo** is a pointer to a `VkDisplayModeCreateInfoKHR` structure describing the new mode to create.

• **pAllocator** is the allocator used for host memory allocated for the display mode object when there is no more specific allocator available (see Memory Allocation).

• **pMode** is a pointer to a `VkDisplayModeKHR` handle in which the mode created is returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkCreateDisplayModeKHR` must not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

### Valid Usage (Implicit)

- VUID-vkCreateDisplayModeKHR-physicalDevice-parameter  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkCreateDisplayModeKHR-display-parameter  
  `display` must be a valid `VkDisplayKHR` handle

- VUID-vkCreateDisplayModeKHR-pCreateInfo-parameter  
  `pCreateInfo` must be a valid pointer to a valid `VkDisplayModeCreateInfoKHR` structure

- VUID-vkCreateDisplayModeKHR-pAllocator-null  
  `pAllocator` must be `NULL`

- VUID-vkCreateDisplayModeKHR-pMode-parameter  
  `pMode` must be a valid pointer to a `VkDisplayModeKHR` handle

- VUID-vkCreateDisplayModeKHR-display-parent  
  `display` must have been created, allocated, or retrieved from `physicalDevice`

### Host Synchronization

- Host access to `display` must be externally synchronized

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkDisplayModeCreateInfoKHR` structure is defined as:
typedef struct VkDisplayModeCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplayModeCreateFlagsKHR flags;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModeCreateInfoKHR;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is reserved for future use, and must be zero.
• **parameters** is a VkDisplayModeParametersKHR structure describing the display parameters to use in creating the new mode. If the parameters are not compatible with the specified display, the implementation must return VK_ERROR_INITIALIZATION_FAILED.

**Valid Usage (Implicit)**

• VUID-VkDisplayModeCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR

• VUID-VkDisplayModeCreateInfoKHR-pNext-pNext
  pNext must be NULL

• VUID-VkDisplayModeCreateInfoKHR-flags-zerobitmask
  flags must be 0

• VUID-VkDisplayModeCreateInfoKHR-parameters-parameter
  parameters must be a valid VkDisplayModeParametersKHR structure

Applications that wish to present directly to a display must select which layer, or “plane” of the display they wish to target, and a mode to use with the display. Each display supports at least one plane. The capabilities of a given mode and plane combination are determined by calling:

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayModeKHR mode,
    uint32_t planeIndex,
    VkDisplayPlaneCapabilitiesKHR* pCapabilities);
```

• **physicalDevice** is the physical device associated with the display specified by **mode**
• **mode** is the display mode the application intends to program when using the specified plane. Note this parameter also implicitly specifies a display.
• **planeIndex** is the plane which the application intends to use with the display, and is less than the number of display planes supported by the device.
• `pCapabilities` is a pointer to a `VkDisplayPlaneCapabilitiesKHR` structure in which the capabilities are returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetDisplayPlaneCapabilitiesKHR` must not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneCapabilitiesKHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parameter `mode` must be a valid `VkDisplayModeKHR` handle
- VUID-vkGetDisplayPlaneCapabilitiesKHR-pCapabilities-parameter `pCapabilities` must be a valid pointer to a `VkDisplayPlaneCapabilitiesKHR` structure
- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parent `mode` must have been created, allocated, or retrieved from `physicalDevice`

Host Synchronization

- Host access to `mode` must be externally synchronized

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlaneCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlaneCapabilitiesKHR {
    VkDisplayPlaneAlphaFlagsKHR supportedAlpha;
    VkOffset2D minSrcPosition;
    VkOffset2D maxSrcPosition;
    VkExtent2D minSrcExtent;
    VkExtent2D maxSrcExtent;
    VkOffset2D minDstPosition;
    VkOffset2D maxDstPosition;
    VkExtent2D minDstExtent;
    VkExtent2D maxDstExtent;
} VkDisplayPlaneCapabilitiesKHR;
```
VkDisplayPlaneCapabilitiesKHR;

- supportedAlpha is a bitmask of VkDisplayPlaneAlphaFlagBitsKHR describing the supported alpha blending modes.
- minSrcPosition is the minimum source rectangle offset supported by this plane using the specified mode.
- maxSrcPosition is the maximum source rectangle offset supported by this plane using the specified mode. The x and y components of maxSrcPosition must each be greater than or equal to the x and y components of minSrcPosition, respectively.
- minSrcExtent is the minimum source rectangle size supported by this plane using the specified mode.
- maxSrcExtent is the maximum source rectangle size supported by this plane using the specified mode.
- minDstPosition, maxDstPosition, minDstExtent, maxDstExtent all have similar semantics to their corresponding *Src* equivalents, but apply to the output region within the mode rather than the input region within the source image. Unlike the *Src* offsets, minDstPosition and maxDstPosition may contain negative values.

The minimum and maximum position and extent fields describe the implementation limits, if any, as they apply to the specified display mode and plane. Vendors may support displaying a subset of a swapchain's presentable images on the specified display plane. This is expressed by returning minSrcPosition, maxSrcPosition, minSrcExtent, and maxSrcExtent values that indicate a range of possible positions and sizes which may be used to specify the region within the presentable images that source pixels will be read from when creating a swapchain on the specified display mode and plane.

Vendors may also support mapping the presentable images' content to a subset or superset of the visible region in the specified display mode. This is expressed by returning minDstPosition, maxDstPosition, minDstExtent, and maxDstExtent values that indicate a range of possible positions and sizes which may be used to describe the region within the display mode that the source pixels will be mapped to.

Other vendors may support only a 1-1 mapping between pixels in the presentable images and the display mode. This may be indicated by returning (0,0) for minSrcPosition, maxSrcPosition, minDstPosition, and maxDstPosition, and (display mode width, display mode height) for minSrcExtent, maxSrcExtent, minDstExtent, and maxDstExtent.

The value supportedAlpha must contain at least one valid VkDisplayPlaneAlphaFlagBitsKHR bit.

These values indicate the limits of the implementation's individual fields. Not all combinations of values within the offset and extent ranges returned in VkDisplayPlaneCapabilitiesKHR are guaranteed to be supported. Presentation requests specifying unsupported combinations may fail.

To query the capabilities of a given mode and plane combination, call:

```
// Provided by VK_KHR_get_display_properties2
```
VkResult vkGetDisplayPlaneCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkDisplayPlaneInfo2KHR* pDisplayPlaneInfo,
    VkDisplayPlaneCapabilities2KHR* pCapabilities);
VkDisplayPlaneInfo2KHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **mode** is the display mode the application intends to program when using the specified plane.

**Note**
This parameter also implicitly specifies a display.

- **planeIndex** is the plane which the application intends to use with the display.

The members of `VkDisplayPlaneInfo2KHR` correspond to the arguments to `vkGetDisplayPlaneCapabilitiesKHR`, with **sType** and **pNext** added for extensibility.

### Valid Usage (Implicit)

- VUID-VkDisplayPlaneInfo2KHR-sType-sType  
  **sType** must be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR`  
- VUID-VkDisplayPlaneInfo2KHR-pNext-pNext  
  **pNext** must be `NULL`  
- VUID-VkDisplayPlaneInfo2KHR-mode-parameter  
  **mode** must be a valid `VkDisplayModeKHR` handle

### Host Synchronization

- Host access to **mode** must be externally synchronized

The `VkDisplayPlaneCapabilities2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlaneCapabilitiesKHR capabilities;
} VkDisplayPlaneCapabilities2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **capabilities** is a `VkDisplayPlaneCapabilitiesKHR` structure.
30.3.2. Display Control

To set the power state of a display, call:

```c
// Provided by VK_EXT_display_control
VkResult vkDisplayPowerControlEXT(
    VkDevice device,          // Provided by VK_EXT_display_control
    VkDisplayKHR display,     // Provided by VK_EXT_display_control
    const VkDisplayPowerInfoEXT* pDisplayPowerInfo);  // Provided by VK_EXT_display_control
```

- `device` is a logical device associated with `display`.
- `display` is the display whose power state is modified.
- `pDisplayPowerInfo` is a pointer to a `VkDisplayPowerInfoEXT` structure specifying the new power state of `display`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkDisplayPowerControlEXT` must not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkDisplayPowerControlEXT-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkDisplayPowerControlEXT-display-parameter
  `display` must be a valid `VkDisplayKHR` handle

- VUID-vkDisplayPowerControlEXT-pDisplayPowerInfo-parameter
  `pDisplayPowerInfo` must be a valid pointer to a valid `VkDisplayPowerInfoEXT` structure

- VUID-vkDisplayPowerControlEXT-commonparent
  Both of `device`, and `display` must have been created, allocated, or retrieved from the same `VkPhysicalDevice`

Return Codes

Success

- `VK_SUCCESS`
The `VkDisplayPowerInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkDisplayPowerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDisplayPowerStateEXT powerState;
} VkDisplayPowerInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `powerState` is a `VkDisplayPowerStateEXT` value specifying the new power state of the display.

### Valid Usage (Implicit)

- `VUID-VkDisplayPowerInfoEXT-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT`.
- `VUID-VkDisplayPowerInfoEXT-pNext-pNext` `pNext` must be `NULL`.
- `VUID-VkDisplayPowerInfoEXT-powerState-parameter` `powerState` must be a valid `VkDisplayPowerStateEXT` value.

Possible values of `VkDisplayPowerInfoEXT::powerState`, specifying the new power state of a display, are:

```c
// Provided by VK_EXT_display_control
typedef enum VkDisplayPowerStateEXT {
    VK_DISPLAY_POWER_STATE_OFF_EXT = 0,
    VK_DISPLAY_POWER_STATE_SUSPEND_EXT = 1,
    VK_DISPLAY_POWER_STATE_ON_EXT = 2,
} VkDisplayPowerStateEXT;
```

- `VK_DISPLAY_POWER_STATE_OFF_EXT` specifies that the display is powered down.
- `VK_DISPLAY_POWER_STATE_SUSPEND_EXT` specifies that the display is put into a low power mode, from which it may be able to transition back to `VK_DISPLAY_POWER_STATE_ON_EXT` more quickly than if it were in `VK_DISPLAY_POWER_STATE_OFF_EXT`. This state may be the same as `VK_DISPLAY_POWER_STATE_OFF_EXT`.
- `VK_DISPLAY_POWER_STATE_ON_EXT` specifies that the display is powered on.
30.3.3. Display Surfaces

A complete display configuration includes a mode, one or more display planes and any parameters describing their behavior, and parameters describing some aspects of the images associated with those planes. Display surfaces describe the configuration of a single plane within a complete display configuration. To create a \texttt{VkSurfaceKHR} object for a display plane, call:

```c
// Provided by VK_KHR_display
VkResult vkCreateDisplayPlaneSurfaceKHR(
    VkInstance instance,
    const VkDisplaySurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- \texttt{instance} is the instance corresponding to the physical device the targeted display is on.
- \texttt{pCreateInfo} is a pointer to a \texttt{VkDisplaySurfaceCreateInfoKHR} structure specifying which mode, plane, and other parameters to use, as described below.
- \texttt{pAllocator} is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- \texttt{pSurface} is a pointer to a \texttt{VkSurfaceKHR} handle in which the created surface is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDisplayPlaneSurfaceKHR-instance-parameter \texttt{instance} \textbf{must} be a valid \texttt{VkInstance} handle
- VUID-vkCreateDisplayPlaneSurfaceKHR-pCreateInfo-parameter \texttt{pCreateInfo} \textbf{must} be a valid pointer to a valid \texttt{VkDisplaySurfaceCreateInfoKHR} structure
- VUID-vkCreateDisplayPlaneSurfaceKHR-pAllocator-null \texttt{pAllocator} \textbf{must} be NULL
- VUID-vkCreateDisplayPlaneSurfaceKHR-pSurface-parameter \texttt{pSurface} \textbf{must} be a valid pointer to a \texttt{VkSurfaceKHR} handle

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The \texttt{VkDisplaySurfaceCreateInfoKHR} structure is defined as:
// Provided by VK_KHR_display

typedef struct VkDisplaySurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplaySurfaceCreateFlagsKHR flags;
    VkDisplayModeKHR displayMode;
    uint32_t planeIndex;
    uint32_t planeStackIndex;
    VkSurfaceTransformFlagBitsKHR transform;
    float globalAlpha;
    VkDisplayPlaneAlphaFlagBitsKHR alphaMode;
    VkExtent2D imageExtent;
} VkDisplaySurfaceCreateInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use, and must be zero.
• displayMode is a VkDisplayModeKHR handle specifying the mode to use when displaying this surface.
• planeIndex is the plane on which this surface appears.
• planeStackIndex is the z-order of the plane.
• transform is a VkSurfaceTransformFlagBitsKHR value specifying the transformation to apply to images as part of the scanout operation.
• globalAlpha is the global alpha value. This value is ignored if alphaMode is not VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR.
• alphaMode is a VkDisplayPlaneAlphaFlagBitsKHR value specifying the type of alpha blending to use.
• imageExtent is the size of the presentable images to use with the surface.

Note
Creating a display surface must not modify the state of the displays, planes, or other resources it names. For example, it must not apply the specified mode to be set on the associated display. Application of display configuration occurs as a side effect of presenting to a display surface.

Valid Usage

• VUID-VkDisplaySurfaceCreateInfoKHR-planeIndex-01252
  planeIndex must be less than the number of display planes supported by the device as determined by calling vkGetPhysicalDeviceDisplayPlanePropertiesKHR

• VUID-VkDisplaySurfaceCreateInfoKHR-planeReorderPossible-01253
  If the planeReorderPossible member of the VkDisplayPropertiesKHR structure returned by vkGetPhysicalDeviceDisplayPropertiesKHR for the display corresponding to displayMode is
VK_TRUE then planeStackIndex must be less than the number of display planes supported by the device as determined by calling vkGetPhysicalDeviceDisplayPlanePropertiesKHR; otherwise planeStackIndex must equal the currentStackIndex member of VkDisplayPlanePropertiesKHR returned by vkGetPhysicalDeviceDisplayPlanePropertiesKHR for the display plane corresponding to displayMode

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01254
  If alphaMode is VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR then globalAlpha must be between 0 and 1, inclusive

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01255
  alphaMode must be one of the bits present in the supportedAlpha member of VkDisplayPlaneCapabilitiesKHR for the display plane corresponding to displayMode

- VUID-VkDisplaySurfaceCreateInfoKHR-transform-06740
  transform must be one of the bits present in the supportedTransforms member of VkDisplayPropertiesKHR for the display corresponding to displayMode

- VUID-VkDisplaySurfaceCreateInfoKHR-width-01256
  The width and height members of imageExtent must be less than or equal to VkPhysicalDeviceLimits::maxImageDimension2D

---

**Valid Usage (Implicit)**

- VUID-VkDisplaySurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR

- VUID-VkDisplaySurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkDisplaySurfaceCreateInfoKHR-flags-zeroBitmask
  flags must be 0

- VUID-VkDisplaySurfaceCreateInfoKHR-displayMode-parameter
  displayMode must be a valid VkDisplayModeKHR handle

- VUID-VkDisplaySurfaceCreateInfoKHR-transform-parameter
  transform must be a valid VkSurfaceTransformFlagBitsKHR value

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-parameter
  alphaMode must be a valid VkDisplayPlaneAlphaFlagBitsKHR value

---

// Provided by VK_KHR_display
typedef VkFlags VkDisplaySurfaceCreateFlagsKHR;

VkDisplaySurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

Bits which can be set in VkDisplaySurfaceCreateInfoKHR::alphaMode, specifying the type of alpha blending to use on a display, are:
typedef enum VkDisplayPlaneAlphaFlagBitsKHR {
    VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR = 0x00000002,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR = 0x00000004,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR = 0x00000008,
} VkDisplayPlaneAlphaFlagBitsKHR;

- **VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR** specifies that the source image will be treated as opaque.
- **VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR** specifies that a global alpha value must be specified that will be applied to all pixels in the source image.
- **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR** specifies that the alpha value will be determined by the alpha component of the source image's pixels. If the source format contains no alpha values, no blending will be applied. The source alpha values are not premultiplied into the source image's other color components.
- **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR** is equivalent to **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR**, except the source alpha values are assumed to be premultiplied into the source image's other color components.

typedef VkFlags VkDisplayPlaneAlphaFlagsKHR;

VkDisplayPlaneAlphaFlagsKHR is a bitmask type for setting a mask of zero or more VkDisplayPlaneAlphaFlagBitsKHR.

### 30.3.4. Presenting to Headless Surfaces

Vulkan rendering can be presented to a headless surface, where the presentation operation is a no-op producing no externally-visible result.

**Note**

Because there is no real presentation target, the headless presentation engine may be extended to impose an arbitrary or customisable set of restrictions and features. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

The usual surface query mechanisms must be used to determine the actual restrictions and features of the implementation.

To create a headless `VkSurfaceKHR` object, call:

```
VkResult

vkCreateHeadlessSurfaceEXT(
  VkInstance instance,
  const VkHeadlessSurfaceCreateInfoEXT* pCreateInfo,
  const VkAllocationCallbacks* pAllocator,
  VkSurfaceKHR* pSurface);

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a *VkHeadlessSurfaceCreateInfoEXT* structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a *VkSurfaceKHR* handle in which the created surface object is returned.

**Valid Usage (Implicit)**

- VUID-vkCreateHeadlessSurfaceEXT-instance-parameter
  - **instance** must be a valid *VkInstance* handle
- VUID-vkCreateHeadlessSurfaceEXT-pCreateInfo-parameter
  - **pCreateInfo** must be a valid pointer to a valid *VkHeadlessSurfaceCreateInfoEXT* structure
- VUID-vkCreateHeadlessSurfaceEXT-pAllocator-null
  - **pAllocator** must be NULL
- VUID-vkCreateHeadlessSurfaceEXT-pSurface-parameter
  - **pSurface** must be a valid pointer to a *VkSurfaceKHR* handle

**Return Codes**

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The *VkHeadlessSurfaceCreateInfoEXT* structure is defined as:

```c
// Provided by VK_EXT_headless_surface
typedef struct VkHeadlessSurfaceCreateInfoEXT {
  VkStructureType sType;
  const void* pNext;
  VkHeadlessSurfaceCreateFlagsEXT flags;
} VkHeadlessSurfaceCreateInfoEXT;
```

- **sType** is a *VkStructureType* value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `flags` is reserved for future use.

Valid Usage (Implicit)

• VUID-VkHeadlessSurfaceCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_HEADLESS_SURFACE_CREATE_INFO_EXT`
• VUID-VkHeadlessSurfaceCreateInfoEXT-pNext-pNext
  `pNext` must be NULL
• VUID-VkHeadlessSurfaceCreateInfoEXT-flags-zerobitmask
  `flags` must be 0

For headless surfaces, `currentExtent` is the reserved value (0xFFFFFFFF, 0xFFFFFFFF). Whatever the application sets a swapchain’s `imageExtent` to will be the size of the surface, after the first image is presented.

```cpp
// Provided by VK_EXT_headless_surface
typedef VkFlags VkHeadlessSurfaceCreateFlagsEXT;
```

`VkHeadlessSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

### 30.4. Querying for WSI Support

Not all physical devices will include WSI support. Within a physical device, not all queue families will support presentation. WSI support and compatibility can be determined in a platform-neutral manner (which determines support for presentation to a particular surface object) and additionally may be determined in platform-specific manners (which determine support for presentation on the specified physical device but do not guarantee support for presentation to a particular surface object).

To determine whether a queue family of a physical device supports presentation to a given surface, call:

```cpp
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    VkSurfaceKHR surface,
    VkBool32* pSupported);
```

• `physicalDevice` is the physical device.
• `queueFamilyIndex` is the queue family.
• surface is the surface.

• pSupported is a pointer to a VkBool32, which is set to VK_TRUE to indicate support, and VK_FALSE otherwise.

If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE, vkGetPhysicalDeviceSurfaceSupportKHR must not return VK_ERROR_OUT_OF_HOST_MEMORY.

Valid Usage

• VUID-vkGetPhysicalDeviceSurfaceSupportKHR-queueFamilyIndex-01269
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by
  vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceSurfaceSupportKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceSurfaceSupportKHR-surface-parameter
  surface must be a valid VkSurfaceKHR handle

• VUID-vkGetPhysicalDeviceSurfaceSupportKHR-pSupported-parameter
  pSupported must be a valid pointer to a VkBool32 value

• VUID-vkGetPhysicalDeviceSurfaceSupportKHR-commonparent
  Both of physicalDevice, and surface must have been created, allocated, or retrieved from
  the same VkInstance

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_SURFACE_LOST_KHR

30.5. Surface Queries

The capabilities of a swapchain targeting a surface are the intersection of the capabilities of the WSI platform, the native window or display, and the physical device. The resulting capabilities can be obtained with the queries listed below in this section.

Note
In addition to the surface capabilities as obtained by surface queries below, swapchain images are also subject to ordinary image creation limits as reported by VkGetPhysicalDeviceImageFormatProperties. As an application is instructed by the appropriate Valid Usage sections, both the surface capabilities and the image creation limits have to be satisfied whenever swapchain images are created.

### 30.5.1. Surface Capabilities

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    VkSurfaceCapabilitiesKHR* pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceCapabilities` is a pointer to a VkSurfaceCapabilitiesKHR structure in which the capabilities are returned.

If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE, vkGetPhysicalDeviceSurfaceCapabilitiesKHR must not return VK_ERROR_OUT_OF_HOST_MEMORY.

#### Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06523 surface must be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06211 surface must be supported by physicalDevice, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

#### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-parameter surface must be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-pSurfaceCapabilities-parameter pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilitiesKHR structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-commonparent Both of physicalDevice, and surface must have been created, allocated, or retrieved from
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceCapabilitiesKHR structure is defined as:

```c
// Provided by VK_KHR_surface
typedef struct VkSurfaceCapabilitiesKHR {
    uint32_t minImageCount;
    uint32_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
} VkSurfaceCapabilitiesKHR;
```

- **minImageCount** is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.

- **maxImageCount** is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to minImageCount. A value of 0 means that there is no limit on the number of images, though there may be limits related to the total amount of memory used by presentable images.

- **currentExtent** is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

- **minImageExtent** contains the smallest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be less than or equal to the corresponding width and height of currentExtent, unless currentExtent has the special value described above.

- **maxImageExtent** contains the largest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be greater than or equal to the corresponding width and height of minImageExtent. The width and height of the extent will each be greater than or equal to the corresponding width and height of currentExtent, unless
currentExtent has the special value described above.

- **maxImageArrayLayers** is the maximum number of layers presentable images can have for a swapchain created for this device and surface, and will be at least one.

- **supportedTransforms** is a bitmask of VkSurfaceTransformFlagBitsKHR indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.

- **currentTransform** is VkSurfaceTransformFlagBitsKHR value indicating the surface’s current transform relative to the presentation engine’s natural orientation.

- **supportedCompositeAlpha** is a bitmask of VkCompositeAlphaFlagBitsKHR, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition can be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

- **supportedUsageFlags** is a bitmask of VkImageUsageFlagBits representing the ways the application can use the presentable images of a swapchain created with VkPresentModeKHR set to VK_PRESENT_MODE_IMMEDIATE_KHR, VK_PRESENT_MODE_MAILBOX_KHR, VK_PRESENT_MODE_FIFO_KHR or VK_PRESENT_MODE_FIFO_RELAXED_KHR for the surface on the specified device. VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT must be included in the set. Implementations may support additional usages.

```
Note
Supported usage flags of a presentable image when using
VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR
or
VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR presentation mode are provided
by VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags.
```

```
Note
Formulas such as min(N, maxImageCount) are not correct, since maxImageCount may
be zero.
```

To query the basic capabilities of a surface defined by the core or extensions, call:

```
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkSurfaceCapabilities2KHR* pSurfaceCapabilities);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.

- **pSurfaceInfo** is a pointer to a VkPhysicalDeviceSurfaceInfo2KHR structure describing the surface and other fixed parameters that would be consumed by vkCreateSwapchainKHR.

- **pSurfaceCapabilities** is a pointer to a VkSurfaceCapabilities2KHR structure in which the capabilities are returned.
vkGetPhysicalDeviceSurfaceCapabilities2KHR behaves similarly to vkGetPhysicalDeviceSurfaceCapabilitiesKHR, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE, vkGetPhysicalDeviceSurfaceCapabilities2KHR must not return VK_ERROR_OUT_OF_HOST_MEMORY.

### Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06521
  - pSurfaceInfo->surface must be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06522
  - pSurfaceInfo->surface must be supported by physicalDevice, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-physicalDevice-parameter
  - physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-parameter
  - pSurfaceInfo must be a valid pointer to a valid VkPhysicalDeviceSurfaceInfo2KHR structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceCapabilities-parameter
  - pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilities2KHR structure

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkPhysicalDeviceSurfaceInfo2KHR structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkPhysicalDeviceSurfaceInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceKHR surface;
};
```
VkPhysicalDeviceSurfaceInfo2KHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surface` is the surface that will be associated with the swapchain.

The members of `VkPhysicalDeviceSurfaceInfo2KHR` correspond to the arguments to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with `sType` and `pNext` added for extensibility.

**Valid Usage**

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-07919
  
surface must be a valid `VkSurfaceKHR` handle

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-sType
  
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR`

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-pNext
  
pNext must be `NULL`

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-parameter
  
If `surface` is not `VK_NULL_HANDLE`, `surface` must be a valid `VkSurfaceKHR` handle

The `VkSurfaceCapabilities2KHR` structure is defined as:

```
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkSurfaceCapabilitiesKHR surfaceCapabilities;
} VkSurfaceCapabilities2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceCapabilities` is a `VkSurfaceCapabilitiesKHR` structure describing the capabilities of the specified surface.

**Valid Usage (Implicit)**

- VUID-VkSurfaceCapabilities2KHR-sType-sType
  
sType must be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR`

- VUID-VkSurfaceCapabilities2KHR-pNext-pNext
pNext must be NULL or a pointer to a valid instance of VkSharedPresentSurfaceCapabilitiesKHR

- VUID-VkSurfaceCapabilities2KHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

The VkSharedPresentSurfaceCapabilitiesKHR structure is defined as:

```c
// Provided by VK_KHR_shared_presentable_image
typedef struct VkSharedPresentSurfaceCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkImageUsageFlags sharedPresentSupportedUsageFlags;
} VkSharedPresentSurfaceCapabilitiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- sharedPresentSupportedUsageFlags is a bitmask of VkImageUsageFlagBits representing the ways the application can use the shared presentable image from a swapchain created with VkPresentModeKHR set to VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR for the surface on the specified device. VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT must be included in the set but implementations may support additional usages.

Valid Usage (Implicit)

- VUID-VkSharedPresentSurfaceCapabilitiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_EXT_display_surface_counter
VkResult vkGetPhysicalDeviceSurfaceCapabilities2EXT(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    VkSurfaceCapabilities2EXT* pSurfaceCapabilities);
```

- physicalDevice is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.
- surface is the surface that will be associated with the swapchain.
- pSurfaceCapabilities is a pointer to a VkSurfaceCapabilities2EXT structure in which the capabilities are returned.

vkGetPhysicalDeviceSurfaceCapabilities2EXT behaves similarly to
vkGetPhysicalDeviceSurfaceCapabilitiesKHR, with the ability to return extended information by adding extending structures to the pNext chain of its pSurfaceCapabilities parameter.

If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE, vkGetPhysicalDeviceSurfaceCapabilities2EXT must not return VK_ERROR_OUT_OF_HOST_MEMORY.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-06523
  surface must be a valid VkSurfaceKHR handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-06211
  surface must be supported by physicalDevice, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-parameter
  surface must be a valid VkSurfaceKHR handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-pSurfaceCapabilities-parameter
  pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilities2EXT structure

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-commonparent
  Both of physicalDevice, and surface must have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceCapabilities2EXT structure is defined as:

```c
// Provided by VK_EXT_display_surface_counter
typedef struct VkSurfaceCapabilities2EXT {
  VkStructureType sType;
  void* pNext;
  uint32_t minImageCount;
} VkSurfaceCapabilities2EXT;
```
uint32_t maxImageCount;
VkExtent2D currentExtent;
VkExtent2D minImageExtent;
VkExtent2D maxImageExtent;
uint32_t maxImageArrayLayers;
VkSurfaceTransformFlagsKHR supportedTransforms;
VkSurfaceTransformFlagBitsKHR currentTransform;
VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
VkImageUsageFlags supportedUsageFlags;
VkSurfaceCounterFlagsEXT supportedSurfaceCounters;
} VkSurfaceCapabilities2EXT;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `minImageCount` is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.
- `maxImageCount` is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to `minImageCount`. A value of 0 means that there is no limit on the number of images, though there may be limits related to the total amount of memory used by presentable images.
- `currentExtent` is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.
- `minImageExtent` contains the smallest valid swapchain extent for the surface on the specified device. The `width` and `height` of the extent will each be less than or equal to the corresponding `width` and `height` of `currentExtent`, unless `currentExtent` has the special value described above.
- `maxImageExtent` contains the largest valid swapchain extent for the surface on the specified device. The `width` and `height` of the extent will each be greater than or equal to the corresponding `width` and `height` of `minImageExtent`. The `width` and `height` of the extent will each be greater than or equal to the corresponding `width` and `height` of `currentExtent`, unless `currentExtent` has the special value described above.
- `maxImageArrayLayers` is the maximum number of layers presentable images can have for a swapchain created for this device and surface, and will be at least one.
- `supportedTransforms` is a bitmask of `VkSurfaceTransformFlagBitsKHR` indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.
- `currentTransform` is `VkSurfaceTransformFlagBitsKHR` value indicating the surface's current transform relative to the presentation engine's natural orientation.
- `supportedCompositeAlpha` is a bitmask of `VkCompositeAlphaFlagBitsKHR`, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition can be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.
- `supportedUsageFlags` is a bitmask of `VkImageUsageFlagBits` representing the ways the
application **can** use the presentable images of a swapchain created with `VkPresentModeKHR` set to `VK_PRESENT_MODE_IMMEDIATE_KHR`, `VK_PRESENT_MODE_MAILBOX_KHR`, `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR` for the surface on the specified device. `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` **must** be included in the set. Implementations **may** support additional usages.

- `supportedSurfaceCounters` is a bitmask of `VkSurfaceCounterFlagBitsEXT` indicating the supported surface counter types.

### Valid Usage

- VUID-VkSurfaceCapabilities2EXT-supportedSurfaceCounters-01246
  
  `supportedSurfaceCounters` **must** not include `VK_SURFACE_COUNTER_VBLANK_BIT_EXT` unless the surface queried is a display surface

### Valid Usage (Implicit)

- VUID-VkSurfaceCapabilities2EXT-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_EXT`

- VUID-VkSurfaceCapabilities2EXT-pNext-pNext
  
  `pNext` **must** be `NULL`

Bits which **can** be set in `VkSurfaceCapabilities2EXT::supportedSurfaceCounters`, indicating supported surface counter types, are:

```c
// Provided by VK_EXT_display_surface_counter
typedef enum VkSurfaceCounterFlagBitsEXT {
    VK_SURFACE_COUNTER_VBLANK_BIT_EXT = 0x00000001,
    VK_SURFACE_COUNTER_VBLANK_EXT = VK_SURFACE_COUNTER_VBLANK_BIT_EXT,
} VkSurfaceCounterFlagBitsEXT;
```

- `VK_SURFACE_COUNTER_VBLANK_BIT_EXT` specifies a counter incrementing once every time a vertical blanking period occurs on the display associated with the surface.

```c
// Provided by VK_EXT_display_surface_counter
typedef VkFlags VkSurfaceCounterFlagsEXT;
```

`VkSurfaceCounterFlagsEXT` is a bitmask type for setting a mask of zero or more `VkSurfaceCounterFlagBitsEXT`.

Bits which **may** be set in `VkSurfaceCapabilitiesKHR::supportedTransforms` indicating the presentation transforms supported for the surface on the specified device, and possible values of `VkSurfaceCapabilitiesKHR::currentTransform` indicating the surface’s current transform relative to the presentation engine’s natural orientation, are:
typedef enum VkSurfaceTransformFlagBitsKHR {
    VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR = 0x00000001,
    VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR = 0x00000002,
    VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR = 0x00000004,
    VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR = 0x00000008,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR = 0x00000010,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR = 0x00000020,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR = 0x00000040,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR = 0x00000080,
    VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR = 0x00000100,
} VkSurfaceTransformFlagBitsKHR;

• **VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR** specifies that image content is presented without being transformed.
• **VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR** specifies that image content is rotated 90 degrees clockwise.
• **VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR** specifies that image content is rotated 180 degrees clockwise.
• **VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR** specifies that image content is rotated 270 degrees clockwise.
• **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR** specifies that image content is mirrored horizontally.
• **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 90 degrees clockwise.
• **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 180 degrees clockwise.
• **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 270 degrees clockwise.
• **VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR** specifies that the presentation transform is not specified, and is instead determined by platform-specific considerations and mechanisms outside Vulkan.

typedef VkFlags VkSurfaceTransformFlagsKHR;

VkSurfaceTransformFlagsKHR is a bitmask type for setting a mask of zero or more VkSurfaceTransformFlagBitsKHR.

The supportedCompositeAlpha member is of type VkCompositeAlphaFlagBitsKHR, containing the following values:

typedef enum VkCompositeAlphaFlagBitsKHR {

VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR = 0x00000002,
VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR = 0x00000004,
VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR = 0x00000008,
} VkCompositeAlphaFlagBitsKHR;

These values are described as follows:

- **VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR**: The alpha component, if it exists, of the images is ignored in the compositing process. Instead, the image is treated as if it has a constant alpha of 1.0.

- **VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR**: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are expected to already be multiplied by the alpha component by the application.

- **VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR**: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are not expected to already be multiplied by the alpha component by the application; instead, the compositor will multiply the non-alpha components of the image by the alpha component during compositing.

- **VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR**: The way in which the presentation engine treats the alpha component in the images is unknown to the Vulkan API. Instead, the application is responsible for setting the composite alpha blending mode using native window system commands. If the application does not set the blending mode using native window system commands, then a platform-specific default will be used.

// Provided by VK_KHR_surface
typedef VkFlags VkCompositeAlphaFlagsKHR;

VkCompositeAlphaFlagsKHR is a bitmask type for setting a mask of zero or more VkCompositeAlphaFlagBitsKHR.

### 30.5.2. Surface Format Support

To query the supported swapchain format-color space pairs for a surface, call:

// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceFormatsKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pSurfaceFormatCount,
    VkSurfaceFormatKHR* pSurfaceFormats);

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.

- **surface** is the surface that will be associated with the swapchain.

- **pSurfaceFormatCount** is a pointer to an integer related to the number of format pairs available or queried, as described below.
pSurfaceFormats is either NULL or a pointer to an array of VkSurfaceFormatKHR structures.

If pSurfaceFormats is NULL, then the number of format pairs supported for the given surface is returned in pSurfaceFormatCount. Otherwise, pSurfaceFormatCount must point to a variable set by the user to the number of elements in the pSurfaceFormats array, and on return the variable is overwritten with the number of structures actually written to pSurfaceFormats. If the value of pSurfaceFormatCount is less than the number of format pairs supported, at most pSurfaceFormatCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available format pairs were returned.

The number of format pairs supported must be greater than or equal to 1. pSurfaceFormats must not contain an entry whose value for format is VK_FORMAT_UNDEFINED.

If pSurfaceFormats includes an entry whose value for colorSpace is VK_COLOR_SPACE_SRGB_NONLINEAR_KHR and whose value for format is a UNORM (or SRGB) format and the corresponding SRGB (or UNORM) format is a color renderable format for VK_IMAGE_TILING_OPTIMAL, then pSurfaceFormats must also contain an entry with the same value for colorSpace and format equal to the corresponding SRGB (or UNORM) format.

If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE, vkGetPhysicalDeviceSurfaceFormatsKHR must not return VK_ERROR_OUT_OF_HOST_MEMORY.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06524 surface must be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06525 surface must be supported by physicalDevice, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-parameter If surface is not VK_NULL_HANDLE, surface must be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormatCount-parameter pSurfaceFormatCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormats-parameter If the value referenced by pSurfaceFormatCount is not 0, and pSurfaceFormats is not NULL, pSurfaceFormats must be a valid pointer to an array of pSurfaceFormatCount VkSurfaceFormatKHR structures
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-commonparent Both of physicalDevice, and surface that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkInstance
Return Codes

Success

• VK_SUCCESS
• VK_INCOMPLETE

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_SURFACE_LOST_KHR

The `VkSurfaceFormatKHR` structure is defined as:

```c
// Provided by VK_KHR_surface
typedef struct VkSurfaceFormatKHR {
    VkFormat format;
    VkColorSpaceKHR colorSpace;
} VkSurfaceFormatKHR;
```

- `format` is a `VkFormat` that is compatible with the specified surface.
- `colorSpace` is a presentation `VkColorSpaceKHR` that is compatible with the surface.

To query the supported swapchain format tuples for a surface, call:

```c
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceFormats2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    uint32_t* pSurfaceFormatCount,
    VkSurfaceFormat2KHR* pSurfaceFormats);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- `pSurfaceFormatCount` is a pointer to an integer related to the number of format tuples available or queried, as described below.
- `pSurfaceFormats` is either `NULL` or a pointer to an array of `VkSurfaceFormat2KHR` structures.

`vkGetPhysicalDeviceSurfaceFormats2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceFormatsKHR`, with the ability to be extended via `pNext` chains.

If `pSurfaceFormats` is `NULL`, then the number of format tuples supported for the given `surface` is returned in `pSurfaceFormatCount`. Otherwise, `pSurfaceFormatCount` must point to a variable set by the
user to the number of elements in the \texttt{pSurfaceFormats} array, and on return the variable is overwritten with the number of structures actually written to \texttt{pSurfaceFormats}. If the value of \texttt{pSurfaceFormatCount} is less than the number of format tuples supported, at most \texttt{pSurfaceFormatCount} structures will be written, and \texttt{VK_INCOMPLETE} will be returned instead of \texttt{VK_SUCCESS}, to indicate that not all the available values were returned.

If \texttt{VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations} is \texttt{VK_TRUE}, \texttt{vkGetPhysicalDeviceSurfaceFormats2KHR} must not return \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}.

### Valid Usage

- \texttt{VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06521} 
  \texttt{pSurfaceInfo->surface} must be a valid \texttt{VkSurfaceKHR} handle

- \texttt{VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06522} 
  \texttt{pSurfaceInfo->surface} must be supported by \texttt{physicalDevice}, as reported by \texttt{vkGetPhysicalDeviceSurfaceSupportKHR} or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- \texttt{VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-physicalDevice-parameter} 
  \texttt{physicalDevice} must be a valid \texttt{VkPhysicalDevice} handle

- \texttt{VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-parameter} 
  \texttt{pSurfaceInfo} must be a valid pointer to a valid \texttt{VkPhysicalDeviceSurfaceInfo2KHR} structure

- \texttt{VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormatCount-parameter} 
  \texttt{pSurfaceFormatCount} must be a valid pointer to a \texttt{uint32_t} value

- \texttt{VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormats-parameter} 
  If the value referenced by \texttt{pSurfaceFormatCount} is not \texttt{0}, and \texttt{pSurfaceFormats} is not \texttt{NULL}, \texttt{pSurfaceFormats} must be a valid pointer to an array of \texttt{pSurfaceFormatCount} \texttt{VkSurfaceFormat2KHR} structures

### Return Codes

**Success**

- \texttt{VK_SUCCESS}
- \texttt{VK_INCOMPLETE}

**Failure**

- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}
- \texttt{VK_ERROR_SURFACE_LOST_KHR}
The `VkSurfaceFormat2KHR` structure is defined as:

```c
typedef struct VkSurfaceFormat2KHR {
    VkStructureType    sType;
    void*              pNext;
    VkSurfaceFormatKHR surfaceFormat;
} VkSurfaceFormat2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceFormat` is a `VkSurfaceFormatKHR` structure describing a format-color space pair that is compatible with the specified surface.

**Valid Usage (Implicit)**

- VUID-VkSurfaceFormat2KHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR`
- VUID-VkSurfaceFormat2KHR-pNext-pNext
  `pNext` must be `NULL`

While the `format` of a presentable image refers to the encoding of each pixel, the `colorSpace` determines how the presentation engine interprets the pixel values. A color space in this document refers to a specific color space (defined by the chromaticities of its primaries and a white point in CIE Lab), and a transfer function that is applied before storing or transmitting color data in the given color space.

Possible values of `VkSurfaceFormatKHR::colorSpace`, specifying supported color spaces of a presentation engine, are:

```c
typedef enum VkColorSpaceKHR {
    VK_COLOR_SPACE_SRGB_NONLINEAR_KHR = 0,
    // Provided by VK_KHR_surface
    VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT = 1000104001,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT = 1000104002,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT = 1000104003,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT = 1000104004,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_LINEAR_EXT = 1000104005,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_NONLINEAR_EXT = 1000104006,
} VkColorSpaceKHR;
```
VK_COLOR_SPACE_BT2020_LINEAR_EXT = 1000104007,
// Provided by VK_EXT_swapchain_colorspace
VK_COLOR_SPACE_HDR10_ST2084_EXT = 1000104008,
// Provided by VK_EXT_swapchain_colorspace
VK_COLOR_SPACE_DOLBYVISION_EXT = 1000104009,
// Provided by VK_EXT_swapchain_colorspace
VK_COLOR_SPACE_HDR10_HLG_EXT = 1000104010,
// Provided by VK_EXT_swapchain_colorspace
VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT = 1000104011,
// Provided by VK_EXT_swapchain_colorspace
VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT = 1000104012,
// Provided by VK_EXT_swapchain_colorspace
VK_COLOR_SPACE_PASS_THROUGH_EXT = 1000104013,
// Provided by VK_EXT_swapchain_colorspace
VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT = 1000104014,
}
VkColorSpaceKHR;

- VK_COLOR_SPACE_SRGB_NONLINEAR_KHR specifies support for the sRGB color space.
- VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT specifies support for the Display-P3 color space to be displayed using an sRGB-like EOTF (defined below).
- VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT specifies support for the extended sRGB color space to be displayed using a linear EOTF.
- VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT specifies support for the extended sRGB color space to be displayed using an sRGB EOTF.
- VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT specifies support for the Display-P3 color space to be displayed using a linear EOTF.
- VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT specifies support for the DCI-P3 color space to be displayed using the DCI-P3 EOTF. Note that values in such an image are interpreted as XYZ encoded color data by the presentation engine.
- VK_COLOR_SPACE_BT709_LINEAR_EXT specifies support for the BT709 color space to be displayed using a linear EOTF.
- VK_COLOR_SPACE_BT709_NONLINEAR_EXT specifies support for the BT709 color space to be displayed using the SMPTE 170M EOTF.
- VK_COLOR_SPACE_BT2020_LINEAR_EXT specifies support for the BT2020 color space to be displayed using a linear EOTF.
- VK_COLOR_SPACE_HDR10_ST2084_EXT specifies support for the HDR10 (BT2020 color) space to be displayed using the SMPTE ST2084 Perceptual Quantizer (PQ) EOTF.
- VK_COLOR_SPACE_DOLBYVISION_EXT specifies support for the Dolby Vision (BT2020 color space), proprietary encoding, to be displayed using the SMPTE ST2084 EOTF.
- VK_COLOR_SPACE_HDR10_HLG_EXT specifies support for the HDR10 (BT2020 color space) to be displayed using the Hybrid Log Gamma (HLG) EOTF.
- VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT specifies support for the AdobeRGB color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT** specifies support for the AdobeRGB color space to be displayed using the Gamma 2.2 EOTF.

- **VK_COLOR_SPACE_PASS_THROUGH_EXT** specifies that color components are used “as is”. This is intended to allow applications to supply data for color spaces not described here.

  **Note**
  For a traditional “Linear” or non-gamma transfer function color space use **VK_COLOR_SPACE_PASS_THROUGH_EXT**.

The color components of non-linear color space swapchain images must have had the appropriate transfer function applied. The color space selected for the swapchain image will not affect the processing of data written into the image by the implementation. Vulkan requires that all implementations support the sRGB transfer function by use of an SRGB pixel format. Other transfer functions, such as SMPTE 170M or SMPTE2084, can be performed by the application shader. This extension defines enums for **VkColorSpaceKHR** that correspond to the following color spaces:

<table>
<thead>
<tr>
<th>Name</th>
<th>Red Primary</th>
<th>Green Primary</th>
<th>Blue Primary</th>
<th>White-point</th>
<th>Transfer function</th>
</tr>
</thead>
<tbody>
<tr>
<td>DCI-P3</td>

<td>AdobeRGB</td>
</tr>
</tbody>
</table>

The transfer functions are described in the “Transfer Functions” chapter of the Khronos Data Format Specification.

Except Display-P3 OETF, which is:
where \( L \) is the linear value of a color component and \( E \) is the encoded value (as stored in the image in memory).

**Note**
For most uses, the sRGB OETF is equivalent.

### 30.5.3. Surface Presentation Mode Support

To query the supported presentation modes for a surface, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfacePresentModesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pPresentModeCount,
    VkPresentModeKHR* pPresentModes);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- **surface** is the surface that will be associated with the swapchain.
- **pPresentModeCount** is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- **pPresentModes** is either **NULL** or a pointer to an array of `VkPresentModeKHR` values, indicating the supported presentation modes.

If `pPresentModes` is **NULL**, then the number of presentation modes supported for the given `surface` is returned in `pPresentModeCount`. Otherwise, `pPresentModeCount` **must** point to a variable set by the user to the number of elements in the `pPresentModes` array, and on return the variable is overwritten with the number of values actually written to `pPresentModes`. If the value of `pPresentModeCount` is less than the number of presentation modes supported, at most `pPresentModeCount` values will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available modes were returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is **VK_TRUE**, `vkGetPhysicalDeviceSurfacePresentModesKHR` **must** not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

#### Valid Usage

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06524
  `surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06525
**Valid Usage (Implicit)**

- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-physicalDevice-parameter**
  *physicalDevice* must be a valid *VkPhysicalDevice* handle

- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-parameter**
  If *surface* is not *VK_NULL_HANDLE*, *surface* must be a valid *VkSurfaceKHR* handle

- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModeCount-parameter**
  *pPresentModeCount* must be a valid pointer to a *uint32_t* value

- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModes-parameter**
  If the value referenced by *pPresentModeCount* is not 0, and *pPresentModes* is not NULL, *pPresentModes* must be a valid pointer to an array of *pPresentModeCount* *VkPresentModeKHR* values

- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-commonparent**
  Both of *physicalDevice*, and *surface* that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same *VkInstance*

**Return Codes**

**Success**
- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_SURFACE_LOST_KHR**

Possible values of elements of the *vkGetPhysicalDeviceSurfacePresentModesKHR::pPresentModes* array, indicating the supported presentation modes for a surface, are:

```c
// Provided by VK_KHR_surface
typedef enum VkPresentModeKHR {
    VK_PRESENT_MODE_IMMEDIATE_KHR = 0,
    VK_PRESENT_MODE_MAILBOX_KHR = 1,
    VK_PRESENT_MODE_FIFO_KHR = 2,
    VK_PRESENT_MODE_FIFO_RELAXED_KHR = 3,
} VkPresentModeKHR;
```

```c
// Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR = 1000111000,
```

```c
// Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR = 1000111001,
```
VK_PRESENT_MODE_IMMEDIATE_KHR specifies that the presentation engine does not wait for a vertical blanking period to update the current image, meaning this mode may result in visible tearing. No internal queuing of presentation requests is needed, as the requests are applied immediately.

VK_PRESENT_MODE_MAILBOX_KHR specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing cannot be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for reuse by the application. One request is removed from the queue and processed during each vertical blanking period in which the queue is non-empty.

VK_PRESENT_MODE_FIFO_KHR specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing cannot be observed. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty. This is the only value of presentMode that is required to be supported.

VK_PRESENT_MODE_FIFO_RELAXED_KHR specifies that the presentation engine generally waits for the next vertical blanking period to update the current image. If a vertical blanking period has already passed since the last update of the current image then the presentation engine does not wait for another vertical blanking period for the update, meaning this mode may result in visible tearing in this case. This mode is useful for reducing visual stutter with an application that will mostly present a new image before the next vertical blanking period, but may occasionally be late, and present a new image just after the next vertical blanking period. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during or after each vertical blanking period in which the queue is non-empty.

VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a shared presentable image. The presentation engine is only required to update the current image after a new presentation request is received. Therefore the application must make a presentation request whenever an update is required. However, the presentation engine may update the current image at any point, meaning this mode may result in visible tearing.

VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a shared presentable image. The presentation engine periodically updates the current image on its regular refresh cycle. The application is only required to make one initial presentation request, after which the presentation engine must update the current image without any need for further presentation requests. The application can indicate the image contents have been updated by making a presentation request, but this does not guarantee the timing of when it will be updated. This mode may result in visible tearing if rendering to the image is not timed correctly.

The supported VkImageUsageFlagBits of the presentable images of a swapchain created for a
surface may differ depending on the presentation mode, and can be determined as per the table below:

**Table 42. Presentable image usage queries**

<table>
<thead>
<tr>
<th>Presentation mode</th>
<th>Image usage flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_PRESENT_MODE_IMMEDIATE_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_MAILBOX_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_FIFO_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_FIFO_RELAXED_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR</td>
<td>VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR</td>
<td>VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags</td>
</tr>
</tbody>
</table>

**Note**

For reference, the mode indicated by VK_PRESENT_MODE_FIFO_KHR is equivalent to the behavior of {wgl|glX|egl}SwapBuffers with a swap interval of 1, while the mode indicated by VK_PRESENT_MODE_FIFO_RELAXED_KHR is equivalent to the behavior of {wgl|glX}SwapBuffers with a swap interval of -1 (from the {WGL|GLX}_EXT_swap_control_tear extensions).

### 30.6. Device Group Queries

A logical device that represents multiple physical devices may support presenting from images on more than one physical device, or combining images from multiple physical devices.

To query these capabilities, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
VkResult vkGetDeviceGroupPresentCapabilitiesKHR(VkDevice device, VkDeviceGroupPresentCapabilitiesKHR* pDeviceGroupPresentCapabilities);
```

- device is the logical device.
- pDeviceGroupPresentCapabilities is a pointer to a VkDeviceGroupPresentCapabilitiesKHR structure in which the device’s capabilities are returned.

If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE, vkGetDeviceGroupPresentCapabilitiesKHR must not return VK_ERROR_OUT_OF_HOST_MEMORY.

**Valid Usage (Implicit)**

- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-device-parameter device must be a valid VkDevice handle
VUID-vkGetDeviceGroupPresentCapabilitiesKHR-pDeviceGroupPresentCapabilities-parameter

*pDeviceGroupPresentCapabilities must be a valid pointer to a VkDeviceGroupPresentCapabilitiesKHR structure*

---

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

---

The VkDeviceGroupPresentCapabilitiesKHR structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
typedef struct VkDeviceGroupPresentCapabilitiesKHR {
  VkStructureType sType;
  void* pNext;
  uint32_t presentMask[VK_MAX_DEVICE_GROUP_SIZE];
  VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupPresentCapabilitiesKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **presentMask** is an array of VK_MAX_DEVICE_GROUP_SIZE uint32_t masks, where the mask at element i is non-zero if physical device i has a presentation engine, and where bit j is set in element i if physical device i can present swapchain images from physical device j. If element i is non-zero, then bit i must be set.
- **modes** is a bitmask of VkDeviceGroupPresentModeFlagBitsKHR indicating which device group presentation modes are supported.

**modes always has VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR set.**

The present mode flags are also used when presenting an image, in VkDeviceGroupPresentInfoKHR::mode.

If a device group only includes a single physical device, then modes must equal VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR.

---

**Valid Usage (Implicit)**

- VUID-VkDeviceGroupPresentCapabilitiesKHR-sType-sType
  
  *sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR*
Bits which **may** be set in `VkDeviceGroupPresentCapabilitiesKHR::modes`, indicating which device group presentation modes are supported, are:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
typedef enum VkDeviceGroupPresentModeFlagBitsKHR {
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR = 0x00000001,
    VKDEVICEGROUPPRESENTMODEREMOTEBIT_KHR = 0x00000002,
    VKDEVICEGROUPPRESENTMODESUMBIT_KHR = 0x00000004,
    VKDEVICEGROUPPRESENTMODELOCALMULTIDEVICEBIT_KHR = 0x00000008,
} VkDeviceGroupPresentModeFlagBitsKHR;
```

- **VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR** specifies that any physical device with a presentation engine *can* present its own swapchain images.
- **VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR** specifies that any physical device with a presentation engine *can* present swapchain images from any physical device in its `presentMask`.
- **VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR** specifies that any physical device with a presentation engine *can* present the sum of swapchain images from any physical devices in its `presentMask`.
- **VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR** specifies that multiple physical devices with a presentation engine *can* each present their own swapchain images.

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
typedef VkFlags VkDeviceGroupPresentModeFlagsKHR;
```

`VkDeviceGroupPresentModeFlagsKHR` is a bitmask type for setting a mask of zero or more `VkDeviceGroupPresentModeFlagBitsKHR`.

Some surfaces **may** not be capable of using all the device group present modes.

To query the supported device group present modes for a particular surface, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
VkResult vkGetDeviceGroupSurfacePresentModesKHR(
    VkDevice device,                // Logical device.
    VkSurfaceKHR surface,           // Surface.
    VkDeviceGroupPresentModeFlagsKHR* pModes);
```

- **device** is the logical device.
- **surface** is the surface.
- **pModes** is a pointer to a `VkDeviceGroupPresentModeFlagsKHR` in which the supported device group present modes for the surface are returned.
The modes returned by this command are not invariant, and may change in response to the surface being moved, resized, or occluded. These modes must be a subset of the modes returned by `vkGetDeviceGroupPresentCapabilitiesKHR`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetDeviceGroupSurfacePresentModesKHR` must not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

### Valid Usage

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-06212
  
  surface must be supported by all physical devices associated with device, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism.

### Valid Usage (Implicit)

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-device-parameter
  
  device must be a valid `VkDevice` handle.

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-parameter
  
  surface must be a valid `VkSurfaceKHR` handle.

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-pModes-parameter
  
  pModes must be a valid pointer to a `VkDeviceGroupPresentModeFlagsKHR` value.

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-commonparent
  
  Both of device, and surface must have been created, allocated, or retrieved from the same `VkInstance`.

### Host Synchronization

- Host access to surface must be externally synchronized.

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

When using `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, the application may need to know which regions of the surface are used when presenting locally on each physical device. Presentation of swapchain images to this surface need only have valid contents in the regions.
To query a set of rectangles used in presentation on the physical device, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
VkResult vkGetPhysicalDevicePresentRectanglesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pRectCount,
    VkRect2D* pRects);
```

- `physicalDevice` is the physical device.
- `surface` is the surface.
- `pRectCount` is a pointer to an integer related to the number of rectangles available or queried, as described below.
- `pRects` is either `NULL` or a pointer to an array of `VkRect2D` structures.

If `pRects` is `NULL`, then the number of rectangles used when presenting the given `surface` is returned in `pRectCount`. Otherwise, `pRectCount` must point to a variable set by the user to the number of elements in the `pRects` array, and on return the variable is overwritten with the number of structures actually written to `pRects`. If the value of `pRectCount` is less than the number of rectangles, at most `pRectCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available rectangles were returned.

The values returned by this command are not invariant, and may change in response to the surface being moved, resized, or occluded.

The rectangles returned by this command must not overlap.

If ` VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDevicePresentRectanglesKHR` must not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

### Valid Usage

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06523  
  `surface` must be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-parameter-06211  
  `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-physicalDevice-parameter  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-parameter
**surface** must be a valid `VkSurfaceKHR` handle

- **VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRectCount-parameter**
  `pRectCount` must be a valid pointer to a `uint32_t` value

- **VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRects-parameter**
  If the value referenced by `pRectCount` is not 0, and `pRects` is not NULL, `pRects` must be a valid pointer to an array of `pRectCount` `VkRect2D` structures

- **VUID-vkGetPhysicalDevicePresentRectanglesKHR-commonparent**
  Both of `physicalDevice`, and `surface` must have been created, allocated, or retrieved from the same `VkInstance`

### Host Synchronization

- Host access to **surface** must be externally synchronized

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

### 30.7. WSI Swapchain

A swapchain object (a.k.a. swapchain) provides the ability to present rendering results to a surface. Swapchain objects are represented by `VkSwapchainKHR` handles:

```c
// Provided by VK_KHR_swapchain
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSwapchainKHR)
```

A swapchain is an abstraction for an array of presentable images that are associated with a surface. The presentable images are represented by `VkImage` objects created by the platform. One image (which **can** be an array image for multiview/stereoscopic-3D surfaces) is displayed at a time, but multiple images **can** be queued for presentation. An application renders to the image, and then queues the image for presentation to the surface.

A native window **cannot** be associated with more than one non-retired swapchain at a time. Further, swapchains **cannot** be created for native windows that have a non-Vulkan graphics API surface associated with them.
Note

The presentation engine is an abstraction for the platform’s compositor or display engine.

The presentation engine may be synchronous or asynchronous with respect to the application and/or logical device.

Some implementations may use the device’s graphics queue or dedicated presentation hardware to perform presentation.

The presentable images of a swapchain are owned by the presentation engine. An application can acquire use of a presentable image from the presentation engine. Use of a presentable image must occur only after the image is returned by vkAcquireNextImageKHR, and before it is released by vkQueuePresentKHR. This includes transitioning the image layout and rendering commands.

An application can acquire use of a presentable image with vkAcquireNextImageKHR. After acquiring a presentable image and before modifying it, the application must use a synchronization primitive to ensure that the presentation engine has finished reading from the image. The application can then transition the image’s layout, queue rendering commands to it, etc. Finally, the application presents the image with vkQueuePresentKHR, which releases the acquisition of the image.

The presentation engine controls the order in which presentable images are acquired for use by the application.

Note

This allows the platform to handle situations which require out-of-order return of images after presentation. At the same time, it allows the application to generate command buffers referencing all of the images in the swapchain at initialization time, rather than in its main loop.

How this all works is described below.

If a swapchain is created with presentMode set to either VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, a single presentable image can be acquired, referred to as a shared presentable image. A shared presentable image may be concurrently accessed by the application and the presentation engine, without transitioning the image’s layout after it is initially presented.

• With VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR, the presentation engine is only required to update to the latest contents of a shared presentable image after a present. The application must call vkQueuePresentKHR to guarantee an update. However, the presentation engine may update from it at any time.

• With VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, the presentation engine will automatically present the latest contents of a shared presentable image during every refresh cycle. The application is only required to make one initial call to vkQueuePresentKHR, after which the presentation engine will update from it without any need for further present calls. The application can indicate the image contents have been updated by calling vkQueuePresentKHR,
but this does not guarantee the timing of when updates will occur.

The presentation engine may access a shared presentable image at any time after it is first presented. To avoid tearing, an application should coordinate access with the presentation engine. This requires presentation engine timing information through platform-specific mechanisms and ensuring that color attachment writes are made available during the portion of the presentation engine’s refresh cycle they are intended for.

Note
The VK_KHR_shared_presentable_image extension does not provide functionality for determining the timing of the presentation engine’s refresh cycles.

In order to query a swapchain’s status when rendering to a shared presentable image, call:

```c
// Provided by VK_KHR_shared_presentable_image
VkResult vkGetSwapchainStatusKHR(
    VkDevice                device,
    VkSwapchainKHR         swapchain);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to query.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetSwapchainStatusKHR` must not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

Valid Usage (Implicit)

- VUID-vkGetSwapchainStatusKHR-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetSwapchainStatusKHR-swapchain-parameter
  `swapchain` must be a valid `VkSwapchainKHR` handle
- VUID-vkGetSwapchainStatusKHR-swapchain-parent
  `swapchain` must have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `swapchain` must be externally synchronized

Return Codes

Success

- `VK_SUCCESS`
- `VK_SUBOPTIMAL_KHR`
Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR

The possible return values for `vkGetSwapchainStatusKHR` should be interpreted as follows:

- **VK_SUCCESS** specifies the presentation engine is presenting the contents of the shared presentable image, as per the swapchain's `VkPresentModeKHR`.
- **VK_SUBOPTIMAL_KHR** the swapchain no longer matches the surface properties exactly, but the presentation engine is presenting the contents of the shared presentable image, as per the swapchain's `VkPresentModeKHR`.
- **VK_ERROR_OUT_OF_DATE_KHR** the surface has changed in such a way that it is no longer compatible with the swapchain.
- **VK_ERROR_SURFACE_LOST_KHR** the surface is no longer available.

**Note**

The swapchain state may be cached by implementations, so applications should regularly call `vkGetSwapchainStatusKHR` when using a swapchain with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

To create a swapchain, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkCreateSwapchainKHR(
    VkDevice device,
    const VkSwapchainCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSwapchainKHR* pSwapchain);
```

- **device** is the device to create the swapchain for.
- **pCreateInfo** is a pointer to a `VkSwapchainCreateInfoKHR` structure specifying the parameters of the created swapchain.
- **pAllocator** is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).
- **pSwapchain** is a pointer to a `VkSwapchainKHR` handle in which the created swapchain object will be returned.

As mentioned above, if `vkCreateSwapchainKHR` succeeds, it will return a handle to a swapchain containing an array of at least `pCreateInfo->minImageCount` presentable images.
While acquired by the application, presentable images can be used in any way that equivalent non-presentable images can be used. A presentable image is equivalent to a non-presentable image created with the following `VkImageCreateInfo` parameters:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>flags</strong></td>
<td>VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT is set if</td>
</tr>
<tr>
<td></td>
<td>VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR is set</td>
</tr>
<tr>
<td></td>
<td>VK_IMAGE_CREATE_PROTECTED_BIT is set if</td>
</tr>
<tr>
<td></td>
<td>VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR is set</td>
</tr>
<tr>
<td></td>
<td>VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and</td>
</tr>
<tr>
<td></td>
<td>VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR are both set if</td>
</tr>
<tr>
<td></td>
<td>VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR is set</td>
</tr>
<tr>
<td></td>
<td>all other bits are unset</td>
</tr>
<tr>
<td><strong>imageType</strong></td>
<td>VK_IMAGE_TYPE_2D</td>
</tr>
<tr>
<td><strong>format</strong></td>
<td>pCreateInfo-&gt;imageFormat</td>
</tr>
<tr>
<td><strong>extent</strong></td>
<td>{pCreateInfo-&gt;imageExtent.width, pCreateInfo-&gt;imageExtent.height, 1}</td>
</tr>
<tr>
<td><strong>mipLevels</strong></td>
<td>1</td>
</tr>
<tr>
<td><strong>arrayLayers</strong></td>
<td>pCreateInfo-&gt;imageArrayLayers</td>
</tr>
<tr>
<td><strong>samples</strong></td>
<td>VK_SAMPLE_COUNT_1_BIT</td>
</tr>
<tr>
<td><strong>tiling</strong></td>
<td>VK_IMAGE_TILING_OPTIMAL</td>
</tr>
<tr>
<td><strong>usage</strong></td>
<td>pCreateInfo-&gt;imageUsage</td>
</tr>
<tr>
<td><strong>sharingMode</strong></td>
<td>pCreateInfo-&gt;imageSharingMode</td>
</tr>
<tr>
<td><strong>queueFamilyIndexCount</strong></td>
<td>pCreateInfo-&gt;queueFamilyIndexCount</td>
</tr>
<tr>
<td><strong>pQueueFamilyIndices</strong></td>
<td>pCreateInfo-&gt;pQueueFamilyIndices</td>
</tr>
<tr>
<td><strong>initialLayout</strong></td>
<td>VK_IMAGE_LAYOUT_UNDEFINED</td>
</tr>
</tbody>
</table>

The `pCreateInfo->surface` must not be destroyed until after the swapchain is destroyed.

If the native window referred to by `pCreateInfo->surface` is already associated with a Vulkan swapchain, **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** must be returned.

If the native window referred to by `pCreateInfo->surface` is already associated with a non-Vulkan graphics API surface, **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** must be returned.

The native window referred to by `pCreateInfo->surface` must not become associated with a non-Vulkan graphics API surface before all associated Vulkan swapchains have been destroyed.

**vkCreateSwapchainKHR** will return **VK_ERROR_DEVICE_LOST** if the logical device was lost. However,
VkSurfaceKHR is not a child of any VkDevice and is not affected by the lost device. After successfully recreating a VkDevice, the same VkSurfaceKHR can be used to create a new VkSwapchainKHR, provided the previous one was destroyed.

If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE, vkCreateSwapchainKHR must not return VK_ERROR_OUT_OF_HOST_MEMORY.

Valid Usage

- VUID-vkCreateSwapchainKHR-device-05068
  The number of swapchains currently allocated from device plus 1 must be less than or equal to the total number of swapchains requested via VkDeviceObjectReservationCreateInfo::swapchainRequestCount specified when device was created

Valid Usage (Implicit)

- VUID-vkCreateSwapchainKHR-device-parameter
device must be a valid VkDevice handle
- VUID-vkCreateSwapchainKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkSwapchainCreateInfoKHR structure
- VUID-vkCreateSwapchainKHR-pAllocator-null
  pAllocator must be NULL
- VUID-vkCreateSwapchainKHR-pSwapchain-parameter
  pSwapchain must be a valid pointer to a VkSwapchainKHR handle

Host Synchronization

- Host access to pCreateInfo->surface must be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR
The `VkSwapchainCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_swapchain
typedef struct VkSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainCreateFlagsKHR flags;
    VkSurfaceKHR surface;
    uint32_t minImageCount;
    VkFormat imageFormat;
    VkColorSpaceKHR imageColorSpace;
    VkExtent2D imageExtent;
    uint32_t imageArrayLayers;
    VkImageUsageFlags imageUsage;
    VkSharingMode imageSharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
    VkSurfaceTransformFlagBitsKHR preTransform;
    VkCompositeAlphaFlagBitsKHR compositeAlpha;
    VkPresentModeKHR presentMode;
    VkBool32 clipped;
    VkSwapchainKHR oldSwapchain;
} VkSwapchainCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkSwapchainCreateFlagBitsKHR` indicating parameters of the swapchain creation.
- `surface` is the surface onto which the swapchain will present images. If the creation succeeds, the swapchain becomes associated with `surface`.
- `minImageCount` is the minimum number of presentable images that the application needs. The implementation will either create the swapchain with at least that many images, or it will fail to create the swapchain.
- `imageFormat` is a `VkFormat` value specifying the format the swapchain image(s) will be created with.
- `imageColorSpace` is a `VkColorSpaceKHR` value specifying the way the swapchain interprets image data.
- `imageExtent` is the size (in pixels) of the swapchain image(s). The behavior is platform-dependent if the image extent does not match the surface's currentExtent as returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`.

**Note**
On some platforms, it is normal that `maxImageExtent` may become `(0, 0), for
example when the window is minimized. In such a case, it is not possible to create a swapchain due to the Valid Usage requirements.

- **imageArrayLayers** is the number of views in a multiview/stereo surface. For non-stereoscopic-3D applications, this value is 1.

- **imageUsage** is a bitmask of `VkImageUsageFlagBits` describing the intended usage of the (acquired) swapchain images.

- **imageSharingMode** is the sharing mode used for the image(s) of the swapchain.

- **queueFamilyIndexCount** is the number of queue families having access to the image(s) of the swapchain when `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`.

- **pQueueFamilyIndices** is a pointer to an array of queue family indices having access to the images(s) of the swapchain when `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`.

- **preTransform** is a `VkSurfaceTransformFlagBitsKHR` value describing the transform, relative to the presentation engine's natural orientation, applied to the image content prior to presentation. If it does not match the `currentTransform` value returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, the presentation engine will transform the image content as part of the presentation operation.

- **compositeAlpha** is a `VkCompositeAlphaFlagBitsKHR` value indicating the alpha compositing mode to use when this surface is composited together with other surfaces on certain window systems.

- **presentMode** is the presentation mode the swapchain will use. A swapchain's present mode determines how incoming present requests will be processed and queued internally.

- **clipped** specifies whether the Vulkan implementation is allowed to discard rendering operations that affect regions of the surface that are not visible.
  - If set to `VK_TRUE`, the presentable images associated with the swapchain may not own all of their pixels. Pixels in the presentable images that correspond to regions of the target surface obscured by another window on the desktop, or subject to some other clipping mechanism will have undefined content when read back. Fragment shaders may not execute for these pixels, and thus any side effects they would have had will not occur. Setting `VK_TRUE` does not guarantee any clipping will occur, but allows more efficient presentation methods to be used on some platforms.
  - If set to `VK_FALSE`, presentable images associated with the swapchain will own all of the pixels they contain.

  **Note**
  Applications should set this value to `VK_TRUE` if they do not expect to read back the content of presentable images before presenting them or after reacquiring them, and if their fragment shaders do not have any side effects that require them to run for all pixels in the presentable image.

- **oldSwapchain** must be `VK_NULL_HANDLE` in Vulkan SC [SCID-4].
Valid Usage

• VUID-VkSwapchainCreateInfoKHR-surface-01270
  surface must be a surface that is supported by the device as determined using
  vkGetPhysicalDeviceSurfaceSupportKHR

• VUID-VkSwapchainCreateInfoKHR-minImageCount-01272
  minImageCount must be less than or equal to the value returned in the maxImageCount
  member of the VkSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface if the returned maxImageCount is
  not zero

• VUID-VkSwapchainCreateInfoKHR-presentMode-02839
  If presentMode is not VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR nor
  VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, then minImageCount must be greater than
  or equal to the value returned in the minImageCount member of the
  VkSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-minImageCount-01383
  minImageCount must be 1 if presentMode is either
  VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or
  VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR

• VUID-VkSwapchainCreateInfoKHR-imageFormat-01273
  imageFormat and imageColorSpace must match the format and colorSpace members,
  respectively, of one of the VkSurfaceFormatKHR structures returned by
  vkGetPhysicalDeviceSurfaceFormatsKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-pNext-07781
  imageExtent must be between minImageExtent and maxImageExtent, inclusive, where
  minImageExtent and maxImageExtent are members of the VkSurfaceCapabilitiesKHR structure
  returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-imageExtent-01689
  imageExtent members width and height must both be non-zero

• VUID-VkSwapchainCreateInfoKHR-imageArrayLayers-01275
  imageArrayLayers must be greater than 0 and less than or equal to the maxImageArrayLayers
  member of the VkSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-presentMode-01427
  If presentMode is VK_PRESENT_MODE_IMMEDIATE_KHR, VK_PRESENT_MODE_MAILBOX_KHR,
  VK_PRESENT_MODE_FIFO_KHR or VK_PRESENT_MODE_FIFO_RELAXED_KHR, imageUsage must be a
  subset of the supported usage flags present in the supportedUsageFlags member of the
  VkSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilitiesKHR for surface

• VUID-VkSwapchainCreateInfoKHR-imageUsage-01384
  If presentMode is VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or
  VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, imageUsage must be a subset of the
  supported usage flags present in the sharedPresentSupportedUsageFlags member of the
VkSharedPresentSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilities2KHR for surface

- **VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01277**
  
  If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, `pQueueFamilyIndices` must be a valid pointer to an array of `queueFamilyIndexCount uint32_t` values

- **VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01278**
  
  If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, `queueFamilyIndexCount` must be greater than 1

- **VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01428**
  
  If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` must be unique and must be less than `pQueueFamilyPropertyCount` returned by either `vkGetPhysicalDeviceQueueFamilyProperties` or `vkGetPhysicalDeviceQueueFamilyProperties2` for the `physicalDevice` that was used to create device

- **VUID-VkSwapchainCreateInfoKHR-preTransform-01279**
  
  `preTransform` must be one of the bits present in the `supportedTransforms` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface

- **VUID-VkSwapchainCreateInfoKHR-compositeAlpha-01280**
  
  `compositeAlpha` must be one of the bits present in the `supportedCompositeAlpha` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface

- **VUID-VkSwapchainCreateInfoKHR-presentMode-01281**
  
  `presentMode` must be one of the `VkPresentModeKHR` values returned by `vkGetPhysicalDeviceSurfacePresentModesKHR` for the surface

- **VUID-VkSwapchainCreateInfoKHR-physicalDeviceCount-01429**
  
  flags must not contain `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR`

- **VUID-VkSwapchainCreateInfoKHR-oldSwapchain-05073**
  
  oldSwapchain must be `VK_NULL_HANDLE`

- **VUID-VkSwapchainCreateInfoKHR-imageFormat-01778**
  
  The implied image creation parameters of the swapchain must be supported as reported by `vkGetPhysicalDeviceImageFormatProperties`

- **VUID-VkSwapchainCreateInfoKHR-flags-03168**
  
  If `flags` contains `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` then the `pNext` chain must include a `VkImageFormatListCreateInfo` structure with a `viewFormatCount` greater than zero and `pViewFormats` must have an element equal to `imageFormat`

- **VUID-VkSwapchainCreateInfoKHR-pNext-04099**
  
  If a `VkImageFormatListCreateInfo` structure was included in the `pNext` chain and `VkImageFormatListCreateInfo::viewFormatCount` is not zero then all of the formats in `VkImageFormatListCreateInfo::pViewFormats` must be compatible with the `format` as described in the compatibility table

- **VUID-VkSwapchainCreateInfoKHR-flags-04100**
  
  If `flags` does not contain `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` and the `pNext` chain
include a `VkImageFormatListCreateInfo` structure then `VkImageFormatListCreateInfo`::viewFormatCount must be 0 or 1

**Valid Usage (Implicit)**

- VUID-VkSwapchainCreateInfoKHR-sType-sType
  sType must be `VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR`

- VUID-VkSwapchainCreateInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of `VkDeviceGroupSwapchainCreateInfoKHR`, `VkImageFormatListCreateInfo`, or `VkSwapchainCounterCreateInfoEXT`

- VUID-VkSwapchainCreateInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkSwapchainCreateInfoKHR-flags-parameter
  flags must be a valid combination of `VkSwapchainCreateFlagBitsKHR` values

- VUID-VkSwapchainCreateInfoKHR-surface-parameter
  surface must be a valid `VkSurfaceKHR` handle

- VUID-VkSwapchainCreateInfoKHR-imageFormat-parameter
  imageFormat must be a valid `VkFormat` value

- VUID-VkSwapchainCreateInfoKHR-imageColorSpace-parameter
  imageColorSpace must be a valid `VkColorSpaceKHR` value

- VUID-VkSwapchainCreateInfoKHR-imageUsage-parameter
  imageUsage must be a valid combination of `VkImageUsageFlagBits` values

- VUID-VkSwapchainCreateInfoKHR-imageUsage-requiredbitmask
  imageUsage must not be 0

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-parameter
  imageSharingMode must be a valid `VkSharingMode` value

- VUID-VkSwapchainCreateInfoKHR-preTransform-parameter
  preTransform must be a valid `VkSurfaceTransformFlagBitsKHR` value

- VUID-VkSwapchainCreateInfoKHR-compositeAlpha-parameter
  compositeAlpha must be a valid `VkCompositeAlphaFlagBitsKHR` value

- VUID-VkSwapchainCreateInfoKHR-presentMode-parameter
  presentMode must be a valid `VkPresentModeKHR` value

- VUID-VkSwapchainCreateInfoKHR-commonparent
  Both of oldSwapchain, and surface that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkInstance`

Bits which can be set in `VkSwapchainCreateInfoKHR::flags`, specifying parameters of swapchain creation, are:

```cpp
// Provided by VK_KHR_swapchain
```
typedef enum VkSwapchainCreateFlagBitsKHR {
    VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = 0x00000001,
    VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR = 0x00000002,
    VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR = 0x00000004,
} VkSwapchainCreateFlagBitsKHR;

• **VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR** specifies that images created from the swapchain (i.e. with the **swapchain** member of **VkImageSwapchainCreateInfoKHR** set to this swapchain’s handle) **must** use **VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT**. This flag is not supported in Vulkan SC [SCID-8].

• **VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR** specifies that images created from the swapchain are protected images.

• **VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR** specifies that the images of the swapchain can be used to create a **VkImageView** with a different format than what the swapchain was created with. The list of allowed image view formats is specified by adding a **VkImageFormatListCreateInfo** structure to the **pNext** chain of **VkSwapchainCreateInfoKHR**. In addition, this flag also specifies that the swapchain can be created with usage flags that are not supported for the format the swapchain is created with but are supported for at least one of the allowed image view formats.

```c
typedef VkFlags VkSwapchainCreateFlagsKHR;
```

**VkSwapchainCreateFlagsKHR** is a bitmask type for setting a mask of zero or more **VkSwapchainCreateFlagBitsKHR**.

If the **pNext** chain of **VkSwapchainCreateInfoKHR** includes a **VkDeviceGroupSwapchainCreateInfoKHR** structure, then that structure includes a set of device group present modes that the swapchain can be used with.

The **VkDeviceGroupSwapchainCreateInfoKHR** structure is defined as:

```c
typedef struct VkDeviceGroupSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupSwapchainCreateInfoKHR;
```

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **modes** is a bitfield of modes that the swapchain can be used with.

If this structure is not present, **modes** is considered to be
VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR.

Valid Usage (Implicit)

- VUID-VkDeviceGroupSwapchainCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-parameter
  modes must be a valid combination of VkDeviceGroupPresentModeFlagBitsKHR values
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-required bitmask
  modes must not be 0

To enable surface counters when creating a swapchain, add a VkSwapchainCounterCreateInfoEXT structure to the pNext chain of VkSwapchainCreateInfoKHR. VkSwapchainCounterCreateInfoEXT is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkSwapchainCounterCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceCounterFlagsEXT surfaceCounters;
} VkSwapchainCounterCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- surfaceCounters is a bitmask of VkSurfaceCounterFlagBitsEXT specifying surface counters to enable for the swapchain.

Valid Usage

- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-01244
  The bits in surfaceCounters must be supported by VkSwapchainCreateInfoKHR::surface, as reported by vkGetPhysicalDeviceSurfaceCapabilities2EXT

Valid Usage (Implicit)

- VUID-VkSwapchainCounterCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT
- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-parameter
  surfaceCounters must be a valid combination of VkSurfaceCounterFlagBitsEXT values

The requested counters become active when the first presentation command for the associated swapchain is processed by the presentation engine. To query the value of an active counter, use:
// Provided by VK_EXT_display_control

VkResult vkGetSwapchainCounterEXT(
    VkDevice device,
    VkSwapchainKHR swapchain,
    VkSurfaceCounterFlagBitsEXT counter,
    uint64_t* pCounterValue);

- **device** is the `VkDevice` associated with `swapchain`.
- **swapchain** is the swapchain from which to query the counter value.
- **counter** is a `VkSurfaceCounterFlagBitsEXT` value specifying the counter to query.
- **pCounterValue** will return the current value of the counter.

If a counter is not available because the swapchain is out of date, the implementation may return `VK_ERROR_OUT_OF_DATE_KHR`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetSwapchainCounterEXT` must not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

### Valid Usage

- VUID-vkGetSwapchainCounterEXT-swapchain-01245
  One or more present commands on `swapchain` must have been processed by the presentation engine

### Valid Usage (Implicit)

- VUID-vkGetSwapchainCounterEXT-device-parameter
device must be a valid `VkDevice` handle

- VUID-vkGetSwapchainCounterEXT-swapchain-parameter
  swapchain must be a valid `VkSwapchainKHR` handle

- VUID-vkGetSwapchainCounterEXT-counter-parameter
  counter must be a valid `VkSurfaceCounterFlagBitsEXT` value

- VUID-vkGetSwapchainCounterEXT-pCounterValue-parameter
  pCounterValue must be a valid pointer to a `uint64_t` value

- VUID-vkGetSwapchainCounterEXT-swapchain-parent
  swapchain must have been created, allocated, or retrieved from device

### Return Codes

**Success**

- `VK_SUCCESS`
Swapchains cannot be destroyed [SCID-4]. If VkPhysicalDeviceVulkanSC10Properties::deviceDestroyFreesMemory is VK_TRUE, the memory for swapchain images is returned to the system when the device is destroyed.

When the VK_KHR_display_swapchain extension is enabled, multiple swapchains that share presentable images are created by calling:

```c
VkResult vkCreateSharedSwapchainsKHR(
    VkDevice device,               // Provided by VK_KHR_display_swapchain
    uint32_t swapchainCount,       // the number of swapchains to create.
    const VkSwapchainCreateInfoKHR* pCreateInfos,  // a pointer to an array of VkSwapchainCreateInfoKHR structures specifying the parameters of the created swapchains.
    const VkAllocationCallbacks* pAllocator,       // the allocator used for host memory allocated for the swapchain objects when there is no more specific allocator available (see Memory Allocation).
    VkSwapchainKHR* pSwapchains);    // a pointer to an array of VkSwapchainKHR handles in which the created swapchain objects will be returned.
```

- `device` is the device to create the swapchains for.
- `swapchainCount` is the number of swapchains to create.
- `pCreateInfos` is a pointer to an array of VkSwapchainCreateInfoKHR structures specifying the parameters of the created swapchains.
- `pAllocator` is the allocator used for host memory allocated for the swapchain objects when there is no more specific allocator available (see Memory Allocation).
- `pSwapchains` is a pointer to an array of VkSwapchainKHR handles in which the created swapchain objects will be returned.

vkCreateSharedSwapchainsKHR is similar to vkCreateSwapchainKHR, except that it takes an array of VkSwapchainCreateInfoKHR structures, and returns an array of swapchain objects.

The swapchain creation parameters that affect the properties and number of presentable images must match between all the swapchains. If the displays used by any of the swapchains do not use the same presentable image layout or are incompatible in a way that prevents sharing images, swapchain creation will fail with the result code VK_ERROR_INCOMPATIBLE_DISPLAY_KHR. If any error occurs, no swapchains will be created. Images presented to multiple swapchains must be re-acquired from all of them before being modified. After destroying one or more of the swapchains, the remaining swapchains and the presentable images can continue to be used.

If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE, vkCreateSharedSwapchainsKHR must not return VK_ERROR_OUT_OF_HOST_MEMORY.
Valid Usage

- VUID-vkCreateSharedSwapchainsKHR-device-05068
  The number of swapchains currently allocated from device plus swapchainCount must be less than or equal to the total number of swapchains requested via VkDeviceObjectReservationCreateInfo::swapchainRequestCount specified when device was created.

Valid Usage (Implicit)

- VUID-vkCreateSharedSwapchainsKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateSharedSwapchainsKHR-pCreateInfo-param
  pCreateInfo must be a valid pointer to an array of swapchainCount valid VkSwapchainCreateInfoKHR structures

- VUID-vkCreateSharedSwapchainsKHR-pAllocator-null
  pAllocator must be NULL

- VUID-vkCreateSharedSwapchainsKHR-pSwapchains-param
  pSwapchains must be a valid pointer to an array of swapchainCount VkSwapchainKHR handles

- VUID-vkCreateSharedSwapchainsKHR-swapchainCount-array-length
  swapchainCount must be greater than 0

Host Synchronization

- Host access to pCreateInfo[].surface must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INCOMPATIBLE_DISPLAY_KHR
- VK_ERROR_DEVICE_LOST
- VK_ERROR_SURFACE_LOST_KHR

To obtain the array of presentable images associated with a swapchain, call:
Provided by VK_KHR_swapchain

```c
VkResult vkGetSwapchainImagesKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint32_t* pSwapchainImageCount,
    VkImage* pSwapchainImages);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to query.
- **pSwapchainImageCount** is a pointer to an integer related to the number of presentable images available or queried, as described below.
- **pSwapchainImages** is either **NULL** or a pointer to an array of **VkImage** handles.

If **pSwapchainImages** is **NULL**, then the number of presentable images for **swapchain** is returned in **pSwapchainImageCount**. Otherwise, **pSwapchainImageCount** **must** point to a variable set by the user to the number of elements in the **pSwapchainImages** array, and on return the variable is overwritten with the number of structures actually written to **pSwapchainImages**. If the value of **pSwapchainImageCount** is less than the number of presentable images for **swapchain**, at most **pSwapchainImageCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available presentable images were returned.

If **VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations** is **VK_TRUE**, **vkGetSwapchainImagesKHR** **must** not return **VK_ERROR_OUT_OF_HOST_MEMORY**.

### Valid Usage (Implicit)

- **VUID-vkGetSwapchainImagesKHR-device-parameter**
  - **device** **must** be a valid **VkDevice** handle
- **VUID-vkGetSwapchainImagesKHR-swapchain-parameter**
  - **swapchain** **must** be a valid **VkSwapchainKHR** handle
- **VUID-vkGetSwapchainImagesKHR-pSwapchainImageCount-parameter**
  - **pSwapchainImageCount** **must** be a valid pointer to a **uint32_t** value
- **VUID-vkGetSwapchainImagesKHR-pSwapchainImages-parameter**
  - If the value referenced by **pSwapchainImageCount** is not **0**, and **pSwapchainImages** is not **NULL**, **pSwapchainImages** **must** be a valid pointer to an array of **pSwapchainImageCount** **VkImage** handles
- **VUID-vkGetSwapchainImagesKHR-swapchain-parent**
  - **swapchain** **must** have been created, allocated, or retrieved from **device**

### Return Codes

**Success**
- **VK_SUCCESS**
Note

By knowing all presentable images used in the swapchain, the application can create command buffers that reference these images prior to entering its main rendering loop.

Images returned by `vkGetSwapchainImagesKHR` are fully backed by memory before they are passed to the application, as if they are each bound completely and contiguously to a single `VkDeviceMemory` object. All presentable images are initially in the `VK_IMAGE_LAYOUT_UNDEFINED` layout, thus before using presentable images, the application must transition them to a valid layout for the intended use.

Images can also be created by using `vkCreateImage` with `VkImageSwapchainCreateInfoKHR` and bound to swapchain memory using `vkBindImageMemory2` with `VkBindImageMemorySwapchainInfoKHR`. These images can be used anywhere swapchain images are used, and are useful in logical devices with multiple physical devices to create peer memory bindings of swapchain memory. These images and bindings have no effect on what memory is presented. Unlike images retrieved from `vkGetSwapchainImagesKHR`, these images must be destroyed with `vkDestroyImage`.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkAcquireNextImageKHR(
    VkDevice device,  
    VkSwapchainKHR swapchain, 
    uint64_t timeout, 
    VkSemaphore semaphore, 
    VkFence fence, 
    uint32_t* pImageIndex);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the non-retired swapchain from which an image is being acquired.
- `timeout` specifies how long the function waits, in nanoseconds, if no image is available.
- `semaphore` is `VK_NULL_HANDLE` or a semaphore to signal.
- `fence` is `VK_NULL_HANDLE` or a fence to signal.
- `pImageIndex` is a pointer to a `uint32_t` in which the index of the next image to use (i.e. an index into the array of images returned by `vkGetSwapchainImagesKHR`) is returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`,
vkAcquireNextImageKHR must not return VK_ERROR_OUT_OF_HOST_MEMORY.

Valid Usage

- VUID-vkAcquireNextImageKHR-swapchain-01285
  
  swapchain must not be in the retired state

- VUID-vkAcquireNextImageKHR-semaphore-01286
  
  If semaphore is not VK_NULL_HANDLE it must be unsignaled

- VUID-vkAcquireNextImageKHR-semaphore-01779
  
  If semaphore is not VK_NULL_HANDLE it must not have any uncompleted signal or wait operations pending

- VUID-vkAcquireNextImageKHR-fence-01287
  
  If fence is not VK_NULL_HANDLE it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue

- VUID-vkAcquireNextImageKHR-semaphore-01780
  
  semaphore and fence must not both be equal to VK_NULL_HANDLE

- VUID-vkAcquireNextImageKHR-surface-07783
  
  If forward progress cannot be guaranteed for the surface used to create the swapchain member of pAcquireInfo, the timeout member of pAcquireInfo must not be UINT64_MAX

- VUID-vkAcquireNextImageKHR-semaphore-03265
  
  semaphore must have a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY

Valid Usage (Implicit)

- VUID-vkAcquireNextImageKHR-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkAcquireNextImageKHR-swapchain-parameter
  
  swapchain must be a valid VkSwapchainKHR handle

- VUID-vkAcquireNextImageKHR-semaphore-parameter
  
  If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle

- VUID-vkAcquireNextImageKHR-fence-parameter
  
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

- VUID-vkAcquireNextImageKHR-pImageIndex-parameter
  
  pImageIndex must be a valid pointer to a uint32_t value

- VUID-vkAcquireNextImageKHR-swapchain-parent
  
  swapchain must have been created, allocated, or retrieved from device

- VUID-vkAcquireNextImageKHR-semaphore-parent
  
  If semaphore is a valid handle, it must have been created, allocated, or retrieved from device

- VUID-vkAcquireNextImageKHR-fence-parent
  
  If fence is a valid handle, it must have been created, allocated, or retrieved from device
Host Synchronization

- Host access to swapchain **must** be externally synchronized
- Host access to semaphore **must** be externally synchronized
- Host access to fence **must** be externally synchronized

Return Codes

**Success**
- VK_SUCCESS
- VK_TIMEOUT
- VK_NOT_READY
- VK_SUBOPTIMAL_KHR

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR

If an image is acquired successfully, *vkAcquireNextImageKHR must* either return VK_SUCCESS or VK_SUBOPTIMAL_KHR. The implementation may return VK_SUBOPTIMAL_KHR if the swapchain no longer matches the surface properties exactly, but can still be used for presentation.

When successful, *vkAcquireNextImageKHR* acquires a presentable image from swapchain that an application can use, and sets pImageIndex to the index of that image within the swapchain. The presentation engine may not have finished reading from the image at the time it is acquired, so the application must use semaphore and/or fence to ensure that the image layout and contents are not modified until the presentation engine reads have completed. Once *vkAcquireNextImageKHR* successfully acquires an image, the semaphore signal operation referenced by semaphore, if not VK_NULL_HANDLE, and the fence signal operation referenced by fence, if not VK_NULL_HANDLE, are submitted for execution. If *vkAcquireNextImageKHR* does not successfully acquire an image, semaphore and fence are unaffected. The order in which images are acquired is implementation-dependent, and may be different than the order the images were presented.

If timeout is zero, then *vkAcquireNextImageKHR* does not wait, and will either successfully acquire an image, or fail and return VK_NOT_READY if no image is available.

If the specified timeout period expires before an image is acquired, *vkAcquireNextImageKHR* returns VK_TIMEOUT. If timeout is UINT64_MAX, the timeout period is treated as infinite, and *vkAcquireNextImageKHR* will block until an image is acquired or an error occurs.
Let $S$ be the number of images in `swapchain`. Let $M$ be the value of `VkSurfaceCapabilitiesKHR::minImageCount`.

`vkAcquireNextImageKHR` should not be called if the number of images that the application has currently acquired is greater than $S - M$. If `vkAcquireNextImageKHR` is called when the number of images that the application has currently acquired is less than or equal to $S - M$, `vkAcquireNextImageKHR` must return in finite time with an allowed `VkResult` code.

**Note**

Returning a result in finite time guarantees that the implementation cannot deadlock an application, or suspend its execution indefinitely with correct API usage. Acquiring too many images at once may block indefinitely, which is covered by valid usage when attempting to use `UINT64_MAX`. For example, a scenario here is when a compositor holds on to images which are currently being presented, and there are not any vacant images left to be acquired.

**Note**

`VK_SUBOPTIMAL_KHR` may happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain in this state, or to re-create the swapchain to better match the platform surface properties.

If the swapchain images no longer match native surface properties, either `VK_SUBOPTIMAL_KHR` or `VK_ERROR_OUT_OF_DATE_KHR` must be returned. If `VK_ERROR_OUT_OF_DATE_KHR` is returned, no image is acquired and attempts to present previously acquired images to the swapchain will also fail with `VK_ERROR_OUT_OF_DATE_KHR`. Applications need to create a new swapchain for the surface to continue presenting if `VK_ERROR_OUT_OF_DATE_KHR` is returned.

If device loss occurs (see Lost Device) before the timeout has expired, `vkAcquireNextImageKHR` must return in finite time with either one of the allowed success codes, or `VK_ERROR_DEVICE_LOST`.

If `semaphore` is not `VK_NULL_HANDLE`, the semaphore must be unsignaled, with no signal or wait operations pending. It will become signaled when the application can use the image.

**Note**

Use of `semaphore` allows rendering operations to be recorded and submitted before the presentation engine has completed its use of the image.

If `fence` is not equal to `VK_NULL_HANDLE`, the fence must be unsignaled, with no signal operations pending. It will become signaled when the application can use the image.

**Note**

Applications should not rely on `vkAcquireNextImageKHR` blocking in order to meter their rendering speed. The implementation may return from this function immediately regardless of how many presentation requests are queued, and regardless of when queued presentation requests will complete relative to the call.
Instead, applications can use fence to meter their frame generation work to match the presentation rate.

An application must wait until either the semaphore or fence is signaled before accessing the image’s data.

**Note**

When the presentable image will be accessed by some stage $S$, the recommended idiom for ensuring correct synchronization is:

- The VkSubmitInfo used to submit the image layout transition for execution includes vkAcquireNextImageKHR::semaphore in its pWaitSemaphores member, with the corresponding element of pWaitDstStageMask including $S$.
- The synchronization command that performs any necessary image layout transition includes $S$ in both the srcStageMask and dstStageMask.

After a successful return, the image indicated by pImageIndex and its data will be unmodified compared to when it was presented.

**Note**

Exclusive ownership of presentable images corresponding to a swapchain created with VK_SHARING_MODE_EXCLUSIVE as defined in Resource Sharing is not altered by a call to vkAcquireNextImageKHR. That means upon the first acquisition from such a swapchain presentable images are not owned by any queue family, while at subsequent acquisitions the presentable images remain owned by the queue family the image was previously presented on.

The possible return values for vkAcquireNextImageKHR depend on the timeout provided:

- VK_SUCCESS is returned if an image became available.
- VK_ERROR_SURFACE_LOST_KHR is returned if the surface becomes no longer available.
- VK_NOT_READY is returned if timeout is zero and no image was available.
- VK_TIMEOUT is returned if timeout is greater than zero and less than UINT64_MAX, and no image became available within the time allowed.
- VK_SUBOPTIMAL_KHR is returned if an image became available, and the swapchain no longer matches the surface properties exactly, but can still be used to present to the surface successfully.

**Note**

This may happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain indefinitely or temporarily in this state, or to recreate the swapchain to better match the platform surface properties.
VK_ERROR_OUT_OF_DATE_KHR is returned if the surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications must query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.

If the native surface and presented image sizes no longer match, presentation may fail. If presentation does succeed, the mapping from the presented image to the native surface is implementation-defined. It is the application's responsibility to detect surface size changes and react appropriately. If presentation fails because of a mismatch in the surface and presented image sizes, a VK_ERROR_OUT_OF_DATE_KHR error will be returned.

Note
For example, consider a 4x3 window/surface that gets resized to be 3x4 (taller than wider). On some window systems, the portion of the window/surface that was previously and still is visible (the 3x3 part) will contain the same contents as before, while the remaining parts of the window will have undefined contents. Other window systems may squash/stretch the image to fill the new window size without any undefined contents, or apply some other mapping.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
VkResult vkAcquireNextImage2KHR(
    VkDevice device,
    const VkAcquireNextImageInfoKHR* pAcquireInfo,
    uint32_t* pImageIndex);
```

- `device` is the device associated with swapchain.
- `pAcquireInfo` is a pointer to a VkAcquireNextImageInfoKHR structure containing parameters of the acquire.
- `pImageIndex` is a pointer to a uint32_t that is set to the index of the next image to use.

If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE, `vkAcquireNextImage2KHR` must not return VK_ERROR_OUT_OF_HOST_MEMORY.

Valid Usage

- VUID-vkAcquireNextImage2KHR-surface-07784
  If forward progress cannot be guaranteed for the surface used to create swapchain, the timeout member of `pAcquireInfo` must not be UINT64_MAX

Valid Usage (Implicit)

- VUID-vkAcquireNextImage2KHR-device-parameter
  `device` must be a valid VkDevice handle
• VUID-vkAcquireNextImage2KHR-pAcquireInfo-parameter
  pAcquireInfo must be a valid pointer to a valid VkAcquireNextImageInfoKHR structure
• VUID-vkAcquireNextImage2KHR-pImageIndex-parameter
  pImageIndex must be a valid pointer to a uint32_t value

**Return Codes**

**Success**
- VK_SUCCESS
- VK_TIMEOUT
- VK_NOT_READY
- VK_SUBOPTIMAL_KHR

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR

The VkAcquireNextImageInfoKHR structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
typedef struct VkAcquireNextImageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
    uint64_t timeout;
    VkSemaphore semaphore;
    VkFence fence;
    uint32_t deviceMask;
} VkAcquireNextImageInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **swapchain** is a non-retired swapchain from which an image is acquired.
- **timeout** specifies how long the function waits, in nanoseconds, if no image is available.
- **semaphore** is VK_NULL_HANDLE or a semaphore to signal.
- **fence** is VK_NULL_HANDLE or a fence to signal.
- **deviceMask** is a mask of physical devices for which the swapchain image will be ready to use when the semaphore or fence is signaled.
If `vkAcquireNextImageKHR` is used, the device mask is considered to include all physical devices in the logical device.

**Note**

`vkAcquireNextImage2KHR` signals at most one semaphore, even if the application requests waiting for multiple physical devices to be ready via the `deviceMask`. However, only a single physical device can wait on that semaphore, since the semaphore becomes unsignaled when the wait succeeds. For other physical devices to wait for the image to be ready, it is necessary for the application to submit semaphore signal operation(s) to that first physical device to signal additional semaphore(s) after the wait succeeds, which the other physical device(s) can wait upon.

### Valid Usage

- **VUID-VkAcquireNextImageInfoKHR-swapchain-01675**  
  `swapchain` must not be in the retired state

- **VUID-VkAcquireNextImageInfoKHR-semaphore-01288**  
  If `semaphore` is not `VK_NULL_HANDLE` it must be unsignaled

- **VUID-VkAcquireNextImageInfoKHR-semaphore-01781**  
  If `semaphore` is not `VK_NULL_HANDLE` it must not have any uncompleted signal or wait operations pending

- **VUID-VkAcquireNextImageInfoKHR-fence-01289**  
  If `fence` is not `VK_NULL_HANDLE` it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue

- **VUID-VkAcquireNextImageInfoKHR-semaphore-01782**  
  `semaphore` and `fence` must not both be equal to `VK_NULL_HANDLE`

- **VUID-VkAcquireNextImageInfoKHR-deviceMask-01290**  
  `deviceMask` must be a valid device mask

- **VUID-VkAcquireNextImageInfoKHR-deviceMask-01291**  
  `deviceMask` must not be zero

- **VUID-VkAcquireNextImageInfoKHR-semaphore-03266**  
  `semaphore` must have a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`

### Valid Usage (Implicit)

- **VUID-VkAcquireNextImageInfoKHR-sType-sType**  
  `sType` must be `VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR`

- **VUID-VkAcquireNextImageInfoKHR-pNext-pNext**  
  `pNext` must be NULL

- **VUID-VkAcquireNextImageInfoKHR-swapchain-parameter**  
  `swapchain` must be a valid `VkSwapchainKHR` handle
VUID-VkAcquireNextImageInfoKHR-semaphore-parameter
If *semaphore* is not *VK_NULL_HANDLE*, *semaphore* must be a valid *VkSemaphore* handle

VUID-VkAcquireNextImageInfoKHR-fence-parameter
If *fence* is not *VK_NULL_HANDLE*, *fence* must be a valid *VkFence* handle

VUID-VkAcquireNextImageInfoKHR-commonparent
Each of *fence*, *semaphore*, and *swapchain* that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same *VkDevice*

Host Synchronization

- Host access to *swapchain* must be externally synchronized
- Host access to *semaphore* must be externally synchronized
- Host access to *fence* must be externally synchronized

After queueing all rendering commands and transitioning the image to the correct layout, to queue an image for presentation, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkQueuePresentKHR(
    VkQueue queue,
    const VkPresentInfoKHR* pPresentInfo);
```

- *queue* is a queue that is capable of presentation to the target surface's platform on the same device as the image's swapchain.
- *pPresentInfo* is a pointer to a *VkPresentInfoKHR* structure specifying parameters of the presentation.

**Note**
There is no requirement for an application to present images in the same order that they were acquired - applications can arbitrarily present any image that is currently acquired.

If *VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations* is *VK_TRUE*, *vkQueuePresentKHR* must not return *VK_ERROR_OUT_OF_HOST_MEMORY*.

Valid Usage

- VUID-vkQueuePresentKHR-pSwapchains-01292
  Each element of *pSwapchains* member of *pPresentInfo* must be a swapchain that is created for a surface for which presentation is supported from *queue* as determined using a call to *vkGetPhysicalDeviceSurfaceSupportKHR*

- VUID-vkQueuePresentKHR-pSwapchains-01293
If more than one member of `pSwapchains` was created from a display surface, all display surfaces referenced that refer to the same display must use the same display mode.

- **VUID-vkQueuePresentKHR-pWaitSemaphores-01294**
  When a semaphore wait operation referring to a binary semaphore defined by the elements of the `pWaitSemaphores` member of `pPresentInfo` executes on `queue`, there must be no other queues waiting on the same semaphore.

- **VUID-vkQueuePresentKHR-pWaitSemaphores-03267**
  All elements of the `pWaitSemaphores` member of `pPresentInfo` must be created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`.

- **VUID-vkQueuePresentKHR-pWaitSemaphores-03268**
  All elements of the `pWaitSemaphores` member of `pPresentInfo` must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends must have also been submitted for execution.

Any writes to memory backing the images referenced by the `pImageIndices` and `pSwapchains` members of `pPresentInfo`, that are available before `vkQueuePresentKHR` is executed, are automatically made visible to the read access performed by the presentation engine. This automatic visibility operation for an image happens-after the semaphore signal operation, and happens-before the presentation engine accesses the image.

Queueing an image for presentation defines a set of *queue operations*, including waiting on the semaphores and submitting a presentation request to the presentation engine. However, the scope of this set of queue operations does not include the actual processing of the image by the presentation engine.

**Note**
The origin of the native orientation of the surface coordinate system is not specified in the Vulkan specification; it depends on the platform. For most platforms the origin is by default upper-left, meaning the pixel of the presented `VkImage` at coordinates (0,0) would appear at the upper left pixel of the platform surface (assuming `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, and the display standing the right way up).

If `vkQueuePresentKHR` fails to enqueue the corresponding set of queue operations, it may return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced is unaffected by the call or its failure.

If `vkQueuePresentKHR` fails in such a way that the implementation is unable to make that guarantee, the implementation must return `VK_ERROR_DEVICE_LOST`.

However, if the presentation request is rejected by the presentation engine with an error `VK_ERROR_OUT_OF_DATE_KHR`, or `VK_ERROR_SURFACE_LOST_KHR`, the set of queue operations are still considered to be enqueued and thus any semaphore wait operation specified in `VkPresentInfoKHR` will execute when the corresponding queue operation is complete.

Calls to `vkQueuePresentKHR` may block, but must return in finite time.
Valid Usage (Implicit)

- VUID-vkQueuePresentKHR-queue-parameter
  queue must be a valid VkQueue handle
- VUID-vkQueuePresentKHR-pPresentInfo-parameter
  pPresentInfo must be a valid pointer to a valid VkPresentInfoKHR structure

Host Synchronization

- Host access to queue must be externally synchronized
- Host access to pPresentInfo->pWaitSemaphores[] must be externally synchronized
- Host access to pPresentInfo->pSwapchains[] must be externally synchronized

Command Properties

Return Codes

Success
- VK_SUCCESS
- VK_SUBOPTIMAL_KHR

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR

The VkPresentInfoKHR structure is defined as:

```c
// Provided by VK_KHR_swapchain
typedef struct VkPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
} VkPresentInfoKHR;
```
The `VkPresentInfoKHR` structure:

```c
uint32_t swapchainCount;
const VkSwapchainKHR* pSwapchains;
const uint32_t* pImageIndices;
VkResult* pResults;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores to wait for before issuing the present request. The number may be zero.
- `pWaitSemaphores` is `NULL` or a pointer to an array of `VkSemaphore` objects with `waitSemaphoreCount` entries, and specifies the semaphores to wait for before issuing the present request.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pSwapchains` is a pointer to an array of `VkSwapchainKHR` objects with `swapchainCount` entries.
- `pImageIndices` is a pointer to an array of indices into the array of each swapchain's presentable images, with `swapchainCount` entries. Each entry in this array identifies the image to present on the corresponding entry in the `pSwapchains` array.
- `pResults` is a pointer to an array of `VkResult` typed elements with `swapchainCount` entries. Applications that do not need per-swapchain results can use `NULL` for `pResults`. If non-`NULL`, each entry in `pResults` will be set to the `VkResult` for presenting the swapchain corresponding to the same index in `pSwapchains`.

Before an application can present an image, the image's layout must be transitioned to the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, or for a shared presentable image the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout.

**Valid Usage**

- VUID-VkPresentInfoKHR-pSwapchain-09231
  Elements of `pSwapchain` must be unique

- VUID-VkPresentInfoKHR-pImageIndices-01430
  Each element of `pImageIndices` must be the index of a presentable image acquired from the swapchain specified by the corresponding element of the `pSwapchains` array, and the presented image subresource must be in the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout at the time the operation is executed on a `VkDevice`
Valid Usage (Implicit)

- **VUID-VkPresentInfoKHR-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PRESENT_INFO_KHR`

- **VUID-VkPresentInfoKHR-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceGroupPresentInfoKHR`, `VkDisplayPresentInfoKHR`, or `VkPresentRegionsKHR`

- **VUID-VkPresentInfoKHR-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain **must** be unique

- **VUID-VkPresentInfoKHR-pWaitSemaphores-parameter**
  
  If `waitSemaphoreCount` is not 0, `pWaitSemaphores` **must** be a valid pointer to an array of `waitSemaphoreCount` valid `VkSemaphore` handles

- **VUID-VkPresentInfoKHR-pSwapchains-parameter**
  
  `pSwapchains` **must** be a valid pointer to an array of `swapchainCount` valid `VkSwapchainKHR` handles

- **VUID-VkPresentInfoKHR-pImageIndices-parameter**
  
  `pImageIndices` **must** be a valid pointer to an array of `swapchainCount` uint32_t values

- **VUID-VkPresentInfoKHR-pResults-parameter**
  
  If `pResults` is not `NULL`, `pResults` **must** be a valid pointer to an array of `swapchainCount` `VkResult` values

- **VUID-VkPresentInfoKHR-swapchainCount-arraylength**
  
  `swapchainCount` **must** be greater than 0

- **VUID-VkPresentInfoKHR-commonparent**
  
  Both of the elements of `pSwapchains`, and the elements of `pWaitSemaphores` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

When the `VK_KHR_incremental_present` extension is enabled, additional fields **can** be specified that allow an application to specify that only certain rectangular regions of the presentable images of a swapchain are changed. This is an optimization hint that a presentation engine **may** use to only update the region of a surface that is actually changing. The application still **must** ensure that all pixels of a presented image contain the desired values, in case the presentation engine ignores this hint. An application **can** provide this hint by adding a `VkPresentRegionsKHR` structure to the `pNext` chain of the `VkPresentInfoKHR` structure.

The `VkPresentRegionsKHR` structure is defined as:

```c
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionsKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentRegionKHR* pRegions;
};
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **swapchainCount** is the number of swapchains being presented to by this command.

• **pRegions** is `NULL` or a pointer to an array of `VkPresentRegionKHR` elements with `swapchainCount` entries. If not `NULL`, each element of **pRegions** contains the region that has changed since the last present to the swapchain in the corresponding entry in the `VkPresentInfoKHR::pSwapchains` array.

### Valid Usage

- **VUID-VkPresentRegionsKHR-swapchainCount-01260**
  
  *swapchainCount must* be the same value as `VkPresentInfoKHR::swapchainCount`, where `VkPresentInfoKHR` is included in the **pNext** chain of this `VkPresentRegionsKHR` structure.

### Valid Usage (Implicit)

- **VUID-VkPresentRegionsKHR-sType-sType**
  
  *sType must* be `VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR`

- **VUID-VkPresentRegionsKHR-pRegions-parameter**
  
  If **pRegions** is not `NULL`, **pRegions must** be a valid pointer to an array of `swapchainCount` valid `VkPresentRegionKHR` structures.

- **VUID-VkPresentRegionsKHR-swapchainCount-arraylength**
  
  *swapchainCount must* be greater than 0

For a given image and swapchain, the region to present is specified by the `VkPresentRegionKHR` structure, which is defined as:

```c
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionKHR {
    uint32_t rectangleCount;
    const VkRectLayerKHR* pRectangles;
} VkPresentRegionKHR;
```

• **rectangleCount** is the number of rectangles in **pRectangles**, or zero if the entire image has changed and should be presented.

• **pRectangles** is either `NULL` or a pointer to an array of `VkRectLayerKHR` structures. The `VkRectLayerKHR` structure is the framebuffer coordinates, plus layer, of a portion of a presentable image that has changed and must be presented. If non-`NULL`, each entry in **pRectangles** is a rectangle of the given image that has changed since the last image was presented to the given swapchain. The rectangles must be specified relative to `VkSurfaceCapabilitiesKHR::currentTransform`, regardless of the swapchain’s `preTransform`. The presentation engine will
apply the \textit{preTransform} transformation to the rectangles, along with any further transformation it applies to the image content.

\textbf{Valid Usage (Implicit)}

\begin{itemize}
  \item VUID-VkPresentRegionKHR-pRectangles-parameter
    
    If \texttt{rectangleCount} is not 0, and \texttt{pRectangles} is not NULL, \texttt{pRectangles} must be a valid pointer to an array of \texttt{rectangleCount} valid \texttt{VkRectLayerKHR} structures.
\end{itemize}

The \texttt{VkRectLayerKHR} structure is defined as:

\begin{verbatim}
// Provided by VK_KHR_incremental_present
typedef struct VkRectLayerKHR {
  VkOffset2D  offset;
  VkExtent2D  extent;
  uint32_t    layer;
} VkRectLayerKHR;
\end{verbatim}

\begin{itemize}
  \item \texttt{offset} is the origin of the rectangle, in pixels.
  \item \texttt{extent} is the size of the rectangle, in pixels.
  \item \texttt{layer} is the layer of the image. For images with only one layer, the value of \texttt{layer} must be 0.
\end{itemize}

Some platforms allow the size of a surface to change, and then scale the pixels of the image to fit the surface. \texttt{VkRectLayerKHR} specifies pixels of the swapchain’s image(s), which will be constant for the life of the swapchain.

\textbf{Valid Usage}

\begin{itemize}
  \item VUID-VkRectLayerKHR-offset-04864
    
    The sum of \texttt{offset} and \texttt{extent}, after being transformed according to the \textit{preTransform} member of the \texttt{VkSwapchainCreateInfoKHR} structure, must be no greater than the \texttt{imageExtent} member of the \texttt{VkSwapchainCreateInfoKHR} structure passed to \texttt{vkCreateSwapchainKHR}.
  \item VUID-VkRectLayerKHR-layer-01262
    
    \texttt{layer} must be less than the \texttt{imageArrayLayers} member of the \texttt{VkSwapchainCreateInfoKHR} structure passed to \texttt{vkCreateSwapchainKHR}.
\end{itemize}

When the \texttt{VK_KHR_display_swapchain} extension is enabled, additional fields can be specified when presenting an image to a swapchain by setting \texttt{VkPresentInfoKHR::pNext} to point to a \texttt{VkDisplayPresentInfoKHR} structure.

The \texttt{VkDisplayPresentInfoKHR} structure is defined as:

\begin{verbatim}
// Provided by VK_KHR_display_swapchain
\end{verbatim}
typedef struct VkDisplayPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkRect2D srcRect;
    VkRect2D dstRect;
    VkBool32 persistent;
} VkDisplayPresentInfoKHR;

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **srcRect** is a rectangular region of pixels to present. It must be a subset of the image being presented. If `VkDisplayPresentInfoKHR` is not specified, this region will be assumed to be the entire presentable image.

• **dstRect** is a rectangular region within the visible region of the swapchain's display mode. If `VkDisplayPresentInfoKHR` is not specified, this region will be assumed to be the entire visible region of the swapchain's mode. If the specified rectangle is a subset of the display mode's visible region, content from display planes below the swapchain's plane will be visible outside the rectangle. If there are no planes below the swapchain's, the area outside the specified rectangle will be black. If portions of the specified rectangle are outside of the display's visible region, pixels mapping only to those portions of the rectangle will be discarded.

• **persistent**: If this is `VK_TRUE`, the display engine will enable buffered mode on displays that support it. This allows the display engine to stop sending content to the display until a new image is presented. The display will instead maintain a copy of the last presented image. This allows less power to be used, but may increase presentation latency. If `VkDisplayPresentInfoKHR` is not specified, persistent mode will not be used.

If the extent of the **srcRect** and **dstRect** are not equal, the presented pixels will be scaled accordingly.

---

**Valid Usage**

• VUID-VkDisplayPresentInfoKHR-srcRect-01257
  **srcRect** must specify a rectangular region that is a subset of the image being presented

• VUID-VkDisplayPresentInfoKHR-dstRect-01258
  **dstRect** must specify a rectangular region that is a subset of the **visibleRegion** parameter of the display mode the swapchain being presented uses

• VUID-VkDisplayPresentInfoKHR-persistentContent-01259
  If the **persistentContent** member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display the present operation targets is `VK_FALSE`, then **persistent** must be `VK_FALSE`

---

**Valid Usage (Implicit)**

• VUID-VkDisplayPresentInfoKHR-sType-sType
**sType** must be `VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR`.

If the `pNext` chain of `VkPresentInfoKHR` includes a `VkDeviceGroupPresentInfoKHR` structure, then that structure includes an array of device masks and a device group present mode.

The `VkDeviceGroupPresentInfoKHR` structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
typedef struct VkDeviceGroupPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const uint32_t* pDeviceMasks;
    VkDeviceGroupPresentModeFlagBitsKHR mode;
} VkDeviceGroupPresentInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **swapchainCount** is zero or the number of elements in `pDeviceMasks`.
- **pDeviceMasks** is a pointer to an array of device masks, one for each element of `VkPresentInfoKHR::pSwapchains`.
- **mode** is a `VkDeviceGroupPresentModeFlagBitsKHR` value specifying the device group present mode that will be used for this present.

If **mode** is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`, then each element of `pDeviceMasks` selects which instance of the swapchain image is presented. Each element of `pDeviceMasks` **must** have exactly one bit set, and the corresponding physical device **must** have a presentation engine as reported by `VkDeviceGroupPresentCapabilitiesKHR`.

If **mode** is `VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR`, then each element of `pDeviceMasks` selects which instance of the swapchain image is presented. Each element of `pDeviceMasks` **must** have exactly one bit set, and some physical device in the logical device **must** include that bit in its `VkDeviceGroupPresentCapabilitiesKHR::presentMask`.

If **mode** is `VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR`, then each element of `pDeviceMasks` selects which instances of the swapchain image are component-wise summed and the sum of those images is presented. If the sum in any component is outside the representable range, the value of that component is undefined. Each element of `pDeviceMasks` **must** have a value for which all set bits are set in one of the elements of `VkDeviceGroupPresentCapabilitiesKHR::presentMask`.

If **mode** is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, then each element of `pDeviceMasks` selects which instance(s) of the swapchain images are presented. For each bit set in each element of `pDeviceMasks`, the corresponding physical device **must** have a presentation engine as reported by `VkDeviceGroupPresentCapabilitiesKHR`.

If `VkDeviceGroupPresentInfoKHR` is not provided or `swapchainCount` is zero then the masks are considered to be 1. If `VkDeviceGroupPresentInfoKHR` is not provided, mode is considered to be...
Valid Usage

• VUID-VkDeviceGroupPresentInfoKHR-swapchainCount-01297
  `swapchainCount` must equal 0 or `VkPresentInfoKHR::swapchainCount`

• VUID-VkDeviceGroupPresentInfoKHR-mode-01298
  If `mode` is `VKDEVICEGROUP_PRESENT_MODE_LOCAL_BIT_KHR`, then each element of `pDeviceMasks` must have exactly one bit set, and the corresponding element of `VkDeviceGroupPresentCapabilitiesKHR::presentMask` must be non-zero

• VUID-VkDeviceGroupPresentInfoKHR-mode-01299
  If `mode` is `VKDEVICEGROUP_PRESENT_MODE_REMOTE_BIT_KHR`, then each element of `pDeviceMasks` must have exactly one bit set, and some physical device in the logical device must include that bit in its `VkDeviceGroupPresentCapabilitiesKHR::presentMask`

• VUID-VkDeviceGroupPresentInfoKHR-mode-01300
  If `mode` is `VKDEVICEGROUP_PRESENT_MODE_SUM_BIT_KHR`, then each element of `pDeviceMasks` must have a value for which all set bits are set in one of the elements of `VkDeviceGroupPresentCapabilitiesKHR::presentMask`

• VUID-VkDeviceGroupPresentInfoKHR-mode-01301
  If `mode` is `VKDEVICEGROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, then for each bit set in each element of `pDeviceMasks`, the corresponding element of `VkDeviceGroupPresentCapabilitiesKHR::presentMask` must be non-zero

• VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-01302
  The value of each element of `pDeviceMasks` must be equal to the device mask passed in `VkAcquireNextImageInfoKHR::deviceMask` when the image index was last acquired

• VUID-VkDeviceGroupPresentInfoKHR-mode-01303
  `mode` must have exactly one bit set, and that bit must have been included in `VkDeviceGroupSwapchainCreateInfoKHR::modes`

Valid Usage (Implicit)

• VUID-VkDeviceGroupPresentInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR`

• VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-parameter
  If `swapchainCount` is not 0, `pDeviceMasks` must be a valid pointer to an array of `swapchainCount uint32_t` values

• VUID-VkDeviceGroupPresentInfoKHR-mode-parameter
  `mode` must be a valid `VkDeviceGroupPresentModeFlagBitsKHR` value

vkQueuePresentKHR releases the acquisition of the images referenced by `imageIndices`. The queue family corresponding to the queue `vkQueuePresentKHR` is executed on must have ownership of the presented images as defined in Resource Sharing. `vkQueuePresentKHR` does not alter the queue family ownership, but the presented images must not be used again before they have been reacquired.
using vkAcquireNextImageKHR.

The processing of the presentation happens in issue order with other queue operations, but semaphores have to be used to ensure that prior rendering and other commands in the specified queue complete before the presentation begins. The presentation command itself does not delay processing of subsequent commands on the queue, however, presentation requests sent to a particular queue are always performed in order. Exact presentation timing is controlled by the semantics of the presentation engine and native platform in use.

If an image is presented to a swapchain created from a display surface, the mode of the associated display will be updated, if necessary, to match the mode specified when creating the display surface. The mode switch and presentation of the specified image will be performed as one atomic operation.

The result codes `VK_ERROR_OUT_OF_DATE_KHR` and `VK_SUBOPTIMAL_KHR` have the same meaning when returned by `vkQueuePresentKHR` as they do when returned by `vkAcquireNextImageKHR`. If multiple swapchains are presented, the result code is determined applying the following rules in order:

- If the device is lost, `VK_ERROR_DEVICE_LOST` is returned.
- If any of the target surfaces are no longer available the error `VK_ERROR_SURFACE_LOST_KHR` is returned.
- If any of the presents would have a result of `VK_ERROR_OUT_OF_DATE_KHR` if issued separately then `VK_ERROR_OUT_OF_DATE_KHR` is returned.
- If any of the presents would have a result of `VK_SUBOPTIMAL_KHR` if issued separately then `VK_SUBOPTIMAL_KHR` is returned.
- Otherwise `VK_SUCCESS` is returned.

Presentation is a read-only operation that will not affect the content of the presentable images. Upon reacquiring the image and transitioning it away from the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, the contents will be the same as they were prior to transitioning the image to the present source layout and presenting it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

![Note]

The application can continue to present any acquired images from a retired swapchain as long as the swapchain has not entered a state that causes `vkQueuePresentKHR` to return `VK_ERROR_OUT_OF_DATE_KHR`.

### 30.8. Hdr Metadata

This section describes how to improve color reproduction of content to better reproduce colors as seen on the reference monitor. Definitions below are from the associated SMPTE 2086, CTA 861.3 and CIE 15:2004 specifications.

To provide Hdr metadata to an implementation, call:
void vkSetHdrMetadataEXT(
    VkDevice device,  // Logical device where the swapchains were created.
    uint32_t swapchainCount,  // Number of swapchains included in pSwapchains.
    const VkSwapchainKHR* pSwapchains,  // Pointer to an array of swapchainCount VkSwapchainKHR handles.
    const VkHdrMetadataEXT* pMetadata);  // Pointer to an array of swapchainCount VkHdrMetadataEXT structures.

The metadata will be applied to the specified VkSwapchainKHR objects at the next vkQueuePresentKHR call using that VkSwapchainKHR object. The metadata will persist until a subsequent vkSetHdrMetadataEXT changes it.

Valid Usage (Implicit)

- VUID-vkSetHdrMetadataEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkSetHdrMetadataEXT-pSwapchains-parameter
  pSwapchains must be a valid pointer to an array of swapchainCount valid VkSwapchainKHR handles

- VUID-vkSetHdrMetadataEXT-pMetadata-parameter
  pMetadata must be a valid pointer to an array of swapchainCount valid VkHdrMetadataEXT structures

- VUID-vkSetHdrMetadataEXT-swapchainCount-arraylength
  swapchainCount must be greater than 0

Each element of pSwapchains must have been created, allocated, or retrieved from device

The VkHdrMetadataEXT structure is defined as:

typedef struct VkHdrMetadataEXT {
    VkStructureType sType;
    const void* pNext;
    VkXYColorEXT displayPrimaryRed;
    VkXYColorEXT displayPrimaryGreen;
    VkXYColorEXT displayPrimaryBlue;
    VkXYColorEXT whitePoint;
    float maxLuminance;
    float minLuminance;
    float maxContentLightLevel;
}...
float maxFrameAverageLightLevel;
} VkHdrMetadataEXT;

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **displayPrimaryRed** is a *VkXYColorEXT* structure specifying the reference monitor’s red primary in chromaticity coordinates
- **displayPrimaryGreen** is a *VkXYColorEXT* structure specifying the reference monitor’s green primary in chromaticity coordinates
- **displayPrimaryBlue** is a *VkXYColorEXT* structure specifying the reference monitor’s blue primary in chromaticity coordinates
- **whitePoint** is a *VkXYColorEXT* structure specifying the reference monitor’s white-point in chromaticity coordinates
- **maxLuminance** is the maximum luminance of the reference monitor in nits
- **minLuminance** is the minimum luminance of the reference monitor in nits
- **maxContentLightLevel** is content’s maximum luminance in nits
- **maxFrameAverageLightLevel** is the maximum frame average light level in nits

### Valid Usage (Implicit)

- VUID-VkHdrMetadataEXT-sType-sType  
  **sType** must be *VK_STRUCTURE_TYPE_HDR_METADATA_EXT*
- VUID-VkHdrMetadataEXT-pNext-pNext  
  **pNext** must be **NULL**

**Note**

The validity and use of this data is outside the scope of Vulkan.

The *VkXYColorEXT* structure is defined as:

```c
// Provided by VK_EXT_hdr_metadata
typedef struct VkXYColorEXT {
    float x;
    float y;
} VkXYColorEXT;
```

- **x** is the x chromaticity coordinate.
- **y** is the y chromaticity coordinate.

Chromaticity coordinates are as specified in CIE 15:2004 “Calculation of chromaticity coordinates” (Section 7.3) and are limited to between 0 and 1 for real colors for the reference monitor.
Chapter 31. Extending Vulkan

New functionality may be added to Vulkan via either new extensions or new versions of the core, or new versions of an extension in some cases.

This chapter describes how Vulkan is versioned, how compatibility is affected between different versions, and compatibility rules that are followed by the Vulkan Working Group.

31.1. Instance and Device Functionality

Commands that enumerate instance properties, or that accept a VkInstance object as a parameter, are considered instance-level functionality.

Commands that dispatch from a VkDevice object or a child object of a VkDevice, or take any of them as a parameter, are considered device-level functionality. Types defined by a device extension are also considered device-level functionality.

Commands that dispatch from VkPhysicalDevice, or accept a VkPhysicalDevice object as a parameter, are considered either instance-level or device-level functionality depending if the functionality is specified by an instance extension or device extension respectively.

Additionally, commands that enumerate physical device properties are considered device-level functionality.

Note

Applications usually interface to Vulkan using a loader that implements only instance-level functionality, passing device-level functionality to implementations of the full Vulkan API on the system. In some circumstances, as these may be implemented independently, it is possible that the loader and device implementations on a given installation will support different versions. To allow for this and call out when it happens, the Vulkan specification enumerates device and instance level functionality separately - they have independent version queries.

Note

Vulkan 1.0 initially specified new physical device enumeration functionality as instance-level, requiring it to be included in an instance extension. As the capabilities of device-level functionality require discovery via physical device enumeration, this led to the situation where many device extensions required an instance extension as well. To alleviate this extra work, VK_KHR_get_physical_device_properties2 (and subsequently Vulkan 1.1) redefined device-level functionality to include physical device enumeration.

31.2. Core Versions

The Vulkan Specification is regularly updated with bug fixes and clarifications. Occasionally new
functionality is added to the core and at some point it is expected that there will be a desire to perform a large, breaking change to the API. In order to indicate to developers how and when these changes are made to the specification, and to provide a way to identify each set of changes, the Vulkan API maintains a version number.

### 31.2.1. Version Numbers

The Vulkan version number comprises four parts indicating the variant, major, minor and patch version of the Vulkan API Specification.

The **variant** indicates the variant of the Vulkan API supported by the implementation. This is always 1 for the Vulkan SC API. The Base Vulkan API is variant 0.

<info>
A non-zero variant indicates the API is a variant of the Vulkan API and applications will typically need to be modified to run against it. The variant field was a later addition to the version number, added in version 1.2.175 of the Base Vulkan Specification.
</info>

The **major version** indicates a significant change in the API, which will encompass a wholly new version of the specification.

The **minor version** indicates the incorporation of new functionality into the core specification.

The **patch version** indicates bug fixes, clarifications, and language improvements have been incorporated into the specification.

Compatibility guarantees made about versions of the API sharing any of the same version numbers are documented in [Core Versions](#).

The version number is used in several places in the API. In each such use, the version numbers are packed into a 32-bit integer as follows:

- The variant is a 3-bit integer packed into bits 31-29.
- The major version is a 7-bit integer packed into bits 28-22.
- The minor version number is a 10-bit integer packed into bits 21-12.
- The patch version number is a 12-bit integer packed into bits 11-0.

`VK_API_VERSION_VARIANT` extracts the API variant number from a packed version number:

```c
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_VARIANT(version) ((uint32_t)(version) >> 29U)
```

`VK_API_VERSION_MAJOR` extracts the API major version number from a packed version number:

```c
// Provided by VK_VERSION_1_0
```
#define VK_API_VERSION_MAJOR(version) (((uint32_t)(version) >> 22U) & 0x7FU)

**VK_API_VERSION_MINOR** extracts the API minor version number from a packed version number:

// Provided by VK_VERSION_1_0
#define VK_API_VERSION_MINOR(version) (((uint32_t)(version) >> 12U) & 0x3FFU)

**VK_API_VERSION_PATCH** extracts the API patch version number from a packed version number:

// Provided by VK_VERSION_1_0
#define VK_API_VERSION_PATCH(version) ((uint32_t)(version) & 0xFFFU)

**VK_MAKE_API_VERSION** constructs an API version number.

// Provided by VK_VERSION_1_0
#define VK_MAKE_API_VERSION(variant, major, minor, patch)\
  (((uint32_t)(variant)) << 29U) | (((uint32_t)(major)) << 22U) |
  (((uint32_t)(minor)) << 12U) | ((uint32_t)(patch))

- **variant** is the variant number.
- **major** is the major version number.
- **minor** is the minor version number.
- **patch** is the patch version number.

**VK_API_VERSION_1_0** returns the API version number for Vulkan 1.0.0.

// Provided by VK_VERSION_1_0
// Vulkan 1.0 version number
#define VK_API_VERSION_1_0 VK_MAKE_API_VERSION(0, 1, 0, 0)// Patch version should always be set to 0

**VK_API_VERSION_1_1** returns the API version number for Vulkan 1.1.0.

// Provided by VK_VERSION_1_1
// Vulkan 1.1 version number
#define VK_API_VERSION_1_1 VK_MAKE_API_VERSION(0, 1, 1, 0)// Patch version should always be set to 0

**VK_API_VERSION_1_2** returns the API version number for Vulkan 1.2.0.

// Provided by VK_VERSION_1_2
// Vulkan 1.2 version number
#define VK_API_VERSION_1_2 VK_MAKE_API_VERSION(0, 1, 2, 0)// Patch version should always be set to 0
VKSC_API_VARIANT returns the API variant number for Vulkan SC.

```c
// Provided by VKSC_VERSION_1_0
// Vulkan SC variant number
#define VKSC_API_VARIANT 1
```

VKSC_API_VERSION_1_0 returns the API version number for Vulkan SC 1.0.0.

```c
// Provided by VKSC_VERSION_1_0
// Vulkan SC 1.0 version number
#define VKSC_API_VERSION_1_0 VK_MAKE_API_VERSION(VKSC_API_VARIANT, 1, 0, 0) // Patch
```

### 31.2.2. Querying Version Support

The version of instance-level functionality can be queried by calling `vkEnumerateInstanceVersion`.

The version of device-level functionality can be queried by calling `vkGetPhysicalDeviceProperties` or `vkGetPhysicalDeviceProperties2`, and is returned in `VkPhysicalDeviceProperties::apiVersion`, encoded as described in Version Numbers.

### 31.3. Layers

When a layer is enabled, it inserts itself into the call chain for Vulkan commands the layer is interested in. Layers can be used for a variety of tasks that extend the base behavior of Vulkan beyond what is required by the specification - such as call logging, tracing, validation, or providing additional extensions.

**Note**

For example, an implementation is not expected to check that the value of enums used by the application fall within allowed ranges. Instead, a validation layer would do those checks and flag issues. This avoids a performance penalty during production use of the application because those layers would not be enabled in production.

**Note**

Vulkan layers may wrap object handles (i.e. return a different handle value to the application than that generated by the implementation). This is generally discouraged, as it increases the probability of incompatibilities with new extensions. The validation layers wrap handles in order to track the proper use and destruction of each object. See the “Architecture of the Vulkan Loader Interfaces” document for additional information.
To query the available layers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumerateInstanceLayerProperties(
    uint32_t* pPropertyCount,
    VkLayerProperties* pProperties);
```

- `pPropertyCount` is a pointer to an integer related to the number of layer properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkLayerProperties` structures.

If `pProperties` is `NULL`, then the number of layer properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of layer properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

The list of available layers may change at any time due to actions outside of the Vulkan implementation, so two calls to `vkEnumerateInstanceLayerProperties` with the same parameters may return different results, or retrieve different `pPropertyCount` values or `pProperties` contents. Once an instance has been created, the layers enabled for that instance will continue to be enabled and valid for the lifetime of that instance, even if some of them become unavailable for future instances.

### Valid Usage (Implicit)

- **VUID-vkEnumerateInstanceLayerProperties-pPropertyCount-parameter**
  - `pPropertyCount` must be a valid pointer to a `uint32_t` value
- **VUID-vkEnumerateInstanceLayerProperties-pProperties-parameter**
  - If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkLayerProperties` structures

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkLayerProperties` structure is defined as:
typedef struct VkLayerProperties {
  char layerName[VK_MAX_EXTENSION_NAME_SIZE];
  uint32_t specVersion;
  uint32_t implementationVersion;
  char description[VK_MAX_DESCRIPTION_SIZE];
} VkLayerProperties;

• **layerName** is an array of **VK_MAX_EXTENSION_NAME_SIZE** char containing a null-terminated UTF-8 string which is the name of the layer. Use this name in the `ppEnabledLayerNames` array passed in the `VkInstanceCreateInfo` structure to enable this layer for an instance.

• **specVersion** is the Vulkan version the layer was written to, encoded as described in *Version Numbers*.

• **implementationVersion** is the version of this layer. It is an integer, increasing with backward compatible changes.

• **description** is an array of **VK_MAX_DESCRIPTION_SIZE** char containing a null-terminated UTF-8 string which provides additional details that can be used by the application to identify the layer.

**VK_MAX_EXTENSION_NAME_SIZE** is the length in char values of an array containing a layer or extension name string, as returned in `VkLayerProperties::layerName`, `VkExtensionProperties::extensionName`, and other queries.

```c
#define VK_MAX_EXTENSION_NAME_SIZE 256U
```

**VK_MAX_DESCRIPTION_SIZE** is the length in char values of an array containing a string with additional descriptive information about a query, as returned in `VkLayerProperties::description` and other queries.

```c
#define VK_MAX_DESCRIPTION_SIZE 256U
```

To enable a layer, the name of the layer **should** be added to the `ppEnabledLayerNames` member of `VkInstanceCreateInfo` when creating a `VkInstance`.

Loader implementations **may** provide mechanisms outside the Vulkan API for enabling specific layers. Layers enabled through such a mechanism are *implicitly enabled*, while layers enabled by including the layer name in the `ppEnabledLayerNames` member of `VkInstanceCreateInfo` are *explicitly enabled*. Implicitly enabled layers are loaded before explicitly enabled layers, such that implicitly enabled layers are closer to the application, and explicitly enabled layers are closer to the driver. Except where otherwise specified, implicitly enabled and explicitly enabled layers differ only in the way they are enabled, and the order in which they are loaded. Explicitly enabling a layer that is implicitly enabled results in this layer being loaded as an implicitly enabled layer; it has no additional effect.
### 31.3.1. Device Layer Deprecation

Previous versions of this specification distinguished between instance and device layers. Instance layers were only able to intercept commands that operate on `VkInstance` and `VkPhysicalDevice`, except they were not able to intercept `vkCreateDevice`. Device layers were enabled for individual devices when they were created, and could only intercept commands operating on that device or its child objects.

Device-only layers are now deprecated, and this specification no longer distinguishes between instance and device layers. Layers are enabled during instance creation, and are able to intercept all commands operating on that instance or any of its child objects. At the time of deprecation there were no known device-only layers and no compelling reason to create one.

To enumerate device layers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumerateDeviceLayerProperties(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkLayerProperties* pProperties);
```

- `physicalDevice` is the physical device that will be queried.
- `pPropertyCount` is a pointer to an integer related to the number of layer properties available or queried.
- `pProperties` is either `NULL` or a pointer to an array of `VkLayerProperties` structures.

Physical device layers are not supported. `pPropertyCount` is set to 0 and `VK_SUCCESS` is returned.

### Valid Usage (Implicit)

- VUID-vkEnumerateDeviceLayerProperties-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkEnumerateDeviceLayerProperties-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkEnumerateDeviceLayerProperties-pProperties-parameter If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkLayerProperties` structures

### Return Codes

**Success**
- `VK_SUCCESS`

The `ppEnabledLayerNames` and `enabledLayerCount` members of `VkDeviceCreateInfo` are deprecated
and their values **must** be ignored by implementations.

The sequence of layers active for a device will be exactly the sequence of layers enabled when the parent instance was created.

### 31.4. Extensions

Extensions **may** define new Vulkan commands, structures, and enumerants. For compilation purposes, the interfaces defined by registered extensions, including new structures and enumerants as well as function pointer types for new commands, are defined in the Khronos-supplied `vulkan_sc_core.h` together with the core API. However, commands defined by extensions **may** not be available for static linking - in which case function pointers to these commands **should** be queried at runtime as described in Command Function Pointers. Extensions **may** be provided by layers as well as by a Vulkan implementation.

Because extensions **may** extend or change the behavior of the Vulkan API, extension authors **should** add support for their extensions to the Khronos validation layers. This is especially important for new commands whose parameters have been wrapped by the validation layers. See the “Architecture of the Vulkan Loader Interfaces” document for additional information.

**Note**

To enable an instance extension, the name of the extension **can** be added to the `ppEnabledExtensionNames` member of `VkInstanceCreateInfo` when creating a `VkInstance`.

To enable a device extension, the name of the extension **can** be added to the `ppEnabledExtensionNames` member of `VkDeviceCreateInfo` when creating a `VkDevice`.

Physical-Device-Level functionality does not have any enabling mechanism and **can** be used as long as the `VkPhysicalDevice` supports the device extension as determined by `vkEnumerateDeviceExtensionProperties`.

Enabling an extension (with no further use of that extension) does not change the behavior of functionality exposed by the core Vulkan API or any other extension, other than making valid the use of the commands, enums and structures defined by that extension.

Valid Usage sections for individual commands and structures do not currently contain which extensions have to be enabled in order to make their use valid, although they might do so in the future. It is defined only in the Valid Usage for Extensions section.

### 31.4.1. Instance Extensions

Instance extensions add new **instance-level functionality** to the API, outside of the core specification.

To query the available instance extensions, call:
// Provided by VK_VERSION_1_0

VkResult vkEnumerateInstanceExtensionProperties(
    const char* pLayerName,
    uint32_t* pPropertyCount,
    VkExtensionProperties* pProperties);

- `pLayerName` is either `NULL` or a pointer to a null-terminated UTF-8 string naming the layer to retrieve extensions from.
- `pPropertyCount` is a pointer to an integer related to the number of extension properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkExtensionProperties` structures.

When `pLayerName` parameter is `NULL`, only extensions provided by the Vulkan implementation or by implicitly enabled layers are returned. When `pLayerName` is the name of a layer, the instance extensions provided by that layer are returned.

If `pProperties` is `NULL`, then the number of extensions properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of extension properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

Because the list of available layers may change externally between calls to `vkEnumerateInstanceExtensionProperties`, two calls may retrieve different results if a `pLayerName` is available in one call but not in another. The extensions supported by a layer may also change between two calls, e.g. if the layer implementation is replaced by a different version between those calls.

Implementations must not advertise any pair of extensions that cannot be enabled together due to behavioral differences, or any extension that cannot be enabled against the advertised version.

Valid Usage (Implicit)

- VUID-vkEnumerateInstanceExtensionProperties-pLayerName-parameter
  If `pLayerName` is not `NULL`, `pLayerName` must be a null-terminated UTF-8 string.

- VUID-vkEnumerateInstanceExtensionProperties-pPropertyCount-parameter
  `pPropertyCount` must be a valid pointer to a `uint32_t` value.

- VUID-vkEnumerateInstanceExtensionProperties-pProperties-parameter
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkExtensionProperties` structures.
Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_LAYER_NOT_PRESENT

31.4.2. Device Extensions

Device extensions add new device-level functionality to the API, outside of the core specification.

To query the extensions available to a given physical device, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumerateDeviceExtensionProperties(
    VkPhysicalDevice physicalDevice,
    const char* pLayerName,
    uint32_t* pPropertyCount,
    VkExtensionProperties* pProperties);
```

- `physicalDevice` is the physical device that will be queried.
- `pLayerName` is either NULL or a pointer to a null-terminated UTF-8 string naming the layer to retrieve extensions from.
- `pPropertyCount` is a pointer to an integer related to the number of extension properties available or queried, and is treated in the same fashion as the `vkEnumerateInstanceExtensionProperties ::pPropertyCount` parameter.
- `pProperties` is either NULL or a pointer to an array of `VkExtensionProperties` structures.

When `pLayerName` parameter is NULL, only extensions provided by the Vulkan implementation or by implicitly enabled layers are returned. When `pLayerName` is the name of a layer, the device extensions provided by that layer are returned.

Implementations must not advertise any pair of extensions that cannot be enabled together due to behavioral differences, or any extension that cannot be enabled against the advertised version.

**Note**

Due to platform details on Android, `vkEnumerateDeviceExtensionProperties` may be called with `physicalDevice` equal to NULL during layer discovery. This behaviour will only be observed by layer implementations, and not the underlying Vulkan driver.
If \( \text{VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations} \) is \( \text{VK_TRUE} \), \( \text{vkEnumerateDeviceExtensionProperties} \) must not return \( \text{VK_ERROR_OUT_OF_HOST_MEMORY} \).

### Valid Usage (Implicit)

- VUID-vkEnumerateDeviceExtensionProperties-physicalDevice-parameter
  - physicalDevice must be a valid \( \text{VkPhysicalDevice} \) handle

- VUID-vkEnumerateDeviceExtensionProperties-pLayerName-parameter
  - If \( \text{pLayerName} \) is not NULL, \( \text{pLayerName} \) must be a null-terminated UTF-8 string

- VUID-vkEnumerateDeviceExtensionProperties-pPropertyCount-parameter
  - \( \text{pPropertyCount} \) must be a valid pointer to a \text{uint32_t} value

- VUID-vkEnumerateDeviceExtensionProperties-pProperties-parameter
  - If the value referenced by \( \text{pPropertyCount} \) is not 0, and \( \text{pProperties} \) is not NULL, \( \text{pProperties} \) must be a valid pointer to an array of \( \text{pPropertyCount} \) \text{ VkExtensionProperties} \) structures

### Return Codes

#### Success

- \( \text{VK_SUCCESS} \)
- \( \text{VK_INCOMPLETE} \)

#### Failure

- \( \text{VK_ERROR_OUT_OF_HOST_MEMORY} \)
- \( \text{VK_ERROR_OUT_OF_DEVICE_MEMORY} \)
- \( \text{VK_ERROR_LAYER_NOT_PRESENT} \)

The \text{VkExtensionProperties} \) structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtensionProperties {
    char extensionName[VK_MAX_EXTENSION_NAME_SIZE];
    uint32_t specVersion;
} VkExtensionProperties;
```

- \( \text{extensionName} \) is an array of \( \text{VK_MAX_EXTENSION_NAME_SIZE} \) char containing a null-terminated UTF-8 string which is the name of the extension.

- \( \text{specVersion} \) is the version of this extension. It is an integer, incremented with backward compatible changes.

### Accessing Device-Level Functionality From a \text{VkPhysicalDevice} \)

Some device extensions also add support for physical-device-level functionality. Physical-device-level functionality can be used, if the required extension is supported as advertised by
vkEnumerateDeviceExtensionProperties for a given VkPhysicalDevice.

**Accessing Device-Level Functionality From a VkDevice**

For commands that are dispatched from a VkDevice, or from a child object of a VkDevice, device extensions must be enabled in vkCreateDevice.

### 31.5. Extension Dependencies

Some extensions are dependent on other extensions, or on specific core API versions, to function. To enable extensions with dependencies, any required extensions must also be enabled through the same API mechanisms when creating an instance with vkCreateInstance or a device with vkCreateDevice. Each extension which has such dependencies documents them in the appendix summarizing that extension.

If an extension is supported (as queried by vkEnumerateInstanceExtensionProperties or vkEnumerateDeviceExtensionProperties), then required extensions of that extension must also be supported for the same instance or physical device.

Any device extension that has an instance extension dependency that is not enabled by vkCreateInstance is considered to be unsupported, hence it must not be returned by vkEnumerateDeviceExtensionProperties for any VkPhysicalDevice child of the instance. Instance extensions do not have dependencies on device extensions.

If a required extension has been promoted to another extension or to a core API version, then as a general rule, the dependency is also satisfied by the promoted extension or core version. This will be true so long as any features required by the original extension are also required or enabled by the promoted extension or core version. However, in some cases an extension is promoted while making some of its features optional in the promoted extension or core version. In this case, the dependency may not be satisfied. The only way to be certain is to look at the descriptions of the original dependency and the promoted version in the Layers & Extensions and Core Revisions appendices.

**Note**

There is metadata in vk.xml describing some aspects of promotion, especially requires, promotedto and deprecatedby attributes of <extension> tags. However, the metadata does not yet fully describe this scenario. In the future, we may extend the XML schema to describe the full set of extensions and versions satisfying a dependency. As discussed in more detail for Promotion below, when an extension is promoted it does not mean that a mechanical substitution of an extension API by the corresponding promoted API will work in exactly the same fashion; be supported at runtime; or even exist.

### 31.6. Compatibility Guarantees (Informative)

This section is marked as informal as there is no binding responsibility on implementations of the Vulkan API - these guarantees are however a contract between the Vulkan Working Group and developers using this Specification.
31.6.1. Core Versions

Each of the **major, minor, and patch versions** of the Vulkan specification provide different compatibility guarantees.

**Patch Versions**

A difference in the patch version indicates that a set of bug fixes or clarifications have been made to the Specification. Informative enums returned by Vulkan commands that will not affect the runtime behavior of a valid application may be added in a patch version (e.g. `VkVendorId`).

The specification’s patch version is strictly increasing for a given major version of the specification; any change to a specification as described above will result in the patch version being increased by 1. Patch versions are applied to all minor versions, even if a given minor version is not affected by the provoking change.

Specifications with different patch versions but the same major and minor version are **fully compatible** with each other - such that a valid application written against one will work with an implementation of another.

![Note]

If a patch version includes a bug fix or clarification that could have a significant impact on developer expectations, these will be highlighted in the change log. Generally the Vulkan Working Group tries to avoid these kinds of changes, instead fixing them in either an extension or core version.

**Minor Versions**

Changes in the minor version of the specification indicate that new functionality has been added to the core specification. This will usually include new interfaces in the header, and may also include behavior changes and bug fixes. Core functionality may be deprecated in a minor version, but will not be obsoleted or removed.

The specification’s minor version is strictly increasing for a given major version of the specification; any change to a specification as described above will result in the minor version being increased by 1. Changes that can be accommodated in a patch version will not increase the minor version.

Specifications with a lower minor version are **backwards compatible** with an implementation of a specification with a higher minor version for core functionality and extensions issued with the KHR vendor tag. Vendor and multi-vendor extensions are not guaranteed to remain functional across minor versions, though in general they are with few exceptions - see **Obsoletion** for more information.

**Major Versions**

A difference in the major version of specifications indicates a large set of changes which will likely include interface changes, behavioral changes, removal of **deprecated functionality**, and the modification, addition, or replacement of other functionality.
The specification's major version is monotonically increasing; any change to the specification as described above will result in the major version being increased. Changes that can be accommodated in a patch or minor version will not increase the major version.

The Vulkan Working Group intends to only issue a new major version of the Specification in order to realise significant improvements to the Vulkan API that will necessarily require breaking compatibility.

A new major version will likely include a wholly new version of the specification to be issued - which could include an overhaul of the versioning semantics for the minor and patch versions. The patch and minor versions of a specification are therefore not meaningful across major versions. If a major version of the specification includes similar versioning semantics, it is expected that the patch and the minor version will be reset to 0 for that major version.

### 31.6.2. Extensions

A KHR extension **must** be able to be enabled alongside any other KHR extension, and for any minor or patch version of the core Specification beyond the minimum version it requires. A multi-vendor extension **should** be able to be enabled alongside any KHR extension or other multi-vendor extension, and for any minor or patch version of the core Specification beyond the minimum version it requires. A vendor extension **should** be able to be enabled alongside any KHR extension, multi-vendor extension, or other vendor extension from the same vendor, and for any minor or patch version of the core Specification beyond the minimum version it requires. A vendor extension **may** be able to be enabled alongside vendor extensions from another vendor.

The one other exception to this is if a vendor or multi-vendor extension is made obsolete by either a core version or another extension, which will be highlighted in the extension appendix.

**Promotion**

Extensions, or features of an extension, **may** be promoted to a new core version of the API, or a newer extension which an equal or greater number of implementors are in favour of.

When extension functionality is promoted, minor changes **may** be introduced, limited to the following:

- Naming
- Non-intrusive parameter changes
- Feature advertisement/enablement
- Combining structure parameters into larger structures
- Author ID suffixes changed or removed

**Note**

If extension functionality is promoted, there is no guarantee of direct compatibility, however it should require little effort to port code from the original feature to the promoted one.

The Vulkan Working Group endeavours to ensure that larger changes are marked
as either deprecated or obsoleted as appropriate, and can do so retroactively if necessary.

Extensions that are promoted are listed as being promoted in their extension appendices, with reference to where they were promoted to.

When an extension is promoted, any backwards compatibility aliases which exist in the extension will not be promoted.

**Note**

As a hypothetical example, if the VK_KHR_surface extension were promoted to part of a future core version, the VK_COLOR_SPACE_SRGB_NONLINEAR_KHR token defined by that extension would be promoted to VK_COLOR_SPACE_SRGB_NONLINEAR. However, the VK_COLORSPACE_SRGB_NONLINEAR_KHR token aliases VK_COLOR_SPACE_SRGB_NONLINEAR_KHR. The VK_COLORSPACE_SRGB_NONLINEAR_KHR would not be promoted, because it is a backwards compatibility alias that exists only due to a naming mistake when the extension was initially published.

### Deprecation

Extensions may be marked as deprecated when the intended use cases either become irrelevant or can be solved in other ways. Generally, a new feature will become available to solve the use case in another extension or core version of the API, but it is not guaranteed.

**Note**

Features that are intended to replace deprecated functionality have no guarantees of compatibility, and applications may require drastic modification in order to make use of the new features.

Extensions that are deprecated are listed as being deprecated in their extension appendices, with an explanation of the deprecation and any features that are relevant.

### Obsoletion

Occasionally, an extension will be marked as obsolete if a new version of the core API or a new extension is fundamentally incompatible with it. An obsoleted extension must not be used with the extension or core version that obsoleted it.

Extensions that are obsoleted are listed as being obsoleted in their extension appendices, with reference to what they were obsoleted by.

### Aliases

When an extension is promoted or deprecated by a newer feature, some or all of its functionality may be replicated into the newer feature. Rather than duplication of all the documentation and definitions, the specification instead identifies the identical commands and types as aliases of one another. Each alias is mentioned together with the definition it aliases, with the older aliases marked as “equivalents”. Each alias of the same command has identical behavior, and each alias of
the same type has identical meaning - they can be used interchangeably in an application with no compatibility issues.

**Note**

For promoted types, the aliased extension type is semantically identical to the new core type. The C99 headers simply `typedef` the older aliases to the promoted types.

For promoted command aliases, however, there are two separate entry point definitions, due to the fact that the C99 ABI has no way to alias command definitions without resorting to macros. Calling via either entry point definition will produce identical behavior within the bounds of the specification, and should still invoke the same entry point in the implementation. Debug tools may use separate entry points with different debug behavior; to write the appropriate command name to an output log, for instance.

**Special Use Extensions**

Some extensions exist only to support a specific purpose or specific class of application. These are referred to as “special use extensions”. Use of these extensions in applications not meeting the special use criteria is not recommended.

Special use cases are restricted, and only those defined below are used to describe extensions:

**Table 43. Extension Special Use Cases**

<table>
<thead>
<tr>
<th>Special Use</th>
<th>XML Tag</th>
<th>Full Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAD support</td>
<td>cadsupport</td>
<td>Extension is intended to support specialized functionality used by CAD/CAM applications.</td>
</tr>
<tr>
<td>D3D support</td>
<td>d3demulation</td>
<td>Extension is intended to support D3D emulation layers, and applications ported from D3D, by adding functionality specific to D3D.</td>
</tr>
<tr>
<td>Developer tools</td>
<td>devtools</td>
<td>Extension is intended to support developer tools such as capture-replay libraries.</td>
</tr>
<tr>
<td>Debugging tools</td>
<td>debugging</td>
<td>Extension is intended for use by applications when debugging.</td>
</tr>
<tr>
<td>OpenGL / ES support</td>
<td>glemulation</td>
<td>Extension is intended to support OpenGL and/or OpenGL ES emulation layers, and applications ported from those APIs, by adding functionality specific to those APIs.</td>
</tr>
</tbody>
</table>

Special use extensions are identified in the metadata for each such extension in the Layers & Extensions appendix, using the name in the “Special Use” column above.

Special use extensions are also identified in `vk.xml` with the short name in “XML Tag” column above, as described in the “API Extensions (extension tag)” section of the registry schema documentation.
Chapter 32. Features

Features describe functionality which is not supported on all implementations. Features are properties of the physical device. Features are optional, and must be explicitly enabled before use. Support for features is reported and enabled on a per-feature basis.

Note
Features are reported via the basic VkPhysicalDeviceFeatures structure, as well as the extensible structure VkPhysicalDeviceFeatures2, which was added in the VK_KHR_get_physical_device_properties2 extension and included in Vulkan 1.1. When new features are added in future Vulkan versions or extensions, each extension should introduce one new feature structure, if needed. This structure can be added to the pNext chain of the VkPhysicalDeviceFeatures2 structure.

For convenience, new core versions of Vulkan may introduce new unified feature structures for features promoted from extensions. At the same time, the extension’s original feature structure (if any) is also promoted to the core API, and is an alias of the extension’s structure. This results in multiple names for the same feature: in the original extension’s feature structure and the promoted structure alias, in the unified feature structure. When a feature was implicitly supported and enabled in the extension, but an explicit name was added during promotion, then the extension itself acts as an alias for the feature as listed in the table below.

All aliases of the same feature in the core API must be reported consistently: either all must be reported as supported, or none of them. When a promoted extension is available, any corresponding feature aliases must be supported.

Table 44. Extension Feature Aliases

<table>
<thead>
<tr>
<th>Extension</th>
<th>Feature(s)</th>
</tr>
</thead>
</table>

To query supported features, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceFeatures(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceFeatures* pFeatures);
```

- `physicalDevice` is the physical device from which to query the supported features.
- `pFeatures` is a pointer to a VkPhysicalDeviceFeatures structure in which the physical device features are returned. For each feature, a value of VK_TRUE specifies that the feature is supported on this physical device, and VK_FALSE specifies that the feature is not supported.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFeatures-physicalDevice-parameter
  `physicalDevice` must be a valid VkPhysicalDevice handle
Fine-grained features used by a logical device **must** be enabled at `VkDevice` creation time. If a feature is enabled that the physical device does not support, `VkDevice` creation will fail and return `VK_ERROR_FEATURE_NOT_PRESENT`.

The fine-grained features are enabled by passing a pointer to the `VkPhysicalDeviceFeatures` structure via the `pEnabledFeatures` member of the `VkDeviceCreateInfo` structure that is passed into the `vkCreateDevice` call. If a member of `pEnabledFeatures` is set to `VK_TRUE` or `VK_FALSE`, then the device will be created with the indicated feature enabled or disabled, respectively. Features **can** also be enabled by using the `VkPhysicalDeviceFeatures2` structure.

If an application wishes to enable all features supported by a device, it **can** simply pass in the `VkPhysicalDeviceFeatures` structure that was previously returned by `vkGetPhysicalDeviceFeatures`. To disable an individual feature, the application **can** set the desired member to `VK_FALSE` in the same structure. Setting `pEnabledFeatures` to `NULL` and not including a `VkPhysicalDeviceFeatures2` in the `pNext` chain of `VkDeviceCreateInfo` is equivalent to setting all members of the structure to `VK_FALSE`.

**Note**

Some features, such as `robustBufferAccess`, **may** incur a runtime performance cost. Application writers **should** carefully consider the implications of enabling all supported features.

To query supported features defined by the core or extensions, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceFeatures2(
    VkPhysicalDevice physicalDevice, 
    VkPhysicalDeviceFeatures2* pFeatures);
```

- `physicalDevice` is the physical device from which to query the supported features.
- `pFeatures` is a pointer to a `VkPhysicalDeviceFeatures2` structure in which the physical device features are returned.

Each structure in `pFeatures` and its `pNext` chain contains members corresponding to fine-grained features. `vkGetPhysicalDeviceFeatures2` writes each member to a boolean value indicating whether that feature is supported.

**Valid Usage (Implicit)**

- **VUID-vkGetPhysicalDeviceFeatures2-physicalDevice-parameter**
  `physicalDevice` **must** be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceFeatures2-pFeatures-parameter**
  `pFeatures` **must** be a valid pointer to a `VkPhysicalDeviceFeatures2` structure
The `VkPhysicalDeviceFeatures2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceFeatures2 {
    VkStructureType      sType;
    void*                 pNext;
    VkPhysicalDeviceFeatures features;
} VkPhysicalDeviceFeatures2;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `features` is a `VkPhysicalDeviceFeatures` structure describing the fine-grained features of the Vulkan 1.0 API.

The `pNext` chain of this structure is used to extend the structure with features defined by extensions. This structure can be used in `vkGetPhysicalDeviceFeatures2` or can be included in the `pNext` chain of a `VkDeviceCreateInfo` structure, in which case it controls which features are enabled on the device in lieu of `pEnabledFeatures`.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceFeatures2-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FEATURES_2`

The `VkPhysicalDeviceFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceFeatures {
    VkBool32 robustBufferAccess;
    VkBool32 fullDrawIndexUint32;
    VkBool32 imageCubeArray;
    VkBool32 independentBlend;
    VkBool32 geometryShader;
    VkBool32 tessellationShader;
    VkBool32 sampleRateShading;
    VkBool32 dualSrcBlend;
    VkBool32 logicOp;
    VkBool32 multiDrawIndirect;
    VkBool32 drawIndirectFirstInstance;
    VkBool32 depthClamp;
    VkBool32 depthBiasClamp;
    VkBool32 fillModeNonSolid;
    VkBool32 depthBounds;
    VkBool32 wideLines;
    VkBool32 largePoints;
    VkBool32 alphaToOne;
    VkBool32 multiViewport;
}````
This structure describes the following features:

- **robustBufferAccess** specifies that accesses to buffers are bounds-checked against the range of the buffer descriptor (as determined by `VkDescriptorBufferInfo::range`, `VkBufferViewCreateInfo::range`, or the size of the buffer). Out of bounds accesses must not cause application termination, and the effects of shader loads, stores, and atomics must conform to an implementation-dependent behavior as described below.

  A buffer access is considered to be out of bounds if any of the following are true:

  - The pointer was formed by `OpImageTexelPointer` and the coordinate is less than zero or greater than or equal to the number of whole elements in the bound range.
  - The pointer was not formed by `OpImageTexelPointer` and the object pointed to is not
wholly contained within the bound range. This includes accesses performed via *variable pointers* where the buffer descriptor being accessed cannot be statically determined. Uninitialized pointers and pointers equal to `OpConstantNull` are treated as pointing to a zero-sized object, so all accesses through such pointers are considered to be out of bounds. Buffer accesses through buffer device addresses are not bounds-checked.

**Note**

If a SPIR-V `OpLoad` instruction loads a structure and the tail end of the structure is out of bounds, then all members of the structure are considered out of bounds even if the members at the end are not statically used.

- If `robustBufferAccess2` is not enabled and any buffer access is determined to be out of bounds, then any other access of the same type (load, store, or atomic) to the same buffer that accesses an address less than 16 bytes away from the out of bounds address may also be considered out of bounds.

- If the access is a load that reads from the same memory locations as a prior store in the same shader invocation, with no other intervening accesses to the same memory locations in that shader invocation, then the result of the load may be the value stored by the store instruction, even if the access is out of bounds. If the load is `Volatile`, then an out of bounds load must return the appropriate out of bounds value.

- Accesses to descriptors written with a `VK_NULL_HANDLE` resource or view are not considered to be out of bounds. Instead, each type of descriptor access defines a specific behavior for accesses to a null descriptor.

- Out-of-bounds buffer loads will return any of the following values:
  - If the access is to a uniform buffer and `robustBufferAccess2` is enabled, loads of offsets between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of `robustUniformBufferAccessSizeAlignment` bytes must return either zero values or the contents of the memory at the offset being loaded. Loads of offsets past the descriptor range rounded up to a multiple of `robustUniformBufferAccessSizeAlignment` bytes must return zero values.
  - If the access is to a storage buffer and `robustBufferAccess2` is enabled, loads of offsets between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of `robustStorageBufferAccessSizeAlignment` bytes must return either zero values or the contents of the memory at the offset being loaded. Loads of offsets past the descriptor range rounded up to a multiple of `robustStorageBufferAccessSizeAlignment` bytes must return zero values. Similarly, stores to addresses between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of `robustStorageBufferAccessSizeAlignment` bytes may be discarded.

- Non-atomic accesses to storage buffers that are a multiple of 32 bits may be decomposed into 32-bit accesses that are individually bounds-checked.

- If the access is to an index buffer and `robustBufferAccess2` is enabled, zero values must be returned.

- If the access is to a uniform texel buffer or storage texel buffer and `robustBufferAccess2`
is enabled, zero values **must** be returned, and then Conversion to RGBA is applied based on the buffer view’s format.

- Values from anywhere within the memory range(s) bound to the buffer (possibly including bytes of memory past the end of the buffer, up to the end of the bound range).
- Zero values, or \((0,0,0,x)\) vectors for vector reads where \(x\) is a valid value represented in the type of the vector components and **may** be any of:
  - 0, 1, or the maximum representable positive integer value, for signed or unsigned integer components
  - 0.0 or 1.0, for floating-point components

- Out-of-bounds writes **may** modify values within the memory range(s) bound to the buffer, but **must** not modify any other memory.
  - If `robustBufferAccess2` is enabled, out of bounds writes **must** not modify any memory.
- Out-of-bounds atomics **may** modify values within the memory range(s) bound to the buffer, but **must** not modify any other memory, and return an undefined value.
  - If `robustBufferAccess2` is enabled, out of bounds atomics **must** not modify any memory, and return an undefined value.
- If `robustBufferAccess2` is disabled, vertex input attributes are considered out of bounds if the offset of the attribute in the bound vertex buffer range plus the size of the attribute is greater than either:
  - `vertexBufferRangeSize`, if `bindingStride == 0`; or
  - \((vertexBufferRangeSize - (vertexBufferRangeSize \% bindingStride))\)

where `vertexBufferRangeSize` is the byte size of the memory range bound to the vertex buffer binding and `bindingStride` is the byte stride of the corresponding vertex input binding. Further, if any vertex input attribute using a specific vertex input binding is out of bounds, then all vertex input attributes using that vertex input binding for that vertex shader invocation are considered out of bounds.

- If a vertex input attribute is out of bounds, it will be assigned one of the following values:
  - Values from anywhere within the memory range(s) bound to the buffer, converted according to the format of the attribute.
  - Zero values, format converted according to the format of the attribute.
  - Zero values, or \((0,0,0,x)\) vectors, as described above.
- If `robustBufferAccess2` is enabled, vertex input attributes are considered out of bounds if the offset of the attribute in the bound vertex buffer range plus the size of the attribute is greater than the byte size of the memory range bound to the vertex buffer binding.
  - If a vertex input attribute is out of bounds, the raw data extracted are zero values, and missing G, B, or A components are filled with \((0,0,1)\).
- If `robustBufferAccess` is not enabled, applications **must** not perform out of bounds accesses.

- **fullDrawIndexUint32** specifies the full 32-bit range of indices is supported for indexed draw calls
when using a VkIndexType of VK_INDEX_TYPE_UINT32. maxDrawIndexedIndexValue is the maximum index value that may be used (aside from the primitive restart index, which is always 2^{32}-1 when the VkIndexType is VK_INDEX_TYPE_UINT32). If this feature is supported, maxDrawIndexedIndexValue must be 2^{32}-1; otherwise it must be no smaller than 2^{24}-1. See maxDrawIndexedIndexValue.

- imageCubeArray specifies whether image views with a VkImageViewType of VK_IMAGE_VIEW_TYPE_CUBE_ARRAY can be created, and that the corresponding SampledCubeArray and ImageCubeArray SPIR-V capabilities can be used in shader code.

- independentBlend specifies whether the VkPipelineColorBlendAttachmentState settings are controlled independently per-attachment. If this feature is not enabled, the VkPipelineColorBlendAttachmentState settings for all color attachments must be identical. Otherwise, a different VkPipelineColorBlendAttachmentState can be provided for each bound color attachment.

- geometryShader specifies whether geometry shaders are supported. If this feature is not enabled, the VK_SHADER_STAGE_GEOMETRY_BIT and VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT enum values must not be used. This also specifies whether shader modules can declare the Geometry capability.

- tessellationShader specifies whether tessellation control and evaluation shaders are supported. If this feature is not enabled, the VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT, VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT, and VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO enum values must not be used. This also specifies whether shader modules can declare the Tessellation capability.

- sampleRateShading specifies whether Sample Shading and multisample interpolation are supported. If this feature is not enabled, the sampleShadingEnable member of the VkPipelineMultisampleStateCreateInfo structure must be set to VK_FALSE and the minSampleShading member is ignored. This also specifies whether shader modules can declare the SampleRateShading capability.

- dualSrcBlend specifies whether blend operations which take two sources are supported. If this feature is not enabled, the VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, and VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA enum values must not be used as source or destination blending factors. See Dual-Source Blending.

- logicOp specifies whether logic operations are supported. If this feature is not enabled, the logicOpEnable member of the VkPipelineColorBlendStateCreateInfo structure must be set to VK_FALSE, and the logicOp member is ignored.

- multiDrawIndirect specifies whether multiple draw indirect is supported. If this feature is not enabled, the drawCount parameter to the vkCmdDrawIndirect and vkCmdDrawIndexedIndirect commands must be 0 or 1. The maxDrawIndirectCount member of the VkPhysicalDeviceLimits structure must also be 1 if this feature is not supported. See maxDrawIndirectCount.

- drawIndirectFirstInstance specifies whether indirect drawing calls support the firstInstance parameter. If this feature is not enabled, the firstInstance member of all VkDrawIndirectCommand and VkCmdDrawIndexedIndirectCommand structures that are provided to the vkCmdDrawIndirect and vkCmdDrawIndexedIndirect commands must be 0.

- depthClamp specifies whether depth clamping is supported. If this feature is not enabled, the
depthClampEnable member of the VkPipelineRasterizationStateCreateInfo structure must be set to VK_FALSE. Otherwise, setting depthClampEnable to VK_TRUE will enable depth clamping.

• depthBiasClamp specifies whether depth bias clamping is supported. If this feature is not enabled, the depthBiasClamp member of the VkPipelineRasterizationStateCreateInfo structure must be set to 0.0 unless the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state is enabled, and the depthBiasClamp parameter to vkCmdSetDepthBias must be set to 0.0.

• fillModeNonSolid specifies whether point and wireframe fill modes are supported. If this feature is not enabled, the VK_POLYGON_MODE_POINT and VK_POLYGON_MODE_LINE enum values must not be used.

• depthBounds specifies whether depth bounds tests are supported. If this feature is not enabled, the depthBoundsTestEnable member of the VkPipelineDepthStencilStateCreateInfo structure must be set to VK_FALSE. When depthBoundsTestEnable is set to VK_FALSE, the minDepthBounds and maxDepthBounds members of the VkPipelineDepthStencilStateCreateInfo structure are ignored.

• wideLines specifies whether lines with width other than 1.0 are supported. If this feature is not enabled, the lineWidth member of the VkPipelineRasterizationStateCreateInfo structure must be set to 1.0 unless the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state is enabled, and the lineWidth parameter to vkCmdSetLineWidth must be set to 1.0. When this feature is supported, the range and granularity of supported line widths are indicated by the lineWidthRange and lineWidthGranularity members of the VkPhysicalDeviceLimits structure, respectively.

• largePoints specifies whether points with size greater than 1.0 are supported. If this feature is not enabled, only a point size of 1.0 written by a shader is supported. The range and granularity of supported point sizes are indicated by the pointSizeRange and pointSizeGranularity members of the VkPhysicalDeviceLimits structure, respectively.

• alphaToOne specifies whether the implementation is able to replace the alpha value of the fragment shader color output in the Multisample Coverage fragment operation. If this feature is not enabled, then the alphaToOneEnable member of the VkPipelineMultisampleStateCreateInfo structure must be set to VK_FALSE. Otherwise setting alphaToOneEnable to VK_TRUE will enable alpha-to-one behavior.

• multiViewport specifies whether more than one viewport is supported. If this feature is not enabled:
  ◦ The viewportCount and scissorCount members of the VkPipelineViewportStateCreateInfo structure must be set to 1.
  ◦ The firstViewport and viewportCount parameters to the vkCmdSetViewport command must be set to 0 and 1, respectively.
  ◦ The firstScissor and scissorCount parameters to the vkCmdSetScissor command must be set to 0 and 1, respectively.

• samplerAnisotropy specifies whether anisotropic filtering is supported. If this feature is not enabled, the anisotropyEnable member of the VkSamplerCreateInfo structure must be VK_FALSE.

• textureCompressionETC2 specifies whether all of the ETC2 and EAC compressed texture formats are supported. If this feature is enabled, then the VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT, VK_FORMAT_FEATURE_BLIT_SRC_BIT and VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT features must be supported in optimalTilingFeatures for the following formats:
• **VK_FORMAT_EAC_R11_UNORM_BLOCK**
• **VK_FORMAT_EAC_R11_SNORM_BLOCK**
• **VK_FORMAT_EAC_R11G11_UNORM_BLOCK**
• **VK_FORMAT_EAC_R11G11_SNORM_BLOCK**

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.

- **textureCompressionASTC_LDR** specifies whether all of the ASTC LDR compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT`, and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features **must** be supported in `optimalTilingFeatures` for the following formats:

  • **VK_FORMAT_ASTC_4x4_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_4x4_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_5x4_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_5x4_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_5x5_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_5x5_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_6x5_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_6x5_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_6x6_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_6x6_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_8x5_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_8x5_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_8x6_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_8x6_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_8x8_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_8x8_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_10x5_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_10x5_SRGB_BLOCK**
• VK_FORMAT_ASTC_10x6_UNORM_BLOCK
• VK_FORMAT_ASTC_10x6_SRGB_BLOCK
• VK_FORMAT_ASTC_10x8_UNORM_BLOCK
• VK_FORMAT_ASTC_10x8_SRGB_BLOCK
• VK_FORMAT_ASTC_10x10_UNORM_BLOCK
• VK_FORMAT_ASTC_10x10_SRGB_BLOCK
• VK_FORMAT_ASTC_12x10_UNORM_BLOCK
• VK_FORMAT_ASTC_12x10_SRGB_BLOCK
• VK_FORMAT_ASTC_12x12_UNORM_BLOCK
• VK_FORMAT_ASTC_12x12_SRGB_BLOCK

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.

• `textureCompressionBC` specifies whether all of the BC compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features must be supported in `optimalTilingFeatures` for the following formats:

  • VK_FORMAT_BC1_RGB_UNORM_BLOCK
  • VK_FORMAT_BC1_RGB_SRGB_BLOCK
  • VK_FORMAT_BC1_RGBA_UNORM_BLOCK
  • VK_FORMAT_BC1_RGBA_SRGB_BLOCK
  • VK_FORMAT_BC2_UNORM_BLOCK
  • VK_FORMAT_BC2_SRGB_BLOCK
  • VK_FORMAT_BC3_UNORM_BLOCK
  • VK_FORMAT_BC3_SRGB_BLOCK
  • VK_FORMAT_BC4_UNORM_BLOCK
  • VK_FORMAT_BC4_SNORM_BLOCK
  • VK_FORMAT_BC5_UNORM_BLOCK
  • VK_FORMAT_BC5_SNORM_BLOCK
  • VK_FORMAT_BC6H_UFLOAT_BLOCK
  • VK_FORMAT_BC6H_SFLOAT_BLOCK
  • VK_FORMAT_BC7_UNORM_BLOCK
  • VK_FORMAT_BC7_SRGB_BLOCK

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.
• **occlusionQueryPrecise** specifies whether occlusion queries returning actual sample counts are supported. Occlusion queries are created in a `VkQueryPool` by specifying the `queryType` of `VK_QUERY_TYPE_OCCLUSION` in the `VkQueryPoolCreateInfo` structure which is passed to `vkCreateQueryPool`. If this feature is enabled, queries of this type can enable `VK_QUERY_CONTROL_PRECISE_BIT` in the `flags` parameter to `vkCmdBeginQuery`. If this feature is not supported, the implementation supports only boolean occlusion queries. When any samples are passed, boolean queries will return a non-zero result value, otherwise a result value of zero is returned. When this feature is enabled and `VK_QUERY_CONTROL_PRECISE_BIT` is set, occlusion queries will report the actual number of samples passed.

• **pipelineStatisticsQuery** specifies whether the pipeline statistics queries are supported. If this feature is not enabled, queries of type `VK_QUERY_TYPE_PIPELINE_STATISTICS` cannot be created, and none of the `VkQueryPipelineStatisticFlagBits` bits can be set in the `pipelineStatistics` member of the `VkQueryPoolCreateInfo` structure.

• **vertexPipelineStoresAndAtomics** specifies whether storage buffers and images support stores and atomic operations in the vertex, tessellation, and geometry shader stages. If this feature is not enabled, all storage image, storage texel buffer, and storage buffer variables used by these stages in shader modules must be decorated with the `NonWritable` decoration (or the `readonly` memory qualifier in GLSL).

• **fragmentStoresAndAtomics** specifies whether storage buffers and images support stores and atomic operations in the fragment shader stage. If this feature is not enabled, all storage image, storage texel buffer, and storage buffer variables used by the fragment stage in shader modules must be decorated with the `NonWritable` decoration (or the `readonly` memory qualifier in GLSL).

• **shaderTessellationAndGeometryPointSize** specifies whether the `PointSize` built-in decoration is available in the tessellation control, tessellation evaluation, and geometry shader stages. If this feature is not enabled, members decorated with the `PointSize` built-in decoration must not be read from or written to and all points written from a tessellation or geometry shader will have a size of 1.0. This also specifies whether shader modules can declare the `TessellationPointSize` capability for tessellation control and evaluation shaders, or if the shader modules can declare the `GeometryPointSize` capability for geometry shaders. An implementation supporting this feature must also support one or both of the `tessellationShader` or `geometryShader` features.

• **shaderImageGatherExtended** specifies whether the extended set of image gather instructions are available in shader code. If this feature is not enabled, the `OpImage*Gather` instructions do not support the `Offset` and `ConstOffsets` operands. This also specifies whether shader modules can declare the `ImageGatherExtended` capability.

• **shaderStorageImageExtendedFormats** specifies whether all the “storage image extended formats” below are supported; if this feature is supported, then the `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT` must be supported in `optimalTilingFeatures` for the following formats:

  - `VK_FORMAT_R16G16_SFLOAT`
  - `VK_FORMAT_B10G11R11_UFLOAT_PACK32`
  - `VK_FORMAT_R16_SFLOAT`
  - `VK_FORMAT_R16G16B16A16_UNORM`
  - `VK_FORMAT_A2B10G10R10_UNORM_PACK32`
  - `VK_FORMAT_R16G16_UNORM`
• VK_FORMAT_R8G8_UNORM
• VK_FORMAT_R16_UNORM
• VK_FORMAT_R8_UNORM
• VK_FORMAT_R16G16B16A16_SNORM
• VK_FORMAT_R16G16_SNORM
• VK_FORMAT_R8G8_SNORM
• VK_FORMAT_R16_SNORM
• VK_FORMAT_R8_SNORM
• VK_FORMAT_R16G16_SINT
• VK_FORMAT_R8G8_SINT
• VK_FORMAT_R16_SINT
• VK_FORMAT_R8_SINT
• VK_FORMAT_A2B10G10R10_UINT_PACK32
• VK_FORMAT_R16G16_UINT
• VK_FORMAT_R8G8_UINT
• VK_FORMAT_R16_UINT
• VK_FORMAT_R8_UINT

Note
shaderStorageImageExtendedFormats feature only adds a guarantee of format support, which is specified for the whole physical device. Therefore enabling or disabling the feature via vkCreateDevice has no practical effect.

To query for additional properties, or if the feature is not supported, vkGetPhysicalDeviceFormatProperties and vkGetPhysicalDeviceImageFormatProperties can be used to check for supported properties of individual formats, as usual rules allow.

VK_FORMAT_R32G32_UINT, VK_FORMAT_R32G32_SINT, and VK_FORMAT_R32G32_SFLOAT from StorageImageExtendedFormats SPIR-V capability, are already covered by core Vulkan mandatory format support.

• shaderStorageImageMultisample specifies whether multisampled storage images are supported. If this feature is not enabled, images that are created with a usage that includes VK_IMAGE_USAGE_STORAGE_BIT must be created with samples equal to VK_SAMPLE_COUNT_1_BIT. This also specifies whether shader modules can declare the StorageImageMultisample and ImageMSArray capabilities.

• shaderStorageImageReadWithoutFormat specifies whether storage images and storage texel buffers require a format qualifier to be specified when reading.

• shaderStorageImageWriteWithoutFormat specifies whether storage images and storage texel buffers require a format qualifier to be specified when writing.
• shaderUniformBufferArrayDynamicIndexing specifies whether arrays of uniform buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the UniformBufferArrayDynamicIndexing capability.

• shaderSampledImageArrayDynamicIndexing specifies whether arrays of samplers or sampled images can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, or VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the SampledImageArrayDynamicIndexing capability.

• shaderStorageBufferArrayDynamicIndexing specifies whether arrays of storage buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the StorageBufferArrayDynamicIndexing capability.

• shaderStorageImageArrayDynamicIndexing specifies whether arrays of storage images can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the StorageImageArrayDynamicIndexing capability.

• shaderClipDistance specifies whether clip distances are supported in shader code. If this feature is not enabled, any members decorated with the ClipDistance built-in decoration must not be read from or written to in shader modules. This also specifies whether shader modules can declare the ClipDistance capability.

• shaderCullDistance specifies whether cull distances are supported in shader code. If this feature is not enabled, any members decorated with the CullDistance built-in decoration must not be read from or written to in shader modules. This also specifies whether shader modules can declare the CullDistance capability.

• shaderFloat64 specifies whether 64-bit floats (doubles) are supported in shader code. If this feature is not enabled, 64-bit floating-point types must not be used in shader code. This also specifies whether shader modules can declare the Float64 capability. Declaring and using 64-bit floats is enabled for all storage classes that SPIR-V allows with the Float64 capability.

• shaderInt64 specifies whether 64-bit integers (signed and unsigned) are supported in shader code. If this feature is not enabled, 64-bit integer types must not be used in shader code. This also specifies whether shader modules can declare the Int64 capability. Declaring and using 64-bit integers is enabled for all storage classes that SPIR-V allows with the Int64 capability.

• shaderInt16 specifies whether 16-bit integers (signed and unsigned) are supported in shader code. If this feature is not enabled, 16-bit integer types must not be used in shader code. This also specifies whether shader modules can declare the Int16 capability. However, this only enables a subset of the storage classes that SPIR-V allows for the Int16 SPIR-V capability: Declaring and using 16-bit integers in the Private, Workgroup, and Function storage classes is
enabled, while declaring them in the interface storage classes (e.g., UniformConstant, Uniform, StorageBuffer, Input, Output, and PushConstant) is not enabled.

- **shaderResourceResidency** specifies whether image operations that return resource residency information are supported in shader code. If this feature is not enabled, the OpImageSparse* instructions must not be used in shader code. This also specifies whether shader modules can declare the SparseResidency capability. The feature requires at least one of the sparseResidency* features to be supported. This must be VK_FALSE in Vulkan SC [SCID-8].

- **shaderResourceMinLod** specifies whether image operations specifying the minimum resource LOD are supported in shader code. If this feature is not enabled, the MinLod image operand must not be used in shader code. This also specifies whether shader modules can declare the MinLod capability.

- **sparseBinding** specifies whether resource memory can be managed at opaque sparse block level instead of at the object level. If this feature is not enabled, resource memory must be bound only on a per-object basis using the vkBindBufferMemory and vkBindImageMemory commands. In this case, buffers and images must not be created with VK_BUFFER_CREATE_SPARSE_BINDING_BIT and VK_IMAGE_CREATE_SPARSE_BINDING_BIT set in the flags member of the VkBufferCreateInfo and VkImageCreateInfo structures, respectively. Otherwise resource memory can be managed as described in Sparse Resource Features. This must be VK_FALSE in Vulkan SC [SCID-8].

- **sparseResidencyBuffer** specifies whether the device can access partially resident buffers. If this feature is not enabled, buffers must not be created with VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT set in the flags member of the VkBufferCreateInfo structure. This must be VK_FALSE in Vulkan SC [SCID-8].

- **sparseResidencyImage2D** specifies whether the device can access partially resident 2D images with 1 sample per pixel. If this feature is not enabled, images with an imageType of VK_IMAGE_TYPE_2D and samples set to VK_SAMPLE_COUNT_1_BIT must not be created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT set in the flags member of the VkImageCreateInfo structure. This must be VK_FALSE in Vulkan SC [SCID-8].

- **sparseResidencyImage3D** specifies whether the device can access partially resident 3D images. If this feature is not enabled, images with an imageType of VK_IMAGE_TYPE_3D must not be created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT set in the flags member of the VkImageCreateInfo structure. This must be VK_FALSE in Vulkan SC [SCID-8].

- **sparseResidency2Samples** specifies whether the physical device can access partially resident 2D images with 2 samples per pixel. If this feature is not enabled, images with an imageType of VK_IMAGE_TYPE_2D and samples set to VK_SAMPLE_COUNT_2_BIT must not be created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT set in the flags member of the VkImageCreateInfo structure. This must be VK_FALSE in Vulkan SC [SCID-8].

- **sparseResidency4Samples** specifies whether the physical device can access partially resident 2D images with 4 samples per pixel. If this feature is not enabled, images with an imageType of VK_IMAGE_TYPE_2D and samples set to VK_SAMPLE_COUNT_4_BIT must not be created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT set in the flags member of the VkImageCreateInfo structure. This must be VK_FALSE in Vulkan SC [SCID-8].

- **sparseResidency8Samples** specifies whether the physical device can access partially resident 2D images with 8 samples per pixel. If this feature is not enabled, images with an imageType of VK_IMAGE_TYPE_2D and samples set to VK_SAMPLE_COUNT_8_BIT must not be created with
VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT set in the flags member of the VkImageCreateInfo structure. This must be VK_FALSE in Vulkan SC [SCID-8].

- sparseResidency16Samples specifies whether the physical device can access partially resident 2D images with 16 samples per pixel. If this feature is not enabled, images with an imageType of VK_IMAGE_TYPE_2D and samples set to VK_SAMPLE_COUNT_16_BIT must not be created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT set in the flags member of the VkImageCreateInfo structure. This must be VK_FALSE in Vulkan SC [SCID-8].

- sparseResidencyAliased specifies whether the physical device can correctly access data aliased into multiple locations. If this feature is not enabled, the VK_BUFFER_CREATE_SPARSE_ALIASED_BIT and VK_IMAGE_CREATE_SPARSE_ALIASED_BIT enum values must not be used in flags members of the VkBufferCreateInfo and VkImageCreateInfo structures, respectively. This must be VK_FALSE in Vulkan SC [SCID-8].

- variableMultisampleRate specifies whether all pipelines that will be bound to a command buffer during a subpass which uses no attachments must have the same value for VkPipelineMultisampleStateCreateInfo::rasterizationSamples. If set to VK_TRUE, the implementation supports variable multisample rates in a subpass which uses no attachments. If set to VK_FALSE, then all pipelines bound in such a subpass must have the same multisample rate. This has no effect in situations where a subpass uses any attachments.

- inheritedQueries specifies whether a secondary command buffer may be executed while a query is active.

The VkPhysicalDeviceVulkan11Features structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan11Features {
    VkStructureType       sType;
    void*                 pNext;
    VkBool32              storageBuffer16BitAccess;
    VkBool32              uniformAndStorageBuffer16BitAccess;
    VkBool32              storagePushConstant16;
    VkBool32              storageInputOutput16;
    VkBool32              multiview;
    VkBool32              multiviewGeometryShader;
    VkBool32              multiviewTessellationShader;
    VkBool32              variablePointersStorageBuffer;
    VkBool32              variablePointers;
    VkBool32              protectedMemory;
    VkBool32              samplerYcbcrConversion;
    VkBool32              shaderDrawParameters;
} VkPhysicalDeviceVulkan11Features;
```

This structure describes the following features:

- sType is a VkStructureType value identifying this structure.

- pNext is NULL or a pointer to a structure extending this structure.

- storageBuffer16BitAccess specifies whether objects in the StorageBuffer, or
PhysicalStorageBuffer storage class with the Block decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the StorageBuffer16BitAccess capability.

• uniformAndStorageBuffer16BitAccess specifies whether objects in the Uniform storage class with the Block decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the UniformAndStorageBuffer16BitAccess capability.

• storagePushConstant16 specifies whether objects in the PushConstant storage class can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or floating-point members must not be used in such objects. This also specifies whether shader modules can declare the StoragePushConstant16 capability.

• storageInputOutput16 specifies whether objects in the Input and Output storage classes can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the StorageInputOutput16 capability.

• multiview specifies whether the implementation supports multiview rendering within a render pass. If this feature is not enabled, the view mask of each subpass must always be zero.

• multiviewGeometryShader specifies whether the implementation supports multiview rendering within a render pass, with geometry shaders. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask must not include a geometry shader.

• multiviewTessellationShader specifies whether the implementation supports multiview rendering within a render pass, with tessellation shaders. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask must not include any tessellation shaders.

• variablePointersStorageBuffer specifies whether the implementation supports the SPIR-V VariablePointersStorageBuffer capability. When this feature is not enabled, shader modules must not declare the SPV_KHR_variable_pointers extension or the VariablePointersStorageBuffer capability.

• variablePointers specifies whether the implementation supports the SPIR-V VariablePointers capability. When this feature is not enabled, shader modules must not declare the VariablePointers capability.

• protectedMemory specifies whether protected memory is supported.

• samplerYcbcrConversion specifies whether the implementation supports sampler YC_{b}C_{r} conversion. If samplerYcbcrConversion is VK_FALSE, sampler YC_{b}C_{r} conversion is not supported, and samplers using sampler YC_{b}C_{r} conversion must not be used.

• shaderDrawParameters specifies whether the implementation supports the SPIR-V DrawParameters capability. When this feature is not enabled, shader modules must not declare the SPV_KHR_shader_draw_parameters extension or the DrawParameters capability.

If the VkPhysicalDeviceVulkan11Features structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceVulkan11Features can
also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceVulkan11Features-sType-sType**
  
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_1_FEATURES`

The `VkPhysicalDeviceVulkan12Features` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan12Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 samplerMirrorClampToEdge;
    VkBool32 drawIndirectCount;
    VkBool32 storageBuffer8BitAccess;
    VkBool32 uniformAndStorageBuffer8BitAccess;
    VkBool32 storagePushConstant8;
    VkBool32 shaderBufferInt64Atomics;
    VkBool32 samplerMirrorClampToEdge;
    VkBool32 drawIndirectCount;
    VkBool32 storageBuffer8BitAccess;
    VkBool32 uniformAndStorageBuffer8BitAccess;
    VkBool32 storagePushConstant8;
    VkBool32 shaderBufferInt64Atomics;
    VkBool32 shaderSharedInt64Atomics;
    VkBool32 shaderFloat16;
    VkBool32 shaderInt8;
    VkBool32 descriptorIndexing;
    VkBool32 shaderInputAttachmentArrayDynamicIndexing;
    VkBool32 shaderUniformTexelBufferArrayDynamicIndexing;
    VkBool32 shaderStorageTexelBufferArrayDynamicIndexing;
    VkBool32 shaderUniformBufferArrayNonUniformIndexing;
    VkBool32 shaderSampledImageArrayNonUniformIndexing;
    VkBool32 shaderStorageBufferArrayNonUniformIndexing;
    VkBool32 descriptorBindingUniformBufferUpdateAfterBind;
    VkBool32 descriptorBindingSampledImageUpdateAfterBind;
    VkBool32 descriptorBindingStorageImageUpdateAfterBind;
    VkBool32 descriptorBindingStorageBufferUpdateAfterBind;
    VkBool32 descriptorBindingUniformTexelBufferUpdateAfterBind;
    VkBool32 descriptorBindingStorageTexelBufferUpdateAfterBind;
    VkBool32 descriptorBindingUpdateUnusedWhilePending;
    VkBool32 descriptorBindingPartiallyBound;
    VkBool32 descriptorBindingVariableDescriptorCount;
    VkBool32 runtimeDescriptorArray;
    VkBool32 samplerFilterMinmax;
    VkBool32 scalarBlockLayout;
    VkBool32 imagelessFramebuffer;
    VkBool32 uniformBufferStandardLayout;
    VkBool32 shaderSubgroupExtendedTypes;
    VkBool32 separateDepthStencilLayouts;
} VkPhysicalDeviceVulkan12Features;
```
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.

- **samplerMirrorClampToEdge** indicates whether the implementation supports the `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` sampler address mode. If this feature is not enabled, the `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` sampler address mode must not be used.

- **drawIndirectCount** indicates whether the implementation supports the `vkCmdDrawIndirectCount` and `vkCmdDrawIndexedIndirectCount` functions. If this feature is not enabled, these functions must not be used.

- **storageBuffer8BitAccess** indicates whether objects in the `StorageBuffer`, or `PhysicalStorageBuffer` storage class with the `Block` decoration can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the `StorageBuffer8BitAccess` capability.

- **uniformAndStorageBuffer8BitAccess** indicates whether objects in the `Uniform` storage class with the `Block` decoration can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the `UniformAndStorageBuffer8BitAccess` capability.

- **storagePushConstant8** indicates whether objects in the `PushConstant` storage class can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the `StoragePushConstant8` capability.

- **shaderBufferInt64Atomics** indicates whether shaders can perform 64-bit unsigned and signed integer atomic operations on buffers.

- **shaderSharedInt64Atomics** indicates whether shaders can perform 64-bit unsigned and signed integer atomic operations on shared memory.

- **shaderFloat16** indicates whether 16-bit floats (halfs) are supported in shader code. This also indicates whether shader modules can declare the `Float16` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Float16` SPIR-V capability: Declaring and using 16-bit floats in the `Private`, `Workgroup`, and `Function` storage classes is
enabled, while declaring them in the interface storage classes (e.g., UniformConstant, Uniform, StorageBuffer, Input, Output, and PushConstant) is not enabled.

- **shaderInt8** indicates whether 8-bit integers (signed and unsigned) are supported in shader code. This also indicates whether shader modules can declare the Int8 capability. However, this only enables a subset of the storage classes that SPIR-V allows for the Int8 SPIR-V capability: Declaring and using 8-bit integers in the Private, Workgroup, and Function storage classes is enabled, while declaring them in the interface storage classes (e.g., UniformConstant, Uniform, StorageBuffer, Input, Output, and PushConstant) is not enabled.

- **descriptorIndexing** indicates whether the implementation supports the minimum set of descriptor indexing features as described in the Feature Requirements section. Enabling the descriptorIndexing member when vkCreateDevice is called does not imply the other minimum descriptor indexing features are also enabled. Those other descriptor indexing features must be enabled individually as needed by the application.

- **shaderInputAttachmentArrayDynamicIndexing** indicates whether arrays of input attachments can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the InputAttachmentArrayDynamicIndexing capability.

- **shaderUniformTexelBufferArrayDynamicIndexing** indicates whether arrays of uniform texel buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the UniformTexelBufferArrayDynamicIndexing capability.

- **shaderStorageTexelBufferArrayDynamicIndexing** indicates whether arrays of storage texel buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the StorageTexelBufferArrayDynamicIndexing capability.

- **shaderUniformBufferArrayNonUniformIndexing** indicates whether arrays of uniform buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the UniformBufferArrayNonUniformIndexing capability.

- **shaderSampledImageArrayNonUniformIndexing** indicates whether arrays of samplers or sampled images can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, or VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the SampledImageArrayNonUniformIndexing capability.

- **shaderStorageBufferArrayNonUniformIndexing** indicates whether arrays of storage buffers can be
indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageBufferArrayNonUniformIndexing` capability.

- `shaderStorageImageArrayNonUniformIndexing` indicates whether arrays of storage images can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageImageArrayNonUniformIndexing` capability.

- `shaderInputAttachmentArrayNonUniformIndexing` indicates whether arrays of input attachments can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `InputAttachmentArrayNonUniformIndexing` capability.

- `shaderUniformTexelBufferArrayNonUniformIndexing` indicates whether arrays of uniform texel buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `UniformTexelBufferArrayNonUniformIndexing` capability.

- `shaderStorageTexelBufferArrayNonUniformIndexing` indicates whether arrays of storage texel buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageTexelBufferArrayNonUniformIndexing` capability.

- `descriptorBindingUniformBufferUpdateAfterBind` indicates whether the implementation supports updating uniform buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`.

- `descriptorBindingSampledImageUpdateAfterBind` indicates whether the implementation supports updating sampled image descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`.

- `descriptorBindingStorageImageUpdateAfterBind` indicates whether the implementation supports updating storage image descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`.

- `descriptorBindingStorageBufferUpdateAfterBind` indicates whether the implementation supports updating storage buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with
VK_DESCRIPTOR_TYPE_STORAGE_BUFFER.

- descriptorBindingUniformTexelBufferUpdateAfterBind indicates whether the implementation supports updating uniform texel buffer descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER.

- descriptorBindingStorageTexelBufferUpdateAfterBind indicates whether the implementation supports updating storage texel buffer descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER.

- descriptorBindingUpdateUnusedWhilePending indicates whether the implementation supports updating descriptors while the set is in use. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT must not be used.

- descriptorBindingPartiallyBound indicates whether the implementation supports statically using a descriptor set binding in which some descriptors are not valid. If this feature is not enabled, VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT must not be used.

- descriptorBindingVariableDescriptorCount indicates whether the implementation supports descriptor sets with a variable-sized last binding. If this feature is not enabled, VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT must not be used.

- runtimeDescriptorArray indicates whether the implementation supports the SPIR-V RuntimeDescriptorArray capability. If this feature is not enabled, descriptors must not be declared in runtime arrays.

- samplerFilterMinmax indicates whether the implementation supports a minimum set of required formats supporting min/max filtering as defined by the filterMinmaxSingleComponentFormats property minimum requirements. If this feature is not enabled, then VkSamplerReductionModeCreateInfo must only use VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE.

- scalarBlockLayout indicates that the implementation supports the layout of resource blocks in shaders using scalar alignment.

- imagelessFramebuffer indicates that the implementation supports specifying the image view for attachments at render pass begin time via VkRenderPassAttachmentBeginInfo.

- uniformBufferStandardLayout indicates that the implementation supports the same layouts for uniform buffers as for storage and other kinds of buffers. See Standard Buffer Layout.

- shaderSubgroupExtendedTypes is a boolean specifying whether subgroup operations can use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types in group operations with subgroup scope, if the implementation supports the types.

- separateDepthStencilLayouts indicates whether the implementation supports a VkImageMemoryBarrier for a depth/stencil image with only one of VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT set, and whether VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL can be used.

- hostQueryReset indicates that the implementation supports resetting queries from the host with vkResetQueryPool.
• `timelineSemaphore` indicates whether semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` are supported.

• `bufferDeviceAddress` indicates that the implementation supports accessing buffer memory in shaders as storage buffers via an address queried from `vkGetBufferDeviceAddress`.

• `bufferDeviceAddressCaptureReplay` indicates that the implementation supports saving and reusing buffer and device addresses, e.g. for trace capture and replay.

• `bufferDeviceAddressMultiDevice` indicates that the implementation supports the `bufferDeviceAddress` feature for logical devices created with multiple physical devices. If this feature is not supported, buffer addresses must not be queried on a logical device created with more than one physical device.

• `vulkanMemoryModel` indicates whether shader modules can declare the `VulkanMemoryModel` capability.

• `vulkanMemoryModelDeviceScope` indicates whether the Vulkan Memory Model can use `Device` scope synchronization. This also indicates whether shader modules can declare the `VulkanMemoryModelDeviceScope` capability.

• `vulkanMemoryModelAvailabilityVisibilityChains` indicates whether the Vulkan Memory Model can use availability and visibility chains with more than one element.

• `shaderOutputViewportIndex` indicates whether the implementation supports the `ShaderViewportIndex` SPIR-V capability enabling variables decorated with the `ViewportIndex` built-in to be exported from vertex or tessellation evaluation shaders. If this feature is not enabled, the `ViewportIndex` built-in decoration must not be used on outputs in vertex or tessellation evaluation shaders.

• `shaderOutputLayer` indicates whether the implementation supports the `ShaderLayer` SPIR-V capability enabling variables decorated with the `Layer` built-in to be exported from vertex or tessellation evaluation shaders. If this feature is not enabled, the `Layer` built-in decoration must not be used on outputs in vertex or tessellation evaluation shaders.

• If `subgroupBroadcastDynamicId` is `VK_TRUE`, the “Id” operand of `OpGroupNonUniformBroadcast` can be dynamically uniform within a subgroup, and the “Index” operand of `OpGroupNonUniformQuadBroadcast` can be dynamically uniform within the derivative group. If it is `VK_FALSE`, these operands must be constants.

If the `VkPhysicalDeviceVulkan12Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVulkan12Features` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkan12Features-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_2_FEATURES`

The `VkPhysicalDeviceVariablePointersFeatures` structure is defined as:
typedef struct VkPhysicalDeviceVariablePointersFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 variablePointersStorageBuffer;
    VkBool32 variablePointers;
} VkPhysicalDeviceVariablePointersFeatures;

This structure describes the following features:

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.

• variablePointersStorageBuffer specifies whether the implementation supports the SPIR-V VariablePointersStorageBuffer capability. When this feature is not enabled, shader modules must not declare the SPV_KHR_variable_pointers extension or the VariablePointersStorageBuffer capability.

• variablePointers specifies whether the implementation supports the SPIR-V VariablePointers capability. When this feature is not enabled, shader modules must not declare the VariablePointers capability.

If the VkPhysicalDeviceVariablePointersFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceVariablePointersFeatures can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage

• VUID-VkPhysicalDeviceVariablePointersFeatures-variablePointers-01431
  If variablePointers is enabled then variablePointersStorageBuffer must also be enabled

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceVariablePointersFeatures-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VARIABLE_POINTERS_FEATURES

The VkPhysicalDeviceMultiviewFeatures structure is defined as:

// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMultiviewFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 multiview;
    VkBool32 multiviewGeometryShader;
} VkPhysicalDeviceMultiviewFeatures;
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **multiview** specifies whether the implementation supports multiview rendering within a render pass. If this feature is not enabled, the view mask of each subpass **must** always be zero.
- **multiviewGeometryShader** specifies whether the implementation supports multiview rendering within a render pass, with **geometry shaders**. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask **must** not include a geometry shader.
- **multiviewTessellationShader** specifies whether the implementation supports multiview rendering within a render pass, with **tessellation shaders**. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask **must** not include any tessellation shaders.

If the `VkPhysicalDeviceMultiviewFeatures` structure is included in the **pNext** chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMultiviewFeatures` can also be used in the **pNext** chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage

- **VUID-VkPhysicalDeviceMultiviewFeatures-multiviewGeometryShader-00580**  
  If **multiviewGeometryShader** is enabled then **multiview** **must** also be enabled

- **VUID-VkPhysicalDeviceMultiviewFeatures-multiviewTessellationShader-00581**  
  If **multiviewTessellationShader** is enabled then **multiview** **must** also be enabled

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceMultiviewFeatures-sType-sType**  
  **sType must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_FEATURES`

The `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_shader_atomic_float
typedef struct VkPhysicalDeviceShaderAtomicFloatFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderBufferFloat32Atomics;
    VkBool32 shaderBufferFloat32AtomicAdd;
    VkBool32 shaderBufferFloat64Atomics;
    VkBool32 shaderBufferFloat64AtomicAdd;
} VkPhysicalDeviceShaderAtomicFloatFeaturesEXT;
```
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderBufferFloat32Atomics** indicates whether shaders can perform 32-bit floating-point load, store and exchange atomic operations on storage buffers.
- **shaderBufferFloat32AtomicAdd** indicates whether shaders can perform 32-bit floating-point add atomic operations on storage buffers.
- **shaderBufferFloat64Atomics** indicates whether shaders can perform 64-bit floating-point load, store and exchange atomic operations on storage buffers.
- **shaderBufferFloat64AtomicAdd** indicates whether shaders can perform 64-bit floating-point add atomic operations on storage buffers.
- **shaderSharedFloat32Atomics** indicates whether shaders can perform 32-bit floating-point load, store and exchange atomic operations on shared memory.
- **shaderSharedFloat32AtomicAdd** indicates whether shaders can perform 32-bit floating-point add atomic operations on shared memory.
- **shaderSharedFloat64Atomics** indicates whether shaders can perform 64-bit floating-point load, store and exchange atomic operations on shared memory.
- **shaderSharedFloat64AtomicAdd** indicates whether shaders can perform 64-bit floating-point add atomic operations on shared memory.
- **shaderImageFloat32Atomics** indicates whether shaders can perform 32-bit floating-point load, store and exchange atomic image operations.
- **shaderImageFloat32AtomicAdd** indicates whether shaders can perform 32-bit floating-point add atomic image operations.
- **sparseImageFloat32Atomics** indicates whether 32-bit floating-point load, store and exchange atomic operations can be used on sparse images.
- **sparseImageFloat32AtomicAdd** indicates whether 32-bit floating-point add atomic operations can be used on sparse images.

If the `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT` can also be used in the `pNext` chain of
VkDeviceCreateInfo to selectively enable these features.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceShaderAtomicFloatFeaturesEXT-sType-sType**
  
  *sType* must be *VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_FLOAT_FEATURES_EXT*

The *VkPhysicalDeviceShaderAtomicInt64Features* structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceShaderAtomicInt64Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderBufferInt64Atomics;
    VkBool32 shaderSharedInt64Atomics;
} VkPhysicalDeviceShaderAtomicInt64Features;
```

This structure describes the following features:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderBufferInt64Atomics** indicates whether shaders can perform 64-bit unsigned and signed integer atomic operations on buffers.
- **shaderSharedInt64Atomics** indicates whether shaders can perform 64-bit unsigned and signed integer atomic operations on shared memory.

If the *VkPhysicalDeviceShaderAtomicInt64Features* structure is included in the *pNext* chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceShaderAtomicInt64Features* can also be used in the *pNext* chain of *VkDeviceCreateInfo* to selectively enable these features.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceShaderAtomicInt64Features-sType-sType**
  
  *sType* must be *VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_INT64_FEATURES_*

The *VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT* structure is defined as:

```c
// Provided by VK_EXT_shader_image_atomic_int64
typedef struct VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderImageInt64Atomics;
} VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT;
```
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderImageInt64Atomics** indicates whether shaders can support 64-bit unsigned and signed integer atomic operations on images.
- **sparseImageInt64Atomics** indicates whether 64-bit integer atomics can be used on sparse images.

If the `VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_IMAGE_ATOMIC_INT64_FEATURES_EXT`.

The `VkPhysicalDevice8BitStorageFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDevice8BitStorageFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 storageBuffer8BitAccess;
    VkBool32 uniformAndStorageBuffer8BitAccess;
    VkBool32 storagePushConstant8;
} VkPhysicalDevice8BitStorageFeatures;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.

- **storageBuffer8BitAccess** indicates whether objects in the `StorageBuffer`, or `PhysicalStorageBuffer` storage class with the `Block` decoration can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the `StorageBuffer8BitAccess` capability.

- **uniformAndStorageBuffer8BitAccess** indicates whether objects in the `Uniform` storage class with the `Block` decoration can have 8-bit integer members. If this feature is not enabled, 8-bit integer
members must not be used in such objects. This also indicates whether shader modules can declare the UniformAndStorageBuffer8BitAccess capability.

- **storagePushConstant8** indicates whether objects in the PushConstant storage class can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the StoragePushConstant8 capability.

If the VkPhysicalDevice8BitStorageFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDevice8BitStorageFeatures can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDevice8BitStorageFeatures-sType-sType**
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_8BIT_STORAGE_FEATURES

The VkPhysicalDevice16BitStorageFeatures structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDevice16BitStorageFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 storageBuffer16BitAccess;
    VkBool32 uniformAndStorageBuffer16BitAccess;
    VkBool32 storagePushConstant16;
    VkBool32 storageInputOutput16;
} VkPhysicalDevice16BitStorageFeatures;
```

This structure describes the following features:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.

- **storageBuffer16BitAccess** specifies whether objects in the StorageBuffer, or PhysicalStorageBuffer storage class with the Block decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the StorageBuffer16BitAccess capability.

- **uniformAndStorageBuffer16BitAccess** specifies whether objects in the Uniform storage class with the Block decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the UniformAndStorageBuffer16BitAccess capability.

- **storagePushConstant16** specifies whether objects in the PushConstant storage class can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or
floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `StoragePushConstant16` capability.

- `storageInputOutput16` specifies whether objects in the `Input` and `Output` storage classes **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `StorageInputOutput16` capability.

If the `VkPhysicalDevice16BitStorageFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevice16BitStorageFeatures can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDevice16BitStorageFeatures-sType-sType**
  
  sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_16BIT_STORAGE_FEATURES`

The `VkPhysicalDeviceShaderFloat16Int8Features` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceShaderFloat16Int8Features {
    VkStructureType      sType;
    void*               pNext;
    VkBool32             shaderFloat16;
    VkBool32             shaderInt8;
} VkPhysicalDeviceShaderFloat16Int8Features;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **shaderFloat16** indicates whether 16-bit floats (halfs) are supported in shader code. This also indicates whether shader modules **can** declare the `Float16` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Float16` SPIR-V capability: Declaring and using 16-bit floats in the `Private`, `Workgroup`, and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.
- **shaderInt8** indicates whether 8-bit integers (signed and unsigned) are supported in shader code. This also indicates whether shader modules **can** declare the `Int8` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Int8` SPIR-V capability: Declaring and using 8-bit integers in the `Private`, `Workgroup`, and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.

If the `VkPhysicalDeviceShaderFloat16Int8Features` structure is included in the `pNext` chain of the
**VkPhysicalDeviceFeatures2** structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceShaderFloat16Int8Features** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceShaderFloat16Int8Features-sType-sType**  
  *sType must be* **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_FLOAT16_INT8_FEATURES**

The **VkPhysicalDeviceShaderClockFeaturesKHR** structure is defined as:

```c
// Provided by VK_KHR_shader_clock
typedef struct VkPhysicalDeviceShaderClockFeaturesKHR {
  VkStructureType sType;
  void* pNext;
  VkBool32 shaderSubgroupClock;
  VkBool32 shaderDeviceClock;
} VkPhysicalDeviceShaderClockFeaturesKHR;
```

This structure describes the following features:

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderSubgroupClock** indicates whether shaders can perform **Subgroup** scoped clock reads.
- **shaderDeviceClock** indicates whether shaders can perform **Device** scoped clock reads.

If the **VkPhysicalDeviceShaderClockFeaturesKHR** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceShaderClockFeaturesKHR** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceShaderClockFeaturesKHR-sType-sType**  
  *sType must be* **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CLOCK_FEATURES_KHR**

The **VkPhysicalDeviceSamplerYcbcrConversionFeatures** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceSamplerYcbcrConversionFeatures {
  VkStructureType sType;
  void* pNext;
  VkBool32 samplerYcbcrConversion;
} VkPhysicalDeviceSamplerYcbcrConversionFeatures;
```
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **samplerYcbcrConversion** specifies whether the implementation supports sampler Y’CbCr conversion. If `samplerYcbcrConversion` is `VK_FALSE`, sampler Y’CbCr conversion is not supported, and samplers using sampler Y’CbCr conversion must not be used.

If the `VkPhysicalDeviceSamplerYcbcrConversionFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceSamplerYcbcrConversionFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSamplerYcbcrConversionFeatures-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLER_YCBCR_CONVERSION_FEATURES`

The `VkPhysicalDeviceProtectedMemoryFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProtectedMemoryFeatures {
    VkStructureType sType;
    void*         pNext;
    VkBool32      protectedMemory;
} VkPhysicalDeviceProtectedMemoryFeatures;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **protectedMemory** specifies whether protected memory is supported.

If the `VkPhysicalDeviceProtectedMemoryFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceProtectedMemoryFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceProtectedMemoryFeatures-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROTECTED_MEMORY_FEATURES**

The **VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT** structure is defined as:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 advancedBlendCoherentOperations;
} VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **advancedBlendCoherentOperations** specifies whether blending using advanced blend operations is guaranteed to execute atomically and in primitive order. If this is **VK_TRUE**, **VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT** is treated the same as **VK_ACCESS_COLOR_ATTACHMENT_READ_BIT**, and advanced blending needs no additional synchronization over basic blending. If this is **VK_FALSE**, then memory dependencies are required to guarantee order between two advanced blending operations that occur on the same sample.

If the **VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BLEND_OPERATION_ADVANCED_FEATURES_EXT**

The **VkPhysicalDeviceShaderDrawParametersFeatures** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceShaderDrawParametersFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderDrawParameters;
} VkPhysicalDeviceShaderDrawParametersFeatures;
```
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.

  - `shaderDrawParameters` specifies whether the implementation supports the SPIR-V `DrawParameters` capability. When this feature is not enabled, shader modules must not declare the `SPV_KHR_shader_draw_parameters` extension or the `DrawParameters` capability.

If the `VkPhysicalDeviceShaderDrawParametersFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderDrawParametersFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceShaderDrawParametersFeatures-sType-sType**
  - `sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_DRAW_PARAMETERS_FEATURES`

The `VkPhysicalDeviceDescriptorIndexingFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDescriptorIndexingFeatures {
    VkStructureType   sType;
    void*             pNext;
    VkBool32          shaderInputAttachmentArrayDynamicIndexing;
    VkBool32          shaderUniformTexelBufferArrayDynamicIndexing;
    VkBool32          shaderStorageTexelBufferArrayDynamicIndexing;
    VkBool32          shaderUniformBufferArrayNonUniformIndexing;
    VkBool32          shaderSampledImageArrayNonUniformIndexing;
    VkBool32          shaderStorageBufferArrayNonUniformIndexing;
    VkBool32          shaderStorageImageArrayNonUniformIndexing;
    VkBool32          shaderInputAttachmentArrayNonUniformIndexing;
    VkBool32          shaderUniformTexelBufferArrayNonUniformIndexing;
    VkBool32          descriptorBindingUniformBufferUpdateAfterBind;
    VkBool32          descriptorBindingSampledImageUpdateAfterBind;
    VkBool32          descriptorBindingStorageImageUpdateAfterBind;
    VkBool32          descriptorBindingStorageBufferUpdateAfterBind;
    VkBool32          descriptorBindingUniformTexelBufferUpdateAfterBind;
    VkBool32          descriptorBindingStorageTexelBufferUpdateAfterBind;
    VkBool32          descriptorBindingUpdateUnusedWhilePending;
    VkBool32          descriptorBindingPartiallyBound;
    VkBool32          descriptorBindingVariableDescriptorCount;
    VkBool32          runtimeDescriptorArray;
} VkPhysicalDeviceDescriptorIndexingFeatures;
```
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.

- **shaderInputAttachmentArrayDynamicIndexing** indicates whether arrays of input attachments can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `InputAttachmentArrayDynamicIndexing` capability.

- **shaderUniformTexelBufferArrayDynamicIndexing** indicates whether arrays of uniform texel buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `UniformTexelBufferArrayDynamicIndexing` capability.

- **shaderStorageTexelBufferArrayDynamicIndexing** indicates whether arrays of storage texel buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageTexelBufferArrayDynamicIndexing` capability.

- **shaderUniformBufferArrayNonUniformIndexing** indicates whether arrays of uniform buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `UniformBufferArrayNonUniformIndexing` capability.

- **shaderSampledImageArrayNonUniformIndexing** indicates whether arrays of samplers or sampled images can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `SampledImageArrayNonUniformIndexing` capability.

- **shaderStorageBufferArrayNonUniformIndexing** indicates whether arrays of storage buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageBufferArrayNonUniformIndexing` capability.

- **shaderStorageImageArrayNonUniformIndexing** indicates whether arrays of storage images can be
indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of \texttt{VK_DESCRIPTOR_TYPE_STORAGE_IMAGE} must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the \texttt{StorageImageArrayNonUniformIndexing} capability.

- \texttt{shaderInputAttachmentArrayNonUniformIndexing} indicates whether arrays of input attachments can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of \texttt{VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT} must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the \texttt{InputAttachmentArrayNonUniformIndexing} capability.

- \texttt{shaderUniformTexelBufferArrayNonUniformIndexing} indicates whether arrays of uniform texel buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER} must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the \texttt{UniformTexelBufferArrayNonUniformIndexing} capability.

- \texttt{shaderStorageTexelBufferArrayNonUniformIndexing} indicates whether arrays of storage texel buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of \texttt{VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER} must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the \texttt{StorageTexelBufferArrayNonUniformIndexing} capability.

- \texttt{descriptorBindingUniformBufferUpdateAfterBind} indicates whether the implementation supports updating uniform buffer descriptors after a set is bound. If this feature is not enabled, \texttt{VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT} must not be used with \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER}.

- \texttt{descriptorBindingSampledImageUpdateAfterBind} indicates whether the implementation supports updating sampled image descriptors after a set is bound. If this feature is not enabled, \texttt{VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT} must not be used with \texttt{VK_DESCRIPTOR_TYPE_SAMPLER}, \texttt{VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER}, or \texttt{VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE}.

- \texttt{descriptorBindingStorageImageUpdateAfterBind} indicates whether the implementation supports updating storage image descriptors after a set is bound. If this feature is not enabled, \texttt{VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT} must not be used with \texttt{VK_DESCRIPTOR_TYPE_STORAGE_IMAGE}.

- \texttt{descriptorBindingStorageBufferUpdateAfterBind} indicates whether the implementation supports updating storage buffer descriptors after a set is bound. If this feature is not enabled, \texttt{VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT} must not be used with \texttt{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER}.

- \texttt{descriptorBindingUniformTexelBufferUpdateAfterBind} indicates whether the implementation supports updating uniform texel buffer descriptors after a set is bound. If this feature is not enabled, \texttt{VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT} must not be used with \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER}.
• descriptorBindingStorageTexelBufferUpdateAfterBind indicates whether the implementation supports updating storage texel buffer descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER.

• descriptorBindingUpdateUnusedWhilePending indicates whether the implementation supports updating descriptors while the set is in use. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT must not be used.

• descriptorBindingPartiallyBound indicates whether the implementation supports statically using a descriptor set binding in which some descriptors are not valid. If this feature is not enabled, VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT must not be used.

• descriptorBindingVariableDescriptorCount indicates whether the implementation supports descriptor sets with a variable-sized last binding. If this feature is not enabled, VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT must not be used.

• runtimeDescriptorArray indicates whether the implementation supports the SPIR-V RuntimeDescriptorArray capability. If this feature is not enabled, descriptors must not be declared in runtime arrays.

If the VkPhysicalDeviceDescriptorIndexingFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceDescriptorIndexingFeatures can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceDescriptorIndexingFeatures-sType-sType sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_INDEXING_FEATURES

The VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 vertexAttributeInstanceRateDivisor;
    VkBool32 vertexAttributeInstanceRateZeroDivisor;
} VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT;
```

This structure describes the following features:

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• vertexAttributeInstanceRateDivisor specifies whether vertex attribute fetching may be repeated in case of instanced rendering.
• `vertexAttributeInstanceRateZeroDivisor` specifies whether a zero value for
`VkVertexInputBindingDivisorDescriptionEXT::divisor` is supported.

If the `VkPhysicalDeviceVertexAttribDivisorFeaturesEXT` structure is included in the `pNext` chain of
the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to
indicate whether each corresponding feature is supported. `VkPhysicalDeviceVertexAttribDivisorFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

• `VUID-VkPhysicalDeviceVertexAttribDivisorFeaturesEXT-sType-sType`  
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_FEATURES_EXT`

The `VkPhysicalDeviceASTCDecodeFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_astc_decode_mode
typedef struct VkPhysicalDeviceASTCDecodeFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 decodeModeSharedExponent;
} VkPhysicalDeviceASTCDecodeFeaturesEXT;
```

This structure describes the following feature:

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `decodeModeSharedExponent` indicates whether the implementation supports decoding ASTC
  compressed formats to `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32` internal precision.

If the `VkPhysicalDeviceASTCDecodeFeaturesEXT` structure is included in the `pNext` chain of the
`VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to
indicate whether each corresponding feature is supported. `VkPhysicalDeviceASTCDecodeFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

• `VUID-VkPhysicalDeviceASTCDecodeFeaturesEXT-sType-sType`  
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ASTC_DecodeFeatures_EXT`

The `VkPhysicalDeviceVulkanMemoryModelFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkanMemoryModelFeatures {
    VkStructureType sType;
} VkPhysicalDeviceVulkanMemoryModelFeatures;
```
This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vulkanMemoryModel` indicates whether shader modules can declare the `VulkanMemoryModel` capability.
- `vulkanMemoryModelDeviceScope` indicates whether the Vulkan Memory Model can use Device scope synchronization. This also indicates whether shader modules can declare the `VulkanMemoryModelDeviceScope` capability.
- `vulkanMemoryModelAvailabilityVisibilityChains` indicates whether the Vulkan Memory Model can use availability and visibility chains with more than one element.

If the `VkPhysicalDeviceVulkanMemoryModelFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVulkanMemoryModelFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceVulkanMemoryModelFeatures-sType-sType`  
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_MEMORY_MODEL_FEATURES`.

The `VkPhysicalDeviceScalarBlockLayoutFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceScalarBlockLayoutFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 scalarBlockLayout;
} VkPhysicalDeviceScalarBlockLayoutFeatures;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `scalarBlockLayout` indicates that the implementation supports the layout of resource blocks in shaders using scalar alignment.
If the `VkPhysicalDeviceScalarBlockLayoutFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceScalarBlockLayoutFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceScalarBlockLayoutFeatures-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SCALAR_BLOCK_LAYOUT_FEATURES`

The `VkPhysicalDeviceUniformBufferStandardLayoutFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceUniformBufferStandardLayoutFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 uniformBufferStandardLayout;
} VkPhysicalDeviceUniformBufferStandardLayoutFeatures;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `uniformBufferStandardLayout` indicates that the implementation supports the same layouts for uniform buffers as for storage and other kinds of buffers. See [Standard Buffer Layout](#).

If the `VkPhysicalDeviceUniformBufferStandardLayoutFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceUniformBufferStandardLayoutFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceUniformBufferStandardLayoutFeatures-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_UNIFORM_BUFFER_STANDARD_LAYOUT_FEATURES`

The `VkPhysicalDeviceDepthClipEnableFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_depth_clip_enable
typedef struct VkPhysicalDeviceDepthClipEnableFeaturesEXT {
    VkStructureType sType;
    void* pNext;
} VkPhysicalDeviceDepthClipEnableFeaturesEXT;
```
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **depthClipEnable** indicates that the implementation supports setting the depth clipping operation explicitly via the `VkPipelineRasterizationDepthClipStateCreateInfoEXT` pipeline state. Otherwise depth clipping is only enabled when `VkPipelineRasterizationStateCreateInfo::depthClampEnable` is set to `VK_FALSE`.

If the `VkPhysicalDeviceDepthClipEnableFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceDepthClipEnableFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDepthClipEnableFeaturesEXT-sType-sType

  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLIP_ENABLE_FEATURES_EXT`

The `VkPhysicalDeviceBufferDeviceAddressFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceBufferDeviceAddressFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 bufferDeviceAddress;
    VkBool32 bufferDeviceAddressCaptureReplay;
    VkBool32 bufferDeviceAddressMultiDevice;
} VkPhysicalDeviceBufferDeviceAddressFeatures;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **bufferDeviceAddress** indicates that the implementation supports accessing buffer memory in shaders as storage buffers via an address queried from `vkGetBufferDeviceAddress`.
- **bufferDeviceAddressCaptureReplay** indicates that the implementation supports saving and reusing buffer and device addresses, e.g. for trace capture and replay.
- **bufferDeviceAddressMultiDevice** indicates that the implementation supports the `bufferDeviceAddress` feature for logical devices created with multiple physical devices. If this
feature is not supported, buffer addresses **must** not be queried on a logical device created with more than one physical device.

**Note**

`bufferDeviceAddressMultiDevice` exists to allow certain legacy platforms to be able to support `bufferDeviceAddress` without needing to support shared GPU virtual addresses for multi-device configurations.

See `vkGetBufferDeviceAddress` for more information.

If the `VkPhysicalDeviceBufferDeviceAddressFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceBufferDeviceAddressFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceBufferDeviceAddressFeatures-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_DEVICE_ADDRESS_FEATURES`  

The `VkPhysicalDeviceImagelessFramebufferFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceImagelessFramebufferFeatures {  
    VkStructureType sType;  
    void*pNext;  
    VkBool32 imagelessFramebuffer;  
} VkPhysicalDeviceImagelessFramebufferFeatures;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imagelessFramebuffer` indicates that the implementation supports specifying the image view for attachments at render pass begin time via `VkRenderPassAttachmentBeginInfo`.

If the `VkPhysicalDeviceImagelessFramebufferFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceImagelessFramebufferFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
Valid Usage (Implicit)

• VUID-VkPhysicalDeviceImagelessFramebufferFeatures-sType-sType
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGELESS_FRAMEBUFFER_FEATURES

The VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_fragment_shader_interlock
typedef struct VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 fragmentShaderSampleInterlock;
    VkBool32 fragmentShaderPixelInterlock;
    VkBool32 fragmentShaderShadingRateInterlock;
} VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT;
```

This structure describes the following features:

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• fragmentShaderSampleInterlock indicates that the implementation supports the FragmentShaderSampleInterlockEXT SPIR-V capability.
• fragmentShaderPixelInterlock indicates that the implementation supports the FragmentShaderPixelInterlockEXT SPIR-V capability.
• fragmentShaderShadingRateInterlock indicates that the implementation supports the FragmentShaderShadingRateInterlockEXT SPIR-V capability.

If the VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_INTERLOCK_FEATURES_EXT

The VkPhysicalDeviceYcbcrImageArraysFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_ycbcr_image_arrays
typedef struct VkPhysicalDeviceYcbcrImageArraysFeaturesEXT {
    VkStructureType sType;
} VkPhysicalDeviceYcbcrImageArraysFeaturesEXT;
```
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **ycbcrImageArrays** indicates that the implementation supports creating images with a format that requires Y’C’bC’r conversion and has multiple array layers.

If the `VkPhysicalDeviceYcbcrImageArraysFeaturesEXT` structure is included in the **pNext** chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceYcbcrImageArraysFeaturesEXT` can also be used in the **pNext** chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceYcbcrImageArraysFeaturesEXT-sType-sType**

  sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_IMAGE ARRAYS_FEATURES_EXT`

The `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderSubgroupExtendedTypes;
} VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderSubgroupExtendedTypes** is a boolean specifying whether subgroup operations can use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types in group operations with subgroup scope, if the implementation supports the types.

If the `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures` structure is included in the **pNext** chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures` can also be used in the **pNext** chain of `VkDeviceCreateInfo` to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SUBGROUP_EXTENDED_TYPES_FEATURES

The `VkPhysicalDeviceHostQueryResetFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceHostQueryReset Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 hostQueryReset;
} VkPhysicalDeviceHostQueryResetFeatures;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `hostQueryReset` indicates that the implementation supports resetting queries from the host with `vkResetQueryPool`.

If the `VkPhysicalDeviceHostQueryResetFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceHostQueryResetFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceHostQueryResetFeatures-sType-sType sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_HOST_QUERY_RESET_FEATURES

The `VkPhysicalDeviceTimelineSemaphoreFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceTimelineSemaphoreFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 timelineSemaphore;
} VkPhysicalDeviceTimelineSemaphoreFeatures;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `timelineSemaphore` indicates whether semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` are supported.

If the `VkPhysicalDeviceTimelineSemaphoreFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceTimelineSemaphoreFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceTimelineSemaphoreFeatures-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TIMELINE_SEMAPHORE_FEATURES`.

The `VkPhysicalDeviceExternalSciSyncFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_external_sci_sync
typedef struct VkPhysicalDeviceExternalSciSyncFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 sciSyncFence;
    VkBool32 sciSyncSemaphore;
    VkBool32 sciSyncImport;
    VkBool32 sciSyncExport;
} VkPhysicalDeviceExternalSciSyncFeaturesNV;
```

The members of the `VkPhysicalDeviceExternalSciSyncFeaturesNV` structure describe the following features:

- `sciSyncFence` indicates whether external fences created with a handle type of `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV` and `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV` are supported for import and/or export.

- `sciSyncSemaphore` indicates whether external semaphores created with a handle type of `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV` are supported for import and/or export.

- `sciSyncImport` indicates whether `NvSciSyncObj` import functionality is supported. If `sciSyncImport` is set to `VK_TRUE`, `VkFence` and/or `VkSemaphore` support importing `NvSciSyncObj` from applications. In this case, the application is responsible for the resource management of the `NvSciSyncObj`.

- `sciSyncExport` indicates whether `NvSciSyncObj` export functionality is supported. If `sciSyncExport` is set to `VK_TRUE`, `VkFence` and/or `VkSemaphore` support exporting `NvSciSyncObj` created by the driver to applications. In this case, the driver is responsible for the resource management of the `NvSciSyncObj`.

*Table 45. Functionality supported for NvSciSync features*
<table>
<thead>
<tr>
<th>Features</th>
<th>sciSyncImport</th>
<th>sciSyncExport</th>
<th>Always supported¹</th>

</thead>
<tbody>
<tr>
<td>sciSyncFence</td>
<td>vkImportFenceSciSyncFenceNV, vkImportFenceSciSyncObjNV</td>
<td>VkExportFenceSciSyncInfoNV</td>
<td></td>
</tr>
<tr>
<td>sciSyncSemaphore</td>
<td>vkImportSemaphoreSciSyncObjNV</td>
<td>VkExportSemaphoreSciSyncInfoNV</td>
<td></td>
</tr>
</tbody>
</table>

¹ Functionality in this column is always available.

The Functionality supported for NvSciSync features table summarizes the functionality enabled by the `VkPhysicalDeviceExternalSciSyncFeaturesNV` structure. There are two orthogonal pieces of functionality: fence and semaphore support; import and export support. Each entry in the body of the table summarizes the functionality that can be used when the given features are supported and enabled. This summarizes Valid Usage statements that are added elsewhere in this specification.

If the `VkPhysicalDeviceExternalSciSyncFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceExternalSciSyncFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalSciSyncFeaturesNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_SCI_SYNC_FEATURES_NV`

The `VkPhysicalDeviceExternalSciSync2FeaturesNV` structure is defined as:

```c
typedef struct VkPhysicalDeviceExternalSciSync2FeaturesNV {
    VkStructureType   sType;
    void*              pNext;
    VkBool32           sciSyncFence;
    VkBool32           sciSyncSemaphore2;
    VkBool32           sciSyncImport;
    VkBool32           sciSyncExport;
} VkPhysicalDeviceExternalSciSync2FeaturesNV;
```
The members of the `VkPhysicalDeviceExternalSciSync2FeaturesNV` structure describe the following features:

- `sciSyncFence` indicates whether external fences created with a handle type of `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV` and `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV` are supported for import and/or export.

- `sciSyncSemaphore2` indicates whether semaphore SciSync pools are supported and semaphores can be created from `NvSciSyncObj` via `VkSemaphoreSciSyncPoolNV` objects. In this case, the application is responsible for the resource management of the `NvSciSyncObj`.

- `sciSyncImport` indicates whether `NvSciSyncObj` import functionality is supported. If `sciSyncImport` is set to `VK_TRUE`, `VkFence` and/or `VkSemaphore` support importing `NvSciSyncObj` from applications. In this case, the application is responsible for the resource management of the `NvSciSyncObj`.

- `sciSyncExport` indicates whether `NvSciSyncObj` export functionality is supported. If `sciSyncExport` is set to `VK_TRUE`, `VkFence` supports exporting `NvSciSyncObj` created by the driver to applications. In this case, the driver is responsible for the resource management of the `NvSciSyncObj`.

¹ Functionality in this column is always available.

The **Functionality supported for NvSciSync features** table summarizes the functionality enabled by the `VkPhysicalDeviceExternalSciSync2FeaturesNV` structure. There are two orthogonal pieces of functionality: fence and semaphore support; import and export support. Each entry in the body of the table summarizes the functionality that can be used when the given features are supported and enabled. This summarizes Valid Usage statements that are added elsewhere in this specification.

If the `VkPhysicalDeviceExternalSciSync2FeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported.
VkPhysicalDeviceExternalSciSync2FeaturesNV can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalSciSync2FeaturesNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_SCI_SYNC_2_FEATURES_NV

The VkPhysicalDeviceExternalMemorySciBufFeaturesNV structure is defined as:

```c
// Provided by VK_NV_external_memory_sci_buf
typedef struct VkPhysicalDeviceExternalMemorySciBufFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 sciBufImport;
    VkBool32 sciBufExport;
} VkPhysicalDeviceExternalMemorySciBufFeaturesNV;
```

The members of the VkPhysicalDeviceExternalMemorySciBufFeaturesNV structure describe the following features:

- sciBufImport indicates whether NvSciBufObj import functionality is supported. If sciBufImport is set to VK_TRUE, VkDeviceMemory supports importing NvSciBufObj from applications. In this case, the application is responsible for the resource management of the NvSciBufObj.

- sciBufExport indicates whether NvSciBufObj export functionality is supported. If sciBufExport is set to VK_TRUE, VkDeviceMemory supports exporting NvSciBufObj created by the driver to applications. In this case, the driver is responsible for the resource management of the NvSciBufObj.

¹ Functionality in this row is always available.
The **Functionality supported for NvSciBuf features** table summarizes the functionality enabled by the `VkPhysicalDeviceExternalMemorySciBufFeaturesNV` structure. Each entry in the body of the table summarizes the functionality that **can** be used when the given features are supported and enabled. This summarizes Valid Usage statements that are added elsewhere in this specification.

If the `VkPhysicalDeviceExternalMemorySciBufFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceExternalMemorySciBufFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalMemorySciBufFeaturesNV-sType-sType
  
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_SCI_BUF_FEATURES_NV`.

The `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX` structure is defined as:

```c
typedef struct VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX {
    VkStructureType sType;
    void* pNext;
    VkBool32 screenBufferImport;
} VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX;
```

The members of the `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX` structure describe the following features:

- `screenBufferImport` indicates whether QNX Screen buffer import functionality is supported. If `screenBufferImport` is set to `VK_TRUE`, `VkDeviceMemory` supports importing `_screen_buffer` from applications. In this case, the application is responsible for the resource management of the `_screen_buffer`.

### Table 48. Functionality supported for QNX Screen Buffer features

<table>
<thead>
<tr>
<th>Features</th>
<th>Functionality</th>

1

Functionality in this row is always available.

The **Functionality supported for QNX Screen buffer features** table summarizes the functionality enabled by the `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX` structure. Each entry in the
body of the table summarizes the functionality that can be used when the given features are supported and enabled. This summarizes Valid Usage statements that are added elsewhere in this specification.

If the `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

```
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_SCREEN_BUFFER_FEATURES_QNX

The `VkPhysicalDeviceIndexTypeUint8FeaturesEXT` structure is defined as:

```
// Provided by VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INDEX_TYPE_UINT8_FEATURES_EXT

typedef struct VkPhysicalDeviceIndexTypeUint8FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 indexTypeUint8;
} VkPhysicalDeviceIndexTypeUint8FeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `indexTypeUint8` indicates that `VK_INDEX_TYPE_UINT8_EXT` can be used with `vkCmdBindIndexBuffer`.

If the `VkPhysicalDeviceIndexTypeUint8FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceIndexTypeUint8FeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

```
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceIndexTypeUint8FeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INDEX_TYPE_UINT8_FEATURES_EXT

The `VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_2
```
typedef struct VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 separateDepthStencilLayouts;
} VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures;

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **separateDepthStencilLayouts** indicates whether the implementation supports a `VkImageMemoryBarrier` for a depth/stencil image with only one of `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` set, and whether `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` can be used.

If the `VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures-sType-sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SEPARATE_DEPTH_STENCIL_LAYOUTS_FEATURES`.

The `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures` structure is defined as:

typedef struct VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderDemoteToHelperInvocation;
} VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures;

or the equivalent

```c
// Provided by VK_EXT_shader_demote_to_helper_invocation
typedef VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures VkPhysicalDeviceShaderDemoteToHelperInvocationFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `shaderDemoteToHelperInvocation` indicates whether the implementation supports the SPIR-V DemoteToHelperInvocationEXT capability.

If the `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_DEMOTE_TO_HELPER_INVOCATION_FEATURES`.

The `VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_texel_buffer_alignment
typedef struct VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT {
    VkStructureType  sType;
    void*            pNext;
    VkBool32         texelBufferAlignment;
} VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `texelBufferAlignment` indicates whether the implementation uses more specific alignment requirements advertised in `VkPhysicalDeviceTexelBufferAlignmentProperties` rather than `VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`.

If the `VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXEL_BUFFER_ALIGNMENT_FEATURES_EXT`.

The `VkPhysicalDeviceTextureCompressionASTCHDRFeatures` structure is defined as:
typedef struct VkPhysicalDeviceTextureCompressionASTCHDRFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 textureCompressionASTC_HDR;
} VkPhysicalDeviceTextureCompressionASTCHDRFeatures;

or the equivalent

// Provided by VK_EXT_texture_compression_astc_hdr
typedef VkPhysicalDeviceTextureCompressionASTCHDRFeatures
    VkPhysicalDeviceTextureCompressionASTCHDRFeaturesEXT;

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- textureCompressionASTC_HDR indicates whether all of the ASTC HDR compressed texture formats are supported. If this feature is enabled, then the VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT, VK_FORMAT_FEATURE_BLIT_SRC_BIT and VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT features must be supported in optimalTilingFeatures for the following formats:

  - VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK

To query for additional properties, or if the feature is not enabled, vkGetPhysicalDeviceFormatProperties and vkGetPhysicalDeviceImageFormatProperties can be used to check for supported properties of individual formats as normal.

If the VkPhysicalDeviceTextureCompressionASTCHDRFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to
indicate whether each corresponding feature is supported. VkPhysicalDeviceTextureCompressionASTCHDRFeatures can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTextureCompressionASTCHDRFeatures-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXTURE_COMPRESSION_ASTC_HDR_FEATURES

The VkPhysicalDeviceLineRasterizationFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_line_rasterization
typedef struct VkPhysicalDeviceLineRasterizationFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 rectangularLines;
    VkBool32 bresenhamLines;
    VkBool32 smoothLines;
    VkBool32 stippledRectangularLines;
    VkBool32 stippledBresenhamLines;
    VkBool32 stippledSmoothLines;
} VkPhysicalDeviceLineRasterizationFeaturesEXT;
```

This structure describes the following features:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **rectangularLines** indicates whether the implementation supports rectangular line rasterization.
- **bresenhamLines** indicates whether the implementation supports Bresenham-style line rasterization.
- **smoothLines** indicates whether the implementation supports smooth line rasterization.
- **stippledRectangularLines** indicates whether the implementation supports stippled line rasterization with VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT lines.
- **stippledBresenhamLines** indicates whether the implementation supports stippled line rasterization with VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT lines.
- **stippledSmoothLines** indicates whether the implementation supports stippled line rasterization with VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT lines.

If the VkPhysicalDeviceLineRasterizationFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceLineRasterizationFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceLineRasterizationFeaturesEXT-sType-sType
  
  \textit{sType} must be \texttt{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_FEATURES_EXT}

The \texttt{VkPhysicalDeviceSubgroupSizeControlFeatures} structure is defined as:

```
typedef struct VkPhysicalDeviceSubgroupSizeControlFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 subgroupSizeControl;
    VkBool32 computeFullSubgroups;
} VkPhysicalDeviceSubgroupSizeControlFeatures;
```

or the equivalent

```
// Provided by VK_EXT_subgroup_size_control
typedef VkPhysicalDeviceSubgroupSizeControlFeatures
    VkPhysicalDeviceSubgroupSizeControlFeaturesEXT;
```

This structure describes the following features:

- \textit{sType} is a \texttt{VkStructureType} value identifying this structure.
- \textit{pNext} is NULL or a pointer to a structure extending this structure.
- \textit{subgroupSizeControl} indicates whether the implementation supports controlling shader subgroup sizes via the \texttt{VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT} flag and the \texttt{VkPipelineShaderStageRequiredSubgroupSizeCreateInfo} structure.
- \textit{computeFullSubgroups} indicates whether the implementation supports requiring full subgroups in compute shaders via the \texttt{VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT} flag.

If the \texttt{VkPhysicalDeviceSubgroupSizeControlFeatures} structure is included in the \textit{pNext} chain of the \texttt{VkPhysicalDeviceFeatures2} structure passed to \texttt{vkGetPhysicalDeviceFeatures2}, it is filled in to indicate whether each corresponding feature is supported. \texttt{VkPhysicalDeviceSubgroupSizeControlFeatures} can also be used in the \textit{pNext} chain of \texttt{VkDeviceCreateInfo} to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSubgroupSizeControlFeatures-sType-sType
  
  \textit{sType} must be \texttt{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_FEATURES}

The \texttt{VkPhysicalDeviceExtendedDynamicStateFeaturesEXT} structure is defined as:
typedef struct VkPhysicalDeviceExtendedDynamicStateFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 extendedDynamicState;
} VkPhysicalDeviceExtendedDynamicStateFeaturesEXT;

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **extendedDynamicState** indicates that the implementation supports the following dynamic states:
  - `VK_DYNAMIC_STATE_CULL_MODE`
  - `VK_DYNAMIC_STATE_FRONT_FACE`
  - `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY`
  - `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`
  - `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`
  - `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE`
  - `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`
  - `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`
  - `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`
  - `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`
  - `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`
  - `VK_DYNAMIC_STATE_STENCIL_OP`

If the `VkPhysicalDeviceExtendedDynamicStateFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceExtendedDynamicStateFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceExtendedDynamicStateFeaturesEXT-sType-sType**
  
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_FEATURES_EXT`

The `VkPhysicalDeviceExtendedDynamicState2FeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_extended_dynamic_state2
typedef struct VkPhysicalDeviceExtendedDynamicState2FeaturesEXT {
    VkStructureType sType;
} VkPhysicalDeviceExtendedDynamicState2FeaturesEXT;
```
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **extendedDynamicState2** indicates that the implementation supports the following dynamic states:
  - `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE`
  - `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE`
  - `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE`
- **extendedDynamicState2LogicOp** indicates that the implementation supports the following dynamic state:
  - `VK_DYNAMIC_STATE_LOGIC_OP_EXT`
- **extendedDynamicState2PatchControlPoints** indicates that the implementation supports the following dynamic state:
  - `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`

If the `VkPhysicalDeviceExtendedDynamicState2FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceExtendedDynamicState2FeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceExtendedDynamicState2FeaturesEXT-sType-sType**  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_2_FEATURES_EXT`
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **robustBufferAccess2** indicates whether buffer accesses are tightly bounds-checked against the range of the descriptor. Uniform buffers **must** be bounds-checked to the range of the descriptor, where the range is rounded up to a multiple of `robustUniformBufferAccessSizeAlignment`. Storage buffers **must** be bounds-checked to the range of the descriptor, where the range is rounded up to a multiple of `robustStorageBufferAccessSizeAlignment`. Out of bounds buffer loads will return zero values, and image load, sample, and atomic operations from texel buffers will have (0,0,1) values inserted for missing G, B, or A components based on the format.
- **robustImageAccess2** indicates whether image accesses are tightly bounds-checked against the dimensions of the image view. Out of bounds image load, sample, and atomic operations from images will return zero values, with (0,0,1) values inserted for missing G, B, or A components based on the format.
- **nullDescriptor** indicates whether descriptors can be written with a `VK_NULL_HANDLE` resource or view, which are considered valid to access and act as if the descriptor were bound to nothing.

If the `VkPhysicalDeviceRobustness2FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRobustness2FeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage

- VUID-VkPhysicalDeviceRobustness2FeaturesEXT-robustBufferAccess2-04000
  
  If robustBufferAccess2 is enabled then robustBufferAccess **must** also be enabled.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRobustness2FeaturesEXT-sType-sType

  sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_FEATURES_EXT`.

The `VkPhysicalDeviceImageRobustnessFeatures` structure is defined as:

```c
typedef struct VkPhysicalDeviceImageRobustnessFeatures {
    VkStructureType       sType;
    void*                  pNext;
    VkBool32               robustImageAccess;
} VkPhysicalDeviceImageRobustnessFeatures;
```

or the equivalent
typedef VkPhysicalDeviceImageRobustnessFeatures
    VkPhysicalDeviceImageRobustnessFeaturesEXT;

This structure describes the following feature:

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **robustImageAccess** indicates whether image accesses are tightly bounds-checked against the dimensions of the image view. **Invalid texels** resulting from out of bounds image loads will be replaced as described in **Texel Replacement**, with either (0,0,1) or (0,0,0) values inserted for missing G, B, or A components based on the format.

If the **VkPhysicalDeviceImageRobustnessFeatures** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceImageRobustnessFeatures** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceImageRobustnessFeatures-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_ROBUSTNESS_FEATURES**

The **VkPhysicalDeviceShaderTerminateInvocationFeatures** structure is defined as:

```c
typedef struct VkPhysicalDeviceShaderTerminateInvocationFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderTerminateInvocation;
} VkPhysicalDeviceShaderTerminateInvocationFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_shader_terminate_invocation
typedef VkPhysicalDeviceShaderTerminateInvocationFeatures
    VkPhysicalDeviceShaderTerminateInvocationFeaturesKHR;
```

This structure describes the following feature:

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **shaderTerminateInvocation** specifies whether the implementation supports SPIR-V modules that
use the `SPV_KHR_terminate_invocation` extension.

If the `VkPhysicalDeviceShaderTerminateInvocationFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderTerminateInvocationFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderTerminateInvocationFeatures-sType-sType
  
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TERMINATE_INVOCATION_FEATURES`

The `VkPhysicalDeviceCustomBorderColorFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_custom_border_color
typedef struct VkPhysicalDeviceCustomBorderColorFeaturesEXT {
    VkStructureType   sType;
    void*             pNext;
    VkBool32          customBorderColors;
    VkBool32          customBorderColorWithoutFormat;
} VkPhysicalDeviceCustomBorderColorFeaturesEXT;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **customBorderColors** indicates that the implementation supports providing a `borderColor` value with one of the following values at sampler creation time:
  - `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT`
  - `VK_BORDER_COLOR_INT_CUSTOM_EXT`
- **customBorderColorWithoutFormat** indicates that explicit formats are not required for custom border colors and the value of the `format` member of the `VkSamplerCustomBorderColorCreateInfoEXT` structure may be `VK_FORMAT_UNDEFINED`. If this feature bit is not set, applications must provide the `VkFormat` of the image view(s) being sampled by this sampler in the `format` member of the `VkSamplerCustomBorderColorCreateInfoEXT` structure.

If the `VkPhysicalDeviceCustomBorderColorFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceCustomBorderColorFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCustomBorderColorFeaturesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_FEATURES_EXT`

The `VkPhysicalDeviceVulkanSC10Features` structure is defined as:

```c
// Provided by VKSC_VERSION_1_0
typedef struct VkPhysicalDeviceVulkanSC10Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderAtomicInstructions;
} VkPhysicalDeviceVulkanSC10Features;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderAtomicInstructions` indicates whether this implementation supports shaders which use the SPIR-V `OpAtomic*` instructions.

If the `VkPhysicalDeviceVulkanSC10Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVulkanSC10Features` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkanSC10Features-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_SC_1_0_FEATURES`

The `VkPhysicalDevicePerformanceQueryFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPhysicalDevicePerformanceQueryFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 performanceCounterQueryPools;
    VkBool32 performanceCounterMultipleQueryPools;
} VkPhysicalDevicePerformanceQueryFeaturesKHR;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.

• **performanceCounterQueryPools** indicates whether the implementation supports performance counter query pools.

• **performanceCounterMultipleQueryPools** indicates whether the implementation supports using multiple performance query pools in a primary command buffer and secondary command buffers executed within it.

If the **VkPhysicalDevicePerformanceQueryFeaturesKHR** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDevicePerformanceQueryFeaturesKHR** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDevicePerformanceQueryFeaturesKHR-sType-sType**
  
  sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_FEATURES_KHR**

The **VkPhysicalDevice4444FormatsFeaturesEXT** structure is defined as:

```c
// Provided by VK_EXT_4444_formats
typedef struct VkPhysicalDevice4444FormatsFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 formatA4R4G4B4;
    VkBool32 formatA4B4G4R4;
} VkPhysicalDevice4444FormatsFeaturesEXT;
```

This structure describes the following features:

- **sType** is a **VkStructureType** value identifying this structure.

- **pNext** is NULL or a pointer to a structure extending this structure.

- **formatA4R4G4B4** indicates that the implementation **must** support using a **VkFormat** of **VK_FORMAT_A4R4G4B4_UNORM_PACK16_EXT** with at least the following **VkFormatFeatureFlagBits**:
  
  - **VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT**
  - **VK_FORMAT_FEATURE_BLIT_SRC_BIT**
  - **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **formatA4B4G4R4** indicates that the implementation **must** support using a **VkFormat** of **VK_FORMAT_A4B4G4R4_UNORM_PACK16_EXT** with at least the following **VkFormatFeatureFlagBits**:
  
  - **VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT**
  - **VK_FORMAT_FEATURE_BLIT_SRC_BIT**
  - **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**
If the `VkPhysicalDevice4444FormatsFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevice4444FormatsFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDevice4444FormatsFeaturesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_4444_FORMATS_FEATURES_EXT`.

The `VkPhysicalDeviceSynchronization2Features` structure is defined as:

```c
typedef struct VkPhysicalDeviceSynchronization2Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 synchronization2;
} VkPhysicalDeviceSynchronization2Features;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkPhysicalDeviceSynchronization2Features VkPhysicalDeviceSynchronization2FeaturesKHR;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `synchronization2` indicates whether the implementation supports the new set of synchronization commands introduced in `VK_KHR_synchronization2`.

If the `VkPhysicalDeviceSynchronization2Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceSynchronization2Features` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSynchronization2Features-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SYNCHRONIZATION_2_FEATURES`.

The `VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT` structure is defined as:
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 vertexInputDynamicState;
} VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT;

This structure describes the following feature:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **vertexInputDynamicState** indicates that the implementation supports the following dynamic states:
  - **VK_DYNAMIC_STATE_VERTEX_INPUT_EXT**

If the *VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT* structure is included in the **pNext** chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT* can also be used in the **pNext** chain of *VkDeviceCreateInfo* to selectively enable these features.

---

Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT-sType-sType**
  - **sType** must be
    - *VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_INPUT_DYNAMIC_STATE_FEATURES_EXT*

The *VkPhysicalDeviceFragmentShadingRateFeaturesKHR* structure is defined as:

// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 pipelineFragmentShadingRate;
    VkBool32 primitiveFragmentShadingRate;
    VkBool32 attachmentFragmentShadingRate;
} VkPhysicalDeviceFragmentShadingRateFeaturesKHR;

This structure describes the following features:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pipelineFragmentShadingRate** indicates that the implementation supports the **pipeline fragment shading rate**.
• `primitiveFragmentShadingRate` indicates that the implementation supports the primitive fragment shading rate.

• `attachmentFragmentShadingRate` indicates that the implementation supports the attachment fragment shading rate.

If the `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

• VUID-VkPhysicalDeviceFragmentShadingRateFeaturesKHR-sType-sType

  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_FEATURES_KHR`

The `VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT` structure is defined as:

```c
typedef struct VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 ycbcr2plane444Formats;
} VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT;
```

This structure describes the following feature:

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `ycbcr2plane444Formats` indicates that the implementation supports the following 2-plane 444 Y′CBCR formats:
  ◦ `VK_FORMAT_G8_B8R8_2PLANE_444_UNORM`
  ◦ `VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16`
  ◦ `VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16`
  ◦ `VK_FORMAT_G16_B16R16_2PLANE_444_UNORM`

If the `VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
The `VkPhysicalDeviceColorWriteEnableFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_color_writer_enable
typedef struct VkPhysicalDeviceColorWriteEnableFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 colorWriteEnable;
} VkPhysicalDeviceColorWriteEnableFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `colorWriteEnable` indicates that the implementation supports the dynamic state `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT`.

If the `VkPhysicalDeviceColorWriteEnableFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceColorWriteEnableFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### 32.1. Feature Requirements

All Vulkan graphics implementations must support the following features:

- `robustBufferAccess`
- `multiview`, if Vulkan 1.1 is supported. Vulkan SC 1.0 does not require `multiview` to be supported [SCID-8].
- `uniformBufferStandardLayout`, if Vulkan 1.2 or the `VK_KHR_uniform_buffer_standard_layout` extension is supported.
- `storageBuffer8BitAccess`, if `uniformAndStorageBuffer8BitAccess` is enabled.
• If the descriptorIndexing feature is supported, or if the VK_EXT_descriptor_indexing extension is supported:
  ◦ shaderSampledImageArrayDynamicIndexing
  ◦ shaderStorageBufferArrayDynamicIndexing
  ◦ shaderUniformTexelBufferArrayDynamicIndexing
  ◦ shaderStorageTexelBufferArrayDynamicIndexing
  ◦ shaderSampledImageArrayNonUniformIndexing
  ◦ shaderStorageBufferArrayNonUniformIndexing
  ◦ shaderUniformTexelBufferArrayNonUniformIndexing
  ◦ descriptorBindingSampledImageUpdateAfterBind
  ◦ descriptorBindingStorageImageUpdateAfterBind
  ◦ descriptorBindingStorageBufferUpdateAfterBind (see also robustBufferAccessUpdateAfterBind)
  ◦ descriptorBindingUniformTexelBufferUpdateAfterBind (see also robustBufferAccessUpdateAfterBind)
  ◦ descriptorBindingStorageTexelBufferUpdateAfterBind (see also robustBufferAccessUpdateAfterBind)
  ◦ descriptorBindingUpdateUnusedWhilePending
  ◦ descriptorBindingPartiallyBound
  ◦ runtimeDescriptorArray
  ◦ subgroupBroadcastDynamicId, if Vulkan 1.2 is supported.
  ◦ subgroupSizeControl, if the VK_EXT_subgroup_size_control extension is supported.
  ◦ computeFullSubgroups, if the VK_EXT_subgroup_size_control extension is supported.
  ◦ imagelessFramebuffer, if Vulkan 1.2 or the VK_KHR_imagelessFramebuffer extension is supported.
  ◦ separateDepthStencilLayouts, if Vulkan 1.2 or the VK_KHR_separate_depthStencil_layouts extension is supported.
  ◦ hostQueryReset, if Vulkan 1.2 or the VK_EXT_host_query_reset extension is supported.
  ◦ timelineSemaphore, if Vulkan 1.2 or the VK_KHR_timeline_semaphore extension is supported. Vulkan SC 1.0 does not require timelineSemaphore to be supported [SCID-8].
  ◦ shaderSubgroupExtendedTypes, if Vulkan 1.2 or the VK_KHR_shader_subgroup_extended_types extension is supported.
  ◦ textureCompressionASTC_HDR, if the VK_EXT_texture_compression_astc_hdr extension is supported.
  ◦ depthClipEnable, if the VK_EXT_depth_clip_enable extension is supported.
  ◦ ycbcrImageArrays, if the VK_EXT_ycbcr_image_arrays extension is supported.
  ◦ indexTypeUint8, if the VK_EXT_index_type_uint8 extension is supported.
  ◦ shaderDemoteToHelperInvocation, if the VK_EXT_shader_demote_to_helper_invocation extension is supported.
  ◦ texelBufferAlignment, if the VK_EXT_texel_buffer_alignment extension is supported.
• `vulkanMemoryModel`, if Vulkan SC 1.0 [SCID-5] or if the `VK_KHR_vulkan_memory_model` extension is supported.

• `performanceCounterQueryPools`, if the `VK_KHR_performance_query` extension is supported.

• `vertexAttributeInstanceRateDivisor`, if the `VK_EXT_vertex_attribute_divisor` extension is supported.

• `shaderSubgroupClock`, if the `VK_KHR_shader_clock` extension is supported.

• `shaderInt64`, if the `shaderSharedInt64Atomics` or `shaderBufferInt64Atomics` features are supported.

• `fragmentShaderSampleInterlock` or `fragmentShaderPixelInterlock` or `fragmentShaderShadingRateInterlock`, if the `VK_EXT_fragment_shader_interlock` extension is supported.

• `rectangularLines` or `bresenhamLines` or `smoothLines` or `stippledRectangularLines` or `stippledBresenhamLines` or `stippledSmoothLines`, if the `VK_EXT_line_rasterization` extension is supported.

• `storageBuffer16BitAccess`, if `uniformAndStorageBuffer16BitAccess` is enabled.

• `robustImageAccess`, if the `VK_EXT_image_robustness` extension is supported.

• `formatA4R4G4B4`, if the `VK_EXT_4444_formats` extension is supported.

• `shaderInt64` and `shaderImageInt64Atomics`, if the `VK_EXT_shader_image_atomic_int64` extension is supported.

• `shaderImageInt64Atomics`, if the `sparseImageInt64Atomics` feature is supported.

• `shaderImageFloat32Atomics`, if the `sparseImageFloat32Atomics` feature is supported.

• `shaderImageFloat32AtomicAdd`, if the `sparseImageFloat32AtomicAdd` feature is supported.

• `pipelineFragmentShadingRate`, if the `VK_KHR_fragment_shading_rate` extension is supported.

• `shaderTerminateInvocation`, if the `VK_KHR_shader_terminate_invocation` extension is supported.

• `vertexInputDynamicState`, if the `VK_EXT_vertex_input_dynamic_state` extension is supported.

• `synchronization2`, if the `VK_KHR_synchronization2` extension is supported.

• `extendedDynamicState`, if the `VK_EXT_extended_dynamic_state` extension is supported.

• `extendedDynamicState2`, if the `VK_EXT_extended_dynamic_state2` extension is supported.

• At least one of `sciSyncFence` and `sciSyncSemaphore`, and at least one of `sciSyncImport` and `sciSyncExport`, if the `VK_NV_external_sci_sync` extension is supported.

• At least one of `sciSyncFence` and `sciSyncSemaphore2`, and at least one of `sciSyncImport` and `sciSyncExport`, if the `VK_NV_external_sci_sync2` extension is supported.

• At least one of `sciBufImport` and `sciBufExport`, if the `VK_NV_external_memory_sci_buf` extension is supported.

• `colorWriteEnable`, if the `VK_EXT_color_write_enable` extension is supported.

All other features defined in the Specification are **optional**.
Chapter 33. Limits

Limits are implementation-dependent minimums, maximums, and other device characteristics that an application may need to be aware of.

Note

Limits are reported via the basic VkPhysicalDeviceLimits structure as well as the extensible structure VkPhysicalDeviceProperties2, which was added in VK_KHR_get_physical_device_properties2 and included in Vulkan 1.1. When limits are added in future Vulkan versions or extensions, each extension should introduce one new limit structure, if needed. This structure can be added to the pNext chain of the VkPhysicalDeviceProperties2 structure.

The VkPhysicalDeviceLimits structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceLimits {
    uint32_t maxImageDimension1D;
    uint32_t maxImageDimension2D;
    uint32_t maxImageDimension3D;
    uint32_t maxImageDimensionCube;
    uint32_t maxImageArrayLayers;
    uint32_t maxTexelBufferElements;
    uint32_t maxUniformBufferRange;
    uint32_t maxStorageBufferRange;
    uint32_t maxPushConstantsSize;
    uint32_t maxMemoryAllocationCount;
    uint32_t maxSamplerAllocationCount;
    VkDeviceSize bufferImageGranularity;
    VkDeviceSize sparseAddressSpaceSize;
    uint32_t maxBoundDescriptorSets;
    uint32_t maxPerStageDescriptorSamplers;
    uint32_t maxPerStageDescriptorUniformBuffers;
    uint32_t maxPerStageDescriptorStorageBuffers;
    uint32_t maxPerStageDescriptorSampledImages;
    uint32_t maxPerStageDescriptorStorageImages;
    uint32_t maxPerStageDescriptorInputAttachments;
    uint32_t maxPerStageResources;
    uint32_t maxDescriptorSetSamplers;
    uint32_t maxDescriptorSetUniformBuffers;
    uint32_t maxDescriptorSetUniformBuffersDynamic;
    uint32_t maxDescriptorSetStorageBuffers;
    uint32_t maxDescriptorSetStorageBuffersDynamic;
    uint32_t maxDescriptorSetSampledImages;
    uint32_t maxDescriptorSetStorageImages;
    uint32_t maxDescriptorSetInputAttachments;
    uint32_t maxVertexInputAttributes;
    uint32_t maxVertexInputBindings;
    uint32_t maxVertexInputAttributeOffset;
};
```
uint32_t maxVertexInputBindingStride;
uint32_t maxVertexOutputComponents;
uint32_t maxTessellationGenerationLevel;
uint32_t maxTessellationPatchSize;
uint32_t maxTessellationControlPerVertexInputComponents;
uint32_t maxTessellationControlPerVertexOutputComponents;
uint32_t maxTessellationControlPerPatchOutputComponents;
uint32_t maxTessellationControlTotalOutputComponents;
uint32_t maxTessellationEvaluationInputComponents;
uint32_t maxTessellationEvaluationOutputComponents;
uint32_t maxGeometryShaderInvocations;
uint32_t maxGeometryInputComponents;
uint32_t maxGeometryOutputComponents;
uint32_t maxGeometryOutputVertices;
uint32_t maxGeometryTotalOutputComponents;
uint32_t maxFragmentInputComponents;
uint32_t maxFragmentOutputAttachments;
uint32_t maxFragmentDualSrcAttachments;
uint32_t maxFragmentCombinedOutputResources;
uint32_t maxComputeSharedMemorySize;
uint32_t maxComputeWorkGroupCount[3];
uint32_t maxComputeWorkGroupInvocations;
uint32_t maxComputeWorkGroupSize[3];
uint32_t subPixelPrecisionBits;
uint32_t subTexelPrecisionBits;
uint32_t mipmapPrecisionBits;
uint32_t maxDrawIndexedIndexValue;
uint32_t maxDrawIndirectCount;
float maxSamplerLodBias;
float maxSamplerAnisotropy;
uint32_t maxViewports;
uint32_t maxViewportDimensions[2];
float viewportBoundsRange[2];
uint32_t viewportSubPixelBits;
size_t minMemoryMapAlignment;
VkDeviceSize minTexelBufferOffsetAlignment;
VkDeviceSize minUniformBufferOffsetAlignment;
VkDeviceSize minStorageBufferOffsetAlignment;
int32_t minTexelOffset;
uint32_t maxTexelOffset;
int32_t minTexelGatherOffset;
uint32_t maxTexelGatherOffset;
float minInterpolationOffset;
float maxInterpolationOffset;
uint32_t subPixelInterpolationOffsetBits;
uint32_t maxFramebufferWidth;
uint32_t maxFramebufferHeight;
uint32_t maxFramebufferLayers;
VkSampleCountFlags framebufferColorSampleCounts;
VkSampleCountFlags framebufferDepthSampleCounts;
VkSampleCountFlags framebufferStencilSampleCounts;
The `VkPhysicalDeviceLimits` are properties of the physical device. These are available in the `limits` member of the `VkPhysicalDeviceProperties` structure which is returned from `vkGetPhysicalDeviceProperties`.

- **maxImageDimension1D** is the largest dimension (width) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_1D`. Some combinations of image parameters (format, usage, etc.) may allow support for larger dimensions, which can be queried using `vkGetPhysicalDeviceImageFormatProperties`.

- **maxImageDimension2D** is the largest dimension (width or height) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_2D` and without `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT` set in `flags`. Some combinations of image parameters (format, usage, etc.) may allow support for larger dimensions, which can be queried using `vkGetPhysicalDeviceImageFormatProperties`.

- **maxImageDimension3D** is the largest dimension (width, height, or depth) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_3D`. Some combinations of image parameters (format, usage, etc.) may allow support for larger dimensions, which can be queried using `vkGetPhysicalDeviceImageFormatProperties`.

- **maxImageDimensionCube** is the largest dimension (width or height) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_2D` and with `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT` set in `flags`. Some combinations of image parameters (format, usage, etc.) may allow support for larger dimensions, which can be queried using `vkGetPhysicalDeviceImageFormatProperties`. 
• **maxImageArrayLayers** is the maximum number of layers (arrayLayers) for an image.

• **maxTexelBufferElements** is the maximum number of addressable texels for a buffer view created on a buffer which was created with the `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT` or `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT` set in the usage member of the `VkBufferCreateInfo` structure.

• **maxUniformBufferRange** is the maximum value that can be specified in the range member of a `VkDescriptorBufferInfo` structure passed to `vkUpdateDescriptorSets` for descriptors of type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`.

• **maxStorageBufferRange** is the maximum value that can be specified in the range member of a `VkDescriptorBufferInfo` structure passed to `vkUpdateDescriptorSets` for descriptors of type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`.

• **maxPushConstantsSize** is the maximum size, in bytes, of the pool of push constant memory. For each of the push constant ranges indicated by the pPushConstantRanges member of the `VkPipelineLayoutCreateInfo` structure, (offset + size) must be less than or equal to this limit.

• **maxMemoryAllocationCount** is the maximum number of device memory allocations, as created by `vkAllocateMemory`, which can simultaneously exist.

• **maxSamplerAllocationCount** is the maximum number of sampler objects, as created by `vkCreateSampler`, which can simultaneously exist on a device.

• **bufferImageGranularity** is the granularity, in bytes, at which buffer or linear image resources, and optimal image resources can be bound to adjacent offsets in the same `VkDeviceMemory` object without aliasing. See Buffer-Image Granularity for more details.

• **sparseAddressSpaceSize** is the total amount of address space available, in bytes, for sparse memory resources. This is an upper bound on the sum of the sizes of all sparse resources, regardless of whether any memory is bound to them.

• **maxBoundDescriptorSets** is the maximum number of descriptor sets that can be simultaneously used by a pipeline. All DescriptorSet decorations in shader modules must have a value less than `maxBoundDescriptorSets`. See Descriptor Sets.

• **maxPerStageDescriptorSamplers** is the maximum number of samplers that can be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a shader stage when the stageFlags member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. See Sampler and Combined Image Sampler.

• **maxPerStageDescriptorUniformBuffers** is the maximum number of uniform buffers that can be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a shader stage when the stageFlags member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. See Uniform Buffer and Dynamic Uniform Buffer.
maxPerStageDescriptorStorageBuffers is the maximum number of storage buffers that can be accessible to a single shader stage in a pipeline layout. Descriptors with a type of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC count against this limit. Only descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit. A descriptor is accessible to a pipeline shader stage when the stageFlags member of the VkDescriptorsetLayoutBinding structure has the bit for that shader stage set. See Storage Buffer and Dynamic Storage Buffer.

maxPerStageDescriptorSampledImages is the maximum number of sampled images that can be accessible to a single shader stage in a pipeline layout. Descriptors with a type of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, or VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER count against this limit. Only descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit. A descriptor is accessible to a pipeline shader stage when the stageFlags member of the VkDescriptorsetLayoutBinding structure has the bit for that shader stage set. See Combined Image Sampler, Sampled Image, and Uniform Texel Buffer.

maxPerStageDescriptorStorageImages is the maximum number of storage images that can be accessible to a single shader stage in a pipeline layout. Descriptors with a type of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER count against this limit. Only descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit. A descriptor is accessible to a pipeline shader stage when the stageFlags member of the VkDescriptorsetLayoutBinding structure has the bit for that shader stage set. See Storage Image, and Storage Texel Buffer.

maxPerStageDescriptorInputAttachments is the maximum number of input attachments that can be accessible to a single shader stage in a pipeline layout. Descriptors with a type of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT count against this limit. Only descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit. A descriptor is accessible to a pipeline shader stage when the stageFlags member of the VkDescriptorsetLayoutBinding structure has the bit for that shader stage set. These are only supported for the fragment stage. See Input Attachment.

maxPerStageResources is the maximum number of resources that can be accessible to a single shader stage in a pipeline layout. Descriptors with a type of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT count against this limit. Only descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit. For the fragment shader stage the framebuffer color attachments also count against this limit.

maxDescriptorSetSamplers is the maximum number of samplers that can be included in a pipeline layout. Descriptors with a type of VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER count against this limit. Only descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit. See
Sampler and Combined Image Sampler.

- `maxDescriptorSetUniformBuffers` is the maximum number of uniform buffers that can be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See Uniform Buffer and Dynamic Uniform Buffer.

- `maxDescriptorSetUniformBuffersDynamic` is the maximum number of dynamic uniform buffers that can be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See Dynamic Uniform Buffer.

- `maxDescriptorSetStorageBuffers` is the maximum number of storage buffers that can be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See Storage Buffer and Dynamic Storage Buffer.

- `maxDescriptorSetStorageBuffersDynamic` is the maximum number of dynamic storage buffers that can be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See Dynamic Storage Buffer.

- `maxDescriptorSetSampledImages` is the maximum number of sampled images that can be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, or `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See Combined Image Sampler, Sampled Image, and Uniform Texel Buffer.

- `maxDescriptorSetStorageImages` is the maximum number of storage images that can be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See Storage Image, and Storage Texel Buffer.

- `maxDescriptorSetInputAttachments` is the maximum number of input attachments that can be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See Input Attachment.

- `maxVertexInputAttributes` is the maximum number of vertex input attributes that can be specified for a graphics pipeline. These are described in the array of `VkVertexInputAttributeDescription` structures that are provided at graphics pipeline creation time via the `pVertexAttributeDescriptions` member of the `VkPipelineVertexInputStateCreateInfo`
structure. See Vertex Attributes and Vertex Input Description.

- maxVertexInputBindings is the maximum number of vertex buffers that can be specified for providing vertex attributes to a graphics pipeline. These are described in the array of VkVertexInputBindingDescription structures that are provided at graphics pipeline creation time via the pVertexBindingDescriptions member of the VkPipelineVertexInputStateCreateInfo structure. The binding member of VkVertexInputBindingDescription must be less than this limit. See Vertex Input Description.

- maxVertexInputAttributeOffset is the maximum vertex input attribute offset that can be added to the vertex input binding stride. The offset member of the VkVertexInputAttributeDescription structure must be less than or equal to this limit. See Vertex Input Description.

- maxVertexInputBindingStride is the maximum vertex input binding stride that can be specified in a vertex input binding. The stride member of the VkVertexInputBindingDescription structure must be less than or equal to this limit. See Vertex Input Description.

- maxVertexOutputComponents is the maximum number of components of output variables which can be output by a vertex shader. See Vertex Shaders.

- maxTessellationGenerationLevel is the maximum tessellation generation level supported by the fixed-function tessellation primitive generator. See Tessellation.

- maxTessellationPatchSize is the maximum patch size, in vertices, of patches that can be processed by the tessellation control shader and tessellation primitive generator. The patchControlPoints member of the VkPipelineTessellationStateCreateInfo structure specified at pipeline creation time and the value provided in the OutputVertices execution mode of shader modules must be less than or equal to this limit. See Tessellation.

- maxTessellationControlPerVertexInputComponents is the maximum number of components of input variables which can be provided as per-vertex inputs to the tessellation control shader stage.

- maxTessellationControlPerVertexOutputComponents is the maximum number of components of per-vertex output variables which can be output from the tessellation control shader stage.

- maxTessellationControlPerPatchOutputComponents is the maximum number of components of per-patch output variables which can be output from the tessellation control shader stage.

- maxTessellationControlTotalOutputComponents is the maximum total number of components of per-vertex and per-patch output variables which can be output from the tessellation control shader stage.

- maxTessellationEvaluationInputComponents is the maximum number of components of input variables which can be provided as per-vertex inputs to the tessellation evaluation shader stage.

- maxTessellationEvaluationOutputComponents is the maximum number of components of per-vertex output variables which can be output from the tessellation evaluation shader stage.

- maxGeometryShaderInvocations is the maximum invocation count supported for instanced geometry shaders. The value provided in the Invocations execution mode of shader modules must be less than or equal to this limit. See Geometry Shading.

- maxGeometryInputComponents is the maximum number of components of input variables which can be provided as inputs to the geometry shader stage.
• **maxGeometryOutputComponents** is the maximum number of components of output variables which can be output from the geometry shader stage.

• **maxGeometryOutputVertices** is the maximum number of vertices which can be emitted by any geometry shader.

• **maxGeometryTotalOutputComponents** is the maximum total number of components of output variables, across all emitted vertices, which can be output from the geometry shader stage.

• **maxFragmentInputComponents** is the maximum number of components of input variables which can be provided as inputs to the fragment shader stage.

• **maxFragmentOutputAttachments** is the maximum number of output attachments which can be written to by the fragment shader stage.

• **maxFragmentDualSrcAttachments** is the maximum number of output attachments which can be written to by the fragment shader stage when blending is enabled and one of the dual source blend modes is in use. See Dual-Source Blending and dualSrcBlend.

• **maxFragmentCombinedOutputResources** is the total number of storage buffers, storage images, and output Location decorated color attachments (described in Fragment Output Interface) which can be used in the fragment shader stage.

• **maxComputeSharedMemorySize** is the maximum total storage size, in bytes, available for variables declared with the Workgroup storage class in shader modules (or with the shared storage qualifier in GLSL) in the compute shader stage.

• **maxComputeWorkGroupCount[3]** is the maximum number of local workgroups that can be dispatched by a single dispatching command. These three values represent the maximum number of local workgroups for the X, Y, and Z dimensions, respectively. The workgroup count parameters to the dispatching commands must be less than or equal to the corresponding limit. See Dispatching Commands.

• **maxComputeWorkGroupInvocations** is the maximum total number of compute shader invocations in a single local workgroup. The product of the X, Y, and Z sizes, as specified by the LocalSize execution mode in shader modules or by the object decorated by the WorkgroupSize decoration, must be less than or equal to this limit.

• **maxComputeWorkGroupSize[3]** is the maximum size of a local compute workgroup, per dimension. These three values represent the maximum local workgroup size in the X, Y, and Z dimensions, respectively. The x, y, and z sizes, as specified by the LocalSize execution mode or by the object decorated by the WorkgroupSize decoration in shader modules, must be less than or equal to the corresponding limit.

• **subPixelPrecisionBits** is the number of bits of subpixel precision in framebuffer coordinates x_f and y_f. See Rasterization.

• **subTexelPrecisionBits** is the number of bits of precision in the division along an axis of an image used for minification and magnification filters. \(2^{\text{subTexelPrecisionBits}}\) is the actual number of divisions along each axis of the image represented. Sub-texel values calculated during image sampling will snap to these locations when generating the filtered results.

• **mipmapPrecisionBits** is the number of bits of division that the LOD calculation for mipmap fetching get snapped to when determining the contribution from each mip level to the mip filtered results. \(2^{\text{mipmapPrecisionBits}}\) is the actual number of divisions.
• **maxDrawIndexedIndexValue** is the maximum index value that *can* be used for indexed draw calls when using 32-bit indices. This excludes the primitive restart index value of 0xFFFFFFFF. See [fullDrawIndexUint32].

• **maxDrawIndirectCount** is the maximum draw count that is supported for indirect drawing calls. See [multiDrawIndirect].

• **maxSamplerLodBias** is the maximum absolute sampler LOD bias. The sum of the `mipLodBias` member of the `VkSamplerCreateInfo` structure and the `Bias` operand of image sampling operations in shader modules (or 0 if no `Bias` operand is provided to an image sampling operation) are clamped to the range \([-\text{maxSamplerLodBias}, \text{+maxSamplerLodBias}]\). See [samplers-mipLodBias].

• **maxSamplerAnisotropy** is the maximum degree of sampler anisotropy. The maximum degree of anisotropic filtering used for an image sampling operation is the minimum of the `maxAnisotropy` member of the `VkSamplerCreateInfo` structure and this limit. See [samplers-maxAnisotropy].

• **maxViewports** is the maximum number of active viewports. The `viewportCount` member of the `VkPipelineViewportStateCreateInfo` structure that is provided at pipeline creation must be less than or equal to this limit.

• **maxViewportDimensions**[2] are the maximum viewport dimensions in the X (width) and Y (height) dimensions, respectively. The maximum viewport dimensions must be greater than or equal to the largest image which can be created and used as a framebuffer attachment. See Controlling the Viewport.

• **viewportBoundsRange**[2] is the \([\text{minimum}, \text{maximum}]\) range that the corners of a viewport must be contained in. This range must be at least \([-2 \times \text{size}, 2 \times \text{size} - 1]\), where \(\text{size} = \max(\text{maxViewportDimensions}[0], \text{maxViewportDimensions}[1])\). See Controlling the Viewport.

  **Note**
  The intent of the `viewportBoundsRange` limit is to allow a maximum sized viewport to be arbitrarily shifted relative to the output target as long as at least some portion intersects. This would give a bounds limit of \([-\text{size} + 1, 2 \times \text{size} - 1]\) which would allow all possible non-empty-set intersections of the output target and the viewport. Since these numbers are typically powers of two, picking the signed number range using the smallest possible number of bits ends up with the specified range.

• **viewportSubPixelBits** is the number of bits of subpixel precision for viewport bounds. The subpixel precision that floating-point viewport bounds are interpreted at is given by this limit.

• **minMemoryMapAlignment** is the minimum **required** alignment, in bytes, of host visible memory allocations within the host address space. When mapping a memory allocation with `vkMapMemory`, subtracting `offset` bytes from the returned pointer will always produce an integer multiple of this limit. See Host Access to Device Memory Objects. The value must be a power of two.

• **minTexelBufferOffsetAlignment** is the minimum **required** alignment, in bytes, for the `offset` member of the `VkBufferViewCreateInfo` structure for texel buffers. The value must be a power of two. If `texelBufferAlignment` is enabled, this limit is equivalent to the maximum of the `uniformTexelBufferOffsetAlignmentBytes` and `storageTexelBufferOffsetAlignmentBytes` members.
of VkPhysicalDeviceTexelBufferAlignmentProperties, but smaller alignment is optionally allowed by storageTexelBufferOffsetSingleTexelAlignment and uniformTexelBufferOffsetSingleTexelAlignment. If texelBufferAlignment is not enabled, VkBufferViewCreateInfo::offset must be a multiple of this value.

- **minUniformBufferOffsetAlignment** is the minimum required alignment, in bytes, for the offset member of the VkDescriptorBufferInfo structure for uniform buffers. When a descriptor of type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC is updated, the offset must be an integer multiple of this limit. Similarly, dynamic offsets for uniform buffers must be multiples of this limit. The value must be a power of two.

- **minStorageBufferOffsetAlignment** is the minimum required alignment, in bytes, for the offset member of the VkDescriptorBufferInfo structure for storage buffers. When a descriptor of type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC is updated, the offset must be an integer multiple of this limit. Similarly, dynamic offsets for storage buffers must be multiples of this limit. The value must be a power of two.

- **minTexelOffset** is the minimum offset value for the ConstOffset image operand of any of the OpImageSample* or OpImageFetch* image instructions.

- **maxTexelOffset** is the maximum offset value for the ConstOffset image operand of any of the OpImageSample* or OpImageFetch* image instructions.

- **minTexelGatherOffset** is the minimum offset value for the Offset, ConstOffset, or ConstOffsets image operands of any of the OpImage*Gather image instructions.

- **maxTexelGatherOffset** is the maximum offset value for the Offset, ConstOffset, or ConstOffsets image operands of any of the OpImage*Gather image instructions.

- **minInterpolationOffset** is the base minimum (inclusive) negative offset value for the Offset operand of the InterpolateAtOffset extended instruction.

- **maxInterpolationOffset** is the base maximum (inclusive) positive offset value for the Offset operand of the InterpolateAtOffset extended instruction.

- **subPixelInterpolationOffsetBits** is the number of fractional bits that the x and y offsets to the InterpolateAtOffset extended instruction may be rounded to as fixed-point values.

- **maxFramebufferWidth** is the maximum width for a framebuffer. The width member of the VkFramebufferCreateInfo structure must be less than or equal to this limit.

- **maxFramebufferHeight** is the maximum height for a framebuffer. The height member of the VkFramebufferCreateInfo structure must be less than or equal to this limit.

- **maxFramebufferLayers** is the maximum layer count for a layered framebuffer. The layers member of the VkFramebufferCreateInfo structure must be less than or equal to this limit.

- **framebufferColorSampleCounts** is a bitmask of VkSampleCountFlagBits indicating the color sample counts that are supported for all framebuffer color attachments with floating- or fixed-point formats. For color attachments with integer formats, see framebufferIntegerColorSampleCounts.

- **framebufferDepthSampleCounts** is a bitmask of VkSampleCountFlagBits indicating the supported depth sample counts for all framebuffer depth/stencil attachments, when the format includes a depth component.

- **framebufferStencilSampleCounts** is a bitmask of VkSampleCountFlagBits indicating the
supported stencil sample counts for all framebuffer depth/stencil attachments, when the format includes a stencil component.

- **framebufferNoAttachmentsSampleCounts** is a bitmask of VkSampleCountFlagBits indicating the supported sample counts for a subpass which uses no attachments.

- **maxColorAttachments** is the maximum number of color attachments that can be used by a subpass in a render pass. The colorAttachmentCount member of the VkSubpassDescription or VkSubpassDescription2 structure must be less than or equal to this limit.

- **sampledImageColorSampleCounts** is a bitmask of VkSampleCountFlagBits indicating the sample counts supported for all 2D images created with VK_IMAGE_TILING_OPTIMAL, usage containing VK_IMAGE_USAGE_SAMPLED_BIT, and a non-integer color format.

- **sampledImageIntegerSampleCounts** is a bitmask of VkSampleCountFlagBits indicating the sample counts supported for all 2D images created with VK_IMAGE_TILING_OPTIMAL, usage containing VK_IMAGE_USAGE_SAMPLED_BIT, and an integer color format.

- **sampledImageDepthSampleCounts** is a bitmask of VkSampleCountFlagBits indicating the sample counts supported for all 2D images created with VK_IMAGE_TILING_OPTIMAL, usage containing VK_IMAGE_USAGE_SAMPLED_BIT, and a depth format.

- **sampledImageStencilSampleCounts** is a bitmask of VkSampleCountFlagBits indicating the sample counts supported for all 2D images created with VK_IMAGE_TILING_OPTIMAL, usage containing VK_IMAGE_USAGE_SAMPLED_BIT, and a stencil format.

- **storageImageSampleCounts** is a bitmask of VkSampleCountFlagBits indicating the sample counts supported for all 2D images created with VK_IMAGE_TILING_OPTIMAL, and usage containing VK_IMAGE_USAGE_STORAGE_BIT.

- **maxSampleMaskWords** is the maximum number of array elements of a variable decorated with the SampleMask built-in decoration.

- **timestampComputeAndGraphics** specifies support for timestamps on all graphics and compute queues. If this limit is set to VK_TRUE, all queues that advertise the VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT in the VkQueueFamilyProperties::queueFlags support VkQueueFamilyProperties::timestampValidBits of at least 36. See Timestamp Queries.

- **timestampPeriod** is the number of nanoseconds required for a timestamp query to be incremented by 1. See Timestamp Queries.

- **maxClipDistances** is the maximum number of clip distances that can be used in a single shader stage. The size of any array declared with the ClipDistance built-in decoration in a shader module must be less than or equal to this limit.

- **maxCullDistances** is the maximum number of cull distances that can be used in a single shader stage. The size of any array declared with the CullDistance built-in decoration in a shader module must be less than or equal to this limit.

- **maxCombinedClipAndCullDistances** is the maximum combined number of clip and cull distances that can be used in a single shader stage. The sum of the sizes of any pair of arrays declared with the ClipDistance and CullDistance built-in decoration used by a single shader stage in a shader module must be less than or equal to this limit.

- **discreteQueuePriorities** is the number of discrete priorities that can be assigned to a queue based on the value of each member of VkDeviceQueueCreateInfo::pQueuePriorities. This must
be at least 2, and levels must be spread evenly over the range, with at least one level at 1.0, and another at 0.0. See Queue Priority.

• pointSizeRange[2] is the range \([\text{minimum}, \text{maximum}]\) of supported sizes for points. Values written to variables decorated with the PointSize built-in decoration are clamped to this range.

• lineWidthRange[2] is the range \([\text{minimum}, \text{maximum}]\) of supported widths for lines. Values specified by the lineWidth member of the VkPipelineRasterizationStateCreateInfo or the lineWidth parameter to vkCmdSetLineWidth are clamped to this range.

• pointSizeGranularity is the granularity of supported point sizes. Not all point sizes in the range defined by pointSizeRange are supported. This limit specifies the granularity (or increment) between successive supported point sizes.

• lineWidthGranularity is the granularity of supported line widths. Not all line widths in the range defined by lineWidthRange are supported. This limit specifies the granularity (or increment) between successive supported line widths.

• strictLines specifies whether lines are rasterized according to the preferred method of rasterization. If set to VK_FALSE, lines may be rasterized under a relaxed set of rules. If set to VK_TRUE, lines are rasterized as per the strict definition. See Basic Line Segment Rasterization.

• standardSampleLocations specifies whether rasterization uses the standard sample locations as documented in Multisampling. If set to VK_TRUE, the implementation uses the documented sample locations. If set to VK_FALSE, the implementation may use different sample locations.

• optimalBufferCopyOffsetAlignment is the optimal buffer offset alignment in bytes for vkCmdCopyBufferToImage2KHR, vkCmdCopyBufferToImage, vkCmdCopyImageToBuffer2KHR, and vkCmdCopyImageToBuffer. The per texel alignment requirements are enforced, but applications should use the optimal alignment for optimal performance and power use. The value must be a power of two.

• optimalBufferCopyRowPitchAlignment is the optimal buffer row pitch alignment in bytes for vkCmdCopyBufferToImage2KHR, vkCmdCopyBufferToImage, vkCmdCopyImageToBuffer2KHR, and vkCmdCopyImageToBuffer. Row pitch is the number of bytes between texels with the same X coordinate in adjacent rows (Y coordinates differ by one). The per texel alignment requirements are enforced, but applications should use the optimal alignment for optimal performance and power use. The value must be a power of two.

• nonCoherentAtomSize is the size and alignment in bytes that bounds concurrent access to host-mapped device memory. The value must be a power of two.

1 For all bitmasks of VkSampleCountFlagBits, the sample count limits defined above represent the minimum supported sample counts for each image type. Individual images may support additional sample counts, which are queried using vkGetPhysicalDeviceImageFormatProperties as described in Supported Sample Counts.

Bits which may be set in the sample count limits returned by VkPhysicalDeviceLimits, as well as in other queries and structures representing image sample counts, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSampleCountFlagBits {
```
VK_SAMPLE_COUNT_1_BIT = 0x00000001,
VK_SAMPLE_COUNT_2_BIT = 0x00000002,
VK_SAMPLE_COUNT_4_BIT = 0x00000004,
VK_SAMPLE_COUNT_8_BIT = 0x00000008,
VK_SAMPLE_COUNT_16_BIT = 0x00000010,
VK_SAMPLE_COUNT_32_BIT = 0x00000020,
VK_SAMPLE_COUNT_64_BIT = 0x00000040,

} VkSampleCountFlagBits;

- **VK_SAMPLE_COUNT_1_BIT** specifies an image with one sample per pixel.
- **VK_SAMPLE_COUNT_2_BIT** specifies an image with 2 samples per pixel.
- **VK_SAMPLE_COUNT_4_BIT** specifies an image with 4 samples per pixel.
- **VK_SAMPLE_COUNT_8_BIT** specifies an image with 8 samples per pixel.
- **VK_SAMPLE_COUNT_16_BIT** specifies an image with 16 samples per pixel.
- **VK_SAMPLE_COUNT_32_BIT** specifies an image with 32 samples per pixel.
- **VK_SAMPLE_COUNT_64_BIT** specifies an image with 64 samples per pixel.

// Provided by VK_VERSION_1_0
typedef VkFlags VkSampleCountFlags;

VkSampleCountFlags is a bitmask type for setting a mask of zero or more VkSampleCountFlagBits.

The VkPhysicalDeviceMultiviewProperties structure is defined as:

// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMultiviewProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t maxMultiviewViewCount;
    uint32_t maxMultiviewInstanceIndex;
} VkPhysicalDeviceMultiviewProperties;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **maxMultiviewViewCount** is one greater than the maximum view index that can be used in a subpass.
- **maxMultiviewInstanceIndex** is the maximum valid value of instance index allowed to be generated by a drawing command recorded within a subpass of a multiview render pass instance.

If the VkPhysicalDeviceMultiviewProperties structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.
**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceMultiviewProperties-sType-sType**  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_PROPERTIES`

The `VkPhysicalDeviceFloatControlsProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceFloatControlsProperties {
    VkStructureType sType;
    void* pNext;
    VkShaderFloatControlsIndependence denormBehaviorIndependence;
    VkShaderFloatControlsIndependence roundingModeIndependence;
    VkBool32 shaderSignedZeroInfNanPreserveFloat16;
    VkBool32 shaderSignedZeroInfNanPreserveFloat32;
    VkBool32 shaderSignedZeroInfNanPreserveFloat64;
    VkBool32 shaderDenormPreserveFloat16;
    VkBool32 shaderDenormPreserveFloat32;
    VkBool32 shaderDenormPreserveFloat64;
    VkBool32 shaderDenormFlushToZeroFloat16;
    VkBool32 shaderDenormFlushToZeroFloat32;
    VkBool32 shaderDenormFlushToZeroFloat64;
    VkBool32 shaderRoundingModeRTEFloat16;
    VkBool32 shaderRoundingModeRTEFloat32;
    VkBool32 shaderRoundingModeRTZFloat16;
    VkBool32 shaderRoundingModeRTZFloat32;
    VkBool32 shaderRoundingModeRTZFloat64;
} VkPhysicalDeviceFloatControlsProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `denormBehaviorIndependence` is a `VkShaderFloatControlsIndependence` value indicating whether, and how, denorm behavior can be set independently for different bit widths.
- `roundingModeIndependence` is a `VkShaderFloatControlsIndependence` value indicating whether, and how, rounding modes can be set independently for different bit widths.
- `shaderSignedZeroInfNanPreserveFloat16` is a boolean value indicating whether sign of a zero, Nans and \(±\infty\) can be preserved in 16-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode can be used for 16-bit floating-point types.
- `shaderSignedZeroInfNanPreserveFloat32` is a boolean value indicating whether sign of a zero, Nans and \(±\infty\) can be preserved in 32-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode can be used for 32-bit floating-point types.
- `shaderSignedZeroInfNanPreserveFloat64` is a boolean value indicating whether sign of a zero, Nans and \(±\infty\) can be preserved in 64-bit floating-point computations. It also indicates whether
the SignedZeroInfNanPreserve execution mode can be used for 64-bit floating-point types.

- shaderDenormPreserveFloat16 is a boolean value indicating whether denormals can be preserved in 16-bit floating-point computations. It also indicates whether the DenormPreserve execution mode can be used for 16-bit floating-point types.

- shaderDenormPreserveFloat32 is a boolean value indicating whether denormals can be preserved in 32-bit floating-point computations. It also indicates whether the DenormPreserve execution mode can be used for 32-bit floating-point types.

- shaderDenormPreserveFloat64 is a boolean value indicating whether denormals can be preserved in 64-bit floating-point computations. It also indicates whether the DenormPreserve execution mode can be used for 64-bit floating-point types.

- shaderDenormFlushToZeroFloat16 is a boolean value indicating whether denormals can be flushed to zero in 16-bit floating-point computations. It also indicates whether the DenormFlushToZero execution mode can be used for 16-bit floating-point types.

- shaderDenormFlushToZeroFloat32 is a boolean value indicating whether denormals can be flushed to zero in 32-bit floating-point computations. It also indicates whether the DenormFlushToZero execution mode can be used for 32-bit floating-point types.

- shaderDenormFlushToZeroFloat64 is a boolean value indicating whether denormals can be flushed to zero in 64-bit floating-point computations. It also indicates whether the DenormFlushToZero execution mode can be used for 64-bit floating-point types.

- shaderRoundingModeRTEFloat16 is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTE execution mode can be used for 16-bit floating-point types.

- shaderRoundingModeRTEFloat32 is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTE execution mode can be used for 32-bit floating-point types.

- shaderRoundingModeRTEFloat64 is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTE execution mode can be used for 64-bit floating-point types.

- shaderRoundingModeRTZFloat16 is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTZ execution mode can be used for 16-bit floating-point types.

- shaderRoundingModeRTZFloat32 is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTZ execution mode can be used for 32-bit floating-point types.

- shaderRoundingModeRTZFloat64 is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTZ execution mode can be used for 64-bit floating-point types.
If the `VkPhysicalDeviceFloatControlsProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceFloatControlsProperties-sType-sType**
  
  sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FLOAT_CONTROLS_PROPERTIES`

Values which may be returned in the `denormBehaviorIndependence` and `roundingModeIndependence` fields of `VkPhysicalDeviceFloatControlsProperties` are:

```c
typedef enum VkShaderFloatControlsIndependence {
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY = 0,
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_ALL = 1,
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE = 2,
} VkShaderFloatControlsIndependence;
```

- **VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY** specifies that shader float controls for 32-bit floating point can be set independently; other bit widths must be set identically to each other.
- **VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_ALL** specifies that shader float controls for all bit widths can be set independently.
- **VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE** specifies that shader float controls for all bit widths must be set identically.

The `VkPhysicalDeviceDiscardRectanglePropertiesEXT` structure is defined as:

```c
typedef struct VkPhysicalDeviceDiscardRectanglePropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t maxDiscardRectangles;
} VkPhysicalDeviceDiscardRectanglePropertiesEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **maxDiscardRectangles** is the maximum number of active discard rectangles that can be specified.

If the `VkPhysicalDeviceDiscardRectanglePropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.
Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceSampleLocationsPropertiesEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLE_LOCATIONS_PROPERTIES_EXT`

The `VkPhysicalDeviceSampleLocationsPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkPhysicalDeviceSampleLocationsPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkSampleCountFlags sampleLocationSampleCounts;
    VkExtent2D maxSampleLocationGridSize;
    float sampleLocationCoordinateRange[2];
    uint32_t sampleLocationSubPixelBits;
    VkBool32 variableSampleLocations;
} VkPhysicalDeviceSampleLocationsPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `sampleLocationSampleCounts` is a bitmask of `VkSampleCountFlagBits` indicating the sample counts supporting custom sample locations.
- `maxSampleLocationGridSize` is the maximum size of the pixel grid in which sample locations can vary that is supported for all sample counts in `sampleLocationSampleCounts`.
- `sampleLocationCoordinateRange[2]` is the range of supported sample location coordinates.
- `sampleLocationSubPixelBits` is the number of bits of subpixel precision for sample locations.
- `variableSampleLocations` specifies whether the sample locations used by all pipelines that will be bound to a command buffer during a subpass must match. If set to `VK_TRUE`, the implementation supports variable sample locations in a subpass. If set to `VK_FALSE`, then the sample locations must stay constant in each subpass.

If the `VkPhysicalDeviceSampleLocationsPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceSampleLocationsPropertiesEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLE_LOCATIONS_PROPERTIES_EXT`

The `VkPhysicalDeviceExternalMemoryHostPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_external_memory_host
```
typedef struct VkPhysicalDeviceExternalMemoryHostPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize minImportedHostPointerAlignment;
} VkPhysicalDeviceExternalMemoryHostPropertiesEXT;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **minImportedHostPointerAlignment** is the minimum **required** alignment, in bytes, for the base address and size of host pointers that **can** be imported to a Vulkan memory object. The value **must** be a power of two.

If the `VkPhysicalDeviceExternalMemoryHostPropertiesEXT` structure is included in the **pNext** chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

• VUID-VkPhysicalDeviceExternalMemoryHostPropertiesEXT-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_HOST_PROPERTIES_EXT`

The `VkPhysicalDevicePointClippingProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDevicePointClippingProperties {
    VkStructureType sType;
    void* pNext;
    VkPointClippingBehavior pointClippingBehavior;
} VkPhysicalDevicePointClippingProperties;
```

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **pointClippingBehavior** is a `VkPointClippingBehavior` value specifying the point clipping behavior supported by the implementation.

If the `VkPhysicalDevicePointClippingProperties` structure is included in the **pNext** chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

• VUID-VkPhysicalDevicePointClippingProperties-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_POINT_CLIPPING_PROPERTIES`
The `VkPhysicalDeviceSubgroupProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceSubgroupProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t subgroupSize;
    VkShaderStageFlags supportedStages;
    VkSubgroupFeatureFlags supportedOperations;
    VkBool32 quadOperationsInAllStages;
} VkPhysicalDeviceSubgroupProperties;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **subgroupSize** is the default number of invocations in each subgroup. `subgroupSize` is at least 1 if any of the physical device’s queues support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT. `subgroupSize` is a power-of-two.
- **supportedStages** is a bitfield of `VkShaderStageFlagBits` describing the shader stages that group operations with subgroup scope are supported in. `supportedStages` will have the VK_SHADER_STAGE_COMPUTE_BIT bit set if any of the physical device’s queues support VK_QUEUE_COMPUTE_BIT.
- **supportedOperations** is a bitmask of `VkSubgroupFeatureFlagBits` specifying the sets of group operations with subgroup scope supported on this device. `supportedOperations` will have the VK_SUBGROUP_FEATURE_BASIC_BIT bit set if any of the physical device’s queues support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT.
- **quadOperationsInAllStages** is a boolean specifying whether quad group operations are available in all stages, or are restricted to fragment and compute stages.

If the `VkPhysicalDeviceSubgroupProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

If `supportedOperations` includes VK_SUBGROUP_FEATURE_QUAD_BIT, subgroupSize must be greater than or equal to 4.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceSubgroupProperties-sType-sType**
  
  `sType` must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_PROPERTIES

Bits which can be set in `VkPhysicalDeviceSubgroupProperties::supportedOperations` and `VkPhysicalDeviceVulkan11Properties::subgroupSupportedOperations` to specify supported group operations with subgroup scope are:
typedef
enum VkSubgroupFeatureFlagBits {
    VK_SUBGROUP_FEATURE_BASIC_BIT   = 0x00000001,
    VK_SUBGROUP_FEATURE_VOTE_BIT    = 0x00000002,
    VK_SUBGROUP_FEATURE_ARITHMETIC_BIT = 0x00000004,
    VK_SUBGROUP_FEATURE_BALLOT_BIT  = 0x00000008,
    VK_SUBGROUP_FEATURE_SHUFFLE_BIT = 0x00000010,
    VK_SUBGROUP_FEATURE_SHUFFLE_RELATIVE_BIT = 0x00000020,
    VK_SUBGROUP_FEATURE_CLUSTERED_BIT = 0x00000040,
    VK_SUBGROUP_FEATURE_QUAD_BIT    = 0x00000080,
} VkSubgroupFeatureFlagBits;

- VK_SUBGROUP_FEATURE_BASIC_BIT specifies the device will accept SPIR-V shader modules containing the GroupNonUniform capability.
- VK_SUBGROUP_FEATURE_VOTE_BIT specifies the device will accept SPIR-V shader modules containing the GroupNonUniformVote capability.
- VK_SUBGROUP_FEATURE_ARITHMETIC_BIT specifies the device will accept SPIR-V shader modules containing the GroupNonUniformArithmetic capability.
- VK_SUBGROUP_FEATURE_BALLOT_BIT specifies the device will accept SPIR-V shader modules containing the GroupNonUniformBallot capability.
- VK_SUBGROUP_FEATURE_SHUFFLE_BIT specifies the device will accept SPIR-V shader modules containing the GroupNonUniformShuffle capability.
- VK_SUBGROUP_FEATURE_SHUFFLE_RELATIVE_BIT specifies the device will accept SPIR-V shader modules containing the GroupNonUniformShuffleRelative capability.
- VK_SUBGROUP_FEATURE_CLUSTERED_BIT specifies the device will accept SPIR-V shader modules containing the GroupNonUniformClustered capability.
- VK_SUBGROUP_FEATURE_QUAD_BIT specifies the device will accept SPIR-V shader modules containing the GroupNonUniformQuad capability.

typedef VkFlags VkSubgroupFeatureFlags;

VkSubgroupFeatureFlags is a bitmask type for setting a mask of zero or more VkSubgroupFeatureFlagBits.

The VkPhysicalDeviceSubgroupSizeControlProperties structure is defined as:

typedef struct VkPhysicalDeviceSubgroupSizeControlProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t minSubgroupSize;
    uint32_t maxSubgroupSize;
    uint32_t maxComputeWorkgroupSubgroups;
    VkShaderStageFlags requiredSubgroupSizeStages;
} VkPhysicalDeviceSubgroupSizeControlProperties;
VkPhysicalDeviceSubgroupSizeControlProperties;

or the equivalent

```c
// Provided by VK_EXT_subgroup_size_control
typedef VkPhysicalDeviceSubgroupSizeControlProperties
    VkPhysicalDeviceSubgroupSizeControlPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `minSubgroupSize` is the minimum subgroup size supported by this device. `minSubgroupSize` is at least one if any of the physical device’s queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `minSubgroupSize` is a power-of-two. `minSubgroupSize` is less than or equal to `maxSubgroupSize`. `minSubgroupSize` is less than or equal to `subgroupSize`.

- `maxSubgroupSize` is the maximum subgroup size supported by this device. `maxSubgroupSize` is at least one if any of the physical device’s queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `maxSubgroupSize` is a power-of-two. `maxSubgroupSize` is greater than or equal to `minSubgroupSize`. `maxSubgroupSize` is greater than or equal to `subgroupSize`.

- `maxComputeWorkgroupSubgroups` is the maximum number of subgroups supported by the implementation within a workgroup.

- `requiredSubgroupSizeStages` is a bitfield of what shader stages support having a required subgroup size specified.

If the `VkPhysicalDeviceSubgroupSizeControlProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

If `VkPhysicalDeviceSubgroupProperties::supportedOperations` includes `VK_SUBGROUP_FEATURE_QUAD_BIT`, `minSubgroupSize` must be greater than or equal to 4.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceSubgroupSizeControlProperties-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_PROPERTIES`

The `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t advancedBlendMaxColorAttachments;
    VkBool32 advancedBlendIndependentBlend;
    VkBool32 advancedBlendNonPremultipliedSrcColor;
};
```
VkBool32 advancedBlendNonPremultipliedDstColor;
VkBool32 advancedBlendCorrelatedOverlap;
VkBool32 advancedBlendAllOperations;
}

VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• advancedBlendMaxColorAttachments is one greater than the highest color attachment index that can be used in a subpass, for a pipeline that uses an advanced blend operation.
• advancedBlendIndependentBlend specifies whether advanced blend operations can vary per-attachment.
• advancedBlendNonPremultipliedSrcColor specifies whether the source color can be treated as non-premultiplied. If this is VK_FALSE, then VkPipelineColorBlendAdvancedStateCreateInfoEXT::srcPremultiplied must be VK_TRUE.
• advancedBlendNonPremultipliedDstColor specifies whether the destination color can be treated as non-premultiplied. If this is VK_FALSE, then VkPipelineColorBlendAdvancedStateCreateInfoEXT::dstPremultiplied must be VK_TRUE.
• advancedBlendCorrelatedOverlap specifies whether the overlap mode can be treated as correlated. If this is VK_FALSE, then VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap must be VK_BLEND_OVERLAP_UNCORRELATED_EXT.
• advancedBlendAllOperations specifies whether all advanced blend operation enums are supported. See the valid usage of VkPipelineColorBlendAttachmentState.

If the VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT-sType-sType

The VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT structure is defined as:

```
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t maxVertexAttribDivisor;
} VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT;
```

• sType is a VkStructureType value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `maxVertexAttribDivisor` is the maximum value of the number of instances that will repeat the value of vertex attribute data when instanced rendering is enabled.

If the `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

• `VUID-VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_PROPERTIES_EXT`.

The `VkPhysicalDeviceSamplerFilterMinmaxProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceSamplerFilterMinmaxProperties {
    VkStructureType sType;
    void* pNext;
    VkBool32 filterMinmaxSingleComponentFormats;
    VkBool32 filterMinmaxImageComponentMapping;
} VkPhysicalDeviceSamplerFilterMinmaxProperties;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `filterMinmaxSingleComponentFormats` is a boolean value indicating whether a minimum set of required formats support min/max filtering.

• `filterMinmaxImageComponentMapping` is a boolean value indicating whether the implementation supports non-identity component mapping of the image when doing min/max filtering.

If the `VkPhysicalDeviceSamplerFilterMinmaxProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

If `filterMinmaxSingleComponentFormats` is `VK_TRUE`, the following formats must support the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT` feature with `VK_IMAGE_TILING_OPTIMAL`, if they support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`:

• `VK_FORMAT_R8_UNORM`
• `VK_FORMAT_R8_SNORM`
• `VK_FORMAT_R16_UNORM`
• `VK_FORMAT_R16_SNORM`
• `VK_FORMAT_R16_SFLOAT`
• VK_FORMAT_R32_SFLOAT
• VK_FORMAT_D16_UNORM
• VK_FORMAT_X8_D24_UNORM_PACK32
• VK_FORMAT_D32_SFLOAT
• VK_FORMAT_D16_UNORM_S8_UINT
• VK_FORMAT_D24_UNORM_S8_UINT
• VK_FORMAT_D32_SFLOAT_S8_UINT

If the format is a depth/stencil format, this bit only specifies that the depth aspect (not the stencil aspect) of an image of this format supports min/max filtering, and that min/max filtering of the depth aspect is supported when depth compare is disabled in the sampler.

If filterMinmaxImageComponentMapping is VK_FALSE the component mapping of the image view used with min/max filtering must have been created with the r component set to the identity swizzle. Only the r component of the sampled image value is defined and the other component values are undefined. If filterMinmaxImageComponentMapping is VK_TRUE this restriction does not apply and image component mapping works as normal.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceSamplerFilterMinmaxProperties-sType-sType

sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLER_FILTER_MINMAX_PROPERTIES

The VkPhysicalDeviceProtectedMemoryProperties structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProtectedMemoryProperties {
    VkStructureType sType;
    void* pNext;
    VkBool32 protectedNoFault;
} VkPhysicalDeviceProtectedMemoryProperties;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• protectedNoFault specifies how an implementation behaves when an application attempts to write to unprotected memory in a protected queue operation, read from protected memory in an unprotected queue operation, or perform a query in a protected queue operation. If this limit is VK_TRUE, such writes will be discarded or have undefined values written, reads and queries will return undefined values. If this limit is VK_FALSE, applications must not perform these operations. See Protected Memory Access Rules for more information.

If the VkPhysicalDeviceProtectedMemoryProperties structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with
The VkPhysicalDeviceMaintenance3Properties structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMaintenance3Properties {
    VkStructureType sType;
    void* pNext;
    uint32_t maxPerSetDescriptors;
    VkDeviceSize maxMemoryAllocationSize;
} VkPhysicalDeviceMaintenance3Properties;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **maxPerSetDescriptors** is a maximum number of descriptors (summed over all descriptor types) in a single descriptor set that is guaranteed to satisfy any implementation-dependent constraints on the size of a descriptor set itself. Applications can query whether a descriptor set that goes beyond this limit is supported using vkGetDescriptorSetLayoutSupport.
- **maxMemoryAllocationSize** is the maximum size of a memory allocation that can be created, even if there is more space available in the heap.

If the VkPhysicalDeviceMaintenance3Properties structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

The VkPhysicalDeviceDescriptorIndexingProperties structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDescriptorIndexingProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t maxUpdateAfterBindDescriptorsInAllPools;
    VkBool32 shaderUniformBufferArrayNonUniformIndexingNative;
    VkBool32 shaderSampledImageArrayNonUniformIndexingNative;
} VkPhysicalDeviceDescriptorIndexingProperties;
```

- **sType** must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_3_PROPERTIES
```
VkBool32 shaderStorageBufferArrayNonUniformIndexingNative;
VkBool32 shaderStorageImageArrayNonUniformIndexingNative;
VkBool32 shaderInputAttachmentArrayNonUniformIndexingNative;
VkBool32 robustBufferAccessUpdateAfterBind;
VkBool32 quadDivergentImplicitLod;
uint32_t maxPerStageDescriptorUpdateAfterBindSamplers;
uint32_t maxPerStageDescriptorUpdateAfterBindUniformBuffers;
uint32_t maxPerStageDescriptorUpdateAfterBindStorageBuffers;
uint32_t maxPerStageDescriptorUpdateAfterBindSampledImages;
uint32_t maxPerStageDescriptorUpdateAfterBindStorageImages;
uint32_t maxPerStageDescriptorUpdateAfterBindInputAttachments;
uint32_t maxPerStageUpdateAfterBindResources;
uint32_t maxPerStageDesUpdateAfterBindSamplers;
uint32_t maxPerStageDesUpdateAfterBindUniformBuffers;
uint32_t maxPerStageDesUpdateAfterBindUniformBuffersDynamic;
uint32_t maxPerStageDesUpdateAfterBindStorageBuffers;
uint32_t maxPerStageDesUpdateAfterBindStorageBuffersDynamic;
uint32_t maxPerStageDesUpdateAfterBindSampledImages;
uint32_t maxPerStageDesUpdateAfterBindStorageImages;
uint32_t maxPerStageDesUpdateAfterBindInputAttachments;

} VkPhysicalDeviceDescriptorIndexingProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `maxUpdateAfterBindDescriptorsInAllPools` is the maximum number of descriptors (summed over all descriptor types) that can be created across all pools that are created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set. Pool creation may fail when this limit is exceeded, or when the space this limit represents is unable to satisfy a pool creation due to fragmentation.

- `shaderUniformBufferArrayNonUniformIndexingNative` is a boolean value indicating whether uniform buffer descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of uniform buffers may execute multiple times in order to access all the descriptors.

- `shaderSampledImageArrayNonUniformIndexingNative` is a boolean value indicating whether sampler and image descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of samplers or images may execute multiple times in order to access all the descriptors.

- `shaderStorageBufferArrayNonUniformIndexingNative` is a boolean value indicating whether storage buffer descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage buffers may execute multiple times in order to access all the descriptors.

- `shaderStorageImageArrayNonUniformIndexingNative` is a boolean value indicating whether storage image descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage images may execute multiple times in order to access all the descriptors.
• `shaderInputAttachmentArrayNonUniformIndexingNative` is a boolean value indicating whether input attachment descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of input attachments may execute multiple times in order to access all the descriptors.

• `robustBufferAccessUpdateAfterBind` is a boolean value indicating whether `robustBufferAccess` can be enabled on a device simultaneously with `descriptorBindingUniformBufferUpdateAfterBind`, `descriptorBindingStorageBufferUpdateAfterBind`, `descriptorBindingUniformTexelBufferUpdateAfterBind`, and/or `descriptorBindingStorageTexelBufferUpdateAfterBind`. If this is `VK_FALSE`, then either `robustBufferAccess` must be disabled or all of these update-after-bind features must be disabled.

• `quadDivergentImplicitLod` is a boolean value indicating whether implicit LOD calculations for image operations have well-defined results when the image and/or sampler objects used for the instruction are not uniform within a quad. See Derivative Image Operations.

• `maxPerStageDescriptorUpdateAfterBindSamplers` is similar to `maxPerStageDescriptorSamplers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxPerStageDescriptorUpdateAfterBindUniformBuffers` is similar to `maxPerStageDescriptorUniformBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxPerStageDescriptorUpdateAfterBindStorageBuffers` is similar to `maxPerStageDescriptorStorageBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxPerStageDescriptorUpdateAfterBindSampledImages` is similar to `maxPerStageDescriptorSampledImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxPerStageDescriptorUpdateAfterBindStorageImages` is similar to `maxPerStageDescriptorStorageImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxPerStageDescriptorUpdateAfterBindInputAttachments` is similar to `maxPerStageDescriptorInputAttachments` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxPerStageUpdateAfterBindResources` is similar to `maxPerStageResources` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxDescriptorSetUpdateAfterBindSamplers` is similar to `maxDescriptorSetSamplers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxDescriptorSetUpdateAfterBindUniformBuffers` is similar to `maxDescriptorSetUniformBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• `maxDescriptorSetUpdateAfterBindStorageBuffersDynamic` is similar to `maxDescriptorSetUniformBuffersDynamic` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
application can allocate dynamic uniform buffer descriptors from a pool created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

- `maxDescriptorSetUpdateAfterBindStorageBuffers` is similar to `maxDescriptorSetStorageBuffers` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- `maxDescriptorSetUpdateAfterBindStorageBuffersDynamic` is similar to `maxDescriptorSetStorageBuffersDynamic` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set. While an application can allocate dynamic storage buffer descriptors from a pool created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

- `maxDescriptorSetUpdateAfterBindSampledImages` is similar to `maxDescriptorSetSampledImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- `maxDescriptorSetUpdateAfterBindStorageImages` is similar to `maxDescriptorSetStorageImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- `maxDescriptorSetUpdateAfterBindInputAttachments` is similar to `maxDescriptorSetInputAttachments` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

If the `VkPhysicalDeviceDescriptorIndexingProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceDescriptorIndexingProperties-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_INDEXING_PROPERTIES`.

The `VkPhysicalDeviceConservativeRasterizationPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_conservative_rasterization
typedef struct VkPhysicalDeviceConservativeRasterizationPropertiesEXT {
    VkStructureType      sType;
    void*                 pNext;
    float                 primitiveOverestimationSize;
    float                 maxExtraPrimitiveOverestimationSize;
    float                 extraPrimitiveOverestimationSizeGranularity;
    VkBool32              primitiveUnderestimation;
    VkBool32              conservativePointAndLineRasterization;
    VkBool32              degenerateTrianglesRasterized;
} VkPhysicalDeviceConservativeRasterizationPropertiesEXT;
```
```c
VkBool32 degenerateLinesRasterized;
VkBool32 fullyCoveredFragmentShaderInputVariable;
VkBool32 conservativeRasterizationPostDepthCoverage;
}

VkPhysicalDeviceConservativeRasterizationPropertiesEXT
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `primitiveOverestimationSize` is the size in pixels the generating primitive is increased at each of its edges during conservative rasterization overestimation mode. Even with a size of 0.0, conservative rasterization overestimation rules still apply and if any part of the pixel rectangle is covered by the generating primitive, fragments are generated for the entire pixel. However implementations may make the pixel coverage area even more conservative by increasing the size of the generating primitive.
- `maxExtraPrimitiveOverestimationSize` is the maximum size in pixels of extra overestimation the implementation supports in the pipeline state. A value of 0.0 means the implementation does not support any additional overestimation of the generating primitive during conservative rasterization. A value above 0.0 allows the application to further increase the size of the generating primitive during conservative rasterization overestimation.
- `extraPrimitiveOverestimationSizeGranularity` is the granularity of extra overestimation that can be specified in the pipeline state between 0.0 and `maxExtraPrimitiveOverestimationSize` inclusive. A value of 0.0 means the implementation can use the smallest representable non-zero value in the screen space pixel fixed-point grid.
- `primitiveUnderestimation` is `VK_TRUE` if the implementation supports the `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` conservative rasterization mode in addition to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`. Otherwise the implementation only supports `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`.
- `conservativePointAndLineRasterization` is `VK_TRUE` if the implementation supports conservative rasterization of point and line primitives as well as triangle primitives. Otherwise the implementation only supports triangle primitives.
- `degenerateTrianglesRasterized` is `VK_FALSE` if the implementation culls primitives generated from triangles that become zero area after they are quantized to the fixed-point rasterization pixel grid. `degenerateTrianglesRasterized` is `VK_TRUE` if these primitives are not culled and the provoking vertex attributes and depth value are used for the fragments. The primitive area calculation is done on the primitive generated from the clipped triangle if applicable. Zero area primitives are backfacing and the application can enable backface culling if desired.
- `degenerateLinesRasterized` is `VK_FALSE` if the implementation culls lines that become zero length after they are quantized to the fixed-point rasterization pixel grid. `degenerateLinesRasterized` is `VK_TRUE` if zero length lines are not culled and the provoking vertex attributes and depth value are used for the fragments.
- `fullyCoveredFragmentShaderInputVariable` is `VK_TRUE` if the implementation supports the SPIR-V builtin fragment shader input variable `FullyCoveredEXT` specifying that conservative rasterization is enabled and the fragment area is fully covered by the generating primitive.
- `conservativeRasterizationPostDepthCoverage` is `VK_TRUE` if the implementation supports conservative rasterization with the `PostDepthCoverage` execution mode enabled. Otherwise the
**PostDepthCoverage** execution mode **must** not be used when conservative rasterization is enabled.

If the `VkPhysicalDeviceConservativeRasterizationPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceConservativeRasterizationPropertiesEXT-sType-sType**

  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CONSERVATIVE_RASTERIZATION_PROPERTIES_EXT`.

The `VkPhysicalDeviceDepthStencilResolveProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDepthStencilResolveProperties {
    VkStructureType sType;
    void* pNext;
    VkResolveModeFlags supportedDepthResolveModes;
    VkResolveModeFlags supportedStencilResolveModes;
    VkBool32 independentResolveNone;
    VkBool32 independentResolve;
} VkPhysicalDeviceDepthStencilResolveProperties;
```

- **sType** is a `VkStructureType` value identifying this structure.

- **pNext** is `NULL` or a pointer to a structure extending this structure.

- **supportedDepthResolveModes** is a bitmask of `VkResolveModeFlagBits` indicating the set of supported depth resolve modes. A value of `VK_RESOLVE_MODE_NONE` indicates that depth resolve operations are disallowed [SCID-8]. If any bits are set then `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` must be included in the set but implementations may support additional modes.

- **supportedStencilResolveModes** is a bitmask of `VkResolveModeFlagBits` indicating the set of supported stencil resolve modes. A value of `VK_RESOLVE_MODE_NONE` indicates that stencil resolve operations are disallowed [SCID-8]. If any bits are set then `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` must be included in the set but implementations may support additional modes. `VK_RESOLVE_MODE_AVERAGE_BIT` must not be included in the set.

- **independentResolveNone** is `VK_TRUE` if the implementation supports setting the depth and stencil resolve modes to different values when one of those modes is `VK_RESOLVE_MODE_NONE`. Otherwise the implementation only supports setting both modes to the same value.

- **independentResolve** is `VK_TRUE` if the implementation supports all combinations of the supported depth and stencil resolve modes, including setting either depth or stencil resolve mode to `VK_RESOLVE_MODE_NONE`. An implementation that supports `independentResolve` must also support `independentResolveNone`.

If the `VkPhysicalDeviceDepthStencilResolveProperties` structure is included in the `pNext` chain of the
The **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceDepthStencilResolveProperties-sType-sType**
  
  
  sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_STENCIL_RESOLVE_PROPERTIES**

The **VkPhysicalDevicePerformanceQueryPropertiesKHR** structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPhysicalDevicePerformanceQueryPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           allowCommandBufferQueryCopies;
} VkPhysicalDevicePerformanceQueryPropertiesKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.

- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **allowCommandBufferQueryCopies** is **VK_TRUE** if the performance query pools are allowed to be used with **vkCmdCopyQueryPoolResults**.

If the **VkPhysicalDevicePerformanceQueryPropertiesKHR** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDevicePerformanceQueryPropertiesKHR-sType-sType**

  
  
  sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_PROPERTIES_KHR**

The **VkPhysicalDeviceTexelBufferAlignmentProperties** structure is defined as:

```c
typedef struct VkPhysicalDeviceTexelBufferAlignmentProperties {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize       storageTexelBufferOffsetAlignmentBytes;
    VkBool32           storageTexelBufferOffsetSingleTexelAlignment;
    VkDeviceSize       uniformTexelBufferOffsetAlignmentBytes;
    VkBool32           uniformTexelBufferOffsetSingleTexelAlignment;
} VkPhysicalDeviceTexelBufferAlignmentProperties;
```

or the equivalent
typedef VkPhysicalDeviceTexelBufferAlignmentProperties
VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT;

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `storageTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a storage texel buffer of any format. The value **must** be a power of two.
• `storageTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a storage texel buffer of any format.
• `uniformTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a uniform texel buffer of any format. The value **must** be a power of two.
• `uniformTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a uniform texel buffer of any format.

If the `VkPhysicalDeviceTexelBufferAlignmentProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

If the single texel alignment property is `VK_FALSE`, then the buffer view's offset **must** be aligned to the corresponding byte alignment value. If the single texel alignment property is `VK_TRUE`, then the buffer view's offset **must** be aligned to the lesser of the corresponding byte alignment value or the size of a single texel, based on `VkBufferViewCreateInfo::format`. If the size of a single texel is a multiple of three bytes, then the size of a single component of the format is used instead.

These limits **must** not advertise a larger alignment than the **required** maximum minimum value of `VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`, for any format that supports use as a texel buffer.

---

**Valid Usage (Implicit)**

• VUID-VkPhysicalDeviceTexelBufferAlignmentProperties-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXEL_BUFFER_ALIGNMENT_PROPERTIES`

The `VkPhysicalDeviceTimelineSemaphoreProperties` structure is defined as:

typedef struct VkPhysicalDeviceTimelineSemaphoreProperties {
    VkStructureType sType;
    void* pNext;
    uint64_t maxTimelineSemaphoreValueDifference;
} VkPhysicalDeviceTimelineSemaphoreProperties;

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `maxTimelineSemaphoreValueDifference` indicates the maximum difference allowed by the implementation between the current value of a timeline semaphore and any pending signal or wait operations.

If the `VkPhysicalDeviceTimelineSemaphoreProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

• `VUID-VkPhysicalDeviceTimelineSemaphoreProperties-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TIMELINE_SEMAPHORE_PROPERTIES`.

The `VkPhysicalDeviceLineRasterizationPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_line_rasterization
typedef struct VkPhysicalDeviceLineRasterizationPropertiesEXT {
    VkStructureType   sType;
    void*             pNext;
    uint32_t          lineSubPixelPrecisionBits;
} VkPhysicalDeviceLineRasterizationPropertiesEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `lineSubPixelPrecisionBits` is the number of bits of subpixel precision in framebuffer coordinates \(x_f\) and \(y_f\) when rasterizing line segments.

If the `VkPhysicalDeviceLineRasterizationPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

• `VUID-VkPhysicalDeviceLineRasterizationPropertiesEXT-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_PROPERTIES_EXT`.

The `VkPhysicalDeviceRobustness2PropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_robustness2
typedef struct VkPhysicalDeviceRobustness2PropertiesEXT {
    VkStructureType       sType;
    void*                 pNext;
    VkDeviceSize          robustStorageBufferAccessSizeAlignment;
} VkPhysicalDeviceRobustness2PropertiesEXT;
```
VkDeviceSize robustUniformBufferAccessSizeAlignment;

{ VkPhysicalDeviceRobustness2PropertiesEXT;

• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **robustStorageBufferAccessSizeAlignment** is the number of bytes that the range of a storage buffer descriptor is rounded up to when used for bounds-checking when the **robustBufferAccess2** feature is enabled. This value **must** be either 1 or 4.
• **robustUniformBufferAccessSizeAlignment** is the number of bytes that the range of a uniform buffer descriptor is rounded up to when used for bounds-checking when the **robustBufferAccess2** feature is enabled. This value **must** be a power of two in the range [1, 256].

If the **VkPhysicalDeviceRobustness2PropertiesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

• VUID-VkPhysicalDeviceRobustness2PropertiesEXT-sType-sType
  sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_PROPERTIES_EXT**

The **VkPhysicalDeviceFragmentShadingRatePropertiesKHR** structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRatePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkExtent2D minFragmentShadingRateAttachmentTexelSize;
    VkExtent2D maxFragmentShadingRateAttachmentTexelSize;
    uint32_t maxFragmentShadingRateAttachmentTexelSizeAspectRatio;
    VkBool32 primitiveFragmentShadingRateWithMultipleViewports;
    VkBool32 layeredShadingRateAttachments;
    VkBool32 fragmentShadingRateNonTrivialCombinerOps;
    VkExtent2D maxFragmentSize;
    uint32_t maxFragmentSizeAspectRatio;
    uint32_t maxFragmentShadingRateCoverageSamples;
    VkSampleCountFlagBits maxFragmentShadingRateRasterizationSamples;
    VkBool32 fragmentShadingRateWithShaderDepthStencilWrites;
    VkBool32 fragmentShadingRateWithSampleMask;
    VkBool32 fragmentShadingRateWithShaderSampleMask;
    VkBool32 fragmentShadingRateWithConservativeRasterization;
    VkBool32 fragmentShadingRateWithFragmentShaderInterlock;
    VkBool32 fragmentShadingRateWithCustomSampleLocations;
    VkBool32 fragmentShadingRateStrictMultiplyCombiner;
} VkPhysicalDeviceFragmentShadingRatePropertiesKHR;
```
• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `minFragmentShadingRateAttachmentTexelSize` indicates minimum supported width and height of the portion of the framebuffer corresponding to each texel in a fragment shading rate attachment. Each value must be less than or equal to the values in `maxFragmentShadingRateAttachmentTexelSize`. Each value must be a power-of-two. It must be (0,0) if the `attachmentFragmentShadingRate` feature is not supported.

• `maxFragmentShadingRateAttachmentTexelSize` indicates maximum supported width and height of the portion of the framebuffer corresponding to each texel in a fragment shading rate attachment. Each value must be greater than or equal to the values in `minFragmentShadingRateAttachmentTexelSize`. Each value must be a power-of-two. It must be (0,0) if the `attachmentFragmentShadingRate` feature is not supported.

• `maxFragmentShadingRateAttachmentTexelSizeAspectRatio` indicates the maximum ratio between the width and height of the portion of the framebuffer corresponding to each texel in a fragment shading rate attachment. `maxFragmentShadingRateAttachmentTexelSizeAspectRatio` must be a power-of-two value, and must be less than or equal to `max(maxFragmentShadingRateAttachmentTexelSize.width / minFragmentShadingRateAttachmentTexelSize.height, maxFragmentShadingRateAttachmentTexelSize.height / minFragmentShadingRateAttachmentTexelSize.width)`. It must be 0 if the `attachmentFragmentShadingRate` feature is not supported.

• `primitiveFragmentShadingRateWithMultipleViewports` specifies whether the primitive fragment shading rate can be used when multiple viewports are used. If this value is `VK_FALSE`, only a single viewport must be used, and applications must not write to the `ViewportIndex` built-in when setting `PrimitiveShadingRateKHR`. It must be `VK_FALSE` if the `shaderOutputViewportIndex` feature, or the `geometryShader` feature is not supported, or if the `primitiveFragmentShadingRate` feature is not supported.

• `layeredShadingRateAttachments` specifies whether a shading rate attachment image view can be created with multiple layers. If this value is `VK_FALSE`, when creating an image view with a usage that includes `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, layerCount must be 1. It must be `VK_FALSE` if the multiview feature, the `shaderOutputViewportIndex` feature, or the `geometryShader` feature is not supported, or if the `attachmentFragmentShadingRate` feature is not supported.

• `fragmentShadingRateNonTrivialCombinerOps` specifies whether `VkFragmentShadingRateCombinerOpKHR` enums other than `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR` can be used. It must be `VK_FALSE` unless either the `primitiveFragmentShadingRate` or `attachmentFragmentShadingRate` feature is supported.

• `maxFragmentSize` indicates the maximum supported width and height of a fragment. Its `width` and `height` members must both be power-of-two values. This limit is purely informational, and is not validated.

• `maxFragmentSizeAspectRatio` indicates the maximum ratio between the width and height of a fragment. `maxFragmentSizeAspectRatio` must be a power-of-two value, and must be less than or equal to the maximum of the `width` and `height` members of `maxFragmentSize`. This limit is purely
informational, and is not validated.

- **maxFragmentShadingRateCoverageSamples** specifies the maximum number of coverage samples supported in a single fragment. **maxFragmentShadingRateCoverageSamples must be** less than or equal to the product of the **width** and **height** members of **maxFragmentSize**, and the sample count reported by **maxFragmentShadingRateRasterizationSamples**. **maxFragmentShadingRateCoverageSamples must be** less than or equal to **maxSampleMaskWords** \( \times 32 \) if **fragmentShadingRateWithShaderSampleMask** is supported. This limit is purely informational, and is not validated.

- **maxFragmentShadingRateRasterizationSamples** is a **VkSampleCountFlagBits** value specifying the maximum sample rate supported when a fragment covers multiple pixels. This limit is purely informational, and is not validated.

- **fragmentShadingRateWithShaderDepthStencilWrites** specifies whether the implementation supports writing **FragDepth** or **FragStencilRefEXT** from a fragment shader for multi-pixel fragments. If this value is **VK_FALSE**, writing to those built-ins will clamp the fragment shading rate to (1,1).

- **fragmentShadingRateWithSampleMask** specifies whether the implementation supports setting valid bits of **VkPipelineMultisampleStateCreateInfo::pSampleMask** to 0 for multi-pixel fragments. If this value is **VK_FALSE**, zeroing valid bits in the sample mask will clamp the fragment shading rate to (1,1).

- **fragmentShadingRateWithShaderSampleMask** specifies whether the implementation supports reading or writing **SampleMask** for multi-pixel fragments. If this value is **VK_FALSE**, using that built-in will clamp the fragment shading rate to (1,1).

- **fragmentShadingRateWithConservativeRasterization** specifies whether **conservative rasterization** is supported for multi-pixel fragments. It **must be** **VK_FALSE** if **VK_EXT_conservative_rasterization** is not supported. If this value is **VK_FALSE**, using **conservative rasterization** will clamp the fragment shading rate to (1,1).

- **fragmentShadingRateWithFragmentShaderInterlock** specifies whether **fragment shader interlock** is supported for multi-pixel fragments. It **must be** **VK_FALSE** if **VK_EXT_fragment_shader_interlock** is not supported. If this value is **VK_FALSE**, using **fragment shader interlock** will clamp the fragment shading rate to (1,1).

- **fragmentShadingRateWithCustomSampleLocations** specifies whether **custom sample locations** are supported for multi-pixel fragments. It **must be** **VK_FALSE** if **VK_EXT_sample_locations** is not supported. If this value is **VK_FALSE**, using **custom sample locations** will clamp the fragment shading rate to (1,1).

- **fragmentShadingRateStrictMultiplyCombiner** specifies whether **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR** accurately performs a multiplication or not. Implementations where this value is **VK_FALSE** will instead combine rates with an addition. If **fragmentShadingRateNonTrivialCombinerOps** is **VK_FALSE**, implementations **must** report this as **VK_FALSE**. If **fragmentShadingRateNonTrivialCombinerOps** is **VK_TRUE**, implementations **should** report this as **VK_TRUE**.

**Note**
Multiplication of the combiner rates using the fragment width/height in linear space is equivalent to an addition of those values in log2 space. Some
implementations inadvertently implemented an addition in linear space due to unclear requirements originating outside of this specification. This resulted in `fragmentShadingRateStrictMultiplyCombiner` being added. Fortunately, this only affects situations where a rate of 1 in either dimension is combined with another rate of 1. All other combinations result in the exact same result as if multiplication was performed in linear space due to the clamping logic, and the fact that both the sum and product of 2 and 2 are equal. In many cases, this limit will not affect the correct operation of applications.

If the `VkPhysicalDeviceFragmentShadingRatePropertiesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties are related to fragment shading rates.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceFragmentShadingRatePropertiesKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_PROPERTIES_KHR`

The `VkPhysicalDeviceCustomBorderColorPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_custom_border_color
typedef struct VkPhysicalDeviceCustomBorderColorPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t maxCustomBorderColorSamplers;
} VkPhysicalDeviceCustomBorderColorPropertiesEXT;
```

- `maxCustomBorderColorSamplers` indicates the maximum number of samplers with custom border colors which can simultaneously exist on a device.

If the `VkPhysicalDeviceCustomBorderColorPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceCustomBorderColorPropertiesEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_PROPERTIES_EXT`

### 33.1. Limit Requirements

The following table specifies the **required** minimum/maximum for all Vulkan graphics implementations. Where a limit corresponds to a fine-grained device feature which is **optional**, the
feature name is listed with two **required** limits, one when the feature is supported and one when it is not supported. If an implementation supports a feature, the limits reported are the same whether or not the feature is enabled.

### Table 49. Required Limit Types

<td>256</td>
<td>min</td>
</tr>
<tr>
<td>maxCommandBufferSize</td>
<td>-</td>
<td>$2^{20}$</td>
<td>min</td>
</tr>
</tbody>
</table>

1. The **Limit Type** column specifies the limit is either the minimum limit all implementations **must** support, the maximum limit all implementations **must** support, or the exact value all implementations **must** support. For bitmasks a minimum limit is the least bits all implementations **must** set, but they **may** have additional bits set beyond this minimum.

2. The **maxPerStageResources** **must** be at least the smallest of the following:

   - the sum of the **maxPerStageDescriptorUniformBuffers**, **maxPerStageDescriptorStorageBuffers**, **maxPerStageDescriptorSampledImages**, **maxPerStageDescriptorStorageImages**, **maxPerStageDescriptorInputAttachments**, **maxColorAttachments** limits, or
   - 128.

It **may** not be possible to reach this limit in every stage.

3. See **maxViewportDimensions** for the **required** relationship to other limits.

4. See **viewportBoundsRange** for the **required** relationship to other limits.

5. The values **minInterpolationOffset** and **maxInterpolationOffset** describe the closed interval of supported interpolation offsets: $[\text{minInterpolationOffset}, \text{maxInterpolationOffset}]$. The ULP is determined by **subPixelInterpolationOffsetBits**. If **subPixelInterpolationOffsetBits** is 4, this provides increments of $(1/2^4) = 0.0625$, and thus the range of supported interpolation offsets would be $[-0.5, 0.4375]$.

6. The point size ULP is determined by **pointSizeGranularity**. If the **pointSizeGranularity** is 0.125, the range of supported point sizes **must** be at least $[1.0, 63.875]$.

7. The line width ULP is determined by **lineWidthGranularity**. If the **lineWidthGranularity** is 0.0625, the range of supported line widths **must** be at least $[1.0, 7.9375]$.

8. The minimum **maxDescriptorSet** limit is $n$ times the corresponding specification minimum **maxPerStageDescriptor** limit, where $n$ is the number of shader stages supported by the **VkPhysicalDevice**. If all shader stages are supported, $n = 6$ (vertex, tessellation control, tessellation evaluation, geometry, fragment, compute).
The `UpdateAfterBind` descriptor limits **must** each be greater than or equal to the corresponding non-`UpdateAfterBind` limit.

**maxFramebufferAttachments** **must** be greater than or equal to two times `maxColorAttachments` (for color and resolve attachments) plus one (for the depth/stencil attachment), or else **must** be equal to $2^{32} - 1$.

### 33.2. Additional Multisampling Capabilities

To query additional multisampling capabilities which **may** be supported for a specific sample count, beyond the minimum capabilities described for `Limits` above, call:

```c
// Provided by VK_EXT_sample_locations
void vkGetPhysicalDeviceMultisamplePropertiesEXT(
    VkPhysicalDevice physicalDevice,
    VkSampleCountFlagBits samples,
    VkMultisamplePropertiesEXT* pMultisampleProperties);
```

- **physicalDevice** is the physical device from which to query the additional multisampling capabilities.
- **samples** is a `VkSampleCountFlagBits` value specifying the sample count to query capabilities for.
- **pMultisampleProperties** is a pointer to a `VkMultisamplePropertiesEXT` structure in which information about additional multisampling capabilities specific to the sample count is returned.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceMultisamplePropertiesEXT-physicalDevice-parameter **physicalDevice** **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceMultisamplePropertiesEXT-samples-parameter **samples** **must** be a valid `VkSampleCountFlagBits` value
- VUID-vkGetPhysicalDeviceMultisamplePropertiesEXT-pMultisampleProperties-parameter **pMultisampleProperties** **must** be a valid pointer to a `VkMultisamplePropertiesEXT` structure

The `VkMultisamplePropertiesEXT` structure is defined as

```c
// Provided by VK_EXT_sample_locations
typedef struct VkMultisamplePropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkExtent2D maxSampleLocationGridSize;
} VkMultisamplePropertiesEXT;
```
VkMultisamplePropertiesEXT;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxSampleLocationGridSize` is the maximum size of the pixel grid in which sample locations can vary.

**Valid Usage (Implicit)**

- VUID-VkMultisamplePropertiesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_MULTISAMPLE_PROPERTIES_EXT`

- VUID-VkMultisamplePropertiesEXT-pNext-pNext
  
  `pNext` must be `NULL`

If the sample count for which additional multisampling capabilities are requested using `vkGetPhysicalDeviceMultisamplePropertiesEXT` is set in `sampleLocationSampleCounts` the `width` and `height` members of `VkMultisamplePropertiesEXT::maxSampleLocationGridSize` must be greater than or equal to the corresponding members of `maxSampleLocationGridSize`, respectively, otherwise both members must be 0.
Chapter 34. Formats

Supported buffer and image formats may vary across implementations. A minimum set of format features are guaranteed, but others must be explicitly queried before use to ensure they are supported by the implementation.

The features for the set of formats (VkFormat) supported by the implementation are queried individually using the vkGetPhysicalDeviceFormatProperties command.

34.1. Format Definition

The following image formats can be passed to, and may be returned from Vulkan commands. The memory required to store each format is discussed with that format, and also summarized in the Representation and Texel Block Size section and the Compatible formats table.

```c
// Provided by VK_VERSION_1_0

• **VK_FORMAT_A4R4G4B4_UNORM_PACK16** specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit R component in bits 12..15, a 4-bit G component in bits 8..11, a 4-bit B component in bits 4..7, and a 4-bit A component in bits 0..3.

• **VK_FORMAT_B4G4R4A4_UNORM_PACK16** specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit B component in bits 12..15, a 4-bit G component in bits 8..11, a 4-bit R component in bits 4..7, and a 4-bit A component in bits 0..3.

• **VK_FORMAT_A4B4G4R4_UNORM_PACK16** specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit A component in bits 12..15, a 4-bit B component in bits 8..11, a 4-bit G component in bits 4..7, and a 4-bit R component in bits 0..3.

• **VK_FORMAT_B5G5R5A5_UNORM_PACK16** specifies a four-component, 16-bit packed unsigned normalized format that has a 5-bit R component in bits 11..15, a 5-bit G component in bits 5..10, and a 5-bit B
component in bits 0..4.

- **VK_FORMAT_B5G6R5_UNORM_PACK16** specifies a three-component, 16-bit packed unsigned normalized format that has a 5-bit B component in bits 11..15, a 6-bit G component in bits 5..10, and a 5-bit R component in bits 0..4.

- **VK_FORMAT_B5G5B5A1_UNORM_PACK16** specifies a four-component, 16-bit packed unsigned normalized format that has a 5-bit R component in bits 11..15, a 5-bit B component in bits 6..10, a 5-bit G component in bits 1..5, and a 1-bit A component in bit 0.

- **VK_FORMAT_B5G5R5A1_UNORM_PACK16** specifies a four-component, 16-bit packed unsigned normalized format that has a 5-bit B component in bits 11..15, a 5-bit G component in bits 6..10, a 5-bit R component in bits 1..5, and a 1-bit A component in bit 0.

- **VK_FORMAT_A1R5G5B5_UNORM_PACK16** specifies a four-component, 16-bit packed unsigned normalized format that has a 1-bit A component in bit 15, a 5-bit R component in bits 10..14, a 5-bit G component in bits 5..9, and a 5-bit B component in bits 0..4.

- **VK_FORMAT_R8_UNORM** specifies a one-component, 8-bit unsigned normalized format that has a single 8-bit R component.

- **VK_FORMAT_R8_SNORM** specifies a one-component, 8-bit signed normalized format that has a single 8-bit R component.

- **VK_FORMAT_R8_USCALED** specifies a one-component, 8-bit unsigned scaled integer format that has a single 8-bit R component.

- **VK_FORMAT_R8_SSCALED** specifies a one-component, 8-bit signed scaled integer format that has a single 8-bit R component.

- **VK_FORMAT_R8_UINT** specifies a one-component, 8-bit unsigned integer format that has a single 8-bit R component.

- **VK_FORMAT_R8_SINT** specifies a one-component, 8-bit signed integer format that has a single 8-bit R component.

- **VK_FORMAT_R8_SRGB** specifies a one-component, 8-bit unsigned normalized format that has a single 8-bit R component stored with sRGB nonlinear encoding.

- **VK_FORMAT_R8G8_UNORM** specifies a two-component, 16-bit unsigned normalized format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.

- **VK_FORMAT_R8G8_SNORM** specifies a two-component, 16-bit signed normalized format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.

- **VK_FORMAT_R8G8_USCALED** specifies a two-component, 16-bit unsigned scaled integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.

- **VK_FORMAT_R8G8_SSCALED** specifies a two-component, 16-bit signed scaled integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.

- **VK_FORMAT_R8G8_UINT** specifies a two-component, 16-bit unsigned integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.

- **VK_FORMAT_R8G8_SINT** specifies a two-component, 16-bit signed integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.

- **VK_FORMAT_R8G8_SRGB** specifies a two-component, 16-bit unsigned normalized format that has an 8-bit R component stored with sRGB nonlinear encoding in byte 0, and an 8-bit G component
• **VK_FORMAT_R8G8B8_UNORM** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.

• **VK_FORMAT_R8G8B8_SNORM** specifies a three-component, 24-bit signed normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.

• **VK_FORMAT_R8G8B8_USCALED** specifies a three-component, 24-bit unsigned scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.

• **VK_FORMAT_R8G8B8_SSCALED** specifies a three-component, 24-bit signed scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.

• **VK_FORMAT_R8G8B8_UINT** specifies a three-component, 24-bit unsigned integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.

• **VK_FORMAT_R8G8B8_SINT** specifies a three-component, 24-bit signed integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.

• **VK_FORMAT_R8G8B8_SRGB** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit R component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, and an 8-bit B component stored with sRGB nonlinear encoding in byte 2.

• **VK_FORMAT_B8G8R8_UNORM** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.

• **VK_FORMAT_B8G8R8_SNORM** specifies a three-component, 24-bit signed normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.

• **VK_FORMAT_B8G8R8_USCALED** specifies a three-component, 24-bit unsigned scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.

• **VK_FORMAT_B8G8R8_SSCALED** specifies a three-component, 24-bit signed scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.

• **VK_FORMAT_B8G8R8_UINT** specifies a three-component, 24-bit unsigned integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.

• **VK_FORMAT_B8G8R8_SINT** specifies a three-component, 24-bit signed integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.

• **VK_FORMAT_B8G8R8_SRGB** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit B component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, and an 8-bit B component stored with sRGB nonlinear encoding in byte 2.

• **VK_FORMAT_R8G8B8A8_UNORM** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.

• **VK_FORMAT_R8G8B8A8_SNORM** specifies a four-component, 32-bit signed normalized format that has
an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_R8G8B8A8_USCALED** specifies a four-component, 32-bit unsigned scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_R8G8B8A8_SSCALED** specifies a four-component, 32-bit signed scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_R8G8B8A8_UINT** specifies a four-component, 32-bit unsigned integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_R8G8B8A8_SINT** specifies a four-component, 32-bit signed integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_R8G8B8A8_SRGB** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit R component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, an 8-bit B component stored with sRGB nonlinear encoding in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_B8G8R8A8_UNORM** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_B8G8R8A8_SNORM** specifies a four-component, 32-bit signed normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_B8G8R8A8_USCALED** specifies a four-component, 32-bit unsigned scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_B8G8R8A8_SSCALED** specifies a four-component, 32-bit signed scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_B8G8R8A8_UINT** specifies a four-component, 32-bit unsigned integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_B8G8R8A8_SINT** specifies a four-component, 32-bit signed integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_B8G8R8A8_SRGB** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit B component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, an 8-bit R component stored with sRGB nonlinear encoding in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_A8B8G8R8_UNORM_PACK32** specifies a four-component, 32-bit packed unsigned normalized format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
• **VK_FORMAT_A8B8G8R8_SNORM_PACK32** specifies a four-component, 32-bit packed signed normalized format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.

• **VK_FORMAT_A8B8G8R8_USCALED_PACK32** specifies a four-component, 32-bit packed unsigned scaled integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.

• **VK_FORMAT_A8B8G8R8_SSCALED_PACK32** specifies a four-component, 32-bit packed signed scaled integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.

• **VK_FORMAT_A8B8G8R8_UINT_PACK32** specifies a four-component, 32-bit packed unsigned integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.

• **VK_FORMAT_A8B8G8R8_SINT_PACK32** specifies a four-component, 32-bit packed signed integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.

• **VK_FORMAT_A8B8G8R8_SRGB_PACK32** specifies a four-component, 32-bit packed unsigned normalized format that has an 8-bit A component in bits 24..31, an 8-bit B component stored with sRGB nonlinear encoding in bits 16..23, an 8-bit G component stored with sRGB nonlinear encoding in bits 8..15, and an 8-bit R component stored with sRGB nonlinear encoding in bits 0..7.

• **VK_FORMAT_A2R10G10B10_UNORM_PACK32** specifies a four-component, 32-bit packed unsigned normalized format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.

• **VK_FORMAT_A2R10G10B10_SNORM_PACK32** specifies a four-component, 32-bit packed signed normalized format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.

• **VK_FORMAT_A2R10G10B10_USCALED_PACK32** specifies a four-component, 32-bit packed unsigned scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.

• **VK_FORMAT_A2R10G10B10_SSCALED_PACK32** specifies a four-component, 32-bit packed signed scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.

• **VK_FORMAT_A2R10G10B10_UINT_PACK32** specifies a four-component, 32-bit packed unsigned integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.

• **VK_FORMAT_A2R10G10B10_SINT_PACK32** specifies a four-component, 32-bit packed signed integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.

• **VK_FORMAT_A2B10G10R10_UNORM_PACK32** specifies a four-component, 32-bit packed unsigned normalized format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.

• **VK_FORMAT_A2B10G10R10_SNORM_PACK32** specifies a four-component, 32-bit packed signed normalized format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.
• **VK_FORMAT_A2B10G10R10_USCALED_PACK32** specifies a four-component, 32-bit packed unsigned scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.

• **VK_FORMAT_A2B10G10R10_SSCALED_PACK32** specifies a four-component, 32-bit packed signed scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.

• **VK_FORMAT_A2B10G10R10_UINT_PACK32** specifies a four-component, 32-bit packed unsigned integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.

• **VK_FORMAT_A2B10G10R10_SINT_PACK32** specifies a four-component, 32-bit packed signed integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.

• **VK_FORMAT_R16_UNORM** specifies a one-component, 16-bit unsigned normalized format that has a single 16-bit R component.

• **VK_FORMAT_R16_SNORM** specifies a one-component, 16-bit signed normalized format that has a single 16-bit R component.

• **VK_FORMAT_R16_USCALED** specifies a one-component, 16-bit unsigned scaled integer format that has a single 16-bit R component.

• **VK_FORMAT_R16_SSCALED** specifies a one-component, 16-bit signed scaled integer format that has a single 16-bit R component.

• **VK_FORMAT_R16_UINT** specifies a one-component, 16-bit unsigned integer format that has a single 16-bit R component.

• **VK_FORMAT_R16_SINT** specifies a one-component, 16-bit signed integer format that has a single 16-bit R component.

• **VK_FORMAT_R16_SFLOAT** specifies a one-component, 16-bit signed floating-point format that has a single 16-bit R component.

• **VK_FORMAT_R16G16_UNORM** specifies a two-component, 32-bit unsigned normalized format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.

• **VK_FORMAT_R16G16_SNORM** specifies a two-component, 32-bit signed normalized format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.

• **VK_FORMAT_R16G16_USCALED** specifies a two-component, 32-bit unsigned scaled integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.

• **VK_FORMAT_R16G16_SSCALED** specifies a two-component, 32-bit signed scaled integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.

• **VK_FORMAT_R16G16_UINT** specifies a two-component, 32-bit unsigned integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.

• **VK_FORMAT_R16G16_SINT** specifies a two-component, 32-bit signed integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.

• **VK_FORMAT_R16G16_SFLOAT** specifies a two-component, 32-bit signed floating-point format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.

• **VK_FORMAT_R16G16B16_UNORM** specifies a three-component, 48-bit unsigned normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and an 8-bit B component in bytes 4..5.
has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.

- **VK_FORMAT_R16G16B16_SNORM** specifies a three-component, 48-bit signed normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_USCALED** specifies a three-component, 48-bit unsigned scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_SSCALED** specifies a three-component, 48-bit signed scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_UINT** specifies a three-component, 48-bit unsigned integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_SINT** specifies a three-component, 48-bit signed integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_SFLOAT** specifies a three-component, 48-bit signed floating-point format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16A16_UNORM** specifies a four-component, 64-bit unsigned normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_SNORM** specifies a four-component, 64-bit signed normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_USCALED** specifies a four-component, 64-bit unsigned scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_SSCALED** specifies a four-component, 64-bit signed scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_UINT** specifies a four-component, 64-bit unsigned integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_SINT** specifies a four-component, 64-bit signed integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R16G16B16A16_SFLOAT** specifies a four-component, 64-bit signed floating-point format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.
- **VK_FORMAT_R32_UINT** specifies a one-component, 32-bit unsigned integer format that has a single
32-bit R component.

- **VK_FORMAT_R32_SINT** specifies a one-component, 32-bit signed integer format that has a single 32-bit R component.

- **VK_FORMAT_R32_SFLOAT** specifies a one-component, 32-bit signed floating-point format that has a single 32-bit R component.

- **VK_FORMAT_R32G32_UINT** specifies a two-component, 64-bit unsigned integer format that has a 32-bit R component in bytes 0..3, and a 32-bit G component in bytes 4..7.

- **VK_FORMAT_R32G32_SINT** specifies a two-component, 64-bit signed integer format that has a 32-bit R component in bytes 0..3, and a 32-bit G component in bytes 4..7.

- **VK_FORMAT_R32G32_SFLOAT** specifies a two-component, 64-bit signed floating-point format that has a 32-bit R component in bytes 0..3, and a 32-bit G component in bytes 4..7.

- **VK_FORMAT_R32G32B32_UINT** specifies a three-component, 96-bit unsigned integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, and a 32-bit B component in bytes 8..11.

- **VK_FORMAT_R32G32B32_SINT** specifies a three-component, 96-bit signed integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, and a 32-bit B component in bytes 8..11.

- **VK_FORMAT_R32G32B32_SFLOAT** specifies a three-component, 96-bit signed floating-point format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, and a 32-bit B component in bytes 8..11.

- **VK_FORMAT_R32G32B32A32_UINT** specifies a four-component, 128-bit unsigned integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, a 32-bit B component in bytes 8..11, and a 32-bit A component in bytes 12..15.

- **VK_FORMAT_R32G32B32A32_SINT** specifies a four-component, 128-bit signed integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, a 32-bit B component in bytes 8..11, and a 32-bit A component in bytes 12..15.

- **VK_FORMAT_R32G32B32A32_SFLOAT** specifies a four-component, 128-bit signed floating-point format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, a 32-bit B component in bytes 8..11, and a 32-bit A component in bytes 12..15.

- **VK_FORMAT_R64_UINT** specifies a one-component, 64-bit unsigned integer format that has a single 64-bit R component.

- **VK_FORMAT_R64_SINT** specifies a one-component, 64-bit signed integer format that has a single 64-bit R component.

- **VK_FORMAT_R64_SFLOAT** specifies a one-component, 64-bit signed floating-point format that has a single 64-bit R component.

- **VK_FORMAT_R64G64_UINT** specifies a two-component, 128-bit unsigned integer format that has a 64-bit R component in bytes 0..7, and a 64-bit G component in bytes 8..15.

- **VK_FORMAT_R64G64_SINT** specifies a two-component, 128-bit signed integer format that has a 64-bit R component in bytes 0..7, and a 64-bit G component in bytes 8..15.

- **VK_FORMAT_R64G64_SFLOAT** specifies a two-component, 128-bit signed floating-point format that has a 64-bit R component in bytes 0..7, and a 64-bit G component in bytes 8..15.
VK_FORMAT_R64G64B64_UINT specifies a three-component, 192-bit unsigned integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, and a 64-bit B component in bytes 16..23.

VK_FORMAT_R64G64B64_SINT specifies a three-component, 192-bit signed integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, and a 64-bit B component in bytes 16..23.

VK_FORMAT_R64G64B64_SFLOAT specifies a three-component, 192-bit signed floating-point format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, and a 64-bit B component in bytes 16..23.

VK_FORMAT_R64G64B64A64_UINT specifies a four-component, 256-bit unsigned integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, a 64-bit B component in bytes 16..23, and a 64-bit A component in bytes 24..31.

VK_FORMAT_R64G64B64A64_SINT specifies a four-component, 256-bit signed integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, a 64-bit B component in bytes 16..23, and a 64-bit A component in bytes 24..31.

VK_FORMAT_R64G64B64A64_SFLOAT specifies a four-component, 256-bit signed floating-point format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, a 64-bit B component in bytes 16..23, and a 64-bit A component in bytes 24..31.

VK_FORMAT_B10G11R11_UFLOAT_PACK32 specifies a three-component, 32-bit packed unsigned floating-point format that has a 10-bit B component in bits 22..31, an 11-bit G component in bits 11..21, an 11-bit R component in bits 0..10. See Unsigned 10-Bit Floating-Point Numbers and Unsigned 11-Bit Floating-Point Numbers.

VK_FORMAT_E5B9G9R9_UFLOAT_PACK32 specifies a three-component, 32-bit packed unsigned floating-point format that has a 5-bit shared exponent in bits 27..31, a 9-bit B component mantissa in bits 18..26, a 9-bit G component mantissa in bits 9..17, and a 9-bit R component mantissa in bits 0..8.

VK_FORMAT_D16_UNORM specifies a one-component, 16-bit unsigned normalized format that has a single 16-bit depth component.

VK_FORMAT_X8_D24_UNORM_PACK32 specifies a two-component, 32-bit format that has 24 unsigned normalized bits in the depth component and, optionally, 8 bits that are unused.

VK_FORMAT_D32_SFLOAT specifies a one-component, 32-bit signed floating-point format that has 32 bits in the depth component.

VK_FORMAT_S8_UINT specifies a one-component, 8-bit unsigned integer format that has 8 bits in the stencil component.

VK_FORMAT_D16_UNORM_S8_UINT specifies a two-component, 24-bit format that has 16 unsigned normalized bits in the depth component and 8 unsigned integer bits in the stencil component.

VK_FORMAT_D24_UNORM_S8_UINT specifies a two-component, 32-bit packed format that has 8 unsigned integer bits in the stencil component, and 24 unsigned normalized bits in the depth component.

VK_FORMAT_D32_SFLOAT_S8_UINT specifies a two-component format that has 32 signed float bits in the depth component and 8 unsigned integer bits in the stencil component. There are optionally 24 bits that are unused.

VK_FORMAT_BC1_RGB_UNORM_BLOCK specifies a three-component, block-compressed format where
each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data. This format has no alpha and is considered opaque.

- **VK_FORMAT_BC1_RGB_SRGB_BLOCK** specifies a three-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding. This format has no alpha and is considered opaque.

- **VK_FORMAT_BC1_RGBA_UNORM_BLOCK** specifies a four-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data, and provides 1 bit of alpha.

- **VK_FORMAT_BC1_RGBA_SRGB_BLOCK** specifies a four-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding, and provides 1 bit of alpha.

- **VK_FORMAT_BC2_UNORM_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values.

- **VK_FORMAT_BC2_SRGB_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values with sRGB nonlinear encoding.

- **VK_FORMAT_BC3_UNORM_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values.

- **VK_FORMAT_BC3_SRGB_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values with sRGB nonlinear encoding.

- **VK_FORMAT_BC4_UNORM_BLOCK** specifies a one-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized red texel data.

- **VK_FORMAT_BC4_SNORM_BLOCK** specifies a one-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of signed normalized red texel data.

- **VK_FORMAT_BC5_UNORM_BLOCK** specifies a two-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.

- **VK_FORMAT_BC5_SNORM_BLOCK** specifies a two-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.

- **VK_FORMAT_BC6H_UFLOAT_BLOCK** specifies a three-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned floating-point RGB texel data.

- **VK_FORMAT_BC6H_SFLOAT_BLOCK** specifies a three-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed floating-point RGB texel data.

- **VK_FORMAT_BC7_UNORM_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data.
data.

- **VK_FORMAT_BC7_SRGB_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK** specifies a three-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data. This format has no alpha and is considered opaque.

- **VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK** specifies a three-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding. This format has no alpha and is considered opaque.

- **VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK** specifies a four-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data, and provides 1 bit of alpha.

- **VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK** specifies a four-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding, and provides 1 bit of alpha.

- **VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK** specifies a four-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values.

- **VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK** specifies a four-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied.

- **VK_FORMAT_EAC_R11_UNORM_BLOCK** specifies a one-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized red texel data.

- **VK_FORMAT_EAC_R11_SNORM_BLOCK** specifies a one-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of signed normalized red texel data.

- **VK_FORMAT_EAC_R11G11_UNORM_BLOCK** specifies a two-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.

- **VK_FORMAT_EAC_R11G11_SNORM_BLOCK** specifies a two-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.

- **VK_FORMAT_ASTC_4x4_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_ASTC_4x4_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed floating-point RGBA texel
data.

- **VK_FORMAT_ASTC_5x4_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×4 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_ASTC_5x4_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×4 rectangle of signed floating-point RGBA texel data.

- **VK_FORMAT_ASTC_5x5_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×5 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_ASTC_5x5_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×5 rectangle of signed floating-point RGBA texel data.

- **VK_FORMAT_ASTC_6x5_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×5 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_ASTC_6x5_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×5 rectangle of signed floating-point RGBA texel data.

- **VK_FORMAT_ASTC_6x6_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×6 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_ASTC_6x6_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×6 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6×6 rectangle of signed floating-point RGBA texel data.

- **VK_FORMAT_ASTC_8x5_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×5 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_ASTC_8x5_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×5 rectangle of unsigned normalized RGBA texel data.
texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 8×5 rectangle of signed floating-point RGBA texel data.

- **VK_FORMAT_ASTC_8x6_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×6 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_ASTC_8x6_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×6 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 8×6 rectangle of signed floating-point RGBA texel data.

- **VK_FORMAT_ASTC_8x8_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×8 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_ASTC_8x8_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×8 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 8×8 rectangle of signed floating-point RGBA texel data.

- **VK_FORMAT_ASTC_10x5_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×5 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_ASTC_10x5_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×5 rectangle of signed floating-point RGBA texel data.

- **VK_FORMAT_ASTC_10x6_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×6 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_ASTC_10x6_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×6 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×6 rectangle of signed floating-point RGBA texel data.

- **VK_FORMAT_ASTC_10x8_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×8 rectangle of unsigned normalized RGBA texel data.
• **VK_FORMAT_ASTC_10x8_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×8 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

• **VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×8 rectangle of signed floating-point RGBA texel data.

• **VK_FORMAT_ASTC_10x10_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×10 rectangle of unsigned normalized RGBA texel data.

• **VK_FORMAT_ASTC_10x10_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×10 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

• **VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×10 rectangle of signed floating-point RGBA texel data.

• **VK_FORMAT_ASTC_12x10_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×10 rectangle of unsigned normalized RGBA texel data.

• **VK_FORMAT_ASTC_12x10_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×10 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

• **VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×10 rectangle of signed floating-point RGBA texel data.

• **VK_FORMAT_ASTC_12x12_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×12 rectangle of unsigned normalized RGBA texel data.

• **VK_FORMAT_ASTC_12x12_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×12 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

• **VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×12 rectangle of signed floating-point RGBA texel data.

• **VK_FORMAT_G8B8G8R8_422_UNORM** specifies a four-component, 32-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each $i$ coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has an 8-bit G component for the even $i$ coordinate in byte 0, an 8-bit B component in byte 1, an 8-bit G component for the odd $i$ coordinate in byte 2, and an 8-bit R component in byte 3. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.
• **VK_FORMAT_B8G8R8G8_422_UNORM** specifies a four-component, 32-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2x1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has an 8-bit B component in byte 0, an 8-bit G component for the even i coordinate in byte 1, an 8-bit R component in byte 2, and an 8-bit G component for the odd i coordinate in byte 3. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2x1 compressed texel block.

• **VK_FORMAT_G8_B8_R8_3PLANE_420_UNORM** specifies an unsigned normalized multi-planar format that has an 8-bit G component in plane 0, an 8-bit B component in plane 1, and an 8-bit R component in plane 2. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which \( i_G \cdot 0.5 = i_R = i_B \) and \( j_G \cdot 0.5 = j_R = j_B \). The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, **VK_IMAGE_ASPECT_PLANE_1_BIT** for the B plane, and **VK_IMAGE_ASPECT_PLANE_2_BIT** for the R plane. This format only supports images with a width and height that is a multiple of two.

• **VK_FORMAT_G8_B8R8_2PLANE_420_UNORM** specifies an unsigned normalized multi-planar format that has an 8-bit G component in plane 0, and a two-component, 16-bit BR plane 1 consisting of an 8-bit B component in byte 0 and an 8-bit R component in byte 1. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which \( i_G \cdot 0.5 = i_B = i_R \). The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using **VK_IMAGE_ASPECT_PLANE_0_BIT** for the G plane, and **VK_IMAGE_ASPECT_PLANE_1_BIT** for the BR plane. This format only supports images with a width and height that is a multiple of two.

• **VK_FORMAT_G8_B8_R8_3PLANE_444_UNORM** specifies an unsigned normalized multi-planar format that has an 8-bit G component in plane 0, an 8-bit B component in plane 1, and an 8-bit R component in plane 2. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R, G and B component contributes to a
single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane.

- **VK_FORMAT_R10X6_UNORM_PACK16** specifies a one-component, 16-bit unsigned normalized format that has a single 10-bit R component in the top 10 bits of a 16-bit word, with the bottom 6 bits unused.

- **VK_FORMAT_R10X6G10X6_UNORM_2PACK16** specifies a two-component, 32-bit unsigned normalized format that has a 10-bit R component in the top 10 bits of the word in bytes 0..1, and a 10-bit G component in the top 10 bits of the word in bytes 2..3, with the bottom 6 bits of each word unused.

- **VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16** specifies a four-component, 64-bit unsigned normalized format that has a 10-bit R component in the top 10 bits of the word in bytes 0..1, a 10-bit G component in the top 10 bits of the word in bytes 2..3, a 10-bit B component in the top 10 bits of the word in bytes 4..5, and a 10-bit A component in the top 10 bits of the word in bytes 6..7, with the bottom 6 bits of each word unused.

- **VK_FORMAT_G10X6B10X6G10X6R10X6_422_UNORM_4PACK16** specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 10-bit G component for the even i coordinate in the top 10 bits of the word in bytes 0..1, a 10-bit B component in the top 10 bits of the word in bytes 2..3, a 10-bit G component for the odd i coordinate in the top 10 bits of the word in bytes 4..5, and a 10-bit R component in the top 10 bits of the word in bytes 6..7, with the bottom 6 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.

- **VK_FORMAT_B10X6G10X6R10X6G10X6_422_UNORM_4PACK16** specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 10-bit B component in the top 10 bits of the word in bytes 0..1, a 10-bit G component for the even i coordinate in the top 10 bits of the word in bytes 2..3, a 10-bit R component in the top 10 bits of the word in bytes 4..5, and a 10-bit G component for the odd i coordinate in the top 10 bits of the word in bytes 6..7, with the bottom 6 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.

- **VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_420_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, a 10-bit B component in the top 10 bits of each 16-bit word of plane 1, and a 10-bit R component in the top 10 bits of each 16-bit word of plane 2, with the bottom 6 bits of each word unused. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which \(|i_G \times 0.5| = i_B = i_R\) and \(|j_G \times 0.5| = j_B = j_R\). The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using
VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane. This format only supports images with a width and height that is a multiple of two.

- **VK_FORMAT_G10X6_B10X6R10X6_2PLANE_420_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 10-bit B component in the top 10 bits of the word in bytes 0..1, and a 10-bit R component in the top 10 bits of the word in bytes 2..3, with the bottom 6 bits of each word unused. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which \(i_G \times 0.5^i = i_B = i_R\) and \(j_G \times 0.5^j = j_B = j_R\). The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane. This format only supports images with a width and height that is a multiple of two.

- **VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_422_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, a 10-bit B component in the top 10 bits of each 16-bit word of plane 1, and a 10-bit R component in the top 10 bits of each 16-bit word of plane 2, with the bottom 6 bits of each word unused. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which \(i_G \times 0.5^i = i_B = i_R\). The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane. This format only supports images with a width that is a multiple of two.

- **VK_FORMAT_G10X6_B10X6R10X6_2PLANE_422_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 10-bit B component in the top 10 bits of the word in bytes 0..1, and a 10-bit R component in the top 10 bits of the word in bytes 2..3, with the bottom 6 bits of each word unused. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which \(i_G \times 0.5^i = i_B = i_R\). The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane. This format only supports images with a width that is a multiple of two.

- **VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_444_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, a 10-bit B component in the top 10 bits of each 16-bit word of plane 1, and a 10-bit R component in the top 10 bits of each 16-bit word of plane 2, with the bottom 6 bits of each word unused. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane.

- **VK_FORMAT_R12X4_UNORM_PACK16** specifies a one-component, 16-bit unsigned normalized format that has a single 12-bit R component in the top 12 bits of a 16-bit word, with the bottom 4 bits unused.

- **VK_FORMAT_R12X4G12X4_UNORM_2PACK16** specifies a two-component, 32-bit unsigned normalized
format that has a 12-bit R component in the top 12 bits of the word in bytes 0..1, and a 12-bit G component in the top 12 bits of the word in bytes 2..3, with the bottom 4 bits of each word unused.

- **VK_FORMAT_R12X4G12X4B12X4_A12X4_UNORM_4PACK16** specifies a four-component, 64-bit unsigned normalized format that has a 12-bit R component in the top 12 bits of the word in bytes 0..1, a 12-bit G component in the top 12 bits of the word in bytes 2..3, a 12-bit B component in the top 12 bits of the word in bytes 4..5, and a 12-bit A component in the top 12 bits of the word in bytes 6..7, with the bottom 4 bits of each word unused.

- **VK_FORMAT_G12X4_B12X4_R12X4_4PLANE_420_UNORM_4PACK16** specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each $i$ coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 12-bit G component for the even $i$ coordinate in the top 12 bits of the word in bytes 0..1, a 12-bit B component in the top 12 bits of the word in bytes 2..3, a 12-bit G component for the odd $i$ coordinate in the top 12 bits of the word in bytes 4..5, and a 12-bit R component in the top 12 bits of the word in bytes 6..7, with the bottom 4 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.

- **VK_FORMAT_G12X4_B12X4R12X4_2PLANE_420_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, a 12-bit B component in the top 12 bits of each 16-bit word of plane 1, and a 12-bit R component in the top 12 bits of each 16-bit word of plane 2, with the bottom 4 bits of each word unused. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which $i_G \times 0.5 = i_B = i_R$ and $j_G \times 0.5 = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane. This format only supports images with a width and height that is a multiple of two.

- **VK_FORMAT_G12X4_B12X4R12X4_2PLANE_420_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 12-bit B component in the top 12 bits of the word in bytes 0..1, and a 12-bit R component in the top 12 bits of the word in bytes 2..3, with the bottom 4 bits of each word unused. The horizontal and vertical dimensions of the BR plane
are halved relative to the image dimensions, and each R and B value is shared with the G components for which $|i_G \times 0.5| = i_B = i_R$ and $|i_G \times 0.5| = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane. This format only supports images with a width and height that is a multiple of two.

- **VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_422_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, a 12-bit B component in the top 12 bits of each 16-bit word of plane 1, and a 12-bit R component in the top 12 bits of each 16-bit word of plane 2, with the bottom 4 bits of each word unused. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $|i_G \times 0.5| = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane. This format only supports images with a width that is a multiple of two.

- **VK_FORMAT_G12X4_B12X4R12X4_2PLANE_422_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 12-bit B component in the top 12 bits of the word in bytes 0..1, and a 12-bit R component in the top 12 bits of the word in bytes 2..3, with the bottom 4 bits of each word unused. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $|i_G \times 0.5| = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane. This format only supports images with a width that is a multiple of two.

- **VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_444_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, and a 12-bit B component in the top 12 bits of each 16-bit word of plane 1, and a 12-bit R component in the top 12 bits of each 16-bit word of plane 2, with the bottom 4 bits of each word unused. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane.

- **VK_FORMAT_G16B16G16R16_422_UNORM** specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each $i$ coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 16-bit G component for the even $i$ coordinate in the word in bytes 0..1, a 16-bit B component in the word in bytes 2..3, a 16-bit G component for the odd $i$ coordinate in the word in bytes 4..5, and a 16-bit R component in the word in bytes 6..7. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.

- **VK_FORMAT_B16G16R16G16_422_UNORM** specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each $i$ coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the
image. This format has a 16-bit B component in the word in bytes 0..1, a 16-bit G component for the even $i$ coordinate in the word in bytes 2..3, a 16-bit R component in the word in bytes 4..5, and a 16-bit G component for the odd $i$ coordinate in the word in bytes 6..7. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a $2\times1$ compressed texel block.

- **VK_FORMAT_G16_B16_R16_3PLANE_420_UNORM** specifies an unsigned normalized multi-planar format that has a 16-bit G component in each 16-bit word of plane 0, a 16-bit B component in each 16-bit word of plane 1, and a 16-bit R component in each 16-bit word of plane 2. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane. This format only supports images with a width and height that is a multiple of two.

- **VK_FORMAT_G16_B16R16_2PLANE_420_UNORM** specifies an unsigned normalized multi-planar format that has a 16-bit G component in each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 16-bit B component in the word in bytes 0..1, and a 16-bit R component in the word in bytes 2..3. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$ and $\lfloor j_G \times 0.5 \rfloor = j_B = j_R$. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane. This format only supports images with a width and height that is a multiple of two.

- **VK_FORMAT_G16_B16_R16_3PLANE_444_UNORM** specifies an unsigned normalized multi-planar format that has a 16-bit G component in each 16-bit word of plane 0, a 16-bit B component in each 16-bit word of plane 1, and a 16-bit R component in each 16-bit word of plane 2. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane. This format only supports images with a width that is a multiple of two.

- **VK_FORMAT_G16_B16R16_2PLANE_444_UNORM** specifies an unsigned normalized multi-planar format that has a 16-bit G component in each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 16-bit B component in the word in bytes 0..1, and a 16-bit R component in the word in bytes 2..3. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which $\lfloor i_G \times 0.5 \rfloor = i_B = i_R$. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane. This format only supports images with a width that is a multiple of two.

- **VK_FORMAT_G16_B16_R16_3PLANE_444_UNORM** specifies an unsigned normalized multi-planar format that has a 16-bit G component in each 16-bit word of plane 0, a 16-bit B component in each 16-bit word of plane 1, and a 16-bit R component in each 16-bit word of plane 2. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via
vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane.

- **VK_FORMAT_G8_B8R8_2PLANE_444_UNORM** specifies an unsigned normalized multi-planar format that has an 8-bit G component in plane 0, and a two-component, 16-bit BR plane 1 consisting of an 8-bit B component in byte 0 and an 8-bit R component in byte 1. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane.

- **VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 10-bit B component in the top 10 bits of the word in bytes 0..1, and a 10-bit R component in the top 10 bits of the word in bytes 2..3, the bottom 6 bits of each word unused. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane.

- **VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 12-bit B component in the top 12 bits of the word in bytes 0..1, and a 12-bit R component in the top 12 bits of the word in bytes 2..3, the bottom 4 bits of each word unused. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane.

- **VK_FORMAT_G16_B16R16_2PLANE_444_UNORM** specifies an unsigned normalized multi-planar format that has a 16-bit G component in each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 16-bit B component in the word in bytes 0..1, and a 16-bit R component in the word in bytes 2..3. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane.

### 34.1.1. Compatible Formats of Planes of Multi-Planar Formats

Individual planes of multi-planar formats are size-compatible with single-plane color formats if they occupy the same number of bits per texel block, and are compatible with those formats if they have the same block extent.

In the following table, individual planes of a multi-planar format are compatible with the format listed against the relevant plane index for that multi-planar format, and any format compatible with the listed single-plane format according to Format Compatibility Classes. These planes are also size-compatible with any format that is size-compatible with the listed single-plane format.

34.1.2. Multi-planar Format Image Aspect

When using `VkImageAspectFlagBits` to select a plane of a multi-planar format, the following are the valid options:

- Two planes
  - `VK_IMAGE_ASPECT_PLANE_0_BIT`
  - `VK_IMAGE_ASPECT_PLANE_1_BIT`

- Three planes
  - `VK_IMAGE_ASPECT_PLANE_0_BIT`
  - `VK_IMAGE_ASPECT_PLANE_1_BIT`
  - `VK_IMAGE_ASPECT_PLANE_2_BIT`
34.1.3. Packed Formats

For the purposes of address alignment when accessing buffer memory containing vertex attribute
or texel data, the following formats are considered packed - components of the texels or attributes
are stored in bitfields packed into one or more 8-, 16-, or 32-bit fundamental data type.

- **Packed into 8-bit data types:**
  - VK_FORMAT_R4G4_UNORM_PACK8

- **Packed into 16-bit data types:**
  - VK_FORMAT_R4G4B4A4_UNORM_PACK16
  - VK_FORMAT_B4G4R4A4_UNORM_PACK16
  - VK_FORMAT_R5G6B5_UNORM_PACK16
  - VK_FORMAT_B5G6R5_UNORM_PACK16
  - VK_FORMAT_R5G5B5A1_UNORM_PACK16
  - VK_FORMAT_B5G5R5A1_UNORM_PACK16
  - VK_FORMAT_A1R5G5B5_UNORM_PACK16
  - VK_FORMAT_R10X6_UNORM_PACK16
  - VK_FORMAT_R8G8B8A8_UNORM_PACK16
  - VK_FORMAT_R10X6G10X6_UNORM_2PACK16
  - VK_FORMAT_R10X6G10X6B10X6A10X6_4PACK16
  - VK_FORMAT_R12X4_UNORM_PACK16
  - VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16
34.1.4. Identification of Formats

A “format” is represented by a single enum value. The name of a format is usually built up by using the following pattern:

\[ \text{VK_FORMAT}_{\{\text{component-format|compression-scheme}\}_{\text{numeric-format}}} \]

The component-format indicates either the size of the R, G, B, and A components (if they are present) in the case of a color format, or the size of the depth (D) and stencil (S) components (if they are present) in the case of a depth/stencil format (see below). An X indicates a component that is
unused, but may be present for padding.
### Table 52. Interpretation of Numeric Format

<table>
<thead>
<tr>
<th>Numeric format</th>
<th>Type-Declaration instructions</th>
<th>Numeric type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNORM</td>
<td>OpTypeFloat</td>
<td>floating-point</td>

</tr>
<tr>
<td>SFLOAT</td>
<td>OpTypeFloat</td>
<td>floating-point</td>
<td>The components are signed floating-point numbers</td>
</tr>
<tr>
<td>SRGB</td>
<td>OpTypeFloat</td>
<td>floating-point</td>
<td>The R, G, and B components are unsigned normalized values that represent values using sRGB nonlinear encoding, while the A component (if one exists) is a regular unsigned normalized value</td>
</tr>
</tbody>
</table>

n is the number of bits in the component.

The suffix _PACKnn_ indicates that the format is packed into an underlying type with nn bits. The suffix _mPACKnn_ is a short-hand that indicates that the format has m groups of components (which may or may not be stored in separate planes) that are each packed into an underlying type with nn bits.

The suffix _BLOCK_ indicates that the format is a block-compressed format, with the representation of multiple pixels encoded interdependently within a region.

### Table 53. Interpretation of Compression Scheme

<table>
<thead>
<tr>
<th>Compression scheme</th>

</tbody>
</table>
### Compression scheme

<table>
<thead>
<tr>
<th>Compression scheme</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASTC</td>
<td>Adaptive Scalable Texture Compression (LDR Profile). See <a href="#">ASTC Compressed Image Formats</a>.</td>
</tr>
</tbody>
</table>

For *multi-planar* images, the components in separate planes are separated by underscores, and the number of planes is indicated by the addition of a `_2PLANE` or `_3PLANE` suffix. Similarly, the separate aspects of depth-stencil formats are separated by underscores, although these are not considered separate planes. Formats are suffixed by `_422` to indicate that planes other than the first are reduced in size by a factor of two horizontally or that the R and B values appear at half the horizontal frequency of the G values, `_420` to indicate that planes other than the first are reduced in size by a factor of two both horizontally and vertically, and `_444` for consistency to indicate that all three planes of a three-planar image are the same size.

![Note](image)

No common format has a single plane containing both R and B components but does not store these components at reduced horizontal resolution.

### 34.1.5. Representation and Texel Block Size

Color formats **must** be represented in memory in exactly the form indicated by the format’s name. This means that promoting one format to another with more bits per component and/or additional components **must** not occur for color formats. Depth/stencil formats have more relaxed requirements as discussed below.

Each format has a *texel block size*, the number of bytes used to store one texel block (a single addressable element of an uncompressed image, or a single compressed block of a compressed image). The texel block size for each format is shown in the [Compatible formats](#) table.

The representation of non-packed formats is that the first component specified in the name of the format is in the lowest memory addresses and the last component specified is in the highest memory addresses. See [Byte mappings for non-packed/compressed color formats](#). The in-memory ordering of bytes within a component is determined by the host endianness.

### Table 54. Byte mappings for non-packed/compressed color formats

1464
Packed formats store multiple components within one underlying type. The bit representation is that the first component specified in the name of the format is in the most-significant bits and the last component specified is in the least-significant bits of the underlying type. The in-memory ordering of bytes comprising the underlying type is determined by the host endianness.

Table 57. Bit mappings for packed 32-bit formats
34.1.6. Depth/Stencil Formats

Depth/stencil formats are considered opaque and need not be stored in the exact number of bits per texel or component ordering indicated by the format enum. However, implementations must not substitute a different depth or stencil precision than is described in the format (e.g. D16 must not be implemented as D24 or D32).

34.1.7. Format Compatibility Classes

Uncompressed color formats are compatible with each other if they occupy the same number of bits per texel block. Compressed color formats are compatible with each other if the only difference between them is the numeric format of the uncompressed pixels. Each depth/stencil format is only compatible with itself. In the following table, all the formats in the same row are compatible. Each format has a defined texel block extent specifying how many texels each texel block represents in each dimension.

</tr>
</tbody>
</table>

**Size Compatibility**

Color formats with the same texel block size are considered *size-compatible*. If two size-compatible formats have different block extents (i.e. for compressed formats), then an image with size $A \times B \times C$ in one format with a block extent of $a \times b \times c$ can be represented as an image with size $X \times Y \times Z$ in the other format with block extent $x \times y \times z$ at the ratio between the block extents for each format, where
\( A/a = X/x \)

\( B/b = Y/y \)

\( C/c = Z/z \)

Note

For example, a 7x3 image in the `VK_FORMAT_ASTC_8x5_UNORM_BLOCK` format can be represented as a 1x1 `VK_FORMAT_R64G64_UINT` image.

Images created with the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag can have size-compatible views created from them to enable access via different size-compatible formats. Image views created in this way will be sized to match the expectations of the block extents noted above.

Copy operations are able to copy between size-compatible formats in different resources to enable manipulation of data in different formats. The extent used in these copy operations always matches the source image, and is resized to the expectations of the block extents noted above for the destination image.

### 34.2. Format Properties

To query supported format features which are properties of the physical device, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceFormatProperties(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkFormatProperties* pFormatProperties);
```

- `physicalDevice` is the physical device from which to query the format properties.
- `format` is the format whose properties are queried.
- `pFormatProperties` is a pointer to a `VkFormatProperties` structure in which physical device properties for `format` are returned.

#### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFormatProperties-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceFormatProperties-format-parameter `format` must be a valid `VkFormat` value
- VUID-vkGetPhysicalDeviceFormatProperties-pFormatProperties-parameter `pFormatProperties` must be a valid pointer to a `VkFormatProperties` structure
The `VkFormatProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkFormatProperties {
    VkFormatFeatureFlags linearTilingFeatures;
    VkFormatFeatureFlags optimalTilingFeatures;
    VkFormatFeatureFlags bufferFeatures;
} VkFormatProperties;
```

- `linearTilingFeatures` is a bitmask of `VkFormatFeatureFlagBits` specifying features supported by images created with a `tiling` parameter of `VK_IMAGE_TILING_LINEAR`.
- `optimalTilingFeatures` is a bitmask of `VkFormatFeatureFlagBits` specifying features supported by images created with a `tiling` parameter of `VK_IMAGE_TILING_OPTIMAL`.
- `bufferFeatures` is a bitmask of `VkFormatFeatureFlagBits` specifying features supported by buffers.

**Note**

If no format feature flags are supported, the format itself is not supported, and images of that format cannot be created.

If `format` is a block-compressed format, then `bufferFeatures` must not support any features for the format.

If `format` is not a multi-plane format then `linearTilingFeatures` and `optimalTilingFeatures` must not contain `VK_FORMAT_FEATURE_DISJOINT_BIT`.

Bits which can be set in the `VkFormatProperties` features `linearTilingFeatures`, `optimalTilingFeatures`, `VkDrmFormatModifierPropertiesEXT::drmFormatModifierTilingFeatures`, and `bufferFeatures` are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkFormatFeatureFlagBits {
    VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT = 0x00000001,
    VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT = 0x00000002,
    VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT = 0x00000004,
    VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT = 0x00000008,
    VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT = 0x00000010,
    VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT = 0x00000020,
    VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT = 0x00000040,
    VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT = 0x00000080,
    VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT = 0x00000100,
    VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT = 0x00000200,
    VK_FORMAT_FEATURE_BLIT_SRC_BIT = 0x00000400,
    VK_FORMAT_FEATURE_BLIT_DST_BIT = 0x00000800,
    VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT = 0x00001000,
    VK_FORMAT_FEATURE_TRANSFER_SRC_BIT = 0x00004000,
    // Provided by VK_VERSION_1_1
    VK_FORMAT_FEATURE_TRANSFER_SRC_BIT = 0x00004000,
} VkFormatFeatureFlagBits;
```
These values may be set in `linearTilingFeatures`, `optimalTilingFeatures`, and `VkDrmFormatModifierPropertiesEXT::drmFormatModifierTilingFeatures`, specifying that the features are supported by images or image views or sampler Y'CbCr conversion objects created with the queried `vkGetPhysicalDeviceFormatProperties::format`:

- **VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT** specifies that an image view can be sampled from.
- **VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT** specifies that an image view can be used as a storage image.
- **VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT** specifies that an image view can be used as storage image that supports atomic operations.
- **VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT** specifies that an image view can be used as a framebuffer color attachment and as an input attachment.
- **VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT** specifies that an image view can be used as a framebuffer color attachment that supports blending.
- **VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT** specifies that an image view can be used as a framebuffer depth/stencil attachment and as an input attachment.
- **VK_FORMAT_FEATURE_BLIT_SRC_BIT** specifies that an image can be used as `srcImage` for the
vkCmdBlitImage2KHR and vkCmdBlitImage commands.

- **VK_FORMAT_FEATURE_BLIT_DST_BIT** specifies that an image can be used as dstImage for the vkCmdBlitImage2KHR and vkCmdBlitImage commands.

- **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT** specifies that if VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT is also set, an image view can be used with a sampler that has either of magFilter or minFilter set to VK_FILTER_LINEAR, or mipmapMode set to VK_SAMPLER_MIPMAP_MODE_LINEAR. If VK_FORMAT_FEATURE_BLIT_SRC_BIT is also set, an image can be used as the srcImage to vkCmdBlitImage2KHR and vkCmdBlitImage with a filter of VK_FILTER_LINEAR. This bit must only be exposed for formats that also support the VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT or VK_FORMAT_FEATURE_BLIT_SRC_BIT.

If the format being queried is a depth/stencil format, this bit only specifies that the depth aspect (not the stencil aspect) of an image of this format supports linear filtering, and that linear filtering of the depth aspect is supported whether depth compare is enabled in the sampler or not. Where depth comparison is supported it may be linear filtered whether this bit is present or not, but where this bit is not present the filtered value may be computed in an implementation-dependent manner which differs from the normal rules of linear filtering. The resulting value must be in the range [0,1] and should be proportional to, or a weighted average of, the number of comparison passes or failures.

- **VK_FORMAT_FEATURE_TRANSFER_SRC_BIT** specifies that an image can be used as a source image for copy commands. If the application apiVersion is Vulkan 1.0 and VK_KHR_maintenance1 is not supported, VK_FORMAT_FEATURE_TRANSFER_SRC_BIT is implied to be set when the format feature flag is not 0.

- **VK_FORMAT_FEATURE_TRANSFER_DST_BIT** specifies that an image can be used as a destination image for copy commands and clear commands. If the application apiVersion is Vulkan 1.0 and VK_KHR_maintenance1 is not supported, VK_FORMAT_FEATURE_TRANSFER_DST_BIT is implied to be set when the format feature flag is not 0.

- **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT** specifies VkImage can be used as a sampled image with a min or max VkSamplerReductionMode. This bit must only be exposed for formats that also support the VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT.

- **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT** specifies that VkImage can be used with a sampler that has either of magFilter or minFilter set to VK_FILTER_CUBIC_EXT, or be the source image for a blit with filter set to VK_FILTER_CUBIC_EXT. This bit must only be exposed for formats that also support the VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT. If the format being queried is a depth/stencil format, this only specifies that the depth aspect is cubic filterable.

- **VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT** specifies that an application can define a sampler Y'CrCb conversion using this format as a source, and that an image of this format can be used with a VkSamplerYcbcrConversionCreateInfo xChromaOffset and/or yChromaOffset of VK_CHROMA_LOCATION_MIDPOINT. Otherwise both xChromaOffset and yChromaOffset must be VK_CHROMA_LOCATION_COSITED_EVEN. If a format does not incorporate chroma downsampling (it is not a “422” or “420” format) but the implementation supports sampler Y’CrCb conversion for this format, the implementation must set VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT.

- **VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT** specifies that an application can define a sampler Y’CrCb conversion using this format as a source, and that an image of this format can be
used with a `VkSamplerYcbcrConversionCreateInfo` `xChromaOffset` and/or `yChromaOffset` of `VK_CHROMA_LOCATION_COSITED_EVEN`. Otherwise both `xChromaOffset` and `yChromaOffset` must be `VK_CHROMA_LOCATION_MIDPOINT`. If neither `VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT` nor `VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT` is set, the application must not define a sampler Y’CbCr conversion using this format as a source.

- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT` specifies that an application can define a sampler Y’CbCr conversion using this format as a source with chromaFilter set to `VK_FILTER_LINEAR`.

- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT` specifies that the format can have different chroma, min, and mag filters.

- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` specifies that reconstruction is explicit, as described in Chroma Reconstruction. If this bit is not present, reconstruction is implicit by default.

- `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT` specifies that reconstruction can be forcibly made explicit by setting `VkSamplerYcbcrConversionCreateInfo::forceExplicitReconstruction` to `VK_TRUE`. If the format being queried supports `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` it must also support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT`.

- `VK_FORMAT_FEATURE_DISJOINT_BIT` specifies that a multi-planar image can have the `VK_IMAGE_CREATE_DISJOINT_BIT` set during image creation. An implementation must not set `VK_FORMAT_FEATURE_DISJOINT_BIT` for single-plane formats.

- `VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` specifies that an image view can be used as a fragment shading rate attachment. An implementation must not set this feature for formats with a numeric format other than `UINT`, or set it as a buffer feature.

The following bits may be set in `bufferFeatures`, specifying that the features are supported by buffers or buffer views created with the queried `vkGetPhysicalDeviceFormatProperties::format`:

- `VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT` specifies that the format can be used to create a buffer view that can be bound to a `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` descriptor.

- `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT` specifies that the format can be used to create a buffer view that can be bound to a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor.

- `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT` specifies that atomic operations are supported on `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` with this format.

- `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT` specifies that the format can be used as a vertex attribute format (`VkVertexInputAttributeDescription::format`).

Note

- `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT` and `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT` are only intended to be advertised for single-component formats, since SPIR-V atomic operations require a
VkFormatFeatureFlags is a bitmask type for setting a mask of zero or more VkFormatFeatureFlagBits.

To query supported format features which are properties of the physical device, call:

```
void vkGetPhysicalDeviceFormatProperties2(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkFormatProperties2* pFormatProperties);
```

- `physicalDevice` is the physical device from which to query the format properties.
- `format` is the format whose properties are queried.
- `pFormatProperties` is a pointer to a VkFormatProperties2 structure in which physical device properties for `format` are returned.

vkGetPhysicalDeviceFormatProperties2 behaves similarly to vkGetPhysicalDeviceFormatProperties, with the ability to return extended information in a `pNext` chain of output structures.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFormatProperties2-physicalDevice-parameter: `physicalDevice` must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceFormatProperties2-format-parameter: `format` must be a valid VkFormat value
- VUID-vkGetPhysicalDeviceFormatProperties2-pFormatProperties-parameter: `pFormatProperties` must be a valid pointer to a VkFormatProperties2 structure

The VkFormatProperties2 structure is defined as:

```
typedef struct VkFormatProperties2 {
    VkStructureType sType;
    void* pNext;
    VkFormatProperties formatProperties;
} VkFormatProperties2;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
• **formatProperties** is a `VkFormatProperties` structure describing features supported by the requested format.

### Valid Usage (Implicit)

- **VUID-VkFormatProperties2-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_FORMAT_PROPERTIES_2`

- **VUID-VkFormatProperties2-pNext-pNext**
  - Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDrmFormatModifierPropertiesList2EXT` or `VkDrmFormatModifierPropertiesListEXT`

- **VUID-VkFormatProperties2-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique

To obtain the list of Linux DRM format modifiers compatible with a `VkFormat`, add a `VkDrmFormatModifierPropertiesListEXT` structure to the `pNext` chain of `VkFormatProperties2`.

The `VkDrmFormatModifierPropertiesListEXT` structure is defined as:

```c
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkDrmFormatModifierPropertiesListEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t drmFormatModifierCount;
    VkDrmFormatModifierPropertiesEXT* pDrmFormatModifierProperties;
} VkDrmFormatModifierPropertiesListEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `drmFormatModifierCount` is an inout parameter related to the number of modifiers compatible with the `format`, as described below.
- `pDrmFormatModifierProperties` is either `NULL` or a pointer to an array of `VkDrmFormatModifierPropertiesEXT` structures.

If `pDrmFormatModifierProperties` is `NULL`, then the function returns in `drmFormatModifierCount` the number of modifiers compatible with the queried `format`. Otherwise, the application must set `drmFormatModifierCount` to the length of the array `pDrmFormatModifierProperties`; the function will write at most `drmFormatModifierCount` elements to the array, and will return in `drmFormatModifierCount` the number of elements written.

Among the elements in array `pDrmFormatModifierProperties`, each returned `drmFormatModifier` must be unique.
Valid Usage (Implicit)

- VUID-VkDrmFormatModifierPropertiesListEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_DRM_FORMAT_MODIFIER_PROPERTIES_LIST_EXT

The **VkDrmFormatModifierPropertiesEXT** structure describes properties of a **VkFormat** when that format is combined with a **Linux DRM format modifier**. These properties, like those of **VkFormatProperties2**, are independent of any particular image.

The **VkDrmFormatModifierPropertiesEXT** structure is defined as:

```c
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkDrmFormatModifierPropertiesEXT {
    uint64_t     drmFormatModifier;
    uint32_t     drmFormatModifierPlaneCount;
    VkFormatFeatureFlags drmFormatModifierTilingFeatures;
} VkDrmFormatModifierPropertiesEXT;
```

- **drmFormatModifier** is a **Linux DRM format modifier**.
- **drmFormatModifierPlaneCount** is the number of **memory planes** in any image created with **format** and **drmFormatModifier**. An image's **memory plane count** is distinct from its **format plane count**, as explained below.
- **drmFormatModifierTilingFeatures** is a bitmask of **VkFormatFeatureFlagBits** that are supported by any image created with **format** and **drmFormatModifier**.

The returned **drmFormatModifierTilingFeatures** must contain at least one bit.

The implementation must not return **DRM_FORMAT_MOD_INVALID** in **drmFormatModifier**.

An image’s **memory plane count** (as returned by **drmFormatModifierPlaneCount**) is distinct from its **format plane count** (in the sense of **multi-planar Y’CbCr** formats). In **VkImageAspectFlags**, each **VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT** represents a **memory plane** and each **VK_IMAGE_ASPECT_PLANE_i_BIT** a **format plane**.

An image’s set of **format planes** is an ordered partition of the image’s **content** into separable groups of format components. The ordered partition is encoded in the name of each **VkFormat**. For example, **VK_FORMAT_G8_B8R8_2PLANE_420_UNORM** contains two **format planes**; the first plane contains the green component and the second plane contains the blue component and red component. If the format name does not contain **PLANE**, then the format contains a single plane; for example, **VK_FORMAT_R8G8B8A8_UNORM**. Some commands, such as **vkCmdCopyBufferToImage**, do not operate on all format components in the image, but instead operate only on the **format planes** explicitly chosen by the application and operate on each **format plane** independently.

An image's set of **memory planes** is an ordered partition of the image's **memory** rather than the image's **content**. Each **memory plane** is a contiguous range of memory. The union of an image's **memory planes** is not necessarily contiguous.
If an image is **linear**, then the partition is the same for *memory planes* and for *format planes*. Therefore, if the returned `drmFormatModifier` is `DRM_FORMAT_MOD_LINEAR`, then `drmFormatModifierPlaneCount` must equal the *format plane count*, and `drmFormatModifierTilingFeatures` must be identical to the `VkFormatProperties2::linearTilingFeatures` returned in the same `pNext` chain.

If an image is **non-linear**, then the partition of the image’s *memory* into *memory planes* is implementation-specific and may be unrelated to the partition of the image’s *content* into *format planes*. For example, consider an image whose *format* is `VK_FORMAT_G8_B8_R8_3PLANE_420_UNORM`, tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, whose `drmFormatModifier` is not `DRM_FORMAT_MOD_LINEAR`, and flags lacks `VK_IMAGE_CREATE_DISJOINT_BIT`. The image has 3 *format planes*, and commands such as `vkCmdCopyBufferToImage` act on each *format plane* independently as if the data of each *format plane* were separable from the data of the other planes. In a straightforward implementation, the implementation may store the image’s content in 3 adjacent *memory planes* where each memory plane corresponds exactly to a *format plane*. However, the implementation may also store the image’s content in a single *memory plane* where all format components are combined using an implementation-private block-compressed format; or the implementation may store the image’s content in a collection of 7 adjacent *memory planes* using an implementation-private sharding technique. Because the image is non-linear and non-disjoint, the implementation has much freedom when choosing the image’s placement in memory.

The *memory plane count* applies to function parameters and structures only when the API specifies an explicit requirement on `drmFormatModifierPlaneCount`. In all other cases, the *memory plane count* is ignored.

### 34.2.1. Potential Format Features

Some valid usage conditions depend on the format features supported by a `VkImage` whose `VkImageTiling` is unknown. In such cases the exact `VkFormatFeatureFlagBits` supported by the `VkImage` cannot be determined, so the valid usage conditions are expressed in terms of the potential format features of the `VkImage` format.

The potential format features of a `VkFormat` are defined as follows:

- The union of `VkFormatFeatureFlagBits` supported when the `VkImageTiling` is `VK_IMAGE_TILING_OPTIMAL`, `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, or `VK_IMAGE_TILING_LINEAR` if `VkFormat` is not `VK_FORMAT_UNDEFINED`
- `VkScreenBufferFormatPropertiesQNX::formatFeatures` of a valid external format if `VkFormat` is `VK_FORMAT_UNDEFINED`

### 34.3. Required Format Support

Implementations must support at least the following set of features on the listed formats. For images, these features must be supported for every `VkImageType` (including arrayed and cube variants) unless otherwise noted. These features are supported on existing formats without needing to advertise an extension or needing to explicitly enable them. Support for additional functionality beyond the requirements listed here is queried using the `vkGetPhysicalDeviceFormatProperties` command.
Note
Unless otherwise excluded below, the required formats are supported for all `VkImageCreateFlags` values as long as those flag values are otherwise allowed.

The following tables show which feature bits must be supported for each format. Formats that are required to support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` must also support `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT` and `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.

</table>
The `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features must be supported in `optimalTilingFeatures` for all the formats in at least one of this table.

**Mandatory format support:**
- BC compressed formats with `VkImageType` `VK_IMAGE_TYPE_2D` and `VK_IMAGE_TYPE_3D`, or
- Mandatory format support: ETC2 and EAC compressed formats with `VkImageType` `VK_IMAGE_TYPE_2D`.

If cubic filtering is supported, `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT` must be supported for the following image view types:

- `VK_IMAGE_VIEW_TYPE_2D`
- `VK_IMAGE_VIEW_TYPE_2D_ARRAY`

for the following formats:

- `VK_FORMAT_R4G4_UNORM_PACK8`
- `VK_FORMAT_R4G4B4A4_UNORM_PACK16`
- `VK_FORMAT_B4G4R4A4_UNORM_PACK16`
- `VK_FORMAT_R5G6B5_UNORM_PACK16`
- `VK_FORMAT_B5G6R5_UNORM_PACK16`
- `VK_FORMAT_R5G5B5A1_UNORM_PACK16`
- `VK_FORMAT_B5G5R5A1_UNORM_PACK16`
- `VK_FORMAT_A1R5G5B5_UNORM_PACK16`
- `VK_FORMAT_R8_UNORM`
- `VK_FORMAT_R8_SNORM`
- `VK_FORMAT_R8_SRGB`
- `VK_FORMAT_R8G8_UNORM`
- `VK_FORMAT_R8G8_SNORM`
- `VK_FORMAT_R8G8_SRGB`
- `VK_FORMAT_R8G8B8_UNORM`
- `VK_FORMAT_R8G8B8_SNORM`
- `VK_FORMAT_R8G8B8_SRGB`
- `VK_FORMAT_B8G8R8_UNORM`
• VK_FORMAT_B8G8R8_SNORM
• VK_FORMAT_B8G8R8_SRGB
• VK_FORMAT_R8G8B8A8_UNORM
• VK_FORMAT_R8G8B8A8_SNORM
• VK_FORMAT_R8G8B8A8_SRGB
• VK_FORMAT_B8G8R8A8_UNORM
• VK_FORMAT_B8G8R8A8_SNORM
• VK_FORMAT_B8G8R8A8_SRGB
• VK_FORMAT_A8B8G8R8_UNORM_PACK32
• VK_FORMAT_A8B8G8R8_SNORM_PACK32
• VK_FORMAT_A8B8G8R8_SRGB_PACK32

If ETC compressed formats are supported, **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT** must be supported for the following image view types:

• VK_IMAGE_VIEW_TYPE_2D
• VK_IMAGE_VIEW_TYPE_2D_ARRAY

for the following additional formats:

• VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK
• VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK
• VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK
• VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK
• VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK
• VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK

If cubic filtering is supported for any other formats, the following image view types **must** be supported for those formats:

• VK_IMAGE_VIEW_TYPE_2D
• VK_IMAGE_VIEW_TYPE_2D_ARRAY

To be used with `VkImageView` with `subresourceRange.aspectMask` equal to `VK_IMAGE_ASPECT_COLOR_BIT`, sampler Y'CbCr conversion must be enabled for the following formats:
Table 73. Formats requiring sampler $Y'CbCr$ conversion for `VK_IMAGE_ASPECT_COLOR_BIT` image views

</tbody>
</table>
Format features marked † must be supported for optimal Tiling Features with VkImageType
VK_IMAGE_TYPE_2D if the VkPhysicalDevice supports the
VkPhysicalDeviceSamplerYcbcrConversionFeatures feature.

Implementations are not required to support the VK_IMAGE_CREATE_SPARSE BINDING_BIT, VK_IMAGE_CREATE_SPARSE RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT VkImageCreateFlags for the above formats that require sampler Y'CbCr conversion. To determine whether the implementation supports sparse image creation flags with these formats use vkGetPhysicalDeviceImageFormatProperties or vkGetPhysicalDeviceImageFormatProperties2.

VK_FORMAT_FEATURE_FRAGMENT SHADING RATE_ATTACHMENT_BIT_KHR must be supported for the following formats if the attachmentFragmentShadingRate feature is supported:

- VK_FORMAT_R8_UINT

34.3.1. Formats Without Shader Storage Format

The device-level features for using a storage image or a storage texel buffer with an image format of Unknown, shaderStorageImageReadWithoutFormat and shaderStorageImageWriteWithoutFormat, only apply to the following formats:

- VK_FORMAT_R8G8B8A8_UNORM
- VK_FORMAT_R8G8B8A8_SNORM
- VK_FORMAT_R8G8B8A8_UINT
- VK_FORMAT_R8G8B8A8_SINT

Note

This list of formats is the union of required storage formats from Required Format Support section and formats listed in `shaderStorageImageExtendedFormats`. 
34.3.2. Format Feature Dependent Usage Flags

Certain resource usage flags depend on support for the corresponding format feature flag for the format in question. The following tables list the `VkBufferUsageFlagBits` and `VkImageUsageFlagBits` that have such dependencies, and the format feature flags they depend on. Additional restrictions, including, but not limited to, further required format feature flags specific to the particular use of the resource may apply, as described in the respective sections of this specification.

Chapter 35. Additional Capabilities

This chapter describes additional capabilities beyond the minimum capabilities described in the Limits and Formats chapters, including:

- Additional Image Capabilities
- Additional Buffer Capabilities
- Optional Semaphore Capabilities
- Optional Fence Capabilities
- Timestamp Calibration Capabilities

35.1. Additional Image Capabilities

Additional image capabilities, such as larger dimensions or additional sample counts for certain image types, or additional capabilities for linear tiling format images, are described in this section.

To query additional capabilities specific to image types, call:

```c
#include <vk_platform.h>

// Provided by VK_VERSION_1_0
VkResult vkGetPhysicalDeviceImageFormatProperties(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkImageType type,
    VkImageTiling tiling,
    VkImageUsageFlags usage,
    VkImageCreateFlags flags,
    VkImageFormatProperties* pImageFormatProperties);
```

- `physicalDevice` is the physical device from which to query the image capabilities.
- `format` is a `VkFormat` value specifying the image format, corresponding to `VkImageCreateInfo::format`.
- `type` is a `VkImageType` value specifying the image type, corresponding to `VkImageCreateInfo::imageType`.
- `tiling` is a `VkImageTiling` value specifying the image tiling, corresponding to `VkImageCreateInfo::tiling`.
- `usage` is a bitmask of `VkImageUsageFlagBits` specifying the intended usage of the image, corresponding to `VkImageCreateInfo::usage`.
- `flags` is a bitmask of `VkImageCreateFlagBits` specifying additional parameters of the image, corresponding to `VkImageCreateInfo::flags`.
- `pImageFormatProperties` is a pointer to a `VkImageFormatProperties` structure in which capabilities are returned.

The `format`, `type`, `tiling`, `usage`, and `flags` parameters correspond to parameters that would be
consumed by vkCreateImage (as members of VkImageCreateInfo).

If format is not a supported image format, or if the combination of format, type, tiling, usage, and flags is not supported for images, then vkGetPhysicalDeviceImageFormatProperties returns VK_ERROR_FORMAT_NOT_SUPPORTED.

The limitations on an image format that are reported by vkGetPhysicalDeviceImageFormatProperties have the following property: if usage1 and usage2 of type VkImageUsageFlags are such that the bits set in usage1 are a subset of the bits set in usage2, and flags1 and flags2 of type VkImageCreateFlags are such that the bits set in flags1 are a subset of the bits set in flags2, then the limitations for usage1 and flags1 must be no more strict than the limitations for usage2 and flags2, for all values of format, type, and tiling.

If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE, vkGetPhysicalDeviceImageFormatProperties must not return VK_ERROR_OUT_OF_HOST_MEMORY.

### Valid Usage

- VUID-vkGetPhysicalDeviceImageFormatProperties-tiling-02248
  - tiling must not be VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT. (Use vkGetPhysicalDeviceImageFormatProperties2 instead)

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceImageFormatProperties-physicalDevice-parameter
  - physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceImageFormatProperties-format-parameter
  - format must be a valid VkFormat value
- VUID-vkGetPhysicalDeviceImageFormatProperties-type-parameter
  - type must be a valid VkImageType value
- VUID-vkGetPhysicalDeviceImageFormatProperties-tiling-parameter
  - tiling must be a valid VkImageTiling value
- VUID-vkGetPhysicalDeviceImageFormatProperties-usage-parameter
  - usage must be a valid combination of VkImageUsageFlagBits values
- VUID-vkGetPhysicalDeviceImageFormatProperties-usage-requiredbitsetmask
  - usage must not be 0
- VUID-vkGetPhysicalDeviceImageFormatProperties-flags-parameter
  - flags must be a valid combination of VkImageCreateFlagBits values
  - pImageFormatProperties must be a valid pointer to a VkImageFormatProperties structure
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_FORMAT_NOT_SUPPORTED

The VkImageFormatProperties structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageFormatProperties {
    VkExtent3D    maxExtent;
    uint32_t      maxMipLevels;
    uint32_t      maxArrayLayers;
    VkSampleCountFlags sampleCounts;
    VkDeviceSize  maxResourceSize;
} VkImageFormatProperties;
```

• `maxExtent` are the maximum image dimensions. See the Allowed Extent Values section below for how these values are constrained by `type`.

• `maxMipLevels` is the maximum number of mipmap levels. `maxMipLevels` must be equal to the number of levels in the complete mipmap chain based on the `maxExtent.width`, `maxExtent.height`, and `maxExtent.depth`, except when one of the following conditions is true, in which case it may instead be 1:
  ◦ `vkGetPhysicalDeviceImageFormatProperties::tiling` was VK_IMAGE_TILING_LINEAR
  ◦ `VkPhysicalDeviceImageFormatInfo2::tiling` was VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT
  ◦ the `VkPhysicalDeviceImageFormatInfo2::pNext` chain included a `VkPhysicalDeviceExternalImageFormatInfo` structure with a handle type included in the `handleTypes` member for which mipmap image support is not required
  ◦ image format is one of the formats that require a sampler Y'CbCr conversion

• `maxArrayLayers` is the maximum number of array layers. `maxArrayLayers` must be no less than `VkPhysicalDeviceLimits::maxImageArrayLayers`, except when one of the following conditions is true, in which case it may instead be 1:
  ◦ `tiling` is VK_IMAGE_TILING_LINEAR
  ◦ `tiling` is VK_IMAGE_TILING_OPTIMAL and `type` is VK_IMAGE_TYPE_3D
  ◦ format is one of the formats that require a sampler Y'CbCr conversion

• If `tiling` is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then `maxArrayLayers` must not be 0.

• `sampleCounts` is a bitmask of `VkSampleCountFlagBits` specifying all the supported sample counts
for this image as described below.

- **maxResourceSize** is an upper bound on the total image size in bytes, inclusive of all image subresources. Implementations may have an address space limit on total size of a resource, which is advertised by this property. **maxResourceSize must** be at least $2^{31}$.

Note

There is no mechanism to query the size of an image before creating it, to compare that size against **maxResourceSize**. If an application attempts to create an image that exceeds this limit, the creation will fail and **vkCreateImage** will return **VK_ERROR_OUT_OF_DEVICE_MEMORY**. While the advertised limit must be at least $2^{31}$, it may not be possible to create an image that approaches that size, particularly for **VK_IMAGE_TYPE_1D**.

If the combination of parameters to **vkGetPhysicalDeviceImageFormatProperties** is not supported by the implementation for use in **vkCreateImage**, then all members of **VkImageFormatProperties** will be filled with zero.

Note

Filling **VkImageFormatProperties** with zero for unsupported formats is an exception to the usual rule that output structures have undefined contents on error. This exception was unintentional, but is preserved for backwards compatibility.

To query additional capabilities specific to image types, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkGetPhysicalDeviceImageFormatProperties2(
    VkPhysicalDevice physicalDevice,  // physicalDevice is the physical device from which to query the image capabilities.
    const VkPhysicalDeviceImageFormatInfo2* pImageFormatInfo,  // pImageFormatInfo is a pointer to a VkPhysicalDeviceImageFormatInfo2 structure describing the parameters that would be consumed by vkCreateImage.
    VkImageFormatProperties2* pImageFormatProperties  // pImageFormatProperties is a pointer to a VkImageFormatProperties2 structure in which capabilities are returned.
);  // vkGetPhysicalDeviceImageFormatProperties2 behaves similarly to vkGetPhysicalDeviceImageFormatProperties, with the ability to return extended information in a pNext chain of output structures.

if (VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations == VK_TRUE,  // If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE,  // vkGetPhysicalDeviceImageFormatProperties2 must not return VK_ERROR_OUT_OF_HOST_MEMORY.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceImageFormatProperties2-physicalDevice-parameter
```
**physicalDevice** must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceImageFormatProperties2-pImageFormatInfo-parameter
  **pImageFormatInfo** must be a valid pointer to a valid `VkPhysicalDeviceImageFormatInfo2` structure

  **pImageFormatProperties** must be a valid pointer to a `VkImageFormatProperties2` structure

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_FORMAT_NOT_SUPPORTED`

The `VkPhysicalDeviceImageFormatInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceImageFormatInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
    VkImageType type;
    VkImageTiling tiling;
    VkImageUsageFlags usage;
    VkImageCreateFlags flags;
} VkPhysicalDeviceImageFormatInfo2;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure. The `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` is used to provide additional image parameters to `vkGetPhysicalDeviceImageFormatProperties2`.
- **format** is a `VkFormat` value indicating the image format, corresponding to `VkImageCreateInfo::format`.
- **type** is a `VkImageType` value indicating the image type, corresponding to `VkImageCreateInfo::imageType`.
- **tiling** is a `VkImageTiling` value indicating the image tiling, corresponding to `VkImageCreateInfo::tiling`.
- **usage** is a bitmask of `VkImageUsageFlagBits` indicating the intended usage of the image, corresponding to `VkImageCreateInfo::usage`. 
• *flags* is a bitmask of `VkImageCreateFlagBits` indicating additional parameters of the image, corresponding to `VkImageCreateInfo::flags`.

The members of `VkPhysicalDeviceImageFormatInfo2` correspond to the arguments to `vkGetPhysicalDeviceImageFormatProperties`, with `sType` and `pNext` added for extensibility.

### Valid Usage

- VUID-VkPhysicalDeviceImageFormatInfo2-tiling-02249
  
  *tiling* must be `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` if and only if the `pNext` chain includes `VkPhysicalDeviceImageDrmFormatModifierInfoEXT`.

- VUID-VkPhysicalDeviceImageFormatInfo2-tiling-02313
  
  If *tiling* is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and *flags* contains `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, then the `pNext` chain must include a `VkImageFormatListCreateInfo` structure with non-zero `viewFormatCount`.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageFormatInfo2-sType-sType
  
  *sType* must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_FORMAT_INFO_2`.

- VUID-VkPhysicalDeviceImageFormatInfo2-pNext-pNext
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkImageFormatListCreateInfo`, `VkImageStencilUsageCreateInfo`, `VkPhysicalDeviceExternalImageFormatInfo`, `VkPhysicalDeviceImageDrmFormatModifierInfoEXT`, or `VkPhysicalDeviceImageViewImageFormatInfoEXT`.

- VUID-VkPhysicalDeviceImageFormatInfo2-sType-unique
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- VUID-VkPhysicalDeviceImageFormatInfo2-format-parameter
  
  `format` must be a valid `VkFormat` value.

- VUID-VkPhysicalDeviceImageFormatInfo2-type-parameter
  
  `type` must be a valid `VkImageType` value.

- VUID-VkPhysicalDeviceImageFormatInfo2-tiling-parameter
  
  `tiling` must be a valid `VkImageTiling` value.

- VUID-VkPhysicalDeviceImageFormatInfo2-usage-parameter
  
  `usage` must be a valid combination of `VkImageUsageFlagBits` values.

- VUID-VkPhysicalDeviceImageFormatInfo2-usage-requiredbitmask
  
  `usage` must not be `0`.

- VUID-VkPhysicalDeviceImageFormatInfo2-flags-parameter
  
  `flags` must be a valid combination of `VkImageCreateFlagBits` values.

The `VkImageFormatProperties2` structure is defined as:
// Provided by VK_VERSION_1_1

typedef struct VkImageFormatProperties2 {
    VkStructureType sType;
    void* pNext;
    VkImageFormatProperties imageFormatProperties;
} VkImageFormatProperties2;

• **sType** is a [VkStructureType](#) value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure. The **pNext** chain of [VkImageFormatProperties2](#) is used to allow the specification of additional capabilities to be returned from [vkGetPhysicalDeviceImageFormatProperties2](#).

• **imageFormatProperties** is a [VkImageFormatProperties](https://man7.org/_dirs/graphics-api-tech-docs/vulkan/vulkan.html) structure in which capabilities are returned.

If the combination of parameters to [vkGetPhysicalDeviceImageFormatProperties2](#) is not supported by the implementation for use in [vkCreateImage](#), then all members of **imageFormatProperties** will be filled with zero.

**Note**

Filling **imageFormatProperties** with zero for unsupported formats is an exception to the usual rule that output structures have undefined contents on error. This exception was unintentional, but is preserved for backwards compatibility. This exception only applies to **imageFormatProperties**, not **sType**, **pNext**, or any structures chained from **pNext**.

---

**Valid Usage (Implicit)**

- **VUID-VkImageFormatProperties2-sType-sType**
  - **sType** **must** be `VK_STRUCTURE_TYPE_IMAGE_FORMAT_PROPERTIES_2`

- **VUID-VkImageFormatProperties2-pNext-pNext**
  - Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either NULL or a pointer to a valid instance of [VkExternalImageFormatProperties](#), [VkFilterCubicImageViewImageFormatPropertiesEXT](#), or [VkSamplerYcbcrConversionImageFormatProperties](#)

- **VUID-VkImageFormatProperties2-sType-unique**
  - The **sType** value of each struct in the **pNext** chain **must** be unique

To determine the image capabilities compatible with an external memory handle type, add a [VkPhysicalDeviceExternalImageFormatInfo](#) structure to the **pNext** chain of the [VkPhysicalDeviceImageFormatInfo2](#) structure and a [VkExternalImageFormatProperties](#) structure to the **pNext** chain of the [VkImageFormatProperties2](#) structure.

The [VkPhysicalDeviceExternalImageFormatInfo](#) structure is defined as:
typedef struct VkPhysicalDeviceExternalImageFormatInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkPhysicalDeviceExternalImageFormatInfo;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **handleType** is a `VkExternalMemoryHandleTypeFlagBits` value specifying the memory handle type that will be used with the memory associated with the image.

If **handleType** is 0, `vkGetPhysicalDeviceImageFormatProperties2` will behave as if `VkPhysicalDeviceExternalImageFormatInfo` was not present, and `VkExternalImageFormatProperties` will be ignored.

If **handleType** is not compatible with the `format`, `type`, `tiling`, `usage`, and `flags` specified in `VkPhysicalDeviceImageFormatInfo2`, then `vkGetPhysicalDeviceImageFormatProperties2` returns `VK_ERROR_FORMAT_NOT_SUPPORTED`.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalImageFormatInfo-sType-sType
  - **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_IMAGE_FORMAT_INFO`

- VUID-VkPhysicalDeviceExternalImageFormatInfo-handleType-parameter
  - If **handleType** is not 0, **handleType** must be a valid `VkExternalMemoryHandleTypeFlagBits` value

Possible values of `VkPhysicalDeviceExternalImageFormatInfo::handleType`, specifying an external memory handle type, are:

typedef enum VkExternalMemoryHandleTypeFlagBits {
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT = 0x00000001,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT = 0x00000002,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT = 0x00000004,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT = 0x00000008,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT = 0x00000010,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT = 0x00000020,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT = 0x00000040,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT = 0x00000200,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT = 0x00000080,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT = 0x00000100,
    // Provided by VK_EXT_external_memory_dma_buf
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT = 0x00000200,
    // Provided by VK_EXT_external_memory_host
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT = 0x00000080,
    // Provided by VK_EXT_external_memory_host
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT = 0x00000100,
}
• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT** specifies a POSIX file descriptor handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the POSIX system calls `dup`, `dup2`, `close`, and the non-standard system call `dup3`. Additionally, it must be transportable over a socket using an `SCM_RIGHTS` control message. It owns a reference to the underlying memory resource represented by its Vulkan memory object.

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT** specifies an NT handle that has only limited valid usage outside of Vulkan and other compatible APIs. It **must** be compatible with the functions `DuplicateHandle`, `CloseHandle`, `CompareObjectHandles`, `GetHandleInformation`, and `SetHandleInformation`. It owns a reference to the underlying memory resource represented by its Vulkan memory object.

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT** specifies a global share handle that has only limited valid usage outside of Vulkan and other compatible APIs. It is not compatible with any native APIs. It does not own a reference to the underlying memory resource represented by its Vulkan memory object, and will therefore become invalid when all Vulkan memory objects associated with it are destroyed.

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT** specifies an NT handle returned by `IDXGIResource1::CreateSharedHandle` referring to a Direct3D 10 or 11 texture resource. It owns a reference to the memory used by the Direct3D resource.

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT** specifies a global share handle returned by `IDXGIResource::GetSharedHandle` referring to a Direct3D 10 or 11 texture resource. It does not own a reference to the underlying Direct3D resource, and will therefore become invalid when all Vulkan memory objects and Direct3D resources associated with it are destroyed.

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT** specifies an NT handle returned by `ID3D12Device::CreateSharedHandle` referring to a Direct3D 12 heap resource. It owns a reference to the resources used by the Direct3D heap.

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12RESOURCE_BIT** specifies an NT handle returned by `ID3D12Device::CreateSharedHandle` referring to a Direct3D 12 committed resource. It owns a reference to the memory used by the Direct3D resource.

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT** specifies a host pointer returned by a host memory allocation command. It does not own a reference to the underlying memory resource, and will therefore become invalid if the host memory is freed.

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT** specifies a host pointer to *host mapped foreign memory*. It does not own a reference to the underlying memory resource, and will therefore become invalid if the foreign memory is unmapped or otherwise becomes no longer available.

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT** is a file descriptor for a Linux `dma_buf`. It owns a reference to the underlying memory resource represented by its Vulkan memory object.

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCI_BUF_BIT_NV** specifies a volatile memory object (`NvSciBufObj`)
that is backed by a buffer and shareable across various hardware engines including the CPU, and software (intra-process and inter-process) and hardware (system memory) operating domains.

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX` specifies a _screen_buffer_ object defined by the QNX SDP. See QNX Screen Buffer for more details of this handle type.
Some external memory handle types can only be shared within the same underlying physical device and/or the same driver version, as defined in the following table:

### Table 76. External memory handle types compatibility

<table>
<thead>
<tr>

</tbody>
</table>

**Note**

The above table does not restrict the drivers and devices with which VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT and VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT may be shared, as these handle types inherently mean memory that does not come from the same device, as they import memory from the host or a foreign device, respectively.

**Note**

Even though the above table does not restrict the drivers and devices with which VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT may be shared, query mechanisms exist in the Vulkan API that prevent the import of incompatible dma-bufs (such as vkGetMemoryFdPropertiesKHR) and that prevent incompatible usage of dma-bufs (such as VkPhysicalDeviceExternalBufferInfo and...
VkPhysicalDeviceExternalImageFormatInfo)

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalMemoryHandleTypeFlags;
```

**VkExternalMemoryHandleTypeFlags** is a bitmask type for setting a mask of zero or more **VkExternalMemoryHandleTypeFlagBits**.

The **VkExternalImageFormatProperties** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExternalImageFormatProperties {
    VkStructureType sType;
    void*pNext;
    VkExternalMemoryProperties externalMemoryProperties;
} VkExternalImageFormatProperties;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **externalMemoryProperties** is a **VkExternalMemoryProperties** structure specifying various capabilities of the external handle type when used with the specified image creation parameters.

### Valid Usage (Implicit)

- VUID-VkExternalImageFormatProperties-sType-sType
  - **sType** must be VK_STRUCTURE_TYPE_EXTERNAL_IMAGE_FORMAT_PROPERTIES

The **VkExternalMemoryProperties** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryProperties {
    VkExternalMemoryFeatureFlags externalMemoryFeatures;
    VkExternalMemoryHandleTypeFlags exportFromImportedHandleTypes;
    VkExternalMemoryHandleTypeFlags compatibleHandleTypes;
} VkExternalMemoryProperties;
```

- **externalMemoryFeatures** is a bitmask of **VkExternalMemoryFeatureFlagBits** specifying the features of **handleType**.
- **exportFromImportedHandleTypes** is a bitmask of **VkExternalMemoryHandleTypeFlagBits** specifying which types of imported handle **handleType** can be exported from.
- **compatibleHandleTypes** is a bitmask of **VkExternalMemoryHandleTypeFlagBits** specifying handle types which can be specified at the same time as **handleType** when creating an image compatible
with external memory.

compatibleHandleTypes must include at least handleType. Inclusion of a handle type in compatibleHandleTypes does not imply the values returned in VkImageFormatProperties2 will be the same when VkPhysicalDeviceExternalImageFormatInfo::handleType is set to that type. The application is responsible for querying the capabilities of all handle types intended for concurrent use in a single image and intersecting them to obtain the compatible set of capabilities.

Bits which may be set in VkExternalMemoryProperties::externalMemoryFeatures, specifying features of an external memory handle type, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkExternalMemoryFeatureFlagBits {
    VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT = 0x00000001,
    VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT = 0x00000002,
    VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT = 0x00000004,
} VkExternalMemoryFeatureFlagBits;
```

- **VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT** specifies that images or buffers created with the specified parameters and handle type must use the mechanisms defined by VkMemoryDedicatedRequirements and VkMemoryDedicatedAllocateInfo to create (or import) a dedicated allocation for the image or buffer.
- **VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT** specifies that handles of this type can be exported from Vulkan memory objects.
- **VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT** specifies that handles of this type can be imported as Vulkan memory objects.

Because their semantics in external APIs roughly align with that of an image or buffer with a dedicated allocation in Vulkan, implementations are required to report **VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT** for the following external handle types:

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT**
- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT**
- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT**
- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX** for images only

Implementations must not report **VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT** for buffers with external handle type **VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX**. Implementations must not report **VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT** for images or buffers with external handle type **VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT**, or **VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT**.

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalMemoryFeatureFlags;
```

VkExternalMemoryFeatureFlags is a bitmask type for setting a mask of zero or more
To query the image capabilities that are compatible with a Linux DRM format modifier, set `VkPhysicalDeviceImageFormatInfo2::tiling` to `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and add a `VkPhysicalDeviceImageDrmFormatModifierInfoEXT` structure to the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2`.

The `VkPhysicalDeviceImageDrmFormatModifierInfoEXT` structure is defined as:

```c
typedef struct VkPhysicalDeviceImageDrmFormatModifierInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint64_t drmFormatModifier;
    VkSharingMode sharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
} VkPhysicalDeviceImageDrmFormatModifierInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `drmFormatModifier` is the image’s Linux DRM format modifier, corresponding to `VkImageDrmFormatModifierExplicitCreateInfoEXT::modifier` or to `VkImageDrmFormatModifierListCreateInfoEXT::pModifiers`.
- `sharingMode` specifies how the image will be accessed by multiple queue families.
- `queueFamilyIndexCount` is the number of entries in the `pQueueFamilyIndices` array.
- `pQueueFamilyIndices` is a pointer to an array of `queueFamilyIndexCount` `uint32_t` values.

If the `drmFormatModifier` is incompatible with the parameters specified in `VkPhysicalDeviceImageFormatInfo2` and its `pNext` chain, then `vkGetPhysicalDeviceImageFormatProperties2` returns `VK_ERROR_FORMAT_NOT_SUPPORTED`. The implementation must support the query of any `drmFormatModifier`, including unknown and invalid modifier values.

Valid Usage

- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-02314
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, then `pQueueFamilyIndices` must be a valid pointer to an array of `queueFamilyIndexCount` `uint32_t` values

- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-02315
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, then `queueFamilyIndexCount` must be greater than `1`

- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-02316
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` must be
unique and must be less than the pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to create device

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_DRM_FORMAT_MODIFIER_INFO_EXT
• VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-parameter
  sharingMode must be a valid VkSharingMode value

To determine the number of combined image samplers required to support a multi-planar format, add VkSamplerYcbcrConversionImageFormatProperties to the pNext chain of the VkImageFormatProperties2 structure in a call to vkGetPhysicalDeviceImageFormatProperties2.

The VkSamplerYcbcrConversionImageFormatProperties structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionImageFormatProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t combinedImageSamplerDescriptorCount;
} VkSamplerYcbcrConversionImageFormatProperties;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• combinedImageSamplerDescriptorCount is the number of combined image sampler descriptors that the implementation uses to access the format.

Valid Usage (Implicit)

• VUID-VkSamplerYcbcrConversionImageFormatProperties-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_IMAGE_FORMAT_PROPERTIES

combinedImageSamplerDescriptorCount is a number between 1 and the number of planes in the format. A descriptor set layout binding with immutable Y’CnCnR conversion samplers will have a maximum combinedImageSamplerDescriptorCount which is the maximum across all formats supported by its samplers of the combinedImageSamplerDescriptorCount for each format. Descriptor sets with that layout will internally use that maximum combinedImageSamplerDescriptorCount descriptors for each descriptor in the binding. This expanded number of descriptors will be consumed from the descriptor pool when a descriptor set is allocated, and counts towards the maxDescriptorSetSamplers, maxDescriptorSetSampledImages, maxPerStageDescriptorSamplers, and maxPerStageDescriptorSampledImages limits.
Note

All descriptors in a binding use the same maximum combinedImageSamplerDescriptorCount descriptors to allow implementations to use a uniform stride for dynamic indexing of the descriptors in the binding.

For example, consider a descriptor set layout binding with two descriptors and immutable samplers for multi-planar formats that have VkSamplerYcbcrConversionImageFormatProperties::combinedImageSamplerDescriptorCount values of 2 and 3 respectively. There are two descriptors in the binding and the maximum combinedImageSamplerDescriptorCount is 3, so descriptor sets with this layout consume 6 descriptors from the descriptor pool. To create a descriptor pool that allows allocating four descriptor sets with this layout, descriptorCount must be at least 24.

To determine if cubic filtering can be used with a given image format and a given image view type add a VkPhysicalDeviceImageViewImageFormatInfoEXT structure to the pNext chain of the VkPhysicalDeviceImageFormatInfo2 structure, and a VkFilterCubicImageViewImageFormatPropertiesEXT structure to the pNext chain of the VkImageFormatProperties2 structure.

The VkPhysicalDeviceImageViewImageFormatInfoEXT structure is defined as:

```c
// Provided by VK_EXT_filter_cubic
typedef struct VkPhysicalDeviceImageViewImageFormatInfoEXT {
    VkStructureType sType;
    void* pNext;
    VkImageViewType imageViewType;
} VkPhysicalDeviceImageViewImageFormatInfoEXT;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• imageViewType is a VkImageViewType value specifying the type of the image view.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceImageViewImageFormatInfoEXT-sType-sType sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_VIEW_IMAGE_FORMAT_INFO_EXT
• VUID-VkPhysicalDeviceImageViewImageFormatInfoEXT-imageViewType-parameter imageViewType must be a valid VkImageViewType value

The VkFilterCubicImageViewImageFormatPropertiesEXT structure is defined as:

```c
// Provided by VK_EXT_filter_cubic
typedef struct VkFilterCubicImageViewImageFormatPropertiesEXT {
    VkStructureType sType;
};
```
void* pNext;
VkBool32 filterCubic;
VkBool32 filterCubicMinmax;
}

VkFilterCubicImageViewImageFormatPropertiesEXT

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **filterCubic** tells if image format, image type and image view type can be used with cubic filtering. This field is set by the implementation. User-specified value is ignored.
- **filterCubicMinmax** tells if image format, image type and image view type can be used with cubic filtering and minmax filtering. This field is set by the implementation. User-specified value is ignored.

### Valid Usage (Implicit)

- VUID-VkFilterCubicImageViewImageFormatPropertiesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_FILTER_CUBIC_IMAGE_VIEW_IMAGE_FORMAT_PROPERTIES_EXT

### Valid Usage

- VUID-VkFilterCubicImageViewImageFormatPropertiesEXT-pNext-02627
  If the pNext chain of the VkImageFormatProperties2 structure includes a VkFilterCubicImageViewImageFormatPropertiesEXT structure, the pNext chain of the VkPhysicalDeviceImageFormatInfo2 structure must include a VkPhysicalDeviceImageViewImageFormatInfoEXT structure with an imageViewType that is compatible with imageType

#### 35.1.1. Supported Sample Counts

vkGetPhysicalDeviceImageFormatProperties returns a bitmask of VkSampleCountFlagBits in sampleCounts specifying the supported sample counts for the image parameters.

sampleCounts will be set to VK_SAMPLE_COUNT_1_BIT if at least one of the following conditions is true:

- **tiling** is VK_IMAGE_TILING_LINEAR
- **type** is not VK_IMAGE_TYPE_2D
- **flags** contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT
- Neither the VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT flag nor the VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT flag in VkFormatProperties::optimalTilingFeatures returned by vkGetPhysicalDeviceFormatProperties is set
- VkPhysicalDeviceExternalImageFormatInfo::handleType is an external handle type for which multisampled image support is not required.
- **format** is one of the formats that require a sampler Y'CbCr conversion
• usage contains VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

Otherwise, the bits set in sampleCounts will be the sample counts supported for the specified values of usage and format. For each bit set in usage, the supported sample counts relate to the limits in VkPhysicalDeviceLimits as follows:

• If usage includes VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT and format is a floating- or fixed-point color format, a superset of VkPhysicalDeviceLimits::framebufferColorSampleCounts

• If usage includes VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT and format is an integer format, a superset of VkPhysicalDeviceVulkan12Properties::framebufferIntegerColorSampleCounts

• If usage includes VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and format includes a depth component, a superset of VkPhysicalDeviceLimits::framebufferDepthSampleCounts

• If usage includes VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and format includes a stencil component, a superset of VkPhysicalDeviceLimits::framebufferStencilSampleCounts

• If usage includes VK_IMAGE_USAGE_SAMPLED_BIT, and format includes a color component, a superset of VkPhysicalDeviceLimits::sampledImageColorSampleCounts

• If usage includes VK_IMAGE_USAGE_SAMPLED_BIT, and format includes a depth component, a superset of VkPhysicalDeviceLimits::sampledImageDepthSampleCounts

• If usage includes VK_IMAGE_USAGE_SAMPLED_BIT, and format includes an integer format, a superset of VkPhysicalDeviceLimits::sampledImageIntegerSampleCounts

• If usage includes VK_IMAGE_USAGE_STORAGE_BIT, a superset of VkPhysicalDeviceLimits::storageImageSampleCounts

If multiple bits are set in usage, sampleCounts will be the intersection of the per-usage values described above.

If none of the bits described above are set in usage, then there is no corresponding limit in VkPhysicalDeviceLimits. In this case, sampleCounts must include at least VK_SAMPLE_COUNT_1_BIT.

35.1.2. Allowed Extent Values Based on Image Type

Implementations may support extent values larger than the required minimum/maximum values for certain types of images. VkImageFormatProperties::maxExtent for each type is subject to the constraints below.

---

**Note**

Implementations must support images with dimensions up to the required minimum/maximum values for all types of images. It follows that the query for additional capabilities must return extent values that are at least as large as the required values.

For VK_IMAGE_TYPE_1D:

- maxExtent.width ≥ VkPhysicalDeviceLimits::maxImageDimension1D
- maxExtent.height = 1
• maxExtent.depth = 1

For VK_IMAGE_TYPE_2D when flags does not contain VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT:

• maxExtent.width ≥ VkPhysicalDeviceLimits::maxImageDimension2D
• maxExtent.height ≥ VkPhysicalDeviceLimits::maxImageDimension2D
• maxExtent.depth = 1

For VK_IMAGE_TYPE_2D when flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT:

• maxExtent.width ≥ VkPhysicalDeviceLimits::maxImageDimensionCube
• maxExtent.height ≥ VkPhysicalDeviceLimits::maxImageDimensionCube
• maxExtent.depth = 1

For VK_IMAGE_TYPE_3D:

• maxExtent.width ≥ VkPhysicalDeviceLimits::maxImageDimension3D
• maxExtent.height ≥ VkPhysicalDeviceLimits::maxImageDimension3D
• maxExtent.depth ≥ VkPhysicalDeviceLimits::maxImageDimension3D

### 35.2. Additional Buffer Capabilities

To query the external handle types supported by buffers, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceExternalBufferProperties(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceExternalBufferInfo* pExternalBufferInfo,
    VkExternalBufferProperties* pExternalBufferProperties);
```

• physicalDevice is the physical device from which to query the buffer capabilities.
• pExternalBufferInfo is a pointer to a VkPhysicalDeviceExternalBufferInfo structure describing the parameters that would be consumed by vkCreateBuffer.
• pExternalBufferProperties is a pointer to a VkExternalBufferProperties structure in which capabilities are returned.

#### Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceExternalBufferProperties-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
• VUID-vkGetPhysicalDeviceExternalBufferProperties-pExternalBufferInfo-parameter pExternalBufferInfo must be a valid pointer to a valid VkPhysicalDeviceExternalBufferInfo structure
• VUID-vkGetPhysicalDeviceExternalBufferProperties-pExternalBufferProperties-
parameter

*pExternalBufferProperties* must be a valid pointer to a *VkExternalBufferProperties* structure.

The *VkPhysicalDeviceExternalBufferInfo* structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalBufferInfo {
    VkStructureType sType;
    const void* pNext;
    VkBufferCreateFlags flags;
    VkBufferUsageFlags usage;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkPhysicalDeviceExternalBufferInfo;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of *VkBufferCreateFlagBits* describing additional parameters of the buffer, corresponding to *VkBufferCreateInfo::flags*.
- **usage** is a bitmask of *VkBufferUsageFlagBits* describing the intended usage of the buffer, corresponding to *VkBufferCreateInfo::usage*.
- **handleType** is a *VkExternalMemoryHandleTypeFlagBits* value specifying the memory handle type that will be used with the memory associated with the buffer.

Only usage flags representable in *VkBufferUsageFlagBits* are returned in this structure’s **usage**.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceExternalBufferInfo-sType-sType**  
  *sType* must be *VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_BUFFER_INFO*

- **VUID-VkPhysicalDeviceExternalBufferInfo-pNext-pNext**  
  *pNext* must be NULL

- **VUID-VkPhysicalDeviceExternalBufferInfo-flags-parameter**  
  *flags* must be a valid combination of *VkBufferCreateFlagBits* values

- **VUID-VkPhysicalDeviceExternalBufferInfo-usage-parameter**  
  *usage* must be a valid combination of *VkBufferUsageFlagBits* values

- **VUID-VkPhysicalDeviceExternalBufferInfo-usage-required bitmask**  
  *usage* must not be 0

- **VUID-VkPhysicalDeviceExternalBufferInfo-handleType-parameter**  
  *handleType* must be a valid *VkExternalMemoryHandleTypeFlagBits* value

The *VkExternalBufferProperties* structure is defined as:
typedef struct VkExternalBufferProperties {
    VkStructureType sType;
    void* pNext;
    VkExternalMemoryProperties externalMemoryProperties;
} VkExternalBufferProperties;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **externalMemoryProperties** is a `VkExternalMemoryProperties` structure specifying various capabilities of the external handle type when used with the specified buffer creation parameters.

### Valid Usage (Implicit)

- VUID-VkExternalBufferProperties-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_EXTERNAL_BUFFER_PROPERTIES`

- VUID-VkExternalBufferProperties-pNext-pNext
  
  **pNext** must be `NULL`

#### 35.3. Optional Semaphore Capabilities

Semaphores **may** support import and export of their payload to external handles. To query the external handle types supported by semaphores, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceExternalSemaphoreProperties(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceExternalSemaphoreInfo* pExternalSemaphoreInfo,
    VkExternalSemaphoreProperties* pExternalSemaphoreProperties);
```

- **physicalDevice** is the physical device from which to query the semaphore capabilities.
- **pExternalSemaphoreInfo** is a pointer to a `VkPhysicalDeviceExternalSemaphoreInfo` structure describing the parameters that would be consumed by `vkCreateSemaphore`.
- **pExternalSemaphoreProperties** is a pointer to a `VkExternalSemaphoreProperties` structure in which capabilities are returned.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceExternalSemaphoreProperties-physicalDevice-parameter
  
  **physicalDevice** must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceExternalSemaphoreProperties-pExternalSemaphoreInfo-
parameter

\[
p\text{ExternalSemaphoreInfo} \quad \text{must} \quad \text{be a valid pointer to a valid}
\]
\[
\text{VkPhysicalDeviceExternalSemaphoreInfo} \quad \text{structure}
\]

- VUID-vkGetPhysicalDeviceExternalSemaphoreProperties-pExternalSemaphoreProperties-parameter

\[
p\text{ExternalSemaphoreProperties} \quad \text{must} \quad \text{be a valid pointer to a valid}
\]
\[
\text{VkExternalSemaphoreProperties} \quad \text{structure}
\]

The \text{VkPhysicalDeviceExternalSemaphoreInfo} structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalSemaphoreInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkPhysicalDeviceExternalSemaphoreInfo;
```

- \text{sType} is a \text{VkStructureType} value identifying this structure.
- \text{pNext} is NULL or a pointer to a structure extending this structure.
- \text{handleType} is a \text{VkExternalSemaphoreHandleTypeFlagBits} value specifying the external semaphore handle type for which capabilities will be returned.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalSemaphoreInfo-sType-sType
  \text{sType} \text{must} \text{be} \text{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_SEMAPHORE_INFO}

- VUID-VkPhysicalDeviceExternalSemaphoreInfo-pNext-pNext
  \text{pNext} \text{must} \text{be} \text{NULL} or a pointer to a valid instance of \text{VkSemaphoreTypeCreateInfo}

- VUID-VkPhysicalDeviceExternalSemaphoreInfo-sType-unique
  The \text{sType} value of each struct in the \text{pNext} chain \text{must} \text{be} \text{unique}

- VUID-VkPhysicalDeviceExternalSemaphoreInfo-handleType-parameter
  \text{handleType} \text{must} \text{be} a valid \text{VkExternalSemaphoreHandleTypeFlagBits} value

Bits which \text{may} be set in \text{VkPhysicalDeviceExternalSemaphoreInfo}\:::\text{handleType}, specifying an external semaphore handle type, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkExternalSemaphoreHandleTypeFlagBits {
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT = 0x00000001,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT = 0x00000002,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT = 0x00000004,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT = 0x00000008,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT = 0x00000010,
} // Provided by VK_NV_external_sci_sync
```
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT specifies a POSIX file descriptor handle that has only limited valid usage outside of Vulkan and other compatible APIs. It must be compatible with the POSIX system calls dup, dup2, close, and the non-standard system call dup3. Additionally, it must be transportable over a socket using an SCM_RIGHTS control message. It owns a reference to the underlying synchronization primitive represented by its Vulkan semaphore object.

VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT specifies an NT handle that has only limited valid usage outside of Vulkan and other compatible APIs. It must be compatible with the functions DuplicateHandle, CloseHandle, CompareObjectHandles, GetHandleInformation, and SetHandleInformation. It owns a reference to the underlying synchronization primitive represented by its Vulkan semaphore object.

VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT specifies a global share handle that has only limited valid usage outside of Vulkan and other compatible APIs. It is not compatible with any native APIs. It does not own a reference to the underlying synchronization primitive represented by its Vulkan semaphore object, and will therefore become invalid when all Vulkan semaphore objects associated with it are destroyed.

VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT specifies an NT handle returned by ID3D12Device::CreateSharedHandle referring to a Direct3D 12 fence, or ID3D11Device5::CreateFence referring to a Direct3D 11 fence. It owns a reference to the underlying synchronization primitive associated with the Direct3D fence.

VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D11_FENCE_BIT is an alias of VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT with the same meaning. It is provided for convenience and code clarity when interacting with D3D11 fences.

VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT specifies a POSIX file descriptor handle to a Linux Sync File or Android Fence object. It can be used with any native API accepting a valid sync file or fence as input. It owns a reference to the underlying synchronization primitive associated with the file descriptor. Implementations which support importing this handle type must accept any type of sync or fence FD supported by the native system they are running on.

VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV specifies a synchronization object (NvSciSyncObj) shareable across various hardware engines including the CPU and software (intra-process and inter-process) operating domains and perform signal and wait operations.

Note
Handles of type VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT generated by the implementation may represent either Linux Sync Files or Android Fences at the implementation’s discretion. Applications should only use operations defined for both types of file descriptors, unless they know via means external to Vulkan the type of the file descriptor, or are prepared to deal with the system-defined operation failures resulting from using the wrong type.
Some external semaphore handle types can only be shared within the same underlying physical device and/or the same driver version, as defined in the following table:

**Table 77. External semaphore handle types compatibility**

<table>
<thead>
<tr>
<th>Handle type</th>

// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalSemaphoreHandleTypeFlags;

VkExternalSemaphoreHandleTypeFlags is a bitmask type for setting a mask of zero or more VkExternalSemaphoreHandleTypeFlagBits.

The VkExternalSemaphoreProperties structure is defined as:

// Provided by VK_VERSION_1_1
typedef struct VkExternalSemaphoreProperties {
    VkStructureType sType;
    void* pNext;
    VkExternalSemaphoreHandleTypeFlags exportFromImportedHandleTypes;
    VkExternalSemaphoreHandleTypeFlags compatibleHandleTypes;
    VkExternalSemaphoreFeatureFlags externalSemaphoreFeatures;
} VkExternalSemaphoreProperties;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **exportFromImportedHandleTypes** is a bitmask of VkExternalSemaphoreHandleTypeFlagBits specifying which types of imported handle handleType can be exported from.
- **compatibleHandleTypes** is a bitmask of VkExternalSemaphoreHandleTypeFlagBits specifying handle types which can be specified at the same time as handleType when creating a semaphore.
- **externalSemaphoreFeatures** is a bitmask of VkExternalSemaphoreFeatureFlagBits describing the
features of `handleType`.

If `handleType` is not supported by the implementation, then `VkExternalSemaphoreProperties::externalSemaphoreFeatures` will be set to zero.

### Valid Usage (Implicit)

- VUID-VkExternalSemaphoreProperties-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_EXTERNAL_SEMAPHORE_PROPERTIES`
  
- VUID-VkExternalSemaphoreProperties-pNext-pNext
  
  `pNext` must be `NULL`

Bits which may be set in `VkExternalSemaphoreProperties::externalSemaphoreFeatures`, specifying the features of an external semaphore handle type, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkExternalSemaphoreFeatureFlagBits {
    VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT = 0x00000001,
    VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT = 0x00000002,
} VkExternalSemaphoreFeatureFlagBits;
```

- `VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT` specifies that handles of this type can be exported from Vulkan semaphore objects.
- `VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT` specifies that handles of this type can be imported as Vulkan semaphore objects.

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalSemaphoreFeatureFlags;
```

`VkExternalSemaphoreFeatureFlags` is a bitmask type for setting a mask of zero or more `VkExternalSemaphoreFeatureFlagBits`.

### 35.4. Optional Fence Capabilities

Fences may support import and export of their `payload` to external handles. To query the external handle types supported by fences, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceExternalFenceProperties(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceExternalFenceInfo* pExternalFenceInfo,
    VkExternalFenceProperties* pExternalFenceProperties);
```

- `physicalDevice` is the physical device from which to query the fence capabilities.
• `pExternalFenceInfo` is a pointer to a `VkPhysicalDeviceExternalFenceInfo` structure describing the parameters that would be consumed by `vkCreateFence`.

• `pExternalFenceProperties` is a pointer to a `VkExternalFenceProperties` structure in which capabilities are returned.

---

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceExternalFenceProperties-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceExternalFenceProperties-pExternalFenceInfo-parameter
  `pExternalFenceInfo` must be a valid pointer to a valid `VkPhysicalDeviceExternalFenceInfo` structure

- VUID-vkGetPhysicalDeviceExternalFenceProperties-pExternalFenceProperties-parameter
  `pExternalFenceProperties` must be a valid pointer to a `VkExternalFenceProperties` structure

---

The `VkPhysicalDeviceExternalFenceInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalFenceInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkPhysicalDeviceExternalFenceInfo;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying an external fence handle type for which capabilities will be returned.

---

**Note**

Handles of type `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` generated by the implementation may represent either Linux Sync Files or Android Fences at the implementation's discretion. Applications should only use operations defined for both types of file descriptors, unless they know via means external to Vulkan the type of the file descriptor, or are prepared to deal with the system-defined operation failures resulting from using the wrong type.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceExternalFenceInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_FENCE_INFO`

- VUID-VkPhysicalDeviceExternalFenceInfo-pNext-pNext
pNext must be NULL

- VUID-VkPhysicalDeviceExternalFenceInfo-handleType-parameter
  handleType must be a valid VkExternalFenceHandleTypeFlagBits value

Bits which may be set in

- VkPhysicalDeviceExternalFenceInfo::handleType
- VkExternalFenceProperties::exportFromImportedHandleTypes
- VkExternalFenceProperties::compatibleHandleTypes

indicate external fence handle types, and are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkExternalFenceHandleTypeFlagBits {
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT = 0x00000001,
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT = 0x00000002,
    VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT = 0x00000004,
    VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT = 0x00000008,
    // Provided by VK_NV_external_sci_sync, VK_NV_external_sci_sync2
    VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV = 0x00000010,
    // Provided by VK_NV_external_sci_sync, VK_NV_external_sci_sync2
    VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV = 0x00000020,
} VkExternalFenceHandleTypeFlagBits;
```

- **VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT** specifies a POSIX file descriptor handle that has only limited valid usage outside of Vulkan and other compatible APIs. It must be compatible with the POSIX system calls `dup`, `dup2`, `close`, and the non-standard system call `dup3`. Additionally, it must be transportable over a socket using an SCM_RIGHTS control message. It owns a reference to the underlying synchronization primitive represented by its Vulkan fence object.

- **VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT** specifies an NT handle that has only limited valid usage outside of Vulkan and other compatible APIs. It must be compatible with the functions `DuplicateHandle`, `CloseHandle`, `CompareObjectHandles`, `GetHandleInformation`, and `SetHandleInformation`. It owns a reference to the underlying synchronization primitive represented by its Vulkan fence object.

- **VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT** specifies a global share handle that has only limited valid usage outside of Vulkan and other compatible APIs. It is not compatible with any native APIs. It does not own a reference to the underlying synchronization primitive represented by its Vulkan fence object, and will therefore become invalid when all Vulkan fence objects associated with it are destroyed.

- **VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT** specifies a POSIX file descriptor handle to a Linux Sync File or Android Fence. It can be used with any native API accepting a valid sync file or fence as input. It owns a reference to the underlying synchronization primitive associated with the file descriptor. Implementations which support importing this handle type must accept any type of sync or fence FD supported by the native system they are running on.

- **VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV** specifies a synchronization object
(NvSciSyncObj) shareable across various hardware engines including the CPU and software (intra-process and inter-process) operating domains and perform signal and wait operations.

- `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV` specifies a struct of `NvSciSyncFence` that is a snapshot of a synchronization object's underlying primitive and represents its possible state.
Some external fence handle types can only be shared within the same underlying physical device and/or the same driver version, as defined in the following table:

**Table 78. External fence handle types compatibility**

<table>
<thead>
<tr>
<th>Handle type</th>
<th>VkPhysicalDeviceIDProperties::driverUUID</th>
<th>VkPhysicalDeviceIDProperties::deviceUUID</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV</td>
<td>Must match</td>
<td>Must match</td>
</tr>
</tbody>
</table>

// Provided by VK_VERSION_1_1

```c
typedef VkFlags VkExternalFenceHandleTypeFlags;
```

_VkExternalFenceHandleTypeFlags_ is a bitmask type for setting a mask of zero or more _VkExternalFenceHandleTypeFlagBits_.

The _VkExternalFenceProperties_ structure is defined as:

// Provided by VK_VERSION_1_1

```c
typedef struct VkExternalFenceProperties {
    VkStructureType sType;
    void* pNext;
    VkExternalFenceHandleTypeFlags exportFromImportedHandleTypes;
    VkExternalFenceHandleTypeFlags compatibleHandleTypes;
    VkExternalFenceFeatureFlags externalFenceFeatures;
} VkExternalFenceProperties;
```

- _exportFromImportedHandleTypes_ is a bitmask of _VkExternalFenceHandleTypeFlagBits_ indicating which types of imported handle _handleType_ can be exported from.

- _compatibleHandleTypes_ is a bitmask of _VkExternalFenceHandleTypeFlagBits_ specifying handle types which can be specified at the same time as _handleType_ when creating a fence.

- _externalFenceFeatures_ is a bitmask of _VkExternalFenceFeatureFlagBits_ indicating the features of _handleType_.

If _handleType_ is not supported by the implementation, then _VkExternalFenceProperties::externalFenceFeatures_ will be set to zero.
Valid Usage (Implicit)

- VUID-VkExternalFenceProperties-sType-sType
  
  *sType must be* VK_STRUCTURE_TYPE_EXTERNAL_FENCE_PROPERTIES

- VUID-VkExternalFenceProperties-pNext-pNext
  
  *pNext must be NULL*

Bits which **may** be set in **VkExternalFenceProperties::externalFenceFeatures**, indicating features of a fence external handle type, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkExternalFenceFeatureFlagBits {
    VK_EXTERNAL_FENCE_FEATURE_EXPORTABLE_BIT = 0x00000001,
    VK_EXTERNAL_FENCE_FEATURE_IMPORTABLE_BIT = 0x00000002,
} VkExternalFenceFeatureFlagBits;
```

- **VK_EXTERNAL_FENCE_FEATURE_EXPORTABLE_BIT** specifies handles of this type **can** be exported from Vulkan fence objects.
- **VK_EXTERNAL_FENCE_FEATURE_IMPORTABLE_BIT** specifies handles of this type **can** be imported to Vulkan fence objects.

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalFenceFeatureFlags;
```

**VkExternalFenceFeatureFlags** is a bitmask type for setting a mask of zero or more **VkExternalFenceFeatureFlagBits**.

### 35.5. Timestamp Calibration Capabilities

To query the set of time domains for which a physical device supports timestamp calibration, call:

```c
// Provided by VK_EXT_calibrated_timestamps
VkResult vkGetPhysicalDeviceCalibrateableTimeDomainsEXT(
    VkPhysicalDevice physicalDevice,
    uint32_t* pTimeDomainCount,
    VkTimeDomainEXT* pTimeDomains);
```

- **physicalDevice** is the physical device from which to query the set of calibrateable time domains.
- **pTimeDomainCount** is a pointer to an integer related to the number of calibrateable time domains available or queried, as described below.
- **pTimeDomains** is either **NULL** or a pointer to an array of **VkTimeDomainEXT** values, indicating the supported calibrateable time domains.
If `pTimeDomains` is `NULL`, then the number of calibrateable time domains supported for the given `physicalDevice` is returned in `pTimeDomainCount`. Otherwise, `pTimeDomainCount` must point to a variable set by the user to the number of elements in the `pTimeDomains` array, and on return the variable is overwritten with the number of values actually written to `pTimeDomains`. If the value of `pTimeDomainCount` is less than the number of calibrateable time domains supported, at most `pTimeDomainCount` values will be written to `pTimeDomains`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available time domains were returned.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetPhysicalDeviceCalibrateableTimeDomainsEXT` must not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

### Valid Usage (Implicit)
- VUID-vkGetPhysicalDeviceCalibrateableTimeDomainsEXT-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceCalibrateableTimeDomainsEXT-pTimeDomainCount-parameter `pTimeDomainCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceCalibrateableTimeDomainsEXT-pTimeDomains-parameter If the value referenced by `pTimeDomainCount` is not 0, and `pTimeDomains` is not `NULL`, `pTimeDomains` must be a valid pointer to an array of `pTimeDomainCount` `VkTimeDomainEXT` values

### Return Codes

#### Success
- `VK_SUCCESS`
- `VK_INCOMPLETE`

#### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

### 35.6. Object Refresh Capabilities

To query the set of object types that require periodic refreshing, call:

```c
// Provided by VK_KHR_object_refresh
VkResult vkGetPhysicalDeviceRefreshableObjectTypesKHR(
    VkPhysicalDevice physicalDevice, uint32_t* pRefreshableObjectTypeCount, VkObjectType* pRefreshableObjectTypes);
```

- `physicalDevice` is the physical device from which to query the set of refreshable object types.
• `pRefreshableObjectTypeCount` is a pointer to an integer related to the number of refreshable object types available or queried, as described below.

• `pRefreshableObjectTypes` is either `NULL` or a pointer to an array of `VkObjectType` values, indicating the supported refreshable object types.

If `pRefreshableObjectTypes` is `NULL`, then the number of refreshable object types supported for the given `physicalDevice` is returned in `pRefreshableObjectTypeCount`. Otherwise, `pRefreshableObjectTypeCount` must point to a variable set by the user to the number of elements in the `pRefreshableObjectTypes` array, and on return the variable is overwritten with the number of object types actually written to `pRefreshableObjectTypes`. If the value of `pRefreshableObjectTypeCount` is less than the number of refreshable object types supported, at most `pRefreshableObjectTypeCount` object types will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available object types were returned.

---

**Valid Usage (Implicit)**

• VUID-vkGetPhysicalDeviceRefreshableObjectTypesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

• VUID-vkGetPhysicalDeviceRefreshableObjectTypesKHR-pRefreshableObjectTypeCount-parameter
  `pRefreshableObjectTypeCount` must be a valid pointer to a `uint32_t` value

• VUID-vkGetPhysicalDeviceRefreshableObjectTypesKHR-pRefreshableObjectTypes-parameter
  If the value referenced by `pRefreshableObjectTypeCount` is not 0, and `pRefreshableObjectTypes` is not `NULL`, `pRefreshableObjectTypes` must be a valid pointer to an array of `pRefreshableObjectTypeCount` `VkObjectType` values

---

**Return Codes**

**Success**

• `VK_SUCCESS`

• `VK_INCOMPLETE`
Chapter 36. Debugging

To aid developers in tracking down errors in the application’s use of Vulkan, particularly in combination with an external debugger or profiler, *debugging extensions* may be available.

The `VkObjectType` enumeration defines values, each of which corresponds to a specific Vulkan handle type. These values can be used to associate debug information with a particular type of object through one or more extensions.

```c
// Provided by VK_VERSION_1_0
typedef enum VkObjectType {
    VK_OBJECT_TYPE_UNKNOWN = 0,
    VK_OBJECT_TYPE_INSTANCE = 1,
    VK_OBJECT_TYPE_PHYSICAL_DEVICE = 2,
    VK_OBJECT_TYPE_DEVICE = 3,
    VK_OBJECT_TYPE_QUEUE = 4,
    VK_OBJECT_TYPE_SEMAPHORE = 5,
    VK_OBJECT_TYPE_COMMAND_BUFFER = 6,
    VK_OBJECT_TYPE_FENCE = 7,
    VK_OBJECT_TYPE_DEVICE_MEMORY = 8,
    VK_OBJECT_TYPE_BUFFER = 9,
    VK_OBJECT_TYPE_IMAGE = 10,
    VK_OBJECT_TYPE_EVENT = 11,
    VK_OBJECT_TYPE_QUERY_POOL = 12,
    VK_OBJECT_TYPE_BUFFER_VIEW = 13,
    VK_OBJECT_TYPE_IMAGE_VIEW = 14,
    VK_OBJECT_TYPE_SHADER_MODULE = 15,
    VK_OBJECT_TYPE_PIPELINE_CACHE = 16,
    VK_OBJECT_TYPE_PIPELINE_LAYOUT = 17,
    VK_OBJECT_TYPE_RENDER_PASS = 18,
    VK_OBJECT_TYPE_PIPELINE = 19,
    VK_OBJECT_TYPE_DESCRIPTOR_SET_LAYOUT = 20,
    VK_OBJECT_TYPE_SAMPLER = 21,
    VK_OBJECT_TYPE_DESCRIPTOR_POOL = 22,
    VK_OBJECT_TYPE_DESCRIPTOR_SET = 23,
    VK_OBJECT_TYPE_FRAMEBUFFER = 24,
    VK_OBJECT_TYPE_COMMAND_POOL = 25,
    // Provided by VK_VERSION_1_1
    VK_OBJECT_TYPE_SAMPLER_YCBCR_CONVERSION = 1000156000,
    // Provided by VK_KHR_surface
    VK_OBJECT_TYPE_SURFACE_KHR = 1000000000,
    // Provided by VK_KHR_swapchain
    VK_OBJECT_TYPE_SWAPCHAIN_KHR = 1000001000,
    // Provided by VK_KHR_display
    VK_OBJECT_TYPE_DISPLAY_KHR = 1000002000,
    VK_OBJECT_TYPE_DISPLAY_MODE_KHR = 1000002001,
    // Provided by VK_EXT_debug_utils
    VK_OBJECT_TYPE_DEBUG_UTILS_MESSENGER_EXT = 1000128000,
    // Provided by VK_NV_external_sci_sync2
    // Provided by VK_NV_external_sci_sync2
}```

### 36.1. Debug Utilities

Vulkan provides flexible debugging utilities for debugging an application.

The **Object Debug Annotation** section describes how to associate either a name or binary data with a specific Vulkan object.

The **Queue Labels** section describes how to annotate and group the work submitted to a queue.

The **Command Buffer Labels** section describes how to associate logical elements of the scene with commands in a `VkCommandBuffer`.

The **Debug Messengers** section describes how to create debug messenger objects associated with an application supplied callback to capture debug messages from a variety of Vulkan components.

#### 36.1.1. Object Debug Annotation

It can be useful for an application to provide its own content relative to a specific Vulkan object.

The following commands allow application developers to associate user-defined information with Vulkan objects. These commands are device-level commands but they **may** reference instance-level objects (such as `VkInstance`) and physical device-level objects (such as `VkPhysicalDevice`) with a few restrictions: * The data for the corresponding object **may** still be available after the `VkDevice` used in the corresponding API call to set it is destroyed, but access to this data is not guaranteed and should be avoided. * Subsequent calls to change the data of the same object across multiple `VkDevice` objects, **may** result in the data being changed to the most recent version for all `VkDevice` objects and not just the `VkDevice` used in the most recent API call.

#### Object Naming

An object can be provided a user-defined name by calling `vkSetDebugUtilsObjectNameEXT` as defined below:

```c
// Provided by VK_EXT_debug_utils
VkResult vkSetDebugUtilsObjectNameEXT(
    VkDevice device,
    const VkDebugUtilsObjectNameInfoEXT* pNameInfo);
```

- `device` is the device that is associated with the named object passed in via `objectHandle`.
- `pNameInfo` is a pointer to a `VkDebugUtilsObjectNameInfoEXT` structure specifying parameters of the name to set on the object.
Valid Usage

- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-02587
  pNameInfo->objectType must not be VK_OBJECT_TYPE_UNKNOWN

- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-02588
  pNameInfo->objectHandle must not be VK_NULL_HANDLE

- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-07872
  If pNameInfo->objectHandle is the valid handle of an instance-level object, the VkDevice identified by device must be a descendent of the same VkInstance as the object identified by pNameInfo->objectHandle

- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-07873
  If pNameInfo->objectHandle is the valid handle of a physical-device-level object, the VkDevice identified by device must be a descendent of the same VkPhysicalDevice as the object identified by pNameInfo->objectHandle

- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-07874
  If pNameInfo->objectHandle is the valid handle of a device-level object, that object must be a descendent of the VkDevice identified by device

Valid Usage (Implicit)

- VUID-vkSetDebugUtilsObjectNameEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-parameter
  pNameInfo must be a valid pointer to a valid VkDebugUtilsObjectNameInfoEXT structure

Host Synchronization

- Host access to pNameInfo->objectHandle must be externally synchronized

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDebugUtilsObjectNameInfoEXT structure is defined as:

```cpp
// Provided by VK_EXT_debug_utils
```
typedef struct VkDebugUtilsObjectNameInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkObjectType objectType;
    uint64_t objectHandle;
    const char* pObjectName;
} VkDebugUtilsObjectNameInfoEXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• objectType is a VkObjectType specifying the type of the object to be named.
• objectHandle is the object to be named.
• pObjectName is either NULL or a null-terminated UTF-8 string specifying the name to apply to objectHandle.

Applications may change the name associated with an object simply by calling vkSetDebugUtilsObjectNameEXT again with a new string. If pObjectName is either NULL or an empty string, then any previously set name is removed.

Valid Usage

• VUID-VkDebugUtilsObjectNameInfoEXT-objectType-02589
  If objectType is VK_OBJECT_TYPE_UNKNOWN, objectHandle must not be VK_NULL_HANDLE

• VUID-VkDebugUtilsObjectNameInfoEXT-objectType-02590
  If objectType is not VK_OBJECT_TYPE_UNKNOWN, objectHandle must be VK_NULL_HANDLE or a valid Vulkan handle of the type associated with objectType as defined in the VkObjectType and Vulkan Handle Relationship table

Valid Usage (Implicit)

• VUID-VkDebugUtilsObjectNameInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_NAME_INFO_EXT

• VUID-VkDebugUtilsObjectNameInfoEXT-objectType-parameter
  objectType must be a valid VkObjectType value

• VUID-VkDebugUtilsObjectNameInfoEXT-pObjectName-parameter
  If pObjectName is not NULL, pObjectName must be a null-terminated UTF-8 string

Object Data Association

In addition to setting a name for an object, debugging and validation layers may have uses for additional binary data on a per-object basis that have no other place in the Vulkan API.

For example, a VkShaderModule could have additional debugging data attached to it to aid in offline shader tracing.
Additional data can be attached to an object by calling `vkSetDebugUtilsObjectTagEXT` as defined below.

```c
// Provided by VK_EXT_debug_utils
VkResult vkSetDebugUtilsObjectTagEXT(
    VkDevice device,
    const VkDebugUtilsObjectTagInfoEXT* pTagInfo);
```

- **device** is the device that created the object.
- **pTagInfo** is a pointer to a `VkDebugUtilsObjectTagInfoEXT` structure specifying parameters of the tag to attach to the object.

### Valid Usage

- **VUID-vkSetDebugUtilsObjectTagEXT-pNameInfo-07875**
  If `pNameInfo->objectHandle` is the valid handle of an instance-level object, the `VkDevice` identified by **device** must be a descendent of the same `VkInstance` as the object identified by `pNameInfo->objectHandle`

- **VUID-vkSetDebugUtilsObjectTagEXT-pNameInfo-07876**
  If `pNameInfo->objectHandle` is the valid handle of a physical-device-level object, the `VkDevice` identified by **device** must be a descendent of the same `VkPhysicalDevice` as the object identified by `pNameInfo->objectHandle`

- **VUID-vkSetDebugUtilsObjectTagEXT-pNameInfo-07877**
  If `pNameInfo->objectHandle` is the valid handle of a device-level object, that object must be a descendent of the `VkDevice` identified by **device**

### Valid Usage (Implicit)

- **VUID-vkSetDebugUtilsObjectTagEXT-device-parameter**
  **device** must be a valid `VkDevice` handle

- **VUID-vkSetDebugUtilsObjectTagEXT-pTagInfo-parameter**
  **pTagInfo** must be a valid pointer to a valid `VkDebugUtilsObjectTagInfoEXT` structure

### Host Synchronization

- Host access to `pTagInfo->objectHandle` must be externally synchronized

### Return Codes

**Success**
- `VK_SUCCESS`
The **VkDebugUtilsObjectTagInfoEXT** structure is defined as:

```c
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsObjectTagInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkObjectType objectType;
    uint64_t objectHandle;
    uint64_t tagName;
    size_t tagSize;
    const void* pTag;
} VkDebugUtilsObjectTagInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **objectType** is a **VkObjectType** specifying the type of the object to be named.
- **objectHandle** is the object to be tagged.
- **tagName** is a numerical identifier of the tag.
- **tagSize** is the number of bytes of data to attach to the object.
- **pTag** is a pointer to an array of **tagSize** bytes containing the data to be associated with the object.

The **tagName** parameter gives a name or identifier to the type of data being tagged. This can be used by debugging layers to easily filter for only data that can be used by that implementation.

### Valid Usage

- **VUID-VkDebugUtilsObjectTagInfoEXT-objectType-01908**  
  **objectType** must not be **VK_OBJECT_TYPE_UNKNOWN**

- **VUID-VkDebugUtilsObjectTagInfoEXT-objectHandle-01910**  
  **objectHandle** must be a valid Vulkan handle of the type associated with **objectType** as defined in the **VkObjectType** and **Vulkan Handle Relationship** table

### Valid Usage (Implicit)

- **VUID-VkDebugUtilsObjectTagInfoEXT-sType-sType**  
  **sType** must be **VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_TAG_INFO_EXT**

- **VUID-VkDebugUtilsObjectTagInfoEXT-pNext-pNext**  
  **pNext** must be **NULL**
36.1.2. Queue Labels

All Vulkan work must be submitted using queues. It is possible for an application to use multiple queues, each containing multiple command buffers, when performing work. It can be useful to identify which queue, or even where in a queue, something has occurred.

To begin identifying a region using a debug label inside a queue, you may use the \texttt{vkQueueBeginDebugUtilsLabelEXT} command.

Then, when the region of interest has passed, you may end the label region using \texttt{vkQueueEndDebugUtilsLabelEXT}.

Additionally, a single debug label may be inserted at any time using \texttt{vkQueueInsertDebugUtilsLabelEXT}.

A queue debug label region is opened by calling:

```c
// Provided by VK_EXT_debug_utils
void vkQueueBeginDebugUtilsLabelEXT(
    VkQueue queue,
    const VkDebugUtilsLabelEXT* pLabelInfo);
```

- \texttt{queue} is the queue in which to start a debug label region.
- \texttt{pLabelInfo} is a pointer to a \texttt{VkDebugUtilsLabelEXT} structure specifying parameters of the label region to open.

Valid Usage (Implicit)

- VUID-vkQueueBeginDebugUtilsLabelEXT-queue-parameter \texttt{queue} must be a valid \texttt{VkQueue} handle
- VUID-vkQueueBeginDebugUtilsLabelEXT-pLabelInfo-parameter \texttt{pLabelInfo} must be a valid pointer to a valid \texttt{VkDebugUtilsLabelEXT} structure
The `VkDebugUtilsLabelEXT` structure is defined as:

```c
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsLabelEXT {
    VkStructureType sType;
    const void* pNext;
    const char* pLabelName;
    float color[4];
} VkDebugUtilsLabelEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pLabelName` is a pointer to a null-terminated UTF-8 string containing the name of the label.
- `color` is an optional RGBA color value that can be associated with the label. A particular implementation may choose to ignore this color value. The values contain RGBA values in order, in the range 0.0 to 1.0. If all elements in `color` are set to 0.0 then it is ignored.

**Valid Usage (Implicit)**

- `VUID-VkDebugUtilsLabelEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT`

- `VUID-VkDebugUtilsLabelEXT-pNext-pNext`  
  `pNext` must be `NULL`

- `VUID-VkDebugUtilsLabelEXT-pLabelName-parameter`  
  `pLabelName` must be a null-terminated UTF-8 string

A queue debug label region is closed by calling:

```c
// Provided by VK_EXT_debug_utils
void vkQueueEndDebugUtilsLabelEXT(VkQueue queue);
```

- `queue` is the queue in which a debug label region should be closed.

The calls to `vkQueueBeginDebugUtilsLabelEXT` and `vkQueueEndDebugUtilsLabelEXT` must be matched and balanced.
Valid Usage

- VUID-vkQueueEndDebugUtilsLabelEXT-None-01911
  There must be an outstanding `vkQueueBeginDebugUtilsLabelEXT` command prior to the `vkQueueEndDebugUtilsLabelEXT` on the queue.

Valid Usage (Implicit)

- VUID-vkQueueEndDebugUtilsLabelEXT-queue-parameter
  queue must be a valid `VkQueue` handle.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>Any</td>
<td>-</td>
</tr>
</tbody>
</table>

A single label can be inserted into a queue by calling:

```c
// Provided by VK_EXT_debug_utils
void vkQueueInsertDebugUtilsLabelEXT(
    VkQueue queue,
    const VkDebugUtilsLabelEXT* pLabelInfo);
```

- `queue` is the queue into which a debug label will be inserted.
- `pLabelInfo` is a pointer to a `VkDebugUtilsLabelEXT` structure specifying parameters of the label to insert.

Valid Usage (Implicit)

- VUID-vkQueueInsertDebugUtilsLabelEXT-queue-parameter
  queue must be a valid `VkQueue` handle.
- VUID-vkQueueInsertDebugUtilsLabelEXT-pLabelInfo-parameter
  `pLabelInfo` must be a valid pointer to a valid `VkDebugUtilsLabelEXT` structure.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>Any</td>
<td>-</td>
</tr>
</tbody>
</table>
36.1.3. Command Buffer Labels

Typical Vulkan applications will submit many command buffers in each frame, with each command buffer containing a large number of individual commands. Being able to logically annotate regions of command buffers that belong together as well as hierarchically subdivide the frame is important to a developer’s ability to navigate the commands viewed holistically.

To identify the beginning of a debug label region in a command buffer, `vkCmdBeginDebugUtilsLabelEXT` can be used as defined below.

To indicate the end of a debug label region in a command buffer, `vkCmdEndDebugUtilsLabelEXT` can be used.

To insert a single command buffer debug label inside of a command buffer, `vkCmdInsertDebugUtilsLabelEXT` can be used as defined below.

A command buffer debug label region can be opened by calling:

```c
// Provided by VK_EXT_debug_utils
void vkCmdBeginDebugUtilsLabelEXT(  
    VkCommandBuffer commandBuffer,  
    const VkDebugUtilsLabelEXT* pLabelInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pLabelInfo` is a pointer to a `VkDebugUtilsLabelEXT` structure specifying parameters of the label region to open.

### Valid Usage (Implicit)

- VUID-vkCmdBeginDebugUtilsLabelEXT-commandBuffer-parameter
  - `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdBeginDebugUtilsLabelEXT-pLabelInfo-parameter
  - `pLabelInfo` must be a valid pointer to a valid `VkDebugUtilsLabelEXT` structure
- VUID-vkCmdBeginDebugUtilsLabelEXT-commandBuffer-recording
  - `commandBuffer` must be in the recording state
- VUID-vkCmdBeginDebugUtilsLabelEXT-commandBuffer-cmdpool
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
A command buffer label region can be closed by calling:

```c
// Provided by VK_EXT_debug_utils
void vkCmdEndDebugUtilsLabelEXT(
  VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer into which the command is recorded.

An application may open a debug label region in one command buffer and close it in another, or otherwise split debug label regions across multiple command buffers or multiple queue submissions. When viewed from the linear series of submissions to a single queue, the calls to `vkCmdBeginDebugUtilsLabelEXT` and `vkCmdEndDebugUtilsLabelEXT` must be matched and balanced.

There can be problems reporting command buffer debug labels during the recording process because command buffers may be recorded out of sequence with the resulting execution order. Since the recording order may be different, a solitary command buffer may have an inconsistent view of the debug label regions by itself. Therefore, if an issue occurs during the recording of a command buffer, and the environment requires returning debug labels, the implementation may return only those labels it is aware of. This is true even if the implementation is aware of only the debug labels within the command buffer being actively recorded.

### Valid Usage

- **VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-01912**
  There must be an outstanding `vkCmdBeginDebugUtilsLabelEXT` command prior to the `vkCmdEndDebugUtilsLabelEXT` on the queue that `commandBuffer` is submitted to

- **VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-01913**
  If `commandBuffer` is a secondary command buffer, there must be an outstanding `vkCmdBeginDebugUtilsLabelEXT` command recorded to `commandBuffer` that has not previously been ended by a call to `vkCmdEndDebugUtilsLabelEXT`

### Valid Usage (Implicit)

- **VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
<td>State</td>
</tr>
</tbody>
</table>

A single debug label can be inserted into a command buffer by calling:

```c
void vkCmdInsertDebugUtilsLabelEXT(
    VkCommandBuffer commandBuffer,
    const VkDebugUtilsLabelEXT* pLabelInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pInfo` is a pointer to a `VkDebugUtilsLabelEXT` structure specifying parameters of the label to insert.

Valid Usage (Implicit)

- VUID-vkCmdInsertDebugUtilsLabelEXT-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdInsertDebugUtilsLabelEXT-pLabelInfo-parameter `pLabelInfo` must be a valid pointer to a valid `VkDebugUtilsLabelEXT` structure
- VUID-vkCmdInsertDebugUtilsLabelEXT-commandBuffer-recording `commandBuffer` must be in the recording state
- VUID-vkCmdInsertDebugUtilsLabelEXT-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tr>
<tr>
<td>Secondary</td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

36.1.4. Debug Messengers

Vulkan allows an application to register multiple callbacks with any Vulkan component wishing to report debug information. Some callbacks may log the information to a file, others may cause a debug break point or other application defined behavior. A primary producer of callback messages are the validation layers. An application can register callbacks even when no validation layers are enabled, but they will only be called for the Vulkan loader and, if implemented, other layer and driver events.

A `VkDebugUtilsMessengerEXT` is a messenger object which handles passing along debug messages to a provided debug callback.

```
// Provided by VK_EXT_debug_utils
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDebugUtilsMessengerEXT)
```

The debug messenger will provide detailed feedback on the application's use of Vulkan when events of interest occur. When an event of interest does occur, the debug messenger will submit a debug message to the debug callback that was provided during its creation. Additionally, the debug messenger is responsible with filtering out debug messages that the callback is not interested in and will only provide desired debug messages.

A debug messenger triggers a debug callback with a debug message when an event of interest occurs. To create a debug messenger which will trigger a debug callback, call:

```
// Provided by VK_EXT_debug_utils
VkResult vkCreateDebugUtilsMessengerEXT(
    VkInstance instance, const VkDebugUtilsMessengerCreateInfoEXT* pCreateInfo, const VkAllocationCallbacks* pAllocator, VkDebugUtilsMessengerEXT* pMessenger);
```
• **instance** is the instance the messenger will be used with.

• **pCreateInfo** is a pointer to a `VkDebugUtilsMessengerCreateInfoEXT` structure containing the callback pointer, as well as defining conditions under which this messenger will trigger the callback.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

• **pMessenger** is a pointer to a `VkDebugUtilsMessengerEXT` handle in which the created object is returned.

Valid Usage (Implicit)

- VUID-vkCreateDebugUtilsMessengerEXT-instance-parameter
  instance must be a valid `VkInstance` handle

- VUID-vkCreateDebugUtilsMessengerEXT-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid `VkDebugUtilsMessengerCreateInfoEXT` structure

- VUID-vkCreateDebugUtilsMessengerEXT-pAllocator-null
  pAllocator must be NULL

- VUID-vkCreateDebugUtilsMessengerEXT-pMessenger-parameter
  pMessenger must be a valid pointer to a `VkDebugUtilsMessengerEXT` handle

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`

The application must ensure that `vkCreateDebugUtilsMessengerEXT` is not executed in parallel with any Vulkan command that is also called with `instance` or child of `instance` as the dispatchable argument.

The definition of `VkDebugUtilsMessengerCreateInfoEXT` is:

```c
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsMessengerCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDebugUtilsMessengerCreateFlagsEXT flags;
    VkDebugUtilsMessageSeverityFlagsEXT messageSeverity;
    VkDebugUtilsMessageTypeFlagsEXT messageType;
    PFN_vkDebugUtilsMessengerCallbackEXT pfnUserCallback;
    void* pUserData;
} VkDebugUtilsMessengerCreateInfoEXT;
```
• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **flags** is **0** and is reserved for future use.
• **messageSeverity** is a bitmask of *VkDebugUtilsMessageSeverityFlagBitsEXT* specifying which severity of event(s) will cause this callback to be called.
• **messageType** is a bitmask of *VkDebugUtilsMessageTypeFlagBitsEXT* specifying which type of event(s) will cause this callback to be called.
• **pfnUserCallback** is the application callback function to call.
• **pUserData** is user data to be passed to the callback.

For each *VkDebugUtilsMessengerEXT* that is created the *VkDebugUtilsMessengerCreateInfoEXT* ::**messageSeverity** and *VkDebugUtilsMessengerCreateInfoEXT* ::**messageType** determine when that *VkDebugUtilsMessengerCreateInfoEXT* ::**pfnUserCallback** is called. The process to determine if the user’s **pfnUserCallback** is triggered when an event occurs is as follows:

1. The implementation will perform a bitwise AND of the event’s *VkDebugUtilsMessageSeverityFlagBitsEXT* with the **messageSeverity** provided during creation of the *VkDebugUtilsMessengerEXT* object.
   a. If the value is 0, the message is skipped.
2. The implementation will perform bitwise AND of the event’s *VkDebugUtilsMessageTypeFlagBitsEXT* with the **messageType** provided during the creation of the *VkDebugUtilsMessengerEXT* object.
   a. If the value is 0, the message is skipped.
3. The callback will trigger a debug message for the current event

The callback will come directly from the component that detected the event, unless some other layer intercepts the calls for its own purposes (filter them in a different way, log to a system error log, etc.).

An application can receive multiple callbacks if multiple *VkDebugUtilsMessengerEXT* objects are created. A callback will always be executed in the same thread as the originating Vulkan call.

A callback can be called from multiple threads simultaneously (if the application is making Vulkan calls from multiple threads).

**Valid Usage**

- VUID-VkDebugUtilsMessengerCreateInfoEXT-pfnUserCallback-01914
  **pfnUserCallback** must be a valid **PFN_vkDebugUtilsMessengerCallbackEXT**
Valid Usage (Implicit)

- VUID-VkDebugUtilsMessengerCreateInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENER_CREATE_INFO_EXT`

- VUID-VkDebugUtilsMessengerCreateInfoEXT-flags-zerobitmask
  `flags` **must** be `0`

- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageSeverity-parameter
  `messageSeverity` **must** be a valid combination of `VkDebugUtilsMessageSeverityFlagBitsEXT` values

- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageSeverity-requiredbitmask
  `messageSeverity` **must** not be `0`

- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageType-parameter
  `messageType` **must** be a valid combination of `VkDebugUtilsMessageTypeFlagBitsEXT` values

- VUID-VkDebugUtilsMessengerCreateInfoEXT-messageType-requiredbitmask
  `messageType` **must** not be `0`

- VUID-VkDebugUtilsMessengerCreateInfoEXT-pfnUserCallback-parameter
  `pfnUserCallback` **must** be a valid `PFN_vkDebugUtilsMessengerCallbackEXT` value

```c
// Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessengerCreateFlagsEXT;
```

`VkDebugUtilsMessengerCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

Bits which **can** be set in `VkDebugUtilsMessengerCreateInfoEXT::messageSeverity`, specifying event severities which cause a debug messenger to call the callback, are:

```c
// Provided by VK_EXT_debug_utils
typedef enum VkDebugUtilsMessageSeverityFlagBitsEXT {
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_VERBOSE_BIT_EXT = 0x00000001,
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_INFO_BIT_EXT = 0x00000010,
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT = 0x00000100,
    VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT = 0x00001000,
} VkDebugUtilsMessageSeverityFlagBitsEXT;
```

- `VK_DEBUG_UTILS_MESSAGE_SEVERITY_VERBOSE_BIT_EXT` specifies the most verbose output indicating all diagnostic messages from the Vulkan loader, layers, and drivers should be captured.

- `VK_DEBUG_UTILS_MESSAGE_SEVERITY_INFO_BIT_EXT` specifies an informational message such as resource details that may be handy when debugging an application.

- `VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT` specifies use of Vulkan that **may** expose an app bug. Such cases may not be immediately harmful, such as a fragment shader outputting to a location with no attachment. Other cases **may** point to behavior that is almost certainly bad
when unintended such as using an image whose memory has not been filled. In general if you see a warning but you know that the behavior is intended/desired, then simply ignore the warning.

- **VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT** specifies that the application has violated a valid usage condition of the specification.

  **Note**
  
The values of `VkDebugUtilsMessageSeverityFlagBitsEXT` are sorted based on severity. The higher the flag value, the more severe the message. This allows for simple boolean operation comparisons when looking at `VkDebugUtilsMessageSeverityFlagBitsEXT` values.

  For example:

  ```c
  if (messageSeverity >= VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT) {
      // Do something for warnings and errors
  }
  ```

  In addition, space has been left between the enums to allow for later addition of new severities in between the existing values.

  ```c
  // Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessageSeverityFlagsEXT;
  ```

  `VkDebugUtilsMessageSeverityFlagsEXT` is a bitmask type for setting a mask of zero or more `VkDebugUtilsMessageSeverityFlagBitsEXT`.

  Bits which **can** be set in `VkDebugUtilsMessengerCreateInfoEXT::messageType`, specifying event types which cause a debug messenger to call the callback, are:

  ```c
  // Provided by VK_EXT_debug_utils
typedef enum VkDebugUtilsMessageTypeFlagBitsEXT {
      VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT = 0x00000001,
      VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT = 0x00000002,
      VK_DEBUG_UTILS_MESSAGE_TYPE_PERFORMANCE_BIT_EXT = 0x00000004,
  } VkDebugUtilsMessageTypeFlagBitsEXT;
  ```

- **VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT** specifies that some general event has occurred. This is typically a non-specification, non-performance event.

- **VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT** specifies that something has occurred during validation against the Vulkan specification that may indicate invalid behavior.

- **VK_DEBUG_UTILS_MESSAGE_TYPE_PERFORMANCE_BIT_EXT** specifies a potentially non-optimal use of Vulkan, e.g. using `vkCmdClearColorImage` when setting `VkAttachmentDescription::loadOp` to
VK_ATTACHMENT_LOAD_OP_CLEAR would have worked.

```c
// Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessageTypeFlagsEXT;
```

VkDebugUtilsMessageTypeFlagsEXT is a bitmask type for setting a mask of zero or more VkDebugUtilsMessageTypeFlagBitsEXT.

The prototype for the VkDebugUtilsMessengerCreateInfoEXT::pfnUserCallback function implemented by the application is:

```c
// Provided by VK_EXT_debug_utils
typedef VkBool32 (VKAPI_PTR *PFN_vkDebugUtilsMessengerCallbackEXT)(
    VkDebugUtilsMessageSeverityFlagBitsEXT messageSeverity,
    VkDebugUtilsMessageTypeFlagsEXT messageTypes,
    const VkDebugUtilsMessengerCallbackDataEXT* pCallbackData,
    void* pUserData);
```

- `messageSeverity` specifies the VkDebugUtilsMessageSeverityFlagBitsEXT that triggered this callback.
- `messageTypes` is a bitmask of VkDebugUtilsMessageTypeFlagBitsEXT specifying which type of event(s) triggered this callback.
- `pCallbackData` contains all the callback related data in the VkDebugUtilsMessengerCallbackDataEXT structure.
- `pUserData` is the user data provided when the VkDebugUtilsMessengerEXT was created.

The callback returns a VkBool32, which is interpreted in a layer-specified manner. The application should always return VK_FALSE. The VK_TRUE value is reserved for use in layer development.

**Valid Usage**

- VUID-PFN_vkDebugUtilsMessengerCallbackEXT-None-04769
  The callback must not make calls to any Vulkan commands

The definition of VkDebugUtilsMessengerCallbackDataEXT is:

```c
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsMessengerCallbackDataEXT {
    VkStructureType sType;
    const void* pNext;
    VkDebugUtilsMessageTypeFlagsEXT flags;
    const char* pMessageIdName;
    int32_t messageIdNumber;
    const char* pMessage;
    uint32_t queueLabelCount;
```

1557
const VkDebugUtilsLabelEXT* pQueueLabels;
uint32_t cmdBufLabelCount;
const VkDebugUtilsLabelEXT* pCmdBufLabels;
uint32_t objectCount;
const VkDebugUtilsObjectNameInfoEXT* pObjects;
}
VkDebugUtilsMessengerCallbackDataEXT;

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• flags is 0 and is reserved for future use.

• pMessageIdName is a null-terminated string that identifies the particular message ID that is associated with the provided message. If the message corresponds to a validation layer message, then this string may contain the portion of the Vulkan specification that is believed to have been violated.

• messageIdNumber is the ID number of the triggering message. If the message corresponds to a validation layer message, then this number is related to the internal number associated with the message being triggered.

• pMessage is a null-terminated string detailing the trigger conditions.

• queueLabelCount is a count of items contained in the pQueueLabels array.

• pQueueLabels is NULL or a pointer to an array of VkDebugUtilsLabelEXT active in the current VkQueue at the time the callback was triggered. Refer to Queue Labels for more information.

• cmdBufLabelCount is a count of items contained in the pCmdBufLabels array.

• pCmdBufLabels is NULL or a pointer to an array of VkDebugUtilsLabelEXT active in the current VkCommandBuffer at the time the callback was triggered. Refer to Command Buffer Labels for more information.

• objectCount is a count of items contained in the pObjects array.

• pObjects is a pointer to an array of VkDebugUtilsObjectNameInfoEXT objects related to the detected issue. The array is roughly in order of importance, but the 0th element is always guaranteed to be the most important object for this message.

Note
This structure should only be considered valid during the lifetime of the triggered callback.

Since adding queue and command buffer labels behaves like pushing and popping onto a stack, the order of both pQueueLabels and pCmdBufLabels is based on the order the labels were defined. The result is that the first label in either pQueueLabels or pCmdBufLabels will be the first defined (and therefore the oldest) while the last label in each list will be the most recent.

Note
pQueueLabels will only be non-NULL if one of the objects in pObjects can be related directly to a defined VkQueue which has had one or more labels associated with it.
Likewise, `pCmdBufLabels` will only be non-NULL if one of the objects in `pObjects` can be related directly to a defined `VkCommandBuffer` which has had one or more labels associated with it. Additionally, while command buffer labels allow for beginning and ending across different command buffers, the debug messaging framework cannot guarantee that labels in `pCmdBufLabels` will contain those defined outside of the associated command buffer. This is partially due to the fact that the association of one command buffer with another may not have been defined at the time the debug message is triggered.

**Valid Usage (Implicit)**

- VUID-VkDebugUtilsMessengerCallbackDataEXT-sType-sType
  *sType must be* `VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CALLBACK_DATA_EXT`

- VUID-VkDebugUtilsMessengerCallbackDataEXT-pNext-pNext
  *pNext must be* `NULL`

- VUID-VkDebugUtilsMessengerCallbackDataEXT-flags-zerobitmask
  *flags must be* `0`

- VUID-VkDebugUtilsMessengerCallbackDataEXT-pMessageIdName-parameter
  If `pMessageIdName` is not `NULL`, `pMessageIdName must be a null-terminated UTF-8 string`

- VUID-VkDebugUtilsMessengerCallbackDataEXT-pMessage-parameter
  *pMessage must be a null-terminated UTF-8 string*

- VUID-VkDebugUtilsMessengerCallbackDataEXT-pQueueLabels-parameter
  If `queueLabelCount` is not `0`, `pQueueLabels must be a valid pointer to an array of queueLabelCount valid VkDebugUtilsLabelEXT structures`

- VUID-VkDebugUtilsMessengerCallbackDataEXT-pCmdBufLabels-parameter
  If `cmdBufLabelCount` is not `0`, `pCmdBufLabels must be a valid pointer to an array of cmdBufLabelCount valid VkDebugUtilsLabelEXT structures`

- VUID-VkDebugUtilsMessengerCallbackDataEXT-pObjects-parameter
  If `objectCount` is not `0`, `pObjects must be a valid pointer to an array of objectCount valid VkDebugUtilsObjectNameInfoEXT structures`

```c
// Provided by VK_EXT_debug_utils
typedef VkFlags VkDebugUtilsMessengerCallbackDataFlagsEXT;
```

`VkDebugUtilsMessengerCallbackDataFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

There may be times that a user wishes to intentionally submit a debug message. To do this, call:

```c
// Provided by VK_EXT_debug_utils
void vkSubmitDebugUtilsMessageEXT(
    VkInstance instance,
    VkDebugUtilsMessageSeverityFlagBitsEXT messageSeverity,
```
• **instance** is the debug stream’s **VkInstance**.

• **messageSeverity** is a **VkDebugUtilsMessageSeverityFlagBitsEXT** value specifying the severity of this event/message.

• **messageTypes** is a bitmask of **VkDebugUtilsMessageTypeFlagBitsEXT** specifying which type of event(s) to identify with this message.

• **pCallbackData** contains all the callback related data in the **VkDebugUtilsMessengerCallbackDataEXT** structure.

The call will propagate through the layers and generate callback(s) as indicated by the message’s flags. The parameters are passed on to the callback in addition to the **pUserData** value that was defined at the time the messenger was registered.

## Valid Usage

- **VUID-vkSubmitDebugUtilsMessageEXT-objectType-02591**
  
  The **objectType** member of each element of **pCallbackData->pObjects** must **not** be **VK_OBJECT_TYPE_UNKNOWN**

## Valid Usage (Implicit)

- **VUID-vkSubmitDebugUtilsMessageEXT-instance-parameter**
  
  **instance** must be a valid **VkInstance** handle

- **VUID-vkSubmitDebugUtilsMessageEXT-messageSeverity-parameter**
  
  **messageSeverity** must be a valid **VkDebugUtilsMessageSeverityFlagBitsEXT** value

- **VUID-vkSubmitDebugUtilsMessageEXT-messageTypes-parameter**
  
  **messageTypes** must be a valid combination of **VkDebugUtilsMessageTypeFlagBitsEXT** values

- **VUID-vkSubmitDebugUtilsMessageEXT-messageTypes-required bitmask**
  
  **messageTypes** must **not** be **0**

- **VUID-vkSubmitDebugUtilsMessageEXT-pCallbackData-parameter**
  
  **pCallbackData** must be a valid pointer to a valid **VkDebugUtilsMessengerCallbackDataEXT** structure

To destroy a **VkDebugUtilsMessengerEXT** object, call:

```c
// Provided by VK_EXT_debug_utils

void vkDestroyDebugUtilsMessengerEXT(
    VkInstance instance,  
    VkDebugUtilsMessengerEXT messenger,
```
const VkAllocationCallbacks* pAllocator);

- **instance** is the instance where the callback was created.
- **messenger** is the VkDebugUtilsMessengerEXT object to destroy. messenger is an externally synchronized object and must not be used on more than one thread at a time. This means that vkDestroyDebugUtilsMessengerEXT must not be called when a callback is active.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage (Implicit)

- VUID-vkDestroyDebugUtilsMessengerEXT-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkDestroyDebugUtilsMessengerEXT-messenger-parameter
  If messenger is not VK_NULL_HANDLE, messenger must be a valid VkDebugUtilsMessengerEXT handle

- VUID-vkDestroyDebugUtilsMessengerEXT-pAllocator-null
  pAllocator must be NULL

- VUID-vkDestroyDebugUtilsMessengerEXT-messenger-parent
  If messenger is a valid handle, it must have been created, allocated, or retrieved from instance

### Host Synchronization

- Host access to messenger must be externally synchronized

The application must ensure that vkDestroyDebugUtilsMessengerEXT is not executed in parallel with any Vulkan command that is also called with instance or child of instance as the dispatchable argument.

### 36.2. Fault Handling

The fault handling mechanism provides a method for the implementation to pass fault information to the application. A fault indicates that an issue has occurred with the host or device that could impact the implementation’s ability to function correctly. It consists of a VkFaultData structure that is used to communicate information about the fault between the implementation and the application, with two methods to obtain the data. The application can obtain the fault data from the implementation using vkGetFaultData. Alternatively, the implementation can directly call a pre-registered fault handler function (PFN_vkFaultCallbackFunction) in the application when a fault occurs.

The VkFaultData structure provides categories the implementation must set to provide basic information on a fault. These allow the implementation to provide a coarse classification of a fault to the application. As the potential faults that could occur will vary between different platforms, it
is expected that an implementation would also provide additional implementation-specific data on the fault, enabling the application to take appropriate action.

The implementation must also define whether a particular fault results in the fault callback function being called, is communicated via `vkGetFaultData`, or both. This will be decided by several factors including:

- the severity of the fault,
- the application’s ability to handle the fault, and
- how the application should handle the fault.

The implementation must document the implementation-specific fault data, how the faults are communicated, and expected responses from the application for each of the faults that it can report.

### 36.2.1. Fault Data

The information on a single fault is returned using the `VkFaultData` structure. The `VkFaultData` structure is defined as:

```c
// Provided by VKSC_VERSION_1_0
typedef struct VkFaultData {
    VkStructureType sType;
    void* pNext;
    VkFaultLevel faultLevel;
    VkFaultType faultType;
    } VkFaultData;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure that provides implementation-specific data on the fault.
- `faultLevel` is a `VkFaultLevel` that provides the severity of the fault.
- `faultType` is a `VkFaultType` that provides the type of the fault.

To retrieve implementation-specific fault data, `pNext` can point to one or more implementation-defined fault structures or `NULL` to not retrieve implementation-specific data.

**Valid Usage**

- VUID-VkFaultData-pNext-05019
  - `pNext` must be `NULL` or a valid pointer to an implementation-specific structure

**Valid Usage (Implicit)**

- VUID-VkFaultData-sType-sType
sType must be VK_STRUCTURE_TYPE_FAULT_DATA

Possible values of VkFaultData::faultLevel, specifying the fault severity, are:

```c
// Provided by VKSC_VERSION_1_0
typedef enum VkFaultLevel {
    VK_FAULT_LEVEL_UNASSIGNED = 0,
    VK_FAULT_LEVEL_CRITICAL = 1,
    VK_FAULT_LEVEL_RECOVERABLE = 2,
    VK_FAULT_LEVEL_WARNING = 3,
} VkFaultLevel;
```

- **VK_FAULT_LEVEL_UNASSIGNED** A fault level has not been assigned.
- **VK_FAULT_LEVEL_CRITICAL** A fault that **cannot** be recovered by the application.
- **VK_FAULT_LEVEL_RECOVERABLE** A fault that **can** be recovered by the application.
- **VK_FAULT_LEVEL_WARNING** A fault that indicates a non-optimal condition has occurred, but no recovery is necessary at this point.

Possible values of VkFaultData::faultType, specifying the fault type, are:

```c
// Provided by VKSC_VERSION_1_0
typedef enum VkFaultType {
    VK_FAULT_TYPE_INVALID = 0,
    VK_FAULT_TYPE_UNASSIGNED = 1,
    VK_FAULT_TYPE_IMPLEMENTATION = 2,
    VK_FAULT_TYPE_SYSTEM = 3,
    VK_FAULT_TYPE_PHYSICAL_DEVICE = 4,
    VK_FAULT_TYPE_COMMAND_BUFFER_FULL = 5,
    VK_FAULT_TYPE_INVALID_API_USAGE = 6,
} VkFaultType;
```

- **VK_FAULT_TYPE_INVALID** The fault data does not contain a valid fault.
- **VK_FAULT_TYPE_UNASSIGNED** A fault type has not been assigned.
- **VK_FAULT_TYPE_IMPLEMENTATION** Implementation-defined fault.
- **VK_FAULT_TYPE_SYSTEM** A fault occurred in the system components.
- **VK_FAULT_TYPE_PHYSICAL_DEVICE** A fault occurred with the physical device.
- **VK_FAULT_TYPE_COMMAND_BUFFER_FULL** Command buffer memory was exhausted before `vkEndCommandBuffer` was called.
- **VK_FAULT_TYPE_INVALID_API_USAGE** Invalid usage of the API was detected by the implementation.

### 36.2.2. Querying Fault Status

To query the number of current faults and obtain the fault data, call `vkGetFaultData`. 

VkResult vkGetFaultData(
    VkDevice device,
    VkFaultQueryBehavior faultQueryBehavior,
    VkBool32* pUnrecordedFaults,
    uint32_t* pFaultCount,
    VkFaultData* pFaults);

- **device** is the logical device to obtain faults from.
- **faultQueryBehavior** is a VkFaultQueryBehavior that specifies the types of faults to obtain from the implementation, and how those faults should be handled.
- **pUnrecordedFaults** is a return boolean that specifies if the logged fault information is incomplete and does not contain entries for all faults that have been detected by the implementation and may be reported via vkGetFaultData.
- **pFaultCount** is a pointer to an integer that specifies the number of fault entries.
- **pFaults** is either NULL or a pointer to an array of pFaultCount VkFaultData structures to be updated with the recorded fault data.

Access to fault data is internally synchronized, meaning vkGetFaultData can be called from multiple threads simultaneously.

The implementation must not record more than maxQueryFaultCount faults to be reported by vkGetFaultData.

pUnrecordedFaults is set to VK_TRUE if the implementation has detected one or more faults since the last successful retrieval of fault data using this command, but was unable to record fault information for all faults. Otherwise, pUnrecordedFaults is set to VK_FALSE.

If pFaults is NULL, then the number of faults with the specified faultQueryBehavior characteristics associated with device is returned in pFaultCount, and pUnrecordedFaults is set as indicated above. Otherwise, pFaultCount must point to a variable set by the user to the number of elements in the pFaults array, and on return the variable is overwritten with the number of faults actually written to pFaults. If pFaultCount is less than the number of recorded device faults with the specified faultQueryBehavior characteristics, at most pFaultCount faults will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available faults were returned.

On success, the fault information stored by the implementation for the faults that were returned will be handled as specified by faultQueryBehavior.

For each filled pFaults entry, if pNext is not NULL, the implementation will fill in any implementation-specific structures applicable to that fault that are included in the pNext chain.

**Note**

In order to simplify the application logic, an application could have a static allocation sized to maxQueryFaultCount which it passes in to each call of vkGetFaultData. This allows an application to obtain all the faults available at this time in a single call to vkGetFaultData. Furthermore, under this usage pattern, the
command will never return `VK_INCOMPLETE`.

If `VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations` is `VK_TRUE`, `vkGetFaultData` must not return `VK_ERROR_OUT_OF_HOST_MEMORY`.

### Valid Usage

- VUID-vkGetFaultData-pFaultCount-05020
  `pFaultCount` must be less than or equal to `maxQueryFaultCount`

### Valid Usage (Implicit)

- VUID-vkGetFaultData-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetFaultData-faultQueryBehavior-parameter
  `faultQueryBehavior` must be a valid `VkFaultQueryBehavior` value

- VUID-vkGetFaultData-pUnrecordedFaults-parameter
  `pUnrecordedFaults` must be a valid pointer to a `VkBool32` value

- VUID-vkGetFaultData-pFaultCount-parameter
  `pFaultCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetFaultData-pFaults-parameter
  If the value referenced by `pFaultCount` is not `0`, and `pFaults` is not `NULL`, `pFaults` must be a valid pointer to an array of `pFaultCount` `VkFaultData` structures

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Possible values that can be set in `VkFaultQueryBehavior`, specifying which faults to return, are:

```c
// Provided by VKSC_VERSION_1_0
typedef enum VkFaultQueryBehavior {
    VK_FAULT_QUERY_BEHAVIOR_GET_AND_CLEAR_ALL_FAULTS = 0,
} VkFaultQueryBehavior;
```

- `VK_FAULT_QUERY_BEHAVIOR_GET_AND_CLEAR_ALL_FAULTS` All fault types and severities are reported
and are cleared from the internal fault storage after retrieval.

### 36.2.3. Fault Callback

The `VkFaultCallbackInfo` structure allows an application to register a function at device creation that the implementation can call to report faults when they occur. A callback function is registered by attaching a valid `VkFaultCallbackInfo` structure to the `pNext` chain of the `VkDeviceCreateInfo` structure. The callback function is only called by the implementation during a call to the API, using the same thread that is making the API call. The `VkFaultCallbackInfo` structure provides the function pointer to be called by the implementation, and optionally, application memory to store fault data.

The `VkFaultCallbackInfo` structure is defined as:

```c
// Provided by VKSC_VERSION_1_0
typedef struct VkFaultCallbackInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t faultCount;
    VkFaultData* pFaults;
   PFN_vkFaultCallbackFunction pfnFaultCallback;
} VkFaultCallbackInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or pointer to a structure extending this structure.
- `faultCount` is the number of reported faults in the array pointed to by `pFaults`.
- `pFaults` is either `NULL` or a pointer to an array of `faultCount` `VkFaultData` structures.
- `pfnFaultCallback` is a function pointer to the fault handler function that will be called by the implementation when a fault occurs.

If provided, the implementation **may** make use of the `pFaults` array to return fault data to the application when using the fault callback.

---

**Note**

Prior to Vulkan SC 1.0.11, the application was required to provide the `pFaults` array for fault callback data. This proved to be unwieldy for both applications and implementations and it was made optional as of version 1.0.11. It is expected that most implementations will ignore this and use stack or other preallocated memory for fault callback parameters.

If provided, the application memory referenced by `pFaults` **must** remain accessible throughout the lifetime of the logical device that was created with this structure.

---

**Note**

The memory pointed to by `pFaults` will be updated by the implementation and should not be used or accessed by the application outside of the fault handling
function pointed to by `PFN_vkFaultCallbackFunction`. This restriction also applies to any implementation-specific structure chained to an element of `pFaults` by `pNext`.

It is expected that implementations will maintain separate storage for fault information and populate the array pointed to by `pFaults` ahead of calling the fault callback function.

### Valid Usage

- **VUID-VkFaultCallbackInfo-faultCount-05138**
  
  `faultCount` must either be 0, or equal to `VkPhysicalDeviceVulkanSC10Properties::maxCallbackFaultCount`

### Valid Usage (Implicit)

- **VUID-VkFaultCallbackInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_FAULT_CALLBACK_INFO`

- **VUID-VkFaultCallbackInfo-pFaults-parameter**
  
  If `faultCount` is not 0, and `pFaults` is not NULL, `pFaults` must be a valid pointer to an array of `faultCount` `VkFaultData` structures

- **VUID-VkFaultCallbackInfo-pfnFaultCallback-parameter**
  
  `pfnFaultCallback` must be a valid `PFN_vkFaultCallbackFunction` value

The function pointer `PFN_vkFaultCallbackFunction` is defined as:

```c
// Provided by VKSC_VERSION_1_0
typedef void (VKAPI_PTR *PFN_vkFaultCallbackFunction)(
    VkBool32 unrecordedFaults,
    uint32_t faultCount,
    const VkFaultData* pFaults);
```

- `unrecordedFaults` is a boolean that specifies if the supplied fault information is incomplete and does not contain entries for all faults that have been detected by the implementation and may be reported via `PFN_vkFaultCallbackFunction` since the last call to this callback.
- `faultCount` will contain the number of reported faults in the array pointed to by `pFaults`.
- `pFaults` will point to an array of `faultCount` `VkFaultData` structures containing the fault information.

An implementation must only make calls to `PFN_vkFaultCallbackFunction` during the execution of an API command. An implementation must only make calls into the application-provided fault callback from the same thread that called the API command. The implementation should not synchronize calls to the callback. If synchronization is needed, the callback must provide it.

The fault callback must not call any Vulkan commands.
It is implementation-dependent whether faults reported by this callback are also reported via \texttt{vkGetFaultData}, but each unique fault will be reported by at most one callback.
Appendix A: Vulkan Environment for SPIR-V

Shaders for Vulkan are defined by the Khronos SPIR-V Specification as well as the Khronos SPIR-V Extended Instructions for GLSL Specification. This appendix defines additional SPIR-V requirements applying to Vulkan shaders.

Versions and Formats

A Vulkan 1.2 implementation must support the 1.0, 1.1, 1.2, 1.3, 1.4, and 1.5 versions of SPIR-V and the 1.0 version of the SPIR-V Extended Instructions for GLSL.

A SPIR-V module is interpreted as a series of 32-bit words in host endianness, with literal strings packed as described in section 2.2 of the SPIR-V Specification. The first few words of the SPIR-V module must be a magic number and a SPIR-V version number, as described in section 2.3 of the SPIR-V Specification.

Capabilities

The table below lists the set of SPIR-V capabilities that may be supported in Vulkan implementations. The application must not select a pipeline cache entry, which was created by passing a SPIR-V module using any of these capabilities to the offline pipeline cache compiler, in a vkCreate*Pipelines command unless one of the following conditions is met for the VkDevice specified in the device parameter of the vkCreate*Pipelines command:

- The corresponding field in the table is blank.
- Any corresponding Vulkan feature is enabled.
- Any corresponding Vulkan extension is enabled.
- Any corresponding Vulkan property is supported.
- The corresponding core version is supported (as returned by VkPhysicalDeviceProperties::apiVersion).

The application **must** not select a pipeline cache entry, which was created by passing a SPIR-V module containing any of the following to the offline pipeline cache compiler, containing any of the following in a `vkCreate*Pipelines` command:

- any `OpCapability` not listed above,
- an unsupported capability, or
- a capability which corresponds to a Vulkan feature or extension which has not been enabled.

**SPIR-V Extensions**

The following table lists SPIR-V extensions that implementations **may** support. The application **must** not select a pipeline cache entry, which was created by passing a SPIR-V module using any of the following SPIR-V extensions to the offline pipeline cache compiler, in a `vkCreate*Pipelines` command unless one of the following conditions is met for the `VkDevice` specified in the `device` parameter of the `vkCreate*Pipelines` command:

- Any corresponding Vulkan extension is enabled.
- The corresponding core version is supported (as returned by `VkPhysicalDeviceProperties::apiVersion`).

### Validation Rules Within a Module

Pipeline cache entries must have been compiled with the offline pipeline cache compiler using
SPIR-V modules that conform to the following rules:

**Standalone SPIR-V Validation**

The following rules can be validated with only the SPIR-V module itself. They do not depend on knowledge of the implementation and its capabilities or knowledge of runtime information, such as enabled features.

### Valid Usage

- **VUID-StandaloneSpirv-None-04633**
  
  Every entry point must have no return value and accept no arguments.

- **VUID-StandaloneSpirv-None-04634**
  
  The static function-call graph for an entry point must not contain cycles; that is, static recursion is not allowed.

- **VUID-StandaloneSpirv-None-04635**
  
  The logical or physical storage buffer addressing model must be selected.

- **VUID-StandaloneSpirv-None-04636**
  
  Scope for execution must be limited to Workgroup or Subgroup.

- **VUID-StandaloneSpirv-None-04637**
  
  If the Scope for execution is Workgroup, then it must only be used in the task, mesh, tessellation control, or compute execution model.

- **VUID-StandaloneSpirv-None-04638**
  
  Scope for memory must be limited to Device, QueueFamily, Workgroup, ShaderCallKHR, Subgroup, or Invocation.

- **VUID-StandaloneSpirv-ExecutionModel-07320**
  
  If the Execution Model is TessellationControl, and the MemoryModel is GLSL450, the Scope for memory must not be Workgroup.

- **VUID-StandaloneSpirv-None-07321**
  
  If the Scope for memory is Workgroup, then it must only be used in the task, mesh, tessellation control, or compute execution model.

- **VUID-StandaloneSpirv-None-04640**
  
  If the Scope for memory is ShaderCallKHR, then it must only be used in ray generation, intersection, closest hit, any-hit, miss, and callable execution model.

- **VUID-StandaloneSpirv-None-04641**
  
  If the Scope for memory is Invocation, then memory semantics must be None.

- **VUID-StandaloneSpirv-None-04642**
  
  Scope for group operations must be limited to Subgroup.

- **VUID-StandaloneSpirv-SubgroupVoteKHR-07951**
  
  If none of the SubgroupVoteKHR, GroupNonUniform, or SubgroupBallotKHR capabilities are declared, Scope for memory must not be Subgroup.

- **VUID-StandaloneSpirv-None-04643**
  
  Storage Class must be limited to UniformConstant, Input, Uniform, Output, Workgroup, Private,
• VUID-StandaloneSpirv-None-04644
If the Storage Class is Output, then it must not be used in the GlCompute, RayGenerationKHR, IntersectionKHR, AnyHitKHR, ClosestHitKHR, MissKHR, or CallableKHR Execution Model

• VUID-StandaloneSpirv-None-04645
If the Storage Class is Workgroup, then it must only be used in the task, mesh, or compute Execution Model

• VUID-StandaloneSpirv-None-08720
If the Storage Class is TileImageEXT, then it must only be used in the fragment execution model

• VUID-StandaloneSpirv-OpAtomicStore-04730
OpAtomicStore must not use Acquire, AcquireRelease, or SequentiallyConsistent memory semantics

• VUID-StandaloneSpirv-OpAtomicLoad-04731
OpAtomicLoad must not use Release, AcquireRelease, or SequentiallyConsistent memory semantics

• VUID-StandaloneSpirv-OpMemoryBarrier-04732
OpMemoryBarrier must use one of Acquire, Release, AcquireRelease, or SequentiallyConsistent memory semantics

• VUID-StandaloneSpirv-OpMemoryBarrier-04733
OpMemoryBarrier must include at least one Storage Class

• VUID-StandaloneSpirv-OpControlBarrier-04650
If the semantics for OpControlBarrier includes one of Acquire, Release, AcquireRelease, or SequentiallyConsistent memory semantics, then it must include at least one Storage Class

• VUID-StandaloneSpirv-OpVariable-04651
Any OpVariable with an Initializer operand must have Output, Private, Function, or Workgroup as its Storage Class operand

• VUID-StandaloneSpirv-OpVariable-04734
Any OpVariable with an Initializer operand and Workgroup as its Storage Class operand must use OpConstantNull as the initializer

• VUID-StandaloneSpirv-OpReadClockKHR-04652
Scope for OpReadClockKHR must be limited to Subgroup or Device

• VUID-StandaloneSpirv-OriginLowerLeft-04653
The OriginLowerLeft Execution Mode must not be used; fragment entry points must declare OriginUpperLeft

• VUID-StandaloneSpirv-PixelCenterInteger-04654
The PixelCenterInteger Execution Mode must not be used (pixels are always centered at half-integer coordinates)

• VUID-StandaloneSpirv-UniformConstant-04655
Any variable in the UniformConstant Storage Class must be typed as either OpTypeImage,
OpTypeSampler, OpTypeSampledImage, OpTypeAccelerationStructureKHR, or an array of one of these types

- VUID-StandaloneSpirv-Uniform-06807
  Any variable in the Uniform or StorageBuffer Storage Class must be typed as OpTypeStruct or an array of this type

- VUID-StandaloneSpirv-PushConstant-06808
  Any variable in the PushConstant Storage Class must be typed as OpTypeStruct

- VUID-StandaloneSpirv-OpTypeImage-04656
  OpTypeImage must declare a scalar 32-bit float, 64-bit integer, or 32-bit integer type for the “Sampled Type” (RelaxedPrecision can be applied to a sampling instruction and to the variable holding the result of a sampling instruction)

- VUID-StandaloneSpirv-OpTypeImage-04657
  OpTypeImage must have a “Sampled” operand of 1 (sampled image) or 2 (storage image)

- VUID-StandaloneSpirv-OpTypeSampledImage-06671
  OpTypeSampledImage must have a OpTypeImage with a “Sampled” operand of 1 (sampled image)

- VUID-StandaloneSpirv-Image-04965
  The SPIR-V Type of the Image Format operand of an OpTypeImage must match the Sampled Type, as defined in Image Format and Type Matching

- VUID-StandaloneSpirv-OpImageTexelPointer-04658
  If an OpImageTexelPointer is used in an atomic operation, the image type of the image parameter to OpImageTexelPointer must have an image format of R64i, R64ui, R32f, R32i, or R32ui

- VUID-StandaloneSpirv-OpImageQuerySizeLod-04659
  OpImageQuerySizeLod, OpImageQueryLod, and OpImageQueryLevels must only consume an “Image” operand whose type has its “Sampled” operand set to 1

- VUID-StandaloneSpirv-OpTypeImage-06214
  An OpTypeImage with a “Dim” operand of SubpassData must have an “Arrayed” operand of 0 (non-arrayed) and a “Sampled” operand of 2 (storage image)

- VUID-StandaloneSpirv-SubpassData-04660
  The (u,v) coordinates used for a SubpassData must be the <id> of a constant vector (0,0), or if a layer coordinate is used, must be a vector that was formed with constant 0 for the u and v components

- VUID-StandaloneSpirv-OpTypeImage-06924
  Objects of types OpTypeImage, OpTypeSampler, OpTypeSampledImage, OpTypeAccelerationStructureKHR, and arrays of these types must not be stored to or modified

- VUID-StandaloneSpirv-UniformKHR-06925
  Any variable in the Uniform Storage Class decorated as Block must not be stored to or modified

- VUID-StandaloneSpirv-Offset-04663
  Image operand Offset must only be used with OpImage*Gather instructions
Any image instruction which uses an `Offset`, `ConstOffset`, or `ConstOffsets` image operand, must only consume a “Sampled Image” operand whose type has its “Sampled” operand set to 1.

The “Component” operand of `OpImageGather`, and `OpImageSparseGather` must be the <id> of a constant instruction.

`OpImage*Dref*` instructions must not consume an image whose `Dim` is 3D.

Structure types must not contain opaque types.

Any `BuiltIn` decoration not listed in `Built-In Variables` must not be used.

The `Location` or `Component` decorations must only be used with the `Input`, `Output`, `RayPayloadKHR`, `IncomingRayPayloadKHR`, `HitAttributeKHR`, `HitObjectAttributeNV`, `CallableDataKHR`, `IncomingCallableDataKHR`, or `ShaderRecordBufferKHR` storage classes.

The `Location` or `Component` decorations must not be used with `BuiltIn`.

The `Location` decorations must be used on user-defined variables.

If a user-defined variable is not a pointer to a `Block` decorated `OpTypeStruct`, then the `OpVariable` must have a `Location` decoration.

If a user-defined variable has a `Location` decoration, and the variable is a pointer to a `OpTypeStruct`, then the members of that structure must not have `Location` decorations.

If a user-defined variable does not have a `Location` decoration, and the variable is a pointer to a `Block` decorated `OpTypeStruct`, then each member of the struct must have a `Location` decoration.

The `Component` decoration value must not be greater than 3.

If the `Component` decoration is used on an `OpVariable` that has a `OpTypeVector` type with a `Component Type` with a `Width` that is less than or equal to 32, the sum of its `Component Count` and the `Component` decoration value must be less than or equal to 4.

If the `Component` decoration is used on an `OpVariable` that has a `OpTypeVector` type with a `Component Type` with a `Width` that is equal to 64, the sum of two times its `Component Count` and the `Component` decoration value must be less than or equal to 4.

The `Component` decoration value must be less than or equal to 4.
The Component decorations value must not be 1 or 3 for scalar or two-component 64-bit data types

- VUID-StandaloneSpirv-Component-04924
  The Component decorations must not be used with any type that is not a scalar or vector, or an array of such a type

- VUID-StandaloneSpirv-Component-07703
  The Component decorations must not be used for a 64-bit vector type with more than two components

- VUID-StandaloneSpirv-GLSLShared-04669
  The GLSLShared and GLSLPacked decorations must not be used

- VUID-StandaloneSpirv-Flat-04670
  The Flat, NoPerspective, Sample, and Centroid decorations must only be used on variables with the Output or Input Storage Class

- VUID-StandaloneSpirv-Flat-06201
  The Flat, NoPerspective, Sample, and Centroid decorations must not be used on variables with the Output storage class in a fragment shader

- VUID-StandaloneSpirv-Flat-06202
  The Flat, NoPerspective, Sample, and Centroid decorations must not be used on variables with the Input storage class in a vertex shader

- VUID-StandaloneSpirv-PerVertexKHR-06777
  The PerVertexKHR decoration must only be used on variables with the Input Storage Class in a fragment shader

- VUID-StandaloneSpirv-Flat-04744
  Any variable with integer or double-precision floating-point type and with Input Storage Class in a fragment shader, must be decorated Flat

- VUID-StandaloneSpirv-ViewportRelativeNV-04672
  The ViewportRelativeNV decoration must only be used on a variable decorated with Layer in the vertex, tessellation evaluation, or geometry shader stages

- VUID-StandaloneSpirv-ViewportRelativeNV-04673
  The ViewportRelativeNV decoration must not be used unless a variable decorated with one of ViewportIndex or ViewportMaskNV is also statically used by the same OpEntryPoint

- VUID-StandaloneSpirv-ViewportMaskNV-04674
  The ViewportMaskNV and ViewportIndex decorations must not both be statically used by one or more OpEntryPoint’s that form the pre-rasterization shader stages of a graphics pipeline

- VUID-StandaloneSpirv-FPRoundingMode-04675
  Rounding modes other than round-to-nearest-even and round-towards-zero must not be used for the FPRoundingMode decoration

- VUID-StandaloneSpirv-Invariant-04677
  Variables decorated with Invariant and variables with structure types that have any members decorated with Invariant must be in the Output or Input Storage Class, Invariant used on an Input Storage Class variable or structure member has no effect

- VUID-StandaloneSpirv-VulkanMemoryModel-04678

1581
If the `VulkanMemoryModel` capability is not declared, the `Volatile` decoration must be used on any variable declaration that includes one of the `SMIDNV`, `WarpIDNV`, `SubgroupSize`, `SubgroupLocalInvocationId`, `SubgroupEqMask`, `SubgroupGeMask`, `SubgroupGtMask`, `SubgroupLeMask`, or `SubgroupLtMask BuiltIn` decorations when used in the ray generation, closest hit, miss, intersection, or callable shaders, or with the `RayTmaxKHR BuiltIn` decoration when used in an intersection shader.

- **VUID-StandaloneSpirv-VulkanMemoryModel-04679**
  If the `VulkanMemoryModel` capability is declared, the `OpLoad` instruction must use the `Volatile` memory semantics when it accesses into any variable that includes one of the `SMIDNV`, `WarpIDNV`, `SubgroupSize`, `SubgroupLocalInvocationId`, `SubgroupEqMask`, `SubgroupGeMask`, `SubgroupGtMask`, `SubgroupLeMask`, or `SubgroupLtMask BuiltIn` decorations when used in the ray generation, closest hit, miss, intersection, or callable shaders, or with the `RayTmaxKHR BuiltIn` decoration when used in an intersection shader.

- **VUID-StandaloneSpirv-OpTypeRuntimeArray-04680**
  `OpTypeRuntimeArray` must only be used for:
  - the last member of a `Block-decorated OpTypeStruct` in `StorageBuffer` or `PhysicalStorageBuffer` storage `Storage Class`
  - `BufferBlock-decorated OpTypeStruct` in the `Uniform` storage `Storage Class`
  - the outermost dimension of an arrayed variable in the `StorageBuffer`, `Uniform`, or `UniformConstant` storage `Storage Class`
  - variables in the `NodePayloadAMDX` storage `Storage Class` when the `CoalescingAMDX Execution Mode` is specified

- **VUID-StandaloneSpirv-Function-04681**
  A type `T` that is an array sized with a specialization constant must neither be, nor be contained in, the type `T2` of a variable `V`, unless either: a) `T` is equal to `T2`, b) `V` is declared in the `Function`, or `Private Storage Class`, c) `V` is a non-Block variable in the `Workgroup Storage Class`, or d) `V` is an interface variable with an additional level of arrayness, as described in interface matching, and `T` is the member type of the array type `T2`

- **VUID-StandaloneSpirv-OpControlBarrier-04682**
  If `OpControlBarrier` is used in ray generation, intersection, any-hit, closest hit, miss, fragment, vertex, tessellation evaluation, or geometry shaders, the execution Scope must be `Subgroup`

- **VUID-StandaloneSpirv-LocalSize-06426**
  For each compute shader entry point, either a `LocalSize` or `LocalSizeId` `Execution Mode`, or an object decorated with the `WorkgroupSize` decoration must be specified

- **VUID-StandaloneSpirv-DerivativeGroupQuadsNV-04684**
  For compute shaders using the `DerivativeGroupQuadsNV` execution mode, the first two dimensions of the local workgroup size must be a multiple of two

- **VUID-StandaloneSpirv-DerivativeGroupLinearNV-04778**
  For compute shaders using the `DerivativeGroupLinearNV` execution mode, the product of the dimensions of the local workgroup size must be a multiple of four

- **VUID-StandaloneSpirv-OpGroupNonUniformBallotBitCount-04685**
  If `OpGroupNonUniformBallotBitCount` is used, the group operation must be limited to `Reduce`. 
• VUID-StandaloneSpirv-None-04686
The Pointer operand of all atomic instructions must have a Storage Class limited to Uniform, Workgroup, Image, StorageBuffer, PhysicalStorageBuffer, or TaskPayloadWorkgroupEXT

• VUID-StandaloneSpirv-Offset-04687
Output variables or block members decorated with Offset that have a 64-bit type, or a composite type containing a 64-bit type, must specify an Offset value aligned to a 8 byte boundary

• VUID-StandaloneSpirv-Offset-04689
The size of any output block containing any member decorated with Offset that is a 64-bit type must be a multiple of 8

• VUID-StandaloneSpirv-Offset-04690
The first member of an output block specifying a Offset decoration must specify a Offset value that is aligned to an 8 byte boundary if that block contains any member decorated with Offset and is a 64-bit type

• VUID-StandaloneSpirv-Offset-04691
Output variables or block members decorated with Offset that have a 32-bit type, or a composite type contains a 32-bit type, must specify an Offset value aligned to a 4 byte boundary

• VUID-StandaloneSpirv-Offset-04692
Output variables, blocks or block members decorated with Offset must only contain base types that have components that are either 32-bit or 64-bit in size

• VUID-StandaloneSpirv-Offset-04716
Only variables or block members in the output interface decorated with Offset can be captured for transform feedback, and those variables or block members must also be decorated with XfbBuffer and XfbStride, or inherit XfbBuffer and XfbStride decorations from a block containing them

• VUID-StandaloneSpirv-XfbBuffer-04693
All variables or block members in the output interface of the entry point being compiled decorated with a specific XfbBuffer value must all be decorated with identical XfbStride values

• VUID-StandaloneSpirv-Stream-04694
If any variables or block members in the output interface of the entry point being compiled are decorated with Stream, then all variables belonging to the same XfbBuffer must specify the same Stream value

• VUID-StandaloneSpirv-XfbBuffer-04696
For any two variables or block members in the output interface of the entry point being compiled with the same XfbBuffer value, the ranges determined by the Offset decoration and the size of the type must not overlap

• VUID-StandaloneSpirv-XfbBuffer-04697
All block members in the output interface of the entry point being compiled that are in the same block and have a declared or inherited XfbBuffer decoration must specify the same XfbBuffer value
- **VUID-StandaloneSpirv-RayPayloadKHR-04698**
  RayPayloadKHR Storage Class **must** only be used in ray generation, closest hit or miss shaders

- **VUID-StandaloneSpirv-IncomingRayPayloadKHR-04699**
  IncomingRayPayloadKHR Storage Class **must** only be used in closest hit, any-hit, or miss shaders

- **VUID-StandaloneSpirv-IncomingRayPayloadKHR-04700**
  There **must** be at most one variable with the IncomingRayPayloadKHR Storage Class in the input interface of an entry point

- **VUID-StandaloneSpirv-HitAttributeKHR-04701**
  HitAttributeKHR Storage Class **must** only be used in intersection, any-hit, or closest hit shaders

- **VUID-StandaloneSpirv-HitAttributeKHR-04702**
  There **must** be at most one variable with the HitAttributeKHR Storage Class in the input interface of an entry point

- **VUID-StandaloneSpirv-HitAttributeKHR-04703**
  A variable with HitAttributeKHR Storage Class **must** only be written to in an intersection shader

- **VUID-StandaloneSpirv-CallableDataKHR-04704**
  CallableDataKHR Storage Class **must** only be used in ray generation, closest hit, miss, and callable shaders

- **VUID-StandaloneSpirv-IncomingCallableDataKHR-04705**
  IncomingCallableDataKHR Storage Class **must** only be used in callable shaders

- **VUID-StandaloneSpirv-IncomingCallableDataKHR-04706**
  There **must** be at most one variable with the IncomingCallableDataKHR Storage Class in the input interface of an entry point

- **VUID-StandaloneSpirv-ShaderRecordBufferKHR-07119**
  ShaderRecordBufferKHR Storage Class **must** only be used in ray generation, intersection, any-hit, closest hit, callable, or miss shaders

- **VUID-StandaloneSpirv-Base-07650**
  The Base operand of OpPtrAccessChain **must** have a storage class of Workgroup, StorageBuffer, or PhysicalStorageBuffer

- **VUID-StandaloneSpirv-Base-07651**
  If the Base operand of OpPtrAccessChain has a Workgroup Storage Class, then the VariablePointers capability **must** be declared

- **VUID-StandaloneSpirv-Base-07652**
  If the Base operand of OpPtrAccessChain has a StorageBuffer Storage Class, then the VariablePointers or VariablePointersStorageBuffer capability **must** be declared

- **VUID-StandaloneSpirv-PhysicalStorageBuffer64-04708**
  If the PhysicalStorageBuffer64 addressing model is enabled, all instructions that support memory access operands and that use a physical pointer **must** include the Aligned operand
If the `PhysicalStorageBuffer64` addressing model is enabled, any access chain instruction that accesses into a `RowMajor` matrix must only be used as the `Pointer` operand to `OpLoad` or `OpStore`.

If the `PhysicalStorageBuffer64` addressing model is enabled, `OpConvertUToPtr` and `OpConvertPtrToU` must use an integer type whose `Width` is 64.

`OpTypeForwardPointer` must have a `Storage Class` of `PhysicalStorageBuffer`.

All block members in a variable with a `Storage Class` of `PushConstant` declared as an array must only be accessed by dynamically uniform indices.

There must not be more than one `OpVariable` in the `PushConstant Storage Class` listed in the Interface for each `OpEntryPoint`.

Each `OpEntryPoint` must not statically use more than one `OpVariable` in the `PushConstant Storage Class`.

Each `OpEntryPoint` must not have more than one `Input` variable assigned the same `Component` word inside a `Location` slot, either explicitly or implicitly.

Each `OpEntryPoint` must not have more than one `Output` variable assigned the same `Component` word inside a `Location` slot, either explicitly or implicitly.

The `Result Type` operand of any `OpImageRead` or `OpImageSparseRead` instruction must be a vector of four components.

The `Base` operand of any `OpBitCount`, `OpBitReverse`, `OpBitFieldInsert`, `OpBitFieldSExtract`, or `OpBitFieldUExtract` instruction must be a 32-bit integer scalar or a vector of 32-bit integers.

Any variable in the `PushConstant` or `StorageBuffer` storage class must be decorated as `Block`.

Any variable in the `Uniform Storage Class` must be decorated as `Block` or `BufferBlock`.

Any variable in the `Uniform Constant`, `StorageBuffer`, or `Uniform Storage Class` must be decorated with `DescriptorSet` and `Binding`.

Variables decorated with `InputAttachmentIndex` must be in the `Uniform Constant Storage Class`.

Any variable in the `PhysicalStorageBuffer64` addressing model is enabled, any access chain instruction that accesses into a `RowMajor` matrix must only be used as the `Pointer` operand to `OpLoad` or `OpStore`.
If a variable is decorated by `DescriptorSet` or `Binding`, the Storage Class must correspond to an entry in Shader Resource and Storage Class Correspondence.

- **VUID-StandaloneSpirv-Input-06778**
  Variables with a Storage Class of Input in a fragment shader stage that are decorated with `PerVertexKHR` must be declared as arrays.

- **VUID-StandaloneSpirv-MeshEXT-07102**
  The module must not contain both an entry point that uses the `TaskEXT` or `MeshEXT` Execution Model and an entry point that uses the `TaskNV` or `MeshNV` Execution Model.

- **VUID-StandaloneSpirv-MeshEXT-07106**
  In mesh shaders using the `MeshEXT` Execution Model `OpSetMeshOutputsEXT` must be called before any outputs are written.

- **VUID-StandaloneSpirv-MeshEXT-07107**
  In mesh shaders using the `MeshEXT` Execution Model all variables declared as output must not be read from.

- **VUID-StandaloneSpirv-MeshEXT-07108**
  In mesh shaders using the `MeshEXT` Execution Model for `OpSetMeshOutputsEXT` instructions, the “Vertex Count” and “Primitive Count” operands must not depend on `ViewIndex`.

- **VUID-StandaloneSpirv-MeshEXT-07109**
  In mesh shaders using the `MeshEXT` Execution Model variables decorated with `PrimitivePointIndicesEXT`, `PrimitiveLineIndicesEXT`, or `PrimitiveTriangleIndicesEXT` declared as an array must not be accessed by indices that depend on `ViewIndex`.

- **VUID-StandaloneSpirv-MeshEXT-07110**
  In mesh shaders using the `MeshEXT` Execution Model any values stored in variables decorated with `PrimitivePointIndicesEXT`, `PrimitiveLineIndicesEXT`, or `PrimitiveTriangleIndicesEXT` must not depend on `ViewIndex`.

- **VUID-StandaloneSpirv-MeshEXT-07111**
  In mesh shaders using the `MeshEXT` Execution Model variables in workgroup or private Storage Class declared as or containing a composite type must not be accessed by indices that depend on `ViewIndex`.

- **VUID-StandaloneSpirv-MeshEXT-07330**
  In mesh shaders using the `MeshEXT` Execution Model the `OutputVertices Execution Mode` must be greater than 0.

- **VUID-StandaloneSpirv-MeshEXT-07331**
  In mesh shaders using the `MeshEXT` Execution Model the `OutputPrimitivesEXT Execution Mode` must be greater than 0.

- **VUID-StandaloneSpirv-Input-07290**
  Variables with a Storage Class of Input or Output and a type of `OpTypeBool` must be decorated with the `BuiltIn` decoration.

- **VUID-StandaloneSpirv-TileImageEXT-08723**
  The tile image variable declarations must obey the constraints on the `TileImageEXT` Storage Class and the Location decoration described in Fragment Tile Image Interface.

- **VUID-StandaloneSpirv-None-08724**
  The `TileImageEXT Storage Class` must only be used for declaring tile image variables.
The Storage Class of the Pointer operand to OpCooperativeMatrixLoadKHR or OpCooperativeMatrixStoreKHR must be limited to Workgroup, StorageBuffer, or PhysicalStorageBuffer.

**Runtime SPIR-V Validation**

The following rules must be validated at runtime. These rules depend on knowledge of the implementation and its capabilities and knowledge of runtime information, such as enabled features.

---

**Valid Usage**

- **VUID-RuntimeSpirv-vulkanMemoryModel-06265**
  If vulkanMemoryModel is enabled and vulkanMemoryModelDeviceScope is not enabled, Device memory scope must not be used

- **VUID-RuntimeSpirv-vulkanMemoryModel-06266**
  If vulkanMemoryModel is not enabled, QueueFamily memory scope must not be used

- **VUID-RuntimeSpirv-shaderSubgroupClock-06267**
  If shaderSubgroupClock is not enabled, the Subgroup scope must not be used for OpReadClockKHR

- **VUID-RuntimeSpirv-shaderDeviceClock-06268**
  If shaderDeviceClock is not enabled, the Device scope must not be used for OpReadClockKHR

- **VUID-RuntimeSpirv-OpTypeImage-06269**
  If shaderStorageImageWriteWithoutFormat is not enabled, any variable created with a “Type” of OpTypeImage that has a “Sampled” operand of 2 and an “Image Format” operand of Unknown must be decorated with NonWritable

- **VUID-RuntimeSpirv-OpTypeImage-06270**
  If shaderStorageImageReadWithoutFormat is not enabled, any variable created with a “Type” of OpTypeImage that has a “Sampled” operand of 2 and an “Image Format” operand of Unknown must be decorated with NonReadable

- **VUID-RuntimeSpirv-OpImageWrite-07112**
  OpImageWrite to any Image whose Image Format is not Unknown must have the Texel operand contain at least as many components as the corresponding VkFormat as given in the SPIR-V Image Format compatibility table

- **VUID-RuntimeSpirv-Location-06272**
  The sum of Location and the number of locations the variable it decorates consumes must be less than or equal to the value for the matching Execution Model defined in Shader Input and Output Locations

- **VUID-RuntimeSpirv-Location-06428**
  The maximum number of storage buffers, storage images, and output Location decorated color attachments written to in the Fragment Execution Model must be less than or equal to maxFragmentCombinedOutputResources
If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is not dynamically uniform, then the operand corresponding to that resource (e.g. the pointer or sampled image operand) must be decorated with NonUniform.

shaderSubgroupExtendedTypes must be enabled for group operations to use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types.

If subgroupBroadcastDynamicId is VK_TRUE, and the shader module version is 1.5 or higher, the “Index” for OpGroupNonUniformQuadBroadcast must be dynamically uniform within the derivative group. Otherwise, “Index” must be a constant.

If subgroupBroadcastDynamicId is VK_TRUE, and the shader module version is 1.5 or higher, the “Id” for OpGroupNonUniformBroadcast must be dynamically uniform within the subgroup. Otherwise, “Id” must be a constant.

shaderBufferFloat32Atomics, or shaderBufferFloat32AtomicAdd, or shaderBufferFloat64Atomics, or shaderBufferFloat64AtomicAdd must be enabled for floating-point atomic operations to be supported on a Pointer with a Storage Class of StorageBuffer.

shaderSharedFloat32Atomics, or shaderSharedFloat32AtomicAdd, or shaderSharedFloat64Atomics, or shaderSharedFloat64AtomicAdd must be enabled for floating-point atomic operations to be supported on a Pointer with a Storage Class of Workgroup.

shaderImageFloat32Atomics or shaderImageFloat32AtomicAdd must be enabled for 32-bit floating-point atomic operations to be supported on a Pointer with a Storage Class of Image.

sparseImageFloat32Atomics or sparseImageFloat32AtomicAdd must be enabled for 32-bit floating-point atomics to be supported on sparse images.

shaderImageInt64Atomics must be enabled for 64-bit integer atomic operations to be supported on a Pointer with a Storage Class of Image.

If denormBehaviorIndependence is VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY, then the entry point must use the same denormals Execution Mode for both 16-bit and 64-bit floating-point types.

If denormBehaviorIndependence is VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE, then the entry point must use the same denormals Execution Mode for all floating-point types.

VUID-RuntimeSpirv-roundingModeIndependence-06291
If `roundingModeIndependence` is `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY`, then the entry point **must** use the same rounding Execution Mode for both 16-bit and 64-bit floating-point types

- VUID-RuntimeSpirv-roundingModeIndependence-06292
  If `roundingModeIndependence` is `VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE`, then the entry point **must** use the same rounding Execution Mode for all floating-point types

- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat16-06293
  If `shaderSignedZeroInfNanPreserveFloat16` is `VK_FALSE`, then `SignedZeroInfNanPreserve` for 16-bit floating-point type **must** not be used

- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat32-06294
  If `shaderSignedZeroInfNanPreserveFloat32` is `VK_FALSE`, then `SignedZeroInfNanPreserve` for 32-bit floating-point type **must** not be used

- VUID-RuntimeSpirv-shaderSignedZeroInfNanPreserveFloat64-06295
  If `shaderSignedZeroInfNanPreserveFloat64` is `VK_FALSE`, then `SignedZeroInfNanPreserve` for 64-bit floating-point type **must** not be used

- VUID-RuntimeSpirv-shaderDenormPreserveFloat16-06296
  If `shaderDenormPreserveFloat16` is `VK_FALSE`, then `DenormPreserve` for 16-bit floating-point type **must** not be used

- VUID-RuntimeSpirv-shaderDenormPreserveFloat32-06297
  If `shaderDenormPreserveFloat32` is `VK_FALSE`, then `DenormPreserve` for 32-bit floating-point type **must** not be used

- VUID-RuntimeSpirv-shaderDenormPreserveFloat64-06298
  If `shaderDenormPreserveFloat64` is `VK_FALSE`, then `DenormPreserve` for 64-bit floating-point type **must** not be used

- VUID-RuntimeSpirv-shaderDenormFlushToZeroFloat16-06299
  If `shaderDenormFlushToZeroFloat16` is `VK_FALSE`, then `DenormFlushToZero` for 16-bit floating-point type **must** not be used

- VUID-RuntimeSpirv-shaderDenormFlushToZeroFloat32-06300
  If `shaderDenormFlushToZeroFloat32` is `VK_FALSE`, then `DenormFlushToZero` for 32-bit floating-point type **must** not be used

- VUID-RuntimeSpirv-shaderDenormFlushToZeroFloat64-06301
  If `shaderDenormFlushToZeroFloat64` is `VK_FALSE`, then `DenormFlushToZero` for 64-bit floating-point type **must** not be used

- VUID-RuntimeSpirv-shaderRoundingModeRTEFloat16-06302
  If `shaderRoundingModeRTEFloat16` is `VK_FALSE`, then `RoundingModeRTE` for 16-bit floating-point type **must** not be used

- VUID-RuntimeSpirv-shaderRoundingModeRTEFloat32-06303
  If `shaderRoundingModeRTEFloat32` is `VK_FALSE`, then `RoundingModeRTE` for 32-bit floating-point type **must** not be used

- VUID-RuntimeSpirv-shaderRoundingModeRTEFloat64-06304
  If `shaderRoundingModeRTEFloat64` is `VK_FALSE`, then `RoundingModeRTE` for 64-bit floating-point type **must** not be used
If shaderRoundingModeRTZFloat16 is VK_FALSE, then RoundingModeRTZ for 16-bit floating-point type must not be used.

If shaderRoundingModeRTZFloat32 is VK_FALSE, then RoundingModeRTZ for 32-bit floating-point type must not be used.

If shaderRoundingModeRTZFloat64 is VK_FALSE, then RoundingModeRTZ for 64-bit floating-point type must not be used.

If the PhysicalStorageBuffer64 addressing model is enabled any load or store through a physical pointer type must be aligned to a multiple of the size of the largest scalar type in the pointed-to type.

If the PhysicalStorageBuffer64 addressing model is enabled the pointer value of a memory access instruction must be at least as aligned as specified by the Aligned memory access operand.

DescriptorSet and Binding decorations must obey the constraints on Storage Class, type, and descriptor type described in DescriptorSet and Binding Assignment.

shaderBufferFloat32Atomics, or shaderBufferFloat32AtomicAdd, or shaderSharedFloat32Atomics, or shaderSharedFloat32AtomicAdd must be enabled for 32-bit floating point atomic operations.

shaderBufferFloat64Atomics, or shaderBufferFloat64AtomicAdd, or shaderSharedFloat64Atomics, or shaderSharedFloat64AtomicAdd must be enabled for 64-bit floating point atomic operations.

If fragmentStoresAndAtomics is not enabled, then all storage image, storage texel buffer, and storage buffer variables in the fragment stage must be decorated with the NonWritable decoration.

If vertexPipelineStoresAndAtomics is not enabled, then all storage image, storage texel buffer, and storage buffer variables in the vertex, tessellation, and geometry stages must be decorated with the NonWritable decoration.

If shaderAtomicInstructions is not enabled, the SPIR-V Atomic Instructions listed in 3.37.18 (OpAtomic*) must not be used [SCID-1].

If subgroupQuadOperationsInAllStages is VK_FALSE, then quad subgroup operations must not be used except for in fragment and compute stages.
Group operations with subgroup scope must not be used if the shader stage is not in subgroupSupportedStages.

The first element of the Offset operand of InterpolateAtOffset must be greater than or equal to:
\[ \text{frag}_{\text{width}} \times \text{minInterpolationOffset} \]
where \( \text{frag}_{\text{width}} \) is the width of the current fragment in pixels.

The first element of the Offset operand of InterpolateAtOffset must be less than or equal to:
\[ \text{frag}_{\text{width}} \times (\text{maxInterpolationOffset} + \text{ULP}) - \text{ULP} \]
where \( \text{frag}_{\text{width}} \) is the width of the current fragment in pixels and \( \text{ULP} = 1 / 2^{\text{subPixelInterpolationOffsetBits}} \).

The second element of the Offset operand of InterpolateAtOffset must be greater than or equal to:
\[ \text{frag}_{\text{height}} \times \text{minInterpolationOffset} \]
where \( \text{frag}_{\text{height}} \) is the height of the current fragment in pixels.

The second element of the Offset operand of InterpolateAtOffset must be less than or equal to:
\[ \text{frag}_{\text{height}} \times (\text{maxInterpolationOffset} + \text{ULP}) - \text{ULP} \]
where \( \text{frag}_{\text{height}} \) is the height of the current fragment in pixels and \( \text{ULP} = 1 / 2^{\text{subPixelInterpolationOffsetBits}} \).

In compute shaders using the GLCompute Execution Model the \( x \) size in LocalSize or LocalSizeId must be less than or equal to \( \text{VkPhysicalDeviceLimits}::\text{maxComputeWorkGroupSize}[0] \).

In compute shaders using the GLCompute Execution Model the \( y \) size in LocalSize or LocalSizeId must be less than or equal to \( \text{VkPhysicalDeviceLimits}::\text{maxComputeWorkGroupSize}[1] \).

In compute shaders using the GLCompute Execution Model the \( z \) size in LocalSize or LocalSizeId must be less than or equal to \( \text{VkPhysicalDeviceLimits}::\text{maxComputeWorkGroupSize}[2] \).

In compute shaders using the GLCompute Execution Model the product of \( x \) size, \( y \) size, and \( z \) size in LocalSize or LocalSizeId must be less than or equal to \( \text{VkPhysicalDeviceLimits}::\text{maxComputeWorkGroupInvocations} \).

The Execution Mode LocalSizeId must not be used.

The VUID-RuntimeSpirv-LocalSizeId-06433
Any OpTypeVector output interface variables must not have a higher Component Count than a matching OpTypeVector input interface variable.

- VUID-RuntimeSpirv-OpEntryPoint-08743
  Any user-defined variables shared between the OpEntryPoint of two shader stages, and declared with Input as its Storage Class for the subsequent shader stage, must have all Location slots and Component words declared in the preceding shader stage's OpEntryPoint with Output as the Storage Class.

- VUID-RuntimeSpirv-OpEntryPoint-07754
  Any user-defined variables between the OpEntryPoint of two shader stages must have the same type and width for each Component.

- VUID-RuntimeSpirv-OpVariable-08746
  Any OpVariable, Block-decorated OpTypeStruct, or Block-decorated OpTypeStruct members shared between the OpEntryPoint of two shader stages must have matching decorations as defined in interface matching.

- VUID-RuntimeSpirv-Workgroup-06530
  The sum of size in bytes for variables and padding in the Workgroup Storage Class in the GLCompute Execution Model must be less than or equal to maxComputeSharedMemorySize.

- VUID-RuntimeSpirv-OpVariable-06373
  Any OpVariable with Workgroup as its Storage Class must not have an Initializer operand.

- VUID-RuntimeSpirv-OpImage-06376
  If an OpImage*Gather operation has an image operand of Offset, ConstOffset, or ConstOffsets the offset value must be greater than or equal to minTexelGatherOffset.

- VUID-RuntimeSpirv-OpImage-06377
  If an OpImage*Gather operation has an image operand of Offset, ConstOffset, or ConstOffsets the offset value must be less than or equal to maxTexelGatherOffset.

- VUID-RuntimeSpirv-OpImageSample-06435
  If an OpImageSample* or OpImageFetch* operation has an image operand of ConstOffset then the offset value must be greater than or equal to minTexelOffset.

- VUID-RuntimeSpirv-OpImageSample-06436
  If an OpImageSample* or OpImageFetch* operation has an image operand of ConstOffset then the offset value must be less than or equal to maxTexelOffset.

- VUID-RuntimeSpirv-samples-08725
  If an OpTypeImage has an MS operand 0, its bound image must have been created with VkImageCreateInfo::samples as VK_SAMPLE_COUNT_1_BIT.

- VUID-RuntimeSpirv-samples-08726
  If an OpTypeImage has an MS operand 1, its bound image must not have been created with VkImageCreateInfo::samples as VK_SAMPLE_COUNT_1_BIT.

- VUID-RuntimeSpirv-OpEntryPoint-08727
  Each OpEntryPoint must not have more than one variable decorated with InputAttachmentIndex per image aspect of the attachment image bound to it, either explicitly or implicitly as described by input attachment interface.

- VUID-RuntimeSpirv-MeshEXT-09218
  In mesh shaders using the MeshEXT or MeshNV Execution Model and the OutputPoints
Precision and Operation of SPIR-V Instructions

The following rules apply to half, single, and double-precision floating point instructions:

- Positive and negative infinities and positive and negative zeros are generated as dictated by IEEE 754, but subject to the precisions allowed in the following table.
- Dividing a non-zero by a zero results in the appropriately signed IEEE 754 infinity.
- Signaling NaNs are not required to be generated and exceptions are never raised. Signaling NaNs may be converted to quiet NaNs values by any floating point instruction.
- By default, the implementation may perform optimizations on half, single, or double-precision floating-point instructions that ignore sign of a zero, or assume that arguments and results are not NaNs or infinities. If the entry point is declared with the SignedZeroInfNanPreserve Execution Mode, then NaNs, infinities, and the sign of zero must not be ignored.

- Denormalized values are supported.

  ◦ By default, any half, single, or double-precision denormalized value input into a shader or potentially generated by any instruction (except those listed above) or any extended instructions for GLSL in a shader may be flushed to zero.

  ◦ If the entry point is declared with the DenormFlushToZero Execution Mode then for the affected instructions the denormalized result must be flushed to zero and the denormalized operands may be flushed to zero. Denormalized values obtained via unpacking an integer into a vector of values with smaller bit width and interpreting those values as floating-point numbers must be flushed to zero.

Sqrt, InverseSqrt, Determinant, MatrixInverse, Modf, ModfStruct, FMin, FMax, FClamp, FMix, Step, SmoothStep, Fma, UnpackHalf2x16, UnpackDouble2x32, Length, Distance, Cross, Normalize, FaceForward, Reflect, Refract, NMin, NMax, NClamp. Other SPIR-V instructions (except those excluded above) may also flush denormalized values.

The precision of double-precision instructions is at least that of single precision.

The precision of individual operations is defined in Precision of Individual Operations. Subject to the constraints below, however, implementations may reorder or combine operations, resulting in expressions exhibiting different precisions than might be expected from the constituent operations.

**Evaluation of Expressions**

Implementations may rearrange floating-point operations using any of the mathematical properties governing the expressions in precise arithmetic, even where the floating-point operations do not share these properties. This includes, but is not limited to, associativity and distributivity, and may involve a different number of rounding steps than would occur if the operations were not rearranged. In shaders that use the SignedZeroInfNanPreserve Execution Mode the values must be preserved if they are generated after any rearrangement but the Execution Mode does not change which rearrangements are valid. This rearrangement can be prevented for particular operations by using the NoContraction decoration.

**Note**

For example, in the absence of the NoContraction decoration implementations are allowed to implement \( a + b - a \) and \( \frac{a x}{b} \) as \( b \). The SignedZeroInfNanPreserve does not prevent these transformations, even though they may overflow to infinity or NaN when evaluated in floating-point.

If the NoContraction decoration is applied then operations may not be rearranged, so, for example, \( a + a - a \) must account for possible overflow to infinity. If infinities are not preserved then the expression may be replaced with \( a \), since the replacement is exact when overflow does not occur and infinities may be replaced with undefined values. If both NoContraction and SignedZeroInfNanPreserve are used then the result must be infinity for sufficiently large \( a \).

**Precision of Individual Operations**

The precision of individual operations is defined either in terms of rounding (correctly rounded), as
an error bound in ULP, or as inherited from a formula as follows:

**Correctly Rounded**

Operations described as “correctly rounded” will return the infinitely precise result, $x$, rounded so as to be representable in floating-point. The rounding mode is not specified, unless the entry point is declared with the `RoundingModeRTE` or the `RoundingModeRTZ` Execution Mode. These execution modes affect only correctly rounded SPIR-V instructions. These execution modes do not affect OpQuantizeToF16. If the rounding mode is not specified then this rounding is implementation specific, subject to the following rules. If $x$ is exactly representable then $x$ will be returned. Otherwise, either the floating-point value closest to and no less than $x$ or the value closest to and no greater than $x$ will be returned.

**ULP**

Where an error bound of $n$ ULP (units in the last place) is given, for an operation with infinitely precise result $x$ the value returned must be in the range $[x - n \times \text{ulp}(x), x + n \times \text{ulp}(x)]$. The function $\text{ulp}(x)$ is defined as follows:

If there exist non-equal, finite floating-point numbers $a$ and $b$ such that $a \leq x \leq b$ then $\text{ulp}(x)$ is the minimum possible distance between such numbers, $\text{ulp}(x) = \min_{a < b \mid b - a}$. If such numbers do not exist then $\text{ulp}(x)$ is defined to be the difference between the two non-equal, finite floating-point numbers nearest to $x$.

Where the range of allowed return values includes any value of magnitude larger than that of the largest representable finite floating-point number, operations may, additionally, return either an infinity of the appropriate sign or the finite number with the largest magnitude of the appropriate sign. If the infinitely precise result of the operation is not mathematically defined then the value returned is undefined.

**Inherited From ...**

Where an operation’s precision is described as being inherited from a formula, the result returned must be at least as accurate as the result of computing an approximation to $x$ using a formula equivalent to the given formula applied to the supplied inputs. Specifically, the formula given may be transformed using the mathematical associativity, commutativity and distributivity of the operators involved to yield an equivalent formula. The SPIR-V precision rules, when applied to each such formula and the given input values, define a range of permitted values. If NaN is one of the permitted values then the operation may return any result, otherwise let the largest permitted value in any of the ranges be $F_{\text{max}}$ and the smallest be $F_{\text{min}}$. The operation must return a value in the range $[x - E, x + E]$ where $E = \max(|x - F_{\text{min}}|, |x - F_{\text{max}}|)$. If the entry point is declared with the DenormFlushToZero execution mode, then any intermediate denormal value(s) while evaluating the formula may be flushed to zero. Denormal final results must be flushed to zero. If the entry point is declared with the DenormPreserve Execution Mode, then denormals must be preserved throughout the formula.

For half- (16 bit) and single- (32 bit) precision instructions, precisions are required to be at least as follows:

Table 82. Precision of core SPIR-V Instructions
<table>
<thead>
<tr>
<th>Instruction</th>
<th>Single precision, unless decorated with RelaxedPrecision</th>
<th>Half precision</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpFAdd</td>
<td>Correctly rounded.</td>
<td></td>
</tr>
<tr>
<td>OpFSub</td>
<td>Correctly rounded.</td>
<td></td>
</tr>
<tr>
<td>OpDot(x, y)</td>
<td>Inherited from $\sum_{i=0}^{n-1} x_i \times y_i$.</td>
<td></td>
</tr>
<tr>
<td>OpFOrdEqual, OpFUNordEqual</td>
<td>Correct result.</td>
<td></td>
</tr>
<tr>
<td>OpFOrdLessThan, OpFUNordLessThan</td>
<td>Correct result.</td>
<td></td>
</tr>
<tr>
<td>OpFOrdGreaterThan, OpFUNordGreaterThan</td>
<td>Correct result.</td>
<td></td>
</tr>
<tr>
<td>OpFOrdGreaterThanEqual, OpFUNordGreaterThanEqual</td>
<td>Correct result.</td>
<td></td>
</tr>
<tr>
<td>OpFDiv(x,y)</td>
<td>2.5 ULP for $</td>
<td>y</td>
</tr>
<tr>
<td>OpFRem(x,y)</td>
<td>Inherited from $x - y \times \text{trunc}(x/y)$.</td>
<td></td>
</tr>
<tr>
<td>OpFMod(x,y)</td>
<td>Inherited from $x - y \times \text{floor}(x/y)$.</td>
<td></td>
</tr>
<tr>
<td>conversions between types</td>
<td>Correctly rounded.</td>
<td></td>
</tr>
</tbody>
</table>

**Note**

The OpFRem and OpFMod instructions use cheap approximations of remainder, and the error can be large due to the discontinuity in trunc() and floor(). This can produce mathematically unexpected results in some cases, such as FMod(x,x) computing $x$ rather than $0$, and can also cause the result to have a different sign than the infinitely precise result.

</table>

GLSL.std.450 extended instructions specifically defined in terms of the above instructions inherit the above errors. GLSL.std.450 extended instructions not listed above and not defined in terms of the above have undefined precision.

For the OpSRem and OpSMod instructions, if either operand is negative the result is undefined.

(Note: While the OpSRem and OpSMod instructions are supported by the Vulkan environment, they require non-negative values and thus do not enable additional functionality beyond what OpUMod provides.)

Signedness of SPIR-V Image Accesses

SPIR-V associates a signedness with all integer image accesses. This is required in certain parts of the SPIR-V and the Vulkan image access pipeline to ensure defined results. The signedness is determined from a combination of the access instruction’s Image Operands and the underlying image’s Sampled Type as follows:

1. If the instruction’s Image Operands contains the SignExtend operand then the access is signed.
2. If the instruction’s Image Operands contains the ZeroExtend operand then the access is unsigned.
3. Otherwise, the image accesses signedness matches that of the Sampled Type of the OpTypeImage being accessed.
Image Format and Type Matching

When specifying the Image Format of an OpTypeImage, the converted bit width and type, as shown in the table below, must match the Sampled Type. The signedness must match the signedness of any access to the image.

Note
Formatted accesses are always converted from a shader readable type to the resource's format or vice versa via Format Conversion for reads and Texel Output Format Conversion for writes. As such, the bit width and format below do not necessarily match 1:1 with what might be expected for some formats.

For a given Image Format, the Sampled Type must be the type described in the Type column of the below table, with its Literal Width set to that in the Bit Width column. Every access that is made to the image must have a signedness equal to that in the Signedness column (where applicable).

Appendix B: Memory Model

Note
This memory model describes synchronizations provided by all implementations; however, some of the synchronizations defined require extra features to be supported by the implementation. See VkPhysicalDeviceVulkanMemoryModelFeatures.

Agent

Operation is a general term for any task that is executed on the system.

Note
An operation is by definition something that is executed. Thus if an instruction is skipped due to control flow, it does not constitute an operation.

Each operation is executed by a particular agent. Possible agents include each shader invocation, each host thread, and each fixed-function stage of the pipeline.

Memory Location

A memory location identifies unique storage for 8 bits of data. Memory operations access a set of memory locations consisting of one or more memory locations at a time, e.g. an operation accessing a 32-bit integer in memory would read/write a set of four memory locations. Memory operations that access whole aggregates may access any padding bytes between elements or members, but no padding bytes at the end of the aggregate. Two sets of memory locations overlap if the intersection of their sets of memory locations is non-empty. A memory operation must not affect memory at a memory location not within its set of memory locations.

Memory locations for buffers and images are explicitly allocated in VkDeviceMemory objects, and are implicitly allocated for SPIR-V variables in each shader invocation.

Allocation

The values stored in newly allocated memory locations are determined by a SPIR-V variable’s initializer, if present, or else are undefined. At the time an allocation is created there have been no memory operations to any of its memory locations. The initialization is not considered to be a memory operation.

Note
For tessellation control shader output variables, a consequence of initialization not being considered a memory operation is that some implementations may need to insert a barrier between the initialization of the output variables and any reads of those variables.
Memory Operation

For an operation A and memory location M:

- A reads M if and only if the data stored in M is an input to A.
- A writes M if and only if the data output from A is stored to M.
- A accesses M if and only if it either reads or writes (or both) M.

**Note**
A write whose value is the same as what was already in those memory locations is still considered to be a write and has all the same effects.

Reference

A reference is an object that a particular agent can use to access a set of memory locations. On the host, a reference is a host virtual address. On the device, a reference is:

- The descriptor that a variable is bound to, for variables in Image, Uniform, or StorageBuffer storage classes. If the variable is an array (or array of arrays, etc.) then each element of the array may be a unique reference.
- The address range for a buffer in PhysicalStorageBuffer storage class, where the base of the address range is queried with vkGetBufferDeviceAddress and the length of the range is the size of the buffer.
- The variable itself for variables in other storage classes.

Two memory accesses through distinct references may require availability and visibility operations as defined below.

Program-Order

A dynamic instance of an instruction is defined in SPIR-V (https://registry.khronos.org/spir-v/specs/unified1/SPIRV.html#DynamicInstance) as a way of referring to a particular execution of a static instruction. Program-order is an ordering on dynamic instances of instructions executed by a single shader invocation:

- (Basic block): If instructions A and B are in the same basic block, and A is listed in the module before B, then the n'th dynamic instance of A is program-ordered before the n'th dynamic instance of B.
- (Branch): The dynamic instance of a branch or switch instruction is program-ordered before the dynamic instance of the OpLabel instruction to which it transfers control.
- (Call entry): The dynamic instance of an OpFunctionCall instruction is program-ordered before the dynamic instances of the OpFunctionParameter instructions and the body of the called function.
- (Call exit): The dynamic instance of the instruction following an OpFunctionCall instruction is program-ordered after the dynamic instance of the return instruction executed by the called
function.

• (Transitive Closure): If dynamic instance A of any instruction is program-ordered before
dynamic instance B of any instruction and B is program-ordered before dynamic instance C of
any instruction then A is program-ordered before C.

• (Complete definition): No other dynamic instances are program-ordered.

For instructions executed on the host, the source language defines the program-order relation (e.g.
as “sequenced-before”).

Scope

Atomic and barrier instructions include scopes which identify sets of shader invocations that must
obey the requested ordering and atomicity rules of the operation, as defined below.

The various scopes are described in detail in the Shaders chapter.

Atomic Operation

An atomic operation on the device is any SPIR-V operation whose name begins with OpAtomic. An
atomic operation on the host is any operation performed with an std::atomic typed object.

Each atomic operation has a memory scope and a semantics. Informally, the scope determines
which other agents it is atomic with respect to, and the semantics constrains its ordering against
other memory accesses. Device atomic operations have explicit scopes and semantics. Each host
atomic operation implicitly uses the CrossDevice scope, and uses a memory semantics equivalent to
a C++ std::memory_order value of relaxed, acquire, release, acq_rel, or seq_cst.

Two atomic operations A and B are potentially-mutually-ordered if and only if all of the following
are true:

• They access the same set of memory locations.
• They use the same reference.
• A is in the instance of B’s memory scope.
• B is in the instance of A’s memory scope.
• A and B are not the same operation (irreflexive).

Two atomic operations A and B are mutually-ordered if and only if they are potentially-mutually-
ordered and any of the following are true:

• A and B are both device operations.
• A and B are both host operations.
• A is a device operation, B is a host operation, and the implementation supports concurrent host-
and device-atomics.

Note
If two atomic operations are not mutually-ordered, and if their sets of memory locations overlap, then each must be synchronized against the other as if they were non-atomic operations.

Scoped Modification Order

For a given atomic write A, all atomic writes that are mutually-ordered with A occur in an order known as A's scoped modification order. A’s scoped modification order relates no other operations.

Note

Invocations outside the instance of A’s memory scope may observe the values at A’s set of memory locations becoming visible to it in an order that disagrees with the scoped modification order.

Note

It is valid to have non-atomic operations or atomics in a different scope instance to the same set of memory locations, as long as they are synchronized against each other as if they were non-atomic (if they are not, it is treated as a data race). That means this definition of A’s scoped modification order could include atomic operations that occur much later, after intervening non-atomics. That is a bit non-intuitive, but it helps to keep this definition simple and non-circular.

Memory Semantics

Non-atomic memory operations, by default, may be observed by one agent in a different order than they were written by another agent.

Atomics and some synchronization operations include memory semantics, which are flags that constrain the order in which other memory accesses (including non-atomic memory accesses and availability and visibility operations) performed by the same agent can be observed by other agents, or can observe accesses by other agents.

Device instructions that include semantics are OpAtomic*, OpControlBarrier, OpMemoryBarrier, and OpMemoryNamedBarrier. Host instructions that include semantics are some std::atomic methods and memory fences.

SPIR-V supports the following memory semantics:

- Relaxed: No constraints on order of other memory accesses.
- Acquire: A memory read with this semantic performs an acquire operation. A memory barrier with this semantic is an acquire barrier.
- Release: A memory write with this semantic performs a release operation. A memory barrier with this semantic is a release barrier.
- AcquireRelease: A memory read-modify-write operation with this semantic performs both an acquire operation and a release operation, and inherits the limitations on ordering from both of those operations. A memory barrier with this semantic is both a release and acquire barrier.
SPIR-V does not support “consume” semantics on the device.

The memory semantics operand also includes storage class semantics which indicate which storage classes are constrained by the synchronization. SPIR-V storage class semantics include:

- UniformMemory
- WorkgroupMemory
- ImageMemory
- OutputMemory

Each SPIR-V memory operation accesses a single storage class. Semantics in synchronization operations can include a combination of storage classes.

The UniformMemory storage class semantic applies to accesses to memory in the PhysicalStorageBuffer, Uniform and StorageBuffer storage classes. The WorkgroupMemory storage class semantic applies to accesses to memory in the Workgroup storage class. The ImageMemory storage class semantic applies to accesses to memory in the Image storage class. The OutputMemory storage class semantic applies to accesses to memory in the Output storage class.

Informally, these constraints limit how memory operations can be reordered, and these limits apply not only to the order of accesses as performed in the agent that executes the instruction, but also to the order the effects of writes become visible to all other agents within the same instance of the instruction’s memory scope.

Release and acquire operations in different threads can act as synchronization operations, to guarantee that writes that happened before the release are visible after the acquire. (This is not a formal definition, just an Informative forward reference.)

The OutputMemory storage class semantic is only useful in tessellation control shaders, which is the only execution model where output variables are shared between invocations.

The memory semantics operand can also include availability and visibility flags, which apply availability and visibility operations as described in availability and visibility. The availability/visibility flags are:

- MakeAvailable: Semantics must be Release or AcquireRelease. Performs an availability operation before the release operation or barrier.
- MakeVisible: Semantics must be Acquire or AcquireRelease. Performs a visibility operation after the acquire operation or barrier.
The specifics of these operations are defined in Availability and Visibility Semantics.

Host atomic operations may support a different list of memory semantics and synchronization operations, depending on the host architecture and source language.

**Release Sequence**

After an atomic operation A performs a release operation on a set of memory locations M, the *release sequence headed by A* is the longest continuous subsequence of A’s scoped modification order that consists of:

- the atomic operation A as its first element
- atomic read-modify-write operations on M by any agent

**Note**
The atomics in the last bullet must be mutually-ordered with A by virtue of being in A’s scoped modification order.

**Note**
This intentionally omits “atomic writes to M performed by the same agent that performed A”, which is present in the corresponding C++ definition.

**Synchronizes-With**

*Synchronizes-with* is a relation between operations, where each operation is either an atomic operation or a memory barrier (aka fence on the host).

If A and B are atomic operations, then A synchronizes-with B if and only if all of the following are true:

- A performs a release operation
- B performs an acquire operation
- A and B are mutually-ordered
- B reads a value written by A or by an operation in the release sequence headed by A

**OpControlBarrier**, **OpMemoryBarrier**, and **OpMemoryNamedBarrier** are memory barrier instructions in SPIR-V.

If A is a release barrier and B is an atomic operation that performs an acquire operation, then A synchronizes-with B if and only if all of the following are true:

- there exists an atomic write X (with any memory semantics)
- A is program-ordered before X
- X and B are mutually-ordered
- B reads a value written by X or by an operation in the release sequence headed by X
If X is relaxed, it is still considered to head a hypothetical release sequence for this rule
• A and B are in the instance of each other’s memory scopes
• X’s storage class is in A’s semantics.

If A is an atomic operation that performs a release operation and B is an acquire barrier, then A synchronizes-with B if and only if all of the following are true:

• there exists an atomic read X (with any memory semantics)
• X is program-ordered before B
• X and A are mutually-ordered
• X reads a value written by A or by an operation in the release sequence headed by A
• A and B are in the instance of each other’s memory scopes
• X’s storage class is in B’s semantics.

If A is an acquire barrier and B is an acquire barrier, then A synchronizes-with B if all of the following are true:

• there exists an atomic write X (with any memory semantics)
• A is program-ordered before X
• there exists an atomic read Y (with any memory semantics)
• Y is program-ordered before B
• X and Y are mutually-ordered
• Y reads the value written by X or by an operation in the release sequence headed by X
  ◦ If X is relaxed, it is still considered to head a hypothetical release sequence for this rule
  • A and B are in the instance of each other’s memory scopes
  • X’s and Y’s storage class is in A’s and B’s semantics.
  ◦ NOTE: X and Y must have the same storage class, because they are mutually ordered.

If A is a release barrier and B is an acquire barrier, then A synchronizes-with B if all of the following are true:

• A is program-ordered before (or equals) C
• C is program-ordered before (or equals) B
• A and B are in the instance of each other’s memory scopes
• A and B are in the instance of C’s execution scope

Note
This is similar to the barrier-barrier synchronization above, but with a control barrier filling the role of the relaxed atomics.

Let F be an ordering of fragment shader invocations, such that invocation F₁ is ordered before invocation F₂ if and only if F₁ and F₂ overlap as described in Fragment Shader Interlock and F₁.
executes the interlocked code before $F_2$.

If A is an `OpEndInvocationInterlockEXT` instruction and B is an `OpBeginInvocationInterlockEXT` instruction, then A synchronizes-with B if the agent that executes A is ordered before the agent that executes B in $F$. A and B are both considered to have `FragmentInterlock` memory scope and semantics of `UniformMemory` and `ImageMemory`, and A is considered to have Release semantics and B is considered to have Acquire semantics.

**Note**

`OpBeginInvocationInterlockEXT` and `OpBeginInvocationInterlockEXT` do not perform implicit availability or visibility operations. Usually, shaders using fragment shader interlock will declare the relevant resources as coherent to get implicit per-instruction availability and visibility operations.

No other release and acquire barriers synchronize-with each other.

## System-Synchronizes-With

`System-synchronizes-with` is a relation between arbitrary operations on the device or host. Certain operations system-synchronize-with each other, which informally means the first operation occurs before the second and that the synchronization is performed without using application-visible memory accesses.

If there is an execution dependency between two operations A and B, then the operation in the first synchronization scope system-synchronizes-with the operation in the second synchronization scope.

**Note**

This covers all Vulkan synchronization primitives, including device operations executing before a synchronization primitive is signaled, wait operations happening before subsequent device operations, signal operations happening before host operations that wait on them, and host operations happening before `vkQueueSubmit`. The list is spread throughout the synchronization chapter, and is not repeated here.

System-synchronizes-with implicitly includes all storage class semantics and has `CrossDevice` scope.

If A system-synchronizes-with B, we also say A is system-synchronized-before B and B is system-synchronized-after A.

## Private vs. Non-Private

By default, non-atomic memory operations are treated as private, meaning such a memory operation is not intended to be used for communication with other agents. Memory operations with the NonPrivatePointer/NonPrivateTexel bit set are treated as non-private, and are intended to be used for communication with other agents.
More precisely, for private memory operations to be Location-Ordered between distinct agents requires using system-synchronizes-with rather than shader-based synchronization. Private memory operations still obey program-order.

Atomic operations are always considered non-private.

**Inter-Thread-Happens-Before**

Let SC be a non-empty set of storage class semantics. Then (using template syntax) operation A `inter-thread-happens-before<SC>` operation B if and only if any of the following is true:

- A system-synchronizes-with B
- A synchronizes-with B, and both A and B have all of SC in their semantics
- A is an operation on memory in a storage class in SC or that has all of SC in its semantics, B is a release barrier or release atomic with all of SC in its semantics, and A is program-ordered before B
- A is an acquire barrier or acquire atomic with all of SC in its semantics, B is an operation on memory in a storage class in SC or that has all of SC in its semantics, and A is program-ordered before B
- A and B are both host operations and A inter-thread-happens-before B as defined in the host language specification
- A inter-thread-happens-before<SC> some X and X inter-thread-happens-before<SC> B

**Happens-Before**

Operation A `happens-before` operation B if and only if any of the following is true:

- A is program-ordered before B
- A inter-thread-happens-before<SC> B for some set of storage classes SC

`Happens-after` is defined similarly.

**Note**

Unlike C++, happens-before is not always sufficient for a write to be visible to a read. Additional availability and visibility operations may be required for writes to be visible-to other memory accesses.

**Note**

Happens-before is not transitive, but each of program-order and inter-thread-happens-before<SC> are transitive. These can be thought of as covering the “single-threaded” case and the “multi-threaded” case, and it is not necessary (and not valid) to form chains between the two.
Availability and Visibility

Availability and visibility are states of a write operation, which (informally) track how far the write has permeated the system, i.e. which agents and references are able to observe the write. Availability state is per memory domain. Visibility state is per (agent,reference) pair. Availability and visibility states are per-memory location for each write.

Memory domains are named according to the agents whose memory accesses use the domain. Domains used by shader invocations are organized hierarchically into multiple smaller memory domains which correspond to the different scopes. Each memory domain is considered the dual of a scope, and vice versa. The memory domains defined in Vulkan include:

- **host** - accessible by host agents
- **device** - accessible by all device agents for a particular device
- **shader** - accessible by shader agents for a particular device, corresponding to the Device scope
- **queue family instance** - accessible by shader agents in a single queue family, corresponding to the QueueFamily scope.
- **fragment interlock instance** - accessible by fragment shader agents that overlap, corresponding to the FragmentInterlock scope.
- **workgroup instance** - accessible by shader agents in the same workgroup, corresponding to the Workgroup scope.
- **subgroup instance** - accessible by shader agents in the same subgroup, corresponding to the Subgroup scope.

The memory domains are nested in the order listed above, with memory domains later in the list nested in the domains earlier in the list.

Note

Memory domains do not correspond to storage classes or device-local and host-local VkDeviceMemory allocations, rather they indicate whether a write can be made visible only to agents in the same subgroup, same workgroup, overlapping fragment shader invocation, in any shader invocation, or anywhere on the device, or host. The shader, queue family instance, fragment interlock instance, workgroup instance, and subgroup instance domains are only used for shader-based availability/visibility operations, in other cases writes can be made available from/visible to the shader via the device domain.

Availability operations, visibility operations, and memory domain operations alter the state of the write operations that happen-before them, and which are included in their source scope to be available or visible to their destination scope.

- For an availability operation, the source scope is a set of (agent,reference,memory location) tuples, and the destination scope is a set of memory domains.
- For a memory domain operation, the source scope is a memory domain and the destination scope is a memory domain.
For a visibility operation, the source scope is a set of memory domains and the destination scope is a set of (agent,reference,memory location) tuples.

How the scopes are determined depends on the specific operation. Availability and memory domain operations expand the set of memory domains to which the write is available. Visibility operations expand the set of (agent,reference,memory location) tuples to which the write is visible.

Recall that availability and visibility states are per-memory location, and let \( W \) be a write operation to one or more locations performed by agent \( A \) via reference \( R \). Let \( L \) be one of the locations written. \((W,L)\) (the write \( W \) to \( L \)), is initially not available to any memory domain and only visible to \((A,R,L)\). An availability operation \( AV \) that happens-after \( W \) and that includes \((A,R,L)\) in its source scope makes \((W,L)\) available to the memory domains in its destination scope. A memory domain operation \( DOM \) that happens-after \( AV \) and for which \((W,L)\) is available in the source scope makes \((W,L)\) available in the destination memory domain.

A visibility operation \( VIS \) that happens-after \( AV \) (or \( DOM \)) and for which \((W,L)\) is available in any domain in the source scope makes \((W,L)\) visible to all \((agent,reference,L)\) tuples included in its destination scope.

If write \( W_2 \) happens-after \( W \), and their sets of memory locations overlap, then \( W \) will not be available/visible to all agents/references for those memory locations that overlap (and future \( AV/DOM/VIS \) ops cannot revive \( W \)'s write to those locations).

Availability, memory domain, and visibility operations are treated like other non-atomic memory accesses for the purpose of memory semantics, meaning they can be ordered by release-acquire sequences or memory barriers.

An availability chain is a sequence of availability operations to increasingly broad memory domains, where element \( N+1 \) of the chain is performed in the dual scope instance of the destination memory domain of element \( N \) and element \( N \) happens-before element \( N+1 \). An example is an availability operation with destination scope of the workgroup instance domain that happens-before an availability operation to the shader domain performed by an invocation in the same workgroup. An availability chain \( AVC \) that happens-after \( W \) and that includes \((A,R,L)\) in the source scope makes \((W,L)\) available to the memory domains in its final destination scope. An availability chain with a single element is just the availability operation.

Similarly, a visibility chain is a sequence of visibility operations from increasingly narrow memory domains, where element \( N \) of the chain is performed in the dual scope instance of the source memory domain of element \( N+1 \) and element \( N \) happens-before element \( N+1 \). An example is a visibility operation with source scope of the shader domain that happens-before a visibility operation with source scope of the workgroup instance domain performed by an invocation in the same workgroup. A visibility chain \( VISC \) that happens-after \( AVC \) (or \( DOM \)) and for which \((W,L)\) is available in any domain in the source scope makes \((W,L)\) visible to all \((agent,reference,L)\) tuples included in its final destination scope. A visibility chain with a single element is just the visibility operation.
Availability, Visibility, and Domain Operations

The following operations generate availability, visibility, and domain operations. When multiple availability/visibility/domain operations are described, they are system-synchronized with each other in the order listed.

An operation that performs a memory dependency generates:

- If the source access mask includes `VK_ACCESS_HOST_WRITE_BIT`, then the dependency includes a memory domain operation from host domain to device domain.
- An availability operation with source scope of all writes in the first access scope of the dependency and a destination scope of the device domain.
- A visibility operation with source scope of the device domain and destination scope of the second access scope of the dependency.
- If the destination access mask includes `VK_ACCESS_HOST_READ_BIT` or `VK_ACCESS_HOST_WRITE_BIT`, then the dependency includes a memory domain operation from device domain to host domain.

`vkFlushMappedMemoryRanges` performs an availability operation, with a source scope of (agents,references) = (all host threads, all mapped memory ranges passed to the command), and destination scope of the host domain.

`vkInvalidateMappedMemoryRanges` performs a visibility operation, with a source scope of the host domain and a destination scope of (agents,references) = (all host threads, all mapped memory ranges passed to the command).

`vkQueueSubmit` performs a memory domain operation from host to device, and a visibility operation with source scope of the device domain and destination scope of all agents and references on the device.

Availability and Visibility Semantics

A memory barrier or atomic operation via agent A that includes MakeAvailable in its semantics performs an availability operation whose source scope includes agent A and all references in the storage classes in that instruction’s storage class semantics, and all memory locations, and whose destination scope is a set of memory domains selected as specified below. The implicit availability operation is program-ordered between the barrier or atomic and all other operations program-ordered before the barrier or atomic.

A memory barrier or atomic operation via agent A that includes MakeVisible in its semantics performs a visibility operation whose source scope is a set of memory domains selected as specified below, and whose destination scope includes agent A and all references in the storage classes in that instruction’s storage class semantics, and all memory locations. The implicit visibility operation is program-ordered between the barrier or atomic and all other operations program-ordered after the barrier or atomic.

The memory domains are selected based on the memory scope of the instruction as follows:

- **Device** scope uses the shader domain
• **QueueFamily** scope uses the queue family instance domain

• **FragmentInterlock** scope uses the fragment interlock instance domain

• **Workgroup** scope uses the workgroup instance domain

• **Subgroup** uses the subgroup instance domain

• **Invocation** perform no availability/visibility operations.

When an availability operation performed by an agent A includes a memory domain D in its destination scope, where D corresponds to scope instance S, it also includes the memory domains that correspond to each smaller scope instance S' that is a subset of S and that includes A. Similarly for visibility operations.

**Per-Instruction Availability and Visibility Semantics**

A memory write instruction that includes MakePointerAvailable, or an image write instruction that includes MakeTexelAvailable, performs an availability operation whose source scope includes the agent and reference used to perform the write and the memory locations written by the instruction, and whose destination scope is a set of memory domains selected by the Scope operand specified in Availability and Visibility Semantics. The implicit availability operation is program-ordered between the write and all other operations program-ordered after the write.

A memory read instruction that includes MakePointerVisible, or an image read instruction that includes MakeTexelVisible, performs a visibility operation whose source scope is a set of memory domains selected by the Scope operand as specified in Availability and Visibility Semantics, and whose destination scope includes the agent and reference used to perform the read and the memory locations read by the instruction. The implicit visibility operation is program-ordered between read and all other operations program-ordered before the read.

**Note**

Although reads with per-instruction visibility only perform visibility ops from the shader or fragment interlock instance or workgroup instance or subgroup instance domain, they will also see writes that were made visible via the device domain, i.e. those writes previously performed by non-shader agents and made visible via API commands.

**Note**

It is expected that all invocations in a subgroup execute on the same processor with the same path to memory, and thus availability and visibility operations with subgroup scope can be expected to be “free”.

**Location-Ordered**

Let X and Y be memory accesses to overlapping sets of memory locations M, where X ≠ Y. Let \((A_X, R_X)\) be the agent and reference used for X, and \((A_Y, R_Y)\) be the agent and reference used for Y. For now, let \(→\) denote happens-before and \(→ \text{rcpo}\) denote the reflexive closure of program-ordered before.
If \( D_1 \) and \( D_2 \) are different memory domains, then let \( \text{DOM}(D_1,D_2) \) be a memory domain operation from \( D_1 \) to \( D_2 \). Otherwise, let \( \text{DOM}(D,D) \) be a placeholder such that \( X \rightarrow \text{DOM}(D,D) \rightarrow Y \) if and only if \( X \rightarrow Y \).

**X is location-ordered before Y for a location L in M if and only if any of the following is true:**

- \( A_x = A_y \) and \( R_x = R_y \) and \( X \rightarrow Y \)
  - NOTE: this case means no availability/visibility ops are required when it is the same (agent,reference).
- \( X \) is a read, both \( X \) and \( Y \) are non-private, and \( X \rightarrow Y \)
- \( X \) is a read, and \( X \) (transitively) system-synchronizes with \( Y \)
- If \( R_x = R_y \) and \( A_x \) and \( A_y \) access a common memory domain \( D \) (e.g. are in the same workgroup instance if \( D \) is the workgroup instance domain), and both \( X \) and \( Y \) are non-private:
  - \( X \) is a write, \( Y \) is a write, \( \text{AVC}(A_x,R_x,D,X,L) \) is an availability chain making \( (X,L) \) available to domain \( D \), and \( X \rightarrow \text{AVC}(A_x,R_x,D,X,L) \rightarrow Y \)
  - \( X \) is a write, \( Y \) is a read, \( \text{AVC}(A_x,R_x,D,X,L) \) is an availability chain making \( (X,L) \) available to domain \( D \), \( \text{VISC}(A_y,R_y,D,Y,L) \) is a visibility chain making writes to \( L \) available in domain \( D \) visible to \( Y \), and \( X \rightarrow \text{AVC}(A_x,R_x,D,X,L) \rightarrow \text{VISC}(A_y,R_y,D,Y,L) \rightarrow Y \)
  - If \( \text{VkPhysicalDeviceVulkanMemoryModelFeatures}::\text{vulkanMemoryModelAvailabilityVisibilityChains} \) is \( \text{VK_FALSE} \), then \( \text{AVC} \) and \( \text{VISC} \) must each only have a single element in the chain, in each sub-bullet above.
- Let \( D_X \) and \( D_Y \) each be either the device domain or the host domain, depending on whether \( A_x \) and \( A_y \) execute on the device or host:
  - \( X \) is a write and \( Y \) is a write, and \( X \rightarrow \text{AV}(A_x,R_x,D_X,X,L) \rightarrow \text{DOM}(D_X,D_Y) \rightarrow Y \)
  - \( X \) is a write and \( Y \) is a read, and \( X \rightarrow \text{AV}(A_x,R_x,D_X,X,L) \rightarrow \text{DOM}(D_X,D_Y) \rightarrow \text{VIS}(A_y,R_y,D_Y,Y,L) \rightarrow Y \)

**Note**
The final bullet (synchronization through device/host domain) requires API-level synchronization operations, since the device/host domains are not accessible via shader instructions. And “device domain” is not to be confused with “device scope”, which synchronizes through the “shader domain”.

**Data Race**

Let \( X \) and \( Y \) be operations that access overlapping sets of memory locations \( M \), where \( X \neq Y \), and at least one of \( X \) and \( Y \) is a write, and \( X \) and \( Y \) are not mutually-ordered atomic operations. If there does not exist a location-ordered relation between \( X \) and \( Y \) for each location in \( M \), then there is a **data race**.

Applications must ensure that no data races occur during the execution of their application.

**Note**
Data races can only occur due to instructions that are actually executed. For
example, an instruction skipped due to control flow must not contribute to a data race.

Visible-To

Let X be a write and Y be a read whose sets of memory locations overlap, and let M be the set of memory locations that overlap. Let M₂ be a non-empty subset of M. Then X is visible-to Y for memory locations M₂ if and only if all of the following are true:

- X is location-ordered before Y for each location L in M₂.
- There does not exist another write Z to any location L in M₂ such that X is location-ordered before Z for location L and Z is location-ordered before Y for location L.

If X is visible-to Y, then Y reads the value written by X for locations M₂.

Note
It is possible for there to be a write between X and Y that overwrites a subset of the memory locations, but the remaining memory locations (M₂) will still be visible-to Y.

Acyclicity

Reads-from is a relation between operations, where the first operation is a write, the second operation is a read, and the second operation reads the value written by the first operation. From-reads is a relation between operations, where the first operation is a read, the second operation is a write, and the first operation reads a value written earlier than the second operation in the second operation’s scoped modification order (or the first operation reads from the initial value, and the second operation is any write to the same locations).

Then the implementation must guarantee that no cycles exist in the union of the following relations:

- location-ordered
- scoped modification order (over all atomic writes)
- reads-from
- from-reads

Note
This is a “consistency” axiom, which informally guarantees that sequences of operations cannot violate causality.

Scoped Modification Order Coherence

Let A and B be mutually-ordered atomic operations, where A is location-ordered before B. Then the following rules are a consequence of acyclicity:
• If A and B are both reads and A does not read the initial value, then the write that A takes its value from must be earlier in its own scoped modification order than (or the same as) the write that B takes its value from (no cycles between location-order, reads-from, and from-reads).

• If A is a read and B is a write and A does not read the initial value, then A must take its value from a write earlier than B in B's scoped modification order (no cycles between location-order, scope modification order, and reads-from).

• If A is a write and B is a read, then B must take its value from A or a write later than A in A's scoped modification order (no cycles between location-order, scoped modification order, and from-reads).

• If A and B are both writes, then A must be earlier than B in A's scoped modification order (no cycles between location-order and scoped modification order).

• If A is a write and B is a read-modify-write and B reads the value written by A, then B comes immediately after A in A's scoped modification order (no cycles between scoped modification order and from-reads).

Shader I/O

If a shader invocation A in a shader stage other than Vertex performs a memory read operation X from an object in storage class Input, then X is system-synchronized-after all writes to the corresponding Output storage variable(s) in the shader invocation(s) that contribute to generating invocation A, and those writes are all visible-to X.

**Note**

It is not necessary for the upstream shader invocations to have completed execution, they only need to have generated the output that is being read.

Deallocation

The deallocation of SPIR-V variables is managed by the system and happens-after all operations on those variables.

Descriptions (Informative)

This subsection offers more easily understandable consequences of the memory model for app/compiler developers.

Let SC be the storage class(es) specified by a release or acquire operation or barrier.

• An atomic write with release semantics must not be reordered against any read or write to SC that is program-ordered before it (regardless of the storage class the atomic is in).

• An atomic read with acquire semantics must not be reordered against any read or write to SC that is program-ordered after it (regardless of the storage class the atomic is in).

• Any write to SC program-ordered after a release barrier must not be reordered against any read or write to SC program-ordered before that barrier.
• Any read from SC program-ordered before an acquire barrier must not be reordered against
  any read or write to SC program-ordered after the barrier.

A control barrier (even if it has no memory semantics) must not be reordered against any memory
barriers.

This memory model allows memory accesses with and without availability and visibility
operations, as well as atomic operations, all to be performed on the same memory location. This is
critical to allow it to reason about memory that is reused in multiple ways, e.g. across the lifetime of
different shader invocations or draw calls. While GLSL (and legacy SPIR-V) applies the “coherent”
decoration to variables (for historical reasons), this model treats each memory access instruction as
having optional implicit availability/visibility operations. GLSL to SPIR-V compilers should map all
(non-atomic) operations on a coherent variable to Make{Pointer,Texel}{Available}{Visible} flags in
this model.

Atomic operations implicitly have availability/visibility operations, and the scope of those
operations is taken from the atomic operation’s scope.

Tessellation Output Ordering

For SPIR-V that uses the Vulkan Memory Model, the OutputMemory storage class is used to
synchronize accesses to tessellation control output variables. For legacy SPIR-V that does not enable
the Vulkan Memory Model via OpMemoryModel, tessellation outputs can be ordered using a control
barrier with no particular memory scope or semantics, as defined below.

Let X and Y be memory operations performed by shader invocations A_x and A_y. Operation X is
tessellation-output-ordered before operation Y if and only if all of the following are true:

• There is a dynamic instance of an OpControlBarrier instruction C such that X is program-ordered
  before C in A_x and C is program-ordered before Y in A_y.

• A_x and A_y are in the same instance of C’s execution scope.

If shader invocations A_x and A_y in the TessellationControl execution model execute memory
operations X and Y, respectively, on the Output storage class, and X is tessellation-output-ordered
before Y with a scope of Workgroup, then X is location-ordered before Y, and if X is a write and Y is a
read then X is visible-to Y.
Appendix C: Compressed Image Formats

The compressed texture formats used by Vulkan are described in the specifically identified sections of the Khronos Data Format Specification, version 1.3.

Unless otherwise described, the quantities encoded in these compressed formats are treated as normalized, unsigned values.

Those formats listed as sRGB-encoded have in-memory representations of R, G and B components which are nonlinearly-encoded as R', G', and B'; any alpha component is unchanged. As part of filtering, the nonlinear R', G', and B' values are converted to linear R, G, and B components; any alpha component is unchanged. The conversion between linear and nonlinear encoding is performed as described in the “KHR_DF_TRANSFER_SRGB” section of the Khronos Data Format Specification.
Block-Compressed Image Formats

BC1, BC2 and BC3 formats are described in “S3TC Compressed Texture Image Formats” chapter of the Khronos Data Format Specification. BC4 and BC5 are described in the “RGTC Compressed Texture Image Formats” chapter. BC6H and BC7 are described in the “BPTC Compressed Texture Image Formats” chapter.

<tr>
<td>VK_FORMAT_ASTC_12x12_UNORM_BLOCK</td>
<td>12 × 12</td>
<td>Linear LDR</td>
</tr>
</tbody>
</table>
ASTC textures containing HDR block encodings should be passed to the API using an ASTC SFLOAT texture format.

**Note**
An HDR block in a texture passed using a LDR UNORM format will return the appropriate ASTC error color if the implementation supports only the ASTC LDR profile, but may result in either the error color or a decompressed HDR color if the implementation supports HDR decoding.

**ASTC Decode Mode**

If the `VK_EXT_astc_decode_mode` extension is enabled, the decode mode is determined as follows:

<table>
<thead>
<tr>
<th>VkFormat</th>
<th>Decoding mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_FORMAT_R16G16B16A16_SFLOAT</td>
<td>decode_float16</td>
</tr>
<tr>
<td>VK_FORMAT_R8G8B8A8_UNORM</td>
<td>decode_unorm8</td>
</tr>
<tr>
<td>VK_FORMAT_E5B9G9R9_UFLOAT_PACK32</td>
<td>decode_rgb9e5</td>
</tr>
</tbody>
</table>

Otherwise, the ASTC decode mode is decode_float16.
Note that an implementation **may** use HDR mode when linear LDR mode is requested unless the decode mode is `decode_unorm8`. 
Appendix D: Core Revisions (Informative)

New minor versions of the Vulkan API are defined periodically by the Khronos Vulkan Working Group. These consist of some amount of additional functionality added to the core API, potentially including both new functionality and functionality promoted from extensions.

It is possible to build the specification for earlier versions, but to aid readability of the latest versions, this appendix gives an overview of the changes as compared to earlier versions.

Version 1.2

Vulkan Version 1.2 promoted a number of key extensions into the core API:

- VK_KHR_8bit_storage
- VK_KHR_buffer_device_address
- VK_KHR_create_renderpass2
- VK_KHR_depth_stencil_resolve
- VK_KHR_draw_indirect_count
- VK_KHR_driver_properties
- VK_KHR_image_format_list
- VK_KHR_imageless_framebuffer
- VK_KHR_sampler_mirror_clamp_to_edge
- VK_KHR_separate_depth_stencil_layouts
- VK_KHR_shader_atomic_int64
- VK_KHR_shader_float16_int8
- VK_KHR_shader_float_controls
- VK_KHR_shader_subgroup_extended_types
- VK_KHR_spirv_1_4
- VK_KHR_timeline_semaphore
- VK_KHR_uniform_buffer_standard_layout
- VK_KHR_vulkan_memory_model
- VK_EXT_descriptor_indexing
- VK_EXT_host_query_reset
- VK_EXT_sampler_filter_minmax
- VK_EXT_scalar_block_layout
- VK_EXT_separate_stencil_usage
- VK_EXT_shader_viewport_index_layer

All differences in behavior between these extensions and the corresponding Vulkan 1.2
Differences Relative to\texttt{VK_KHR\_8bit\_storage}

If the \texttt{VK_KHR\_8bit\_storage} extension is not supported, support for the SPIR-V\linebreak storageBuffer8BitAccess capability in shader modules is optional. Support for this feature is defined by \texttt{VkPhysicalDeviceVulkan12Features::storageBuffer8BitAccess} when queried via
\texttt{vkGetPhysicalDeviceFeatures2}.

Differences Relative to\texttt{VK_KHR\_draw\_indirect\_count}

If the \texttt{VK_KHR\_draw\_indirect\_count} extension is not supported, support for the entry points 
\texttt{vkCmdDrawIndirectCount} and \texttt{vkCmdDrawIndexedIndirectCount} is optional. Support for this feature is defined by \texttt{VkPhysicalDeviceVulkan12Features::drawIndirectCount} when queried via
\texttt{vkGetPhysicalDeviceFeatures2}.

Differences Relative to\texttt{VK_KHR\_sampler\_mirror\_clamp\_to\_edge}

If the \texttt{VK_KHR\_sampler\_mirror\_clamp\_to\_edge} extension is not supported, support for the \texttt{VkSamplerAddressMode VK\_SAMPLER\_ADDRESS\_MODE\_MIRROR\_CLAMP\_TO\_EDGE} is optional. Support for this feature is defined by \texttt{VkPhysicalDeviceVulkan12Features::samplerMirrorClampToEdge} when queried via 
\texttt{vkGetPhysicalDeviceFeatures2}.

Differences Relative to\texttt{VK_EXT\_descriptor\_indexing}

If the \texttt{VK_EXT\_descriptor\_indexing} extension is not supported, support for the descriptorIndexing feature is optional. Support for this feature is defined by \texttt{VkPhysicalDeviceVulkan12Features::descriptorIndexing} when queried via \texttt{vkGetPhysicalDeviceFeatures2}.

Differences Relative to\texttt{VK_EXT\_scalar\_block\_layout}

If the \texttt{VK_EXT\_scalar\_block\_layout} extension is not supported, support for the scalarBlockLayout feature is optional. Support for this feature is defined by \texttt{VkPhysicalDeviceVulkan12Features::scalarBlockLayout} when queried via \texttt{vkGetPhysicalDeviceFeatures2}.

Differences Relative to\texttt{VK_EXT\_shader\_viewport\_index\_layer}

The \texttt{ShaderViewportIndexLayerEXT} SPIR-V capability was replaced with the \texttt{ShaderViewportIndex} and \texttt{ShaderLayer} capabilities. Declaring both is equivalent to declaring \texttt{ShaderViewportIndexLayerEXT}. If the \texttt{VK_EXT\_shader\_viewport\_index\_layer} extension is not supported, support for the \texttt{ShaderViewportIndexLayerEXT} SPIR-V capability is optional. Support for this feature is defined by \texttt{VkPhysicalDeviceVulkan12Features::shaderOutputViewportIndex} and \texttt{VkPhysicalDeviceVulkan12Features::shaderOutputLayer} when queried via \texttt{vkGetPhysicalDeviceFeatures2}.

Differences Relative to\texttt{VK_KHR\_buffer\_device\_address}

If the \texttt{VK_KHR\_buffer\_device\_address} extension is not supported, support for the bufferDeviceAddress
feature is optional. Support for this feature is defined by \texttt{VkPhysicalDeviceVulkan12Features::bufferDeviceAddress} when queried via \texttt{vkGetPhysicalDeviceFeatures2}.

**Differences Relative to VK_KHR_shader_atomic_int64**

If the \texttt{VK_KHR_shader_atomic_int64} extension is not supported, support for the \texttt{shaderBufferInt64Atomics} feature is optional. Support for this feature is defined by \texttt{VkPhysicalDeviceVulkan12Features::shaderBufferInt64Atomics} when queried via \texttt{vkGetPhysicalDeviceFeatures2}.

**Differences Relative to VK_KHR_shader_float16_int8**

If the \texttt{VK_KHR_shader_float16_int8} extension is not supported, support for the \texttt{shaderFloat16} and \texttt{shaderInt8} features is optional. Support for these features are defined by \texttt{VkPhysicalDeviceVulkan12Features::shaderFloat16} and \texttt{VkPhysicalDeviceVulkan12Features::shaderInt8} when queried via \texttt{vkGetPhysicalDeviceFeatures2}.

**Differences Relative to VK_KHR_vulkan_memory_model**

If the \texttt{VK_KHR_vulkan_memory_model} extension is not supported, support for the \texttt{vulkanMemoryModel} feature is optional. Support for this feature is defined by \texttt{VkPhysicalDeviceVulkan12Features::vulkanMemoryModel} when queried via \texttt{vkGetPhysicalDeviceFeatures2}.

**Additional Vulkan 1.2 Feature Support**

In addition to the promoted extensions described above, Vulkan 1.2 added support for:

- SPIR-V version 1.4.
- SPIR-V version 1.5.
- The \texttt{samplerMirrorClampToEdge} feature which indicates whether the implementation supports the \texttt{VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE} sampler address mode.
- The \texttt{ShaderNonUniform} capability in SPIR-V version 1.5.
- The \texttt{shaderOutputViewportIndex} feature which indicates that the \texttt{ShaderViewportIndex} capability can be used.
- The \texttt{shaderOutputLayer} feature which indicates that the \texttt{ShaderLayer} capability can be used.
- The \texttt{subgroupBroadcastDynamicId} feature which allows the “Id” operand of \texttt{OpGroupNonUniformBroadcast} to be dynamically uniform within a subgroup, and the “Index” operand of \texttt{OpGroupNonUniformQuadBroadcast} to be dynamically uniform within a derivative group, in shader modules of version 1.5 or higher.
- The \texttt{drawIndirectCount} feature which indicates whether the \texttt{vkCmdDrawIndirectCount} and \texttt{vkCmdDrawIndexedIndirectCount} functions can be used.
- The \texttt{descriptorIndexing} feature which indicates the implementation supports the minimum number of descriptor indexing features as defined in the \texttt{Feature Requirements} section.
- The \texttt{samplerFilterMinmax} feature which indicates whether the implementation supports the minimum number of image formats that support the
VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT feature bit as defined by the filterMinmaxSingleComponentFormats property minimum requirements.

- The framebufferIntegerColorSampleCounts limit which indicates the color sample counts that are supported for all framebuffer color attachments with integer formats.

New Macros

- VK_API_VERSION_1_2

New Commands

- vkCmdBeginRenderPass2
- vkCmdDrawIndexedIndirectCount
- vkCmdDrawIndirectCount
- vkCmdEndRenderPass2
- vkCmdNextSubpass2
- vkCreateRenderPass2
- vkGetBufferDeviceAddress
- vkGetBufferOpaqueCaptureAddress
- vkGetDeviceMemoryOpaqueCaptureAddress
- vkGetSemaphoreCounterValue
- vkResetQueryPool
- vkSignalSemaphore
- vkWaitSemaphores

Version 1.1

Vulkan Version 1.1 promoted a number of key extensions into the core API:

- VK_KHR_16bit_storage
- VK_KHR_bind_memory2
- VK_KHR_dedicated_allocation
- VK_KHR_descriptor_update_template
- VK_KHR_device_group
- VK_KHR_device_group_creation
- VK_KHR_external_fence
- VK_KHR_external_fence_capabilities
- VK_KHR_external_memory
- VK_KHR_external_memory_capabilities
- VK_KHR_external_semaphore
- VK_KHR_external_semaphore_capabilities
- VK_KHR_get_memory_requirements2
- VK_KHR_get_physical_device_properties2
- VK_KHR_maintenance1
- VK_KHR_maintenance2
- VK_KHR_maintenance3
- VK_KHR_multiview
- VK_KHR_relaxed_block_layout
- VK_KHR_sampler_ycbcr_conversion
• VK_KHR_shader_draw_parameters
• VK_KHR_storage_buffer_storage_class
• VK_KHR_variable_pointers

All differences in behavior between these extensions and the corresponding Vulkan 1.1 functionality are summarized below.

**Differences Relative to VK_KHR_16bit_storage**

If the VK_KHR_16bit_storage extension is not supported, support for the storageBuffer16BitAccess feature is optional. Support for this feature is defined by VkPhysicalDevice16BitStorageFeatures::storageBuffer16BitAccess or VkPhysicalDeviceVulkan11Features::storageBuffer16BitAccess when queried via vkGetPhysicalDeviceFeatures2.

**Differences Relative to VK_KHR_sampler_ycbcr_conversion**

If the VK_KHR_sampler_ycbcr_conversion extension is not supported, support for the samplerYcbcrConversion feature is optional. Support for this feature is defined by VkPhysicalDeviceSamplerYcbcrConversionFeatures::samplerYcbcrConversion or VkPhysicalDeviceVulkan11Features::samplerYcbcrConversion when queried via vkGetPhysicalDeviceFeatures2.

**Differences Relative to VK_KHR_shader_draw_parameters**

If the VK_KHR_shader_draw_parameters extension is not supported, support for the SPV_KHR_shader_draw_parameters SPIR-V extension is optional. Support for this feature is defined by VkPhysicalDeviceShaderDrawParametersFeatures::shaderDrawParameters or VkPhysicalDeviceVulkan11Features::shaderDrawParameters when queried via vkGetPhysicalDeviceFeatures2.

**Differences Relative to VK_KHR_variable_pointers**

If the VK_KHR_variable_pointers extension is not supported, support for the variablePointersStorageBuffer feature is optional. Support for this feature is defined by VkPhysicalDeviceVariablePointersFeatures::variablePointersStorageBuffer or VkPhysicalDeviceVulkan11Features::variablePointersStorageBuffer when queried via vkGetPhysicalDeviceFeatures2.

**Additional Vulkan 1.1 Feature Support**

In addition to the promoted extensions described above, Vulkan 1.1 added support for:

- The group operations and subgroup scope.
- The protected memory feature.
- A new command to enumerate the instance version: vkEnumerateInstanceVersion.
- The VkPhysicalDeviceShaderDrawParametersFeatures feature query struct (where the VK_KHR_shader_draw_parameters extension did not have one).
New Macros

- VK_VERSION_PATCH

New Base Types

- VkBool32
- VkDeviceAddress
- VkDeviceSize
- VkFlags
• VkSampleMask

**New Object Types**

• VkBuffer
• VkBufferView
• VkCommandBuffer
• VkCommandPool
• VkDescriptorPool
• VkDescriptorSet
• VkDescriptorSetLayout
• VkDevice
• VkDeviceMemory
• VkEvent
• VkFence
• VkFramebuffer
• VkImage
• VkImageView
• VkInstance
• VkPhysicalDevice
• VkPipeline
• VkPipelineCache
• VkPipelineLayout
• VkQueryPool
• VkQueue
•VkRenderPass
• VkSampler
• VkSemaphore
• VkShaderModule

**New Commands**

• vkAllocateCommandBuffers
• vkAllocateDescriptorSets
• vkAllocateMemory
• vkBeginCommandBuffer
• vkBindBufferMemory
• vkBindImageMemory
• vkCmdBeginQuery
• vkCmdBeginRenderPass
• vkCmdBindDescriptorSets
• vkCmdBindIndexBuffer
• vkCmdBindPipeline
• vkCmdBindVertexBuffer
• vkCmdBlitImage
• vkCmdClearAttachments
• vkCmdClearColorImage
• vkCmdClearDepthStencilImage
• vkCmdCopyBuffer
• vkCmdCopyBufferToImage
• vkCmdCopyImage
• vkCmdCopyImageToBuffer
• vkCmdCopyQueryPoolResults
• vkCmdDispatch
• vkCmdDispatchIndirect
• vkCmdDraw
• vkCmdDrawIndexed
• vkCmdDrawIndexedIndirect
• vkCmdDrawIndirect
• vkCmdEndQuery
• vkCmdEndRenderPass
• vkCmdExecuteCommands
• vkCmdFillBuffer
• vkCmdNextSubpass
• vkCmdPipelineBarrier
• vkCmdPushConstants
• vkCmdResetEvent
• vkCmdResetQueryPool
• vkCmdResolveImage
• vkCmdSetBlendConstants
• vkCmdSetDepthBias
• vkCmdSetDepthBounds
• vkCmdSetEvent
• vkCmdSetLineWidth
• vkCmdSetScissor
• vkCmdSetStencilCompareMask
• vkCmdSetStencilReference
• vkCmdSetStencilWriteMask
• vkCmdSetViewport
• vkCmdUpdateBuffer
• vkCmdWaitEvents
• vkCmdWriteTimestamp
• vkCreateBuffer
• vkCreateBufferView
• vkCreateCommandPool
• vkCreateComputePipelines
• vkCreateDescriptorPool
• vkCreateDescriptorSetLayout
• vkCreateDevice
• vkCreateEvent
• vkCreateFence
• vkCreateFramebuffer
• vkCreateGraphicsPipelines
• vkCreateImage
• vkCreateImageView
• vkCreateInstance
• vkCreatePipelineCache
• vkCreatePipelineLayout
• vkCreateQueryPool
• vkCreateRenderPass
• vkCreateSampler
• vkCreateSemaphore
• vkCreateShaderModule
• vkDestroyBuffer
• vkDestroyBufferView
• vkDestroyCommandPool
• vkDestroyDescriptorPool
• vkDestroyDescriptorSetLayout
• vkDestroyDevice
• vkDestroyEvent
• vkDestroyFence
• vkDestroyFramebuffer
• vkDestroyImage
• vkDestroyImageView
• vkDestroyInstance
• vkDestroyPipeline
• vkDestroyPipelineCache
• vkDestroyPipelineLayout
• vkDestroyQueryPool
• vkDestroyRenderPass
• vkDestroySampler
• vkDestroySemaphore
• vkDestroyShaderModule
• vkDeviceWaitIdle
• vkEndCommandBuffer
• vkEnumerateDeviceExtensionProperties
• vkEnumerateDeviceLayerProperties
• vkEnumerateInstanceExtensionProperties
• vkEnumerateInstanceLayerProperties
• vkEnumeratePhysicalDevices
• vkFlushMappedMemoryRanges
• vkFreeCommandBuffers
• vkFreeDescriptorSets
• vkFreeMemory
• vkGetBufferMemoryRequirements
• vkGetDeviceMemoryCommitment
• vkGetDeviceProcAddr
• vkGetDeviceQueue
• vkGetEventStatus
• vkGetFenceStatus
• vkGetImageMemoryRequirements
• vkGetImageSparseMemoryRequirements
• vkGetImageSubresourceLayout
• vkGetInstanceProcAddr
• vkGetPhysicalDeviceFeatures
• vkGetPhysicalDeviceFormatProperties
• vkGetPhysicalDeviceImageFormatProperties
• vkGetPhysicalDeviceMemoryProperties
• vkGetPhysicalDeviceProperties
• vkGetPhysicalDeviceQueueFamilyProperties
• vkGetPhysicalDeviceSparseImageFormatProperties
• vkGetPipelineCacheData
• vkGetQueryPoolResults
• vkGetRenderAreaGranularity
• vkInvalidateMappedMemoryRanges
• vkMapMemory
• vkMergePipelineCaches
• vkQueueBindSparse
• vkQueueSubmit
• vkQueueWaitIdle
• vkResetCommandBuffer
• vkResetCommandPool
• vkResetDescriptorPool
• vkResetEvent
• vkResetFences
• vkSetEvent
• vkUnmapMemory
• vkUpdateDescriptorSets
• vkWaitForFences

New Structures

• VkAllocationCallbacks
• VkApplicationInfo
• VkAttachmentDescription
• VkAttachmentReference
• VkBaseInStructure
• VkBaseOutStructure
• VkBindSparseInfo

Appendix E: Layers & Extensions (Informative)

Extensions to the Vulkan API can be defined by authors, groups of authors, and the Khronos Vulkan Safety Critical Working Group. In order not to compromise the readability of the Vulkan Specification, the core Specification does not incorporate most extensions. The online Registry of extensions is available at URL

https://registry.khronos.org/vulkansc/

and allows generating versions of the Specification incorporating different extensions.

Authors creating extensions and layers must follow the mandatory procedures described in the Vulkan Documentation and Extensions document when creating extensions and layers.

The remainder of this appendix documents a set of extensions chosen when this document was built. Versions of the Specification published in the Registry include:

- Core API + mandatory extensions required of all Vulkan implementations.
- Core API + all registered and published extensions.

Extensions are grouped as Khronos KHR, multivendor EXT, and then alphabetically by author ID. Within each group, extensions are listed in alphabetical order by their name.

Extension Dependencies

Extensions which have dependencies on specific core versions or on other extensions will list such dependencies.

For core versions, the specified version must be supported at runtime. All extensions implicitly require support for Vulkan 1.0.

For a device extension, use of any device-level functionality defined by that extension requires that any extensions that extension depends on be enabled.

For any extension, use of any instance-level functionality defined by that extension requires only that any extensions that extension depends on be supported at runtime.

Extension Interactions

Some extensions define APIs which are only supported when other extensions or core versions are supported at runtime. Such interactions are noted as “API Interactions”.

List of Current Extensions

- VK_KHR_copy_commands2
- VK_KHR_display
• VK_KHR_display_swapchain
• VK_KHR_external_fence_fd
• VK_KHR_external_memory_fd
• VK_KHR_external_semaphore_fd
• VK_KHR_fragment_shading_rate
• VK_KHR_get_display_properties2
• VK_KHR_get_surface_capabilities2

Description
This extension provides extensible versions of the Vulkan buffer and image copy commands. The new commands are functionally identical to the core commands, except that their copy parameters are specified using extensible structures that can be used to pass extension-specific information.

The following extensible copy commands are introduced with this extension: vkCmdCopyBuffer2KHR, vkCmdCopyImage2KHR, vkCmdCopyBufferToImage2KHR, vkCmdCopyImageToBuffer2KHR, vkCmdBlitImage2KHR, and vkCmdResolveImage2KHR. Each
command contains an *Info2KHR structure parameter that includes sType/pNext members. Lower level structures describing each region to be copied are also extended with sType/pNext members.

**New Commands**

- vkCmdBlitImage2KHR
- vkCmdCopyBuffer2KHR
- vkCmdCopyBufferToImage2KHR
- vkCmdCopyImage2KHR
- vkCmdCopyImageToBuffer2KHR
- vkCmdResolveImage2KHR

**New Structures**

- VkBlitImageInfo2KHR
- VkBufferCopy2KHR
- VkBufferImageCopy2KHR
- VkCopyBufferInfo2KHR
- VkCopyBufferToImageInfo2KHR
- VkCopyImageInfo2KHR
- VkCopyImageToBufferInfo2KHR
- VkImageBlit2KHR
- VkImageCopy2KHR
- VkImageResolve2KHR
- VkResolveImageInfo2KHR

**New Enum Constants**

- VK_KHR_COPY_COMMANDS_2_EXTENSION_NAME
- VK_KHR_COPY_COMMANDS_2_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_BLIT_IMAGE_INFO_2_KHR
- VK_STRUCTURE_TYPE_BUFFER_COPY_2_KHR
- VK_STRUCTURE_TYPE_BUFFER_IMAGE_COPY_2_KHR
- VK_STRUCTURE_TYPE_COPY_BUFFER_INFO_2_KHR
- VK_STRUCTURE_TYPE_COPY_BUFFER_TO_IMAGE_INFO_2_KHR
- VK_STRUCTURE_TYPE_COPY_IMAGE_INFO_2_KHR
- VK_STRUCTURE_TYPE_COPY_IMAGE_TO_BUFFER_INFO_2_KHR
Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Description

This extension provides the API to enumerate displays and available modes on a given device.

New Object Types

• VkDisplayKHR
• VkDisplayModeKHR

New Commands

• vkCreateDisplayModeKHR
• vkCreateDisplayPlaneSurfaceKHR
• vkGetDisplayModePropertiesKHR
• vkGetDisplayPlaneCapabilitiesKHR
• vkGetDisplayPlaneSupportedDisplaysKHR
• vkGetPhysicalDeviceDisplayPlanePropertiesKHR
• vkGetPhysicalDeviceDisplayPropertiesKHR

New Structures

• VkDisplayModeCreateInfoKHR
• VkDisplayModeParametersKHR
• VkDisplayModePropertiesKHR
• VkDisplayPlaneCapabilitiesKHR
• VkDisplayPlanePropertiesKHR
• VkDisplayPropertiesKHR
• VkDisplaySurfaceCreateInfoKHR

New Enums

• VkDisplayPlaneAlphaFlagBitsKHR

New Bitmasks

• VkDisplayModeCreateFlagsKHR
• VkDisplayPlaneAlphaFlagsKHR
• VkDisplaySurfaceCreateFlagsKHR
• VkSurfaceTransformFlagsKHR

New Enum Constants

• VK_KHR_DISPLAY_EXTENSION_NAME
• VK_KHR_DISPLAY_SPEC_VERSION

• Extending VkObjectType:
  ◦ VK_OBJECT_TYPE_DISPLAY_KHR
  ◦ VK_OBJECT_TYPE_DISPLAY_MODE_KHR

• Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR
  ◦ VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR

Issues

1) Which properties of a mode should be fixed in the mode information vs. settable in some other function when setting the mode? E.g., do we need to double the size of the mode pool to include both stereo and non-stereo modes? YUV and RGB scanout even if they both take RGB input images? BGR vs. RGB input? etc.

RESOLVED: Many modern displays support at most a handful of resolutions and timings natively. Other “modes” are expected to be supported using scaling hardware on the display engine or GPU. Other properties, such as rotation and mirroring should not require duplicating hardware modes just to express all combinations. Further, these properties may be implemented on a per-display or per-overlay granularity.

To avoid the exponential growth of modes as mutable properties are added, as was the case with EGLConfig/WGL pixel formats/GLXFBConfig, this specification should separate out hardware properties and configurable state into separate objects. Modes and overlay planes will express capabilities of the hardware, while a separate structure will allow applications to configure scaling, rotation, mirroring, color keys, LUT values, alpha masks, etc. for a given swapchain independent of the mode in use. Constraints on these settings will be established by properties of the immutable objects.

Note the resolution of this issue may affect issue 5 as well.

2) What properties of a display itself are useful?

RESOLVED: This issue is too broad. It was meant to prompt general discussion, but resolving this issue amounts to completing this specification. All interesting properties should be included. The issue will remain as a placeholder since removing it would make it hard to parse existing discussion notes that refer to issues by number.

3) How are multiple overlay planes within a display or mode enumerated?
**RESOLVED**: They are referred to by an index. Each display will report the number of overlay planes it contains.

4) Should swapchains be created relative to a mode or a display?

**RESOLVED**: When using this extension, swapchains are created relative to a mode and a plane. The mode implies the display object the swapchain will present to. If the specified mode is not the display's current mode, the new mode will be applied when the first image is presented to the swapchain, and the default operating system mode, if any, will be restored when the swapchain is destroyed.

5) Should users query generic ranges from displays and construct their own modes explicitly using those constraints rather than querying a fixed set of modes (Most monitors only have one real “mode” these days, even though many support relatively arbitrary scaling, either on the monitor side or in the GPU display engine, making “modes” something of a relic/compatibility construct).

**RESOLVED**: Expose both. Display information structures will expose a set of predefined modes, as well as any attributes necessary to construct a customized mode.

6) Is it fine if we return the display and display mode handles in the structure used to query their properties?

**RESOLVED**: Yes.

7) Is there a possibility that not all displays of a device work with all of the present queues of a device? If yes, how do we determine which displays work with which present queues?

**RESOLVED**: No known hardware has such limitations, but determining such limitations is supported automatically using the existing `VK_KHR_surface` and `VK_KHR_swapchain` query mechanisms.

8) Should all presentation need to be done relative to an overlay plane, or can a display mode + display be used alone to target an output?

**RESOLVED**: Require specifying a plane explicitly.

9) Should displays have an associated window system display, such as an `HDC` or `Display*`?

**RESOLVED**: No. Displays are independent of any windowing system in use on the system. Further, neither `HDC` nor `Display*` refer to a physical display object.

10) Are displays queried from a physical GPU or from a device instance?

**RESOLVED**: Developers prefer to query modes directly from the physical GPU so they can use display information as an input to their device selection algorithms prior to device creation. This avoids the need to create placeholder device instances to enumerate displays.

This preference must be weighed against the extra initialization that must be done by driver vendors prior to device instance creation to support this usage.

11) Should displays and/or modes be dispatchable objects? If functions are to take displays, overlays, or modes as their first parameter, they must be dispatchable objects as defined in
Khronos bug 13529. If they are not added to the list of dispatchable objects, functions operating on them must take some higher-level object as their first parameter. There is no performance case against making them dispatchable objects, but they would be the first extension objects to be dispatchable.

**RESOLVED:** Do not make displays or modes dispatchable. They will dispatch based on their associated physical device.

12) Should hardware cursor capabilities be exposed?

**RESOLVED:** Defer. This could be a separate extension on top of the base WSI specs.

13) How many display objects should be enumerated for “tiled” display devices? There are ongoing design discussions among lower-level display API authors regarding how to expose displays if they are one physical display device to an end user, but may internally be implemented as two side-by-side displays using the same display engine (and sometimes cabling) resources as two physically separate display devices.

**RESOLVED:** Tiled displays will appear as a single display object in this API.

14) Should the raw EDID data be included in the display information?

**RESOLVED:** No. A future extension could be added which reports the EDID if necessary. This may be complicated by the outcome of issue 13.

15) Should min and max scaling factor capabilities of overlays be exposed?

**RESOLVED:** Yes. This is exposed indirectly by allowing applications to query the min/max position and extent of the source and destination regions from which image contents are fetched by the display engine when using a particular mode and overlay pair.

16) Should devices be able to expose planes that can be moved between displays? If so, how?

**RESOLVED:** Yes. Applications can determine which displays a given plane supports using **vkGetDisplayPlaneSupportedDisplaysKHR**.

17) Should there be a way to destroy display modes? If so, does it support destroying “built in” modes?

**RESOLVED:** Not in this extension. A future extension could add this functionality.

18) What should the lifetime of display and built-in display mode objects be?

**RESOLVED:** The lifetime of the instance. These objects cannot be destroyed. A future extension may be added to expose a way to destroy these objects and/or support display hotplug.

19) Should persistent mode for smart panels be enabled/disabled at swapchain creation time, or on a per-present basis?

**RESOLVED:** On a per-present basis.
Version History

- Revision 1, 2015-02-24 (James Jones)
  - Initial draft

- Revision 2, 2015-03-12 (Norbert Nopper)
  - Added overlay enumeration for a display.

- Revision 3, 2015-03-17 (Norbert Nopper)
  - Fixed typos and namings as discussed in Bugzilla.
  - Reordered and grouped functions.
  - Added functions to query count of display, mode and overlay.
  - Added native display handle, which may be needed on some platforms to create a native Window.

- Revision 4, 2015-03-18 (Norbert Nopper)
  - Removed primary and virtualPostion members (see comment of James Jones in Bugzilla).
  - Added native overlay handle to information structure.
  - Replaced , with ; in struct.

- Revision 6, 2015-03-18 (Daniel Rakos)
  - Added WSI extension suffix to all items.
  - Made the whole API more “Vulkanish”.
  - Replaced all functions with a single vkGetDisplayInfoKHR function to better match the rest of the API.
  - Made the display, display mode, and overlay objects be first class objects, not subclasses of VkBaseObject as they do not support the common functions anyways.
  - Renamed *Info structures to *Properties.
  - Removed overlayIndex field from VkOverlayProperties as there is an implicit index already as a result of moving to a “Vulkanish” API.
  - Displays are not get through device, but through physical GPU to match the rest of the Vulkan API. Also this is something ISVs explicitly requested.

- Revision 7, 2015-03-25 (James Jones)
  - Added an issues section
  - Added rotation and mirroring flags

- Revision 8, 2015-03-25 (James Jones)
  - Combined the duplicate issues sections introduced in last change.
  - Added proposed resolutions to several issues.

- Revision 9, 2015-04-01 (Daniel Rakos)
  - Rebased extension against Vulkan 0.82.0
Revision 10, 2015-04-01 (James Jones)
  ◦ Added issues (10) and (11).
  ◦ Added more straw-man issue resolutions, and cleaned up the proposed resolution for issue (4).
  ◦ Updated the rotation and mirroring enums to have proper bitmask semantics.

Revision 11, 2015-04-15 (James Jones)
  ◦ Added proposed resolution for issues (1) and (2).
  ◦ Added issues (12), (13), (14), and (15)
  ◦ Removed pNativeHandle field from overlay structure.
  ◦ Fixed small compilation errors in example code.

Revision 12, 2015-07-29 (James Jones)
  ◦ Rewrote the guts of the extension against the latest WSI swapchain specifications and the latest Vulkan API.
  ◦ Address overlay planes by their index rather than an object handle and refer to them as “planes” rather than “overlays” to make it slightly clearer that even a display with no “overlays” still has at least one base “plane” that images can be displayed on.
  ◦ Updated most of the issues.
  ◦ Added an “extension type” section to the specification header.
  ◦ Reused the VK_EXT_KHR_surface surface transform enumerations rather than redefining them here.
  ◦ Updated the example code to use the new semantics.

Revision 13, 2015-08-21 (Ian Elliott)
  ◦ Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
  ◦ Switched from “revision” to “version”, including use of the VK_MAKE_VERSION macro in the header file.

Revision 14, 2015-09-01 (James Jones)
  ◦ Restore single-field revision number.

Revision 15, 2015-09-08 (James Jones)
  ◦ Added alpha flags enum.
  ◦ Added premultiplied alpha support.

Revision 16, 2015-09-08 (James Jones)
  ◦ Added description section to the spec.
  ◦ Added issues 16 - 18.

Revision 17, 2015-10-02 (James Jones)
  ◦ Planes are now a property of the entire device rather than individual displays. This allows planes to be moved between multiple displays on devices that support it.
Added a function to create a VkSurfaceKHR object describing a display plane and mode to align with the new per-platform surface creation conventions.

Removed detailed mode timing data. It was agreed that the mode extents and refresh rate are sufficient for current use cases. Other information could be added back in as an extension if it is needed in the future.

Added support for smart/persistent/buffered display devices.

- Revision 18, 2015-10-26 (Ian Elliott)
  - Renamed from VK_EXT_KHR_display to VK_KHR_display.

- Revision 19, 2015-11-02 (James Jones)
  - Updated example code to match revision 17 changes.

- Revision 20, 2015-11-03 (Daniel Rakos)
  - Added allocation callbacks to creation functions.

- Revision 21, 2015-11-10 (Jesse Hall)
  - Added VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR, and use VkDisplayPlaneAlphaFlagBitsKHR for VkDisplayPlanePropertiesKHR::alphaMode instead of VkDisplayPlaneAlphaFlagsKHR, since it only represents one mode.
  - Added reserved flags bitmask to VkDisplayPlanePropertiesKHR.
  - Use VkSurfaceTransformFlagBitsKHR instead of obsolete VkSurfaceTransformKHR.
  - Renamed vkGetDisplayPlaneSupportedDisplaysKHR parameters for clarity.

- Revision 22, 2015-12-18 (James Jones)
  - Added missing “planeIndex” parameter to vkGetDisplayPlaneSupportedDisplaysKHR()

- Revision 23, 2017-03-13 (James Jones)
  - Closed all remaining issues. The specification and implementations have been shipping with the proposed resolutions for some time now.
  - Removed the sample code and noted it has been integrated into the official Vulkan SDK cube demo.

Description
This extension provides an API to create a swapchain directly on a device's display without any underlying window system.

New Commands
• vkCreateSharedSwapchainsKHR

New Structures
• Extending VkPresentInfoKHR:
  ◦ VkDisplayPresentInfoKHR

New Enum Constants
• VK_KHR_DISPLAY_SWAPCHAIN_EXTENSION_NAME
• VK_KHR_DISPLAY_SWAPCHAIN_SPEC_VERSION
• Extending VkResult:
  ◦ VK_ERROR_INCOMPATIBLE_DISPLAY_KHR
• Extending VkStructureType:
Issues

1) Should swapchains sharing images each hold a reference to the images, or should it be up to the application to destroy the swapchains and images in an order that avoids the need for reference counting?

**RESOLVED:** Take a reference. The lifetime of presentable images is already complex enough.

2) Should the `srcRect` and `dstRect` parameters be specified as part of the presentation command, or at swapchain creation time?

**RESOLVED:** As part of the presentation command. This allows moving and scaling the image on the screen without the need to respecify the mode or create a new swapchain and presentable images.

3) Should `srcRect` and `dstRect` be specified as rects, or separate offset/extent values?

**RESOLVED:** As rects. Specifying them separately might make it easier for hardware to expose support for one but not the other, but in such cases applications must just take care to obey the reported capabilities and not use non-zero offsets or extents that require scaling, as appropriate.

4) How can applications create multiple swapchains that use the same images?

**RESOLVED:** By calling `vkCreateSharedSwapchainsKHR`.

An earlier resolution used `vkCreateSwapchainKHR`, chaining multiple `VkSwapchainCreateInfoKHR` structures through `pNext`. In order to allow each swapchain to also allow other extension structs, a level of indirection was used: `VkSwapchainCreateInfoKHR::pNext` pointed to a different structure, which had both `sType` and `pNext` members for additional extensions, and also had a pointer to the next `VkSwapchainCreateInfoKHR` structure. The number of swapchains to be created could only be found by walking this linked list of alternating structures, and the `pSwapchains` out parameter was reinterpreted to be an array of `VkSwapchainKHR` handles.

Another option considered was a method to specify a “shared” swapchain when creating a new swapchain, such that groups of swapchains using the same images could be built up one at a time. This was deemed unusable because drivers need to know all of the displays an image will be used on when determining which internal formats and layouts to use for that image.

Version History

- Revision 1, 2015-07-29 (James Jones)
  - Initial draft
- Revision 2, 2015-08-21 (Ian Elliott)
  - Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
  - Switched from “revision” to “version”, including use of the VK_MAKE_VERSION macro in the header file.
- Revision 3, 2015-09-01 (James Jones)
  ◦ Restore single-field revision number.

- Revision 4, 2015-09-08 (James Jones)
  ◦ Allow creating multiple swapchains that share the same images using a single call to
    `vkCreateSwapchainKHR()`.

- Revision 5, 2015-09-10 (Alon Or-bach)
  ◦ Removed underscores from SWAP_CHAIN in two enums.

- Revision 6, 2015-10-02 (James Jones)
  ◦ Added support for smart panels/buffered displays.

- Revision 7, 2015-10-26 (Ian Elliott)
  ◦ Renamed from VK_EXT_KHR_display_swapchain to VK_KHR_display_swapchain.

- Revision 8, 2015-11-03 (Daniel Rakos)
  ◦ Updated sample code based on the changes to VK_KHR_swapchain.

- Revision 9, 2015-11-10 (Jesse Hall)
  ◦ Replaced `VkDisplaySwapchainCreateInfoKHR` with `vkCreateSharedSwapchainsKHR`,
    changing resolution of issue #4.

- Revision 10, 2017-03-13 (James Jones)
  ◦ Closed all remaining issues. The specification and implementations have been shipping with
    the proposed resolutions for some time now.
  ◦ Removed the sample code and noted it has been integrated into the official Vulkan SDK cube
    demo.

`VK_KHR_external_fence`

or
Description

An application using external memory may wish to synchronize access to that memory using fences. This extension enables an application to export fence payload to and import fence payload from POSIX file descriptors.

New Commands

- vkGetFenceFdKHR
- vkImportFenceFdKHR

New Structures

- VkFenceGetFdInfoKHR
- VkImportFenceFdInfoKHR

New Enum Constants

- VK_KHR_EXTERNAL_FENCE_FD_EXTENSION_NAME
- VK_KHR_EXTERNAL_FENCE_FD_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_FENCE_GET_FD_INFO_KHR
- VK_STRUCTURE_TYPE_IMPORT_FENCE_FD_INFO_KHR
**Issues**

This extension borrows concepts, semantics, and language from VK_KHR_external_semaphore_fd. That extension's issues apply equally to this extension.

**Version History**

- Revision 1, 2017-05-08 (Jesse Hall)

- Jeff Juliano, NVIDIA
Description

An application may wish to reference device memory in multiple Vulkan logical devices or instances, in multiple processes, and/or in multiple APIs. This extension enables an application to export POSIX file descriptor handles from Vulkan memory objects and to import Vulkan memory objects from POSIX file descriptor handles exported from other Vulkan memory objects or from similar resources in other APIs.

New Commands

- vkGetMemoryFdKHR
- vkGetMemoryFdPropertiesKHR

New Structures

- VkMemoryFdPropertiesKHR
- VkMemoryGetFdInfoKHR
- Extending VkMemoryAllocateInfo:
  - VkImportMemoryFdInfoKHR

New Enum Constants

- VK_KHR_EXTERNAL_MEMORY_FD_EXTENSION_NAME
- VK_KHR_EXTERNAL_MEMORY_FD_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_IMPORT_MEMORY_FD_INFO_KHR
  - VK_STRUCTURE_TYPE_MEMORY_FD_PROPERTIES_KHR
  - VK_STRUCTURE_TYPE_MEMORY_GET_FD_INFO_KHR

Issues

1) Does the application need to close the file descriptor returned by vkGetMemoryFdKHR?

**RESOLVED**: Yes, unless it is passed back in to a driver instance to import the memory. A successful get call transfers ownership of the file descriptor to the application, and a successful import transfers it back to the driver. Destroying the original memory object will not close the file descriptor or remove its reference to the underlying memory resource associated with it.

2) Do drivers ever need to expose multiple file descriptors per memory object?

**RESOLVED**: No. This would indicate there are actually multiple memory objects, rather than a single memory object.

3) How should the valid size and memory type for POSIX file descriptor memory handles created outside of Vulkan be specified?
**RESOLVED**: The valid memory types are queried directly from the external handle. The size will be specified by future extensions that introduce such external memory handle types.

**Version History**

Description

An application using external memory may wish to synchronize access to that memory using semaphores. This extension enables an application to export semaphore payload to and import semaphore payload from POSIX file descriptors.

New Commands

- vkGetSemaphoreFdKHR
- vkImportSemaphoreFdKHR

New Structures

- VkImportSemaphoreFdInfoKHR
- VkSemaphoreGetFdInfoKHR

New Enum Constants

- VK_KHR_EXTERNAL_SEMAPHORE_FD_EXTENSION_NAME
- VK_KHR_EXTERNAL_SEMAPHORE_FD_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_FD_INFO_KHR
- VK_STRUCTURE_TYPE_SEMAPHORE_GET_FD_INFO_KHR

Issues

1) Does the application need to close the file descriptor returned by vkGetSemaphoreFdKHR?

RESOLVED: Yes, unless it is passed back in to a driver instance to import the semaphore. A successful get call transfers ownership of the file descriptor to the application, and a successful import transfers it back to the driver. Destroying the original semaphore object will not close the file descriptor or remove its reference to the underlying semaphore resource associated with it.

• Jan-Harald Fredriksen, Arm
• Jeff Bolz, Nvidia
Description

This extension adds the ability to change the rate at which fragments are shaded. Rather than the usual single fragment invocation for each pixel covered by a primitive, multiple pixels can be shaded by a single fragment shader invocation.

Up to three methods are available to the application to change the fragment shading rate:

- **Pipeline Fragment Shading Rate**, which allows the specification of a rate per-draw.
- **Primitive Fragment Shading Rate**, which allows the specification of a rate per primitive, specified during shading.
- **Attachment Fragment Shading Rate**, which allows the specification of a rate per-region of the framebuffer, specified in a specialized image attachment.

Additionally, these rates can all be specified and combined in order to adjust the overall detail in the image at each point.

This functionality can be used to focus shading efforts where higher levels of detail are needed in some parts of a scene compared to others. This can be particularly useful in high resolution rendering, or for XR contexts.

This extension also adds support for the `SPV_KHR_fragment_shading_rate` extension which enables setting the **primitive fragment shading rate**, and allows querying the final shading rate from a fragment shader.

New Commands

- `vkCmdSetFragmentShadingRateKHR`
- `vkGetPhysicalDeviceFragmentShadingRatesKHR`

New Structures

- `VkPhysicalDeviceFragmentShadingRateKHR`
- Extending `VkGraphicsPipelineCreateInfo`:
  - `VkPipelineFragmentShadingRateStateCreateInfoKHR`
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceFragmentShadingRateFeaturesKHR`
- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceFragmentShadingRatePropertiesKHR`
- Extending `VkSubpassDescription2`:
New Enums

• VkFragmentShadingRateCombinerOpKHR

New Enum Constants

Description
This extension provides new queries for device display properties and capabilities that can be easily extended by other extensions, without introducing any further queries. This extension can be considered the VK_KHR_display equivalent of the VK_KHR_get_physical_device_properties2 extension.

New Commands
• vkGetDisplayModeProperties2KHR
• vkGetDisplayPlaneCapabilities2KHR
• vkGetPhysicalDeviceDisplayPlaneProperties2KHR
• vkGetPhysicalDeviceDisplayProperties2KHR
New Structures

- VkDisplayModeProperties2KHR
- VkDisplayPlaneCapabilities2KHR
- VkDisplayPlaneInfo2KHR
-VkDisplayPlaneProperties2KHR
- VkDisplayProperties2KHR

New Enum Constants

- VK_KHR_GET_DISPLAY_PROPERTIES_2_EXTENSION_NAME
- VK_KHR_GET_DISPLAY_PROPERTIES_2_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR
- VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR
- VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR
- VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR
- VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR

Issues

1) What should this extension be named?

**RESOLVED:** VK_KHR_get_display_properties2. Other alternatives:

- VK_KHR_display2
- One extension, combined with VK_KHR_surface_capabilities2.

2) Should extensible input structs be added for these new functions?

**RESOLVED:**

- vkGetPhysicalDeviceDisplayProperties2KHR: No. The only current input is a VkPhysicalDevice. Other inputs would not make sense.
- vkGetPhysicalDeviceDisplayPlaneProperties2KHR: No. The only current input is a VkPhysicalDevice. Other inputs would not make sense.
- vkGetDisplayModeProperties2KHR: No. The only current inputs are a VkPhysicalDevice and a VkDisplayModeKHR. Other inputs would not make sense.

3) Should additional display query functions be extended?

**RESOLVED:**

- vkGetDisplayPlaneSupportedDisplaysKHR: No. Extensions should instead extend vkGetDisplayPlaneCapabilitiesKHR().
Version History

Description

This extension provides new queries for device surface capabilities that can be easily extended by other extensions, without introducing any further queries. This extension can be considered the VK_KHR_surface equivalent of the VK_KHR_get_physical_device_properties2 extension.
New Commands

- vkGetPhysicalDeviceSurfaceCapabilities2KHR
- vkGetPhysicalDeviceSurfaceFormats2KHR

New Structures

- VkPhysicalDeviceSurfaceInfo2KHR
- VkSurfaceCapabilities2KHR
- VkSurfaceFormat2KHR

New Enum Constants

- VK_KHR_GET_SURFACE_CAPABILITIES_2_EXTENSION_NAME
- VK_KHR_GET_SURFACE_CAPABILITIES_2_SPEC_VERSION

Extending VkStructureType:
- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR
- VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR
- VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR

Issues

1) What should this extension be named?

RESOLVED: VK_KHR_get_surface_capabilities2. Other alternatives:

- VK_KHR_surface2
- One extension, combining a separate display-specific query extension.

2) Should additional WSI query functions be extended?

RESOLVED:

- vkGetPhysicalDeviceSurfaceCapabilitiesKHR: Yes. The need for this motivated the extension.
- vkGetPhysicalDeviceSurfaceSupportKHR: No. Currently only has boolean output. Extensions should instead extend vkGetPhysicalDeviceSurfaceCapabilities2KHR.
- vkGetPhysicalDeviceSurfaceFormatsKHR: Yes.
- vkGetPhysicalDeviceSurfacePresentModesKHR: No. Recent discussion concluded this introduced too much variability for applications to deal with. Extensions should instead extend vkGetPhysicalDeviceSurfaceCapabilities2KHR.
- vkGetPhysicalDeviceXlibPresentationSupportKHR: Not in this extension.
- vkGetPhysicalDeviceXcbPresentationSupportKHR: Not in this extension.
- vkGetPhysicalDeviceWaylandPresentationSupportKHR: Not in this extension.
vkGetPhysicalDeviceWin32PresentationSupportKHR: Not in this extension.

Description

This device extension extends `vkQueuePresentKHR`, from the `VK_KHR_swapchain` extension, allowing an application to specify a list of rectangular, modified regions of each image to present. This should be used in situations where an application is only changing a small portion of the presentable images within a swapchain, since it enables the presentation engine to avoid wasting time presenting parts of the surface that have not changed.

This extension is leveraged from the `EGL_KHR_swap_buffers_with_damage` extension.

New Structures

- `VkPresentRegionKHR`
- `VkRectLayerKHR`
- Extending `VkPresentInfoKHR`:
  - `VkPresentRegionsKHR`

New Enum Constants

- `VK_KHR_INCREMENTAL_PRESENT_EXTENSION_NAME`
- `VK_KHR_INCREMENTAL_PRESENT_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR`

Issues

1) How should we handle steroescopic-3D swapchains? We need to add a layer for each rectangle. One approach is to create another struct containing the `VkRect2D` plus layer, and have `VkPresentRegionsKHR` point to an array of that struct. Another approach is to have two parallel arrays, `pRectangles` and `pLayers`, where `pRectangles[i]` and `pLayers[i]` must be used together. Which approach should we use, and if the array of a new structure, what should that be called?

**RESOLVED**: Create a new structure, which is a `VkRect2D` plus a layer, and will be called `VkRectLayerKHR`.

2) Where is the origin of the `VkRectLayerKHR`?

**RESOLVED**: The upper left corner of the presentable image(s) of the swapchain, per the definition of framebuffer coordinates.

3) Does the rectangular region, `VkRectLayerKHR`, specify pixels of the swapchain’s image(s), or of the surface?
RESOLVED: Of the image(s). Some presentation engines may scale the pixels of a swapchain’s image(s) to the size of the surface. The size of the swapchain’s image(s) will be consistent, where the size of the surface may vary over time.

4) What if all of the rectangles for a given swapchain contain a width and/or height of zero?

RESOLVED: The application is indicating that no pixels changed since the last present. The presentation engine may use such a hint and not update any pixels for the swapchain. However, all other semantics of vkQueuePresentKHR must still be honored, including waiting for semaphores to signal.

5) When the swapchain is created with VkSwapchainCreateInfoKHR::preTransform set to a value other than VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR, should the rectangular region, VkRectLayerKHR, be transformed to align with the preTransform?

RESOLVED: No. The rectangular region in VkRectLayerKHR should not be transformed. As such, it may not align with the extents of the swapchain’s image(s). It is the responsibility of the presentation engine to transform the rectangular region. This matches the behavior of the Android presentation engine, which set the precedent.

Version History

Description

Many safety critical environments are required to contend with single event upsets (SEUs). These occur when a bit in a physical device’s memory or register is inadvertently flipped. It is typical for host memory to include automatic error detection (EDC) or correction (ECC) on platforms where this a concern. However, device-accessible memory may not have these protections. In that case, the data must be periodically refreshed.

Unextended Vulkan provides a variety of methods to mitigate SEUs. Image and buffer objects can be bound to SEU-safe memory, and many object types can be refreshed explicitly by the application by reloading or regenerating the object’s data. However, implementations may store internal object-specific data in non-SEU-safe memory, and unextended Vulkan provides no clear method to determine which object types this applies to or how to refresh that data.

This extension adds a mechanism to query which object types store implementation-internal data in device regions susceptible to SEUs, and to explicitly refresh that implementation-internal data.

New Commands
  • vkCmdRefreshObjectsKHR
  • vkGetPhysicalDeviceRefreshableObjectTypesKHR

New Structures
  • VkRefreshObjectKHR
  • VkRefreshObjectListKHR

New Enums
  • VkRefreshObjectFlagBitsKHR
New Bitmasks

- VkRefreshObjectFlagsKHR

New Enum Constants

- VK_KHR_OBJECT_REFRESH_EXTENSION_NAME
- VK_KHR_OBJECT_REFRESH_SPEC_VERSION

Extending VkStructureType:
  - VK_STRUCTURE_TYPE_REFRESH_OBJECT_LIST_KHR

Issues

1) Should this extension refresh object data, or validate whether or not the data has been corrupted?

RESOLVED This extension should refresh data, not validate it. This reduces application error-handling complexity, and invalid data would have to be refreshed anyway.

2) Should object refreshes be done using the host or with command buffers?

RESOLVED Object refreshes should be done with command buffers. This reduces the synchronization complexity.

3) Refresh operations will need a pipeline barrier so that subsequent commands will see the results of the refresh. What access flags and pipeline stage should apply to refresh operations? Should they use new flags and stages, or reuse an existing one?

RESOLVED Object refreshes are considered to be a transfer operation for the purposes of pipeline barriers.

4) Should this extension add a feature bit?

RESOLVED A feature bit is not necessary. In the case of this extension being promoted to core, implementations that do not support or require refreshing of any object types will return 0 for the count parameter of vkGetPhysicalDeviceRefreshableObjectTypesKHR.

Examples

None.

Description

The VK_KHR_performance_query extension adds a mechanism to allow querying of performance counters for use in applications and by profiling tools.

Each queue family may expose counters that can be enabled on a queue of that family. We extend VkQueryType to add a new query type for performance queries, and chain a structure on VkQueryPoolCreateInfo to specify the performance queries to enable.

New Commands

- vkAcquireProfilingLockKHR
- vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR
- vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR
- vkReleaseProfilingLockKHR

New Structures

- VkAcquireProfilingLockInfoKHR
- VkPerformanceCounterDescriptionKHR
- VkPerformanceCounterKHR

Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDevicePerformanceQueryFeaturesKHR

Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDevicePerformanceQueryPropertiesKHR

Extending VkQueryPoolCreateInfo:
  - VkQueryPoolPerformanceCreateInfoKHR

Extending VkSubmitInfo, VkSubmitInfo2:
  - VkPerformanceQuerySubmitInfoKHR

If Vulkan SC 1.0 is supported:

- Extending VkDeviceCreateInfo:
  - VkPerformanceQueryReservationInfoKHR
New Unions

- VkPerformanceCounterResultKHR

New Enums

- VkAcquireProfilingLockFlagBitsKHR
- VkPerformanceCounterDescriptionFlagBitsKHR
- VkPerformanceCounterScopeKHR
- VkPerformanceCounterStorageKHR
- VkPerformanceCounterUnitKHR

New Bitmasks

- VkAcquireProfilingLockFlagsKHR
- VkPerformanceCounterDescriptionFlagsKHR

New Enum Constants

- VK_KHR_PERFORMANCE_QUERY_EXTENSION_NAME
- VK_KHR_PERFORMANCE_QUERY_SPEC_VERSION
- Extending VkQueryType:
  - VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR
  - VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR
  - VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_KHR
  - VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_FEATURES_KHR
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_PROPERTIES_KHR
  - VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR

If Vulkan SC 1.0 is supported:

- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_RESERVATION_INFO_KHR

Issues

1) Should this extension include a mechanism to begin a query in command buffer A and end the query in command buffer B?

RESOLVED No - queries are tied to command buffer creation and thus have to be encapsulated
within a single command buffer.

2) Should this extension include a mechanism to begin and end queries globally on the queue, not using the existing command buffer commands?

**RESOLVED** No - for the same reasoning as the resolution of 1).

3) Should this extension expose counters that require multiple passes?

**RESOLVED** Yes - users should re-submit a command buffer with the same commands in it multiple times, specifying the pass to count as the query parameter in VkPerformanceQuerySubmitInfoKHR.

4) How to handle counters across parallel workloads?

**RESOLVED** In the spirit of Vulkan, a counter description flag `VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR` denotes that the accuracy of a counter result is affected by parallel workloads.

5) How to handle secondary command buffers?

**RESOLVED** Secondary command buffers inherit any counter pass index specified in the parent primary command buffer. Note: this is no longer an issue after change from issue 10 resolution.

6) What commands does the profiling lock have to be held for?

**RESOLVED** For any command buffer that is being queried with a performance query pool, the profiling lock **must** be held while that command buffer is in the `recording`, `executable`, or `pending` state.

7) Should we support `vkCmdCopyQueryPoolResults`?

**RESOLVED** Yes.

8) Should we allow performance queries to interact with multiview?

**RESOLVED** Yes, but the performance queries must be performed once for each pass per view.

9) Should a `queryCount > 1` be usable for performance queries?

**RESOLVED** Yes. Some vendors will have costly performance counter query pool creation, and would rather if a certain set of counters were to be used multiple times that a `queryCount > 1` can be used to amortize the instantiation cost.

10) Should we introduce an indirect mechanism to set the counter pass index?

**RESOLVED** Specify the counter pass index at submit time instead, to avoid requiring re-recording of command buffers when multiple counter passes are needed.

**Examples**

The following example shows how to find what performance counters a queue family supports, setup a query pool to record these performance counters, how to add the query pool to the
command buffer to record information, and how to get the results from the query pool.

```c
// A previously created physical device
VkPhysicalDevice physicalDevice;

// One of the queue families our device supports
uint32_t queueFamilyIndex;

uint32_t counterCount;

// Get the count of counters supported
vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    physicalDevice,
    queueFamilyIndex,
    &counterCount,
    NULL,
    NULL);

VkPerformanceCounterKHR* counters =
    malloc(sizeof(VkPerformanceCounterKHR) * counterCount);
VkPerformanceCounterDescriptionKHR* counterDescriptions =
    malloc(sizeof(VkPerformanceCounterDescriptionKHR) * counterCount);

// Get the counters supported
vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    physicalDevice,
    queueFamilyIndex,
    &counterCount,
    counters,
    counterDescriptions);

// Try to enable the first 8 counters
uint32_t enabledCounters[8];

const uint32_t enabledCounterCount = min(counterCount, 8));

for (uint32_t i = 0; i < enabledCounterCount; i++) {
    enabledCounters[i] = i;
}

// A previously created device that had the performanceCounterQueryPools feature
// set to VK_TRUE
VkDevice device;

VkQueryPoolPerformanceCreateInfoKHR performanceQueryCreateInfo = {
    .sType = VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR,
    .pNext = NULL,
    .queueFamilyIndex = queueFamilyIndex,
```
// The number of counters to enable
   .counterIndexCount = enabledCounterCount,

// The array of indices of counters to enable
   .pCounterIndices = enabledCounters
};

// Get the number of passes our counters will require.
uint32_t numPasses;

vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR(
   physicalDevice,
   @performanceQueryCreateInfo,
   @numPasses);

VkQueryPoolCreateInfo queryPoolCreateInfo = {
   .sType = VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO,
   .pNext = &performanceQueryCreateInfo,
   .flags = 0,
   // Using our new query type here
   .queryType = VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR,
   .queryCount = 1,
   .pipelineStatistics = 0
};

VkQueryPool queryPool;

VkResult result = vkCreateQueryPool(
   device,
   &queryPoolCreateInfo,
   NULL,
   &queryPool);

assert(VK_SUCCESS == result);

// A queue from queueFamilyIndex
VkQueue queue;

// A command buffer we want to record counters on
VkCommandBuffer commandBuffer;

VkCommandBufferBeginInfo commandBufferBeginInfo = {
   .sType = VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO,
   .pNext = NULL,
   .flags = 0,
   .pInheritanceInfo = NULL
};

sType = VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR,
PNext = NULL,
.flags = 0,
.timeout = UINT64_MAX // Wait forever for the lock
};

// Acquire the profiling lock before we record command buffers
// that will use performance queries

result = vkAcquireProfilingLockKHR(device, &lockInfo);
assert(VK_SUCCESS == result);

result = vkBeginCommandBuffer(commandBuffer, &commandBufferBeginInfo);
assert(VK_SUCCESS == result);

vkCmdResetQueryPool(
    commandBuffer,
    queryPool,
    0,
    1);

vkCmdBeginQuery(
    commandBuffer,
    queryPool,
    0,
    0);

// Perform the commands you want to get performance information on
// ...

// Perform a barrier to ensure all previous commands were complete before
// ending the query
vkCmdPipelineBarrier(commandBuffer,
    VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT,
    VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT,
    0,
    0,
    NULL,
    0,
    NULL,
    0,
    NULL);

vkCmdEndQuery(
    commandBuffer,
    queryPool,
    0);

result = vkEndCommandBuffer(commandBuffer);
assert(VK_SUCCESS == result);

for (uint32_t counterPass = 0; counterPass < numPasses; counterPass++) {

    VkPerformanceQuerySubmitInfoKHR performanceQuerySubmitInfo = {
        VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR,
        NULL,
        counterPass
    };

    // Submit the command buffer and wait for its completion
    // ...
}

// Release the profiling lock after the command buffer is no longer in the
// pending state.
vkReleaseProfilingLockKHR(device);

result = vkResetCommandBuffer(commandBuffer, 0);

assert(VK_SUCCESS == result);

// Create an array to hold the results of all counters
VkPerformanceCounterResultKHR* recordedCounters = malloc(
    sizeof(VkPerformanceCounterResultKHR) * enabledCounterCount);

result = vkGetQueryPoolResults(
    device,
    queryPool,
    0,
    1,
    sizeof(VkPerformanceCounterResultKHR) * enabledCounterCount,
    recordedCounters,
    sizeof(VkPerformanceCounterResultKHR) * enabledCounterCount,
    NULL);

// recordedCounters is filled with our counters, we will look at one for posterity
switch (counters[0].storage) {
    case VK_PERFORMANCE_COUNTER_STORAGE_INT32:
        // use recordCounters[0].int32 to get at the counter result!
        break;
    case VK_PERFORMANCE_COUNTER_STORAGE_INT64:
        // use recordCounters[0].int64 to get at the counter result!
        break;
    case VK_PERFORMANCE_COUNTER_STORAGE_UINT32:
        // use recordCounters[0].uint32 to get at the counter result!
        break;
    case VK_PERFORMANCE_COUNTER_STORAGE_UINT64:
        // use recordCounters[0].uint64 to get at the counter result!
        break;
    }
break;
case VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32:
    // use recordCounters[0].float32 to get at the counter result!
    break;
case VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64:
    // use recordCounters[0].float64 to get at the counter result!
    break;
}

Interactions and External Dependencies

- This extension provides API support for GL_ARB_shader_clock and GL_EXT_shader_realtime_clock

Contributors

- Aaron Hagan, AMD
- Daniel Koch, NVIDIA

Description

This extension advertises the SPIR-V ShaderClockKHR capability for Vulkan, which allows a shader to query a real-time or monotonically incrementing counter at the subgroup level or across the device level. The two valid SPIR-V scopes for OpReadClockKHR are Subgroup and Device.

When using GLSL source-based shading languages, the clockRealtime*EXT() timing functions map to the OpReadClockKHR instruction with a scope of Device, and the clock*ARB() timing functions map to the OpReadClockKHR instruction with a scope of Subgroup.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceShaderClockFeaturesKHR

New Enum Constants

- VK_KHR_SHADER_CLOCK_EXTENSION_NAME
- VK_KHR_SHADER_CLOCK_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CLOCK_FEATURES_KHR

New SPIR-V Capabilities

- ShaderClockKHR

Version History

- Revision 1, 2019-4-25 (Aaron Hagan)
  - Initial revision

VK_KHR_shader_terminate_invocation

Name String

- VK_KHR_shader_terminate_invocation

Extension Type

- Device extension
This extension adds Vulkan support for the `SPV_KHR_terminate_invocation` SPIR-V extension. That SPIR-V extension provides a new instruction, `OpTerminateInvocation`, which causes a shader invocation to immediately terminate and sets the coverage of shaded samples to 0; only previously executed instructions will have observable effects. The `OpTerminateInvocation` instruction, along with the `OpDemoteToHelperInvocation` instruction from the `VK_EXT_shader_demote_to_helper_invocation` extension, together replace the `OpKill` instruction, which could behave like either of these instructions. `OpTerminateInvocation` provides the behavior...
required by the GLSL `discard` statement, and should be used when available by GLSL compilers and applications that need the GLSL `discard` behavior.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceShaderTerminateInvocationFeaturesKHR`

New Enum Constants

- `VK_KHR_SHADER_TERMINATE_INVOCATION_EXTENSION_NAME`
- `VK_KHR_SHADER_TERMINATE_INVOCATION_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TERMINATE_INVOCATION_FEATURES_KHR`

Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Version History

- Revision 1, 2020-08-11 (Jesse Hall)

VK_KHR_shared_presentable_image

Name String

- `VK_KHR_shared_presentable_image`

Extension Type

- Device extension

Registered Extension Number

- 112

Revision

- 1

Ratification Status

- Ratified

Extension and Version Dependencies

- `VK_KHR_swapchain`
- `VK_KHR_get_surface_capabilities2`
- `VK_KHR_get_physical_device_properties2`
This extension extends `VK_KHR_swapchain` to enable creation of a shared presentable image. This allows the application to use the image while the presentation engine is accessing it, in order to reduce the latency between rendering and presentation.

**New Commands**

- `vkGetSwapchainStatusKHR`

**New Structures**

- Extending `VkSurfaceCapabilities2KHR`:
  - `VkSharedPresentSurfaceCapabilitiesKHR`
New Enum Constants

- **VK_KHR_SHARED_PRESENTABLE_IMAGE_EXTENSION_NAME**
- **VK_KHR_SHARED_PRESENTABLE_IMAGE_SPEC_VERSION**

Extending *VkImageLayout*:
- **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**

Extending *VkPresentModeKHR*:
- **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR**
- **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR**

Extending *VkStructureType*:
- **VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR**

Issues

1) Should we allow a Vulkan WSI swapchain to toggle between normal usage and shared presentation usage?

**RESOLVED:** No. WSI swapchains are typically recreated with new properties instead of having their properties changed. This can also save resources, assuming that fewer images are needed for shared presentation, and assuming that most VR applications do not need to switch between normal and shared usage.

2) Should we have a query for determining how the presentation engine refresh is triggered?

**RESOLVED:** Yes. This is done via which presentation modes a surface supports.

3) Should the object representing a shared presentable image be an extension of a *VkSwapchainKHR* or a separate object?

**RESOLVED:** Extension of a swapchain due to overlap in creation properties and to allow common functionality between shared and normal presentable images and swapchains.

4) What should we call the extension and the new structures it creates?

**RESOLVED:** Shared presentable image / shared present.

5) Should the *minImageCount* and *presentMode* values of the *VkSwapchainCreateInfoKHR* be ignored, or required to be compatible values?

**RESOLVED:** *minImageCount* must be set to 1, and *presentMode* should be set to either **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** or **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR**.

6) What should the layout of the shared presentable image be?

**RESOLVED:** After acquiring the shared presentable image, the application must transition it to the **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR** layout prior to it being used. After this initial transition, any image usage that was requested during swapchain creation **can** be performed on the image.
without layout transitions being performed.

7) Do we need a new API for the trigger to refresh new content?

**RESOLVED:** `vkQueuePresentKHR` to act as API to trigger a refresh, as will allow combination with other compatible extensions to `vkQueuePresentKHR`.

8) How should an application detect a `VK_ERROR_OUT_OF_DATE_KHR` error on a swapchain using the `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` present mode?

**RESOLVED:** Introduce `vkGetSwapchainStatusKHR` to allow applications to query the status of a swapchain using a shared presentation mode.

9) What should subsequent calls to `vkQueuePresentKHR` for `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` swapchains be defined to do?

**RESOLVED:** State that implementations may use it as a hint for updated content.

10) Can the ownership of a shared presentable image be transferred to a different queue?

**RESOLVED:** No. It is not possible to transfer ownership of a shared presentable image obtained from a swapchain created using `VK_SHARING_MODE_EXCLUSIVE` after it has been presented.

11) How should `vkQueueSubmit` behave if a command buffer uses an image from a `VK_ERROR_OUT_OF_DATE_KHR` swapchain?

**RESOLVED:** `vkQueueSubmit` is expected to return the `VK_ERROR_DEVICE_LOST` error.

12) Can Vulkan provide any guarantee on the order of rendering, to enable beam chasing?

**RESOLVED:** This could be achieved via use of render passes to ensure strip rendering.

Description
The `VK_KHR_surface` extension is an instance extension. It introduces `VkSurfaceKHR` objects, which abstract native platform surface or window objects for use with Vulkan. It also provides a way to determine whether a queue family in a physical device supports presenting to particular surface.

Separate extensions for each platform provide the mechanisms for creating `VkSurfaceKHR` objects, but once created they may be used in this and other platform-independent extensions, in particular the `VK_KHR_swapchain` extension.
New Object Types

- VkSurfaceKHR

New Commands

- vkDestroySurfaceKHR
- vkGetPhysicalDeviceSurfaceCapabilitiesKHR
- vkGetPhysicalDeviceSurfaceFormatsKHR
- vkGetPhysicalDeviceSurfacePresentModesKHR
- vkGetPhysicalDeviceSurfaceSupportKHR

New Structures

- VkSurfaceCapabilitiesKHR
- VkSurfaceFormatKHR

New Enums

- VkColorSpaceKHR
- VkCompositeAlphaFlagBitsKHR
- VkPresentModeKHR
- VkSurfaceTransformFlagBitsKHR

New Bitmasks

- VkCompositeAlphaFlagsKHR

New Enum Constants

- VK_KHR_SURFACE_EXTENSION_NAME
- VK_KHR_SURFACE_SPEC_VERSION

Extending VkObjectType:

- VK_OBJECT_TYPE_SURFACE_KHR

Extending VkResult:

- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR
- VK_ERROR_SURFACE_LOST_KHR

Issues

1) Should this extension include a method to query whether a physical device supports presenting to a specific window or native surface on a given platform?
RESOLVED: Yes. Without this, applications would need to create a device instance to determine whether a particular window can be presented to. Knowing that a device supports presentation to a platform in general is not sufficient, as a single machine might support multiple seats, or instances of the platform that each use different underlying physical devices. Additionally, on some platforms, such as the X Window System, different drivers and devices might be used for different windows depending on which section of the desktop they exist on.

2) Should the `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, `vkGetPhysicalDeviceSurfaceFormatsKHR`, and `vkGetPhysicalDeviceSurfacePresentModesKHR` functions be in this extension and operate on physical devices, rather than being in `VK_KHR_swapchain` (i.e. device extension) and being dependent on `VkDevice`?

RESOLVED: Yes. While it might be useful to depend on `VkDevice` (and therefore on enabled extensions and features) for the queries, Vulkan was released only with the `VkPhysicalDevice` versions. Many cases can be resolved by a Valid Usage statement, and/or by a separate `pNext` chain version of the query struct specific to a given extension or parameters, via extensible versions of the queries: `vkGetPhysicalDeviceSurfaceCapabilities2KHR`, `vkGetPhysicalDeviceSurfaceFormats2KHR`.

3) Should Vulkan support Xlib or XCB as the API for accessing the X Window System platform?

RESOLVED: Both. XCB is a more modern and efficient API, but Xlib usage is deeply ingrained in many applications and likely will remain in use for the foreseeable future. Not all drivers necessarily need to support both, but including both as options in the core specification will probably encourage support, which should in turn ease adoption of the Vulkan API in older codebases. Additionally, the performance improvements possible with XCB likely will not have a measurable impact on the performance of Vulkan presentation and other minimal window system interactions defined here.

4) Should the GBM platform be included in the list of platform enums?

RESOLVED: Deferred, and will be addressed with a platform-specific extension to be written in the future.

Version History

- Revision 1, 2015-05-20 (James Jones)
  - Initial draft, based on LunarG KHR spec, other KHR specs, patches attached to bugs.
- Revision 2, 2015-05-22 (Ian Elliott)
  - Created initial Description section.
  - Removed query for whether a platform requires the use of a queue for presentation, since it was decided that presentation will always be modeled as being part of the queue.
  - Fixed typos and other minor mistakes.
- Revision 3, 2015-05-26 (Ian Elliott)
  - Improved the Description section.
- Revision 4, 2015-05-27 (James Jones)
• Fixed compilation errors in example code.

• Revision 5, 2015-06-01 (James Jones)
  • Added issues 1 and 2 and made related spec updates.

• Revision 6, 2015-06-01 (James Jones)
  • Merged the platform type mappings table previously removed from VK_KHR_swapchain with the platform description table in this spec.
  • Added issues 3 and 4 documenting choices made when building the initial list of native platforms supported.

• Revision 7, 2015-06-11 (Ian Elliott)
  • Updated table 1 per input from the KHR TSG.
  • Updated issue 4 (GBM) per discussion with Daniel Stone. He will create a platform-specific extension sometime in the future.

• Revision 8, 2015-06-17 (James Jones)
  • Updated enum-extending values using new convention.
  • Fixed the value of VK_SURFACE_PLATFORM_INFO_TYPE_SUPPORTED_KHR.

• Revision 9, 2015-06-17 (James Jones)
  • Rebased on Vulkan API version 126.

• Revision 10, 2015-06-18 (James Jones)
  • Marked issues 2 and 3 resolved.

• Revision 11, 2015-06-23 (Ian Elliott)
  • Examples now show use of function pointers for extension functions.
  • Eliminated extraneous whitespace.

• Revision 12, 2015-07-07 (Daniel Rakos)
  • Added error section describing when each error is expected to be reported.
  • Replaced the term “queue node index” with “queue family index” in the spec as that is the agreed term to be used in the latest version of the core header and spec.
  • Replaced bool32_t with VkBool32.

• Revision 13, 2015-08-06 (Daniel Rakos)
  • Updated spec against latest core API header version.

• Revision 14, 2015-08-20 (Ian Elliott)
  • Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
  • Switched from “revision” to “version”, including use of the VK_MAKE_VERSION macro in the header file.
  • Did miscellaneous cleanup, etc.

• Revision 15, 2015-08-20 (Ian Elliott—porting a 2015-07-29 change from James Jones)
Moved the surface transform enums here from VK_WSI_swapchain so they could be reused by VK_WSI_display.

- Revision 16, 2015-09-01 (James Jones)
  - Restore single-field revision number.

- Revision 17, 2015-09-01 (James Jones)
  - Fix example code compilation errors.

- Revision 18, 2015-09-26 (Jesse Hall)
  - Replaced VkSurfaceDescriptionKHR with the VkSurfaceKHR object, which is created via layered extensions. Added VkDestroySurfaceKHR.

- Revision 19, 2015-09-28 (Jesse Hall)
  - Renamed from VK_EXT_KHR_swapchain to VK_EXT_KHR_surface.

- Revision 20, 2015-09-30 (Jesse Hall)
  - Add error result VK_ERROR_SURFACE_LOST_KHR.

- Revision 21, 2015-10-15 (Daniel Rakos)
  - Updated the resolution of issue #2 and include the surface capability queries in this extension.
  - Renamed SurfaceProperties to SurfaceCapabilities as it better reflects that the values returned are the capabilities of the surface on a particular device.
  - Other minor cleanup and consistency changes.

- Revision 22, 2015-10-26 (Ian Elliott)
  - Renamed from VK_EXT_KHR_surface to VK_KHR_surface.

- Revision 23, 2015-11-03 (Daniel Rakos)
  - Added allocation callbacks to vkDestroySurfaceKHR.

- Revision 24, 2015-11-10 (Jesse Hall)
  - Removed VkSurfaceTransformKHR. Use VkSurfaceTransformFlagBitsKHR instead.
  - Rename VkSurfaceCapabilitiesKHR member maxImageArraySize to maxImageArrayLayers.

- Revision 25, 2016-01-14 (James Jones)
  - Moved VK_ERROR_NATIVE_WINDOW_IN_USE_KHR from the VK_KHR_android_surface to the VK_KHR_surface extension.

- 2016-08-23 (Ian Elliott)
  - Update the example code, to not have so many characters per line, and to split out a new example to show how to obtain function pointers.

- 2016-08-25 (Ian Elliott)
  - A note was added at the beginning of the example code, stating that it will be removed from future versions of the appendix.

Description

The Vk_KHR_swapchain extension is the device-level companion to the VK_KHR_surface extension. It introduces VkSwapchainKHR objects, which provide the ability to present rendering results to a surface.

New Object Types

- VkSwapchainKHR

New Commands

- vkAcquireNextImageKHR
- vkCreateSwapchainKHR
- vkDestroySwapchainKHR
- vkGetSwapchainImagesKHR
- vkQueuePresentKHR

If Version 1.1 is supported:

- VkAcquireNextImage2KHR
- vkGetDeviceGroupPresentCapabilitiesKHR
- vkGetDeviceGroupSurfacePresentModesKHR
- vkGetPhysicalDevicePresentRectanglesKHR

New Structures

- VkPresentInfoKHR
- VkSwapchainCreateInfoKHR

If Version 1.1 is supported:

- VkAcquireNextImageInfoKHR
- VkDeviceGroupPresentCapabilitiesKHR
• Extending VkBindImageMemoryInfo:
  ◦ VkBindImageMemorySwapchainInfoKHR

• Extending VkImageCreateInfo:
  ◦ VkImageSwapchainCreateInfoKHR

• Extending VkPresentInfoKHR:
  ◦ VkDeviceGroupPresentInfoKHR

• Extending VkSwapchainCreateInfoKHR:
  ◦ VkDeviceGroupSwapchainCreateInfoKHR

New Enums

• VkSwapchainCreateFlagBitsKHR

If Version 1.1 is supported:

• VkDeviceGroupPresentModeFlagBitsKHR

New Bitmasks

• VkSwapchainCreateFlagsKHR

If Version 1.1 is supported:

• VkDeviceGroupPresentModeFlagsKHR

New Enum Constants

• VK_KHR_SWAPCHAIN_EXTENSION_NAME
• VK_KHR_SWAPCHAIN_SPEC_VERSION

Extending VkImageLayout:
  ◦ VK_IMAGE_LAYOUT_PRESENT_SRC_KHR

Extending VkObjectType:
  ◦ VK_OBJECT_TYPE_SWAPCHAIN_KHR

Extending VkResult:
  ◦ VK_ERROR_OUT_OF_DATE_KHR
  ◦ VK_SUBOPTIMAL_KHR

Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_PRESENT_INFO_KHR
  ◦ VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR

If Version 1.1 is supported:

• Extending VkStructureType:
Issues

1) Does this extension allow the application to specify the memory backing of the presentable images?

**RESOLVED:** No. Unlike standard images, the implementation will allocate the memory backing of the presentable image.

2) What operations are allowed on presentable images?

**RESOLVED:** This is determined by the image usage flags specified when creating the presentable image’s swapchain.

3) Does this extension support MSAA presentable images?

**RESOLVED:** No. Presentable images are always single-sampled. Multi-sampled rendering must use regular images. To present the rendering results the application must manually resolve the multi-sampled image to a single-sampled presentable image prior to presentation.

4) Does this extension support stereo/multi-view presentable images?

**RESOLVED:** Yes. The number of views associated with a presentable image is determined by the `imageArrayLayers` specified when creating a swapchain. All presentable images in a given swapchain use the same array size.

5) Are the layers of stereo presentable images half-sized?

**RESOLVED:** No. The image extents always match those requested by the application.

6) Do the “present” and “acquire next image” commands operate on a queue? If not, do they need to include explicit semaphore objects to interlock them with queue operations?

**RESOLVED:** The present command operates on a queue. The image ownership operation it represents happens in order with other operations on the queue, so no explicit semaphore object is required to synchronize its actions.

Applications may want to acquire the next image in separate threads from those in which they manage their queue, or in multiple threads. To make such usage easier, the acquire next image
command takes a semaphore to signal as a method of explicit synchronization. The application must later queue a wait for this semaphore before queuing execution of any commands using the image.

7) Does `vkAcquireNextImageKHR` block if no images are available?

**RESOLVED:** The command takes a timeout parameter. Special values for the timeout are 0, which makes the call a non-blocking operation, and `UINT64_MAX`, which blocks indefinitely. Values in between will block for up to the specified time. The call will return when an image becomes available or an error occurs. It may, but is not required to, return before the specified timeout expires if the swapchain becomes out of date.

8) Can multiple presents be queued using one `vkQueuePresentKHR` call?

**RESOLVED:** Yes. `VkPresentInfoKHR` contains a list of swapchains and corresponding image indices that will be presented. When supported, all presentations queued with a single `vkQueuePresentKHR` call will be applied atomically as one operation. The same swapchain must not appear in the list more than once. Later extensions may provide applications stronger guarantees of atomicity for such present operations, and/or allow them to query whether atomic presentation of a particular group of swapchains is possible.

9) How do the presentation and acquire next image functions notify the application the targeted surface has changed?

**RESOLVED:** Two new result codes are introduced for this purpose:

- **VK_SUBOPTIMAL_KHR** - Presentation will still succeed, subject to the window resize behavior, but the swapchain is no longer configured optimally for the surface it targets. Applications should query updated surface information and recreate their swapchain at the next convenient opportunity.

- **VK_ERROR_OUT_OF_DATE_KHR** - Failure. The swapchain is no longer compatible with the surface it targets. The application must query updated surface information and recreate the swapchain before presentation will succeed.

These can be returned by both `vkAcquireNextImageKHR` and `vkQueuePresentKHR`.

10) Does the `vkAcquireNextImageKHR` command return a semaphore to the application via an output parameter, or accept a semaphore to signal from the application as an object handle parameter?

**RESOLVED:** Accept a semaphore to signal as an object handle. This avoids the need to specify whether the application must destroy the semaphore or whether it is owned by the swapchain, and if the latter, what its lifetime is and whether it can be reused for other operations once it is received from `vkAcquireNextImageKHR`.

11) What types of swapchain queuing behavior should be exposed? Options include swap interval specification, mailbox/most recent vs. FIFO queue management, targeting specific vertical blank intervals or absolute times for a given present operation, and probably others. For some of these, whether they are specified at swapchain creation time or as per-present parameters needs to be decided as well.
RESOLVED: The base swapchain extension will expose 3 possible behaviors (of which, FIFO will always be supported):

- Immediate present: Does not wait for vertical blanking period to update the current image, likely resulting in visible tearing. No internal queue is used. Present requests are applied immediately.

- Mailbox queue: Waits for the next vertical blanking period to update the current image. No tearing should be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for reuse by the application.

- FIFO queue: Waits for the next vertical blanking period to update the current image. No tearing should be observed. An internal queue containing \( \text{numSwapchainImages} - 1 \) entries is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty.

Not all surfaces will support all of these modes, so the modes supported will be returned using a surface information query. All surfaces must support the FIFO queue mode. Applications must choose one of these modes up front when creating a swapchain. Switching modes can be accomplished by recreating the swapchain.

12) Can \texttt{VK_PRESENT_MODE_MAILBOX_KHR} provide non-blocking guarantees for \texttt{vkAcquireNextImageKHR}? If so, what is the proper criteria?

RESOLVED: Yes. The difficulty is not immediately obvious here. Naively, if at least 3 images are requested, mailbox mode should always have an image available for the application if the application does not own any images when the call to \texttt{vkAcquireNextImageKHR} was made. However, some presentation engines may have more than one “current” image, and would still need to block in some cases. The right requirement appears to be that if the application allocates the surface’s minimum number of images + 1 then it is guaranteed non-blocking behavior when it does not currently own any images.

13) Is there a way to create and initialize a new swapchain for a surface that has generated a \texttt{VK_SUBOPTIMAL_KHR} return code while still using the old swapchain?

RESOLVED: Not as part of this specification. This could be useful to allow the application to create an “optimal” replacement swapchain and rebuild all its command buffers using it in a background thread at a low priority while continuing to use the “suboptimal” swapchain in the main thread. It could probably use the same “atomic replace” semantics proposed for recreating direct-to-device swapchains without incurring a mode switch. However, after discussion, it was determined some platforms probably could not support concurrent swapchains for the same surface though, so this will be left out of the base KHR extensions. A future extension could add this for platforms where it is supported.

14) Should there be a special value for \texttt{VkSurfaceCapabilitiesKHR::maxImageCount} to indicate there are no practical limits on the number of images in a swapchain?

RESOLVED: Yes. There will often be cases where there is no practical limit to the number of images
in a swapchain other than the amount of available resources (i.e., memory) in the system. Trying to derive a hard limit from things like memory size is prone to failure. It is better in such cases to leave it to applications to figure such soft limits out via trial/failure iterations.

15) Should there be a special value for \texttt{VkSurfaceCapabilitiesKHR::currentExtent} to indicate the size of the platform surface is undefined?

**RESOLVED:** Yes. On some platforms (Wayland, for example), the surface size is defined by the images presented to it rather than the other way around.

16) Should there be a special value for \texttt{VkSurfaceCapabilitiesKHR::maxImageExtent} to indicate there is no practical limit on the surface size?

**RESOLVED:** No. It seems unlikely such a system would exist. 0 could be used to indicate the platform places no limits on the extents beyond those imposed by Vulkan for normal images, but this query could just as easily return those same limits, so a special “unlimited” value does not seem useful for this field.

17) How should surface rotation and mirroring be exposed to applications? How do they specify rotation and mirroring transforms applied prior to presentation?

**RESOLVED:** Applications can query both the supported and current transforms of a surface. Both are specified relative to the device’s “natural” display rotation and direction. The supported transforms indicate which orientations the presentation engine accepts images in. For example, a presentation engine that does not support transforming surfaces as part of presentation, and which is presenting to a surface that is displayed with a 90-degree rotation, would return only one supported transform bit: \texttt{VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR}. Applications must transform their rendering by the transform they specify when creating the swapchain in \texttt{preTransform} field.

18) Can surfaces ever not support \texttt{VK_MIRROR_NONE}? Can they support vertical and horizontal mirroring simultaneously? Relatedly, should \texttt{VK_MIRROR_NONE[BIT]} be zero, or bit one, and should applications be allowed to specify multiple pre and current mirror transform bits, or exactly one?

**RESOLVED:** Since some platforms may not support presenting with a transform other than the native window’s current transform, and prerotation/mirroring are specified relative to the device’s natural rotation and direction, rather than relative to the surface’s current rotation and direction, it is necessary to express lack of support for no mirroring. To allow this, the \texttt{MIRROR_NONE} enum must occupy a bit in the flags. Since \texttt{MIRROR_NONE} must be a bit in the bitmask rather than a bitmask with no values set, allowing more than one bit to be set in the bitmask would make it possible to describe undefined transforms such as \texttt{VK_MIRROR_NONE_BIT | VK_MIRROR_HORIZONTAL_BIT}, or a transform that includes both “no mirroring” and “horizontal mirroring” simultaneously. Therefore, it is desirable to allow specifying all supported mirroring transforms using only one bit. The question then becomes, should there be a \texttt{VK_MIRROR_HORIZONTAL_AND_VERTICAL_BIT} to represent a simultaneous horizontal and vertical mirror transform? However, such a transform is equivalent to a 180 degree rotation, so presentation engines and applications that wish to support or use such a transform can express it through rotation instead. Therefore, 3 exclusive bits are sufficient to express all needed mirroring transforms.

19) Should support for sRGB be required?
**RESOLVED:** In the advent of UHD and HDR display devices, proper color space information is vital to the display pipeline represented by the swapchain. The app can discover the supported format/color-space pairs and select a pair most suited to its rendering needs. Currently only the sRGB color space is supported, future extensions may provide support for more color spaces. See issues 23 and 24.

20) Is there a mechanism to modify or replace an existing swapchain with one targeting the same surface?

**RESOLVED:** Yes. This is described above in the text.

21) Should there be a way to set prerotation and mirroring using native APIs when presenting using a Vulkan swapchain?

**RESOLVED:** Yes. The transforms that can be expressed in this extension are a subset of those possible on native platforms. If a platform exposes a method to specify the transform of presented images for a given surface using native methods and exposes more transforms or other properties for surfaces than Vulkan supports, it might be impossible, difficult, or inconvenient to set some of those properties using Vulkan KHR extensions and some using the native interfaces. To avoid overwriting properties set using native commands when presenting using a Vulkan swapchain, the application can set the pretransform to “inherit”, in which case the current native properties will be used, or if none are available, a platform-specific default will be used. Platforms that do not specify a reasonable default or do not provide native mechanisms to specify such transforms should not include the inherit bits in the supportedTransforms bitmask they return in VkSurfaceCapabilitiesKHR.

22) Should the content of presentable images be clipped by objects obscuring their target surface?

**RESOLVED:** Applications can choose which behavior they prefer. Allowing the content to be clipped could enable more efficient presentation methods on some platforms, but some applications might rely on the content of presentable images to perform techniques such as partial updates or motion blurs.

23) What is the purpose of specifying a VkColorSpaceKHR along with VkFormat when creating a swapchain?

**RESOLVED:** While Vulkan itself is color space agnostic (e.g. even the meaning of R, G, B and A can be freely defined by the rendering application), the swapchain eventually will have to present the images on a display device with specific color reproduction characteristics. If any color space transformations are necessary before an image can be displayed, the color space of the presented image must be known to the swapchain. A swapchain will only support a restricted set of color format and -space pairs. This set can be discovered via vkGetPhysicalDeviceSurfaceFormatsKHR. As it can be expected that most display devices support the sRGB color space, at least one format/color-space pair has to be exposed, where the color space is VK_COLOR_SPACE_SRGB_NONLINEAR_KHR.

24) How are sRGB formats and the sRGB color space related?

**RESOLVED:** While Vulkan exposes a number of SRGB texture formats, using such formats does not guarantee working in a specific color space. It merely means that the hardware can directly support applying the non-linear transfer functions defined by the sRGB standard color space when.
reading from or writing to images of those formats. Still, it is unlikely that a swapchain will expose an *_SRGB format along with any color space other than VK_COLOR_SPACE_SRGB_NONLINEAR_KHR.

On the other hand, non-*_SRGB formats will be very likely exposed in pair with a SRGB color space. This means, the hardware will not apply any transfer function when reading from or writing to such images, yet they will still be presented on a device with sRGB display characteristics. In this case the application is responsible for applying the transfer function, for instance by using shader math.

25) How are the lifetimes of surfaces and swapchains targeting them related?

RESOLVED: A surface must outlive any swapchains targeting it. A VkSurfaceKHR owns the binding of the native window to the Vulkan driver.

26) How can the client control the way the alpha component of swapchain images is treated by the presentation engine during compositing?

RESOLVED: We should add new enum values to allow the client to negotiate with the presentation engine on how to treat image alpha values during the compositing process. Since not all platforms can practically control this through the Vulkan driver, a value of VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR is provided like for surface transforms.

27) Is vkCreateSwapchainKHR the right function to return VK_ERROR_NATIVE_WINDOW_IN_USE_KHR, or should the various platform-specific VkSurfaceKHR factory functions catch this error earlier?

RESOLVED: For most platforms, the VkSurfaceKHR structure is a simple container holding the data that identifies a native window or other object representing a surface on a particular platform. For the surface factory functions to return this error, they would likely need to register a reference on the native objects with the native display server somehow, and ensure no other such references exist. Surfaces were not intended to be that heavyweight.

Swapchains are intended to be the objects that directly manipulate native windows and communicate with the native presentation mechanisms. Swapchains will already need to communicate with the native display server to negotiate allocation and/or presentation of presentable images for a native surface. Therefore, it makes more sense for swapchain creation to be the point at which native object exclusivity is enforced. Platforms may choose to enforce further restrictions on the number of VkSurfaceKHR objects that may be created for the same native window if such a requirement makes sense on a particular platform, but a global requirement is only sensible at the swapchain level.

Version History

• Revision 1, 2015-05-20 (James Jones)
  ◦ Initial draft, based on LunarG KHR spec, other KHR specs, patches attached to bugs.
• Revision 2, 2015-05-22 (Ian Elliott)
  ◦ Made many agreed-upon changes from 2015-05-21 KHR TSG meeting. This includes using only a queue for presentation, and having an explicit function to acquire the next image.
  ◦ Fixed typos and other minor mistakes.
• Revision 3, 2015-05-26 (Ian Elliott)
  ◦ Improved the Description section.
  ◦ Added or resolved issues that were found in improving the Description. For example, pSurfaceDescription is used consistently, instead of sometimes using pSurface.

• Revision 4, 2015-05-27 (James Jones)
  ◦ Fixed some grammatical errors and typos
  ◦ Filled in the description of imageUseFlags when creating a swapchain.
  ◦ Added a description of swapInterval.
  ◦ Replaced the paragraph describing the order of operations on a queue for image ownership and presentation.

• Revision 5, 2015-05-27 (James Jones)
  ◦ Imported relevant issues from the (abandoned) vk_wsi_persistent_swapchain_images extension.
  ◦ Added issues 6 and 7, regarding behavior of the acquire next image and present commands with respect to queues.
  ◦ Updated spec language and examples to align with proposed resolutions to issues 6 and 7.

• Revision 6, 2015-05-27 (James Jones)
  ◦ Added issue 8, regarding atomic presentation of multiple swapchains
  ◦ Updated spec language and examples to align with proposed resolution to issue 8.

• Revision 7, 2015-05-27 (James Jones)
  ◦ Fixed compilation errors in example code, and made related spec fixes.

• Revision 8, 2015-05-27 (James Jones)
  ◦ Added issue 9, and the related VK_SUBOPTIMAL_KHR result code.
  ◦ Renamed VK_OUT_OF_DATE_KHR to VK_ERROR_OUT_OF_DATE_KHR.

• Revision 9, 2015-05-27 (James Jones)
  ◦ Added inline proposed resolutions (marked with [JRJ]) to some XXX questions/issues. These should be moved to the issues section in a subsequent update if the proposals are adopted.

• Revision 10, 2015-05-28 (James Jones)
  ◦ Converted vkAcquireNextImageKHR back to a non-queue operation that uses a VkSemaphore object for explicit synchronization.
  ◦ Added issue 10 to determine whether vkAcquireNextImageKHR generates or returns semaphores, or whether it operates on a semaphore provided by the application.

• Revision 11, 2015-05-28 (James Jones)
  ◦ Marked issues 6, 7, and 8 resolved.
  ◦ Renamed VkSurfaceCapabilityPropertiesKHR to VkSurfacePropertiesKHR to better convey the mutable nature of the information it contains.

• Revision 12, 2015-05-28 (James Jones)
- Added issue 11 with a proposed resolution, and the related issue 12.
- Updated various sections of the spec to match the proposed resolution to issue 11.

- Revision 13, 2015-06-01 (James Jones)
  - Moved some structures to VK_EXT_KHR_swap_chain to resolve the specification’s issues 1 and 2.

- Revision 14, 2015-06-01 (James Jones)
  - Added code for example 4 demonstrating how an application might make use of the two different present and acquire next image KHR result codes.
  - Added issue 13.

- Revision 15, 2015-06-01 (James Jones)
  - Added issues 14 - 16 and related spec language.
  - Fixed some spelling errors.
  - Added language describing the meaningful return values for vkAcquireNextImageKHR and vkQueuePresentKHR.

- Revision 16, 2015-06-02 (James Jones)
  - Added issues 17 and 18, as well as related spec language.
  - Removed some erroneous text added by mistake in the last update.

- Revision 17, 2015-06-15 (Ian Elliott)
  - Changed special value from “-1” to “0” so that the data types can be unsigned.

- Revision 18, 2015-06-15 (Ian Elliott)
  - Clarified the values of VkSurfacePropertiesKHR::minImageCount and the timeout parameter of the vkAcquireNextImageKHR function.

- Revision 19, 2015-06-17 (James Jones)
  - Misc. cleanup. Removed resolved inline issues and fixed typos.
  - Fixed clarification of VkSurfacePropertiesKHR::minImageCount made in version 18.
  - Added a brief “Image Ownership” definition to the list of terms used in the spec.

- Revision 20, 2015-06-17 (James Jones)
  - Updated enum-extending values using new convention.

- Revision 21, 2015-06-17 (James Jones)
  - Added language describing how to use VK_IMAGE_LAYOUT_PRESENT_SOURCE_KHR.
  - Cleaned up an XXX comment regarding the description of which queues vkQueuePresentKHR can be used on.

- Revision 22, 2015-06-17 (James Jones)
  - Rebased on Vulkan API version 126.

- Revision 23, 2015-06-18 (James Jones)
  - Updated language for issue 12 to read as a proposed resolution.
Marked issues 11, 12, 13, 16, and 17 resolved.
Temporarily added links to the relevant bugs under the remaining unresolved issues.
Added issues 19 and 20 as well as proposed resolutions.

Revision 24, 2015-06-19 (Ian Elliott)
- Changed special value for VkSurfacePropertiesKHR::currentExtent back to “-1” from “0”. This value will never need to be unsigned, and “0” is actually a legal value.

Revision 25, 2015-06-23 (Ian Elliott)
- Examples now show use of function pointers for extension functions.
- Eliminated extraneous whitespace.

Revision 26, 2015-06-25 (Ian Elliott)
- Resolved Issues 9 & 10 per KHR TSG meeting.

Revision 27, 2015-06-25 (James Jones)
- Added oldSwapchain member to VkSwapchainCreateInfoKHR.

Revision 28, 2015-06-25 (James Jones)
- Added the “inherit” bits to the rotation and mirroring flags and the associated issue 21.

Revision 29, 2015-06-25 (James Jones)
- Added the “clipped” flag to VkSwapchainCreateInfoKHR, and the associated issue 22.
- Specified that presenting an image does not modify it.

Revision 30, 2015-06-25 (James Jones)
- Added language to the spec that clarifies the behavior of vkCreateSwapchainKHR() when the oldSwapchain field of VkSwapchainCreateInfoKHR is not NULL.

Revision 31, 2015-06-26 (Ian Elliott)
- Example of new VkSwapchainCreateInfoKHR members, “oldSwapchain” and “clipped”.
- Example of using VkSurfacePropertiesKHR::{min|max}ImageCount to set VkSwapchainCreateInfoKHR::minImageCount.
- Rename vkGetSurfaceInfoKHR()'s 4th parameter to “pDataSize”, for consistency with other functions.
- Add macro with C-string name of extension (just to header file).

Revision 32, 2015-06-26 (James Jones)
- Minor adjustments to the language describing the behavior of “oldSwapchain”
- Fixed the version date on my previous two updates.

Revision 33, 2015-06-26 (Jesse Hall)
- Add usage flags to VkSwapchainCreateInfoKHR

Revision 34, 2015-06-26 (Ian Elliott)
- Rename vkQueuePresentKHR()'s 2nd parameter to “pPresentInfo”, for consistency with other functions.
• Revision 35, 2015-06-26 (Faith Ekstrand)
  ◦ Merged the VkRotationFlagBitsKHR and VkMirrorFlagBitsKHR enums into a single
    VkSurfaceTransformFlagBitsKHR enum.

• Revision 36, 2015-06-26 (Faith Ekstrand)
  ◦ Added a VkSurfaceTransformKHR enum that is not a bitmask. Each value in
    VkSurfaceTransformKHR corresponds directly to one of the bits in
    VkSurfaceTransformFlagBitsKHR so transforming from one to the other is easy. Having a
    separate enum means that currentTransform and preTransform are now unambiguous by
    definition.

• Revision 37, 2015-06-29 (Ian Elliott)
  ◦ Corrected one of the signatures of vkAcquireNextImageKHR, which had the last two
    parameters switched from what it is elsewhere in the specification and header files.

• Revision 38, 2015-06-30 (Ian Elliott)
  ◦ Corrected a typo in description of the vkGetSwapchainInfoKHR() function.
  ◦ Corrected a typo in header file comment for VkPresentInfoKHR::sType.

• Revision 39, 2015-07-07 (Daniel Rakos)
  ◦ Added error section describing when each error is expected to be reported.
  ◦ Replaced bool32_t with VkBool32.

• Revision 40, 2015-07-10 (Ian Elliott)
  ◦ Updated to work with version 138 of the vulkan.h header. This includes declaring the
    VkSwapchainKHR type using the new VK_DEFINE_NONDISP_HANDLE macro, and no longer
    extending VkObjectType (which was eliminated).

• Revision 41 2015-07-09 (Mathias Heyer)
  ◦ Added color space language.

• Revision 42, 2015-07-10 (Daniel Rakos)
  ◦ Updated query mechanism to reflect the convention changes done in the core spec.
  ◦ Removed “queue” from the name of VK_STRUCTURE_TYPE_QUEUE_PRESENT_INFO_KHR to
    be consistent with the established naming convention.
  ◦ Removed reference to the no longer existing VkObjectType enum.

• Revision 43, 2015-07-17 (Daniel Rakos)
  ◦ Added support for concurrent sharing of swapchain images across queue families.
  ◦ Updated sample code based on recent changes

• Revision 44, 2015-07-27 (Ian Elliott)
  ◦ Noted that support for VK_PRESENT_MODE_FIFO_KHR is required. That is ICDs may
    optionally support IMMEDIATE and MAILBOX, but must support FIFO.

• Revision 45, 2015-08-07 (Ian Elliott)
  ◦ Corrected a typo in spec file (type and variable name had wrong case for the
    imageColorSpace member of the VkSwapchainCreateInfoKHR struct).
• Corrected a typo in header file (last parameter in PFN_vkGetSurfacePropertiesKHR was missing “KHR” at the end of type: VkSurfacePropertiesKHR).

• Revision 46, 2015-08-20 (Ian Elliott)
  ◦ Renamed this extension and all of its enumerations, types, functions, etc. This makes it compliant with the proposed standard for Vulkan extensions.
  ◦ Switched from “revision” to “version”, including use of the VK_MAKE_VERSION macro in the header file.
  ◦ Made improvements to several descriptions.
  ◦ Changed the status of several issues from PROPOSED to RESOLVED, leaving no unresolved issues.
  ◦ Resolved several TODOs, did miscellaneous cleanup, etc.

• Revision 47, 2015-08-20 (Ian Elliott—porting a 2015-07-29 change from James Jones)
  ◦ Moved the surface transform enums to VK_WSI_swapchain so they could be reused by VK_WSI_display.

• Revision 48, 2015-09-01 (James Jones)
  ◦ Various minor cleanups.

• Revision 49, 2015-09-01 (James Jones)
  ◦ Restore single-field revision number.

• Revision 50, 2015-09-01 (James Jones)
  ◦ Update Example #4 to include code that illustrates how to use the oldSwapchain field.

• Revision 51, 2015-09-01 (James Jones)
  ◦ Fix example code compilation errors.

• Revision 52, 2015-09-08 (Matthaeus G. Chajdas)
  ◦ Corrected a typo.

• Revision 53, 2015-09-10 (Alon Or-bach)
  ◦ Removed underscore from SWAP_CHAIN left in VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR.

• Revision 54, 2015-09-11 (Jesse Hall)
  ◦ Described the execution and memory coherence requirements for image transitions to and from VK_IMAGE_LAYOUT_PRESENT_SOURCE_KHR.

• Revision 55, 2015-09-11 (Ray Smith)
  ◦ Added errors for destroying and binding memory to presentable images

• Revision 56, 2015-09-18 (James Jones)
  ◦ Added fence argument to vkAcquireNextImageKHR
  ◦ Added example of how to meter a host thread based on presentation rate.

• Revision 57, 2015-09-26 (Jesse Hall)
  ◦ Replace VkSurfaceDescriptionKHR with VkSurfaceKHR.
• Added issue 25 with agreed resolution.

• Revision 58, 2015-09-28 (Jesse Hall)
  ◦ Renamed from VK_EXT_KHR_device_swapchain to VK_EXT_KHR_swapchain.

• Revision 59, 2015-09-29 (Ian Elliott)
  ◦ Changed vkDestroySwapchainKHR() to return void.

• Revision 60, 2015-10-01 (Jeff Vigil)
  ◦ Added error result VK_ERROR_SURFACE_LOST_KHR.

• Revision 61, 2015-10-05 (Faith Ekstrand)
  ◦ Added the VkCompositeAlpha enum and corresponding structure fields.

• Revision 62, 2015-10-12 (Daniel Rakos)
  ◦ Added VK_PRESENT_MODE_FIFO_RELAXED_KHR.

• Revision 63, 2015-10-15 (Daniel Rakos)
  ◦ Moved surface capability queries to VK_EXT_KHR_surface.

• Revision 64, 2015-10-26 (Ian Elliott)
  ◦ Renamed from VK_EXT_KHR_swapchain to VK_KHR_swapchain.

• Revision 65, 2015-10-28 (Ian Elliott)
  ◦ Added optional pResult member to VkPresentInfoKHR, so that per-swapchain results can be obtained from vkQueuePresentKHR().
  ◦ Make VkPresentInfoKHR::pResults non-const; it is an output array parameter.
  ◦ Make pPresentInfo parameter to vkQueuePresentKHR const.

• Revision 66, 2015-11-03 (Daniel Rakos)
  ◦ Added allocation callbacks to create and destroy functions.
  ◦ Updated resource transition language.
  ◦ Updated sample code.

• Revision 67, 2015-11-10 (Jesse Hall)
  ◦ Add reserved flags bitmask to VkSwapchainCreateInfoKHR.
  ◦ Modify naming and member ordering to match API style conventions, and so the VkSwapchainCreateInfoKHR image property members mirror corresponding VkImageCreateInfo members but with an ‘image’ prefix.
  ◦ Make VkPresentInfoKHR::pResults non-const; it is an output array parameter.
  ◦ Make pPresentInfo parameter to vkQueuePresentKHR const.

• Revision 68, 2016-04-05 (Ian Elliott)
  ◦ Moved the “validity” include for vkAcquireNextImage to be in its proper place, after the prototype and list of parameters.
  ◦ Clarified language about presentable images, including how they are acquired, when applications can and cannot use them, etc. As part of this, removed language about “ownership” of presentable images, and replaced it with more-consistent language about presentable images being “acquired” by the application.

• 2016-08-23 (Ian Elliott)
- Update the example code, to use the final API command names, to not have so many characters per line, and to split out a new example to show how to obtain function pointers. This code is more similar to the LunarG “cube” demo program.

- 2016-08-25 (Ian Elliott)
  - A note was added at the beginning of the example code, stating that it will be removed from future versions of the appendix.

- Revision 69, 2017-09-07 (Tobias Hector)
  - Added interactions with Vulkan 1.1

- Revision 70, 2017-10-06 (Ian Elliott)
  - Corrected interactions with Vulkan 1.1

**Other Extension Metadata**
Description

This extension allows processing of swapchain images as different formats to that used by the window system, which is particularly useful for switching between sRGB and linear RGB formats.

It adds a new swapchain creation flag that enables creating image views from presentable images with a different format than the one used to create the swapchain.

New Enum Constants

- VK_KHR_SWAPCHAIN_MUTABLE_FORMAT_EXTENSION_NAME
- VK_KHR_SWAPCHAIN_MUTABLE_FORMAT_SPEC_VERSION
- ExtendingVkSwapchainCreateFlagBitsKHR:
  - VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR

Issues

1) Are there any new capabilities needed?

**RESOLVED**: No. It is expected that all implementations exposing this extension support swapchain image format mutability.

2) Do we need a separate VK_SWAPCHAIN_CREATE_EXTENDED_USAGE_BIT_KHR?

**RESOLVED**: No. This extension requires VK_KHR_maintenance2 and presentable images of swapchains created with VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR are created internally in a way equivalent to specifying both VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR.

3) Do we need a separate structure to allow specifying an image format list for swapchains?

**RESOLVED**: No. We simply use the same VkImageFormatListCreateInfoKHR structure introduced by VK_KHR_image_format_list. The structure is required to be included in the pNext chain of VkSwapchainCreateInfoKHR for swapchains created with VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR.

API Interactions

- Interacts with VK_AMD_buffer_marker
- Interacts with VK_EXT_blend_operation_advanced
- Interacts with VK_EXT_conditional_rendering
- Interacts with VK_EXT_fragment_density_map
- Interacts with VK_EXT_mesh_shader
- Interacts with VK_EXT_transform_feedback
- Interacts with VK_KHR_acceleration_structure
- Interacts with VK_KHR_fragment_shading_rate
- Interacts with VK_KHR_ray_tracing_pipeline
- Interacts with VK_NV_device_diagnostic_checkpoints
- Interacts with VK_NV_device_generated_commands
- Interacts with VK_NV_mesh_shader
- Interacts with VK_NV_ray_tracing
- Interacts with VK_NV_shading_rate_image
Description

This extension modifies the original core synchronization APIs to simplify the interface and improve usability of these APIs. It also adds new pipeline stage and access flag types that extend into the 64-bit range, as we have run out within the 32-bit range. The new flags are identical to the old values within the 32-bit range, with new stages and bits beyond that.

Pipeline stages and access flags are now specified together in memory barrier structures, making the connection between the two more obvious. Additionally, scoping the pipeline stages into the barrier structs allows the use of the MEMORY_READ and MEMORY_WRITE flags without sacrificing precision. The per-stage access flags should be used to disambiguate specific accesses in a given stage or set of stages - for instance, between uniform reads and sampling operations.

Layout transitions have been simplified as well; rather than requiring a different set of layouts for depth/stencil/color attachments, there are generic VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR and VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR layouts which are contextually applied based on the image format. For example, for a depth format image, VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR is equivalent to VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR. VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR also functionally replaces VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL.

Events are now more efficient, because they include memory dependency information when you set them on the device. Previously, this information was only known when waiting on an event, so the dependencies could not be satisfied until the wait occurred. That sometimes meant stalling the pipeline when the wait occurred. The new API provides enough information for implementations to satisfy these dependencies in parallel with other tasks.

Queue submission has been changed to wrap command buffers and semaphores in extensible structures, which incorporate changes from Vulkan 1.1, VK_KHR_device_group, and VK_KHR_timeline_semaphore. This also adds a pipeline stage to the semaphore signal operation, mirroring the existing pipeline stage specification for wait operations.

Other miscellaneous changes include:
• Events can now be specified as interacting only with the device, allowing more efficient access to the underlying object.

• Image memory barriers that do not perform an image layout transition can be specified by setting `oldLayout` equal to `newLayout`.
  ◦ E.g. the old and new layout can both be set to `VK_IMAGE_LAYOUT_UNDEFINED`, without discarding data in the image.

• Queue family ownership transfer parameters are simplified in some cases.

• Where two synchronization commands need to be matched up (queue transfer operations, events), the dependency information specified in each place must now match completely for consistency.

• Extensions with commands or functions with a `VkPipelineStageFlags` or `VkPipelineStageFlagBits` parameter have had those APIs replaced with equivalents using `VkPipelineStageFlags2KHR`.

• The new event and barrier interfaces are now more extensible for future changes.

• Relevant pipeline stage masks can now be specified as empty with the new `VK_PIPELINE_STAGE_NONE_KHR` and `VK_PIPELINE_STAGE_2_NONE_KHR` values.

• `VkMemoryBarrier2KHR` can be chained to `VkSubpassDependency2`, overriding the original 32-bit stage and access masks.

New Base Types

• `VkFlags64`

New Commands

• `vkCmdPipelineBarrier2KHR`
• `vkCmdResetEvent2KHR`
• `vkCmdSetEvent2KHR`
• `vkCmdWaitEvents2KHR`
• `vkCmdWriteTimestamp2KHR`
• `vkQueueSubmit2KHR`

New Structures

• `VkBufferMemoryBarrier2KHR`
• `VkCommandBufferSubmitInfoKHR`
• `VkDependencyInfoKHR`
• `VkImageMemoryBarrier2KHR`
• `VkSemaphoreSubmitInfoKHR`
• `VkSubmitInfo2KHR`
• Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`: 
- VkPhysicalDeviceSynchronization2FeaturesKHR
- Extending VkSubpassDependency2:
  - VkMemoryBarrier2KHR

**New Enums**

- VkAccessFlagBits2KHR
- VkPipelineStageFlagBits2KHR
- VkSubmitFlagBitsKHR

**New Bitmasks**

- VkAccessFlags2KHR
- VkPipelineStageFlags2KHR
- VkSubmitFlagsKHR

**New Enum Constants**

- VK_KHR_SYNCHRONIZATION_2_EXTENSION_NAME
- VK_KHR_SYNCHRONIZATION_2_SPEC_VERSION
- Extending VkAccessFlagBits:
  - VK_ACCESS_NONE_KHR
- Extending VkEventCreateFlagBits:
  - VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR
- Extending VkImageLayout:
  - VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR
  - VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR
- Extending VkPipelineStageFlagBits:
  - VK_PIPELINE_STAGE_NONE_KHR
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER_2_KHR
  - VK_STRUCTURE_TYPE_COMMAND_BUFFER_SUBMIT_INFO_KHR
  - VK_STRUCTURE_TYPE_DEPENDENCY_INFO_KHR
  - VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER_2_KHR
  - VK_STRUCTURE_TYPE_MEMORY_BARRIER_2_KHR
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SYNCHRONIZATION_2_FEATURES_KHR
  - VK_STRUCTURE_TYPE_SEMAPHORE_SUBMIT_INFO_KHR
  - VK_STRUCTURE_TYPE_SUBMIT_INFO_2_KHR
If `VK_EXT_blend_operation_advanced` is supported:

- Extending `VkAccessFlagBits2`:
  - `VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT`  

If `VK_KHR_fragment_shading_rate` is supported:

- Extending `VkAccessFlagBits2`:
  - `VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR`  

- Extending `VkPipelineStageFlagBits2`:
  - `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`  

**Promotion to Vulkan 1.3**

Functionality in this extension is included in core Vulkan 1.3, with the KHR suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

**Examples**

See [https://github.com/KhronosGroup/Vulkan-Docs/wiki/Synchronization-Examples](https://github.com/KhronosGroup/Vulkan-Docs/wiki/Synchronization-Examples)

Description

This extension defines the VK_FORMAT_A4R4G4B4_UNORM_PACK16_EXT and VK_FORMAT_A4B4G4R4_UNORM_PACK16_EXT formats which are defined in other current graphics APIs.

This extension may be useful for building translation layers for those APIs or for porting applications that use these formats without having to resort to swizzles.

When VK_EXT_custom_border_color is used, these formats are not subject to the same restrictions for border color without format as with VK_FORMAT_B4G4R4A4_UNORM_PACK16.

New Structures

• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDevice4444FormatsFeaturesEXT

New Enum Constants

• VK_EXT_4444_FORMATS_EXTENSION_NAME
• VK_EXT_4444_FORMATS_SPEC_VERSION

• Extending VkFormat:
  ◦ VK_FORMAT_A4B4G4R4_UNORM_PACK16_EXT
  ◦ VK_FORMAT_A4R4G4B4_UNORM_PACK16_EXT

• Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_4444_FORMATS_FEATURES_EXT
Promotion to Vulkan 1.3

This extension has been partially promoted. The format enumerants introduced by the extension are included in core Vulkan 1.3, with the EXT suffix omitted. However, runtime support for these formats is optional in core Vulkan 1.3, while if this extension is supported, runtime support is mandatory. The feature structure is not promoted. The original enum names are still available as aliases of the core functionality.

Description

This instance extension enables an application to pass application parameters to the implementation at instance or device creation time.

The application parameters consist of a set of vendor-specific keys and values. Each key is a 32-bit enum, and each value is a 64-bit integer. The valid keys, range of values, and default values are documented external to this specification in implementation-specific documentation.

This extension is an instance extension rather than a device extension so that the implementation can modify reported `VkPhysicalDevice` properties or features as needed.

New Structures

- Extending `VkApplicationInfo`, `VkDeviceCreateInfo`:
  - `VkApplicationParametersEXT`

New Enum Constants

- `VK_EXT_APPLICATION_PARAMETERS_EXTENSION_NAME`
- `VK_EXT_APPLICATION_PARAMETERS_SPEC_VERSION`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_APPLICATION_PARAMETERS_EXT`

Issues

1. How should the key enumerants be assigned?

   **RESOLVED:** The key enumerants are completely implementation-specific and do not need to be centrally reserved. They should be documented in the implementation-specific documentation. The vendor ID and optionally the device ID are provided to disambiguate between multiple ICDs or devices.

2. How does an application know what application parameters are valid on a particular implementation?

   **DISCUSSION:** There is no ability to enumerate device or system properties before an instance is created, however key and values must be recognized by an implementation in order for instance or device creation to succeed. The vendor and optionally the device ID are provided to identify which ICD or device the application parameters are targeted at.

3. Is it OK if the "valid value" for specified keys is not from static documented values, but must be consistent-with/interdependent-on other `VkApplicationParametersEXT`?

   **DISCUSSION:** Yes this is fine. Examples for how this could be used include:

   - a checksum key where the value is computed based on other `VkApplicationParametersEXT` structures in the pNext chain.
an "application key" which either implies or explicitly lists a set of prevalidated key/value pairs.

Description

The existing specification requires that low dynamic range (LDR) ASTC textures are decompressed to FP16 values per component. In many cases, decompressing LDR textures to a lower precision intermediate result gives acceptable image quality. Source material for LDR textures is typically authored as 8-bit UNORM values, so decoding to FP16 values adds little value. On the other hand, reducing precision of the decoded result reduces the size of the decompressed data, potentially
improving texture cache performance and saving power.

The goal of this extension is to enable this efficiency gain on existing ASTC texture data. This is achieved by giving the application the ability to select the intermediate decoding precision.

Three decoding options are provided:

- Decode to `VK_FORMAT_R16G16B16A16_SFLOAT` precision: This is the default, and matches the required behavior in the core API.
- Decode to `VK_FORMAT_R8G8B8A8_UNORM` precision: This is provided as an option in LDR mode.
- Decode to `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32` precision: This is provided as an option in both LDR and HDR mode. In this mode, negative values cannot be represented and are clamped to zero. The alpha component is ignored, and the results are as if alpha was 1.0. This decode mode is optional and support can be queried via the physical device properties.

### New Structures

- Extending `VkImageViewCreateInfo`:
  - `VkImageViewASTCDecodeModeEXT`
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceASTCDecodeFeaturesEXT`

### New Enum Constants

- `VK_EXT_ASTC_DECODE_MODE_EXTENSION_NAME`
- `VK_EXT_ASTC_DECODE_MODE_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ASTC_DECODE_FEATURES_EXT`

### Issues

1) Are implementations allowed to decode at a higher precision than what is requested?

RESOLUTION: No. If we allow this, then this extension could be exposed on all implementations that support ASTC. But developers would have no way of knowing what precision was actually used, and thus whether the image quality is sufficient at reduced precision.

2) Should the decode mode be image view state and/or sampler state?

RESOLUTION: Image view state only.
Some implementations treat the different decode modes as different texture formats.

**Example**

Create an image view that decodes to `VK_FORMAT_R8G8B8A8 UNORM` precision:

```c
VkImageViewASTCDecodeModeEXT decodeMode =
{
    .sType = VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT,
    .pNext = NULL,
    .decodeMode = VK_FORMAT_R8G8B8A8 UNORM
};

VkImageViewCreateInfo createInfo =
{
    .sType = VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO,
    .pNext = &decodeMode,
    // flags, image, viewType set to application-desired values
    .format = VK_FORMAT_ASTC_8x8 UNORM_BLOCK,
    // components, subresourceRange set to application-desired values
};

VkImageView imageView;
VkResult result = vkCreateImageView(  
    device,  
    &createInfo,  
    NULL,  
    &imageView);
```

**Version History**

- Revision 1, 2018-08-07 (Jan-Harald Fredriksen)
  - Initial revision

**VK_EXT_blend_operation_advanced**

- **Name String**: `VK_EXT_blend_operation_advanced`
- **Extension Type**: Device extension
- **Registered Extension Number**: 149
Description

This extension adds a number of “advanced” blending operations that can be used to perform new color blending operations, many of which are more complex than the standard blend modes provided by unextended Vulkan. This extension requires different styles of usage, depending on the level of hardware support and the enabled features:

- If `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT::advancedBlendCoherentOperations` is `VK_FALSE`, the new blending operations are supported, but a memory dependency must separate each advanced blend operation on a given sample. `VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT` is used to synchronize reads using advanced blend operations.

- If `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT::advancedBlendCoherentOperations` is `VK_TRUE`, advanced blend operations obey primitive order just like basic blend operations.

In unextended Vulkan, the set of blending operations is limited, and can be expressed very simply. The `VK_BLEND_OP_MIN` and `VK_BLEND_OP_MAX` blend operations simply compute component-wise minimums or maximums of source and destination color components. The `VK_BLEND_OP_ADD`, `VK_BLEND_OP_SUBTRACT`, and `VK_BLEND_OP_REVERSE_SUBTRACT` modes multiply the source and destination colors by source and destination factors and either add the two products together or subtract one from the other. This limited set of operations supports many common blending operations but precludes the use of more sophisticated transparency and blending operations commonly available in many dedicated imaging APIs.

This extension provides a number of new “advanced” blending operations. Unlike traditional blending operations using `VK_BLEND_OP_ADD`, these blending equations do not use source and
destination factors specified by `VkBlendFactor`. Instead, each blend operation specifies a complete equation based on the source and destination colors. These new blend operations are used for both RGB and alpha components; they must not be used to perform separate RGB and alpha blending (via different values of color and alpha `VkBlendOp`).

These blending operations are performed using premultiplied colors, where RGB colors can be considered premultiplied or non-premultiplied by alpha, according to the `srcPremultiplied` and `dstPremultiplied` members of `VkPipelineColorBlendAdvancedStateCreateInfoEXT`. If a color is considered non-premultiplied, the (R,G,B) color components are multiplied by the alpha component prior to blending. For non-premultiplied color components in the range [0,1], the corresponding premultiplied color component would have values in the range \([0 \times A, 1 \times A]\).

Many of these advanced blending equations are formulated where the result of blending source and destination colors with partial coverage have three separate contributions: from the portions covered by both the source and the destination, from the portion covered only by the source, and from the portion covered only by the destination. The blend parameter `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap` can be used to specify a correlation between source and destination pixel coverage. If set to `VK_BLEND_OVERLAP_CONJOINT_EXT`, the source and destination are considered to have maximal overlap, as would be the case if drawing two objects on top of each other. If set to `VK_BLEND_OVERLAP_DISJOINT_EXT`, the source and destination are considered to have minimal overlap, as would be the case when rendering a complex polygon tessellated into individual non-intersecting triangles. If set to `VK_BLEND_OVERLAP_UNCORRELATED_EXT`, the source and destination coverage are assumed to have no spatial correlation within the pixel.

In addition to the coherency issues on implementations not supporting `advancedBlendCoherentOperations`, this extension has several limitations worth noting. First, the new blend operations have a limit on the number of color attachments they can be used with, as indicated by `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendMaxColorAttachments`. Additionally, blending precision may be limited to 16-bit floating-point, which may result in a loss of precision and dynamic range for framebuffer formats with 32-bit floating-point components, and in a loss of precision for formats with 12- and 16-bit signed or unsigned normalized integer components.

**New Structures**

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT`

- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT`

Extension and Version Dependencies

VK_KHR_get_physical_device_properties2
Description

This extension allows for selectively enabling and disabling writes to output color attachments via a pipeline dynamic state.

The intended use cases for this new state are mostly identical to those of colorWriteMask, such as selectively disabling writes to avoid feedback loops between subpasses or bandwidth savings for unused outputs. By making the state dynamic, one additional benefit is the ability to reduce pipeline counts and pipeline switching via shaders that write a superset of the desired data of which subsets are selected dynamically. The reason for a new state, colorWriteEnable, rather than making colorWriteMask dynamic is that, on many implementations, the more flexible per-component semantics of the colorWriteMask state cannot be made dynamic in a performant manner.

New Commands

Description

This extension adds a new rasterization mode called conservative rasterization. There are two modes of conservative rasterization; overestimation and underestimation.

When overestimation is enabled, if any part of the primitive, including its edges, covers any part of the rectangular pixel area, including its sides, then a fragment is generated with all coverage samples turned on. This extension allows for some variation in implementations by accounting for differences in overestimation, where the generating primitive size is increased at each of its edges by some sub-pixel amount to further increase conservative pixel coverage. Implementations can allow the application to specify an extra overestimation beyond the base overestimation the implementation already does. It also allows implementations to either cull degenerate primitives or rasterize them.

When underestimation is enabled, fragments are only generated if the rectangular pixel area is fully covered by the generating primitive. If supported by the implementation, when a pixel rectangle is fully covered the fragment shader input variable builtin called `FullyCoveredEXT` is set to true. The shader variable works in either overestimation or underestimation mode.

Implementations can process degenerate triangles and lines by either discarding them or generating conservative fragments for them. Degenerate triangles are those that end up with zero area after the rasterizer quantizes them to the fixed-point pixel grid. Degenerate lines are those with zero length after quantization.
New Structures

• Extending `VkPhysicalDeviceProperties2`:

Description

This extension provides cross-vendor functionality to specify a custom border color for use when the sampler address mode `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER` is used.

To create a sampler which uses a custom border color set `VkSamplerCreateInfo::borderColor` to one of:

- `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT`
- `VK_BORDER_COLOR_INT_CUSTOM_EXT`

When `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT` is used, applications must provide a `VkSamplerCustomBorderColorCreateInfoEXT` in the `pNext` chain for `VkSamplerCreateInfo`.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceCustomBorderColorFeaturesEXT`
- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceCustomBorderColorPropertiesEXT`
- Extending `VkSamplerCreateInfo`:
  - `VkSamplerCustomBorderColorCreateInfoEXT`

New Enum Constants

- `VK_EXT_CUSTOM_BORDER_COLOR_EXTENSION_NAME`
- `VK_EXT_CUSTOM_BORDER_COLOR_SPEC_VERSION`
- Extending `VkBorderColor`:
  - `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT`
  - `VK_BORDER_COLOR_INT_CUSTOM_EXT`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_PROPERTIES_EXT`
  - `VK_STRUCTURE_TYPE_SAMPLER_CUSTOM_BORDER_COLOR_CREATE_INFO_EXT`

Issues

1) Should `VkClearColorValue` be used for the border color value, or should we have our own
struct/union? Do we need to specify the type of the input values for the components? This is more of a concern if VkClearColorValue is used here because it provides a union of float,int,uint types.

**RESOLVED:** Will reuse existing VkClearColorValue structure in order to easily take advantage of float,int,uint borderColor types.

2) For hardware which supports a limited number of border colors what happens if that number is exceeded? Should this be handled by the driver unbeknownst to the application? In Revision 1 we had solved this issue using a new Object type, however that may have lead to additional system resource consumption which would otherwise not be required.

**RESOLVED:** Added VkPhysicalDeviceCustomBorderColorPropertiesEXT::maxCustomBorderColorSamplers for tracking implementation-specific limit, and Valid Usage statement handling overflow.

3) Should this be supported for immutable samplers at all, or by a feature bit? Some implementations may not be able to support custom border colors on immutable samplers — is it worthwhile enabling this to work on them for implementations that can support it, or forbidding it entirely.

**RESOLVED:** Samplers created with a custom border color are forbidden from being immutable. This resolves concerns for implementations where the custom border color is an index to a LUT instead of being directly embedded into sampler state.

4) Should UINT and SINT (unsigned integer and signed integer) border color types be separated or should they be combined into one generic INT (integer) type?

**RESOLVED:** Separating these does not make much sense as the existing fixed border color types do not have this distinction, and there is no reason in hardware to do so. This separation would also create unnecessary work and considerations for the application.

**Version History**

- **Revision 1, 2019-10-10 (Joshua Ashton)**
  - Internal revisions.
- **Revision 2, 2019-10-11 (Liam Middlebrook)**
  - Remove VkCustomBorderColor object and associated functions
  - Add issues concerning HW limitations for custom border color count
- **Revision 3, 2019-10-12 (Joshua Ashton)**
  - Re-expose the limits for the maximum number of unique border colors
  - Add extra details about border color tracking
  - Fix typos
- **Revision 4, 2019-10-12 (Joshua Ashton)**
  - Changed maxUniqueCustomBorderColorColors to a uint32_t from a VkDeviceSize
- **Revision 5, 2019-10-14 (Liam Middlebrook)**
  - Added features bit
• Revision 6, 2019-10-15 (Joshua Ashton)
  ◦ Type-ize VK_BORDER_COLOR_CUSTOM
  ◦ Fix const-ness on pNext of VkSamplerCustomBorderColorCreateInfoEXT
• Revision 7, 2019-11-26 (Liam Middlebrook)
  ◦ Renamed maxUniqueCustomBorderColorColors to maxCustomBorderColorColors
• Revision 8, 2019-11-29 (Joshua Ashton)
  ◦ Renamed borderColor member of VkSamplerCustomBorderColorCreateInfoEXT to customBorderColor
• Revision 9, 2020-02-19 (Joshua Ashton)
  ◦ Renamed maxCustomBorderColorColors to maxCustomBorderColorSamplers
• Revision 10, 2020-02-21 (Joshua Ashton)
  ◦ Added format to VkSamplerCustomBorderColorCreateInfoEXT and feature bit
• Revision 11, 2020-04-07 (Joshua Ashton)
  ◦ Dropped UINT/SINT border color differences, consolidated types
• Revision 12, 2020-04-16 (Joshua Ashton)
  ◦ Renamed VK_BORDER_COLOR_CUSTOM_FLOAT_EXT to VK_BORDER_COLOR_FLOAT_CUSTOM_EXT for consistency

Description

Due to the nature of the Vulkan interface, there is very little error information available to the developer and application. By using the VK_EXT_debug_utils extension, developers can obtain more information. When combined with validation layers, even more detailed feedback on the application's use of Vulkan will be provided.

This extension provides the following capabilities:

- The ability to create a debug messenger which will pass along debug messages to an application supplied callback.
- The ability to identify specific Vulkan objects using a name or tag to improve tracking.
• The ability to identify specific sections within a `VkQueue` or `VkCommandBuffer` using labels to aid organization and offline analysis in external tools.

The main difference between this extension and `VK_EXT_debug_report` and `VK_EXT_debug_marker` is that those extensions use `VkDebugReportObjectTypeEXT` to identify objects. This extension uses the core `VkObjectType` in place of `VkDebugReportObjectTypeEXT`. The primary reason for this move is that no future object type handle enumeration values will be added to `VkDebugReportObjectTypeEXT` since the creation of `VkObjectType`.

In addition, this extension combines the functionality of both `VK_EXT_debug_report` and `VK_EXT_debug_marker` by allowing object name and debug markers (now called labels) to be returned to the application's callback function. This should assist in clarifying the details of a debug message including: what objects are involved and potentially which location within a `VkQueue` or `VkCommandBuffer` the message occurred.

**New Object Types**

• `VkDebugUtilsMessengerEXT`

**New Commands**

• `vkCmdBeginDebugUtilsLabelEXT`
• `vkCmdEndDebugUtilsLabelEXT`
• `vkCmdInsertDebugUtilsLabelEXT`
• `vkCreateDebugUtilsMessengerEXT`
• `vkDestroyDebugUtilsMessengerEXT`

- VK_EXT_DEBUG_UTILS_SPEC_VERSION

Extending VkObjectType:

- VK_OBJECT_TYPE_DEBUG_UTILS_MESSENGER_EXT

Extending VkStructureType:

- VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT
- VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CALLBACK_DATA_EXT
- VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT
- VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_NAME_INFO_EXT
- VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_TAG_INFO_EXT

Examples

Example 1

VK_EXT_debug_utils allows an application to register multiple callbacks with any Vulkan component wishing to report debug information. Some callbacks may log the information to a file, others may cause a debug break point or other application defined behavior. An application can register callbacks even when no validation layers are enabled, but they will only be called for loader and, if implemented, driver events.

To capture events that occur while creating or destroying an instance an application can link a VkDebugUtilsMessengerCreateInfoEXT structure to the pNext element of the VkInstanceCreateInfo structure given to vkCreateInstance.

Example uses: Create three callback objects. One will log errors and warnings to the debug console.
using Windows `OutputDebugString`. The second will cause the debugger to break at that callback when an error happens and the third will log warnings to stdout.

```c
extern VkInstance instance;
VkResult res;
VkDebugUtilsMessengerEXT cb1, cb2, cb3;

// Must call extension functions through a function pointer:
PFN_vkCreateDebugUtilsMessengerEXT pfnCreateDebugUtilsMessengerEXT =
    (PFN_vkCreateDebugUtilsMessengerEXT)vkGetInstanceProcAddr(instance,
    "vkCreateDebugUtilsMessengerEXT");
PFN_vkDestroyDebugUtilsMessengerEXT pfnDestroyDebugUtilsMessengerEXT =
    (PFN_vkDestroyDebugUtilsMessengerEXT)vkGetInstanceProcAddr(instance,
    "vkDestroyDebugUtilsMessengerEXT");

VkDebugUtilsMessengerCreateInfoEXT callback1 = {
    .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT,
    .pNext = NULL,
    .flags = 0,
    .messageSeverity = VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT |
        VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT,
    .messageType = VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT |
        VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT,
    .PFNUserCallback = myOutputDebugString,
    .pUserData = NULL
};
res = pfnCreateDebugUtilsMessengerEXT(instance, &callback1, NULL, &cb1);
if (res != VK_SUCCESS) {
    // Do error handling for VK_ERROR_OUT_OF_MEMORY
}

callback1.messageSeverity = VK_DEBUG_UTILS_MESSAGE_SEVERITY_ERROR_BIT_EXT;
callback1.pFNUserCallback = myDebugBreak;
callback1.pUserData = NULL;
res = pfnCreateDebugUtilsMessengerEXT(instance, &callback1, NULL, &cb2);
if (res != VK_SUCCESS) {
    // Do error handling for VK_ERROR_OUT_OF_MEMORY
}

VkDebugUtilsMessengerCreateInfoEXT callback3 = {
    .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_MESSENGER_CREATE_INFO_EXT,
    .pNext = NULL,
    .flags = 0,
    .messageSeverity = VK_DEBUG_UTILS_MESSAGE_SEVERITY_WARNING_BIT_EXT,
    .messageType = VK_DEBUG_UTILS_MESSAGE_TYPE_GENERAL_BIT_EXT |
        VK_DEBUG_UTILS_MESSAGE_TYPE_VALIDATION_BIT_EXT,
    .PFNUserCallback = mystdOutLogger,
    .pUserData = NULL
};
res = pfnCreateDebugUtilsMessengerEXT(instance, &callback3, NULL, &cb3);
```
if (res != VK_SUCCESS) {
    // Do error handling for VK_ERROR_OUT_OF_MEMORY
}

// Remove callbacks when cleaning up
PFN_vkDestroyDebugUtilsMessengerEXT pfnDestroyDebugUtilsMessengerEXT(instance, cb1, NULL);
pfnDestroyDebugUtilsMessengerEXT(instance, cb2, NULL);
pfnDestroyDebugUtilsMessengerEXT(instance, cb3, NULL);

Example 2

Associate a name with an image, for easier debugging in external tools or with validation layers that can print a friendly name when referring to objects in error messages.

```c
extern VkInstance instance;
extern VkDevice device;
extern VkImage image;

// Must call extension functions through a function pointer:
PFN_vkSetDebugUtilsObjectNameEXT pfnSetDebugUtilsObjectNameEXT =
(PFN_vkSetDebugUtilsObjectNameEXT)vkGetInstanceProcAddr(instance, "vkSetDebugUtilsObjectNameEXT");

// Set a name on the image
const VkDebugUtilsObjectNameInfoEXT imageNameInfo =
{
    .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_NAME_INFO_EXT,
    .pNext = NULL,
    .objectType = VK_OBJECT_TYPE_IMAGE,
    .objectHandle = (uint64_t)image,
    .pObjectName = "Brick Diffuse Texture",
};
pfnSetDebugUtilsObjectNameEXT(device, &imageNameInfo);

// A subsequent error might print:
// Image 'Brick Diffuse Texture' (0xc0dec0dedeadbeef) is used in a
// command buffer with no memory bound to it.
```

Example 3

Annotating regions of a workload with naming information so that offline analysis tools can display a more usable visualization of the commands submitted.

```c
extern VkInstance instance;
extern VkCommandBuffer commandBuffer;
```
// Must call extension functions through a function pointer:
PFN_vkQueueBeginDebugUtilsLabelEXT pfnQueueBeginDebugUtilsLabelEXT = (PFN_vkQueueBeginDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance, "vkQueueBeginDebugUtilsLabelEXT");
PFN_vkQueueEndDebugUtilsLabelEXT pfnQueueEndDebugUtilsLabelEXT = (PFN_vkQueueEndDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance, "vkQueueEndDebugUtilsLabelEXT");
PFN_vkCmdBeginDebugUtilsLabelEXT pfnCmdBeginDebugUtilsLabelEXT = (PFN_vkCmdBeginDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance, "vkCmdBeginDebugUtilsLabelEXT");
PFN_vkCmdEndDebugUtilsLabelEXT pfnCmdEndDebugUtilsLabelEXT = (PFN_vkCmdEndDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance, "vkCmdEndDebugUtilsLabelEXT");
PFN_vkCmdInsertDebugUtilsLabelEXT pfnCmdInsertDebugUtilsLabelEXT = (PFN_vkCmdInsertDebugUtilsLabelEXT)vkGetInstanceProcAddr(instance, "vkCmdInsertDebugUtilsLabelEXT");

// Describe the area being rendered
const VkDebugUtilsLabelEXT houseLabel =
{
  .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT,
  .pNext = NULL,
  .pLabelName = "Brick House",
  .color = { 1.0f, 0.0f, 0.0f, 1.0f },
};

// Start an annotated group of calls under the 'Brick House' name
pfnCmdBeginDebugUtilsLabelEXT(commandBuffer, &houseLabel);
{
  // A mutable structure for each part being rendered
  VkDebugUtilsLabelEXT housePartLabel =
  {
    .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT,
    .pNext = NULL,
    .pLabelName = NULL,
    .color = { 0.0f, 0.0f, 0.0f, 0.0f },
  };

  // Set the name and insert the marker
  housePartLabel.pLabelName = "Walls";
  pfnCmdInsertDebugUtilsLabelEXT(commandBuffer, &housePartLabel);

  // Insert the drawcall for the walls
  vkCmdDrawIndexed(commandBuffer, 1000, 1, 0, 0, 0);

  // Insert a recursive region for two sets of windows
  housePartLabel.pLabelName = "Windows";
  pfnCmdBeginDebugUtilsLabelEXT(commandBuffer, &housePartLabel);
  {
    vkCmdDrawIndexed(commandBuffer, 75, 6, 1000, 0, 0);
    vkCmdDrawIndexed(commandBuffer, 100, 2, 1450, 0, 0);
  };
}
pfnCmdEndDebugUtilsLabelEXT(commandBuffer);

housePartLabel.pLabelName = "Front Door";
pfnCmdInsertDebugUtilsLabelEXT(commandBuffer, &housePartLabel);

vkCmdDrawIndexed(commandBuffer, 350, 1, 1650, 0, 0);

housePartLabel.pLabelName = "Roof";
pfnCmdInsertDebugUtilsLabelEXT(commandBuffer, &housePartLabel);

vkCmdDrawIndexed(commandBuffer, 500, 1, 2000, 0, 0);

}  // End the house annotation started above
pfnCmdEndDebugUtilsLabelEXT(commandBuffer);

// Do other work
vkEndCommandBuffer(commandBuffer);

// Describe the queue being used
const VkDebugUtilsLabelEXT queueLabel =
{
    .sType = VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT,
    .pNext = NULL,
    .pLabelName = "Main Render Work",
    .color = { 0.0f, 1.0f, 0.0f, 1.0f },
};

// Identify the queue label region
pfnQueueBeginDebugUtilsLabelEXT(queue, &queueLabel);

// Submit the work for the main render thread
const VkCommandBuffer cmd_bufs[] = {commandBuffer};
VkSubmitInfo submit_info =
{
    .sType = VK_STRUCTURE_TYPE_SUBMIT_INFO,
    .pNext = NULL,
    .waitSemaphoreCount = 0,
    .pWaitSemaphores = NULL,
    .pWaitDstStageMask = NULL,
    .commandBufferCount = 1,
    .pCommandBuffers = cmd_bufs,
    .signalSemaphoreCount = 0,
    .pSignalSemaphores = NULL
};
vkQueueSubmit(queue, 1, &submit_info, fence);

// End the queue label region
pfnQueueEndDebugUtilsLabelEXT(queue);
Issues

1) Should we just name this extension VK_EXT_debug_report2

**RESOLVED:** No. There is enough additional changes to the structures to break backwards compatibility. So, a new name was decided that would not indicate any interaction with the previous extension.

2) Will validation layers immediately support all the new features.

**RESOLVED:** Not immediately. As one can imagine, there is a lot of work involved with converting the validation layer logging over to the new functionality. Basic logging, as seen in the origin VK_EXT_debug_report extension will be made available immediately. However, adding the labels and object names will take time. Since the priority for Khronos at this time is to continue focusing on Valid Usage statements, it may take a while before the new functionality is fully exposed.

3) If the validation layers will not expose the new functionality immediately, then what is the point of this extension?

**RESOLVED:** We needed a replacement for VK_EXT_debug_report because the VkDebugReportObjectTypeEXT enumeration will no longer be updated and any new objects will need to be debugged using the new functionality provided by this extension.

4) Should this extension be split into two separate parts (1 extension that is an instance extension providing the callback functionality, and another device extension providing the general debug marker and annotation functionality)?

**RESOLVED:** No, the functionality for this extension is too closely related. If we did split up the extension, where would the structures and enums live, and how would you define that the device behavior in the instance extension is really only valid if the device extension is enabled, and the functionality is passed in. It is cleaner to just define this all as an instance extension, plus it allows the application to enable all debug functionality provided with one enable string during vkCreateInstance.

Version History

- Revision 1, 2017-09-14 (Mark Young and all listed Contributors)
  - Initial draft, based on VK_EXT_debug_report and VK_EXT_debug_marker in addition to previous feedback supplied from various companies including Valve, Epic, and Oxide games.
- Revision 2, 2020-04-03 (Mark Young and Piers Daniell)
  - Updated to allow either NULL or an empty string to be passed in for pObjectName in VkDebugUtilsObjectNameInfoEXT, because the loader and various drivers support NULL already.

• Tobias Hector, AMD

Description

This extension allows the depth clipping operation, that is normally implicitly controlled by VkPipelineRasterizationStateCreateInfo::depthClampEnable, to instead be controlled explicitly by VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable.

This is useful for translating DX content which assumes depth clamping is always enabled, but depth clip can be controlled by the DepthClipEnable rasterization state (D3D12_RASTERIZER_DESC).

New Structures

• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
- `VkPhysicalDeviceDepthClipEnableFeaturesEXT`
- Extending `VkPipelineRasterizationStateCreateInfo`:
  - `VkPipelineRasterizationDepthClipStateCreateInfoEXT`

### New Bitmasks

- `VkPipelineRasterizationDepthClipStateCreateFlagsEXT`

### New Enum Constants

- `VK_EXT_DEPTH_CLIP_ENABLE_EXTENSION_NAME`
- `VK_EXT_DEPTH_CLIP_ENABLE_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLIP_ENABLE_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_DEPTH_CLIP_STATE_CREATE_INFO_EXT`

Contributors
• Daniel Koch, NVIDIA
  • Jeff Bolz, NVIDIA

Description
This extension removes the VkViewport minDepth and maxDepth restrictions that the values must be between 0.0 and 1.0, inclusive. It also removes the same restriction on VkPipelineDepthStencilStateCreateInfo minDepthBounds and maxDepthBounds. Finally it removes the restriction on the depth value in VkClearDepthStencilValue.

New Enum Constants
• VK_EXT_DEPTH_RANGE_UNRESTRICTED_EXTENSION_NAME
• VK_EXT_DEPTH_RANGE_UNRESTRICTED_SPEC_VERSION

Issues
1) How do VkViewport minDepth and maxDepth values outside of the 0.0 to 1.0 range interact with Primitive Clipping?

**RESOLVED**: The behavior described in Primitive Clipping still applies. If depth clamping is disabled the depth values are still clipped to 0 ≤ z ≤ w before the viewport transform. If depth clamping is enabled the above equation is ignored and the depth values are instead clamped to the VkViewport minDepth and maxDepth values, which in the case of this extension can be outside of the 0.0 to 1.0 range.

2) What happens if a resulting depth fragment is outside of the 0.0 to 1.0 range and the depth buffer is fixed-point rather than floating-point?

**RESOLVED**: This situation can also arise without this extension (when fragment shaders replace depth values, for example), and this extension does not change the behaviour, which is defined in the Depth Test section of the Fragment Operations chapter.

Description
This is an extension, along with related platform extensions, allows applications to take exclusive control of displays associated with a native windowing system. This is especially useful for virtual reality applications that wish to hide HMDs (head mounted displays) from the native platform’s display management system, desktop, and/or other applications.

New Commands
• vkReleaseDisplayEXT
New Enum Constants

- VK_EXT_DIRECT_MODE_DISPLAY_EXTENSION_NAME
- VK_EXT_DIRECT_MODE_DISPLAY_SPEC_VERSION

Issues

1) Should this extension and its related platform-specific extensions leverage VK_KHR_display, or provide separate equivalent interfaces.

**RESOLVED**: Use VK_KHR_display concepts and objects. VK_KHR_display can be used to enumerate all displays on the system, including those attached to/in use by a window system or native platform, but VK_KHR_display_swapchain will fail to create a swapchain on in-use displays. This extension and its platform-specific children will allow applications to grab in-use displays away from window systems and/or native platforms, allowing them to be used with VK_KHR_display_swapchain.

2) Are separate calls needed to acquire displays and enable direct mode?

**RESOLVED**: No, these operations happen in one combined command. Acquiring a display puts it into direct mode.

• Jeff Bolz, NVIDIA

Description

This extension provides additional orthogonally aligned “discard rectangles” specified in framebuffer-space coordinates that restrict rasterization of all points, lines and triangles.

From zero to an implementation-dependent limit (specified by maxDiscardRectangles) number of discard rectangles can be operational at once. When one or more discard rectangles are active, rasterized fragments can either survive if the fragment is within any of the operational discard rectangles (VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT mode) or be rejected if the fragment is within any of the operational discard rectangles (VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT mode).

These discard rectangles operate orthogonally to the existing scissor test functionality. The discard rectangles can be different for each physical device in a device group by specifying the device mask and setting discard rectangle dynamic state.

Version 2 of this extension introduces new dynamic states VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT and VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT, and the corresponding functions vkCmdSetDiscardRectangleEnableEXT and vkCmdSetDiscardRectangleModeEXT. Applications that use these dynamic states must ensure the implementation advertises at least specVersion 2 of this extension.

New Commands

• vkCmdSetDiscardRectangleEXT
• vkCmdSetDiscardRectangleEnableEXT
• vkCmdSetDiscardRectangleModeEXT

New Structures

• Extending VkGraphicsPipelineCreateInfo:
  ◦ VkPipelineDiscardRectangleStateCreateInfoEXT
• Extending `VkPhysicalDeviceProperties2`:
  ◦ `VkPhysicalDeviceDiscardRectanglePropertiesEXT`

New Enums

• `VkDiscardRectangleModeEXT`

New Bitmasks

• `VkPipelineDiscardRectangleStateCreateFlagsEXT`

New Enum Constants

• `VK_EXT_DISCARD_RECTANGLES_EXTENSION_NAME`
• `VK_EXT_DISCARD_RECTANGLES_SPEC_VERSION`
• Extending `VkDynamicState`:
  ◦ `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT`
  ◦ `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT`
  ◦ `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT`
• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DISCARD_RECTANGLE_PROPERTIES_EXT`
  ◦ `VK_STRUCTURE_TYPE_PIPELINE_DISCARD_RECTANGLE_STATE_CREATE_INFO_EXT`

Version History

• Revision 2, 2023-01-18 (Piers Daniell)
  ◦ Add dynamic states for discard rectangle enable/disable and mode.
• Revision 1, 2016-12-22 (Piers Daniell)

Description
This extension defines a set of utility functions for use with the VK_KHR_display and VK_KHR_display_swapchain extensions.

New Commands
• vkDisplayPowerControlEXT
• vkGetSwapchainCounterEXT
• vkRegisterDeviceEventEXT
• vkRegisterDisplayEventEXT

New Structures
• VkDeviceEventInfoEXT
• VkDisplayEventInfoEXT
• VkDisplayPowerInfoEXT
• Extending VkSwapchainCreateInfoKHR:
New Enums

- VkDeviceEventTypeEXT
- VkDisplayEventTypeEXT
- VkDisplayPowerStateEXT

New Enum Constants

- VK_EXT_DISPLAY_CONTROL_EXTENSION_NAME
- VK_EXT_DISPLAY_CONTROL_SPEC_VERSION

Extending VkStructureType:

- VK_STRUCTURE_TYPE_DEVICE_EVENT_INFO_EXT
- VK_STRUCTURE_TYPE_DISPLAY_EVENT_INFO_EXT
- VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT
- VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT

Issues

1) Should this extension add an explicit “WaitForVsync” API or a fence signaled at vsync that the application can wait on?

**RESOLVED:** A fence. A separate API could later be provided that allows exporting the fence to a native object that could be inserted into standard run loops on POSIX and Windows systems.

2) Should callbacks be added for a vsync event, or in general to monitor events in Vulkan?

**RESOLVED:** No, fences should be used. Some events are generated by interrupts which are managed in the kernel. In order to use a callback provided by the application, drivers would need to have the userspace driver spawn threads that would wait on the kernel event, and hence the callbacks could be difficult for the application to synchronize with its other work given they would arrive on a foreign thread.

3) Should vblank or scanline events be exposed?

**RESOLVED:** Vblank events. Scanline events could be added by a separate extension, but the latency of processing an interrupt and waking up a userspace event is high enough that the accuracy of a scanline event would be rather low. Further, per-scanline interrupts are not supported by all hardware.

- Tobias Hector, AMD

Description

This extension adds some more dynamic state to support applications that need to reduce the number of pipeline state objects they compile and bind.

New Commands

- vkCmdBindVertexBuffers2EXT
- vkCmdSetCullModeEXT
- vkCmdSetDepthBoundsTestEnableEXT
- vkCmdSetDepthCompareOpEXT
- vkCmdSetDepthTestEnableEXT
- vkCmdSetDepthWriteEnableEXT
- vkCmdSetFrontFaceEXT
- vkCmdSetPrimitiveTopologyEXT
- vkCmdSetScissorWithCountEXT
- `vkCmdSetStencilOpEXT`
- `vkCmdSetStencilTestEnableEXT`
- `vkCmdSetViewportWithCountEXT`

**New Structures**

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceExtendedDynamicStateFeaturesEXT`

**New Enum Constants**

- `VK_EXT_EXTENDED_DYNAMIC_STATE_EXTENSION_NAME`
- `VK_EXT_EXTENDED_DYNAMIC_STATE_SPEC_VERSION`

- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_CULL_MODE_EXT`
  - `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE_EXT`
  - `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP_EXT`
  - `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE_EXT`
  - `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE_EXT`
  - `VK_DYNAMIC_STATE_FRONT_FACE_EXT`
  - `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT`
  - `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT_EXT`
  - `VK_DYNAMIC_STATE_STENCIL_OP_EXT`
  - `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE_EXT`
  - `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT`
  - `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT_EXT`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_FEATURES_EXT`

**Promotion to Vulkan 1.3**

This extension has been partially promoted. All dynamic state enumerants and entry points in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. The feature structure is not promoted. Extension interfaces that were promoted remain available as aliases of the core functionality.

**Issues**

1) Why are the values of `pStrides` in `vkCmdBindVertexBuffers2EXT` limited to be between 0 and the maximum extent of the binding, when this restriction is not present for the same static state?
Implementing these edge cases adds overhead to some implementations that would require significant cost when calling this function, and the intention is that this state should be more or less free to change.

*VK_EXT_vertex_input_dynamic_state* allows the stride to be changed freely when supported via *vkCmdSetVertexInputEXT*.

Description
This extension adds some more dynamic state to support applications that need to reduce the number of pipeline state objects they compile and bind.

New Commands
- `vkCmdSetDepthBiasEnableEXT`
- `vkCmdSetLogicOpEXT`
- `vkCmdSetPatchControlPointsEXT`
- `vkCmdSetPrimitiveRestartEnableEXT`
- `vkCmdSetRasterizerDiscardEnableEXT`

New Structures
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceExtendedDynamicState2FeaturesEXT`

New Enum Constants
- `VK_EXT_EXTENDED_DYNAMIC_STATE_2_EXTENSION_NAME`
- `VK_EXT_EXTENDED_DYNAMIC_STATE_2_SPEC_VERSION`
- Extending `VkDynamicState`:
  - `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT`
  - `VK_DYNAMIC_STATE_LOGIC_OP_EXT`
  - `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`
  - `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT`
  - `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_2_FEATURES_EXT`

Promotion to Vulkan 1.3
This extension has been partially promoted. The dynamic state enumerants `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT`, `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT`, and `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT`; and the corresponding entry points in this extension are included in core Vulkan 1.3, with the EXT suffix omitted. The enumerants and entry
points for dynamic logic operation and patch control points are not promoted, nor is the feature structure. Extension interfaces that were promoted remain available as aliases of the core functionality.

Description

A dma_buf is a type of file descriptor, defined by the Linux kernel, that allows sharing memory across kernel device drivers and across processes. This extension enables applications to import a dma_buf as VkDeviceMemory, to export VkDeviceMemory as a dma_buf, and to create VkBuffer objects that can be bound to that memory.

New Enum Constants

- VK_EXT_EXTERNAL_MEMORY_DMA_BUF_EXTENSION_NAME
- VK_EXT_EXTERNAL_MEMORY_DMA_BUF_SPEC_VERSION
- Extending VkExternalMemoryHandleTypeFlagBits:
  - VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT

Issues

1) How does the application, when creating a VkImage that it intends to bind to dma_buf VkDeviceMemory containing an externally produced image, specify the memory layout (such as row pitch and DRM format modifier) of the VkImage? In other words, how does the application achieve behavior comparable to that provided by EGL_EXT_image_dma_buf_import and EGL_EXT_image_dma_buf_import_modifiers?

RESOLVED: Features comparable to those in EGL_EXT_image_dma_buf_import and EGL_EXT_image_dma_buf_import_modifiers will be provided by an extension layered atop this one.

2) Without the ability to specify the memory layout of external dma_buf images, how is this extension useful?

RESOLVED: This extension provides exactly one new feature: the ability to import/export between dma_buf and VkDeviceMemory. This feature, together with features provided by VK_KHR_external_memory_fd, is sufficient to bind a VkBuffer to dma_buf.

- Extending `VkExternalMemoryHandleTypeFlagBits`:
  - `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT`
  - `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_IMPORT_MEMORY_HOST_POINTER_INFO_EXT`
  - `VK_STRUCTURE_TYPE_MEMORY_HOST_POINTER_PROPERTIES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_HOST_PROPERTIES_EXT`

Issues

1) What memory type has to be used to import host pointers?

**RESOLVED:** Depends on the implementation. Applications have to use the new `vkGetMemoryHostPointerPropertiesEXT` command to query the supported memory types for a particular host pointer. The reported memory types may include memory types that come from a memory heap that is otherwise not usable for regular memory object allocation and thus such a heap’s size may be zero.

2) Can the application still access the contents of the host allocation after importing?

**RESOLVED:** Yes. However, usual synchronization requirements apply.

3) Can the application free the host allocation?

**RESOLVED:** No, it violates valid usage conditions. Using the memory object imported from a host allocation that is already freed thus results in undefined behavior.

4) Is `vkMapMemory` expected to return the same host address which was specified when importing it to the memory object?

**RESOLVED:** No. Implementations are allowed to return the same address but it is not required. Some implementations might return a different virtual mapping of the allocation, although the same physical pages will be used.

5) Is there any limitation on the alignment of the host pointer and/or size?

**RESOLVED:** Yes. Both the address and the size have to be an integer multiple of `minImportedHostPointerAlignment`. In addition, some platforms and foreign devices may have additional restrictions.

6) Can the same host allocation be imported multiple times into a given physical device?
RESOLVED: No, at least not guaranteed by this extension. Some platforms do not allow locking the same physical pages for device access multiple times, so attempting to do it may result in undefined behavior.

7) Does this extension support exporting the new handle type?

RESOLVED: No.

8) Should we include the possibility to import host mapped foreign device memory using this API?

RESOLVED: Yes, through a separate handle type. Implementations are still allowed to support only one of the handle types introduced by this extension by not returning import support for a particular handle type as returned in VkExternalMemoryPropertiesKHR.

Description

VK_EXT_filter_cubic extends VK_IMG_filter_cubic.

It documents cubic filtering of other image view types. It adds new structures that can be added to the pNext chain of VkPhysicalDeviceImageFormatInfo2 and VkImageFormatProperties2 that can be used to determine which image types and which image view types support cubic filtering.

New Structures

- Extending VkImageFormatProperties2:
  - VkFilterCubicImageViewImageFormatPropertiesEXT
- Extending VkPhysicalDeviceImageFormatInfo2:
  - VkPhysicalDeviceImageViewImageFormatInfoEXT

New Enum Constants

- VK_EXT_FILTER_CUBIC_EXTENSION_NAME
- VK_EXT_FILTER_CUBIC_SPEC_VERSION
- Extending VkFilter:
  - VK_FILTER_CUBIC_EXT
- Extending VkFormatFeatureFlagBits:

Description

This extension adds support for the `FragmentShaderPixelInterlockEXT`, `FragmentShaderSampleInterlockEXT`, and `FragmentShaderShadingRateInterlockEXT` capabilities from the `SPV_EXT_fragment_shader_interlock` extension to Vulkan.

Enabling these capabilities provides a critical section for fragment shaders to avoid overlapping pixels being processed at the same time, and certain guarantees about the ordering of fragment shader invocations of fragments of overlapping pixels.

This extension can be useful for algorithms that need to access per-pixel data structures via shader loads and stores. Algorithms using this extension can access per-pixel data structures in critical sections without other invocations accessing the same per-pixel data. Additionally, the ordering guarantees are useful for cases where the API ordering of fragments is meaningful. For example, applications may be able to execute programmable blending operations in the fragment shader, where the destination buffer is read via image loads and the final value is written via image stores.

New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT`

New Enum Constants

**Description**

In Vulkan, users can specify device-scope queue priorities. In some cases it may be useful to extend this concept to a system-wide scope. This extension provides a mechanism for callers to set their system-wide priority. The default queue priority is `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`.

The driver implementation will attempt to skew hardware resource allocation in favour of the higher-priority task. Therefore, higher-priority work may retain similar latency and throughput characteristics even if the system is congested with lower priority work.

The global priority level of a queue shall take precedence over the per-process queue priority (`VkDeviceQueueCreateInfo::pQueuePriorities`).

Abuse of this feature may result in starving the rest of the system from hardware resources. Therefore, the driver implementation may deny requests to acquire a priority above the default priority (`VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`) if the caller does not have sufficient privileges. In this scenario `VK_ERROR_NOT_PERMITTED_EXT` is returned.

The driver implementation may fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this scenario `VK_ERROR_INITIALIZATION_FAILED` is returned.

**New Structures**

**Description**

This extension defines two new structures and a function to assign SMPTE (the Society of Motion Picture and Television Engineers) 2086 metadata and CTA (Consumer Technology Association) 861.3 metadata to a swapchain. The metadata includes the color primaries, white point, and luminance range of the reference monitor, which all together define the color volume containing all the possible colors the reference monitor can produce. The reference monitor is the display where creative work is done and creative intent is established. To preserve such creative intent as much as possible and achieve consistent color reproduction on different viewing displays, it is useful for the display pipeline to know the color volume of the original reference monitor where content was created or tuned. This avoids performing unnecessary mapping of colors that are not displayable
on the original reference monitor. The metadata also includes the `maxContentLightLevel` and `maxFrameAverageLightLevel` as defined by CTA 861.3.

While the intended purpose of the metadata is to assist in the transformation between different color volumes of different displays and help achieve better color reproduction, it is not in the scope of this extension to define how exactly the metadata should be used in such a process. It is up to the implementation to determine how to make use of the metadata.

**New Commands**

- `vkSetHdrMetadataEXT`

**New Structures**

- `VkHdrMetadataEXT`
- `VkXYColorEXT`

**New Enum Constants**

- `VK_EXT_HDR_METADATA_EXTENSION_NAME`
- `VK_EXT_HDR_METADATA_SPEC_VERSION`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_HDR_METADATA_EXT`

**Issues**

1) Do we need a query function?

**PROPOSED**: No, Vulkan does not provide queries for state that the application can track on its own.

2) Should we specify default if not specified by the application?

**PROPOSED**: No, that leaves the default up to the display.

Description
The VK_EXT_headless_surface extension is an instance extension. It provides a mechanism to create VkSurfaceKHR objects independently of any window system or display device. The presentation operation for a swapchain created from a headless surface is by default a no-op, resulting in no externally-visible result.

Because there is no real presentation target, future extensions can layer on top of the headless surface to introduce arbitrary or customisable sets of restrictions or features. These could include features like saving to a file or restrictions to emulate a particular presentation target.

This functionality is expected to be useful for application and driver development because it allows any platform to expose an arbitrary or customisable set of restrictions and features of a presentation engine. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

Description
This extension provides the ability to use DRM format modifiers with images, enabling Vulkan to better integrate with the Linux ecosystem of graphics, video, and display APIs.

Its functionality closely overlaps with EGL_EXT_image_dma_buf_import_modifiers\(^2\) and EGL_MESA_image_dma_buf_export\(^3\). Unlike the EGL extensions, this extension does not require the use of a specific handle type (such as a dma_buf) for external memory and provides more explicit control of image creation.

Introduction to DRM Format Modifiers

A DRM format modifier is a 64-bit, vendor-prefixed, semi-opaque unsigned integer. Most modifiers represent a concrete, vendor-specific tiling format for images. Some exceptions are DRM_FORMAT_MOD_LINEAR (which is not vendor-specific); DRM_FORMAT_MOD_NONE (which is an alias of
The modifier's vendor prefix consists of the 8 most significant bits. The canonical list of modifiers and vendor prefixes is found in `drm_fourcc.h` in the Linux kernel source. The other dominant source of modifiers are vendor kernel trees.

One goal of modifiers in the Linux ecosystem is to enumerate for each vendor a reasonably sized set of tiling formats that are appropriate for images shared across processes, APIs, and/or devices, where each participating component may possibly be from different vendors. A non-goal is to enumerate all tiling formats supported by all vendors. Some tiling formats used internally by vendors are inappropriate for sharing; no modifiers should be assigned to such tiling formats.

Modifier values typically do not describe memory layouts. More precisely, a modifier's lower 56 bits usually have no structure. Instead, modifiers name memory layouts; they name a small set of vendor-preferred layouts for image sharing. As a consequence, in each vendor namespace the modifier values are often sequentially allocated starting at 1.

Each modifier is usually supported by a single vendor and its name matches the pattern `{VENDOR}_FORMAT_MOD_*` or `DRM_FORMAT_MOD_{VENDOR}_*`. Examples are `I915_FORMAT_MOD_X_TILED` and `DRM_FORMAT_MOD_BROADCOM_VC4_T_TILED`. An exception is `DRM_FORMAT_MOD_LINEAR`, which is supported by most vendors.

Many APIs in Linux use modifiers to negotiate and specify the memory layout of shared images. For example, a Wayland compositor and Wayland client may, by relaying modifiers over the Wayland protocol `zwp_linux_dmbuf_v1`, negotiate a vendor-specific tiling format for a shared `wl_buffer`. The client may allocate the underlying memory for the `wl_buffer` with GBM, providing the chosen modifier to `gbm_bo_create_withModifiers`. The client may then import the `wl_buffer` into Vulkan for producing image content, providing the resource's `dma_buf` to `VkImportMemoryFdInfoKHR` and its modifier to `VkImageDrmFormatModifierExplicitCreateInfoEXT`. The compositor may then import the `wl_buffer` into OpenGL for sampling, providing the resource's `dma_buf` and modifier to `eglCreateImage`. The compositor may also bypass OpenGL and submit the `wl_buffer` directly to the kernel's display API, providing the `dma_buf` and modifier through `drm_mode_fb_cmd2`.

### Format Translation

Modifier-capable APIs often pair modifiers with DRM formats, which are defined in `drm_fourcc.h`. However, `VK_EXT_image_drm_format_modifier` uses `VkFormat` instead of DRM formats. The application must convert between `VkFormat` and DRM format when it sends or receives a DRM format to or from an external API.

The mapping from `VkFormat` to DRM format is lossy. Therefore, when receiving a DRM format from an external API, often the application must use information from the external API to accurately map the DRM format to a `VkFormat`. For example, DRM formats do not distinguish between RGB and sRGB (as of 2018-03-28); external information is required to identify the image's color space.

The mapping between `VkFormat` and DRM format is also incomplete. For some DRM formats there exist no corresponding Vulkan format, and for some Vulkan formats there exist no corresponding DRM format.
Usage Patterns

Three primary usage patterns are intended for this extension:

- **Negotiation.** The application negotiates with modifier-aware, external components to determine sets of image creation parameters supported among all components.

  In the Linux ecosystem, the negotiation usually assumes the image is a 2D, single-sampled, non-mipmapped, non-array image; this extension permits that assumption but does not require it. The result of the negotiation usually resembles a set of tuples such as \((\text{drmFormat}, \text{drmFormatModifier})\), where each participating component supports all tuples in the set.

  Many details of this negotiation - such as the protocol used during negotiation, the set of image creation parameters expressible in the protocol, and how the protocol chooses which process and which API will create the image - are outside the scope of this specification.

  In this extension, \(\text{vkGetPhysicalDeviceFormatProperties2}\) with \(\text{VkDrmFormatModifierPropertiesListEXT}\) serves a primary role during the negotiation, and \(\text{vkGetPhysicalDeviceImageFormatProperties2}\) with \(\text{VkPhysicalDeviceImageDrmFormatModifierInfoEXT}\) serves a secondary role.

- **Import.** The application imports an image with a modifier.

  In this pattern, the application receives from an external source the image's memory and its creation parameters, which are often the result of the negotiation described above. Some image creation parameters are implicitly defined by the external source; for example, \(\text{VK_IMAGE_TYPE_2D}\) is often assumed. Some image creation parameters are usually explicit, such as the image's format, drmFormatModifier, and extent; and each plane's offset and rowPitch.

  Before creating the image, the application first verifies that the physical device supports the received creation parameters by querying \(\text{vkGetPhysicalDeviceFormatProperties2}\) with \(\text{VkDrmFormatModifierPropertiesListEXT}\) and \(\text{vkGetPhysicalDeviceImageFormatProperties2}\) with \(\text{VkPhysicalDeviceImageDrmFormatModifierInfoEXT}\). Then the application creates the image by chaining \(\text{VkImageDrmFormatModifierExplicitCreateInfoEXT}\) and \(\text{VkExternalMemoryImageCreateInfo}\) onto \(\text{VkImageCreateInfo}\).

- **Export.** The application creates an image and allocates its memory. Then the application exports to modifier-aware consumers the image's memory handles; its creation parameters; its modifier; and the offset, size, and rowPitch of each memory plane.

  In this pattern, the Vulkan device is the authority for the image; it is the allocator of the image's memory and the decider of the image's creation parameters. When choosing the image's creation parameters, the application usually chooses a tuple \((\text{format}, \text{drmFormatModifier})\) from the result of the negotiation described above. The negotiation's result often contains multiple tuples that share the same format but differ in their modifier. In this case, the application should defer the choice of the image's modifier to the Vulkan implementation by providing all such modifiers to \(\text{VkImageDrmFormatModifierListCreateInfoEXT}::\text{pDrmFormatModifiers}\); and the implementation should choose from \(\text{pDrmFormatModifiers}\) the optimal modifier in consideration with the other image parameters.
The application creates the image by chaining `VkImageDrmFormatModifierListCreateInfoEXT` and `VkExternalMemoryImageCreateInfo` onto `VkImageCreateInfo`. The protocol and APIs by which the application will share the image with external consumers will likely determine the value of `VkExternalMemoryImageCreateInfo::handleTypes`. The implementation chooses for the image an optimal `modifier` from `VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers`. The application then queries the implementation-chosen `modifier` with `vkGetImageDrmFormatModifierPropertiesEXT`, and queries the memory layout of each plane with `vkGetImageSubresourceLayout`.

The application then allocates the image's memory with `VkMemoryAllocateInfo`, adding chained extending structures for external memory; binds it to the image; and exports the memory, for example, with `vkGetMemoryFdKHR`.

Finally, the application sends the image's creation parameters, its `modifier`, its per-plane memory layout, and the exported memory handle to the external consumers. The details of how the application transmits this information to external consumers is outside the scope of this specification.

**Prior Art**

Extension `EGL_EXT_image_dma_buf_import` introduced the ability to create an `EGLImage` by importing for each plane a `dma_buf`, offset, and row pitch.

Later, extension `EGL_EXT_image_dma_buf_import_modifiers` introduced the ability to query which combination of formats and `modifiers` the implementation supports and to specify `modifiers` during creation of the `EGLImage`.

Extension `EGL_MESA_image_dma_buf_export` is the inverse of `EGL_EXT_image_dma_buf_import_modifiers`.

The Linux kernel modesetting API (KMS), when configuring the display’s framebuffer with `struct drm_mode_fb_cmd2`, allows one to specify the framebuffer’s `modifier` as well as a per-plane memory handle, offset, and row pitch.

GBM, a graphics buffer manager for Linux, allows creation of a `gbm_bo` (that is, a graphics `buffer object`) by importing data similar to that in `EGL_EXT_image_dma_buf_import_modifiers`; and symmetrically allows exporting the same data from the `gbm_bo`. See the references to `modifier` and `plane` in `gbm.h`.

**New Commands**

- `vkGetImageDrmFormatModifierPropertiesEXT`

  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_DRM_FORMAT_MODIFIER_INFO_EXT

Issues

1) Should this extension define a single DRM format modifier per VkImage? Or define one per plane?

+ 

RESOLVED: There exists a single DRM format modifier per VkImage.

DISCUSSION: Prior art, such as EGL_EXT_image_dma_buf_import_modifiers, struct drm_mode_fb_cmd2, and struct gbm_import_fd_modifier_data, allows defining one modifier per plane. However, developers of the GBM and kernel APIs concede it was a mistake. Beginning in Linux 4.10, the kernel requires that the application provide the same DRM format modifier for each plane. (See Linux commit bae781b259269590109e8a4a8227331362b88212). And GBM provides an entry point, gbm_bo_get_modifier, for querying the modifier of the image but does not provide one to query the modifier of individual planes.
2) When creating an image with `VkImageDrmFormatModifierExplicitCreateInfoEXT`, which is typically used when importing an image, should the application explicitly provide the size of each plane?

*RESOLVED*: No. The application **must** not provide the size. To enforce this, the API requires that `VkImageDrmFormatModifierExplicitCreateInfoEXT::pPlaneLayouts->size` must be 0.

**DISCUSSION**: Prior art, such as `EGL_EXT_image_dma_buf_import_modifiers2`, `struct drm_mode_fb_cmd24`, and `struct gbm_import_fd_modifier_data5`, omits from the API the size of each plane. Instead, the APIs infer each plane’s size from the import parameters, which include the image’s pixel format and a dma_buf, offset, and row pitch for each plane.

However, Vulkan differs from EGL and GBM with regards to image creation in the following ways:

**Differences in Image Creation**

- **Undedicated allocation by default.** When importing or exporting a set of dma_bufs as an `EGLImage` or `gbm_bo`, common practice mandates that each dma_buf’s memory be dedicated (in the sense of `VK_KHR_dedicated_allocation`) to the image (though not necessarily dedicated to a single plane). In particular, neither the GBM documentation nor the EGL extension specifications explicitly state this requirement, but in light of common practice this is likely due to under-specification rather than intentional omission. In contrast, `VK_EXT_image_drm_format_modifier` permits, but does not require, the implementation to require dedicated allocations for images created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`.

- **Separation of image creation and memory allocation.** When importing a set of dma_bufs as an `EGLImage` or `gbm_bo`, EGL and GBM create the image resource and bind it to memory (the dma_bufs) simultaneously. This allows EGL and GBM to query each dma_buf’s size during image creation. In Vulkan, image creation and memory allocation are independent unless a dedicated allocation is used (as in `VK_KHR_dedicated_allocation`). Therefore, without requiring dedicated allocation, Vulkan cannot query the size of each dma_buf (or other external handle) when calculating the image’s memory layout. Even if dedication allocation were required, Vulkan cannot calculate the image’s memory layout until after the image is bound to its dma_ufs.

The above differences complicate the potential inference of plane size in Vulkan. Consider the following problematic cases:

**Problematic Plane Size Calculations**

- **Padding.** Some plane of the image may require implementation-dependent padding.

- **Metadata.** For some modifiers, the image may have a metadata plane which requires a non-trivial calculation to determine its size.

- **Mipmapped, array, and 3D images.** The implementation may support `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` for images whose `mipLevels`, `arrayLayers`, or `depth` is greater than 1. For such images with certain modifiers, the calculation of each plane’s size may be non-trivial.

However, an application-provided plane size solves none of the above problems.
For simplicity, consider an external image with a single memory plane. The implementation is obviously capable calculating the image’s size when its tiling is `VK_IMAGE_TILING_OPTIMAL`. Likewise, any reasonable implementation is capable of calculating the image’s size when its tiling uses a supported `modifier`.

Suppose that the external image’s size is smaller than the implementation-calculated size. If the application provided the external image’s size to `vkCreateImage`, the implementation would observe the mismatched size and recognize its inability to comprehend the external image’s layout (unless the implementation used the application-provided size to select a refinement of the tiling layout indicated by the `modifier`, which is strongly discouraged). The implementation would observe the conflict, and reject image creation with `VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT`. On the other hand, if the application did not provide the external image’s size to `vkCreateImage`, then the application would observe after calling `vkGetImageMemoryRequirements` that the external image’s size is less than the size required by the implementation. The application would observe the conflict and refuse to bind the `VkImage` to the external memory. In both cases, the result is explicit failure.

Suppose that the external image’s size is larger than the implementation-calculated size. If the application provided the external image’s size to `vkCreateImage`, for reasons similar to above the implementation would observe the mismatched size and recognize its inability to comprehend the image data residing in the extra size. The implementation, however, must assume that image data resides in the entire size provided by the application. The implementation would observe the conflict and reject image creation with `VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT`. On the other hand, if the application did not provide the external image’s size to `vkCreateImage`, then the application would observe after calling `vkGetImageMemoryRequirements` that the external image’s size is larger than the implementation-usable size. The application would observe the conflict and refuse to bind the `VkImage` to the external memory. In both cases, the result is explicit failure.

Therefore, an application-provided size provides no benefit, and this extension should not require it. This decision renders `VkSubresourceLayout::size` an unused field during image creation, and thus introduces a risk that implementations may require applications to submit sideband creation parameters in the unused field. To prevent implementations from relying on sideband data, this extension requires the application to set `size` to 0.

Description

This extension adds stricter requirements for how out of bounds reads from images are handled. Rather than returning undefined values, most out of bounds reads return R, G, and B values of zero and alpha values of either zero or one. Components not present in the image format may be set to zero or to values based on the format as described in Conversion to RGBA.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceImageRobustnessFeaturesEXT

New Enum Constants

- VK_EXT_IMAGE_ROBUSTNESS_EXTENSION_NAME
- VK_EXT_IMAGE_ROBUSTNESS_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_ROBUSTNESS_FEATURES_EXT

Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

Issues

1. How does this extension differ from VK_EXT_robustness2?

The guarantees provided by this extension are a subset of those provided by the robustImageAccess2 feature of VK_EXT_robustness2. Where this extension allows return values of (0, 0, 0, 0) or (0, 0, 0, 1), robustImageAccess2 requires that a particular value dependent on the image format be returned. This extension provides no guarantees about the values returned for an access to an invalid Lod.

Examples

None.

Description

This extension adds some line rasterization features that are commonly used in CAD applications and supported in other APIs like OpenGL. Bresenham-style line rasterization is supported, smooth rectangular lines (coverage to alpha) are supported, and stippled lines are supported for all three line rasterization modes.

New Commands

• vkCmdSetLineStippleEXT

New Structures

• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDeviceLineRasterizationFeaturesEXT
• Extending VkPhysicalDeviceProperties2:
  ◦ VkPhysicalDeviceLineRasterizationPropertiesEXT
• Extending VkPipelineRasterizationStateCreateInfo:
  ◦ VkPipelineRasterizationLineStateCreateInfoEXT

New Enums

• VkLineRasterizationModeEXT

New Enum Constants

• VK_EXT_LINE_RASTERIZATION_EXTENSION_NAME
• VK_EXT_LINE_RASTERIZATION_SPEC_VERSION
• Extending VkDynamicState:
  ◦ VK_DYNAMIC_STATE_LINE_STIPPLE_EXT
• Extending VkStructureType:
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_FEATURES_EXT
  ◦ VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_PROPERTIES_EXT
  ◦ VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_EXT

Issues

1) Do we need to support Bresenham-style and smooth lines with more than one rasterization sample? i.e. the equivalent of glEnable(GL_MULTISAMPLE) in OpenGL when the framebuffer has more than one sample?

RESOLVED: Yes. For simplicity, Bresenham line rasterization carries forward a few restrictions
from OpenGL, such as not supporting per-sample shading, alpha to coverage, or alpha to one.

**Description**

While running a Vulkan application, other processes on the machine might also be attempting to use the same device memory, which can pose problems. This extension adds support for querying the amount of memory used and the total memory budget for a memory heap. The values returned by this query are implementation-dependent and can depend on a variety of factors including
operating system and system load.

The `VkPhysicalDeviceMemoryBudgetPropertiesEXT::heapBudget` values can be used as a guideline for how much total memory from each heap the current process can use at any given time, before allocations may start failing or causing performance degradation. The values may change based on other activity in the system that is outside the scope and control of the Vulkan implementation.

The `VkPhysicalDeviceMemoryBudgetPropertiesEXT::heapUsage` will display the current process estimated heap usage.

With this information, the idea is for an application at some interval (once per frame, per few seconds, etc) to query `heapBudget` and `heapUsage`. From here the application can notice if it is over budget and decide how it wants to handle the memory situation (free it, move to host memory, changing mipmap levels, etc). This extension is designed to be used in concert with `VK_EXT_memory_priority` to help with this part of memory management.

### New Structures

Description
This extension adds a new query to obtain PCI bus information about a physical device.

Not all physical devices have PCI bus information, either due to the device not being connected to the system through a PCI interface or due to platform specific restrictions and policies. Thus this extension is only expected to be supported by physical devices which can provide the information.

As a consequence, applications should always check for the presence of the extension string for each individual physical device for which they intend to issue the new query for and should not have any assumptions about the availability of the extension on any given platform.

New Structures

Interactions and External Dependencies

• This extension provides API support for GL_ARB_post_depth_coverage and GL_EXT_post_depth_coverage

Contributors

• Jeff Bolz, NVIDIA

Description

This extension adds support for the following SPIR-V extension in Vulkan:
• SPV_KHR_post_depth_coverage

which allows the fragment shader to control whether values in the SampleMask built-in input variable reflect the coverage after early depth and stencil tests are applied.

This extension adds a new PostDepthCoverage execution mode under the SampleMaskPostDepthCoverage capability. When this mode is specified along with EarlyFragmentTests, the value of an input variable decorated with the SampleMask built-in reflects the coverage after the early fragment tests are applied. Otherwise, it reflects the coverage before the depth and stencil tests.

When using GLSL source-based shading languages, the post_depth_coverage layout qualifier from GL_ARB_post_depth_coverage or GL_EXT_post_depth_coverage maps to the PostDepthCoverage execution mode.

Extension and Version Dependencies
  VK_KHR_external_memory
This extension defines a special queue family, `VK_QUEUE_FAMILY_FOREIGN_EXT`, which can be used to transfer ownership of resources backed by external memory to foreign, external queues. This is similar to `VK_QUEUE_FAMILY_EXTERNAL_KHR`, defined in `VK_KHR_external_memory`. The key differences between the two are:

- The queues represented by `VK_QUEUE_FAMILY_EXTERNAL_KHR` must share the same physical device and the same driver version as the current `VkInstance`. `VK_QUEUE_FAMILY_FOREIGN_EXT` has no such restrictions. It can represent devices and drivers from other vendors, and can even represent non-Vulkan-capable devices.
- All resources backed by external memory support `VK_QUEUE_FAMILY_EXTERNAL_KHR`. Support for `VK_QUEUE_FAMILY_FOREIGN_EXT` is more restrictive.
- Applications should expect transitions to/from `VK_QUEUE_FAMILY_FOREIGN_EXT` to be more expensive than transitions to/from `VK_QUEUE_FAMILY_EXTERNAL_KHR`.

Description

This extension adds stricter requirements for how out of bounds reads and writes are handled. Most accesses must be tightly bounds-checked, out of bounds writes must be discarded, out of bound reads must return zero. Rather than allowing multiple possible (0,0,0,x) vectors, the out of
bounds values are treated as zero, and then missing components are inserted based on the format as described in Conversion to RGBA and vertex input attribute extraction.

These additional requirements may be expensive on some implementations, and should only be enabled when truly necessary.

This extension also adds support for “null descriptors”, where VK_NULL_HANDLE can be used instead of a valid handle. Accesses to null descriptors have well-defined behavior, and do not rely on robustness.

**New Structures**

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceRobustness2FeaturesEXT
- Extending VkPhysicalDeviceProperties2:
  - VkPhysicalDeviceRobustness2PropertiesEXT

**New Enum Constants**

- VK_EXT_ROBUSTNESS_2_EXTENSION_NAME
- VK_EXT_ROBUSTNESS_2_SPEC_VERSION
- Extending VkStructureType:
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_FEATURES_EXT
  - VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_PROPERTIES_EXT

**Issues**

**RESOLVED**: Some implementations cannot efficiently tightly bounds-check all buffer accesses. Rather, the size of the bound range is padded to some power of two multiple, up to 256 bytes for uniform buffers and up to 4 bytes for storage buffers, and that padded size is bounds-checked. This is sufficient to implement D3D-like behavior, because D3D only allows binding whole uniform buffers or ranges that are a multiple of 256 bytes, and D3D raw and structured buffers only support 32-bit accesses.

**Description**

This extension allows an application to modify the locations of samples within a pixel used in rasterization. Additionally, it allows applications to specify different sample locations for each pixel in a group of adjacent pixels, which can increase antialiasing quality (particularly if a custom resolve shader is used that takes advantage of these different locations).
It is common for implementations to optimize the storage of depth values by storing values that can be used to reconstruct depth at each sample location, rather than storing separate depth values for each sample. For example, the depth values from a single triangle may be represented using plane equations. When the depth value for a sample is needed, it is automatically evaluated at the sample location. Modifying the sample locations causes the reconstruction to no longer evaluate the same depth values as when the samples were originally generated, thus the depth aspect of a depth/stencil attachment must be cleared before rendering to it using different sample locations.

Some implementations may need to evaluate depth image values while performing image layout transitions. To accommodate this, instances of the VkSampleLocationsInfoEXT structure can be specified for each situation where an explicit or automatic layout transition has to take place. VkSampleLocationsInfoEXT can be chained from VkImageMemoryBarrier structures to provide sample locations for layout transitions performed by vkCmdWaitEvents and vkCmdPipelineBarrier calls, and VkRenderPassSampleLocationsBeginInfoEXT can be chained from VkRenderPassBeginInfo to provide sample locations for layout transitions performed implicitly by a render pass instance.

Interactions and External Dependencies
• This extension provides API support for GL_EXT_demote_to_helper_invocation

Contributors
• Jeff Bolz, NVIDIA

Description
This extension adds Vulkan support for the SPV_EXT_demote_to_helper_invocation SPIR-V extension. That SPIR-V extension provides a new instruction OpDemoteToHelperInvocationEXT allowing shaders
“demote” a fragment shader invocation to behave like a helper invocation for its duration. The demoted invocation will have no further side effects and will not output to the framebuffer, but remains active and can participate in computing derivatives and in group operations. This is a better match for the “discard” instruction in HLSL.

**New Structures**

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceShaderDemoteToHelperInvocationFeaturesEXT`

**New Enum Constants**

- `VK_EXT_SHADER_DEMOTE_TO_HELPER_INVOCATION_EXTENSION_NAME`

- Jeff Bolz, Nvidia
- Faith Ekstrand, Intel

Description
This extension extends existing 64-bit integer atomic support to enable these operations on images as well.

When working with large 2- or 3-dimensional data sets (e.g. rasterization or screen-space effects), image accesses are generally more efficient than equivalent buffer accesses. This extension allows applications relying on 64-bit integer atomics in this manner to quickly improve performance with only relatively minor code changes.

64-bit integer atomic support is guaranteed for optimally tiled images with the VK_FORMAT_R64_UINT and VK_FORMAT_R64_SINT formats.
New Structures

Version 1.1
Description

This extension enables an implementation to control the subgroup size by allowing a varying subgroup size and also specifying a required subgroup size.

It extends the subgroup support in Vulkan 1.1 to allow an implementation to expose a varying subgroup size. Previously Vulkan exposed a single subgroup size per physical device, with the expectation that implementations will behave as if all subgroups have the same size. Some implementations may dispatch shaders with a varying subgroup size for different subgroups. As a result they could implicitly split a large subgroup into smaller subgroups or represent a small subgroup as a larger subgroup, some of whose invocations were inactive on launch.

To aid developers in understanding the performance characteristics of their programs, this extension exposes a minimum and maximum subgroup size that a physical device supports and a pipeline create flag to enable that pipeline to vary its subgroup size. If enabled, any SubgroupSize decorated variables in the SPIR-V shader modules provided to pipeline creation may vary between the minimum and maximum subgroup sizes.

An implementation is also optionally allowed to support specifying a required subgroup size for a given pipeline stage. Implementations advertise which stages support a required subgroup size, and any pipeline of a supported stage can be passed a
**VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT** structure to set the subgroup size for that shader stage of the pipeline. For compute shaders, this requires the developer to query the `maxComputeWorkgroupSubgroups` and ensure that:

\[ s = \text{WorkGroupSize}.x \times \text{WorkGroupSize}.y \times \text{WorkGroupSize}.z \leq \text{SubgroupSize} \times \text{maxComputeWorkgroupSubgroups} \]

Developers can also specify a new pipeline shader stage create flag that requires the implementation to have fully populated subgroups within local workgroups. This requires the workgroup size in the X dimension to be a multiple of the subgroup size.

### New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceSubgroupSizeControlFeaturesEXT`

- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceSubgroupSizeControlPropertiesEXT`

- Extending `VkPipelineShaderStageCreateInfo`, `VkShaderCreateInfoEXT`:
  - `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT`

### New Enum Constants

- `VK_EXT_SUBGROUP_SIZE_CONTROL_EXTENSION_NAME`
- `VK_EXT_SUBGROUP_SIZE_CONTROL_SPEC_VERSION`

- Extending `VkPipelineShaderStageCreateFlagBits`:
  - `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT`
  - `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_PROPERTIES_EXT`
  - `VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_REQUIRED_SUBGROUP_SIZE_CREATE_INFO_EXT`

### Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. The original type, enum and command names are still available as aliases of the core functionality.

### Version History

- Revision 1, 2019-03-05 (Neil Henning)
  - Initial draft
- Revision 2, 2019-07-26 (Faith Ekstrand)
  - Add the missing `VkPhysicalDeviceSubgroupSizeControlFeaturesEXT` for querying subgroup size control features.

**IP Status**

No known IP claims.

**Contributors**

- Courtney Goeltzenleuchter, Google

**Description**

This extension expands VkColorSpaceKHR to add support for most standard color spaces beyond VK_COLOR_SPACE_SRGB_NONLINEAR_KHR. This extension also adds support for VK_COLOR_SPACE_PASS_THROUGH_EXT which allows applications to use color spaces not explicitly enumerated in VkColorSpaceKHR.

**New Enum Constants**

- VK_EXT_SWAPCHAIN_COLOR_SPACE_EXTENSION_NAME
- VK_EXT_SWAPCHAIN_COLOR_SPACE_SPEC_VERSION
- Extending VkColorSpaceKHR:
  - VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT
Issues

1) Does the spec need to specify which kinds of image formats support the color spaces?

**Resolved:** Pixel format is independent of color space (though some color spaces really want / need floating point color components to be useful). Therefore, do not plan on documenting what formats support which color spaces. An application can call `vkGetPhysicalDeviceSurfaceFormatsKHR` to query what a particular implementation supports.

2) How does application determine if HW supports appropriate transfer function for a color space?

**Resolved:** Extension indicates that implementation must not do the OETF encoding if it is not sRGB. That responsibility falls to the application shaders. Any other native OETF / EOTF functions supported by an implementation can be described by separate extension.

Version History

- Revision 1, 2016-12-27 (Courtney Goeltzenleuchter)
  - Initial version
- Revision 2, 2017-01-19 (Courtney Goeltzenleuchter)
  - Add pass through and multiple options for BT2020.
  - Clean up some issues with equations not displaying properly.
- Revision 3, 2017-06-23 (Courtney Goeltzenleuchter)
  - Add extended sRGB non-linear enum.
- Revision 4, 2019-04-26 (Graeme Leese)
  - Clarify color space transfer function usage.
  - Refer to normative definitions in the Data Format Specification.
Clarify DCI-P3 and Display P3 usage.

**Description**

This extension adds more expressive alignment requirements for uniform and storage texel buffers. Some implementations have single texel alignment requirements that cannot be expressed via `VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`. 
New Structures

- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT`

- Extending `VkPhysicalDeviceProperties2`:
  - `VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT`

New Enum Constants

- `VK_EXT_TEXEL_BUFFER_ALIGNMENT_EXTENSION_NAME`
- `VK_EXT_TEXEL_BUFFER_ALIGNMENT_SPEC_VERSION`

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXEL_BUFFER_ALIGNMENT_FEATURES_EXT`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXEL_BUFFER_ALIGNMENT_PROPERTIES_EXT`

Promotion to Vulkan 1.3

Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. However, only the properties structure is promoted. The feature structure is not promoted and `texelBufferAlignment` is enabled if using a Vulkan 1.3 instance. The original type name is still available as an alias of the core functionality.

Description

This extension adds support for textures compressed using the Adaptive Scalable Texture Compression (ASTC) High Dynamic Range (HDR) profile.

When this extension is enabled, the HDR profile is supported for all ASTC formats listed in ASTC Compressed Image Formats.

New Structures

- Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  - VkPhysicalDeviceTextureCompressionASTCHDRFeaturesEXT

New Enum Constants

- VK_EXT_TEXTURE_COMPRESSION_ASTC_HDR_EXTENSION_NAME
- VK_EXT_TEXTURE_COMPRESSION_ASTC_HDR_SPEC_VERSION

- Extending VkFormat:
  - VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK_EXT
  - VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK_EXT
  - VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK_EXT
  - VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK_EXT
  - VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK_EXT
Promotion to Vulkan 1.3

This extension has been partially promoted. Functionality in this extension is included in core Vulkan 1.3, with the EXT suffix omitted. However, the feature is made optional in Vulkan 1.3. The original type, enum and command names are still available as aliases of the core functionality.

Issues

1) Should we add a feature or limit for this functionality?

Yes. It is consistent with the ASTC LDR support to add a feature like textureCompressionASTC_HDR.

The feature is strictly speaking redundant as long as this is just an extension; it would be sufficient to just enable the extension. But adding the feature is more forward-looking if wanted to make this an optional core feature in the future.

2) Should we introduce new format enums for HDR?

Yes. Vulkan 1.0 describes the ASTC format enums as UNORM, e.g. VK_FORMAT_ASTC_4x4_UNORM_BLOCK, so it is confusing to make these contain HDR data. Note that the OpenGL (ES) extensions did not make this distinction because a single ASTC HDR texture may contain both unorm and float blocks. Implementations may not be able to distinguish between LDR and HDR ASTC textures internally and just treat them as the same format, i.e. if this extension is supported then sampling from a VK_FORMAT_ASTC_4x4_UNORM_BLOCK image format may return HDR results. Applications can get predictable results by using the appropriate image format.

Description

This extension provides the VkValidationFeaturesEXT struct that can be included in the pNext chain of the VkInstanceCreateInfo structure passed as the pCreateInfo parameter of vkCreateInstance. The structure contains an array of VkValidationFeatureEnableEXT enum values that enable specific validation features that are disabled by default. The structure also contains an array of VkValidationFeatureDisableEXT enum values that disable specific validation layer features that are enabled by default.

Deprecation by VK_EXT_layer_settings

Functionality in this extension is subsumed into the VK_EXT_layer_settings extension.

New Structures

- Extending VkInstanceCreateInfo:
  - VkValidationFeaturesEXT

New Enums

- VkValidationFeatureDisableEXT
- VkValidationFeatureEnableEXT

Description

This extension allows instance-rate vertex attributes to be repeated for certain number of instances instead of advancing for every instance when instanced rendering is enabled.

New Structures

• VkVertexInputBindingDivisorDescriptionEXT
• Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  ◦ `VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT`

• Extending `VkPhysicalDeviceProperties2`:
  ◦ `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT`

• Extending `VkPipelineVertexInputStateCreateInfo`:
  ◦ `VkPipelineVertexInputDivisorStateCreateInfoEXT`

New Enum Constants

• `VK_EXT_VERTEX_ATTRIBUTE_DIVISOR_EXTENSION_NAME`
• `VK_EXT_VERTEX_ATTRIBUTE_DIVISOR_SPEC_VERSION`

• Extending `VkStructureType`:
  ◦ `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_FEATURES_EXT`
  ◦ `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_PROPERTIES_EXT`
  ◦ `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_EXT`

Issues

1) What is the effect of a non-zero value for `firstInstance`?

**RESOLVED**: The Vulkan API should follow the OpenGL convention and offset attribute fetching by `firstInstance` while computing vertex attribute offsets.

2) Should zero be an allowed divisor?

**RESOLVED**: Yes. A zero divisor means the vertex attribute is repeated for all instances.

Examples

To create a vertex binding such that the first binding uses instanced rendering and the same attribute is used for every 4 draw instances, an application could use the following set of structures:

```c
const VkVertexInputBindingDivisorDescriptionEXT divisorDesc = {
  .binding = 0,
  .divisor = 4
};

const VkPipelineVertexInputDivisorStateCreateInfoEXT divisorInfo = {
  .sType = VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_EXT,
  .pNext = NULL,
  .vertexBindingDivisorCount = 1,
  .pVertexBindingDivisors = &divisorDesc
};
```

```cpp
const VkVertexInputBindingDescription binding = {
    .binding = 0,
    .stride = sizeof(Vertex),
    .inputRate = VK_VERTEX_INPUT_RATE_INSTANCE
};

const VkPipelineVertexInputStateCreateInfo viInfo = {
    .sType = VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_CREATE_INFO,
    .pNext = &divisorInfo,
    ...
};
```

Description

One of the states that contributes to the combinatorial explosion of pipeline state objects that need to be created, is the vertex input binding and attribute descriptions. By allowing them to be dynamic applications may reduce the number of pipeline objects they need to create.

This extension adds dynamic state support for what is normally static state in VkPipelineVertexInputStateCreateInfo.

New Commands

• vkCmdSetVertexInputEXT

New Structures

• VkVertexInputAttributeDescription2EXT
• VkVertexInputBindingDescription2EXT
• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:

Description

This extension enables an application to access external memory via \textit{NvSciBufObj}. To import a \textit{NvSciBufObj} to \textit{VkDeviceMemory}, applications need to:

- Create an unreconciled \textit{NvSciBufAttrList} via \textit{NvSciBufAttrListCreate()}
- Fill in the private attribute list via \textit{vkGetPhysicalDeviceSciBufAttributesNV()}
- Fill in the public attribute list via \textit{NvSciBufAttrListSetAttrs()}
- Reconcile the \textit{NvSciBufAttrList} via \textit{NvSciBufAttrListReconcile()}
- Create a \textit{NvSciBufObj} via \textit{NvSciBufObjAlloc()}
- Import the \textit{NvSciBufObj} to a \textit{VkDeviceMemory} by chaining \textit{VkImportMemorySciBufInfoNV} structure to the command \textit{vkAllocateMemory}.

For details of the \textit{NvSciBuf} APIs and data structures, see the \textit{NvStreams Documentation}.

New Commands

- \textit{vkGetMemorySciBufNV}
- \textit{vkGetPhysicalDeviceExternalMemorySciBufPropertiesNV}
- \textit{vkGetPhysicalDeviceSciBufAttributesNV}

New Structures

- \textit{VkMemoryGetSciBufInfoNV}
- \textit{VkMemorySciBufPropertiesNV}
- Extending \textit{VkMemoryAllocateInfo}:
  - \textit{VkExportMemorySciBufInfoNV}
  - \textit{VkImportMemorySciBufInfoNV}
- Extending \textit{VkPhysicalDeviceFeatures2, VkDeviceCreateInfo}:
  - \textit{VkPhysicalDeviceExternalMemorySciBufFeaturesNV}
  - \textit{VkPhysicalDeviceExternalSciBufFeaturesNV}

New Enum Constants

- \textit{VK_NV_EXTERNAL_MEMORY_SCI_BUF_EXTENSION_NAME}
- \textit{VK_NV_EXTERNAL_MEMORY_SCI_BUF_SPEC_VERSION}
- Extending \textit{VkExternalMemoryHandleTypeFlagBits}:
  - \textit{VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCI_BUF_BIT_NV}
- Extending \textit{VkStructureType}:
  - \textit{VK_STRUCTURE_TYPE_EXPORT_MEMORY_SCI_BUF_INFO_NV}
  - \textit{VK_STRUCTURE_TYPE_IMPORT_MEMORY_SCI_BUF_INFO_NV}
Issues

1) What should we call this extension?

RESOLVED. The external API is NvSciBuf, but the Vulkan convention is to append the vendor suffix at the end of an identifier. Using NvSciBufNV seems awkward, so we have chosen to use just the SciBuf portion of the name in Vulkan commands and tokens. Since this is for interacting with memory objects allocated from outside Vulkan, we use “external_memory” in the name, similar to VK_KHR_external_memory_fd. To avoid an explosion of extensions, we include the capability to import and export memory in one extension but include separate features in case implementations only implement (or safety certify) a subset.

2) What changed in revision 2?

RESOLVED. The VkPhysicalDeviceExternalSciBufFeaturesNV struct was renamed to VkPhysicalDeviceExternalMemorySciBufFeaturesNV to follow naming conventions (previous names retained as aliases), and drop const on pNext pointer.

Version History

- Revision 1, 2022-04-12 (Kai Zhang, Daniel Koch)
  - Internal revisions

• Daniel Koch, NVIDIA

Description

An application using external memory may wish to synchronize access to that memory using semaphores and fences. This extension enables an application to import semaphore and import/export fence payloads to and from NvSciSync objects. To import a NvSciSyncObj to a VkSemaphore or VkFence, applications need to:

• Create an unreconciled NvSciSyncAttrList via NvSciSyncAttrListCreate()
• Fill the private attribute list via vkGetPhysicalDeviceSciSyncAttributesNV()
• Fill the public attribute list via NvSciSyncAttrListSetAttrs()
• Reconcile the NvSciSyncAttrList via NvSciSyncAttrListReconcile()
• Create a NvSciSyncObj via NvSciSyncObjAlloc()

To import a NvSciSyncObj to a VkSemaphore, create a VkSemaphoreSciSyncPoolNV for the NvSciSyncObj and then select the semaphore from VkSemaphoreSciSyncPoolNV by passing the VkSemaphoreSciSyncCreateInfoNV structure to vkCreateSemaphore

To import a NvSciSyncObj to a VkFence, pass the VkImportFenceSciSyncInfoNV structure to the vkImportFenceSciSyncObjNV command.

To import/export a NvSciSyncFence to a VkFence object, that VkFence object must already have a NvSciSyncObj previously imported.

This extension does not support exporting semaphores from NvSciSync objects.

For details of the NvSciSync APIs and data structures, see the NvStreams Documentation.
New Object Types

• VkSemaphoreSciSyncPoolNV

New Commands

• vkCreateSemaphoreSciSyncPoolNV
• vkDestroySemaphoreSciSyncPoolNV
• vkGetFenceSciSyncFenceNV
• vkGetFenceSciSyncObjNV
• vkGetPhysicalDeviceSciSyncAttributesNV
• vkImportFenceSciSyncFenceNV
• vkImportFenceSciSyncObjNV

New Structures

• VkFenceGetSciSyncInfoNV
• VkImportFenceSciSyncInfoNV
• VkSciSyncAttributesInfoNV
• VkSemaphoreSciSyncPoolCreateInfoNV
• Extending VkFenceCreateInfo:
  ◦ VkExportFenceSciSyncInfoNV
• Extending VkPhysicalDeviceFeatures2, VkDeviceCreateInfo:
  ◦ VkPhysicalDeviceExternalSciSync2FeaturesNV
• Extending VkSemaphoreCreateInfo:
  ◦ VkSemaphoreSciSyncCreateInfoNV

If Vulkan SC 1.0 is supported:

• Extending VkDeviceCreateInfo:
  ◦ VkDeviceSemaphoreSciSyncPoolReservationCreateInfoNV

New Enums

• VkSciSyncClientTypeNV
• VkSciSyncPrimitiveTypeNV

New Enum Constants

• VK_NV_EXTERNAL_SCI_SYNC_2_EXTENSION_NAME
• VK_NV_EXTERNAL_SCI_SYNC_2_SPEC_VERSION
• Extending VkExternalFenceHandleTypeFlagBits:
Extending `VkObjectType`:
- `VK_OBJECT_TYPE_SEMAPHORE_SCI_SYNC_POOL_NV`

Extending `VkStructureType`:
- `VK_STRUCTURE_TYPE_EXPORT_FENCE_SCI_SYNC_INFO_NV`
- `VK_STRUCTURE_TYPE_FENCE_GET_SCI_SYNC_INFO_NV`
- `VK_STRUCTURE_TYPE_IMPORT_FENCE_SCI_SYNC_INFO_NV`
- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_SCI_SYNC_2_FEATURES_NV`
- `VK_STRUCTURE_TYPE_SCI_SYNC_ATTRIBUTES_INFO_NV`
- `VK_STRUCTURE_TYPE_SEMAPHORE_SCI_SYNC_CREATE_INFO_NV`
- `VK_STRUCTURE_TYPE_SEMAPHORE_SCI_SYNC_POOL_CREATE_INFO_NV`

If Vulkan SC 1.0 is supported:

- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPEDEVICE_SEMAPHORE_SCI_SYNC_POOL_RESERVATION_CREATE_INFO_NV`

Issues

1) Does this extension extend or replace `VK_NV_external_sci_sync`?

RESOLVED. Replaces - expect to deprecate it and eventually remove it.

2) What part of `VK_NV_external_sci_sync` is deprecated/removed in this extension?

RESOLVED. The commands to import and export semaphores from `VK_NV_external_sci_sync` are removed and have been replaced with an alternate mechanism to import semaphores. Fence import and export functionality is unchanged.

In particular:

- Removed Commands:
  - `vkImportSemaphoreSciSyncObjNV`
  - `vkGetSemaphoreSciSyncObjNV`

- Removed Structures:
  - `VkImportSemaphoreSciSyncInfoNV`
  - `VkExportSemaphoreSciSyncInfoNV`
  - `VkSemaphoreGetSciSyncInfoNV`

3) Application migration guide from `VK_NV_external_sci_sync` to `VK_NV_external_sci_sync2`

- In `VK_NV_external_sci_sync`, to import a `NvSciSyncObj` to `VkSemaphore`, applications need to:
Create a VkSemaphore by command vkCreateSemaphore.

Call vkImportSemaphoreSciSyncObjNV command to import the NvSciSyncObj to VkSemaphore created.

Call vkDestroySemaphore to destroy the VkSemaphore after all submitted batches that refer to it have completed execution.

In order to migrate to VK_NV_external_sci_sync2, applications need to:

- Chain VkDeviceSemaphoreSciSyncPoolReservationCreateInfoNV to VkDeviceObjectReservationCreateInfo and specify the semaphoreSciSyncPoolRequestCount maximum number of semaphore SciSync pools that will be used simultaneously.
- Import the a NvSciSyncObj to a VkSemaphoreSciSyncPoolNV by command vkCreateSemaphoreSciSyncPoolNV.
- Select the VkSemaphore from VkSemaphoreSciSyncPoolNV by passing the VkSemaphoreSciSyncCreateInfoNV structure to vkCreateSemaphore.
- Can call vkDestroySemaphore to destroy the VkSemaphore immediately after all the batches that refer to it are submitted.

Description
This extension enables an application to import QNX Screen _screen_buffer objects created outside of the Vulkan device into Vulkan memory objects, where they can be bound to images and buffers.

Some _screen_buffer images have implementation-defined external formats that may not correspond to Vulkan formats. Sampler Y'CbCr conversion can be used to sample from these images and convert them to a known color space.

/screen_buffer is strongly typed, so naming the handle type is redundant. The internal layout and therefore size of a _screen_buffer image may depend on native usage flags that do not have
New Commands

- `vkGetScreenBufferPropertiesQNX`

New Structures

- `VkScreenBufferPropertiesQNX`
- Extending `VkImageCreateInfo`, `VkSamplerYcbcrConversionCreateInfo`:
  - `VkExternalFormatQNX`
- Extending `VkMemoryAllocateInfo`:
  - `VkImportScreenBufferInfoQNX`
- Extending `VkPhysicalDeviceFeatures2`, `VkDeviceCreateInfo`:
  - `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX`
- Extending `VkScreenBufferPropertiesQNX`:
  - `VkScreenBufferFormatPropertiesQNX`

New Enum Constants

- `VK_QNX_EXTERNAL_MEMORY_SCREEN_BUFFER_EXTENSION_NAME`
- `VK_QNX_EXTERNAL_MEMORY_SCREEN_BUFFER_SPEC_VERSION`
- Extending `VkExternalMemoryHandleTypeFlagBits`:
  - `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX`
- Extending `VkStructureType`:
  - `VK_STRUCTURE_TYPE_EXTERNAL_FORMAT_QNX`
  - `VK_STRUCTURE_TYPE_IMPORT_SCREEN_BUFFER_INFO_QNX`
  - `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_SCREEN_BUFFER_FEATURES_QNX`
  - `VK_STRUCTURE_TYPE_SCREEN_BUFFER_FORMAT_PROPERTIES_QNX`
  - `VK_STRUCTURE_TYPE_SCREEN_BUFFER_PROPERTIES_QNX`

Description

An application using external memory may wish to synchronize access to that memory using semaphores and fences. This extension enables an application to import and export semaphore and fence payloads to and from NvSciSync objects. To import a NvSciSyncObj to a VkSemaphore or VkFence, applications need to:

- Create an unreconciled NvSciSyncAttrList via NvSciSyncAttrListCreate()
- Fill the private attribute list via vkGetPhysicalDeviceSciSyncAttributesNV()
- Fill the public attribute list via NvSciSyncAttrListSetAttrs()
• Reconcile the `NvSciSyncAttrList` via `NvSciSyncAttrListReconcile`

• Create a `NvSciSyncObj` via `NvSciSyncObjAlloc`

• Import the `NvSciSyncObj` to a `VkSemaphore` by passing the `VkImportSemaphoreSciSyncInfoNV` structure to the `vkImportSemaphoreSciSyncObjNV` command, or to a `VkFence` by passing the `VkImportFenceSciSyncInfoNV` structure to the `vkImportFenceSciSyncObjNV` command.

To import/export a `NvSciSyncFence` to a `VkFence` object, that `VkFence` object must already have a `NvSciSyncObj` previously imported.

For details of the `NvSciSync` APIs and data structures, see the `NvStreams Documentation`.

**New Commands**

- `vkGetFenceSciSyncFenceNV`
- `vkGetFenceSciSyncObjNV`
- `vkGetPhysicalDeviceSciSyncAttributesNV`
- `vkGetSemaphoreSciSyncObjNV`
- `vkImportFenceSciSyncFenceNV`
- `vkImportFenceSciSyncObjNV`
- `vkImportSemaphoreSciSyncObjNV`

**New Structures**

- `VkFenceGetSciSyncInfoNV`
- `VkImportFenceSciSyncInfoNV`
- `VkImportSemaphoreSciSyncInfoNV`
- `VkSciSyncAttributesInfoNV`
- `VkSemaphoreGetSciSyncInfoNV`
- Extending `VkFenceCreateInfo`:
  - `VkExportFenceSciSyncInfoNV`
- Extending `VkPhysicalDeviceFeatures2, VkDeviceCreateInfo`:
  - `VkPhysicalDeviceExternalSciSyncFeaturesNV`
- Extending `VkSemaphoreCreateInfo`:
  - `VkExportSemaphoreSciSyncInfoNV`

**New Enums**

- `VkSciSyncClientTypeNV`
- `VkSciSyncPrimitiveTypeNV`
New Enum Constants

- `VK_NV_EXTERNAL_SCI_SYNC_EXTENSION_NAME`
- `VK_NV_EXTERNAL_SCI_SYNC_SPEC_VERSION`

Extending `VkExternalFenceHandleTypeFlagBits`:
- `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_FENCE_BIT_NV`
- `VK_EXTERNAL_FENCE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV`

Extending `VkExternalSemaphoreHandleTypeFlagBits`:
- `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SCI_SYNC_OBJ_BIT_NV`

Extending `VkStructureType`:
- `VK_STRUCTURE_TYPE_EXPORT_FENCE_SCI_SYNC_INFO_NV`
- `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_SCI_SYNC_INFO_NV`
- `VK_STRUCTURE_TYPE_FENCE_GET_SCI_SYNC_INFO_NV`
- `VK_STRUCTURE_TYPE_IMPORT_FENCE_SCI_SYNC_INFO_NV`
- `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_SCI_SYNC_INFO_NV`
- `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_SCI_SYNC_FEATURES_NV`
- `VK_STRUCTURE_TYPE_SCI_SYNC_ATTRIBUTES_INFO_NV`
- `VK_STRUCTURE_TYPE_SEMAPHORE_GET_SCI_SYNC_INFO_NV`

Issues

1) What should we call this extension?

RESOLVED. The external API is `NvSciSync`, but the Vulkan convention is to append the vendor suffix at the end of an identifier. Using `NvSciSyncNV` seems awkward, so we have chosen to use just the `SciSync` portion of the name in Vulkan commands and tokens. Since this is for interacting with objects from outside Vulkan, we use "external" in the name, similar to `VK_KHR_external_fence_fd`. To avoid an explosion of extensions, we include the capability to import and export both semaphores and fences in one extension but include separate features in case implementations only implement (or safety certify) a subset.

2) How do we resolve the NvStreams terminology of `NvSciSyncFence` which conflicts with the Vulkan SC terminology of `VkFence`?

RESOLVED: "fence" refers to `VkFence`. "NvSciSyncFence" refers to the NvStreams type and "VkFence" refers to the Vulkan SC type.

Version History

- Revision 2, 2022-03-29 (Daniel Koch)
  - use separate entry points for `NvSciSyncFence` and `NvSciSyncObj` handles
- Revision 1, 2020-11-25 (Kai Zhang, Daniel Koch)
- Initial revision
Appendix F: API Boilerplate

This appendix defines Vulkan API features that are infrastructure required for a complete functional description of Vulkan, but do not logically belong elsewhere in the Specification.

Vulkan Header Files

Vulkan is defined as an API in the C99 language. Khronos provides a corresponding set of header files for applications using the API, which may be used in either C or C++ code. The interface descriptions in the specification are the same as the interfaces defined in these header files, and both are derived from the `vk.xml` XML API Registry, which is the canonical machine-readable description of the Vulkan API. The Registry, scripts used for processing it into various forms, and documentation of the registry schema are available as described at https://registry.khronos.org/vulkansc/#apiregistry.

Language bindings for other languages can be defined using the information in the Specification and the Registry. Khronos does not provide any such bindings, but third-party developers have created some additional bindings.

Vulkan Combined API Header `vulkan_sc.h` (Informative)

Applications normally will include the header `vulkan_sc.h`. In turn, `vulkan_sc.h` always includes the following headers:

- `vk_platform.h`, defining platform-specific macros and headers.
- `vulkan_sc_core.h`, defining APIs for the Vulkan core and all registered extensions other than window system-specific and provisional extensions, which are included in separate header files.

In addition, specific preprocessor macros defined at the time `vulkan_sc.h` is included cause header files for the corresponding window system-specific and provisional interfaces to be included, as described below.

Vulkan Platform-Specific Header `vk_platform.h` (Informative)

Platform-specific macros and interfaces are defined in `vk_platform.h`. These macros are used to control platform-dependent behavior, and their exact definitions are under the control of specific platforms and Vulkan implementations.

Platform-Specific Calling Conventions

On many platforms the following macros are empty strings, causing platform- and compiler-specific default calling conventions to be used.

`VKAPI_ATTR` is a macro placed before the return type in Vulkan API function declarations. This macro controls calling conventions for C++11 and GCC/Clang-style compilers.

`VKAPI_CALL` is a macro placed after the return type in Vulkan API function declarations. This macro controls calling conventions for MSVC-style compilers.
**VKAPI_PTR** is a macro placed between the '()' and '*' in Vulkan API function pointer declarations. This macro also controls calling conventions, and typically has the same definition as **VKAPI_ATTR** or **VKAPI_CALL**, depending on the compiler.

With these macros, a Vulkan function declaration takes the form of:

```c
VKAPI_ATTR <return_type> VKAPI_CALL <command_name>(<command_parameters>);
```

Additionally, a Vulkan function pointer type declaration takes the form of:

```c
typedef <return_type> (VKAPI_PTR *PFN_<command_name>)(<command_parameters>);
```

**Platform-Specific Header Control**

If the **VK_NO_STDINT_H** macro is defined by the application at compile time, extended integer types used by the Vulkan API, such as **uint8_t**, must also be defined by the application. Otherwise, the Vulkan headers will not compile. If **VK_NO_STDINT_H** is not defined, the system **<stdint.h>** is used to define these types. There is a fallback path when Microsoft Visual Studio version 2008 and earlier versions are detected at compile time.

If the **VK_NO_STDDEF_H** macro is defined by the application at compile time, **size_t**, must also be defined by the application. Otherwise, the Vulkan headers will not compile. If **VK_NO_STDDEF_H** is not defined, the system **<stddef.h>** is used to define this type.

**Vulkan Core API Header** **vulkan_sc_core.h**

Applications that do not make use of window system-specific extensions may simply include **vulkan_sc_core.h** instead of **vulkan_sc.h**, although there is usually no reason to do so. In addition to the Vulkan API, **vulkan_sc_core.h** also defines a small number of C preprocessor macros that are described below.

**vulkan_sc_core.hpp** provides the same functionality as **vulkan_sc_core.h**, but does so in a manner that is aligned for compliance with MISRA C++. In contrast, **vulkan_sc_core.h** is aligned for compliance with MISRA C:2012.

**Vulkan Header File Version Number**

**VK_HEADER_VERSION** is the version number of the **vulkan_sc_core.h** header. This value is kept synchronized with the patch version of the released Specification.

```c
// Provided by VK_VERSION_1_0
// Version of this file
#define VK_HEADER_VERSION 14
```

**VK_HEADER_VERSION_COMPLETE** is the complete version number of the **vulkan_sc_core.h** header, comprising the major, minor, and patch versions. The major/minor values are kept synchronized.
with the complete version of the released Specification. This value is intended for use by automated
tools to identify exactly which version of the header was used during their generation.

Applications should not use this value as their `VkApplicationInfo::apiVersion`. Instead applications
should explicitly select a specific fixed major/minor API version using, for example, one of the
`VK_API_VERSION_*_*` values.

```c
// Provided by VK_VERSION_1_0
// Complete version of this file
#define VK_HEADER_VERSION_COMPLETE VK_MAKE_API_VERSION(VKSC_API_VARIANT, 1, 0,
  VK_HEADER_VERSION)
```

**Vulkan Handle Macros**

`VK_DEFINE_HANDLE` defines a **dispatchable handle** type.

```c
// Provided by VK_VERSION_1_0
#define VK_DEFINE_HANDLE(object) typedef struct object##_T* (object);
```

- `object` is the name of the resulting C type.

The only dispatchable handle types are those related to device and instance management, such as
`VkDevice`.

`VK_DEFINE_NON_DISPATCHABLE_HANDLE` defines a **non-dispatchable handle** type.

```c
// Provided by VK_VERSION_1_0

#ifndef VK_DEFINE_NON_DISPATCHABLE_HANDLE
#if (VK_USE_64_BIT_PTR_DEFINES==1)
#define VK_DEFINE_NON_DISPATCHABLE_HANDLE(object) typedef struct object##_T
*(object);
#else
#define VK_DEFINE_NON_DISPATCHABLE_HANDLE(object) typedef uint64_t (object);
#endif
#endif
```

- `object` is the name of the resulting C type.

Most Vulkan handle types, such as `VkBuffer`, are non-dispatchable.

---

**Note**

The `vulkan_sc_core.h` header allows the `VK_DEFINE_NON_DISPATCHABLE_HANDLE` and `VK_NULL_HANDLE` definitions to
be overridden by the application. If `VK_DEFINE_NON_DISPATCHABLE_HANDLE` is
already defined when `vulkan_sc_core.h` is compiled, the default definitions for
**VK_DEFINE_NON_DISPATCHABLE_HANDLE** and **VK_NULL_HANDLE** are skipped. This allows the application to define a binary-compatible custom handle which may provide more type-safety or other features needed by the application. Applications must not define handles in a way that is not binary compatible - where binary compatibility is platform dependent.

**VK_NULL_HANDLE** is a reserved value representing a non-valid object handle. It may be passed to and returned from Vulkan commands only when specifically allowed.

```
// Provided by VK_VERSION_1_0

#ifndef VK_DEFINE_NON_DISPATCHABLE_HANDLE
    #if (VK_USE_64_BIT_PTR_DEFINES==1)
        #if (defined(__cplusplus) && (__cplusplus >= 201103L)) || (defined(_MSVC_LANG) && (_MSVC_LANG >= 201103L))
            #define VK_NULL_HANDLE nullptr
        #else
            #define VK_NULL_HANDLE ((void*)0)
        #endif
    #else
        #define VK_NULL_HANDLE 0ULL
    #endif
    #ifndef VK_NULL_HANDLE
        #define VK_NULL_HANDLE 0
    #endif
#endif
```

**VK_USE_64_BIT_PTR_DEFINES** defines whether the default non-dispatchable handles are declared using either a 64-bit pointer type or a 64-bit unsigned integer type.

**VK_USE_64_BIT_PTR_DEFINES** is set to ‘1’ to use a 64-bit pointer type or any other value to use a 64-bit unsigned integer type.

```
// Provided by VK_VERSION_1_0

#ifndef VK_USE_64_BIT_PTR_DEFINES
    #if defined(__LP64__) || defined(_WIN64) || (defined(__x86_64__) && !defined(__ILP32__)) || defined(_M_X64) || defined(__ia64) || defined (_M_IA64) || defined(__aarch64__) || defined(__powerpc64__) || (defined(__riscv) && __riscv_xlen == 64)
        #define VK_USE_64_BIT_PTR_DEFINES 1
    #else
        #define VK_USE_64_BIT_PTR_DEFINES 0
    #endif
#endif
```

**Note**
The *vulkan_sc_core.h* header allows the `VK_USE_64_BIT_PTR_DEFINES` definition to be overridden by the application. This allows the application to select either a 64-bit pointer type or a 64-bit unsigned integer type for non-dispatchable handles in the case where the predefined preprocessor check does not identify the desired configuration.

## Window System-Specific Header Control (Informative)

To use a Vulkan extension supporting a platform-specific window system, header files for that window system must be included at compile time, or platform-specific types must be forward-declared. The Vulkan header files are unable to determine whether or not an external header is available at compile time, so platform-specific extensions are provided in separate headers from the core API and platform-independent extensions, allowing applications to decide which ones they need to be defined and how the external headers are included.

Extensions dependent on particular sets of platform headers, or that forward-declare platform-specific types, are declared in a header named for that platform. Before including these platform-specific Vulkan headers, applications must include both *vulkan_sc_core.h* and any external native headers the platform extensions depend on.

As a convenience for applications that do not need the flexibility of separate platform-specific Vulkan headers, *vulkan_sc.h* includes *vulkan_sc_core.h*, and then conditionally includes platform-specific Vulkan headers and the external headers they depend on. Applications control which platform-specific headers are included by #defining macros before including *vulkan_sc.h*.

The correspondence between platform-specific extensions, external headers they require, the platform-specific header which declares them, and the preprocessor macros which enable inclusion by *vulkan_sc.h* are shown in the following table.

</table>

**Note**
This section describes the purpose of the headers independently of the specific underlying functionality of the window system extensions themselves. Each extension name will only link to a description of that extension when viewing a specification built with that extension included.

**Provisional Extension Header Control (Informative)**

Provisional extensions **should** not be used in production applications. The functionality defined by such extensions **may** change in ways that break backwards compatibility between revisions, and before final release of a non-provisional version of that extension.

Provisional extensions are defined in a separate **provisional header**, `vulkan_beta.h`, allowing applications to decide whether or not to include them. The mechanism is similar to window system-specific headers: before including `vulkan_beta.h`, applications **must** include `vulkan_sc_core.h`.

```
Note
Sometimes a provisional extension will include a subset of its interfaces in `vulkan_sc_core.h`. This may occur if the provisional extension is promoted from an existing vendor or EXT extension and some of the existing interfaces are defined as aliases of the provisional extension interfaces. All other interfaces of that provisional extension which are not aliased will be included in `vulkan_beta.h`.
```

As a convenience for applications, `vulkan_sc.h` conditionally includes `vulkan_beta.h`. Applications **can** control inclusion of `vulkan_beta.h` by `#`defining the macro `VK_ENABLE_BETA_EXTENSIONS` before including `vulkan_sc.h`.

```
Note
Starting in version 1.2.171 of the Specification, all provisional enumerants are protected by the macro `VK_ENABLE_BETA_EXTENSIONS`. Applications needing to use provisional extensions must always define this macro, even if they are explicitly including `vulkan_beta.h`. This is a minor change to behavior, affecting only provisional extensions.
```

```
Note
This section describes the purpose of the provisional header independently of the specific provisional extensions which are contained in that header at any given time. The extension appendices for provisional extensions note their provisional status, and link back to this section for more information. Provisional extensions are intended to provide early access for bleeding-edge developers, with the understanding that extension interfaces may change in response to developer feedback. Provisional extensions are very likely to eventually be updated and released as non-provisional extensions, but there is no guarantee this will happen, or how long it will take if it does happen.
```
Appendix G: Invariance

The Vulkan specification is not pixel exact. It therefore does not guarantee an exact match between images produced by different Vulkan implementations. However, the specification does specify exact matches, in some cases, for images produced by the same implementation. The purpose of this appendix is to identify and provide justification for those cases that require exact matches.

Repeatability

The obvious and most fundamental case is repeated issuance of a series of Vulkan commands. For any given Vulkan and framebuffer state vector, and for any Vulkan command, the resulting Vulkan and framebuffer state must be identical whenever the command is executed on that initial Vulkan and framebuffer state. This repeatability requirement does not apply when using shaders containing side effects (image and buffer variable stores and atomic operations), because these memory operations are not guaranteed to be processed in a defined order.

One purpose of repeatability is avoidance of visual artifacts when a double-buffered scene is redrawn. If rendering is not repeatable, swapping between two buffers rendered with the same command sequence may result in visible changes in the image. Such false motion is distracting to the viewer. Another reason for repeatability is testability.

Repeatability, while important, is a weak requirement. Given only repeatability as a requirement, two scenes rendered with one (small) polygon changed in position might differ at every pixel. Such a difference, while within the law of repeatability, is certainly not within its spirit. Additional invariance rules are desirable to ensure useful operation.

Multi-pass Algorithms

Invariance is necessary for a whole set of useful multi-pass algorithms. Such algorithms render multiple times, each time with a different Vulkan mode vector, to eventually produce a result in the framebuffer. Examples of these algorithms include:

- “Erasing” a primitive from the framebuffer by redrawing it, either in a different color or using the XOR logical operation.
- Using stencil operations to compute capping planes.

Invariance Rules

For a given Vulkan device:

**Rule 1** For any given Vulkan and framebuffer state vector, and for any given Vulkan command, the resulting Vulkan and framebuffer state must be identical each time the command is executed on that initial Vulkan and framebuffer state.

**Rule 2** Changes to the following state values have no side effects (the use of any other state value is not affected by the change):
Required:

- Color and depth/stencil attachment contents
- Scissor parameters (other than enable)
- Write masks (color, depth, stencil)
- Clear values (color, depth, stencil)

Strongly suggested:

- Stencil parameters (other than enable)
- Depth test parameters (other than enable)
- Blend parameters (other than enable)
- Logical operation parameters (other than enable)

Corollary 1 Fragment generation is invariant with respect to the state values listed in Rule 2.

Rule 3 The arithmetic of each per-fragment operation is invariant except with respect to parameters that directly control it.

Corollary 2 Images rendered into different color attachments of the same framebuffer, either simultaneously or separately using the same command sequence, are pixel identical.

Rule 4 Identical pipelines will produce the same result when run multiple times with the same input. The wording “Identical pipelines” means VkPipeline objects that have been created with identical SPIR-V binaries and identical state, which are then used by commands executed using the same Vulkan state vector. Invariance is relaxed for shaders with side effects, such as performing stores or atomics.

Rule 5 All fragment shaders that either conditionally or unconditionally assign FragCoord.z to FragDepth are depth-invariant with respect to each other, for those fragments where the assignment to FragDepth actually is done.

If a sequence of Vulkan commands specifies primitives to be rendered with shaders containing side effects (image and buffer variable stores and atomic operations), invariance rules are relaxed. In particular, rule 1, corollary 2, and rule 4 do not apply in the presence of shader side effects.

The following weaker versions of rules 1 and 4 apply to Vulkan commands involving shader side effects:

Rule 6 For any given Vulkan and framebuffer state vector, and for any given Vulkan command, the contents of any framebuffer state not directly or indirectly affected by results of shader image or buffer variable stores or atomic operations must be identical each time the command is executed on that initial Vulkan and framebuffer state.

Rule 7 Identical pipelines will produce the same result when run multiple times with the same input as long as:

- shader invocations do not use image atomic operations;
• no framebuffer memory is written to more than once by image stores, unless all such stores write the same value; and

• no shader invocation, or other operation performed to process the sequence of commands, reads memory written to by an image store.

Note
The OpenGL specification has the following invariance rule: Consider a primitive \( p' \) obtained by translating a primitive \( p \) through an offset \((x, y)\) in window coordinates, where \( x \) and \( y \) are integers. As long as neither \( p' \) nor \( p \) is clipped, it must be the case that each fragment \( f' \) produced from \( p' \) is identical to a corresponding fragment \( f \) from \( p \) except that the center of \( f' \) is offset by \((x, y)\) from the center of \( f \).

This rule does not apply to Vulkan and is an intentional difference from OpenGL.

When any sequence of Vulkan commands triggers shader invocations that perform image stores or atomic operations, and subsequent Vulkan commands read the memory written by those shader invocations, these operations must be explicitly synchronized.

Tessellation Invariance

When using a pipeline containing tessellation evaluation shaders, the fixed-function tessellation primitive generator consumes the input patch specified by an application and emits a new set of primitives. The following invariance rules are intended to provide repeatability guarantees. Additionally, they are intended to allow an application with a carefully crafted tessellation evaluation shader to ensure that the sets of triangles generated for two adjacent patches have identical vertices along shared patch edges, avoiding “cracks” caused by minor differences in the positions of vertices along shared edges.

Rule 1 When processing two patches with identical outer and inner tessellation levels, the tessellation primitive generator will emit an identical set of point, line, or triangle primitives as long as the pipeline used to process the patch primitives has tessellation evaluation shaders specifying the same tessellation mode, spacing, vertex order, and point mode decorations. Two sets of primitives are considered identical if and only if they contain the same number and type of primitives and the generated tessellation coordinates for the vertex numbered \( m \) of the primitive numbered \( n \) are identical for all values of \( m \) and \( n \).

Rule 2 The set of vertices generated along the outer edge of the subdivided primitive in triangle and quad tessellation, and the tessellation coordinates of each, depend only on the corresponding outer tessellation level and the spacing decorations in the tessellation shaders of the pipeline.

Rule 3 The set of vertices generated when subdividing any outer primitive edge is always symmetric. For triangle tessellation, if the subdivision generates a vertex with tessellation coordinates of the form \((0, x, 1-x)\), \((x, 0, 1-x)\), or \((x, 1-x, 0)\), it will also generate a vertex with coordinates of exactly \((0, 1-x, x)\), \((1-x, 0, x)\), or \((1-x, x, 0)\), respectively. For quad tessellation, if the subdivision generates a vertex with coordinates of \((x, 0)\) or \((0, x)\), it will also generate a vertex with coordinates of exactly \((1-x, 0)\) or \((0, 1-x)\), respectively. For isoline tessellation, if it generates vertices at \((0, x)\) and \((1, x)\) where \( x \) is not zero, it will also generate vertices at exactly \((0, 1-x)\) and \((1, 1-x)\), respectively.
**Rule 4** The set of vertices generated when subdividing outer edges in triangular and quad tessellation **must** be independent of the specific edge subdivided, given identical outer tessellation levels and spacing. For example, if vertices at \((x, 1 - x, 0)\) and \((1-x, x, 0)\) are generated when subdividing the \(w = 0\) edge in triangular tessellation, vertices **must** be generated at \((x, 0, 1-x)\) and \((1-x, 0, x)\) when subdividing an otherwise identical \(v = 0\) edge. For quad tessellation, if vertices at \((x, 0)\) and \((1-x, 0)\) are generated when subdividing the \(v = 0\) edge, vertices **must** be generated at \((0, x)\) and \((0, 1-x)\) when subdividing an otherwise identical \(u = 0\) edge.

**Rule 5** When processing two patches that are identical in all respects enumerated in rule 1 except for vertex order, the set of triangles generated for triangle and quad tessellation **must** be identical except for vertex and triangle order. For each triangle \(n1\) produced by processing the first patch, there **must** be a triangle \(n2\) produced when processing the second patch each of whose vertices has the same tessellation coordinates as one of the vertices in \(n1\).

**Rule 6** When processing two patches that are identical in all respects enumerated in rule 1 other than matching outer tessellation levels and/or vertex order, the set of interior triangles generated for triangle and quad tessellation **must** be identical in all respects except for vertex and triangle order. For each interior triangle \(n1\) produced by processing the first patch, there **must** be an interior triangle \(n2\) produced when processing the second patch each of whose vertices has the same tessellation coordinates as one of the vertices in \(n1\). A triangle produced by the tessellator is considered an interior triangle if none of its vertices lie on an outer edge of the subdivided primitive.

**Rule 7** For quad and triangle tessellation, the set of triangles connecting an inner and outer edge depends only on the inner and outer tessellation levels corresponding to that edge and the spacing decorations.

**Rule 8** The value of all defined components of \(\text{TessCoord}\) will be in the range \([0, 1]\). Additionally, for any defined component \(x\) of \(\text{TessCoord}\), the results of computing \(1.0-x\) in a tessellation evaluation shader will be exact. If any floating-point values in the range \([0, 1]\) fail to satisfy this property, such values **must** not be used as tessellation coordinate components.
Appendix H: Vulkan SC Deviations From Base Vulkan

Additions

The following extensions have been added to Vulkan SC:

### Modifications

The following aspects of Base Vulkan have been modified for Vulkan SC:

<table>
<thead>
<tr>
<th>Chapter</th>
<th>Modifications</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fundamentals</td>
<td>• If VkPhysicalDeviceVulkanSC10Properties::deviceNoDynamicHostAllocations is VK_TRUE, VK_ERROR_OUT_OF_HOST_MEMORY must not be returned by physical or logical device commands which explicitly disallow it [SCID-4].</td>
</tr>
<tr>
<td>Devices and Queues</td>
<td>• The VkDeviceCreateInfo::pNext chain must include a VkDeviceObjectReservationCreateInfo structure [SCID-4].</td>
</tr>
<tr>
<td></td>
<td>• The VkDeviceCreateInfo::pNext chain must include a VkPhysicalDeviceVulkanSC10Features structure [SCID-1].</td>
</tr>
<tr>
<td></td>
<td>• vkCreateDevice returns VK_ERROR_INVALID_PIPELINE_CACHE_DATA if the pInitialData member of any element of VkDeviceObjectReservationCreateInfo::pPipelineCacheCreateInfos is a pointer to incompatible pipeline cache data [SCID-1].</td>
</tr>
<tr>
<td>Chapter</td>
<td>Modifications</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Command Buffers</td>
<td>• The <code>VkCommandPoolCreateInfo::pNext</code> chain <strong>must</strong> include a valid <code>VkCommandPoolMemoryReservationCreateInfo</code> structure [SCID-4].</td>
</tr>
<tr>
<td></td>
<td>• If <code>commandPoolResetCommandBuffer</code> is not supported [SCID-8], <code>vkResetCommandBuffer</code> <strong>must</strong> not be called.</td>
</tr>
<tr>
<td></td>
<td>• <code>vkFreeCommandBuffers</code> does not return the memory used by command recording back to its parent command pool [SCID-4]. This memory is reclaimed when <code>vkResetCommandPool</code> is next called.</td>
</tr>
<tr>
<td></td>
<td>• If <code>VkPhysicalDeviceVulkanSC10Properties::commandPoolMultipleCommandBuffersRecording</code> is <code>VK_FALSE</code>, then only one command buffer from a command pool can be in the recording state at a time [SCID-8].</td>
</tr>
<tr>

Extension Support

Vulkan SC supports a subset of the extensions supported in Base Vulkan. This subset was decided by:

- Excluding any extensions that would pose significant difficulty to certify their implementations.
- Excluding any extension that would not be used in deployed devices. This was primarily extensions focused on application development and debug.
- Excluding any extensions that are specific to an Operating System or Windowing system that is highly unlikely to be used in the Safety Critical space.
- Non-KHR or EXT extension are supported on request.

**Note**

During development it is likely that application developers will need additional functionality in a Vulkan SC implementation beyond what is provided by the supported extensions. This can be achieved by implementing a development focused version of the implementation that exposes additional Vulkan extensions and tools support but is non-conformant to the Vulkan SC specification.

A Vulkan SC conformant implementation with this additional functionality removed will be used on the end device.

Fault and Error Handling

Vulkan SC maintains the use of VkResult Return Codes on a small number of commands. These allow the command to confirm it completed successfully or return an error code for situations where a failure could be detected at runtime during the execution of the command.

In addition to VkResult Return Codes Vulkan SC adds Fault Handling support. This provides the implementation the ability to communicate information on errors or faults to the application that have been detected but are not covered by VkResult Return Codes in the Vulkan SC API. These could be runtime failures of the system or application faults that are detected asynchronously to the Vulkan API commands.

Undefined Behavior in the API

If an application uses the API incorrectly the behavior of the API is undefined. The Vulkan SC runtime will perform minimal error and state checking and it is assumed that applications are using the API correctly, see Valid Usage.

With incorrect input to the API, the implementation could continue to function correctly, generate unexpected output, become unstable, or be terminated. The exact behavior will vary and be
dependent on the specifics of the invalid usage and the implementation.

It is primarily the application's responsibility to ensure it always uses the API correctly. Potential methods to detect incorrect API usage include performing manual code inspection, use of validation layers during development, use of validation layers at runtime, or adding runtime checking to the application. Outside of this, Vulkan SC implementations can add implementation-specific targeted checks to detect invalid API usage that could significantly impact the correct operation of the application or implementation. The Fault Handling extension allows implementations to communicate information on such occurrences.

**MISRA C:2012 Deviations**

`vulkan_sc_core.h` is intended to be compatible with safety coding standards like MISRA C:2012.

The following provides information on items a MISRA C code analysis tool may report for a project using Vulkan SC.

MISRA headline guidelines are copyright © The MISRA Consortium Limited and are reproduced with permission. For further explanation of the directives and rules please see the [MISRA C:2012 specification](https://www.misra.org.uk/misra-c/). See [MISRA Compliance:2020](https://www.misra.org.uk/app/uploads/2021/06/MISRA-Compliance-2020.pdf) for a framework for handling deviations.

### Directives

<table>
<thead>
<tr>
<th>Directive</th>
<th>4.6: &quot;typedefs that indicate size and signedness should be used in place of the basic numerical types&quot;</th>
</tr>
</thead>
<tbody>
<tr>

```c
#define VK_DEFINE_HANDLE(object) typedef struct object##_T* (object);
#define VK_DEFINE_NON_DISPATCHABLE_HANDLE(object) typedef struct object##_T *object);
```

| Rationale | This is expected usage of the macro expansion operation and there are not multiple operators used in the statement. |
Appendix I: Lexicon

This appendix defines terms, abbreviations, and API prefixes used in the Specification.

Glossary

The terms defined in this section are used consistently throughout the Specification and may be used with or without capitalization.

Accessible (Descriptor Binding)

A descriptor binding is accessible to a shader stage if that stage is included in the `stageFlags` of the descriptor binding. Descriptors using that binding can only be used by stages in which they are accessible.

Acquire Operation (Resource)

An operation that acquires ownership of an image subresource or buffer range.

Adjacent Vertex

A vertex in an adjacency primitive topology that is not part of a given primitive, but is accessible in geometry shaders.

Advanced Blend Operation

Blending performed using one of the blend operation enums introduced by the `VK_EXT_blend_operation_advanced` extension. See Advanced Blending Operations.

Alias (API type/command)

An identical definition of another API type/command with the same behavior but a different name.

Aliased Range (Memory)

A range of a device memory allocation that is bound to multiple resources simultaneously.

Allocation Scope

An association of a host memory allocation to a parent object or command, where the allocation's lifetime ends before or at the same time as the parent object is freed or destroyed, or during the parent command.

Aspect (Image)

Some image types contain multiple kinds (called “aspects”) of data for each pixel, where each aspect is used in a particular way by the pipeline and may be stored differently or separately from other aspects. For example, the color components of an image format make up the color aspect of the image, and can be used as a framebuffer color attachment. Some operations, like depth testing, operate only on specific aspects of an image.

Attachment (Render Pass)

A zero-based integer index name used in render pass creation to refer to a framebuffer attachment that is accessed by one or more subpasses. The index also refers to an attachment
description which includes information about the properties of the image view that will later be attached.

**Availability Operation**
An operation that causes the values generated by specified memory write accesses to become available for future access.

**Available**
A state of values written to memory that allows them to be made visible.

**Back-Facing**
See Facingness.

**Batch**
A single structure submitted to a queue as part of a queue submission command, describing a set of queue operations to execute.

**Backwards Compatibility**
A given version of the API is backwards compatible with an earlier version if an application, relying only on valid behavior and functionality defined by the earlier specification, is able to correctly run against each version without any modification. This assumes no active attempt by that application to not run when it detects a different version.

**Binary Semaphore**
A semaphore with a boolean payload indicating whether the semaphore is signaled or unsignaled. Represented by a `VkSemaphore` object created with a semaphore type of `VK_SEMAPHORE_TYPE_BINARY`.

**Binding (Memory)**
An association established between a range of a resource object and a range of a memory object. These associations determine the memory locations affected by operations performed on elements of a resource object. Memory bindings are established using the `vkBindBufferMemory` command for non-sparse buffer objects, and using the `vkBindImageMemory` command for non-sparse image objects.

**Blend Constant**
Four floating point (RGBA) values used as an input to blending.

**Blending**
Arithmetic operations between a fragment color value and a value in a color attachment that produce a final color value to be written to the attachment.

**Buffer**
A resource that represents a linear array of data in device memory. Represented by a `VkBuffer` object.

**Buffer Device Address**
A 64-bit value used in a shader to access buffer memory through the `PhysicalStorageBuffer`
Buffer View
An object that represents a range of a specific buffer, and state controlling how the contents are interpreted. Represented by a VkBufferView object.

Built-In Variable
A variable decorated in a shader, where the decoration makes the variable take values provided by the execution environment or values that are generated by fixed-function pipeline stages.

Built-In Interface Block
A block defined in a shader containing only variables decorated with built-in decorations, and is used to match against other shader stages.

Clip Coordinates
The homogeneous coordinate space in which vertex positions (Position decoration) are written by pre-rasterization shader stages.

Clip Distance
A built-in output from pre-rasterization shader stages defining a clip half-space against which the primitive is clipped.

Clip Volume
The intersection of the view volume with all clip half-spaces.

Color Attachment
A subpass attachment point, or image view, that is the target of fragment color outputs and blending.

Color Renderable Format
A VkFormat where VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT is set in one of the following, depending on the image's tiling:

- VkFormatProperties::linearTilingFeatures
- VkFormatProperties::optimalTilingFeatures
- VkDrmFormatModifierPropertiesEXT::drmFormatModifierTilingFeatures

Combined Image Sampler
A descriptor type that includes both a sampled image and a sampler.

Command Buffer
An object that records commands to be submitted to a queue. Represented by a VkCommandBuffer object.

Command Pool
An object that command buffer memory is allocated from, and that owns that memory. Command pools aid multithreaded performance by enabling different threads to use different allocators, without internal synchronization on each use. Represented by a VkCommandPool
Compatible Allocator
When allocators are compatible, allocations from each allocator can be freed by the other allocator.

Compatible Image Formats
When formats are compatible, images created with one of the formats can have image views created from it using any of the compatible formats. Also see Size-Compatible Image Formats.

Compatible Queues
Queues within a queue family. Compatible queues have identical properties.

Complete Mipmap Chain
The entire set of mip levels that can be provided for an image, from the largest application specified mip level size down to the minimum mip level size. See Image Mip Level Sizing.

Component (Format)
A distinct part of a format. Color components are represented with R, G, B, and A. Depth and stencil components are represented with D and S. Formats can have multiple instances of the same component. Some formats have other notations such as E or X which are not considered a component of the format.

Compressed Texel Block
An element of an image having a block-compressed format, comprising a rectangular block of texel values that are encoded as a single value in memory. Compressed texel blocks of a particular block-compressed format have a corresponding width, height, and depth defining the dimensions of these elements in units of texels, and a size in bytes of the encoding in memory.

Constant Integral Expressions
A SPIR-V constant instruction whose type is OpTypeInt. See Constant Instruction in section 2.2.1 “Instructions” of the Khronos SPIR-V Specification.

Coverage Index
The index of a sample in the coverage mask.

Coverage Mask
A bitfield associated with a fragment representing the samples that were determined to be covered based on the result of rasterization, and then subsequently modified by fragment operations or the fragment shader.

Cull Distance
A built-in output from pre-rasterization shader stages defining a cull half-space where the primitive is rejected if all vertices have a negative value for the same cull distance.

Cull Volume
The intersection of the view volume with all cull half-spaces.
Decoration (SPIR-V)
Auxiliary information such as built-in variables, stream numbers, invariance, interpolation type, relaxed precision, etc., added to variables or structure-type members through decorations.

Deprecated (feature)
A feature is deprecated if it is no longer recommended as the correct or best way to achieve its intended purpose.

Depth/Stencil Attachment
A subpass attachment point, or image view, that is the target of depth and/or stencil test operations and writes.

Depth/Stencil Format
A `VkFormat` that includes depth and/or stencil components.

Depth/Stencil Image (or ImageView)
A `VkImage` (or `VkImageView`) with a depth/stencil format.

Depth/Stencil Resolve Attachment
A subpass attachment point, or image view, that is the target of a multisample resolve operation from the corresponding depth/stencil attachment at the end of the subpass.

Derivative Group
A set of fragment shader invocations that cooperate to compute derivatives, including implicit derivatives for sampled image operations.

Descriptor
Information about a resource or resource view written into a descriptor set that is used to access the resource or view from a shader.

Descriptor Binding
An entry in a descriptor set layout corresponding to zero or more descriptors of a single descriptor type in a set. Defined by a `VkDescriptorSetLayoutBinding` structure.

Descriptor Pool
An object that descriptor sets are allocated from, and that owns the storage of those descriptor sets. Descriptor pools aid multithreaded performance by enabling different threads to use different allocators, without internal synchronization on each use. Represented by a `VkDescriptorPool` object.

Descriptor Set
An object that resource descriptors are written into via the API, and that can be bound to a command buffer such that the descriptors contained within it can be accessed from shaders. Represented by a `VkDescriptorSet` object.

Descriptor Set Layout
An object defining the set of resources (types and counts) and their relative arrangement (in the binding namespace) within a descriptor set. Used when allocating descriptor sets and when
creating pipeline layouts. Represented by a `VkDescriptorSetLayout` object.

**Device**

The processor(s) and execution environment that perform tasks requested by the application via the Vulkan API.

**Device Group**

A set of physical devices that support accessing each other’s memory and recording a single command buffer that can be executed on all the physical devices.

**Device Index**

A zero-based integer that identifies one physical device from a logical device. A device index is valid if it is less than the number of physical devices in the logical device.

**Device Mask**

A bitmask where each bit represents one device index. A device mask value is valid if every bit that is set in the mask is at a bit position that is less than the number of physical devices in the logical device.

**Device Memory**

Memory accessible to the device. Represented by a `VkDeviceMemory` object.

**Device-Level Command**

Any command that is dispatched from a logical device, or from a child object of a logical device.

**Device-Level Functionality**

All device-level commands and objects, and their structures, enumerated types, and enumerants. Additionally, physical-device-level functionality defined by a device extension is also considered device-level functionality.

**Device-Level Object**

Logical device objects and their child objects. For example, `VkDevice`, `VkQueue`, and `VkCommandBuffer` objects are device-level objects.

**Device-Local Memory**

Memory that is connected to the device, and may be more performant for device access than host-local memory.

**Direct Drawing Commands**

*Drawing commands* that take all their parameters as direct arguments to the command (and not sourced via structures in buffer memory as the *indirect drawing commands*). Includes `vkCmdDraw`, and `vkCmdDrawIndexed`.

**Disjoint**

*Disjoint planes* are *image planes* to which memory is bound independently. A *disjoint image* consists of multiple *disjoint planes*, and is created with the `VK_IMAGE_CREATE_DISJOINT_BIT` bit set.
Dispatchable Command
A non-global command. The first argument to each dispatchable command is a dispatchable handle type.

Dispatchable Handle
A handle of a pointer handle type which may be used by layers as part of intercepting API commands.

Dispatching Commands
Commands that provoke work using a compute pipeline. Includes `vkCmdDispatch` and `vkCmdDispatchIndirect`.

Drawing Commands
Commands that provoke work using a graphics pipeline. Includes `vkCmdDraw`, `vkCmdDrawIndexed`, `vkCmdDrawIndirectCount`, `vkCmdDrawIndexedIndirectCount`, `vkCmdDrawIndirect`, and `vkCmdDrawIndexedIndirect`.

Duration (Command)
The duration of a Vulkan command refers to the interval between calling the command and its return to the caller.

Dynamic Storage Buffer
A storage buffer whose offset is specified each time the storage buffer is bound to a command buffer via a descriptor set.

Dynamic Uniform Buffer
A uniform buffer whose offset is specified each time the uniform buffer is bound to a command buffer via a descriptor set.

Dynamically Uniform
See Dynamically Uniform in section 2.2 “Terms” of the Khronos SPIR-V Specification.

Element
Arrays are composed of multiple elements, where each element exists at a unique index within that array. Used primarily to describe data passed to or returned from the Vulkan API.

Explicitly-Enabled Layer
A layer enabled by the application by adding it to the enabled layer list in `vkCreateInstance` or `vkCreateDevice`.

Event
A synchronization primitive that is signaled when execution of previous commands completes through a specified set of pipeline stages. Events can be waited on by the device and polled by the host. Represented by a `VkEvent` object.

Executable State (Command Buffer)
A command buffer that has ended recording commands and can be executed. See also Initial State and Recording State.
Execution Dependency
A dependency that guarantees that certain pipeline stages’ work for a first set of commands has completed execution before certain pipeline stages’ work for a second set of commands begins execution. This is accomplished via pipeline barriers, subpass dependencies, events, or implicit ordering operations.

Execution Dependency Chain
A sequence of execution dependencies that transitively act as a single execution dependency.

Explicit chroma reconstruction
An implementation of sampler Y’C_aC_b conversion which reconstructs reduced-resolution chroma samples to luma resolution and then separately performs texture sample interpolation. This is distinct from an implicit implementation, which incorporates chroma sample reconstruction into texture sample interpolation.

Extension Scope
The set of objects and commands that can be affected by an extension. Extensions are either device scope or instance scope.

Extending Structure
A structure type which may appear in the pNext chain of another structure, extending the functionality of the other structure. Extending structures may be defined by either core API versions or extensions.

External Handle
A resource handle which has meaning outside of a specific Vulkan device or its parent instance. External handles may be used to share resources between multiple Vulkan devices in different instances, or between Vulkan and other APIs. Some external handle types correspond to platform-defined handles, in which case the resource may outlive any particular Vulkan device or instance and may be transferred between processes, or otherwise manipulated via functionality defined by the platform for that handle type.

External synchronization
A type of synchronization required of the application, where parameters defined to be externally synchronized must not be used simultaneously in multiple threads.

Facingness (Polygon)
A classification of a polygon as either front-facing or back-facing, depending on the orientation (winding order) of its vertices.

Facingness (Fragment)
A fragment is either front-facing or back-facing, depending on the primitive it was generated from. If the primitive was a polygon (regardless of polygon mode), the fragment inherits the facingness of the polygon. All other fragments are front-facing.

Fence
A synchronization primitive that is signaled when a set of batches or sparse binding operations complete execution on a queue. Fences can be waited on by the host. Represented by a VkFence
Flat Shading
A property of a vertex attribute that causes the value from a single vertex (the provoking vertex) to be used for all vertices in a primitive, and for interpolation of that attribute to return that single value unaltered.

Format Features
A set of features from VkFormatFeatureFlagBits that a VkFormat is capable of using for various commands. The list is determined by factors such as VkImageTiling.

Fragment
A rectangular framebuffer region with associated data produced by rasterization and processed by fragment operations including the fragment shader.

Fragment Area
The width and height, in pixels, of a fragment.

Fragment Input Attachment Interface
Variables with UniformConstant storage class and a decoration of InputAttachmentIndex that are statically used by a fragment shader’s entry point, which receive values from input attachments.

Fragment Output Interface
A fragment shader entry point's variables with Output storage class, which output to color and/or depth/stencil attachments.

Framebuffer
A collection of image views and a set of dimensions that, in conjunction with a render pass, define the inputs and outputs used by drawing commands. Represented by a VkFramebuffer object.

Framebuffer Attachment
One of the image views used in a framebuffer.

Framebuffer Coordinates
A coordinate system in which adjacent pixels' coordinates differ by 1 in x and/or y, with (0,0) in the upper left corner and pixel centers at half-integers.

Framebuffer-Space
Operating with respect to framebuffer coordinates.

Framebuffer-Local
A framebuffer-local dependency guarantees that only for a single framebuffer region, the first set of operations happens-before the second set of operations.

Framebuffer-Global
A framebuffer-global dependency guarantees that for all framebuffer regions, the first set of operations happens-before the second set of operations.
Framebuffer Region
A framebuffer region is a set of sample (x, y, layer, sample) coordinates that is a subset of the entire framebuffer.

Front-Facing
See Facingness.

Full Compatibility
A given version of the API is fully compatible with another version if an application, relying only on valid behavior and functionality defined by either of those specifications, is able to correctly run against each version without any modification. This assumes no active attempt by that application to not run when it detects a different version.

Global Command
A Vulkan command for which the first argument is not a dispatchable handle type.

Global Workgroup
A collection of local workgroups dispatched by a single dispatching command.

Handle
An opaque integer or pointer value used to refer to a Vulkan object. Each object type has a unique handle type.

Happen-after, happens-after
A transitive, irreflexive and antisymmetric ordering relation between operations. An execution dependency with a source of A and a destination of B enforces that B happens-after A. The inverse relation of happens-before.

Happen-before, happens-before
A transitive, irreflexive and antisymmetric ordering relation between operations. An execution dependency with a source of A and a destination of B enforces that A happens-before B. The inverse relation of happens-after.

Helper Invocation
A fragment shader invocation that is created solely for the purposes of evaluating derivatives for use in non-helper fragment shader invocations, and which does not have side effects.

Host
The processor(s) and execution environment that the application runs on, and that the Vulkan API is exposed on.

Host Mapped Device Memory
Device memory that is mapped for host access using `vkMapMemory`.

Host Mapped Foreign Memory
Memory owned by a foreign device that is mapped for host access.
Host Memory
Memory not accessible to the device, used to store implementation data structures.

Host-Accessible Subresource
A buffer, or a linear image subresource in either the VK_IMAGE_LAYOUT_PREINITIALIZED or VK_IMAGE_LAYOUT_GENERAL layout. Host-accessible subresources have a well-defined addressing scheme which can be used by the host.

Host-Local Memory
Memory that is not local to the device, and may be less performant for device access than device-local memory.

Host-Visible Memory
Device memory that can be mapped on the host and can be read and written by the host.

ICD
Installable Client Driver. An ICD is represented as a VkPhysicalDevice.

Identically Defined Objects
Objects of the same type where all arguments to their creation or allocation functions, with the exception of pAllocator, are

1. Vulkan handles which refer to the same object or
2. identical scalar or enumeration values or
3. Host pointers which point to an array of values or structures which also satisfy these three constraints.

Image
A resource that represents a multi-dimensional formatted interpretation of device memory. Represented by a VkImage object.

Image Subresource
A specific mipmap level, layer, and set of aspects of an image.

Image Subresource Range
A set of image subresources that are contiguous mipmap levels and layers.

Image View
An object that represents an image subresource range of a specific image, and state controlling how the contents are interpreted. Represented by a VkImageView object.

Immutable Sampler
A sampler descriptor provided at descriptor set layout creation time for a specific binding. This sampler is then used for that binding in all descriptor sets allocated with the layout, and it cannot be changed.

Implicit chroma reconstruction
An implementation of sampler Y’C_{b}C_{r} conversion which reconstructs the reduced-resolution
chroma samples directly at the sample point, as part of the normal texture sampling operation. This is distinct from an explicit chroma reconstruction implementation, which reconstructs the reduced-resolution chroma samples to the resolution of the luma samples, then filters the result as part of texture sample interpolation.

**Implicitly-Enabled Layer**
A layer enabled by a loader-defined mechanism outside the Vulkan API, rather than explicitly by the application during instance or device creation.

**Index Buffer**
A buffer bound via `vkCmdBindIndexBuffer` which is the source of index values used to fetch vertex attributes for a `vkCmdDrawIndexed` or `vkCmdDrawIndexedIndirect` command.

**Indexed Drawing Commands**

*Drawing commands* which use an *index buffer* as the source of index values used to fetch vertex attributes for a drawing command. Includes `vkCmdDrawIndexed`, `vkCmdDrawIndexedIndirectCount`, and `vkCmdDrawIndexedIndirect`.

**Indirect Commands**

Drawing or dispatching commands that source some of their parameters from structures in buffer memory. Includes `vkCmdDrawIndirect`, `vkCmdDrawIndexedIndirect`, `vkCmdDrawIndirectCount`, `vkCmdDrawIndexedIndirectCount`, and `vkCmdDispatchIndirect`.

**Indirect Drawing Commands**

*Drawing commands* that source some of their parameters from structures in buffer memory. Includes `vkCmdDrawIndirect`, `vkCmdDrawIndirectCount`, `vkCmdDrawIndexedIndirectCount`, and `vkCmdDrawIndexedIndirect`.

**Initial State (Command Buffer)**
A command buffer that has not begun recording commands. See also Recording State and Executable State.

**Input Attachment**
A descriptor type that represents an image view, and supports unfiltered read-only access in a shader, only at the fragment's location in the view.

**Instance**
The top-level Vulkan object, which represents the application's connection to the implementation. Represented by a `VkInstance` object.

**Instance-Level Command**
Any command that is dispatched from an instance, or from a child object of an instance, except for physical devices and their children.

**Instance-Level Functionality**
All instance-level commands and objects, and their structures, enumerated types, and enumerants.
**Instance-Level Object**

High-level Vulkan objects, which are not physical devices, nor children of physical devices. For example, `VkInstance` is an instance-level object.

**Instance (Memory)**

In a logical device representing more than one physical device, some device memory allocations have the requested amount of memory allocated multiple times, once for each physical device in a device mask. Each such replicated allocation is an instance of the device memory.

**Instance (Resource)**

In a logical device representing more than one physical device, buffer and image resources exist on all physical devices but can be bound to memory differently on each. Each such replicated resource is an instance of the resource.

**Internal Synchronization**

A type of synchronization required of the implementation, where parameters not defined to be externally synchronized may require internal mutexing to avoid multithreaded race conditions.

**Invocation (Shader)**

A single execution of an entry point in a SPIR-V module. For example, a single vertex’s execution of a vertex shader or a single fragment’s execution of a fragment shader.

**Invocation Group**

A set of shader invocations that are executed in parallel and that must execute the same control flow path in order for control flow to be considered dynamically uniform.

**Linear Resource**

A resource is linear if it is one of the following:

- a `VkBuffer`
- a `VkImage` created with `VK_IMAGE_TILING_LINEAR`
- a `VkImage` created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and whose Linux DRM format modifier is `DRM_FORMAT_MOD_LINEAR`

A resource is non-linear if it is one of the following:

- a `VkImage` created with `VK_IMAGE_TILING_OPTIMAL`
- a `VkImage` created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and whose Linux DRM format modifier is not `DRM_FORMAT_MOD_LINEAR`

**Linux DRM Format Modifier**

A 64-bit, vendor-prefixed, semi-opaque unsigned integer describing vendor-specific details of an image’s memory layout. In Linux graphics APIs, modifiers are commonly used to specify the memory layout of externally shared images. An image has a modifier if and only if it is created with tiling equal to `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`. For more details, refer to the appendix for extension `VK_EXT_image_drm_format_modifier`.
**Local Workgroup**
A collection of compute shader invocations invoked by a single dispatching command, which share data via `WorkgroupLocal` variables and can synchronize with each other.

**Logical Device**
An object that represents the application’s interface to the physical device. The logical device is the parent of most Vulkan objects. Represented by a `VkDevice` object.

**Logical Operation**
Bitwise operations between a fragment color value and a value in a color attachment, that produce a final color value to be written to the attachment.

**Lost Device**
A state that a logical device may be in as a result of unrecoverable implementation errors, or other exceptional conditions.

**Mappable**
See Host-Visible Memory.

**Memory Dependency**
A memory dependency is an execution dependency which includes availability and visibility operations such that:

- The first set of operations happens-before the availability operation
- The availability operation happens-before the visibility operation
- The visibility operation happens-before the second set of operations

**Memory Domain**
A memory domain is an abstract place to which memory writes are made available by availability operations and memory domain operations. The memory domains correspond to the set of agents that the write can then be made visible to. The memory domains are `host`, `device`, `shader`, `workgroup instance` (for workgroup instance there is a unique domain for each compute workgroup) and `subgroup instance` (for subgroup instance there is a unique domain for each subgroup).

**Memory Domain Operation**
An operation that makes the writes that are available to one memory domain available to another memory domain.

**Memory Heap**
A region of memory from which device memory allocations can be made.

**Memory Type**
An index used to select a set of memory properties (e.g. mappable, cached) for a device memory allocation.

**Minimum Mip Level Size**
The smallest size that is permitted for a mip level. For conventional images this is 1x1x1. See
Image Mip Level Sizing.

Mip Tail Region

The set of mipmap levels of a sparse residency texture that are too small to fill a sparse block, and that must all be bound to memory collectively and opaquely.

Multi-planar

A multi-planar format (or “planar format”) is an image format consisting of more than one plane, identifiable with a _2PLANE or _3PLANE component to the format name and listed in Formats requiring sampler Y’C₈C₆R conversion for VK_IMAGE_ASPECT_COLOR_BIT image views. A multi-planar image (or “planar image”) is an image of a multi-planar format.

Non-Dispatchable Handle

A handle of an integer handle type. Handle values may not be unique, even for two objects of the same type.

Non-Indexed Drawing Commands

Drawing commands for which the vertex attributes are sourced in linear order from the vertex input attributes for a drawing command (i.e. they do not use an index buffer). Includes vkCmdDraw, vkCmdDrawIndirectCount, and vkCmdDrawIndirect.

Normalized

A value that is interpreted as being in the range [0,1] as a result of being implicitly divided by some other value.

Normalized Device Coordinates

A coordinate space after perspective division is applied to clip coordinates, and before the viewport transformation converts them to framebuffer coordinates.

Obsoleted (feature)

A feature is obsolete if it can no longer be used.

Opaque Capture Address

A 64-bit value representing the device address of a buffer or memory object that is expected to be used by trace capture/replay tools in combination with the bufferDeviceAddress feature.

Overlapped Range (Aliased Range)

The aliased range of a device memory allocation that intersects a given image subresource of an image or range of a buffer.

Ownership (Resource)

If an entity (e.g. a queue family) has ownership of a resource, access to that resource is well-defined for access by that entity.

Packed Format

A format whose components are stored as a single texel block in memory, with their relative locations defined within that element.
Payload
Importable or exportable reference to the internal data of an object in Vulkan.

Peer Memory
An instance of memory corresponding to a different physical device than the physical device performing the memory access, in a logical device that represents multiple physical devices.

Physical Device
An object that represents a single device in the system. Represented by a VkPhysicalDevice object.

Physical-Device-Level Command
Any command that is dispatched from a physical device.

Physical-Device-Level Functionality
All physical-device-level commands and objects, and their structures, enumerated types, and enumerants.

Physical-Device-Level Object
Physical device objects. For example, VkPhysicalDevice is a physical-device-level object.

Pipeline
An object controlling how graphics or compute work is executed on the device. A pipeline includes one or more shaders, as well as state controlling any non-programmable stages of the pipeline. Represented by a VkPipeline object.

Pipeline Barrier
An execution and/or memory dependency recorded as an explicit command in a command buffer, that forms a dependency between the previous and subsequent commands.

Pipeline Cache
An object that can be used to collect and retrieve information from pipelines as they are created, and can be populated with previously retrieved information in order to accelerate pipeline creation. Represented by a VkPipelineCache object.

Pipeline JSON Schema
A JSON-based representation for encapsulating all pipeline state which is necessary for the offline pipeline cache compiler. This includes the SPIR-V shader module, pipeline layout, render pass information and pipeline state creation information.

Pipeline Layout
An object defining the set of resources (via a collection of descriptor set layouts) and push constants used by pipelines that are created using the layout. Used when creating a pipeline and when binding descriptor sets and setting push constant values. Represented by a VkPipelineLayout object.

Pipeline Stage
A logically independent execution unit that performs some of the operations defined by an
Pipeline Identifier

An identifier that can be used to identify a specific pipeline independently from the pipeline description.

pNext Chain

A set of structures chained together through their pNext members.

Planar

See multi-planar.

Plane

An image plane is part of the representation of an image, containing a subset of the color components necessary to represent the texels in the image and with a contiguous mapping of coordinates to bound memory. Most images consist only of a single plane, but some formats spread the components across multiple image planes. The host-accessible properties of each image plane are accessible for a linear layout using vkGetImageSubresourceLayout. If a multi-planar image is created with the VK_IMAGE_CREATE_DISJOINT_BIT bit set, the image is described as disjoint, and its planes are therefore bound to memory independently.

Point Sampling (Rasterization)

A rule that determines whether a fragment sample location is covered by a polygon primitive by testing whether the sample location is in the interior of the polygon in framebuffer-space, or on the boundary of the polygon according to the tie-breaking rules.

Potential Format Features

The union of all VkFormatFeatureFlagBits that the implementation supports for a specified VkFormat, over all supported image tilings. For QNX Screen external formats the VkFormatFeatureFlagBits is provided by the implementation.

Pre-rasterization

Operations that execute before rasterization, and any state associated with those operations.

Presentable image

A VkImage object obtained from a VkSwapchainKHR used to present to a VkSurfaceKHR object.

Preserve Attachment

One of a list of attachments in a subpass description that is not read or written by the subpass, but that is read or written on earlier and later subpasses and whose contents must be preserved through this subpass.

Primary Command Buffer

A command buffer that can execute secondary command buffers, and can be submitted directly to a queue.

Primitive Topology

State controlling how vertices are assembled into primitives, e.g. as lists of triangles, strips of
Promoted (feature)
A feature from an older extension is considered promoted if it is made available as part of a new core version or newer extension with wider support.

Protected Buffer
A buffer to which protected device memory can be bound.

Protected-capable Device Queue
A device queue to which protected command buffers can be submitted.

Protected Command Buffer
A command buffer which can be submitted to a protected-capable device queue.

Protected Device Memory
Device memory which can be visible to the device but must not be visible to the host.

Protected Image
An image to which protected device memory can be bound.

Provisional
A feature is released provisionally in order to get wider feedback on the functionality before it is finalized. Provisional features may change in ways that break backwards compatibility, and thus are not recommended for use in production applications.

Provoking Vertex
The vertex in a primitive from which flat shaded attribute values are taken. This is generally the “first” vertex in the primitive, and depends on the primitive topology.

Push Constants
A small bank of values writable via the API and accessible in shaders. Push constants allow the application to set values used in shaders without creating buffers or modifying and binding descriptor sets for each update.

Push Constant Interface
The set of variables with PushConstant storage class that are statically used by a shader entry point, and which receive values from push constant commands.

Descriptor Update Template
An object specifying a mapping from descriptor update information in host memory to elements in a descriptor set, which helps enable more efficient descriptor set updates.

Query Pool
An object containing a number of query entries and their associated state and results. Represented by a VkQueryPool object.
Queue
An object that executes command buffers and sparse binding operations on a device. Represented by a VkQueue object.

Queue Family
A set of queues that have common properties and support the same functionality, as advertised in VkQueueFamilyProperties.

Queue Operation
A unit of work to be executed by a specific queue on a device, submitted via a queue submission command. Each queue submission command details the specific queue operations that occur as a result of calling that command. Queue operations typically include work that is specific to each command, and synchronization tasks.

Queue Submission
Zero or more batches and an optional fence to be signaled, passed to a command for execution on a queue. See the Devices and Queues chapter for more information.

Recording State (Command Buffer)
A command buffer that is ready to record commands. See also Initial State and Executable State.

Release Operation (Resource)
An operation that releases ownership of an image subresource or buffer range.

Render Pass
An object that represents a set of framebuffer attachments and phases of rendering using those attachments. Represented by a VkRenderPass object.

Render Pass Instance
A use of a render pass in a command buffer.

Required Extensions
Extensions that must be enabled alongside extensions dependent on them (see Extension Dependencies).

Reset (Command Buffer)
Resetting a command buffer discards any previously recorded commands and puts a command buffer in the initial state.

Residency Code
An integer value returned by sparse image instructions, indicating whether any sparse unbound texels were accessed.

Resolve Attachment
A subpass attachment point, or image view, that is the target of a multisample resolve operation from the corresponding color attachment at the end of the subpass.
Retired Swapchain
A swapchain that has been used as the `oldSwapchain` parameter to `vkCreateSwapchainKHR`. Images cannot be acquired from a retired swapchain, however images that were acquired (but not presented) before the swapchain was retired can be presented.

Sample Index
The index of a sample within a single set of samples.

Sample Shading
Invoking the fragment shader multiple times per fragment, with the covered samples partitioned among the invocations.

Sampled Image
A descriptor type that represents an image view, and supports filtered (sampled) and unfiltered read-only access in a shader.

Sampler
An object containing state controlling how sampled image data is sampled (or filtered) when accessed in a shader. Also a descriptor type describing the object. Represented by a `VkSampler` object.

Secondary Command Buffer
A command buffer that can be executed by a primary command buffer, and must not be submitted directly to a queue.

Self-Dependency
A subpass dependency from a subpass to itself, i.e. with `srcSubpass` equal to `dstSubpass`. A self-dependency is not automatically performed during a render pass instance, rather a subset of it can be performed via `vkCmdPipelineBarrier` during the subpass.

Semaphore
A synchronization primitive that supports signal and wait operations, and can be used to synchronize operations within a queue or across queues. Represented by a `VkSemaphore` object.

Shader
Instructions selected (via an entry point) from a shader module, which are executed in a shader stage.

Shader Code
A stream of instructions used to describe the operation of a shader.

Shader Module
A collection of shader code, potentially including several functions and entry points, that is used to create shaders in pipelines. Represented by a `VkShaderModule` object.

Shader Stage
A stage of the graphics or compute pipeline that executes shader code.
**Shading Rate**

The ratio of the number of fragment shader invocations generated in a fully covered framebuffer region to the size (in pixels) of that region.

**Shared presentable image**

A presentable image created from a swapchain with `VkPresentModeKHR` set to either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

**Side Effect**

A store to memory or atomic operation on memory from a shader invocation.

**Single Event Upset**

A change of physical device state, such as a register or memory bitflip, e.g. caused by ionizing radiation.

**Single-plane format**

A format that is not *multi-planar*.

**Size-Compatible Image Formats**

When a compressed image format and an uncompressed image format are size-compatible, it means that the texel block size of the uncompressed format must equal the texel block size of the compressed format.

**Sparse Block**

An element of a sparse resource that can be independently bound to memory. Sparse blocks of a particular sparse resource have a corresponding size in bytes that they use in the bound memory.

**Sparse Image Block**

A sparse block in a sparse partially-resident image. In addition to the sparse block size in bytes, sparse image blocks have a corresponding width, height, and depth defining the dimensions of these elements in units of texels or compressed texel blocks, the latter being used in case of sparse images having a block-compressed format.

**Sparse Unbound Texel**

A texel read from a region of a sparse texture that does not have memory bound to it.

**Static Use**

An object in a shader is statically used by a shader entry point if any function in the entry point’s call tree contains an instruction using the object. A reference in the entry point’s interface list does not constitute a static use. Static use is used to constrain the set of descriptors used by a shader entry point.

**Storage Buffer**

A descriptor type that represents a buffer, and supports reads, writes, and atomics in a shader.

**Storage Image**

A descriptor type that represents an image view, and supports unfiltered loads, stores, and...
atomics in a shader.

**Storage Texel Buffer**
A descriptor type that represents a buffer view, and supports unfiltered, formatted reads, writes, and atomics in a shader.

**Subgroup**
A set of shader invocations that **can** synchronize and share data with each other efficiently. In compute shaders, the *local workgroup* is a superset of the subgroup.

**Subgroup Mask**
A bitmask for all invocations in the current subgroup with one bit per invocation, starting with the least significant bit in the first vector component, continuing to the last bit (less than SubgroupSize) in the last required vector component.

**Subpass**
A phase of rendering within a render pass, that reads and writes a subset of the attachments.

**Subpass Dependency**
An execution and/or memory dependency between two subpasses described as part of render pass creation, and automatically performed between subpasses in a render pass instance. A subpass dependency limits the overlap of execution of the pair of subpasses, and **can** provide guarantees of memory coherence between accesses in the subpasses.

**Subpass Description**
Lists of attachment indices for input attachments, color attachments, depth/stencil attachment, resolve attachments, depth/stencil resolve, and preserve attachments used by the subpass in a render pass.

**Subset (Self-Dependency)**
A subset of a self-dependency is a pipeline barrier performed during the subpass of the self-dependency, and whose stage masks and access masks each contain a subset of the bits set in the identically named mask in the self-dependency.

**Texel Block**
A single addressable element of an image with an uncompressed VkFormat, or a single compressed block of an image with a compressed VkFormat.

**Texel Block Size**
The size (in bytes) used to store a texel block of a compressed or uncompressed image.

**Texel Coordinate System**
One of three coordinate systems (normalized, unnormalized, integer) defining how texel coordinates are interpreted in an image or a specific mipmap level of an image.

**Timeline Semaphore**
A semaphore with a strictly increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. Represented by a
VkSemaphore object created with a semaphore type of VK_SEMAPHORE_TYPE_TIMELINE.

**Uniform Texel Buffer**
A descriptor type that represents a buffer view, and supports unfiltered, formatted, read-only access in a shader.

**Uniform Buffer**
A descriptor type that represents a buffer, and supports read-only access in a shader.

**Units in the Last Place (ULP)**
A measure of floating-point error loosely defined as the smallest representable step in a floating-point format near a given value. For the precise definition see Precision and Operation of SPIR-V instructions or Jean-Michel Muller, “On the definition of ulp(x)”, RR-5504, INRIA. Other sources may also use the term “unit of least precision”.

**Unnormalized**
A value that is interpreted according to its conventional interpretation, and is not normalized.

**Unprotected Buffer**
A buffer to which unprotected device memory **can** be bound.

**Unprotected Command Buffer**
A command buffer which **can** be submitted to an unprotected device queue or a protected-capable device queue.

**Unprotected Device Memory**
Device memory which **can** be visible to the device and **can** be visible to the host.

**Unprotected Image**
An image to which unprotected device memory **can** be bound.

**User-Defined Variable Interface**
A shader entry point’s variables with **Input** or **Output** storage class that are not built-in variables.

**Vertex Input Attribute**
A graphics pipeline resource that produces input values for the vertex shader by reading data from a vertex input binding and converting it to the attribute’s format.

**Variable-Sized Descriptor Binding**
A descriptor binding whose size will be specified when a descriptor set is allocated using this layout.

**Vertex Input Binding**
A graphics pipeline resource that is bound to a buffer and includes state that affects addressing calculations within that buffer.

**Vertex Input Interface**
A vertex shader entry point’s variables with **Input** storage class, which receive values from
vertex input attributes.

**View Mask**
When multiview is enabled, a view mask is a property of a subpass controlling which views the rendering commands are broadcast to.

**View Volume**
A subspace in homogeneous coordinates, corresponding to post-projection x and y values between -1 and +1, and z values between 0 and +1.

**Viewport Transformation**
A transformation from normalized device coordinates to framebuffer coordinates, based on a viewport rectangle and depth range.

**Visibility Operation**
An operation that causes available values to become visible to specified memory accesses.

**Visible**
A state of values written to memory that allows them to be accessed by a set of operations.

**Common Abbreviations**
The abbreviations and acronyms defined in this section are sometimes used in the Specification and the API where they are considered clear and commonplace.

**Src**
Source

**Dst**
Destination

**Min**
Minimum

**Max**
Maximum

**Rect**
Rectangle

**Info**
Information

**LOD**
Level of Detail

**Log**
Logarithm
ID
Identifier

UUID
Universally Unique Identifier

Op
Operation

R
Red color component

G
Green color component

B
Blue color component

A
Alpha color component

RTZ
Round towards zero

RTE
Round to nearest even

Prefixes

Prefixes are used in the API to denote specific semantic meaning of Vulkan names, or as a label to avoid name clashes, and are explained here:

VK/Vk/vk
Vulkan namespace
All types, commands, enumerants and defines in this specification are prefixed with these two characters.

PFN/pfn
Function Pointer
Denotes that a type is a function pointer, or that a variable is of a pointer type.

p
Pointer
Variable is a pointer.

vkCmd
Commands that record commands in command buffers
These API commands do not result in immediate processing on the device. Instead, they record
the requested action in a command buffer for execution when the command buffer is submitted to a queue.

s

Structure
Used to denote the VK_STRUCTURE_TYPE* member of each structure in sType
Appendix J: Credits (Informative)

Vulkan SC 1.0 is the result of contributions from many people and companies participating in the Khronos Vulkan SC Working Group, building upon the Base Vulkan specification produced by the Khronos Vulkan Working Group, as well as input from the Vulkan Advisory Panel.

Members of the Working Group, including the company that they represented at the time of their most recent contribution, are listed in the following sections. Some specific contributions made by individuals are listed together with their name.

**Working Group Contributors to Vulkan SC 1.0**

- Aarusha Thakral, CoreAVI
- Aidan Fabius, CoreAVI
- Alastair Donaldson, Google
- Alastair Murray, Codeplay Software Ltd.
- Alex Crabb, Khronos
- Alexander Galazin, Arm
- Alis Ors, NXP Semiconductors
- Alon Or-bach, Samsung Electronics
- Andrew Garrard, Imagination Technologies
- Anna Buczkowska, Mobica
- Balajee Gurumoorah, Huawei Technologies Co., Ltd.
- Bogdan Naodovic, NVIDIA
- Boris Zanin, Mobica
- Brad Cain, NVIDIA
- Cary Ashby, Collins Aerospace
- Chris Forbes, Google
- Craig Davies, Huawei Technologies Co., Ltd.
- Daniel Bernal, Arm
- Daniel Koch, NVIDIA
- Dave Higham, Imagination Technologies
- Dave McCloskey, Juice Labs
- David Hayward, Imagination Technologies
- Donald Scorgie, Imagination Technologies
- Doug Singkofer, Collins Aerospace
- Emily Stearns, Khronos
• Erik Tomusk, Codeplay Software Ltd.
• Ewa Galamon, Mobica
• Greg Szober, CoreAVI
• Illya Rudkin, Codeplay Software Ltd.
• Jacek Wisniewski, Mobica
• James Helferty, NVIDIA
• Jan Hemes, Continental Corporation
• Jan-Harald Fredriksen, Arm
• Janos Lakatos, Imagination Technologies
• Jeff Bolz, NVIDIA
• Jim Carroll, Mobica
• John Zulauf, LunarG
• Jon Leech, Independent (XML toolchain, normative language, release wrangler)
• Jun Wang, Huawei Technologies Co., Ltd.
• Karen Ghavam, LunarG
• Karolina Palka, Mobica
• Ken Wenger, CoreAVI
• Lenny Komow, LunarG
• Lilja Tamminen, Basemark Oy
• Luca Di Mauro, Arm
• Lukasz Janyst, Daedalean
• Mark Bellamy, Arm

• Tony Barbour, LunarG (versions 1.0, 1.1, 1.2)
• Tony Zlatinski, NVIDIA (version 1.3)
• Victor Eruhimov, Unknown (version 1.1)
• Vikram Kushwaha, NVIDIA (version 1.3)
• Vincent Hindriksen, Stream HPC (versions 1.2, 1.3)
• Wasim Abbas, Arm (version 1.3)
Other Credits

The Vulkan Advisory Panel members provided important real-world usage information and advice that helped guide design decisions.

The wider Vulkan community have provided useful feedback, questions and specification changes that have helped improve the quality of the Specification via GitHub.

Administrative support to the Working Group for Vulkan 1.1, 1.2, and 1.3 was provided by Khronos staff including Ann Thorsnes, Blaine Kohl, Dominic Agoro-Ombaka, Emily Stearns, Jeff Phillips, Lisie Aartsen, Liz Maitral, Marty Johnson, Tim Lewis, and Xiao-Yu CHENG; and by Alex Crabb, Laura Shubel, and Rachel Bradshaw of Caster Communications.

Administrative support for Vulkan 1.0 was provided by Andrew Riegel, Elizabeth Riegel, Glenn Fredericks, Kathleen Mattson and Michelle Clark of Gold Standard Group.

Technical support was provided by James Riordon, site administration of Khronos.org and OpenGL.org.
