If `OpImageBlockMatchSADQCOM` is used to read from a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

Any shader invocation executed by this command must terminate.

The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.
If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it must be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07469
  Input attachment views accessed in a subpass must be created with the same `VkFormat` as the corresponding subpass definition be created with a `VkImageView` that is an attachment in the currently bound `VkFramebuffer` at an index that corresponds to a valid input attachment in the current subpass.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-06537
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-06538
  If any recorded command in the current subpass will write to an image subresource as an attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-06539
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, all stencil ops must be `VK_STENCIL_OP_KEEP`.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-06666
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-03417
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then...
vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::scissorCount of the pipeline.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-04138
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-04139
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-04140
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

If the bound graphics pipeline state was created with the `VK_PIPELINE_CREATE_VIEWPORT_CREATE_INFO` dynamic state enabled and a `VkPipelineViewportCreateInfo` structure chained from `VkPipelineStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportCreateInfo::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

If the bound graphics pipeline state was created with the `VK_PIPELINE_CREATE_VIEWPORT_CREATE_INFO` dynamic state enabled and a `VkPipelineViewportCreateInfo` structure chained from `VkPipelineStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportCreateInfo::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

If the bound graphics pipeline state was created with the `VK_PIPELINE_CREATE_VIEWPORT_CREATE_INFO` dynamic state enabled and a `VkPipelineViewportCreateInfo` structure chained from `VkPipelineStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportCreateInfo::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.
If rasterization is not disabled in the bound graphics pipeline, and none of the `VK_AMD_mixed_attachment_samples` extension, the `VK_NV_framebuffer_mixed_samples` extension, or the `multisampledRenderToSingleSampled` feature are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06172**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06173**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06174**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06175**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06176**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06177**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewMask-06178**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-colorAttachmentCount-06179**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`.
If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.
If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pDepthAttachment-06186
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pStencilAttachment-06187
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-multisampledRenderToSingleSampled-07285
  If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-multisampledRenderToSingleSampled-07286
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-multisampledRenderToSingleSampled-07287
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-renderPass-06198**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-primitivesGeneratedQueryWithRasterizerDiscard-06708**
  If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-primitivesGeneratedQueryWithNonZeroStreams-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-pColorBlendEnables-07470**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last call to `vkCmdSetColorBlendEnableEXT` set `pColorBlendEnables` for any attachment to `VK_TRUE`, then for those attachments in the subpass the corresponding image view’s format features must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-rasterizationSamples-07471**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must follow the rules for a zero-attachment subpass.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-samples-07473**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-samples-07472**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline.
must be greater or equal to the rasterizationSamples parameter in the last call to 
\texttt{vkCmdSetRasterizationSamplesEXT}.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectCountEXT-multisampledRenderToSingleSampled-07475}
  
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT} state enabled, and none of the \texttt{VK_AMD_mixed_attachment_samples} extension, \texttt{VK_NV_framebuffer_mixed_samples} extension, or the \texttt{multisampledRenderToSingleSampled} feature is enabled, then the \texttt{rasterizationSamples} in the last call to \texttt{vkCmdSetRasterizationSamplesEXT} must be the same as the current subpass color and/or depth/stencil attachments.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectCountEXT-firstAttachment-07476}
  
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT} state enabled then \texttt{vkCmdSetColorBlendEnableEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorBlendEnableEXT} calls must specify an enable for all active color attachments in the current subpass.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectCountEXT-firstAttachment-07477}
  
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT} dynamic state enabled then \texttt{vkCmdSetColorBlendEquationEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorBlendEquationEXT} calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectCountEXT-firstAttachment-07478}
  
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT} dynamic state enabled then \texttt{vkCmdSetColorWriteMaskEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorWriteMaskEXT} calls must specify the color write mask for all active color attachments in the current subpass.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectCountEXT-firstAttachment-07479}
  
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT} dynamic state enabled then \texttt{vkCmdSetColorBlendAdvancedEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorBlendAdvancedEXT} calls must specify the advanced blend equations for all active color attachments in the current subpass where blending is enabled.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectCountEXT-advancedBlendMaxColorAttachments-07480}
  
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT} and \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT} dynamic states enabled and the last calls to \texttt{vkCmdSetColorBlendEnableEXT} and
vkCmdSetColorBlendAdvancedEXT have enabled advanced blending, then the number of active color attachments in the current subpass must not exceed advancedBlendMaxColorAttachments

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-primitivesGeneratedQueryWithNonZeroStreams-07481
If the primitivesGeneratedQueryWithNonZeroStreams feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, and the bound graphics pipeline was created with VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT state enabled, the last call to vkCmdSetRasterizationStreamEXT must have set the rasterizationStream to zero

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsPerPixel-07482
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state disabled, then the sampleLocationsPerPixel member of pSampleLocationsInfo in the last call to vkCmdSetSampleLocationsEXT must equal the rasterizationSamples member of the VkPipelineMultisampleStateCreateInfo structure the bound graphics pipeline has been created with

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsPerPixel-07483
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, then the sampleLocationsPerPixel member of pSampleLocationsInfo in the last call to vkCmdSetSampleLocationsEXT must equal the rasterizationSamples parameter of the last call to vkCmdSetRasterizationSamplesEXT

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07484
If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07485
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled and the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, then the sampleLocationsInfo.sampleLocationGridSize.width in the last call to vkCmdSetSampleLocationsEXT must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.width as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07486
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, then the
In the last call to `vkCmdSetSampleLocationsEXT` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`.

- If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, the fragment shader code must not statically use the extended shader instruction `InterpolateAtSample`.

- If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` state enabled and the last call to `vkCmdSetCoverageModulationTableEnableNV` set `coverageModulationTableEnable` to `VK_TRUE`, then the `coverageModulationTableCount` parameter in the last call to `vkCmdSetCoverageModulationTableNV` must equal the current `rasterizationSamples` divided by the number of color samples in the current subpass.

- If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if current subpass has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled in the currently bound pipeline state, then the current `rasterizationSamples` must be the same as the sample count of the depth/stencil attachment.

- If this `VK_NV_coverage_reduction_mode` extension is enabled, the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` state enabled and the last call to `vkCmdSetCoverageToColorEnableNV` set the `coverageToColorEnable` to `VK_TRUE`, then the current coverage reduction mode `coverageReductionMode`, then the current `rasterizationSamples`, and the sample counts for the color and depth/stencil attachments (if the subpass has them) must be a valid combination returned by `vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV`.

- If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.  

1755
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV dynamic
states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportSwizzleNV must be greater than or equal to the viewportCount
parameter in the last call to vkCmdSetViewportWithCount

If the VK_NV_framebuffer_mixed_samples extension is enabled, and if the current subpass
has any color attachments and rasterizationSamples of the last call to
vkCmdSetRasterizationSamplesEXT is greater than the number of color samples, then the pipeline sampleShadingEnable must be VK_FALSE

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or
VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current
stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is
VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT, then the stippledRectangularLines feature
must be enabled

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or
VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current
stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is
VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT, then the stippledBresenhamLines feature must
be enabled

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or
VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current
stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is
VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT, then the stippledSmoothLines feature
must be enabled

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or
VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current
stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is
VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT, then the stippledRectangularLines feature must
be enabled and VkPhysicalDeviceLimits::strictLines must be VK_TRUE

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT dynamic state enabled,
conservativePointAndLineRasterization is not supported, and the effective primitive
topology output by the last pre-rasterization shader stage is a line or point, then the
The conservative rasterization mode set by the last call to `vkCmdSetConservativeRasterizationModeEXT` must be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-stage-07073**
  If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo`::`stage` member of an element of `VkGraphicsPipelineCreateInfo`::`pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then **Mesh Shader Queries** must not be active.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-buffer-02708**
  If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-buffer-02709**
  `buffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-offset-02710**
  `offset` **must** be a multiple of 4.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-02711**
  `commandBuffer` **must** not be a protected command buffer.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-02714**
  If `countBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-02715**
  `countBuffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBufferOffset-02716**
  `countBufferOffset` **must** be a multiple of 4.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-02717**
  The count stored in `countBuffer` **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxDrawIndirectCount`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBufferOffset-04129**
  `countBufferOffset + sizeof(uint32_t))` **must** be less than or equal to the size of `countBuffer`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-04445**
  **If `drawIndirectCount` is not enabled this function** must not be used.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-stride-07096**
  `stride` **must** be a multiple of 4 and **must** be greater than or equal to `sizeof(VkDrawMeshTasksIndirectCommandEXT)`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-maxDrawCount-07097**
  If `maxDrawCount` is greater than or equal to 1, `(stride × (maxDrawCount - 1) + offset + sizeof(VkDrawMeshTasksIndirectCommandEXT))` **must** be less than or equal to the size of `buffer`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-07098**
  If the count stored in `countBuffer` is equal to 1, `(offset + sizeof(VkDrawMeshTasksIndirectCommandEXT))` **must** be less than or equal to the size of `buffer`.
If the count stored in `countBuffer` is greater than 1, \((\text{stride} \times (\text{drawCount} - 1) + \text{offset} + \text{sizeof}(\text{VkDrawMeshTasksIndirectCommandEXT}))\) must be less than or equal to the size of `buffer`.

The current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` must contain a shader stage using the `MeshEXT Execution Model`.

### Valid Usage (Implicit)

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-buffer-parameter**
  - `buffer` must be a valid `VkBuffer` handle.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-parameter**
  - `countBuffer` must be a valid `VkBuffer` handle.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-recording**
  - `commandBuffer` must be in the recording state.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-renderpass**
  - This command must only be called inside of a render pass instance.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-videocoding**
  - This command must only be called outside of a video coding scope.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-commonparent**
  - Each of `buffer`, `commandBuffer`, and `countBuffer` must have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Chapter 22. Fixed-Function Vertex Processing

Vertex fetching is controlled via configurable state, as a logically distinct graphics pipeline stage.

22.1. Vertex Attributes

Vertex shaders can define input variables, which receive vertex attribute data transferred from one or more VkBuffer(s) by drawing commands. Vertex shader input variables are bound to buffers via an indirect binding where the vertex shader associates a vertex input attribute number with each variable, vertex input attributes are associated to vertex input bindings on a per-pipeline basis, and vertex input bindings are associated with specific buffers on a per-draw basis via the vkCmdBindVertexBuffers command. Vertex input attribute and vertex input binding descriptions also contain format information controlling how data is extracted from buffer memory and converted to the format expected by the vertex shader.

There are VkPhysicalDeviceLimits::maxVertexInputAttributes number of vertex input attributes and VkPhysicalDeviceLimits::maxVertexInputBindings number of vertex input bindings (each referred to by zero-based indices), where there are at least as many vertex input attributes as there are vertex input bindings. Applications can store multiple vertex input attributes interleaved in a single buffer, and use a single vertex input binding to access those attributes.

In GLSL, vertex shaders associate input variables with a vertex input attribute number using the location layout qualifier. The component layout qualifier associates components of a vertex shader input variable with components of a vertex input attribute.

**GLSL example**

```glsl
// Assign location M to variableName
layout (location=M, component=2) in vec2 variableName;

// Assign locations [N,N+L) to the array elements of variableNameArray
layout (location=N) in vec4 variableNameArray[L];
```

In SPIR-V, vertex shaders associate input variables with a vertex input attribute number using the Location decoration. The Component decoration associates components of a vertex shader input variable with components of a vertex input attribute. The Location and Component decorations are specified via the OpDecorate instruction.

**SPIR-V example**

```spir-v
...%1 = OpExtInstImport "GLSL.std.450"
...
OpName %9 "variableName"
OpName %15 "variableNameArray"
OpDecorate %18 BuiltIn VertexIndex
```

1759
22.1.1. Attribute Location and Component Assignment

Vertex shaders allow Location and Component decorations on input variable declarations. The Location decoration specifies which vertex input attribute is used to read and interpret the data that a variable will consume. The Component decoration allows the location to be more finely specified for scalars and vectors, down to the individual components within a location that are consumed. The components within a location are 0, 1, 2, and 3. A variable starting at component N will consume components N, N+1, N+2, … up through its size. For single precision types, it is invalid if the sequence of components gets larger than 3.

When a vertex shader input variable declared using a 16- or 32-bit scalar or vector data type is assigned a location, its value(s) are taken from the components of the input attribute specified with the corresponding VkVertexInputAttributeDescription::location. The components used depend on the type of variable and the Component decoration specified in the variable declaration, as identified in Input attribute components accessed by 16-bit and 32-bit input variables. Any 16-bit or 32-bit scalar or vector input will consume a single location. For 16-bit and 32-bit data types, missing components are filled in with default values as described below.

Table 30. Input attribute components accessed by 16-bit and 32-bit input variables

<table>
<thead>
<tr>
<th>16-bit or 32-bit data type</th>
<th>Component decoration</th>
<th>Components consumed</th>
</tr>
</thead>
<tbody>
<tr>
<td>scalar</td>
<td>0 or unspecified</td>

</tr>
</tbody>
</table>

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a 32-bit floating point matrix type is assigned a location \( i \), its values are taken from consecutive input attributes starting with the corresponding \( \text{VkVertexInputAttributeDescription}::\text{location} \). Such matrices are treated as an array of column vectors with values taken from the input attributes identified in Input attributes accessed by 32-bit input matrix variables. The \( \text{VkVertexInputAttributeDescription}::\text{format} \) must be specified with a \( \text{VkFormat} \) that corresponds to the appropriate type of column vector. The Component decoration must not be used with matrix types.

**Table 31. Input attributes accessed by 32-bit input matrix variables**

</tr>
<tr>
<td>mat4x3</td>
<td>three-component vector</td>
<td>i, i+1, i+2, i+3</td>
<td>(x, y, z, o), (x, y, z, o), (x, y, z, o), (x, y, z, o)</td>
</tr>
<tr>
<td>mat4</td>
<td>four-component vector</td>
<td>i, i+1, i+2, i+3</td>
<td>(x, y, z, w), (x, y, z, w), (x, y, z, w), (x, y, z, w)</td>
</tr>
</tbody>
</table>

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.
When a vertex shader input variable declared using a scalar or vector 64-bit data type is assigned a location \( i \), its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. The locations and components used depend on the type of variable and the `Component` decoration specified in the variable declaration, as identified in `Input attribute locations and components accessed by 64-bit input variables`. For 64-bit data types, no default attribute values are provided. Input variables must not use more components than provided by the attribute. Input attributes which have one- or two-component 64-bit formats will consume a single location. Input attributes which have three- or four-component 64-bit formats will consume two consecutive locations. A 64-bit scalar data type will consume two components, and a 64-bit two-component vector data type will consume all four components available within a location. A three- or four-component 64-bit data type must not specify a component. A three-component 64-bit data type will consume all four components of the first location and components 0 and 1 of the second location. This leaves components 2 and 3 available for other component-qualified declarations. A four-component 64-bit data type will consume all four components of the first location and all four components of the second location. It is invalid for a scalar or two-component 64-bit data type to specify a component of 1 or 3.

</tr>
</tbody>
</table>

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute. Components indicated by “-” are not available for input variables as there are no default values provided for 64-bit data types, and there is no data provided by the input format.

When a vertex shader input variable declared using a 64-bit floating-point matrix type is assigned a location \(i\), its values are taken from consecutive input attribute locations. Such matrices are treated as an array of column vectors with values taken from the input attributes as shown in Input attribute locations and components accessed by 64-bit input variables. Each column vector starts at the location immediately following the last location of the previous column vector. The number of attributes and components assigned to each matrix is determined by the matrix dimensions and ranges from two to eight locations.

When a vertex shader input variable declared using an array type is assigned a location, its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. The number of attributes and components assigned to each element are determined according to the data type of the array elements and Component decoration (if any) specified in the declaration of the array, as described above. Each element of the array, in order, is assigned to consecutive locations, but all at the same specified component within each location.

Only input variables declared with the data types and component decorations as specified above are supported. Location aliasing is causing two variables to have the same location number. Component aliasing is assigning the same (or overlapping) component number for two location aliases. Location aliasing is allowed only if it does not cause component aliasing. Further, when
location aliasing, the aliases sharing the location must all have the same SPIR-V floating-point component type or all have the same width integer-type components.

### 22.2. Vertex Input Description

Applications specify vertex input attribute and vertex input binding descriptions as part of graphics pipeline creation by setting the VkGraphicsPipelineCreateInfo::pVertexInputState pointer to a VkPipelineVertexInputStateCreateInfo structure. Alternatively, if the graphics pipeline is created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then the vertex input attribute and vertex input binding descriptions are specified dynamically with vkCmdSetVertexInputEXT, and the VkGraphicsPipelineCreateInfo::pVertexInputState pointer is ignored.

The VkPipelineVertexInputStateCreateInfo structure is defined as:

```c
typedef struct VkPipelineVertexInputStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineVertexInputStateCreateFlags flags;
    uint32_t vertexBindingDescriptionCount;
    const VkVertexInputBindingDescription* pVertexBindingDescriptions;
    uint32_t vertexAttributeDescriptionCount;
    const VkVertexInputAttributeDescription* pVertexAttributeDescriptions;
} VkPipelineVertexInputStateCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **vertexBindingDescriptionCount** is the number of vertex binding descriptions provided in **pVertexBindingDescriptions**.
- **pVertexBindingDescriptions** is a pointer to an array of VkVertexInputBindingDescription structures.
- **vertexAttributeDescriptionCount** is the number of vertex attribute descriptions provided in **pVertexAttributeDescriptions**.
- **pVertexAttributeDescriptions** is a pointer to an array of VkVertexInputAttributeDescription structures.

#### Valid Usage

- VUID-VkPipelineVertexInputStateCreateInfo-vertexBindingDescriptionCount-00613
  vertexBindingDescriptionCount must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-VkPipelineVertexInputStateCreateInfo-vertexAttributeDescriptionCount-00614
  vertexAttributeDescriptionCount must be less than or equal to VkPhysicalDeviceLimits
For every binding specified by each element of `pVertexAttributeDescriptions`, a `VkVertexInputBindingDescription` must exist in `pVertexBindingDescriptions` with the same value of `binding`.

All elements of `pVertexBindingDescriptions` must describe distinct binding numbers.

All elements of `pVertexAttributeDescriptions` must describe distinct attribute locations.

### Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO`.
- `pNext` must be `NULL` or a pointer to a valid instance of `VkPipelineVertexInputDivisorStateCreateInfoEXT`.
- The `sType` value of each struct in the `pNext` chain must be unique.
- Flags must be `0`.
- If `vertexBindingDescriptionCount` is not `0`, `pVertexBindingDescriptions` must be a valid pointer to an array of `vertexBindingDescriptionCount` valid `VkVertexInputBindingDescription` structures.
- If `vertexAttributeDescriptionCount` is not `0`, `pVertexAttributeDescriptions` must be a valid pointer to an array of `vertexAttributeDescriptionCount` valid `VkVertexInputAttributeDescription` structures.

```c
#include <vulkan/vulkan.h>

typedef VkFlags VkPipelineVertexInputStateCreateFlags;
```

`VkPipelineVertexInputStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

Each vertex input binding is specified by the `VkVertexInputBindingDescription` structure, defined as:

```c
#include <vulkan/vulkan.h>

typedef struct VkVertexInputBindingDescription {
    uint32_t binding;
    uint32_t stride;
} VkVertexInputBindingDescription;
```
VkVertexInputRate inputRate;
} VkVertexInputBindingDescription;

- **binding** is the binding number that this structure describes.
- **stride** is the byte stride between consecutive elements within the buffer.
- **inputRate** is a VkVertexInputRate value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.

### Valid Usage

- VUID-VkVertexInputBindingDescription-binding-00618
  
  binding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-VkVertexInputBindingDescription-stride-00619
  
  stride must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputBindingStride

- VUID-VkVertexInputBindingDescription-stride-04456
  
  If the VK_KHR_portability_subset extension is enabled, stride must be a multiple of, and at least as large as, VkPhysicalDevicePortabilitySubsetPropertiesKHR::minVertexInputBindingStrideAlignment

### Valid Usage (Implicit)

- VUID-VkVertexInputBindingDescription-inputRate-parameter
  
  inputRate must be a valid VkVertexInputRate value

Possible values of VkVertexInputBindingDescription::inputRate, specifying the rate at which vertex attributes are pulled from buffers, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkVertexInputRate {
    VK_VERTEX_INPUT_RATE_VERTEX = 0,
    VK_VERTEX_INPUT_RATE_INSTANCE = 1,
} VkVertexInputRate;
```

- **VK_VERTEX_INPUT_RATE_VERTEX** specifies that vertex attribute addressing is a function of the vertex index.
- **VK_VERTEX_INPUT_RATE_INSTANCE** specifies that vertex attribute addressing is a function of the instance index.

Each vertex input attribute is specified by the VkVertexInputAttributeDescription structure, defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputAttributeDescription {
```
uint32_t location;
uint32_t binding;
VkFormat format;
uint32_t offset;
} VkVertexInputAttributeDescription;

- **location** is the shader input location number for this attribute.
- **binding** is the binding number which this attribute takes its data from.
- **format** is the size and type of the vertex attribute data.
- **offset** is a byte offset of this attribute relative to the start of an element in the vertex input binding.

### Valid Usage

- VUID-VkVertexInputAttributeDescription-location-00620
  location must be less than VkPhysicalDeviceLimits::maxVertexInputAttributes

- VUID-VkVertexInputAttributeDescription-binding-00621
  binding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-VkVertexInputAttributeDescription-offset-00622
  offset must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputAttributeOffset

- VUID-VkVertexInputAttributeDescription-format-00623
  format must be allowed as a vertex buffer format, as specified by the VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT flag in VkFormatProperties::bufferFeatures returned by vkGetPhysicalDeviceFormatProperties

- VUID-VkVertexInputAttributeDescription-vertexAttributeAccessBeyondStride-04457
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride is VK_FALSE, the sum of offset plus the size of the vertex attribute data described by format must not be greater than stride in the VkVertexInputBindingDescription referenced in binding

### Valid Usage (Implicit)

- VUID-VkVertexInputAttributeDescription-format-parameter
  format must be a valid VkFormat value

To **dynamically set** the vertex input attribute and vertex input binding descriptions, call:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
void vkCmdSetVertexInputEXT(
  VkCommandBuffer commandBuffer,
  uint32_t vertexBindingDescriptionCount,
```
const VkVertexInputBindingDescription2EXT* pVertexBindingDescriptions,
uint32_t vertexAttributeDescriptionCount,
const VkVertexInputAttributeDescription2EXT* pVertexAttributeDescriptions);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `vertexBindingDescriptionCount` is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.
- `pVertexBindingDescriptions` is a pointer to an array of `VkVertexInputBindingDescription2EXT` structures.
- `vertexAttributeDescriptionCount` is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.
- `pVertexAttributeDescriptions` is a pointer to an array of `VkVertexInputAttributeDescription2EXT` structures.

This command sets the vertex input attribute and vertex input binding descriptions state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkGraphicsPipelineCreateInfo::pVertexInputState` values used to create the currently active pipeline.

If the bound pipeline state object was also created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` dynamic state enabled, then `vkCmdBindVertexBuffers2` can be used instead of `vkCmdSetVertexInputEXT` to dynamically set the stride.

**Valid Usage**

- VUID-vkCmdSetVertexInputEXT-None-04790
  The `vertexInputDynamicState` feature **must** be enabled

- VUID-vkCmdSetVertexInputEXT-vertexBindingDescriptionCount-04791
  `vertexBindingDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdSetVertexInputEXT-vertexAttributeDescriptionCount-04792
  `vertexAttributeDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- VUID-vkCmdSetVertexInputEXT-binding-04793
  For every binding specified by each element of `pVertexAttributeDescriptions`, a `VkVertexInputBindingDescription2EXT` **must** exist in `pVertexBindingDescriptions` with the same value of `binding`

- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-04794
  All elements of `pVertexBindingDescriptions` **must** describe distinct binding numbers

- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-04795
  All elements of `pVertexAttributeDescriptions` **must** describe distinct attribute locations
Valid Usage (Implicit)

- VUID-vkCmdSetVertexInputEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-parameter
  If vertexBindingDescriptionCount is not 0, pVertexBindingDescriptions must be a valid pointer to an array of vertexBindingDescriptionCount valid VkVertexInputBindingDescription2EXT structures

- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-parameter
  If vertexAttributeDescriptionCount is not 0, pVertexAttributeDescriptions must be a valid pointer to an array of vertexAttributeDescriptionCount valid VkVertexInputAttributeDescription2EXT structures

- VUID-vkCmdSetVertexInputEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetVertexInputEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetVertexInputEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

The VkVertexInputBindingDescription2EXT structure is defined as:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputBindingDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t binding;
    uint32_t stride;
} VkVertexInputBindingDescription2EXT;
```
VkVertexInputRate  inputRate;
uint32_t  divisor;
} VkVertexInputBindingDescription2EXT;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **binding** is the binding number that this structure describes.
• **stride** is the byte stride between consecutive elements within the buffer.
• **inputRate** is a *VkVertexInputRate* value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.

• **divisor** is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. This member can be set to a value other than 1 if the vertexAttributeInstanceRateDivisor feature is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of divisor is implementation-dependent and can be queried using *VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor*. A value of 0 can be used for the divisor if the vertexAttributeInstanceRateZeroDivisor feature is enabled. In this case, the same vertex attribute will be applied to all instances.

---

### Valid Usage

- **VUID-VkVertexInputBindingDescription2EXT-binding-04796**
  - binding must be less than *VkPhysicalDeviceLimits::maxVertexInputBindings*

- **VUID-VkVertexInputBindingDescription2EXT-stride-04797**
  - stride must be less than or equal to *VkPhysicalDeviceLimits::maxVertexInputBindingStride*

- **VUID-VkVertexInputBindingDescription2EXT-divisor-04798**
  - If the vertexAttributeInstanceRateZeroDivisor feature is not enabled, divisor must not be 0

- **VUID-VkVertexInputBindingDescription2EXT-divisor-04799**
  - If the vertexAttributeInstanceRateDivisor feature is not enabled, divisor must be 1

- **VUID-VkVertexInputBindingDescription2EXT-divisor-06226**
  - divisor must be a value between 0 and *VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor*, inclusive

- **VUID-VkVertexInputBindingDescription2EXT-divisor-06227**
  - If divisor is not 1 then inputRate must be of type *VK_VERTEX_INPUT_RATE_INSTANCE*

---

### Valid Usage (Implicit)

- **VUID-VkVertexInputBindingDescription2EXT-sType-sType**
  - sType must be *VK_STRUCTURE_TYPE_VERTEX_INPUT_BINDING_DESCRIPTION_2_EXT*

- **VUID-VkVertexInputBindingDescription2EXT-inputRate-parameter**
  - inputRate must be a valid *VkVertexInputRate* value
The `VkVertexInputAttributeDescription2EXT` structure is defined as:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputAttributeDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t location;
    uint32_t binding;
    VkFormat format;
    uint32_t offset;
} VkVertexInputAttributeDescription2EXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `location` is the shader input location number for this attribute.
- `binding` is the binding number which this attribute takes its data from.
- `format` is the size and type of the vertex attribute data.
- `offset` is a byte offset of this attribute relative to the start of an element in the vertex input binding.

### Valid Usage

- **VUID-VkVertexInputAttributeDescription2EXT-location-06228**
  - `location` must be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`.

- **VUID-VkVertexInputAttributeDescription2EXT-binding-06229**
  - `binding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`.

- **VUID-VkVertexInputAttributeDescription2EXT-offset-06230**
  - `offset` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributeOffset`.

- **VUID-VkVertexInputAttributeDescription2EXT-format-04805**
  - `format` must be allowed as a vertex buffer format, as specified by the `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT` flag in `VkFormatProperties::bufferFeatures` returned by `vkGetPhysicalDeviceFormatProperties`.

- **VUID-VkVertexInputAttributeDescription2EXT-vertexAttributeAccessBeyondStride-04806**
  - If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride` is `VK_FALSE`, the sum of `offset` plus the size of the vertex attribute data described by `format` must not be greater than `stride` in the `VkVertexInputBindingDescription2EXT` referenced in `binding`.
Valid Usage (Implicit)

- VUID-VkVertexInputAttributeDescription2EXT-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_VERTEX_INPUT_ATTRIBUTE_DESCRIPTION_2_EXT**

- VUID-VkVertexInputAttributeDescription2EXT-format-parameter
  
  **format** must be a valid **VkFormat** value

To bind vertex buffers to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindVertexBuffers(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,  
    uint32_t bindingCount,  
    const VkBuffer* pBuffers,  
    const VkDeviceSize* pOffsets);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **firstBinding** is the index of the first vertex input binding whose state is updated by the command.
- **bindingCount** is the number of vertex input bindings whose state is updated by the command.
- **pBuffers** is a pointer to an array of buffer handles.
- **pOffsets** is a pointer to an array of buffer offsets.

The values taken from elements i of **pBuffers** and **pOffsets** replace the current state for the vertex input binding **firstBinding** + i, for i in [0, **bindingCount**). The vertex input binding is updated to start at the offset indicated by **pOffsets[i]** from the start of the buffer **pBuffers[i]**. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the **nullDescriptor** feature is enabled, elements of **pBuffers** can be **VK_NULL_HANDLE**, and can be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is **VK_NULL_HANDLE**, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with (0,0,1).

Valid Usage

- VUID-vkCmdBindVertexBuffers-firstBinding-00624
  
  **firstBinding** must be less than **VkPhysicalDeviceLimits::maxVertexInputBindings**

- VUID-vkCmdBindVertexBuffers-firstBinding-00625
  
  The sum of **firstBinding** and **bindingCount** must be less than or equal to **VkPhysicalDeviceLimits::maxVertexInputBindings**

- VUID-vkCmdBindVertexBuffers-pOffsets-00626
  
  All elements of **pOffsets** must be less than the size of the corresponding element in **pBuffers**
All elements of `pBuffers` must have been created with the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` flag.

Each element of `pBuffers` that is non-sparse must be bound completely and contiguously to a single `VkDeviceMemory` object.

If the `nullDescriptor` feature is not enabled, all elements of `pBuffers` must not be `VK_NULL_HANDLE`.

If an element of `pBuffers` is `VK_NULL_HANDLE`, then the corresponding element of `pOffsets` must be zero.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pBuffers` must be a valid pointer to an array of `bindingCount` valid or `VK_NULL_HANDLE` `VkBuffer` handles.
- `pOffsets` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values.
- `commandBuffer` must be in the `recording state`.
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
- This command must only be called outside of a video coding scope.
- `bindingCount` must be greater than 0.
- Both of `commandBuffer`, and the elements of `pBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.
Alternatively, to bind vertex buffers, along with their sizes and strides, to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBindVertexBuffers2(
    VkCommandBuffer commandBuffer, 
    uint32_t firstBinding, 
    uint32_t bindingCount, 
    const VkBuffer* pBuffers, 
    const VkDeviceSize* pOffsets, 
    const VkDeviceSize* pSizes, 
    const VkDeviceSize* pStrides);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdBindVertexBuffers2EXT(
    VkCommandBuffer commandBuffer, 
    uint32_t firstBinding, 
    uint32_t bindingCount, 
    const VkBuffer* pBuffers, 
    const VkDeviceSize* pOffsets, 
    const VkDeviceSize* pSizes, 
    const VkDeviceSize* pStrides);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first vertex input binding whose state is updated by the command.
- `bindingCount` is the number of vertex input bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is `NULL` or a pointer to an array of the size in bytes of vertex data bound from `pBuffers`.
- `pStrides` is `NULL` or a pointer to an array of buffer strides.

The values taken from elements $i$ of `pBuffers` and `pOffsets` replace the current state for the vertex input binding $firstBinding + i$, for $i$ in $[0, bindingCount)$. The vertex input binding is updated to start
at the offset indicated by $p\text{Offsets}[i]$ from the start of the buffer $p\text{Buffers}[i]$. If $p\text{Sizes}$ is not NULL then $p\text{Sizes}[i]$ specifies the bound size of the vertex buffer starting from the corresponding elements of $p\text{Buffers}[i]$ plus $p\text{Offsets}[i]$. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the nullDescriptor feature is enabled, elements of $p\text{Buffers}$ can be VK_NULL_HANDLE, and can be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is VK_NULL_HANDLE, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with (0,0,1).

This command also dynamically sets the byte strides between consecutive elements within buffer $p\text{Buffers}[i]$ to the corresponding $p\text{Strides}[i]$ value when the graphics pipeline is created with VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, strides are specified by the VkVertexInputBindingDescription::stride values used to create the currently active pipeline.

If the bound pipeline state object was also created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then vkCmdSetVertexInputEXT can be used instead of vkCmdBindVertexBuffers2 to set the stride.

**Valid Usage**

- VUID-vkCmdBindVertexBuffers2-firstBinding-03355
  
  $first\text{Binding}$ must be less than VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-vkCmdBindVertexBuffers2-firstBinding-03356
  
  The sum of $first\text{Binding}$ and $binding\text{Count}$ must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-vkCmdBindVertexBuffers2-pOffsets-03357
  All elements of $p\text{Offsets}$ must be less than the size of the corresponding element in $p\text{Buffers}$

- VUID-vkCmdBindVertexBuffers2-pSizes-03358
  
  If $p\text{Sizes}$ is not NULL, all elements of $p\text{Offsets}$ plus $p\text{Sizes}$ must be less than or equal to the size of the corresponding element in $p\text{Buffers}$

- VUID-vkCmdBindVertexBuffers2-pBuffers-03359
  All elements of $p\text{Buffers}$ must have been created with the VK_BUFFER_USAGE_VERTEX_BUFFER_BIT flag

- VUID-vkCmdBindVertexBuffers2-pBuffers-03360
  Each element of $p\text{Buffers}$ that is non-sparse must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBindVertexBuffers2-pBuffers-04111
  If the nullDescriptor feature is not enabled, all elements of $p\text{Buffers}$ must not be VK_NULL_HANDLE

- VUID-vkCmdBindVertexBuffers2-pBuffers-04112
  If an element of $p\text{Buffers}$ is VK_NULL_HANDLE, then the corresponding element of $p\text{Offsets}$ must be zero

- VUID-vkCmdBindVertexBuffers2-pStrides-03362
If `pStrides` is not NULL each element of `pStrides` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`

- **VUID-vkCmdBindVertexBuffers2-pStrides-06209**
  If `pStrides` is not NULL each element of `pStrides` must be either 0 or greater than or equal to the maximum extent of all vertex input attributes fetched from the corresponding binding, where the extent is calculated as the `VkVertexInputAttributeDescription::offset` plus `VkVertexInputAttributeDescription::format` size

---

### Valid Usage (Implicit)

- **VUID-vkCmdBindVertexBuffers2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdBindVertexBuffers2-pBuffers-parameter**
  `pBuffers` must be a valid pointer to an array of `bindingCount` valid or `VK_NULL_HANDLE` `VkBuffer` handles

- **VUID-vkCmdBindVertexBuffers2-pOffsets-parameter**
  `pOffsets` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values

- **VUID-vkCmdBindVertexBuffers2-pSizes-parameter**
  If `pSizes` is not NULL, `pSizes` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values

- **VUID-vkCmdBindVertexBuffers2-pStrides-parameter**
  If `pStrides` is not NULL, `pStrides` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values

- **VUID-vkCmdBindVertexBuffers2-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdBindVertexBuffers2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdBindVertexBuffers2-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdBindVertexBuffers2-bindingCount-arraylength**
  If any of `pSizes`, or `pStrides` are not NULL, `bindingCount` must be greater than 0

- **VUID-vkCmdBindVertexBuffers2-commonparent**
  Both of `commandBuffer`, and the elements of `pBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

---

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
22.3. Vertex Attribute Divisor in Instanced Rendering

If the `vertexAttributeInstanceRateDivisor` feature is enabled and the `pNext` chain of `VkPipelineVertexInputStateCreateInfo` includes a `VkPipelineVertexInputDivisorStateCreateInfoEXT` structure, then that structure controls how vertex attributes are assigned to an instance when instanced rendering is enabled.

The `VkPipelineVertexInputDivisorStateCreateInfoEXT` structure is defined as:

```c
typedef struct VkPipelineVertexInputDivisorStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t vertexBindingDivisorCount;
    const VkVertexInputBindingDivisorDescriptionEXT* pVertexBindingDivisors;
} VkPipelineVertexInputDivisorStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexBindingDivisorCount` is the number of elements in the `pVertexBindingDivisors` array.
- `pVertexBindingDivisors` is a pointer to an array of `VkVertexInputBindingDivisorDescriptionEXT` structures specifying the divisor value for each binding.

**Valid Usage (Implicit)**

- VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_EXT`

- VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-pVertexBindingDivisors-parameter
  `pVertexBindingDivisors` must be a valid pointer to an array of `vertexBindingDivisorCount` `VkVertexInputBindingDivisorDescriptionEXT` structures

- VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-vertexBindingDivisorCount-arraylength
  `vertexBindingDivisorCount` must be greater than 0
The individual divisor values per binding are specified using the `VkVertexInputBindingDivisorDescriptionEXT` structure which is defined as:

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkVertexInputBindingDivisorDescriptionEXT {
    uint32_t binding;
    uint32_t divisor;
} VkVertexInputBindingDivisorDescriptionEXT;
```

- `binding` is the binding number for which the divisor is specified.
- `divisor` is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of `divisor` is implementation-dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`. A value of 0 can be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.

If this structure is not used to define a divisor value for an attribute, then the divisor has a logical default value of 1.

### Valid Usage

- VUID-VkVertexInputBindingDivisorDescriptionEXT-binding-01869
  binding must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkVertexInputBindingDivisorDescriptionEXT-vertexAttributeInstanceRateZeroDivisor-02228
  If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, divisor must not be 0

- VUID-VkVertexInputBindingDivisorDescriptionEXT-vertexAttributeInstanceRateDivisor-02229
  If the `vertexAttributeInstanceRateDivisor` feature is not enabled, divisor must be 1

- VUID-VkVertexInputBindingDivisorDescriptionEXT-divisor-01870
  divisor must be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`, inclusive

- VUID-VkVertexInputBindingDivisorDescriptionEXT-inputRate-01871
  `VkVertexInputBindingDescription::inputRate` must be of type `VK_VERTEX_INPUT_RATE_INSTANCE` for this binding

### 22.4. Vertex Input Address Calculation

The address of each attribute for each `vertexIndex` and `instanceIndex` is calculated as follows:

- Let `attribDesc` be the member of `VkPipelineVertexInputStateCreateInfo`
Given an array of vertex attributes from 
\(\text{pVertexAttributeDescriptions} \) with 
\(\text{VkVertexInputAttributeDescription::location} \) equal to the 
vertex input attribute number.

- Let \(\text{bindingDesc} \) be the member of 
\(\text{VkPipelineVertexInputStateCreateInfo::pVertexBindingDescriptions} \) with 
\(\text{VkVertexInputAttributeDescription::binding} \) equal to 
\(\text{attribDesc.binding} \).

- Let \(\text{vertexIndex} \) be the index of the vertex within the draw (a value between \(\text{firstVertex} \) and \(\text{firstVertex+vertexCount} \) for \(\text{vkCmdDraw} \), or a value taken from the index buffer plus \(\text{vertexOffset} \) for 
\(\text{vkCmdDrawIndexed} \)).

- Let \(\text{instanceIndex} \) be the instance number of the draw (a value between \(\text{firstInstance} \) and \(\text{firstInstance+instanceCount} \)).

- Let \(\text{offset} \) be an array of offsets into the currently bound vertex buffers specified during 
\(\text{vkCmdBindVertexBuffers} \) or 
\(\text{vkCmdBindVertexBuffers2} \) with \(\text{pOffsets} \).

- Let \(\text{divisor} \) be the member of 
\(\text{VkPipelineVertexInputDivisorStateCreateInfoEXT::pVertexBindingDivisors} \) with 
\(\text{VkVertexInputBindingDivisorDescriptionEXT::binding} \) equal to 
\(\text{attribDesc.binding} \).

\[
\begin{align*}
\text{bufferBindingAddress} &= \text{buffer}\[\text{binding}].\text{baseAddress} + \text{offset}\[\text{binding}]; \\
\text{if} \ (\text{bindingDesc.inputRate} == \text{VK_VERTEX_INPUT_RATE_VERTEX})
\quad \text{effectiveVertexOffset} &= \text{vertexIndex} \ast \text{bindingDesc.stride}; \\
\text{else}
\quad \text{if} \ (\text{divisor} == 0)
\quad \quad \text{effectiveVertexOffset} &= \text{firstInstance} \ast \text{bindingDesc.stride}; \\
\text{else}
\quad \quad \text{effectiveVertexOffset} &= (\text{firstInstance} + ((\text{instanceIndex} - \text{firstInstance}) / \text{divisor})) \ast \text{bindingDesc.stride}; \\
\text{attribAddress} &= \text{bufferBindingAddress} + \text{effectiveVertexOffset} + \text{attribDesc.offset};
\end{align*}
\]

### 22.4.1. Vertex Input Extraction

For each attribute, raw data is extracted starting at \(\text{attribAddress} \) and is converted from the 
\(\text{VkVertexInputAttributeDescription::format} \) to either floating-point, unsigned integer, or signed 
integer based on the base type of the format; the base type of the format must match the base type 
of the input variable in the shader. The input variable in the shader must be declared as a 64-bit 
data type if and only if \(\text{format} \) is a 64-bit data type. If \(\text{format} \) is a packed format, \(\text{attribAddress} \) must 
be a multiple of the size in bytes of the whole attribute data type as described in Packed Formats. 
Otherwise, \(\text{attribAddress} \) must be a multiple of the size in bytes of the component type indicated by 
\(\text{format} \) (see Formats). For attributes that are not 64-bit data types, each component is converted to 
the format of the input variable based on its type and size (as defined in the Format Definition 
section for each \(\text{VkFormat} \)), using the appropriate equations in 16-Bit Floating-Point Numbers, 
Unsigned 11-Bit Floating-Point Numbers, Unsigned 10-Bit Floating-Point Numbers, Fixed-Point Data 
Conversion, and Shared Exponent to RGB. Signed integer components smaller than 32 bits are sign-
extended. Attributes that are not 64-bit data types are expanded to four components in the same 
way as described in conversion to RGBA. The number of components in the vertex shader input 
variable need not exactly match the number of components in the format. If the vertex shader has 
fewer components, the extra components are discarded.
Chapter 23. Tessellation

Tessellation involves three pipeline stages. First, a tessellation control shader transforms control points of a patch and can produce per-patch data. Second, a fixed-function tessellator generates multiple primitives corresponding to a tessellation of the patch in (u,v) or (u,v,w) parameter space. Third, a tessellation evaluation shader transforms the vertices of the tessellated patch, for example to compute their positions and attributes as part of the tessellated surface. The tessellator is enabled when the pipeline contains both a tessellation control shader and a tessellation evaluation shader.

23.1. Tessellator

If a pipeline includes both tessellation shaders (control and evaluation), the tessellator consumes each input patch (after vertex shading) and produces a new set of independent primitives (points, lines, or triangles). These primitives are logically produced by subdividing a geometric primitive (rectangle or triangle) according to the per-patch outer and inner tessellation levels written by the tessellation control shader. These levels are specified using the built-in variables TessLevelOuter and TessLevelInner, respectively. This subdivision is performed in an implementation-dependent manner. If no tessellation shaders are present in the pipeline, the tessellator is disabled and incoming primitives are passed through without modification.

The type of subdivision performed by the tessellator is specified by an OpExecutionMode instruction in the tessellation evaluation or tessellation control shader using one of execution modes Triangles, Quads, and IsoLines. Other tessellation-related execution modes can also be specified in either the tessellation control or tessellation evaluation shaders, and if they are specified in both then the modes must be the same.

Tessellation execution modes include:

- **Triangles, Quads, and IsoLines.** These control the type of subdivision and topology of the output primitives. One mode must be set in at least one of the tessellation shader stages. If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines is VK_FALSE, then isoline tessellation is not supported by the implementation, and IsoLines must not be used in either tessellation shader stage.

- **VertexOrderCw and VertexOrderCcw.** These control the orientation of triangles generated by the tessellator. One mode must be set in at least one of the tessellation shader stages.

- **PointMode.** Controls generation of points rather than triangles or lines. This functionality defaults to disabled, and is enabled if either shader stage includes the execution mode. If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode is VK_FALSE, then point mode tessellation is not supported by the implementation, and PointMode must not be used in either tessellation shader stage.

- **SpacingEqual, SpacingFractionalEven, and SpacingFractionalOdd.** Controls the spacing of segments on the edges of tessellated primitives. One mode must be set in at least one of the tessellation shader stages.
- **OutputVertices.** Controls the size of the output patch of the tessellation control shader. One value must be set in at least one of the tessellation shader stages.

For triangles, the tessellator subdivides a triangle primitive into smaller triangles. For quads, the tessellator subdivides a rectangle primitive into smaller triangles. For isolines, the tessellator subdivides a rectangle primitive into a collection of line segments arranged in strips stretching across the rectangle in the u dimension (i.e. the coordinates in TessCoord are of the form $(0,x)$ through $(1,x)$ for all tessellation evaluation shader invocations that share a line).

Each vertex produced by the tessellator has an associated (u,v,w) or (u,v) position in a normalized parameter space, with parameter values in the range $[0,1]$, as illustrated in figures Domain parameterization for tessellation primitive modes (upper-left origin) and Domain parameterization for tessellation primitive modes (lower-left origin). The domain space can have either an upper-left or lower-left origin, selected by the domainOrigin member of VkPipelineTessellationDomainOriginStateCreateInfo.

![Figure 15. Domain parameterization for tessellation primitive modes (upper-left origin)](image_url)
23.2. Tessellator Patch Discard

A patch is discarded by the tessellator if any relevant outer tessellation level is less than or equal to zero.

Patches will also be discarded if any relevant outer tessellation level corresponds to a floating-point
NaN (not a number) in implementations supporting NaN.

No new primitives are generated and the tessellation evaluation shader is not executed for patches that are discarded. For Quads, all four outer levels are relevant. For Triangles and IsoLines, only the first three or two outer levels, respectively, are relevant. Negative inner levels will not cause a patch to be discarded; they will be clamped as described below.

### 23.3. Tessellator Spacing

Each of the tessellation levels is used to determine the number and spacing of segments used to subdivide a corresponding edge. The method used to derive the number and spacing of segments is specified by an OpExecutionMode in the tessellation control or tessellation evaluation shader using one of the identifiers SpacingEqual, SpacingFractionalEven, or SpacingFractionalOdd.

If SpacingEqual is used, the floating-point tessellation level is first clamped to \([1, \maxLevel]\), where \maxLevel is the implementation-dependent maximum tessellation level (VkPhysicalDeviceLimits::maxTessellationGenerationLevel). The result is rounded up to the nearest integer \(n\), and the corresponding edge is divided into \(n\) segments of equal length in \((u,v)\) space.

If SpacingFractionalEven is used, the tessellation level is first clamped to \([2, \maxLevel]\) and then rounded up to the nearest even integer \(n\). If SpacingFractionalOdd is used, the tessellation level is clamped to \([1, \maxLevel - 1]\) and then rounded up to the nearest odd integer \(n\). If \(n\) is one, the edge will not be subdivided. Otherwise, the corresponding edge will be divided into \(n - 2\) segments of equal length, and two additional segments of equal length that are typically shorter than the other segments. The length of the two additional segments relative to the others will decrease monotonically with \(n - f\), where \(f\) is the clamped floating-point tessellation level. When \(n - f\) is zero, the additional segments will have equal length to the other segments. As \(n - f\) approaches 2.0, the relative length of the additional segments approaches zero. The two additional segments must be placed symmetrically on opposite sides of the subdivided edge. The relative location of these two segments is implementation-dependent, but must be identical for any pair of subdivided edges with identical values of \(f\).

When tessellating triangles or quads using point mode with fractional odd spacing, the tessellator may produce interior vertices that are positioned on the edge of the patch if an inner tessellation level is less than or equal to one. Such vertices are considered distinct from vertices produced by subdividing the outer edge of the patch, even if there are pairs of vertices with identical coordinates.

### 23.4. Tessellation Primitive Ordering

Few guarantees are provided for the relative ordering of primitives produced by tessellation, as they pertain to primitive order.

- The output primitives generated from each input primitive are passed to subsequent pipeline stages in an implementation-dependent order.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.
23.5. Tessellator Vertex Winding Order

When the tessellator produces triangles (in the `Triangles` or `Quads` modes), the orientation of all triangles is specified with an `OpExecutionMode` of `VertexOrderCw` or `VertexOrderCcW` in the tessellation control or tessellation evaluation shaders. If the order is `VertexOrderCw`, the vertices of all generated triangles will have clockwise ordering in (u,v) or (u,v,w) space. If the order is `VertexOrderCcW`, the vertices will have counter-clockwise ordering in that space.

If the tessellation domain has an upper-left origin, the vertices of a triangle have counter-clockwise ordering if

\[ a = u_0 v_1 - u_1 v_0 + u_1 v_2 - u_2 v_1 + u_2 v_0 - u_0 v_2 \]

is negative, and clockwise ordering if \( a \) is positive. \( u_i \) and \( v_i \) are the \( u \) and \( v \) coordinates in normalized parameter space of the \( i \)th vertex of the triangle. If the tessellation domain has a lower-left origin, the vertices of a triangle have counter-clockwise ordering if \( a \) is positive, and clockwise ordering if \( a \) is negative.

**Note**
The value \( a \) is proportional (with a positive factor) to the signed area of the triangle.

In `Triangles` mode, even though the vertex coordinates have a \( w \) value, it does not participate directly in the computation of \( a \), being an affine combination of \( u \) and \( v \).

23.6. Triangle Tessellation

If the tessellation primitive mode is `Triangles`, an equilateral triangle is subdivided into a collection of triangles covering the area of the original triangle. First, the original triangle is subdivided into a collection of concentric equilateral triangles. The edges of each of these triangles are subdivided, and the area between each triangle pair is filled by triangles produced by joining the vertices on the subdivided edges. The number of concentric triangles and the number of subdivisions along each triangle except the outermost is derived from the first inner tessellation level. The edges of the outermost triangle are subdivided independently, using the first, second, and third outer tessellation levels to control the number of subdivisions of the \( u = 0 \) (left), \( v = 0 \) (bottom), and \( w = 0 \) (right) edges, respectively. The second inner tessellation level and the fourth outer tessellation level have no effect in this mode.

If the first inner tessellation level and all three outer tessellation levels are exactly one after clamping and rounding, only a single triangle with \((u,v,w)\) coordinates of \((0,0,1)\), \((1,0,0)\), and \((0,1,0)\) is generated. If the inner tessellation level is one and any of the outer tessellation levels is greater than one, the inner tessellation level is treated as though it were originally specified as \(1 + \varepsilon\) and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision **may** produce **inner vertices** positioned on the edge of the triangle.
If any tessellation level is greater than one, tessellation begins by producing a set of concentric inner triangles and subdividing their edges. First, the three outer edges are temporarily subdivided using the clamped and rounded first inner tessellation level and the specified tessellation spacing, generating \( n \) segments. For the outermost inner triangle, the inner triangle is degenerate — a single point at the center of the triangle — if \( n \) is two. Otherwise, for each corner of the outer triangle, an inner triangle corner is produced at the intersection of two lines extended perpendicular to the corner's two adjacent edges running through the vertex of the subdivided outer edge nearest that corner. If \( n \) is three, the edges of the inner triangle are not subdivided and it is the final triangle in the set of concentric triangles. Otherwise, each edge of the inner triangle is divided into \( n - 2 \) segments, with the \( n - 1 \) vertices of this subdivision produced by intersecting the inner edge with lines perpendicular to the edge running through the \( n - 1 \) innermost vertices of the subdivision of the outer edge. Once the outermost inner triangle is subdivided, the previous subdivision process repeats itself, using the generated triangle as an outer triangle. This subdivision process is illustrated in Inner Triangle Tessellation.

![Figure 17. Inner Triangle Tessellation](image)

Caption

In the Inner Triangle Tessellation diagram, inner tessellation levels of (a) four and (b) five are shown (not to scale). Solid black circles depict vertices along the edges of the concentric triangles. The edges of inner triangles are subdivided by intersecting the edge with segments perpendicular to the edge running through the \( n - 1 \) innermost vertices of the subdivision of the outer edge. Dotted lines depict edges connecting corresponding vertices on the inner and outer triangle edges.

Once all the concentric triangles are produced and their edges are subdivided, the area between each pair of adjacent inner triangles is filled completely with a set of non-overlapping triangles. In this subdivision, two of the three vertices of each triangle are taken from adjacent vertices on a subdivided edge of one triangle; the third is one of the vertices on the corresponding edge of the other triangle. If the innermost triangle is degenerate (i.e., a point), the triangle containing it is subdivided into six triangles by connecting each of the six vertices on that triangle with the center point. If the innermost triangle is not degenerate, that triangle is added to the set of generated triangles as-is.
After the area corresponding to any inner triangles is filled, the tessellator generates triangles to cover the area between the outermost triangle and the outermost inner triangle. To do this, the temporary subdivision of the outer triangle edge above is discarded. Instead, the $u = 0$, $v = 0$, and $w = 0$ edges are subdivided according to the first, second, and third outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the first inner triangle is retained. The area between the outer and first inner triangles is completely filled by non-overlapping triangles as described above. If the first (and only) inner triangle is degenerate, a set of triangles is produced by connecting each vertex on the outer triangle edges with the center point.

After all triangles are generated, each vertex in the subdivided triangle is assigned a barycentric $(u,v,w)$ coordinate based on its location relative to the three vertices of the outer triangle.

The algorithm used to subdivide the triangular domain in $(u,v,w)$ space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is consistent across the domain as described in Tessellator Vertex Winding Order.

### 23.7. Quad Tessellation

If the tessellation primitive mode is Quads, a rectangle is subdivided into a collection of triangles covering the area of the original rectangle. First, the original rectangle is subdivided into a regular mesh of rectangles, where the number of rectangles along the $u = 0$ and $u = 1$ (vertical) and $v = 0$ and $v = 1$ (horizontal) edges are derived from the first and second inner tessellation levels, respectively. All rectangles, except those adjacent to one of the outer rectangle edges, are decomposed into triangle pairs. The outermost rectangle edges are subdivided independently, using the first, second, third, and fourth outer tessellation levels to control the number of subdivisions of the $u = 0$ (left), $v = 0$ (bottom), $u = 1$ (right), and $v = 1$ (top) edges, respectively. The area between the inner rectangles of the mesh and the outer rectangle edges are filled by triangles produced by joining the vertices on the subdivided outer edges to the vertices on the edge of the inner rectangle mesh.

If both clamped inner tessellation levels and all four clamped outer tessellation levels are exactly one, only a single triangle pair covering the outer rectangle is generated. Otherwise, if either clamped inner tessellation level is one, that tessellation level is treated as though it was originally specified as $1 + \varepsilon$ and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the rectangle.

If any tessellation level is greater than one, tessellation begins by subdividing the $u = 0$ and $u = 1$ edges of the outer rectangle into $m$ segments using the clamped and rounded first inner tessellation level and the tessellation spacing. The $v = 0$ and $v = 1$ edges are subdivided into $n$ segments using the second inner tessellation level. Each vertex on the $u = 0$ and $v = 0$ edges are joined with the corresponding vertex on the $u = 1$ and $v = 1$ edges to produce a set of vertical and horizontal lines that divide the rectangle into a grid of smaller rectangles. The primitive generator emits a pair of
non-overlapping triangles covering each such rectangle not adjacent to an edge of the outer rectangle. The boundary of the region covered by these triangles forms an inner rectangle, the edges of which are subdivided by the grid vertices that lie on the edge. If either \( m \) or \( n \) is two, the inner rectangle is degenerate, and one or both of the rectangle’s edges consist of a single point. This subdivision is illustrated in Figure Inner Quad Tessellation.

![Inner Quad Tessellation Diagram](image)

**Figure 18. Inner Quad Tessellation**

**Caption**

In the Inner Quad Tessellation diagram, inner quad tessellation levels of (a) \((4,2)\) and (b) \((7,4)\) are shown. The regions highlighted in red in figure (b) depict the 10 inner rectangles, each of which will be subdivided into two triangles. Solid black circles depict vertices on the boundary of the outer and inner rectangles, where the inner rectangle of figure (a) is degenerate (a single line segment). Dotted lines depict the horizontal and vertical edges connecting corresponding vertices on the inner and outer rectangle edges.

After the area corresponding to the inner rectangle is filled, the tessellator must produce triangles to cover the area between the inner and outer rectangles. To do this, the subdivision of the outer rectangle edge above is discarded. Instead, the \( u = 0 \), \( v = 0 \), \( u = 1 \), and \( v = 1 \) edges are subdivided according to the first, second, third, and fourth outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the inner rectangle is retained. The area between the outer and inner rectangles is completely filled by non-overlapping triangles. Two of the three vertices of each triangle are adjacent vertices on a subdivided edge of one rectangle; the third is one of the vertices on the corresponding edge of the other rectangle. If either edge of the innermost rectangle is degenerate, the area near the corresponding outer edges is filled by connecting each vertex on the outer edge with the single vertex making up the inner edge.

The algorithm used to subdivide the rectangular domain in \((u,v)\) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is
consistent across the domain as described in [Tessellator Vertex Winding Order](#).

### 23.8. Isoline Tessellation

If the tessellation primitive mode is *Isolines*, a set of independent horizontal line segments is drawn. The segments are arranged into connected strips called *isolines*, where the vertices of each isoline have a constant v coordinate and u coordinates covering the full range \([0,1]\). The number of isolines generated is derived from the first outer tessellation level; the number of segments in each isoline is derived from the second outer tessellation level. Both inner tessellation levels and the third and fourth outer tessellation levels have no effect in this mode.

As with quad tessellation above, isoline tessellation begins with a rectangle. The \(u = 0\) and \(u = 1\) edges of the rectangle are subdivided according to the first outer tessellation level. For the purposes of this subdivision, the tessellation spacing mode is ignored and treated as `equal_spacing`. An isoline is drawn connecting each vertex on the \(u = 0\) rectangle edge to the corresponding vertex on the \(u = 1\) rectangle edge, except that no line is drawn between \((0,1)\) and \((1,1)\). If the number of isolines on the subdivided \(u = 0\) and \(u = 1\) edges is \(n\), this process will result in \(n\) equally spaced lines with constant v coordinates of \(0, \frac{1}{n}, \frac{2}{n}, ..., \frac{n-1}{n}\).

Each of the \(n\) isolines is then subdivided according to the second outer tessellation level and the tessellation spacing, resulting in \(m\) line segments. Each segment of each line is emitted by the tessellator. These line segments are generated with a topology similar to `line lists`, except that the order in which each line is generated, and the order in which the vertices are generated for each line segment, are implementation-dependent.

**Note**

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines` is `VK_FALSE`, then isoline tessellation is not supported by the implementation.

### 23.9. Tessellation Point Mode

For all primitive modes, the tessellator is capable of generating points instead of lines or triangles. If the tessellation control or tessellation evaluation shader specifies the `OpExecutionMode PointMode`, the primitive generator will generate one point for each distinct vertex produced by tessellation, rather than emitting triangles or lines. Otherwise, the tessellator will produce a collection of line segments or triangles according to the primitive mode. These points are generated with a topology similar to `point lists`, except the order in which the points are generated for each input primitive is undefined.

**Note**

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode` is `VK_FALSE`, then tessellation point mode is not supported by the implementation.
23.10. Tessellation Pipeline State

The \texttt{pTessellationState} member of \texttt{VkGraphicsPipelineCreateInfo} is a pointer to a \texttt{VkPipelineTessellationStateCreateInfo} structure.

The \texttt{VkPipelineTessellationStateCreateInfo} structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineTessellationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineTessellationStateCreateFlags flags;
    uint32_t patchControlPoints;
} VkPipelineTessellationStateCreateInfo;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{flags} is reserved for future use.
- \texttt{patchControlPoints} is the number of control points per patch.

### Valid Usage

- VUID-VkPipelineTessellationStateCreateInfo-patchControlPoints-01214
  \texttt{patchControlPoints} must be greater than zero and less than or equal to \texttt{VkPhysicalDeviceLimits::maxTessellationPatchSize}

### Valid Usage (Implicit)

- VUID-VkPipelineTessellationStateCreateInfo-sType-sType
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO}

- VUID-VkPipelineTessellationStateCreateInfo-pNext-pNext
  \texttt{pNext} must be \texttt{NULL} or a pointer to a valid instance of \texttt{VkPipelineTessellationDomainOriginStateCreateInfo}

- VUID-VkPipelineTessellationStateCreateInfo-sType-unique
  The \texttt{sType} value of each struct in the \texttt{pNext} chain must be unique

- VUID-VkPipelineTessellationStateCreateInfo-flags-zerobitmask
  \texttt{flags} must be \texttt{0}

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineTessellationStateCreateFlags;
```

\texttt{VkPipelineTessellationStateCreateFlags} is a bitmask type for setting a mask, but is currently
The `VkPipelineTessellationDomainOriginStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPipelineTessellationDomainOriginStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkTessellationDomainOrigin domainOrigin;
} VkPipelineTessellationDomainOriginStateCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkPipelineTessellationDomainOriginStateCreateInfo
VkPipelineTessellationDomainOriginStateCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `domainOrigin` is a `VkTessellationDomainOrigin` value controlling the origin of the tessellation domain space.

If the `VkPipelineTessellationDomainOriginStateCreateInfo` structure is included in the `pNext` chain of `VkPipelineTessellationStateCreateInfo`, it controls the origin of the tessellation domain. If this structure is not present, it is as if `domainOrigin` was `VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT`.

### Valid Usage (Implicit)

- `VUID-VkPipelineTessellationDomainOriginStateCreateInfo-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_DOMAIN_ORIGIN_STATE_CREATE_INFO`
- `VUID-VkPipelineTessellationDomainOriginStateCreateInfo-domainOrigin-parameter` `domainOrigin` must be a valid `VkTessellationDomainOrigin` value

The possible tessellation domain origins are specified by the `VkTessellationDomainOrigin` enumeration:

```c
// Provided by VK_VERSION_1_1
typedef enum VkTessellationDomainOrigin {
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT = 0,
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT = 1,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT_KHR = VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT_KHR =
```
or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkTessellationDomainOrigin VkTessellationDomainOriginKHR;
```

- **VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT** specifies that the origin of the domain space is in the upper left corner, as shown in figure Domain parameterization for tessellation primitive modes (upper-left origin).
- **VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT** specifies that the origin of the domain space is in the lower left corner, as shown in figure Domain parameterization for tessellation primitive modes (lower-left origin).

This enum affects how the `VertexOrderCw` and `VertexOrderCcw` tessellation execution modes are interpreted, since the winding is defined relative to the orientation of the domain.

To dynamically set the origin of the tessellation domain space, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetTessellationDomainOriginEXT(
    VkCommandBuffer commandBuffer,
    VkTessellationDomainOrigin domainOrigin);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `domainOrigin` specifies the origin of the tessellation domain space.

This command sets the origin of the tessellation domain space for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineTessellationDomainOriginStateCreateInfo::domainOrigin` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetTessellationDomainOriginEXT-extendedDynamicState3TessellationDomainOrigin-07444
  The `extendedDynamicState3TessellationDomainOrigin` feature **must** be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
• VUID-vkCmdSetTessellationDomainOriginEXT-domainOrigin-parameter
  domainOrigin must be a valid VkTessellationDomainOrigin value

• VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetTessellationDomainOriginEXT-videocoding
  This command must only be called outside of a video coding scope

---

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

Chapter 24. Geometry Shading

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive. Geometry shading is enabled when a geometry shader is included in the pipeline.

24.1. Geometry Shader Input Primitives

Each geometry shader invocation has access to all vertices in the primitive (and their associated data), which are presented to the shader as an array of inputs.

The input primitive type expected by the geometry shader is specified with an `OpExecutionMode` instruction in the geometry shader, and must match the incoming primitive type specified by either the pipeline's primitive topology if tessellation is inactive, or the tessellation mode if tessellation is active, as follows:

- An input primitive type of `InputPoints` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, or with a tessellation shader specifying `PointMode`. The input arrays always contain one element, as described by the point list topology or tessellation in point mode.

- An input primitive type of `InputLines` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, or with a tessellation shader specifying `IsoLines` that does not specify `PointMode`. The input arrays always contain two elements, as described by the line list topology or line strip topology, or by isoline tessellation.

- An input primitive type of `InputLinesAdjacency` must only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`. The input arrays always contain four elements, as described by the line list with adjacency topology or line strip with adjacency topology.

- An input primitive type of `Triangles` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`; or with a tessellation shader specifying `Quads` or `Triangles` that does not specify `PointMode`. The input arrays always contain three elements, as described by the triangle list topology, triangle strip topology, or triangle fan topology, or by triangle or quad tessellation. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order.

- An input primitive type of `InputTrianglesAdjacency` must only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`. The input arrays always contain six elements, as described by the triangle list with adjacency topology or triangle strip with adjacency topology. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order, and the vertices making up the main primitive must still occur at the first, third, and fifth index.
24.2. Geometry Shader Output Primitives

A geometry shader generates primitives in one of three output modes: points, line strips, or triangle strips. The primitive mode is specified in the shader using an `OpExecutionMode` instruction with the `OutputPoints`, `OutputLineStrip` or `OutputTriangleStrip` modes, respectively. Each geometry shader must include exactly one output primitive mode.

The vertices output by the geometry shader are assembled into points, lines, or triangles based on the output primitive type and the resulting primitives are then further processed as described in Rasterization. If the number of vertices emitted by the geometry shader is not sufficient to produce a single primitive, vertices corresponding to incomplete primitives are not processed by subsequent pipeline stages. The number of vertices output by the geometry shader is limited to a maximum count specified in the shader.

The maximum output vertex count is specified in the shader using an `OpExecutionMode` instruction with the mode set to `OutputVertices` and the maximum number of vertices that will be produced by the geometry shader specified as a literal. Each geometry shader must specify a maximum output vertex count.

24.3. Multiple Invocations of Geometry Shaders

Geometry shaders can be invoked more than one time for each input primitive. This is known as geometry shader instancing and is requested by including an `OpExecutionMode` instruction with mode specified as `Invocations` and the number of invocations specified as an integer literal.

In this mode, the geometry shader will execute at least n times for each input primitive, where n is the number of invocations specified in the `OpExecutionMode` instruction. The instance number is available to each invocation as a built-in input using `InvocationId`.

24.4. Geometry Shader Primitive Ordering

Limited guarantees are provided for the relative ordering of primitives produced by a geometry shader, as they pertain to primitive order.

- For instanced geometry shaders, the output primitives generated from each input primitive are passed to subsequent pipeline stages using the invocation number to order the primitives, from least to greatest.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.

24.5. Geometry Shader Passthrough

A geometry shader that uses the `PassthroughNV` decoration on a variable in its input interface is considered a passthrough geometry shader. Output primitives in a passthrough geometry shader must have the same topology as the input primitive and are not produced by emitting vertices. The vertices of the output primitive have two different types of attributes, per-vertex and per-primitive. Geometry shader input variables with `PassthroughNV` decoration are considered to produce per-
vertex outputs, where values for each output vertex are copied from the corresponding input vertex. Any built-in or user-defined geometry shader outputs are considered per-primitive in a passthrough geometry shader, where a single output value is copied to all output vertices.

The remainder of this section details the usage of the **PassthroughNV** decoration and modifications to the interface matching rules when using passthrough geometry shaders.

### 24.5.1. **PassthroughNV** Decoration

Decorating a geometry shader input variable with the **PassthroughNV** decoration indicates that values of this input are copied through to the corresponding vertex of the output primitive. Input variables and block members which do not have the **PassthroughNV** decoration are consumed by the geometry shader without being passed through to subsequent stages.

The **PassthroughNV** decoration **must** only be used within a geometry shader.

Any variable decorated with **PassthroughNV** **must** be declared using the **Input** storage class.

The **PassthroughNV** decoration **must** not be used with any of:

- an input primitive type other than **InputPoints**, **InputLines**, or **Triangles**, as specified by the mode for **OpExecutionMode**.
- an invocation count other than one, as specified by the **Invocations** mode for **OpExecutionMode**.
- an **OpEntryPoint** which statically uses the **Op EmitVertex** or **OpEndPrimitive** instructions.
- a variable decorated with the **InvocationId** built-in decoration.
- a variable decorated with the **PrimitiveId** built-in decoration that is declared using the **Input** storage class.

### 24.5.2. **Passthrough** Interface Matching

When a passthrough geometry shader is in use, the **Interface Matching** rules involving the geometry shader input and output interfaces operate as described in this section.

For the purposes of matching passthrough geometry shader inputs with outputs of the previous pipeline stages, the **PassthroughNV** decoration is ignored.

For the purposes of matching the outputs of the geometry shader with subsequent pipeline stages, each input variable with the **PassthroughNV** decoration is considered to add an equivalent output variable with the same type, decoration (other than **PassthroughNV**), number, and declaration order on the output interface. The output variable declaration corresponding to an input variable decorated with **PassthroughNV** will be identical to the input declaration, except that the outermost array dimension of such variables is removed. The output block declaration corresponding to an input block decorated with **PassthroughNV** or having members decorated with **PassthroughNV** will be identical to the input declaration, except that the outermost array dimension of such declaration is removed.

If an input block is decorated with **PassthroughNV**, the equivalent output block contains all the members of the input block. Otherwise, the equivalent output block contains only those input block
members decorated with `PassthroughNV`. All members of the corresponding output block are assigned `Location` and `Component` decorations identical to those assigned to the corresponding input block members.

Output variables and blocks generated from inputs decorated with `PassthroughNV` will only exist for the purposes of interface matching; these declarations are not available to geometry shader code or listed in the module interface.

For the purposes of component counting, passthrough geometry shaders count all statically used input variable components declared with the `PassthroughNV` decoration as output components as well, since their values will be copied to the output primitive produced by the geometry shader.
Chapter 25. Mesh Shading

Task and mesh shaders operate in workgroups to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline.

Work on the mesh pipeline is initiated by the application drawing a set of mesh tasks organized in global workgroups. If the optional task shader is active, each workgroup triggers the execution of task shader invocations that will create a new set of mesh workgroups upon completion. Each of these created workgroups, or each of the original workgroups if no task shader is present, triggers the execution of mesh shader invocations.

Each mesh shader workgroup emits zero or more output primitives along with the group of vertices and their associated data required for each output primitive.

25.1. Task Shader Input

For every workgroup issued via the drawing commands a group of task shader invocations is executed. There are no inputs other than the builtin workgroup identifiers.

25.2. Task Shader Output

The task shader can emit zero or more mesh workgroups to be generated. Shaders using the TaskNV Execution Model can do so using the built-in variable TaskCountNV. This value must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV::maxTaskOutputCount. Shaders using the TaskEXT Execution Model can do so using the OpEmitMeshTasksEXT instruction. The groupCountX, groupCountY and groupCountZ arguments passed to this instruction must be less than or equal to the respective dimension within VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount. The product of these arguments must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupTotalCount.

The task shader can also pass user-defined data to all mesh shader invocations that it creates. Shaders using the TaskNV Execution Model can do so by writing to output variables that are decorated with PerTaskNV. They are available as inputs in mesh shaders. Shaders using the TaskEXT Execution Model can do so by writing to a payload variable with TaskPayloadWorkgroupEXT storage class that is passed to the OpEmitMeshTasksEXT instruction.

25.3. Mesh Generation

If a task shader exists, the mesh assembler creates a variable amount of mesh workgroups depending on each task's output. If there is no task shader, the drawing commands emit the mesh shader invocations directly.

25.4. Mesh Shader Input

The only inputs available to the mesh shader are variables identifying the specific workgroup and invocation and, if applicable, any outputs written as PerTaskNV or the payload variable passed to the
OpEmitMeshTasksEXT instruction by the task shader that spawned the mesh shader's workgroup. The mesh shader can operate without a task shader as well.

25.5. Mesh Shader Output

A mesh shader generates primitives in one of three output modes: points, lines, or triangles. For shaders using the MeshNV Execution Model the primitive mode is specified in the shader using an OpExecutionMode instruction with the OutputPoints, OutputLinesNV, or OutputTrianglesNV modes, respectively. For shaders using the MeshEXT Execution Model the primitive mode is specified in the shader using an OpExecutionMode instruction with the OutputPoints, OutputLinesEXT, or OutputTrianglesEXT modes, respectively. Each mesh shader must include exactly one output primitive mode.

For shaders using the MeshNV Execution Model the maximum output vertex count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputVertices and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputVertices. For shaders using the MeshEXT Execution Model the maximum output vertex count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputVertices and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshOutputVertices.

For shaders using the MeshNV Execution Model the maximum output primitive count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputPrimitivesNV and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputPrimitives. For shaders using the MeshEXT Execution Model the maximum output primitive count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputPrimitivesEXT, and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshOutputPrimitives.

For shaders using the MeshNV Execution Model the number of primitives output by the mesh shader is provided via writing to the built-in variable PrimitiveCountNV and must be less than or equal to the maximum output primitive count specified in the shader. A variable decorated with PrimitiveIndicesNV is an output array of local index values into the vertex output arrays from which primitives are assembled according to the output primitive type. For shaders using the MeshEXT Execution Model the number of vertices and primitives output by the mesh shader is provided via calling the OpSetMeshOutputsEXT instruction. The vertexCount argument must be less than or equal to the maximum output vertex count specified in the shader. The primitiveCount argument must be less than or equal to the maximum output primitive count specified in the shader.

Depending on the output primitive mode an appropriately-decorated variable is the output array of local index values into the vertex output arrays from which primitives are assembled according to the output primitive type:

- OutputPoints uses the PrimitivePointIndicesEXT decoration.
- OutputLinesEXT uses the PrimitiveLineIndicesEXT decoration.
- OutputTrianglesEXT uses the PrimitiveTriangleIndicesEXT decoration.

These resulting primitives are then further processed as described in Rasterization.
With the exception of primitive indices, all output built-ins and custom attributes count towards the total storage size occupied by output variables in mesh shaders. This size can be calculated as follows, taking into account the fact that the number of effective scalar attributes is 4 times the number of effective locations used according to the location assignment rules. Let \( v \) be the number of views, \( n_v \) be the number of effective scalar per-vertex attributes not dependent on \( \text{ViewIndex} \), \( n_{vpv} \) be the number of effective scalar per-vertex attributes dependent on \( \text{ViewIndex} \), \( m_v \) be the maximum number of vertices specified by the \( \text{OutputVertices} \) Execution Mode, \( \text{g}_v \) be \text{meshOutputPerVertexGranularity}, \( n_p \) be the number of effective scalar per-primitive attributes not dependent on \( \text{ViewIndex} \), \( m_{ppv} \) be the number of effective scalar per-primitive attributes dependent on \( \text{ViewIndex} \), \( m_p \) be the maximum number of primitives specified by the \( \text{OutputPrimitivesEXT} \) Execution Mode and \( g_p \) be \text{meshOutputPerPrimitiveGranularity}:

\[
(n_v + (n_{vpv} \times v)) \times 4 \times \text{align}(m_v, g_v) + (n_p + (m_{ppv} \times v)) \times 4 \times \text{align}(m_p, g_p)
\]

### 25.6. Mesh Shader Per-View Outputs

The mesh shader outputs decorated with the \( \text{PositionPerViewNV} \), \( \text{ClipDistancePerViewNV} \), \( \text{CullDistancePerViewNV} \), \( \text{LayerPerViewNV} \), and \( \text{ViewportMaskPerViewNV} \) built-in decorations are the per-view versions of the single-view variables with equivalent names (that is \( \text{Position} \), \( \text{ClipDistance} \), \( \text{CullDistance} \), \( \text{Layer} \), and \( \text{ViewportMaskNV} \), respectively). If a shader statically assigns a value to any element of a per-view array it must not statically assign a value to the equivalent single-view variable.

Each of these outputs is considered arrayed, with separate values for each view. The view number is used to index the first dimension of these arrays.

The second dimension of the \( \text{ClipDistancePerViewNV} \), and \( \text{CullDistancePerViewNV} \) arrays have the same requirements as the \( \text{ClipDistance} \), and \( \text{CullDistance} \) arrays.

If a mesh shader output is per-view, the corresponding fragment shader input is taken from the element of the per-view output array that corresponds to the view that is currently being processed by the fragment shader.

These per-view outputs are available only in shaders using the \( \text{MeshNV} \) Execution Model. They are not available in shaders using the \( \text{MeshEXT} \) Execution Model.

### 25.7. Mesh Shader Primitive Ordering

Following guarantees are provided for the relative ordering of primitives produced by a mesh shader, as they pertain to primitive order.

- When a task shader is used, mesh workgroups spawned from lower tasks will be ordered prior those workgroups from subsequent tasks.
- All output primitives generated from a given mesh workgroup are passed to subsequent pipeline stages before any output primitives generated from subsequent input workgroups.
- All output primitives within a mesh workgroup, will be generated in the ordering provided by the builtin primitive indexbuffer (from low address to high address).
Chapter 26. Fixed-Function Vertex Post-Processing

After pre-rasterization shader stages, the following fixed-function operations are applied to vertices of the resulting primitives:

- Transform feedback (see Transform Feedback)
- Viewport swizzle (see Viewport Swizzle)
- Flat shading (see Flat Shading).
- Primitive clipping, including client-defined half-spaces (see Primitive Clipping).
- Shader output attribute clipping (see Clipping Shader Outputs).
- Clip space W scaling (see Controlling Viewport W Scaling).
- Perspective division on clip coordinates (see Coordinate Transformations).
- Viewport mapping, including depth range scaling (see Controlling the Viewport).
- Front face determination for polygon primitives (see Basic Polygon Rasterization).

Next, rasterization is performed on primitives as described in chapter Rasterization.

26.1. Transform Feedback

Before any other fixed-function vertex post-processing, vertex outputs from the last shader in the pre-rasterization shader stage can be written out to one or more transform feedback buffers bound to the command buffer. To capture vertex outputs the last pre-rasterization shader stage shader must be declared with the Xfb execution mode. Outputs decorated with XfbBuffer will be written out to the corresponding transform feedback buffers bound to the command buffer when transform feedback is active. Transform feedback buffers are bound to the command buffer by using vkCmdBindTransformFeedbackBuffersEXT. Transform feedback is made active by calling vkCmdBeginTransformFeedbackEXT and made inactive by calling vkCmdEndTransformFeedbackEXT. After vertex data is written it is possible to use vkCmdDrawIndirectByteCountEXT to start a new draw where the vertexCount is derived from the number of bytes written by a previous transform feedback.

When an individual point, line, or triangle primitive reaches the transform feedback stage while transform feedback is active, the values of the specified output variables are assembled into primitives and appended to the bound transform feedback buffers. After activating transform feedback, the values of the first assembled primitive are written at the starting offsets of the bound transform feedback buffers, and subsequent primitives are appended to the buffer. If the optional pCounterBuffers and pCounterBufferOffsets parameters are specified, the starting points within the transform feedback buffers are adjusted so data is appended to the previously written values indicated by the value stored by the implementation in the counter buffer.

For multi-vertex primitives, all values for a given vertex are written before writing values for any other vertex. When transformFeedbackPreservesProvokingVertex is not enabled, implementations may write out any vertex within the primitive first, but all subsequent vertices for that primitive
must be written out in a consistent winding order defined as follows:

- If neither geometry or tessellation shading is active, vertices within a primitive are appended according to the winding order described by the primitive topology defined by the `VkPipelineInputAssemblyStateCreateInfo:topology` used to execute the drawing command.

- If geometry shading is active, vertices within a primitive are appended according to the winding order described by the primitive topology defined by the `OutputPoints`, `OutputLineStrips`, or `OutputTriangleStrips` execution mode.

- If tessellation shading is active but geometry shading is not, vertices within a primitive are appended according to the winding order defined by triangle tessellation, quad tessellation, and isoline tessellation.

When `transformFeedbackPreservesProvokingVertex` is enabled, then in addition to writing vertices with a consistent winding order, the vertex order must preserve the provoking vertex of each primitive:

- When the pipeline's provoking vertex mode is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the primitive's provoking vertex must be the first vertex written.

- When the pipeline's provoking vertex mode is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the primitive's provoking vertex must be the last vertex written.

If `transformFeedbackPreservesTriangleFanProvokingVertex` is `VK_FALSE`, neither geometry nor tessellation shading is active, and the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`, then the first vertex written from each primitive is implementation-defined even when `transformFeedbackPreservesProvokingVertex` is enabled.

When capturing vertices, the stride associated with each transform feedback buffer, as indicated by the `XfbStride` decoration, indicates the number of bytes of storage reserved for each vertex in the transform feedback buffer. For every vertex captured, each output attribute with a `Offset` decoration will be written to the storage reserved for the vertex at the associated transform feedback buffer. When writing output variables that are arrays or structures, individual array elements or structure members are written tightly packed in order. For vector types, individual components are written in order. For matrix types, outputs are written as an array of column vectors.

If any component of an output with an assigned transform feedback offset was not written to by its shader, the value recorded for that component is undefined. All components of an output variable must be written at an offset aligned to the size of the component. The size of each component of an output variable must be at least 32-bits. When capturing a vertex, any portion of the reserved storage not associated with an output variable with an assigned transform feedback offset will be unmodified.

When transform feedback is inactive, no vertices are recorded. If there is a valid counter buffer handle and counter buffer offset in the `pCounterBuffers` and `pCounterBufferOffsets` arrays, writes to the corresponding transform feedback buffer will start at the byte offset represented by the value stored in the counter buffer location.

Individual lines or triangles of a strip or fan primitive will be extracted and recorded separately.
Incomplete primitives are not recorded.

When using a geometry shader that emits vertices to multiple vertex streams, a primitive will be assembled and output for each stream when there are enough vertices emitted for the output primitive type. All outputs assigned to a given transform feedback buffer are required to come from a single vertex stream.

The sizes of the transform feedback buffers are defined by the `vkCmdBindTransformFeedbackBuffersEXT` `pSizes` parameter for each of the bound buffers, or the size of the bound buffer, whichever is the lesser. If there is less space remaining in any of the transform feedback buffers than the size of all of the vertex data for that primitive based on the `XfbStride` for that `XfbBuffer` then no vertex data of that primitive is recorded in any transform feedback buffer, and the value for the number of primitives written in the corresponding `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` query for all transform feedback buffers is no longer incremented.

Any outputs made to a `XfbBuffer` that is not bound to a transform feedback buffer is ignored.

To bind transform feedback buffers to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBindTransformFeedbackBuffersEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first transform feedback binding whose state is updated by the command.
- `bindingCount` is the number of transform feedback bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is NULL or a pointer to an array of `VkDeviceSize` buffer sizes, specifying the maximum number of bytes to capture to the corresponding transform feedback buffer. If `pSizes` is NULL, or the value of the `pSizes` array element is `VK_WHOLE_SIZE`, then the maximum number of bytes captured will be the size of the corresponding buffer minus the buffer offset.

The values taken from elements i of `pBuffers`, `pOffsets` and `pSizes` replace the current state for the transform feedback binding `firstBinding + i`, for i in [0, `bindingCount`). The transform feedback binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i].`
Valid Usage

- VUID-vkCmdBindTransformFeedbackBuffersEXT-transformFeedback-02355
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback must be enabled

- VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02356
  firstBinding must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

- VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02357
  The sum of firstBinding and bindingCount must be less than or equal to
  VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02358
  All elements of pOffsets must be less than the size of the corresponding element in pBuffers

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02359
  All elements of pOffsets must be a multiple of 4

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02360
  All elements of pBuffers must have been created with the
  VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT flag

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pSize-02361
  If the optional pSize array is specified, each element of pSizes must either be
  VK_WHOLE_SIZE, or be less than or equal to
  VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferSize

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pSizes-02362
  All elements of pSizes must be either VK_WHOLE_SIZE, or less than or equal to the size of the
  corresponding buffer in pBuffers

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02363
  All elements of pOffsets plus pSizes, where the pSizes element is not VK_WHOLE_SIZE, must
  be less than or equal to the size of the corresponding buffer in pBuffers

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02364
  Each element of pBuffers that is non-sparse must be bound completely and contiguously
  to a single VkDeviceMemory object

- VUID-vkCmdBindTransformFeedbackBuffersEXT-None-02365
  Transform feedback must not be active when the vkCmdBindTransformFeedbackBuffersEXT
  command is recorded

Valid Usage (Implicit)

- VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-parameter
  pBuffers must be a valid pointer to an array of bindingCount valid VkBuffer handles
• VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-parameter
  `pOffsets` must be a valid pointer to an array of `bindingCount VkDeviceSize` values

• VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-recording
  `commandBuffer` must be in the `recording state`

• VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

• VUID-vkCmdBindTransformFeedbackBuffersEXT-vidcoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdBindTransformFeedbackBuffersEXT-bindingCount-arraylength
  `bindingCount` must be greater than 0

• VUID-vkCmdBindTransformFeedbackBuffersEXT-commonparent
  Both of `commandBuffer`, and the elements of `pBuffers` must have been created, allocated, or retrieved from the same `VkDevice`

---

### Host Synchronization

• Host access to `commandBuffer` must be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

---

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>

<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Transform feedback for specific transform feedback buffers is made active by calling:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBeginTransformFeedbackEXT(
  VkCommandBuffer commandBuffer,
  uint32_t firstCounterBuffer,
  uint32_t counterBufferCount,
  const VkBuffer* pCounterBuffers,
  const VkDeviceSize* pCounterBufferOffsets);
```

• `commandBuffer` is the command buffer into which the command is recorded.

• `firstCounterBuffer` is the index of the first transform feedback buffer corresponding to `pCounterBuffers[0]` and `pCounterBufferOffsets[0]`. 
• `counterBufferCount` is the size of the `pCounterBuffers` and `pCounterBufferOffsets` arrays.

• `pCounterBuffers` is `NULL` or a pointer to an array of `VkBuffer` handles to counter buffers. Each buffer contains a 4 byte integer value representing the byte offset from the start of the corresponding transform feedback buffer from where to start capturing vertex data. If the byte offset stored to the counter buffer location was done using `vkCmdEndTransformFeedbackEXT` it can be used to resume transform feedback from the previous location. If `pCounterBuffers` is `NULL`, then transform feedback will start capturing vertex data to byte offset zero in all bound transform feedback buffers. For each element of `pCounterBuffers` that is `VK_NULL_HANDLE`, transform feedback will start capturing vertex data to byte zero in the corresponding bound transform feedback buffer.

• `pCounterBufferOffsets` is `NULL` or a pointer to an array of `VkDeviceSize` values specifying offsets within each of the `pCounterBuffers` where the counter values were previously written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. This data is the number of bytes captured by the previous transform feedback to this buffer. If `pCounterBufferOffsets` is `NULL`, then it is assumed the offsets are zero.

The active transform feedback buffers will capture primitives emitted from the corresponding `XfbBuffer` in the bound graphics pipeline. Any `XfbBuffer` emitted that does not output to an active transform feedback buffer will not be captured.

### Valid Usage

- `VUID-vkCmdBeginTransformFeedbackEXT-transformFeedback-02366
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback must be enabled`

- `VUID-vkCmdBeginTransformFeedbackEXT-None-02367
  Transform feedback must not be active`

- `VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02368
  firstCounterBuffer must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`

- `VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02369
  The sum of firstCounterBuffer and counterBufferCount must be less than or equal to VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`

- `VUID-vkCmdBeginTransformFeedbackEXT-counterBufferCount-02607
  If counterBufferCount is not 0, and pCounterBuffers is not NULL, pCounterBuffers must be a valid pointer to an array of counterBufferCount VkBuffer handles that are either valid or VK_NULL_HANDLE`

- `VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-02370
  For each buffer handle in the array, if it is not VK_NULL_HANDLE it must reference a buffer large enough to hold 4 bytes at the corresponding offset from the pCounterBufferOffsets array`

- `VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffer-02371
  If pCounterBuffer is NULL, then pCounterBufferOffsets must also be NULL`

- `VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffers-02372
  For each buffer handle in the pCounterBuffers array that is not VK_NULL_HANDLE it must`
have been created with a usage value containing
VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT

• VUID-vkCmdBeginTransformFeedbackEXT-None-06233
  A valid graphics pipeline must be bound to VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdBeginTransformFeedbackEXT-None-04128
  The last pre-rasterization shader stage of the bound graphics pipeline must have been declared with the Xfb execution mode

• VUID-vkCmdBeginTransformFeedbackEXT-None-02373
  Transform feedback must not be made active in a render pass instance with multiview enabled

Valid Usage (Implicit)

• VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-parameter
  If counterBufferCount is not 0, and pCounterBufferOffsets is not NULL, pCounterBufferOffsets must be a valid pointer to an array of counterBufferCount VkDeviceSize values

• VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdBeginTransformFeedbackEXT-renderpass
  This command must only be called inside of a render pass instance

• VUID-vkCmdBeginTransformFeedbackEXT-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdBeginTransformFeedbackEXT-commonparent
  Both of commandBuffer, and the elements of pCounterBuffers that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Transform feedback for specific transform feedback buffers is made inactive by calling:

```c
// Provided by VK_EXT_transform_feedback
define void vkCmdEndTransformFeedbackEXT(
    VkCommandBuffer commandBuffer,        
    uint32_t firstCounterBuffer,         
    uint32_t counterBufferCount,         
    const VkBuffer* pCounterBuffers,     
    const VkDeviceSize* pCounterBufferOffsets);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstCounterBuffer` is the index of the first transform feedback buffer corresponding to `pCounterBuffers[0]` and `pCounterBufferOffsets[0].`
- `counterBufferCount` is the size of the `pCounterBuffers` and `pCounterBufferOffsets` arrays.
- `pCounterBuffers` is `NULL` or a pointer to an array of `VkBuffer` handles to counter buffers. The counter buffers are used to record the current byte positions of each transform feedback buffer where the next vertex output data would be captured. This can be used by a subsequent `vkCmdBeginTransformFeedbackEXT` call to resume transform feedback capture from this position. It can also be used by `vkCmdDrawIndirectByteCountEXT` to determine the vertex count of the draw call.
- `pCounterBufferOffsets` is `NULL` or a pointer to an array of `VkDeviceSize` values specifying offsets within each of the `pCounterBuffers` where the counter values can be written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. The data stored at this location is the byte offset from the start of the transform feedback buffer binding where the next vertex data would be written. If `pCounterBufferOffsets` is `NULL`, then it is assumed the offsets are zero.

## Valid Usage

- **VUID-vkCmdEndTransformFeedbackEXT-transformFeedback-02374**
  `VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` must be enabled
- **VUID-vkCmdEndTransformFeedbackEXT-None-02375**
  Transform feedback must be active
- **VUID-vkCmdEndTransformFeedbackEXT-firstCounterBuffer-02376**
  `firstCounterBuffer` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`
The sum of `firstCounterBuffer` and `counterBufferCount` must be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`.

If `counterBufferCount` is not 0, and `pCounterBuffers` is not NULL, `pCounterBuffers` must be a valid pointer to an array of `counterBufferCount` `VkBuffer` handles that are either valid or `VK_NULL_HANDLE`.

For each buffer handle in the array, if it is not `VK_NULL_HANDLE` it must reference a buffer large enough to hold 4 bytes at the corresponding offset from the `pCounterBufferOffsets` array.

If `pCounterBuffer` is NULL, then `pCounterBufferOffsets` must also be NULL.

For each buffer handle in the `pCounterBuffers` array that is not `VK_NULL_HANDLE` it must have been created with a usage value containing `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT`.

Host access to `commandBuffer` must be externally synchronized.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pCounterBufferOffsets` parameter
  - If `counterBufferCount` is not 0, and `pCounterBufferOffsets` is not NULL, `pCounterBufferOffsets` must be a valid pointer to an array of `counterBufferCount` `VkDeviceSize` values.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
- This command must only be called inside of a render pass instance.
- This command must only be called outside of a video coding scope.
- Both of `commandBuffer`, and the elements of `pCounterBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### 26.2. Viewport Swizzle

Each primitive sent to a given viewport has a swizzle and optional negation applied to its clip coordinates. The swizzle that is applied depends on the viewport index, and is controlled by the VkPipelineViewportSwizzleStateCreateInfoNV pipeline state:

```c
// Provided by VK_NV_viewport_swizzle
typedef struct VkPipelineViewportSwizzleStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportSwizzleStateCreateFlagsNV flags;
    uint32_t viewportCount;
    const VkViewportSwizzleNV* pViewportSwizzles;
} VkPipelineViewportSwizzleStateCreateInfoNV;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **viewportCount** is the number of viewport swizzles used by the pipeline.
- **pViewportSwizzles** is a pointer to an array of VkViewportSwizzleNV structures, defining the viewport swizzles.

### Valid Usage

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-viewportCount-01215
  viewportCount must be greater than or equal to the viewportCount set in VkPipelineViewportStateCreateInfo

### Valid Usage (Implicit)

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-sType-sType
sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_SWIZZLE_STATE_CREATE_INFO_NV

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-flags-zerobitmask
  flags must be 0

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-pViewportSwizzles-parameter
  pViewportSwizzles must be a valid pointer to an array of viewportCount valid
  VkViewportSwizzleNV structures

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-viewportCount-arraylength
  viewportCount must be greater than 0

// Provided by VK_NV_viewport_swizzle
typedef VkFlags VkPipelineViewportSwizzleStateCreateFlagsNV;

VkPipelineViewportSwizzleStateCreateFlagsNV is a bitmask type for setting a mask, but is currently
reserved for future use.

The VkPipelineViewportSwizzleStateCreateInfoNV state is set by adding this structure to the pNext
chain of a VkPipelineViewportStateCreateInfo structure and setting the graphics pipeline state with
vkCreateGraphicsPipelines.

To dynamically set the viewport swizzle state, call:

// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetViewportSwizzleNV(
    VkCommandBuffer commandBuffer,                 // Provided by VK_NV_viewport_swizzle
    uint32_t firstViewport,                        // Provided by VK_NV_viewport_swizzle
    uint32_t viewportCount,                       // Provided by VK_NV_viewport_swizzle
    const VkViewportSwizzleNV* pViewportSwizzles); // Provided by VK_NV_viewport_swizzle

- commandBuffer is the command buffer into which the command will be recorded.
- firstViewport is the index of the first viewport whose parameters are updated by the command.
- viewportCount is the number of viewports whose parameters are updated by the command.
- pViewportSwizzles is a pointer to an array of VkViewportSwizzleNV structures specifying
  viewport swizzles.

This command sets the viewport swizzle state for subsequent drawing commands when the
graphics pipeline is created with VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV set in
VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the
VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount, and
VkPipelineViewportSwizzleStateCreateInfoNV::pViewportSwizzles values used to create
the currently active pipeline.

Valid Usage

- VUID-vkCmdSetViewportSwizzleNV-extendedDynamicState3ViewportSwizzle-07445
The extendedDynamicState3ViewportSwizzle feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetViewportSwizzleNV-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetViewportSwizzleNV-pViewportSwizzles-parameter pViewportSwizzles must be a valid pointer to an array of viewportCount valid VkViewportSwizzleNV structures
- VUID-vkCmdSetViewportSwizzleNV-commandBuffer-recording commandBuffer must be in the recording state
- VUID-vkCmdSetViewportSwizzleNV-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetViewportSwizzleNV-videocoding This command must only be called outside of a video coding scope
- VUID-vkCmdSetViewportSwizzleNV-viewportCount-arraylength viewportCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td>Both</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Each viewport specified from 0 to viewportCount - 1 has its x,y,z,w swizzle state set to the corresponding x, y, z and w in the VkViewportSwizzleNV structure. Each component is of type VkViewportCoordinateSwizzleNV, which determines the type of swizzle for that component. The value of x computes the new x component of the position as:

```cpp
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV) x' = x;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_X_NV) x' = -x;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV) x' = y;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Y_NV) x' = -y;
```
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV) x' = z;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Z_NV) x' = -z;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV) x' = w;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_W_NV) x' = -w;

Similar selections are performed for the y, z, and w coordinates. This swizzling is applied before clipping and perspective divide. If the swizzle for an active viewport index is not specified, the swizzle for x is VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV, y is VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV, z is VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV and w is VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV.

Viewport swizzle parameters are specified by setting the pNext pointer of VkGraphicsPipelineCreateInfo to point to a VkPipelineViewportSwizzleStateCreateInfoNV structure. VkPipelineViewportSwizzleStateCreateInfoNV uses VkViewportSwizzleNV to set the viewport swizzle parameters.

The VkViewportSwizzleNV structure is defined as:

```c
// Provided by VK_NV_viewport_swizzle
typedef struct VkViewportSwizzleNV {
    VkViewportCoordinateSwizzleNV x;
    VkViewportCoordinateSwizzleNV y;
    VkViewportCoordinateSwizzleNV z;
    VkViewportCoordinateSwizzleNV w;
} VkViewportSwizzleNV;
```

- x is a VkViewportCoordinateSwizzleNV value specifying the swizzle operation to apply to the x component of the primitive
- y is a VkViewportCoordinateSwizzleNV value specifying the swizzle operation to apply to the y component of the primitive
- z is a VkViewportCoordinateSwizzleNV value specifying the swizzle operation to apply to the z component of the primitive
- w is a VkViewportCoordinateSwizzleNV value specifying the swizzle operation to apply to the w component of the primitive

**Valid Usage (Implicit)**

- VUID-VkViewportSwizzleNV-x-parameter
  x must be a valid VkViewportCoordinateSwizzleNV value
- VUID-VkViewportSwizzleNV-y-parameter
  y must be a valid VkViewportCoordinateSwizzleNV value
- VUID-VkViewportSwizzleNV-z-parameter
  z must be a valid VkViewportCoordinateSwizzleNV value
- VUID-VkViewportSwizzleNV-w-parameter
  w must be a valid VkViewportCoordinateSwizzleNV value
Possible values of the `VkViewportSwizzleNV::x, y, z, and w` members, specifying swizzling of the corresponding components of primitives, are:

```c
// Provided by VK_NV_viewport_swizzle
typedef enum VkViewportCoordinateSwizzleNV {
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV = 0,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_X_NV = 1,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV = 2,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Y_NV = 3,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV = 4,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Z_NV = 5,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV = 6,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_W_NV = 7,
} VkViewportCoordinateSwizzleNV;
```

These values are described in detail in Viewport Swizzle.

### 26.3. Flat Shading

*Flat shading* a vertex output attribute means to assign all vertices of the primitive the same value for that output. The output values assigned are those of the *provoking vertex* of the primitive. Flat shading is applied to those vertex attributes that match fragment input attributes which are decorated as *Flat*.

If neither *mesh, geometry* nor *tessellation shading* is active, the provoking vertex is determined by the primitive topology defined by `VkPipelineInputAssemblyStateCreateInfo::topology` used to execute the drawing command.

If a shader using *MeshNV Execution Model* is active, the provoking vertex is determined by the primitive topology defined by the `OutputPoints`, `OutputLinesNV`, or `OutputTrianglesNV` execution mode.

If a shader using *MeshEXT Execution Model* is active, the provoking vertex is determined by the primitive topology defined by the `OutputPoints`, `OutputLinesEXT`, or `OutputTrianglesEXT` execution mode.

If *geometry shading* is active, the provoking vertex is determined by the primitive topology defined by the `OutputPoints`, `OutputLineStrips`, or `OutputTriangleStrips` execution mode.

If *tessellation shading* is active but *geometry shading* is not, the provoking vertex may be any of the vertices in each primitive.

For a given primitive topology, the pipeline’s provoking vertex mode determines which vertex is the provoking vertex. To specify the provoking vertex mode, include a `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT` structure in the `VkPipelineRasterizationStateCreateInfo::pNext` chain when creating the pipeline.

The `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT` structure is defined as:
typedef struct VkPipelineRasterizationProvokingVertexStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkProvokingVertexModeEXT provokingVertexMode;
} VkPipelineRasterizationProvokingVertexStateCreateInfoEXT;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `provokingVertexMode` is a `VkProvokingVertexModeEXT` value selecting the provoking vertex mode.

If this struct is not provided when creating the pipeline, the pipeline will use the `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT` mode.

If the `provokingVertexModePerPipeline` limit is `VK_FALSE`, then all pipelines bound within a render pass instance must have the same `provokingVertexMode`.

### Valid Usage

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-04883
  If `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, then the `provokingVertexLast` feature must be enabled.

### Valid Usage (Implicit)

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_PROVOKING_VERTEX_STATE_CREATE_INFO_EXT`

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-parameter
  `provokingVertexMode` must be a valid `VkProvokingVertexModeEXT` value

Possible values of `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode` are:

```c
typedef enum VkProvokingVertexModeEXT {
    VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT = 0,
    VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT = 1,
} VkProvokingVertexModeEXT;
```

- `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT` specifies that the provoking vertex is the first non-
adjacency vertex in the list of vertices used by a primitive.

- **VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT** specifies that the provoking vertex is the last non-adjacency vertex in the list of vertices used by a primitive.

These modes are described more precisely in **Primitive Topologies**.

To **dynamically set** the **provokingVertexMode** state, call:

```c
void vkCmdSetProvokingVertexModeEXT(
    VkCommandBuffer commandBuffer,  
    VkProvokingVertexModeEXT provokingVertexMode);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **provokingVertexMode** specifies the **provokingVertexMode** state.

This command sets the **provokingVertexMode** state for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode** value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetProvokingVertexModeEXT-extendedDynamicState3ProvokingVertexMode-07446**
  The **extendedDynamicState3ProvokingVertexMode** feature **must** be enabled

- **VUID-vkCmdSetProvokingVertexModeEXT-provokingVertexMode-07447**
  If **provokingVertexMode** is **VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT**, then the **provokingVertexLast** feature **must** be enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetProvokingVertexModeEXT-commandBuffer-parameter**
  **commandBuffer** **must** be a valid **VkCommandBuffer** handle

- **VUID-vkCmdSetProvokingVertexModeEXT-provokingVertexMode-parameter**
  **provokingVertexMode** **must** be a valid **VkProvokingVertexModeEXT** value

- **VUID-vkCmdSetProvokingVertexModeEXT-commandBuffer-recording**
  **commandBuffer** **must** be in the **recording state**

- **VUID-vkCmdSetProvokingVertexModeEXT-commandBuffer-cmdpool**
  The **VkCommandPool** that **commandBuffer** was allocated from **must** support graphics operations

- **VUID-vkCmdSetProvokingVertexModeEXT-videocoding**
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

## Command Properties

26.4. Primitive Clipping

Primitives are culled against the *cull volume* and then clipped to the *clip volume*. In clip coordinates, the *view volume* is defined by:

\[
\begin{align*}
-w_c & \leq x_c \leq w_c \\
-w_c & \leq y_c \leq w_c \\
z_m & \leq z_c \leq w_c
\end{align*}
\]

where if `VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne` is `VK_TRUE`, `z_m` is equal to `-w_c`, otherwise `z_m` is equal to zero.

This view volume can be further restricted by as many as `VkPhysicalDeviceLimits::maxClipDistances` client-defined half-spaces.

The cull volume is the intersection of up to `VkPhysicalDeviceLimits::maxCullDistances` client-defined half-spaces (if no client-defined cull half-spaces are enabled, culling against the cull volume is skipped).

A shader must write a single cull distance for each enabled cull half-space to elements of the `CullDistance` array. If the cull distance for any enabled cull half-space is negative for all of the vertices of the primitive under consideration, the primitive is discarded. Otherwise the primitive is clipped against the clip volume as defined below.

The clip volume is the intersection of up to `VkPhysicalDeviceLimits::maxClipDistances` client-defined half-spaces with the view volume (if no client-defined clip half-spaces are enabled, the clip volume is the view volume).

A shader must write a single clip distance for each enabled clip half-space to elements of the `ClipDistance` array. Clip half-space i is then given by the set of points satisfying the inequality

\[
c(P) \geq 0
\]
where \( c_i(\mathbf{P}) \) is the clip distance \( i \) at point \( \mathbf{P} \). For point primitives, \( c_i(\mathbf{P}) \) is simply the clip distance for the vertex in question. For line and triangle primitives, per-vertex clip distances are interpolated using a weighted mean, with weights derived according to the algorithms described in sections Basic Line Segment Rasterization and Basic Polygon Rasterization, using the perspective interpolation equations.

The number of client-defined clip and cull half-spaces that are enabled is determined by the explicit size of the built-in arrays ClipDistance and CullDistance, respectively, declared as an output in the interface of the entry point of the final shader stage before clipping.

If \( \text{VkPipelineRasterizationDepthClipStateCreateInfoEXT} \) is present in the graphics pipeline state then depth clipping is disabled if \( \text{VkPipelineRasterizationDepthClipStateCreateInfoEXT} :: \text{depthClipEnable} \) is \( \text{VK_FALSE} \). Otherwise, if \( \text{VkPipelineRasterizationDepthClipStateCreateInfoEXT} \) is not present, depth clipping is disabled when \( \text{VkPipelineRasterizationStateCreateInfo} :: \text{depthClampEnable} \) is \( \text{VK_TRUE} \).

To dynamically set enable or disable depth clamping, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetDepthClampEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthClampEnable);
```

- \( \text{commandBuffer} \) is the command buffer into which the command will be recorded.
- \( \text{depthClampEnable} \) specifies whether depth clamping is enabled.

This command sets whether depth clamping is enabled or disabled for subsequent drawing commands when the graphics pipeline is created with \( \text{VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT} \) set in \( \text{VkPipelineDynamicStateCreateInfo} :: \text{pDynamicStates} \). Otherwise, this state is specified by the \( \text{VkPipelineRasterizationStateCreateInfo} :: \text{depthClampEnable} \) value used to create the currently active pipeline.

If the depth clamping state is changed dynamically, and the pipeline was not created with \( \text{VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT} \) enabled, then depth clipping is enabled when depth clamping is disabled and vice versa.

### Valid Usage

- VUID-vkCmdSetDepthClampEnableEXT-extendedDynamicState3DepthClampEnable-07448
  The extendedDynamicState3DepthClampEnable feature must be enabled
- VUID-vkCmdSetDepthClampEnableEXT-depthClamp-07449
  If the depthClamp feature is not enabled, depthClampEnable must be \( \text{VK_FALSE} \)

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-parameter
**commandBuffer** must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-recording
  **commandBuffer** must be in the recording state

- VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetDepthClampEnableEXT-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

To **dynamically set** enable or disable depth clipping, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetDepthClipEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthClipEnable);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **depthClipEnable** specifies whether depth clipping is enabled.

This command sets whether depth clipping is enabled or disabled for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable` value used to create the currently active pipeline, or is set to the inverse of `VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClampEnable` if `VkPipelineRasterizationDepthClipStateCreateInfoEXT` is not specified.
• VUID-vkCmdSetDepthClipEnableEXT-extendedDynamicState3DepthClipEnable-07450
  The extendedDynamicState3DepthClipEnable feature must be enabled

• VUID-vkCmdSetDepthClipEnableEXT-depthClipEnable-07451
  The depthClipEnable feature must be enabled

Valid Usage (Implicit)

• VUID-vkCmdSetDepthClipEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetDepthClipEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetDepthClipEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetDepthClipEnableEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>

<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

When depth clipping is disabled, the plane equation

\[ z_m \leq z_c \leq w_c \]

(see the clip volume definition above) is ignored by view volume clipping (effectively, there is no near or far plane clipping).

If the primitive under consideration is a point or line segment, then clipping passes it unchanged if its vertices lie entirely within the clip volume.

Possible values of VkPhysicalDevicePointClippingProperties::pointClippingBehavior, specifying
clipping behavior of a point primitive whose vertex lies outside the clip volume, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkPointClippingBehavior {
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES = 0,
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY = 1,
    // Provided by VK_KHR_maintenance2
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES_KHR =
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES,
    // Provided by VK_KHR_maintenance2
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY_KHR =
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY,
} VkPointClippingBehavior;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkPointClippingBehavior VkPointClippingBehaviorKHR;
```

- **VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES** specifies that the primitive is discarded if the vertex lies outside any clip plane, including the planes bounding the view volume.

- **VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY** specifies that the primitive is discarded only if the vertex lies outside any user clip plane.

If either of a line segment's vertices lie outside of the clip volume, the line segment may be clipped, with new vertex coordinates computed for each vertex that lies outside the clip volume. A clipped line segment endpoint lies on both the original line segment and the boundary of the clip volume. This clipping produces a value, $0 \leq t \leq 1$, for each clipped vertex. If the coordinates of a clipped vertex are $P$ and the unclipped line segment's vertex coordinates are $P_1$ and $P_2$, then $t$ satisfies the following equation

$$P = tP_1 + (1-t)P_2.$$ 

$t$ is used to clip vertex output attributes as described in [Clipping Shader Outputs](#).

If the primitive is a polygon, it passes unchanged if every one of its edges lies entirely inside the clip volume, and is either clipped or discarded otherwise. If the edges of the polygon intersect the boundary of the clip volume, the intersecting edges are reconnected by new edges that lie along the boundary of the clip volume - in some cases requiring the introduction of new vertices into a polygon.

If a polygon intersects an edge of the clip volume’s boundary, the clipped polygon must include a point on this boundary edge.

Primitives rendered with user-defined half-spaces must satisfy a complementarity criterion. Suppose a series of primitives is drawn where each vertex $i$ has a single specified clip distance $d_i$ (or
a number of similarly specified clip distances, if multiple half-spaces are enabled). Next, suppose that the same series of primitives are drawn again with each such clip distance replaced by -d, (and the graphics pipeline is otherwise the same). In this case, primitives must not be missing any pixels, and pixels must not be drawn twice in regions where those primitives are cut by the clip planes.

The VkPipelineViewportDepthClipControlCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_depth_clip_control
typedef struct VkPipelineViewportDepthClipControlCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 negativeOneToOne;
} VkPipelineViewportDepthClipControlCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `negativeOneToOne` sets the $z_m$ in the view volume to $-w_c$

**Valid Usage**

- VUID-VkPipelineViewportDepthClipControlCreateInfoEXT-negativeOneToOne-06470
  If `depthClipControl` is not enabled, `negativeOneToOne` must be VK_FALSE

**Valid Usage (Implicit)**

- VUID-VkPipelineViewportDepthClipControlCreateInfoEXT-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_DEPTH_CLIP_CONTROL_CREATE_INFO_EXT

To dynamically set `negativeOneToOne`, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetDepthClipNegativeOneToOneEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 negativeOneToOne);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `negativeOneToOne` specifies the `negativeOneToOne` state.

This command sets the `negativeOneToOne` state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne` value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-extendedDynamicState3DepthClipNegativeOneToOne-07452
  The extendedDynamicState3DepthClipNegativeOneToOne feature must be enabled

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-depthClipControl-07453
  The depthClipControl feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

26.5. Clipping Shader Outputs

Next, vertex output attributes are clipped. The output values associated with a vertex that lies within the clip volume are unaffected by clipping. If a primitive is clipped, however, the output values assigned to vertices produced by clipping are clipped.

Let the output values assigned to the two vertices \( P_1 \) and \( P_2 \) of an unclipped edge be \( c_1 \) and \( c_2 \). The
value of \( t \) (see \textit{Primitive Clipping}) for a clipped point \( P \) is used to obtain the output value associated with \( P \) as

\[
c = t \, c_1 + (1-t) \, c_2.
\]

(Multiplying an output value by a scalar means multiplying each of \( x, y, z, \) and \( w \) by the scalar.)

Since this computation is performed in clip space before division by \( w_c \), clipped output values are perspective-correct.

Polygon clipping creates a clipped vertex along an edge of the clip volume's boundary. This situation is handled by noting that polygon clipping proceeds by clipping against one half-space at a time. Output value clipping is done in the same way, so that clipped points always occur at the intersection of polygon edges (possibly already clipped) with the clip volume's boundary.

For vertex output attributes whose matching fragment input attributes are decorated with \texttt{NoPerspective}, the value of \( t \) used to obtain the output value associated with \( P \) will be adjusted to produce results that vary linearly in framebuffer space.

Output attributes of integer or unsigned integer type \textbf{must} always be flat shaded. Flat shaded attributes are constant over the primitive being rasterized (see \textit{Basic Line Segment Rasterization} and \textit{Basic Polygon Rasterization}), and no interpolation is performed. The output value \( c \) is taken from either \( c_1 \) or \( c_2 \), since flat shading has already occurred and the two values are identical.

### 26.6. Controlling Viewport \( W \) Scaling

If viewport \( W \) scaling is enabled, the \( W \) component of the clip coordinate is modified by the provided coefficients from the corresponding viewport as follows.

\[
w' = x_{\text{coeff}} \, x_c + y_{\text{coeff}} \, y_c + w_c
\]

The \texttt{VkPipelineViewportWScalingStateCreateInfoNV} structure is defined as:

```c
// Provided by VK_NV_clip_space_w_scaling
typedef struct VkPipelineViewportWScalingStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 viewportWScalingEnable;
    uint32_t viewportCount;
    const VkViewportWScalingNV* pViewportWScalings;
} VkPipelineViewportWScalingStateCreateInfoNV;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{viewportWScalingEnable} controls whether viewport \( W \) scaling is enabled.
• **viewportCount** is the number of viewports used by **W** scaling, and **must** match the number of viewports in the pipeline if viewport **W** scaling is enabled.

• **pViewportWScalings** is a pointer to an array of **VkViewportWScalingNV** structures defining the **W** scaling parameters for the corresponding viewports. If the viewport **W** scaling state is dynamic, this member is ignored.

### Valid Usage (Implicit)

- **VUID-VkPipelineViewportWScalingStateCreateInfoNV-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_W_SCALING_STATE_CREATE_INFO_NV**
- **VUID-VkPipelineViewportWScalingStateCreateInfoNV-viewportCount-arraylength**
  - **viewportCount** must be greater than 0

The **VkPipelineViewportWScalingStateCreateInfoNV** state is set by adding this structure to the **pNext** chain of a **VkPipelineViewportStateCreateInfo** structure and setting the graphics pipeline state with **vkCreateGraphicsPipelines**.

To **dynamically set** the **viewportWScalingEnable** state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetViewportWScalingEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 viewportWScalingEnable);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **viewportWScalingEnable** specifies the **viewportWScalingEnable** state.

This command sets the **viewportWScalingEnable** state for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineViewportWScalingStateCreateInfoNV::viewportWScalingEnable** value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetViewportWScalingEnableNV-extendedDynamicState3ViewportWScalingEnable-07580**
  - The **extendedDynamicState3ViewportWScalingEnable** feature **must** be enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetViewportWScalingEnableNV-commandBuffer-parameter**
  - **commandBuffer** must be a valid **VkCommandBuffer** handle
- **VUID-vkCmdSetViewportWScalingEnableNV-commandBuffer-recording**

---

1824
**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the viewport W scaling parameters, call:

```c
// Provided by VK_NV_clip_space_w_scaling
void vkCmdSetViewportWScalingNV(
    VkCommandBuffer commandBuffer,
    uint32_t firstViewport,
    uint32_t viewportCount,
    const VkViewportWScalingNV* pViewportWScalings);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstViewport` is the index of the first viewport whose parameters are updated by the command.
- `viewportCount` is the number of viewports whose parameters are updated by the command.
- `pViewportWScalings` is a pointer to an array of `VkViewportWScalingNV` structures specifying viewport parameters.

The viewport parameters taken from element i of `pViewportWScalings` replace the current state for the viewport index `firstViewport + i`, for i in [0, `viewportCount`).

This command sets the viewport W scaling for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportWScalingStateCreateInfoNV::pViewportWScalings` values used to create the
currently active pipeline.

Valid Usage

- VUID-vkCmdSetViewportWScalingNV-firstViewport-01324
  The sum of firstViewport and viewportCount must be between 1 and VkPhysicalDeviceLimits::maxViewports, inclusive

Valid Usage (Implicit)

- VUID-vkCmdSetViewportWScalingNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetViewportWScalingNV-pViewportWScalings-parameter
  pViewportWScalings must be a valid pointer to an array of viewportCount VkViewportWScalingNV structures
- VUID-vkCmdSetViewportWScalingNV-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetViewportWScalingNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetViewportWScalingNV-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdSetViewportWScalingNV-viewportCount-arraylength
  viewportCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Both VkPipelineViewportWScalingStateCreateInfoNV and vkCmdSetViewportWScalingNV use VkViewportWScalingNV to set the viewport transformation parameters.
The `VkViewportWScalingNV` structure is defined as:

```c
// Provided by VK_NV_clip_space_w_scaling
typedef struct VkViewportWScalingNV {
  float xcoeff;
  float ycoeff;
} VkViewportWScalingNV;
```

- `xcoeff` and `ycoeff` are the viewport's W scaling factor for x and y respectively.

### 26.7. Coordinate Transformations

**Clip coordinates** for a vertex result from shader execution, which yields a vertex coordinate **Position**.

Perspective division on clip coordinates yields *normalized device coordinates*, followed by a *viewport* transformation (see Controlling the Viewport) to convert these coordinates into *framebuffer coordinates*.

If a vertex in clip coordinates has a position given by

\[
\begin{pmatrix}
  x_c \\
  y_c \\
  z_c \\
  w_c
\end{pmatrix}
\]

then the vertex's normalized device coordinates are

\[
\begin{pmatrix}
  x_d \\
  y_d \\
  z_d
\end{pmatrix} = \begin{pmatrix}
  x_c \\
  w_c \\
  y_c \\
  w_c \\
  z_c \\
  w_c
\end{pmatrix}
\]

### 26.8. Render Pass Transform

A *render pass transform* can be enabled for render pass instances. The clip coordinates \((x_c, y_c)\) that result from vertex shader execution are transformed by a rotation of 0, 90, 180, or 270 degrees in the XY plane, centered at the origin.

When *Render pass transform* is enabled, the transform applies to all primitives for all subpasses of the render pass. The transformed vertex in clip coordinates has a position given by

\[
\begin{pmatrix}
  x_{c_{\text{trans}}} \\
  y_{c_{\text{trans}}} \\
  z_{c_{\text{trans}}}
\end{pmatrix} = \begin{pmatrix}
  x_c\cos\theta - y_c\sin\theta \\
  x_c\sin\theta + y_c\cos\theta \\
  z_c
\end{pmatrix}
\]

where
• $\theta$ is 0 degrees for `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`
• $\theta$ is 90 degrees for `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR`
• $\theta$ is 180 degrees for `VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR`
• $\theta$ is 270 degrees for `VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR`

The transformed vertex's normalized device coordinates are

$$
\begin{pmatrix}
X_d \\
Y_d \\
Z_d
\end{pmatrix}
= \begin{pmatrix}
X_{c\text{trans}} \\
Y_{c\text{trans}} \\
Z_{c\text{trans}}
\end{pmatrix} \frac{W_c}{w_c}
$$

When render pass transform is enabled for a render pass instance, the following additional features are enabled:

• Each `VkViewport` specified by either `VkPipelineViewportStateCreateInfo::pViewports` or `vkCmdSetViewport` will have its width/height ($p_x, p_y$) and its center ($o_x, o_y$) similarly transformed by the implementation.
• Each scissor specified by `VkPipelineViewportStateCreateInfo::pScissors` or `vkCmdSetScissor` will have its $(offset_x, offset_y)$ and $(extent_x, extent_y)$ similarly transformed by the implementation.
• The `renderArea` specified in `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` and `VkRenderPassBeginInfo` will be similarly transformed by the implementation.
• The $(x, y)$ components of shader variables with built-in decorations `FragCoord`, `SamplePosition`, or `PointCoord` will be similarly transformed by the implementation.
• The $(x,y)$ components of the `offset` operand of the `InterpolateAtOffset` extended instruction will be similarly transformed by the implementation.
• The values returned by SPIR-V derivative instructions `OpDPdx`, `OpDPdy`, `OpDPdxCourse`, `OpDPdyCourse`, `OpDPdxFine`, `OpDPdyFine` will be similarly transformed by the implementation.

The net result of the above, is that applications can act as if rendering to a framebuffer oriented with the `VkSurfaceCapabilitiesKHR::currentTransform`. In other words, applications can act as if the presentation engine will be performing the transformation of the swapchain image after rendering and prior to presentation to the user. In fact, the transformation of the various items cited above are being handled by the implementation as the rendering takes place.

26.9. Controlling the Viewport

The viewport transformation is determined by the selected viewport's width and height in pixels, $p_x$ and $p_y$, respectively, and its center $(o_x, o_y)$ (also in pixels), as well as its depth range min and max determining a depth range scale value $p_z$ and a depth range bias value $o_z$ (defined below). The vertex's framebuffer coordinates $(x_f, y_f, z_f)$ are given by
\[ x_t = (p_x / 2) x_d + o_z \]

\[ y_t = (p_y / 2) y_d + o_y \]

\[ z_t = p_z \times z_d + o_z \]

Multiple viewports are available, numbered zero up to `VkPhysicalDeviceLimits::maxViewports` minus one. The number of viewports used by a pipeline is controlled by the `viewportCount` member of the `VkPipelineViewportStateCreateInfo` structure used in pipeline creation.

\( x_t \) and \( y_t \) have limited precision, where the number of fractional bits retained is specified by `VkPhysicalDeviceLimits::subPixelPrecisionBits`. When rasterizing line segments, the number of fractional bits is specified by `VkPhysicalDeviceLineRasterizationPropertiesEXT::lineSubPixelPrecisionBits`.

The `VkPipelineViewportStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineViewportStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportStateCreateFlags flags;
    uint32_t viewportCount;
    const VkViewport* pViewports;
    uint32_t scissorCount;
    const VkRect2D* pScissors;
} VkPipelineViewportStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `viewportCount` is the number of viewports used by the pipeline.
- `pViewports` is a pointer to an array of `VkViewport` structures, defining the viewport transforms. If the viewport state is dynamic, this member is ignored.
- `scissorCount` is the number of `scissors` and `must` match the number of viewports.
- `pScissors` is a pointer to an array of `VkRect2D` structures defining the rectangular bounds of the scissor for the corresponding viewport. If the scissor state is dynamic, this member is ignored.

**Valid Usage**

- VUID-VkPipelineViewportStateCreateInfo-viewportCount-01216
  If the multiViewport feature is not enabled, `viewportCount` must not be greater than 1
• VUID-VkPipelineViewportStateCreateInfo-scissorCount-01217
  If the multiViewport feature is not enabled, scissorCount must not be greater than 1

• VUID-VkPipelineViewportStateCreateInfo-viewportCount-01218
  viewportCount must be less than or equal to VkPhysicalDeviceLimits::maxViewports

• VUID-VkPipelineViewportStateCreateInfo-scissorCount-01219
  scissorCount must be less than or equal to VkPhysicalDeviceLimits::maxViewports

• VUID-VkPipelineViewportStateCreateInfo-x-02821
  The x and y members of offset member of any element of pScissors must be greater than or equal to 0

• VUID-VkPipelineViewportStateCreateInfo-offset-02822
  Evaluation of (offset.x + extent.width) must not cause a signed integer addition overflow for any element of pScissors

• VUID-VkPipelineViewportStateCreateInfo-offset-02823
  Evaluation of (offset.y + extent.height) must not cause a signed integer addition overflow for any element of pScissors

• VUID-VkPipelineViewportStateCreateInfo-scissorCount-04134
  If the graphics pipeline is being created without VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT set then scissorCount and viewportCount must be identical

• VUID-VkPipelineViewportStateCreateInfo-viewportCount-04135
  If the graphics pipeline is being created with VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT set then viewportCount must be 0, otherwise it must be greater than 0

• VUID-VkPipelineViewportStateCreateInfo-scissorCount-04136
  If the graphics pipeline is being created with VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT set then scissorCount must be 0, otherwise it must be greater than 0

• VUID-VkPipelineViewportStateCreateInfo-viewportWScalingEnable-01726
  If the viewportWScalingEnable member of a VkPipelineViewportWScalingStateCreateInfoNV structure included in the pNext chain is VK_TRUE, the viewportCount member of the VkPipelineViewportWScalingStateCreateInfoNV structure must be greater than or equal to VkPipelineViewportStateCreateInfo::viewportCount

---

**Valid Usage (Implicit)**

• VUID-VkPipelineViewportStateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO

• VUID-VkPipelineViewportStateCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of
  VkPipelineViewportCoarseSampleOrderStateCreateInfoNV,
  VkPipelineViewportDepthClipControlCreateInfoEXT,
  VkPipelineViewportExclusiveScissorStateCreateInfoNV,
  VkPipelineViewportShadingRateImageStateCreateInfoNV,
VkPipelineViewportSwizzleStateCreateInfoNV, or VkPipelineViewportWScalingStateCreateInfoNV

- **VUID-VkPipelineViewportStateCreateInfo-sType-unique**
The *sType* value of each struct in the *pNext* chain **must** be unique

- **VUID-VkPipelineViewportStateCreateInfo-flags-zerobitmask**
  *flags* **must** be 0

To **dynamically set** the viewport count and viewports, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetViewportWithCount(VkCommandBuffer commandBuffer, uint32_t viewportCount, const VkViewport* pViewports);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetViewportWithCountEXT(VkCommandBuffer commandBuffer, uint32_t viewportCount, const VkViewport* pViewports);
```

- *commandBuffer* is the command buffer into which the command will be recorded.
- *viewportCount* specifies the viewport count.
- *pViewports* specifies the viewports to use for drawing.

This command sets the viewport count and viewports state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::viewportCount` and *pViewports* values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetViewportWithCount-viewportCount-03394**
  *viewportCount* **must** be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- **VUID-vkCmdSetViewportWithCount-viewportCount-03395**
  If the *multiViewport* feature is not enabled, *viewportCount* **must** be 1

- **VUID-vkCmdSetViewportWithCount-viewportCommandBuffer-04819**
  *commandBuffer* **must** not have `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled
Valid Usage (Implicit)

- VUID-vkCmdSetViewportWithCount-commandBuffer-parameter
  \textit{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdSetViewportWithCount-pViewports-parameter
  \textit{pViewports} must be a valid pointer to an array of \textit{viewportCount} valid \texttt{VkViewport} structures

- VUID-vkCmdSetViewportWithCount-commandBuffer-recording
  \textit{commandBuffer} must be in the \textit{recording} state

- VUID-vkCmdSetViewportWithCount-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \textit{commandBuffer} was allocated from must support graphics operations

- VUID-vkCmdSetViewportWithCount-viewportCount-arraylength
  \textit{viewportCount} must be greater than 0

Host Synchronization

- Host access to \textit{commandBuffer} must be externally synchronized
- Host access to the \texttt{VkCommandPool} that \textit{commandBuffer} was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>

<td></td>
</tr>
</tbody>
</table>

To \textit{dynamically set} the scissor count and scissor rectangular bounds, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetScissorWithCount(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

or the equivalent command
// Provided by VK_EXT_extended_dynamic_state

```c
void vkCmdSetScissorWithCountEXT(
    VkCommandBuffer commandBuffer,    // commandBuffer is the command buffer into which the command will be recorded.
    uint32_t scissorCount,            // scissorCount specifies the scissor count.
    const VkRect2D* pScissors);       // pScissors specifies the scissors to use for drawing.
```

• `commandBuffer` is the command buffer into which the command will be recorded.
• `scissorCount` specifies the scissor count.
• `pScissors` specifies the scissors to use for drawing.

This command sets the scissor count and scissor rectangular bounds state for subsequence drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::scissorCount` and `pScissors` values used to create the currently active pipeline.

## Valid Usage

- **VUID-vkCmdSetScissorWithCount-scissorCount-03397**
  
  `scissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive.

- **VUID-vkCmdSetScissorWithCount-scissorCount-03398**
  
  If the `multiViewport` feature is not enabled, `scissorCount` must be 1.

- **VUID-vkCmdSetScissorWithCount-x-03399**
  
  The `x` and `y` members of `offset` member of any element of `pScissors` must be greater than or equal to 0.

- **VUID-vkCmdSetScissorWithCount-offset-03400**
  
  Evaluation of `(offset.x + extent.width)` must not cause a signed integer addition overflow for any element of `pScissors`.

- **VUID-vkCmdSetScissorWithCount-offset-03401**
  
  Evaluation of `(offset.y + extent.height)` must not cause a signed integer addition overflow for any element of `pScissors`.

- **VUID-vkCmdSetScissorWithCount-commandBuffer-04820**
  
  `commandBuffer` must not have `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled.

## Valid Usage (Implicit)

- **VUID-vkCmdSetScissorWithCount-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetScissorWithCount-pScissors-parameter**
  
  `pScissors` must be a valid pointer to an array of `VkRect2D` structures.

- **VUID-vkCmdSetScissorWithCount-commandBuffer-recording**
commandBuffer must be in the recording state

- VUID-vkCmdSetScissorWithCount-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetScissorWithCount-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetScissorWithCount-scissorCount-arraylength
  scissorCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

</tbody>
</table>

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineViewportStateCreateFlags;

VkPipelineViewportStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

A pre-rasterization shader stage can direct each primitive to zero or more viewports. The destination viewports for a primitive are selected by the last active pre-rasterization shader stage that has an output variable decorated with ViewportIndex (selecting a single viewport) or ViewportMaskNV (selecting multiple viewports). The viewport transform uses the viewport corresponding to either the value assigned to ViewportIndex or one of the bits set in ViewportMaskNV, and taken from an implementation-dependent vertex of each primitive. If ViewportIndex or any of the bits in ViewportMaskNV are outside the range zero to viewportCount minus one for a primitive, or if the last active pre-rasterization shader stage did not assign a value to either ViewportIndex or ViewportMaskNV for all vertices of a primitive due to flow control, the values resulting from the viewport transformation of the vertices of such primitives are undefined. If the last pre-rasterization shader stage does not have an output decorated with ViewportIndex or ViewportMaskNV, the viewport numbered zero is used by the viewport transformation.

A single vertex can be used in more than one individual primitive, in primitives such as
VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP. In this case, the viewport transformation is applied separately for each primitive.

To **dynamically set** the viewport transformation parameters, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetViewport(
    VkCommandBuffer commandBuffer,
    uint32_t firstViewport,
    uint32_t viewportCount,
    const VkViewport* pViewports);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **firstViewport** is the index of the first viewport whose parameters are updated by the command.
- **viewportCount** is the number of viewports whose parameters are updated by the command.
- **pViewports** is a pointer to an array of `VkViewport` structures specifying viewport parameters.

This command sets the viewport transformation parameters state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportStateCreateInfo::pViewports` values used to create the currently active pipeline.

The viewport parameters taken from element i of `pViewports` replace the current state for the viewport index `firstViewport + i`, for i in [0, `viewportCount`).

### Valid Usage

- **VUID-vkCmdSetViewport-firstViewport-01223**
  The sum of `firstViewport` and `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive.

- **VUID-vkCmdSetViewport-firstViewport-01224**
  If the multiViewport feature is not enabled, `firstViewport` must be 0.

- **VUID-vkCmdSetViewport-viewportCount-01225**
  If the multiViewport feature is not enabled, `viewportCount` must be 1.

- **VUID-vkCmdSetViewport-commandBuffer-04821**
  `commandBuffer` must not have `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled.

### Valid Usage (Implicit)

- **VUID-vkCmdSetViewport-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetViewport-pViewports-parameter**
  `pViewports` must be a valid pointer to an array of `viewportCount` valid `VkViewport`
structures

- **VUID-vkCmdSetViewport-commandBuffer-recording**
  commandBuffer must be in the recording state

- **VUID-vkCmdSetViewport-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- **VUID-vkCmdSetViewport-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdSetViewport-viewportCount-arraylength**
  viewportCount must be greater than 0

---

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

<table>

<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Both VkPipelineViewportStateCreateInfo and vkCmdSetViewport use VkViewport to set the viewport transformation parameters.

The VkViewport structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkViewport {
    float x;
    float y;
    float width;
    float height;
    float minDepth;
    float maxDepth;
} VkViewport;
```

- x and y are the viewport's upper left corner (x,y).
- width and height are the viewport's width and height, respectively.
- \texttt{minDepth} and \texttt{maxDepth} are the depth range for the viewport.

\begin{itemize}
  \item \textit{Note} \hfill \textbf{1837}
  
  Despite their names, \texttt{minDepth} \textbf{can} be less than, equal to, or greater than \texttt{maxDepth}.
\end{itemize}

The framebuffer depth coordinate \( z_f \) \textbf{may} be represented using either a fixed-point or floating-point representation. However, a floating-point representation \textbf{must} be used if the depth/stencil attachment has a floating-point depth component. If an \( m \)-bit fixed-point representation is used, we assume that it represents each value \( \frac{k}{2^m - 1} \), where \( k \in \{0, 1, \ldots, 2^m - 1\} \), as \( k \) (e.g. 1.0 is represented in binary as a string of all ones).

The viewport parameters shown in the above equations are found from these values as

\[ o_x = x + \text{width} / 2 \]
\[ o_y = y + \text{height} / 2 \]
\[ o_z = \minDepth \text{ (or } (\maxDepth + \minDepth) / 2 \text{ if } \text{VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne is VK_TRUE) } \]
\[ p_x = \text{width} \]
\[ p_y = \text{height} \]
\[ p_z = \maxDepth - \minDepth \text{ (or } (\maxDepth - \minDepth) / 2 \text{ if } \text{VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne is VK_TRUE) } \]

If a render pass transform is enabled, the values \((p_x, p_y)\) and \((o_x, o_z)\) defining the viewport are transformed as described in \textbf{render pass transform} before participating in the viewport transform.

The application \textbf{can} specify a negative term for \texttt{height}, which has the effect of negating the \( y \) coordinate in clip space before performing the transform. When using a negative \texttt{height}, the application \textbf{should} also adjust the \( y \) value to point to the lower left corner of the viewport instead of the upper left corner. Using the negative \texttt{height} allows the application to avoid having to negate the \( y \) component of the \texttt{Position} output from the last \textbf{pre-rasterization shader stage}.

The width and height of the \textbf{implementation-dependent maximum viewport dimensions} \textbf{must} be greater than or equal to the width and height of the largest image which \textbf{can} be created and attached to a framebuffer.

The floating-point viewport bounds are represented with an \textbf{implementation-dependent precision}.
Valid Usage

- VUID-VkViewport-width-01770
  \textit{width must} be greater than \texttt{0.0}

- VUID-VkViewport-width-01771
  \textit{width must} be less than or equal to \texttt{VkPhysicalDeviceLimits::maxViewportDimensions[0]}

- VUID-VkViewport-height-01773
  The absolute value of \textit{height must} be less than or equal to \texttt{VkPhysicalDeviceLimits::maxViewportDimensions[1]}

- VUID-VkViewport-x-01774
  \textit{x must} be greater than or equal to \texttt{viewportBoundsRange[0]}

- VUID-VkViewport-x-01232
  \textit{(x + width) must} be less than or equal to \texttt{viewportBoundsRange[1]}

- VUID-VkViewport-y-01775
  \textit{y must} be greater than or equal to \texttt{viewportBoundsRange[0]}

- VUID-VkViewport-y-01776
  \textit{y must} be less than or equal to \texttt{viewportBoundsRange[1]}

- VUID-VkViewport-y-01777
  \textit{(y + height) must} be greater than or equal to \texttt{viewportBoundsRange[0]}

- VUID-VkViewport-y-01233
  \textit{(y + height) must} be less than or equal to \texttt{viewportBoundsRange[1]}

- VUID-VkViewport-minDepth-01234
  Unless \texttt{VK_EXT_depth_range_unrestricted} extension is enabled \textit{minDepth must} be between \texttt{0.0} and \texttt{1.0}, inclusive

- VUID-VkViewport-maxDepth-01235
  Unless \texttt{VK_EXT_depth_range_unrestricted} extension is enabled \textit{maxDepth must} be between \texttt{0.0} and \texttt{1.0}, inclusive
Chapter 27. Rasterization

Rasterization is the process by which a primitive is converted to a two-dimensional image. Each discrete location of this image contains associated data such as depth, color, or other attributes.

Rasterizing a primitive begins by determining which squares of an integer grid in framebuffer coordinates are occupied by the primitive, and assigning one or more depth values to each such square. This process is described below for points, lines, and polygons.

A grid square, including its (x,y) framebuffer coordinates, z (depth), and associated data added by fragment shaders, is called a fragment. A fragment is located by its upper left corner, which lies on integer grid coordinates.

Rasterization operations also refer to a fragment’s sample locations, which are offset by fractional values from its upper left corner. The rasterization rules for points, lines, and triangles involve testing whether each sample location is inside the primitive. Fragments need not actually be square, and rasterization rules are not affected by the aspect ratio of fragments. Display of non-square grids, however, will cause rasterized points and line segments to appear fatter in one direction than the other.

We assume that fragments are square, since it simplifies antialiasing and texturing. After rasterization, fragments are processed by fragment operations.

Several factors affect rasterization, including the members of VkPipelineRasterizationStateCreateInfo and VkPipelineMultisampleStateCreateInfo.

The VkPipelineRasterizationStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineRasterizationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateCreateFlags flags;
    VkBool32 depthClampEnable;
    VkBool32 rasterizerDiscardEnable;
    VkPolygonMode polygonMode;
    VkCullModeFlags cullMode;
    VkFrontFace frontFace;
    float depthBiasConstantFactor;
    float depthBiasClamp;
    float depthBiasSlopeFactor;
    float lineWidth;
} VkPipelineRasterizationStateCreateInfo;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
• **depthClampEnable** controls whether to clamp the fragment's depth values as described in Depth Test. If the pipeline is not created with VkPipelineRasterizationDepthClipStateCreateInfoEXT present then enabling depth clamp will also disable clipping primitives to the z planes of the frustrum as described in Primitive Clipping. Otherwise depth clipping is controlled by the state set in VkPipelineRasterizationDepthClipStateCreateInfoEXT.

• **rasterizerDiscardEnable** controls whether primitives are discarded immediately before the rasterization stage.

• **polygonMode** is the triangle rendering mode. See VkPolygonMode.

• **cullMode** is the triangle facing direction used for primitive culling. See VkCullModeFlagBits.

• **frontFace** is a VkFrontFace value specifying the front-facing triangle orientation to be used for culling.

• **depthBiasEnable** controls whether to bias fragment depth values.

• **depthBiasConstantFactor** is a scalar factor controlling the constant depth value added to each fragment.

• **depthBiasClamp** is the maximum (or minimum) depth bias of a fragment.

• **depthBiasSlopeFactor** is a scalar factor applied to a fragment's slope in depth bias calculations.

• **lineWidth** is the width of rasterized line segments.

The application can also add a VkPipelineRasterizationStateRasterizationOrderAMD structure to the pNext chain of a VkPipelineRasterizationStateCreateInfo structure. This structure enables selecting the rasterization order to use when rendering with the corresponding graphics pipeline as described in Rasterization Order.

---

**Valid Usage**

- VUID-VkPipelineRasterizationStateCreateInfo-depthClampEnable-00782
  If the depthClamp feature is not enabled, depthClampEnable must be VK_FALSE

- VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01507
  If the fillModeNonSolid feature is not enabled, polygonMode must be VK_POLYGON_MODE_FILL or VK_POLYGON_MODE_FILL_RECTANGLE_NV

- VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01414
  If the VK_NV_fill_rectangle extension is not enabled, polygonMode must not be VK_POLYGON_MODE_FILL_RECTANGLE_NV

- VUID-VkPipelineRasterizationStateCreateInfo-pointPolygons-04458
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::pointPolygons is VK_FALSE, and rasterizerDiscardEnable is VK_FALSE, polygonMode must not be VK_POLYGON_MODE_POINT

---

**Valid Usage (Implicit)**

- VUID-VkPipelineRasterizationStateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO

---

1840
Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineRasterizationConservativeStateCreateInfoEXT`, `VkPipelineRasterizationDepthClipStateCreateInfoEXT`, `VkPipelineRasterizationLineStateCreateInfoEXT`, `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT`, `VkPipelineRasterizationStateRasterizationOrderAMD`, or `VkPipelineRasterizationStateStreamCreateInfoEXT`.

The `sType` value of each struct in the `pNext` chain must be unique.

`flags` must be 0.

`polygonMode` must be a valid `VkPolygonMode` value.

`cullMode` must be a valid combination of `VkCullModeFlagBits` values.

`frontFace` must be a valid `VkFrontFace` value.

`VkPipelineRasterizationStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

If the `pNext` chain of `VkPipelineRasterizationStateCreateInfo` includes a `VkPipelineRasterizationDepthClipStateCreateInfoEXT` structure, then that structure controls whether depth clipping is enabled or disabled.

The `VkPipelineRasterizationDepthClipStateCreateInfoEXT` structure is defined as:

```c
typedef VkFlags VkPipelineRasterizationStateCreateFlags;

typedef struct VkPipelineRasterizationDepthClipStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationDepthClipStateCreateFlagsEXT flags;
    VkBool32 depthClipEnable;
} VkPipelineRasterizationDepthClipStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- **depthClipEnable** controls whether depth clipping is enabled as described in *Primitive Clipping*.

### Valid Usage (Implicit)

- VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_DEPTH_CLIP_STATE_CREATE_INFO_EXT`.

- VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-flags-zerobitmask
  
  `flags` must be 0.

```c
// Provided by VK_EXT_depth_clip_enable
typedef VkFlags VkPipelineRasterizationDepthClipStateCreateFlagsEXT;
```

**VkPipelineRasterizationDepthClipStateCreateFlagsEXT** is a bitmask type for setting a mask, but is currently reserved for future use.

The **VkPipelineMultisampleStateCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineMultisampleStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineMultisampleStateCreateFlags flags;
    VkSampleCountFlagBits rasterizationSamples;
    VkBool32 sampleShadingEnable;
    float minSampleShading;
    const VkSampleMask* pSampleMask;
    VkBool32 alphaToCoverageEnable;
    VkBool32 alphaToOneEnable;
} VkPipelineMultisampleStateCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **rasterizationSamples** is a **VkSampleCountFlagBits** value specifying the number of samples used in rasterization.
- **sampleShadingEnable** can be used to enable *Sample Shading*.
- **minSampleShading** specifies a minimum fraction of sample shading if **sampleShadingEnable** is set to **VK_TRUE**.
- **pSampleMask** is a pointer to an array of **VkSampleMask** values used in the **sample mask test**.
- **alphaToCoverageEnable** controls whether a temporary coverage value is generated based on the alpha component of the fragment's first color output as specified in the *Multisample Coverage* section.
• **alphaToOneEnable** controls whether the alpha component of the fragment's first color output is replaced with one as described in Multisample Coverage.

Each bit in the sample mask is associated with a unique sample index as defined for the coverage mask. Each bit \( b \) for mask word \( w \) in the sample mask corresponds to sample index \( i \), where \( i = 32 \times w + b \).

\[ p_{\text{SampleMask}} \] has a length equal to \( \left\lceil \frac{rasterizationSamples}{32} \right\rceil \) words.

If \( p_{\text{SampleMask}} \) is NULL, it is treated as if the mask has all bits set to 1.

### Valid Usage

- **VUID-VkPipelineMultisampleStateCreateInfo-sampleShadingEnable-00784**
  If the sampleRateShading feature is not enabled, \( \text{sampleShadingEnable} \) must be \( \text{VK_FALSE} \)

- **VUID-VkPipelineMultisampleStateCreateInfo-alphaToOneEnable-00785**
  If the alphaToOne feature is not enabled, \( \text{alphaToOneEnable} \) must be \( \text{VK_FALSE} \)

- **VUID-VkPipelineMultisampleStateCreateInfo-minSampleShading-00786**
  \( \text{minSampleShading} \) must be in the range \([0,1]\)

- **VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-01415**
  If the \( \text{VK_NV_framebuffer_mixed_samples} \) extension is enabled, and if the subpass has any color attachments and \( \text{rasterizationSamples} \) is greater than the number of color samples, then \( \text{sampleShadingEnable} \) must be \( \text{VK_FALSE} \)

### Valid Usage (Implicit)

- **VUID-VkPipelineMultisampleStateCreateInfo-sType-sType**
  \( \text{sType} \) must be \( \text{VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO} \)

- **VUID-VkPipelineMultisampleStateCreateInfo-pNext-pNext**
  Each \( \text{pNext} \) member of any structure (including this one) in the \( \text{pNext} \) chain must be either \( \text{NULL} \) or a pointer to a valid instance of \( \text{VkPipelineCoverageModulationStateCreateInfoNV} \), \( \text{VkPipelineCoverageReductionStateCreateInfoNV} \), \( \text{VkPipelineCoverageToColorStateCreateInfoNV} \), or \( \text{VkPipelineSampleLocationsStateCreateInfoEXT} \)

- **VUID-VkPipelineMultisampleStateCreateInfo-sType-unique**
  The \( \text{sType} \) value of each struct in the \( \text{pNext} \) chain must be unique

- **VUID-VkPipelineMultisampleStateCreateInfo-flags-zeroBitmask**
  \( \text{flags} \) must be 0

- **VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-parameter**
  \( \text{rasterizationSamples} \) must be a valid \( \text{VkSampleCountFlagBits} \) value

- **VUID-VkPipelineMultisampleStateCreateInfo-pSampleMask-parameter**
  If \( p_{\text{SampleMask}} \) is not \( \text{NULL} \), \( p_{\text{SampleMask}} \) must be a valid pointer to an array of \( \left\lfloor \frac{\text{rasterizationSamples}}{32} \right\rfloor \) \( \text{VkSampleMask} \) values
VkPipelineMultisampleStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The elements of the sample mask array are of type VkSampleMask, each representing 32 bits of coverage information:

Rasterization only generates fragments which cover one or more pixels inside the framebuffer. Pixels outside the framebuffer are never considered covered in the fragment. Fragments which would be produced by application of any of the primitive rasterization rules described below but which lie outside the framebuffer are not produced, nor are they processed by any later stage of the pipeline, including any of the fragment operations.

Surviving fragments are processed by fragment shaders. Fragment shaders determine associated data for fragments, and can also modify or replace their assigned depth values.

### 27.1. Discarding Primitives Before Rasterization

Primitives are discarded before rasterization if the rasterizerDiscardEnable member of VkPipelineRasterizationStateCreateInfo is enabled. When enabled, primitives are discarded after they are processed by the last active shader stage in the pipeline before rasterization.

To **dynamically enable** whether primitives are discarded before the rasterization stage, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetRasterizerDiscardEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 rasterizerDiscardEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetRasterizerDiscardEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 rasterizerDiscardEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizerDiscardEnable` controls whether primitives are discarded immediately before the rasterization stage.
This command sets the discard enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::rasterizerDiscardEnable` value used to create the currently active pipeline.

### Valid Usage (Implicit)

- `VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-parameter` 
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- `VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-recording` 
  
  `commandBuffer` must be in the `recording state`

- `VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-cmdpool` 
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- `VUID-vkCmdSetRasterizerDiscardEnable-videocoding` 
  
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>

<td></td>
</tr>
</tbody>
</table>

### 27.2. Controlling the Vertex Stream Used for Rasterization

By default vertex data output from the last `pre-rasterization shader stage` are directed to vertex stream zero. Geometry shaders can emit primitives to multiple independent vertex streams. Each vertex emitted by the geometry shader is directed at one of the vertex streams. As vertices are received on each vertex stream, they are arranged into primitives of the type specified by the geometry shader output primitive type. The shading language instructions `OpEndPrimitive` and `OpEndStreamPrimitive` can be used to end the primitive being assembled on a given vertex stream and start a new empty primitive of the same type. An implementation supports up to
`VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams` streams, which is at least 1. The individual streams are numbered 0 through `maxTransformFeedbackStreams` minus 1. There is no requirement on the order of the streams to which vertices are emitted, and the number of vertices emitted to each vertex stream can be completely independent, subject only to the `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreamDataSize` and `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferDataSize` limits. The primitives output from all vertex streams are passed to the transform feedback stage to be captured to transform feedback buffers in the manner specified by the last pre-rasterization shader stage shader's `XfbBuffer`, `XfbStride`, and `Offsets` decorations on the output interface variables in the graphics pipeline. To use a vertex stream other than zero, or to use multiple streams, the `GeometryStreams` capability must be specified.

By default, the primitives output from vertex stream zero are rasterized. If the implementation supports the `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect` property it is possible to rasterize a vertex stream other than zero.

By default, geometry shaders that emit vertices to multiple vertex streams are limited to using only the `OutputPoints` output primitive type. If the implementation supports the `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackStreamsLinesTriangles` property it is possible to emit `OutputLineStrip` or `OutputTriangleStrip` in addition to `OutputPoints`.

The vertex stream used for rasterization is specified by adding a `VkPipelineRasterizationStateStreamCreateInfoEXT` structure to the `pNext` chain of a `VkPipelineRasterizationStateCreateInfo` structure.

The `VkPipelineRasterizationStateStreamCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_transform_feedback
typedef struct VkPipelineRasterizationStateStreamCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateStreamCreateFlagsEXT flags;
    uint32_t rasterizationStream;
} VkPipelineRasterizationStateStreamCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `rasterizationStream` is the vertex stream selected for rasterization.

If this structure is not present, `rasterizationStream` is assumed to be zero.

### Valid Usage

- `VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-geometryStreams-02324
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams must be enabled`
• VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02325
  rasterizationStream must be less than
  VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams

• VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02326
  rasterizationStream must be zero if
  VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect is VK_FALSE

Valid Usage (Implicit)

• VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_STREAM_CREATE_INFO_EXT

• VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-flags-zerobitmask
  flags must be 0

// Provided by VK_EXT_transform_feedback
typedef VkFlags VkPipelineRasterizationStateStreamCreateFlagsEXT;

VkPipelineRasterizationStateStreamCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

To dynamically set the rasterizationStream state, call:

// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetRasterizationStreamEXT(
  VkCommandBuffer commandBuffer,       // Provided by VK_EXT_transform_feedback
  uint32_t rasterizationStream
);

• commandBuffer is the command buffer into which the command will be recorded.
• rasterizationStream specifies the rasterizationStream state.

This command sets the rasterizationStream state for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream value used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetRasterizationStreamEXT-extendedDynamicState3RasterizationStream-07410
  The extendedDynamicState3RasterizationStream feature must be enabled

• VUID-vkCmdSetRasterizationStreamEXT-transformFeedback-07411
  The transformFeedback feature must be enabled
• VUID-vkCmdSetRasterizationStreamEXT-rasterizationStream-07412
  `rasterizationStream` **must** be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`

• VUID-vkCmdSetRasterizationStreamEXT-rasterizationStream-07413
  `rasterizationStream` **must** be zero if `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect` is `VK_FALSE`

**Valid Usage (Implicit)**

• VUID-vkCmdSetRasterizationStreamEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

• VUID-vkCmdSetRasterizationStreamEXT-commandBuffer-recording
  `commandBuffer` **must** be in the `recording state`

• VUID-vkCmdSetRasterizationStreamEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

• VUID-vkCmdSetRasterizationStreamEXT-videocoding
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

• Host access to `commandBuffer` **must** be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

**Command Properties**

<table>
<thead>
<tr>

</tbody>
</table>

**27.3. Rasterization Order**

Within a subpass of a render pass instance, for a given (x,y,layer,sample) sample location, the following operations are guaranteed to execute in rasterization order, for each separate primitive that includes that sample location:

1. **Fragment operations**, in the order defined
2. **Blending, logic operations**, and color writes
Execution of these operations for each primitive in a subpass occurs in an order determined by the application.

The rasterization order to use for a graphics pipeline is specified by adding a `VkPipelineRasterizationStateRasterizationOrderAMD` structure to the `pNext` chain of a `VkPipelineRasterizationStateCreateInfo` structure.

The `VkPipelineRasterizationStateRasterizationOrderAMD` structure is defined as:

```c
typedef struct VkPipelineRasterizationStateRasterizationOrderAMD {
    VkStructureType sType;
    const void* pNext;
    VkRasterizationOrderAMD rasterizationOrder;
} VkPipelineRasterizationStateRasterizationOrderAMD;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `rasterizationOrder` is a `VkRasterizationOrderAMD` value specifying the primitive rasterization order to use.

### Valid Usage (Implicit)

- VUID-VkPipelineRasterizationStateRasterizationOrderAMD-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_RASTERIZATION_ORDER_AMD`
- VUID-VkPipelineRasterizationStateRasterizationOrderAMD-rasterizationOrder-parameter `rasterizationOrder` must be a valid `VkRasterizationOrderAMD` value

If the `VK_AMD_rasterization_order` device extension is not enabled or the application does not request a particular rasterization order through specifying a `VkPipelineRasterizationStateRasterizationOrderAMD` structure then the rasterization order used by the graphics pipeline defaults to `VK_RASTERIZATION_ORDER_STRICT_AMD`.

Possible values of `VkPipelineRasterizationStateRasterizationOrderAMD::rasterizationOrder`, specifying the primitive rasterization order, are:

```c
typedef enum VkRasterizationOrderAMD {
    VK_RASTERIZATION_ORDER_STRICT_AMD = 0,
    VK_RASTERIZATION_ORDER_RELAXED_AMD = 1,
} VkRasterizationOrderAMD;
```

- `VK_RASTERIZATION_ORDER_STRICT_AMD` specifies that operations for each primitive in a subpass must occur in primitive order.
- `VK_RASTERIZATION_ORDER_RELAXED_AMD` specifies that operations for each primitive in a subpass
may not occur in primitive order.

27.4. Multisampling

Multisampling is a mechanism to antialias all Vulkan primitives: points, lines, and polygons. The technique is to sample all primitives multiple times at each pixel. Each sample in each framebuffer attachment has storage for a color, depth, and/or stencil value, such that per-fragment operations apply to each sample independently. The color sample values can be later resolved to a single color (see Resolving Multisample Images and the Render Pass chapter for more details on how to resolve multisample images to non-multisample images).

Vulkan defines rasterization rules for single-sample modes in a way that is equivalent to a multisample mode with a single sample in the center of each fragment.

Each fragment includes a coverage mask with a single bit for each sample in the fragment, and a number of depth values and associated data for each sample.

It is understood that each pixel has rasterizationSamples locations associated with it. These locations are exact positions, rather than regions or areas, and each is referred to as a sample point. The sample points associated with a pixel must be located inside or on the boundary of the unit square that is considered to bound the pixel. Furthermore, the relative locations of sample points may be identical for each pixel in the framebuffer, or they may differ.

If the render pass has a fragment density map attachment, each fragment only has rasterizationSamples locations associated with it regardless of how many pixels are covered in the fragment area. Fragment sample locations are defined as if the fragment had an area of (1,1) and its sample points must be located within these bounds. Their actual location in the framebuffer is calculated by scaling the sample location by the fragment area. Attachments with storage for multiple samples per pixel are located at the pixel sample locations. Otherwise, the fragment’s sample locations are generally used for evaluation of associated data and fragment operations.

If the current pipeline includes a fragment shader with one or more variables in its interface decorated with Sample and Input, the data associated with those variables will be assigned independently for each sample. The values for each sample must be evaluated at the location of the sample. The data associated with any other variables not decorated with Sample and Input need not be evaluated independently for each sample.

A coverage mask is generated for each fragment, based on which samples within that fragment are determined to be within the area of the primitive that generated the fragment.

Single pixel fragments and multi-pixel fragments defined by a fragment density map have one set of samples. Multi-pixel fragments defined by a shading rate image have one set of samples per pixel. Multi-pixel fragments defined by setting the fragment shading rate have one set of samples per pixel. Each set of samples has a number of samples determined by VkPipelineMultisampleStateCreateInfo::rasterizationSamples. Each sample in a set is assigned a unique sample index i in the range [0, rasterizationSamples).

To dynamically set the rasterizationSamples, call:
void vkCmdSetRasterizationSamplesEXT(
    VkCommandBuffer commandBuffer,
    VkSampleCountFlagBits rasterizationSamples);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizationSamples` specifies `rasterizationSamples`.

This command sets the `rasterizationSamples` for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetRasterizationSamplesEXT-extendedDynamicState3RasterizationSamples-07414
  The `extendedDynamicState3RasterizationSamples` feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetRasterizationSamplesEXT-rasterizationSamples-parameter
  `rasterizationSamples` must be a valid `VkSampleCountFlagBits` value
- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetRasterizationSamplesEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
Each sample in a fragment is also assigned a unique coverage index $j$ in the range $[0, n \times \text{rasterizationSamples})$, where $n$ is the number of sets in the fragment. If the fragment contains a single set of samples, the coverage index is always equal to the sample index. If a shading rate image is used and a fragment covers multiple pixels, the coverage index is determined as defined by VkPipelineViewportCoarseSampleOrderStateCreateInfoNV or vkCmdSetCoarseSampleOrderNV.

If the fragment shading rate is set, the coverage index $j$ is determined as a function of the pixel index $p$, the sample index $i$, and the number of rasterization samples $r$ as:

$$j = i + r \times ((f_w \times f_h) - 1 - p)$$

where the pixel index $p$ is determined as a function of the pixel’s framebuffer location $(x, y)$ and the fragment size $(f_w, f_h)$:

$$p_x = x \% f_w$$

$$p_y = y \% f_h$$

$$p = p_x + (p_y \times f_w)$$

The table below illustrates the pixel index for multi-pixel fragments:

*Table 33. Pixel indices - 1 wide*
Table 34. Pixel indices - 2 wide

<table>
<thead>
<tr>
<th>1x1</th>
<th>1x2</th>
<th>1x4</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="1x1 pixel indices" /></td>
<td><img src="image" alt="1x2 pixel indices" /></td>
<td><img src="image" alt="1x4 pixel indices" /></td>
</tr>
</tbody>
</table>

Table 35. Pixel indices - 4 wide

<table>
<thead>
<tr>
<th>2x1</th>
<th>2x2</th>
<th>2x4</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="2x1 pixel indices" /></td>
<td><img src="image" alt="2x2 pixel indices" /></td>
<td><img src="image" alt="2x4 pixel indices" /></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>4x1</th>
<th>4x2</th>
<th>4x4</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="4x1 pixel indices" /></td>
<td><img src="image" alt="4x2 pixel indices" /></td>
<td><img src="image" alt="4x4 pixel indices" /></td>
</tr>
</tbody>
</table>

The coverage mask includes B bits packed into W words, defined as:

$$B = n \times \text{rasterizationSamples}$$
\[ W = \lceil B/32 \rceil \]

Bit \( b \) in coverage mask word \( w \) is 1 if the sample with coverage index \( j = 32 \times w + b \) is covered, and 0 otherwise.

If the `standardSampleLocations` member of `VkPhysicalDeviceLimits` is `VK_TRUE`, then the sample counts `VK_SAMPLE_COUNT_1_BIT`, `VK_SAMPLE_COUNT_2_BIT`, `VK_SAMPLE_COUNT_4_BIT`, `VK_SAMPLE_COUNT_8_BIT`, and `VK_SAMPLE_COUNT_16_BIT` have sample locations as listed in the following table, with the \( i \)th entry in the table corresponding to sample index \( i \). `VK_SAMPLE_COUNT_32_BIT` and `VK_SAMPLE_COUNT_64_BIT` do not have standard sample locations. Locations are defined relative to an origin in the upper left corner of the fragment.
Table 36. Standard sample locations

</table>

Color images created with multiple samples per pixel use a compression technique where there are
two arrays of data associated with each pixel. The first array contains one element per sample where each element stores an index to the second array defining the fragment mask of the pixel. The second array contains one element per color fragment and each element stores a unique color value in the format of the image. With this compression technique it is not always necessary to actually use unique storage locations for each color sample: when multiple samples share the same color value the fragment mask may have two samples referring to the same color fragment. The number of color fragments is determined by the samples member of the VkImageCreateInfo structure used to create the image. The VK_AMD_shader_fragment_mask device extension provides shader instructions enabling the application to get direct access to the fragment mask and the individual color fragment values.

![Figure 19. Fragment Mask](image)

### 27.5. Custom Sample Locations

Applications can also control the sample locations used for rasterization.

If the pNext chain of the VkPipelineMultisampleStateCreateInfo structure specified at pipeline creation time includes a VkPipelineSampleLocationsStateCreateInfoEXT structure, then that structure controls the sample locations used when rasterizing primitives with the pipeline.

The VkPipelineSampleLocationsStateCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkPipelineSampleLocationsStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 sampleLocationsEnable;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkPipelineSampleLocationsStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `sampleLocationsEnable` controls whether custom sample locations are used. If `sampleLocationsEnable` is VK_FALSE, the default sample locations are used and the values specified in `sampleLocationsInfo` are ignored.
- `sampleLocationsInfo` is the sample locations to use during rasterization if `sampleLocationsEnable` is VK_TRUE and the graphics pipeline is not created with VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT.
Valid Usage (Implicit)

- VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_SAMPLE_LOCATIONS_STATE_CREATE_INFO_EXT`

- VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sampleLocationsInfo-parameter
  `sampleLocationsInfo` must be a valid `VkSampleLocationsInfoEXT` structure

The `VkSampleLocationsInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationsInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSampleCountFlagBits sampleLocationsPerPixel;
    VkExtent2D sampleLocationGridSize;
    uint32_t sampleLocationsCount;
    const VkSampleLocationEXT* pSampleLocations;
} VkSampleLocationsInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `sampleLocationsPerPixel` is a `VkSampleCountFlagBits` value specifying the number of sample locations per pixel.
- `sampleLocationGridSize` is the size of the sample location grid to select custom sample locations for.
- `sampleLocationsCount` is the number of sample locations in `pSampleLocations`.
- `pSampleLocations` is a pointer to an array of `sampleLocationsCount` `VkSampleLocationEXT` structures.

This structure can be used either to specify the sample locations to be used for rendering or to specify the set of sample locations an image subresource has been last rendered with for the purposes of layout transitions of depth/stencil images created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT`.

The sample locations in `pSampleLocations` specify `sampleLocationsPerPixel` number of sample locations for each pixel in the grid of the size specified in `sampleLocationGridSize`. The sample location for sample `i` at the pixel grid location `(x, y)` is taken from `pSampleLocations[(x + y * sampleLocationGridSize.width) * sampleLocationsPerPixel + i].` 

If the render pass has a fragment density map, the implementation will choose the sample locations for the fragment and the contents of `pSampleLocations` may be ignored.
Valid Usage

• VUID-VkSampleLocationsInfoEXT-sampleLocationsPerPixel-01526
  sampleLocationsPerPixel must be a bit value that is set in
  VkPhysicalDeviceSampleLocationsPropertiesEXT::sampleLocationSampleCounts

• VUID-VkSampleLocationsInfoEXT-sampleLocationsCount-01527
  sampleLocationsCount must equal sampleLocationsPerPixel × sampleLocationGridSize.width
  × sampleLocationGridSize.height

Valid Usage (Implicit)

• VUID-VkSampleLocationsInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLE_LOCATIONS_INFO_EXT

• VUID-VkSampleLocationsInfoEXT-pSampleLocations-parameter
  If sampleLocationsCount is not 0, pSampleLocations must be a valid pointer to an array of
  sampleLocationsCount VkSampleLocationEXT structures

The VkSampleLocationEXT structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationEXT {
    float x;
    float y;
} VkSampleLocationEXT;
```

• x is the horizontal coordinate of the sample’s location.

• y is the vertical coordinate of the sample’s location.

The domain space of the sample location coordinates has an upper-left origin within the pixel in framebuffer space.

The values specified in a VkSampleLocationEXT structure are always clamped to the implementation-dependent sample location coordinate range [sampleLocationCoordinateRange[0], sampleLocationCoordinateRange[1]] that can be queried using VkPhysicalDeviceSampleLocationsPropertiesEXT.

To dynamically set the sampleLocationsEnable state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetSampleLocationsEnableEXT(
    VkCommandBuffer commandBuffer, /* commandBuffer is the command buffer into which the command will be recorded. */
    VkBool32 sampleLocationsEnable);
```
• `sampleLocationsEnable` specifies the `sampleLocationsEnable` state.

This command sets the `sampleLocationsEnable` state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetSampleLocationsEnableEXT-extendedDynamicState3SampleLocationsEnable-07415
  The `extendedDynamicState3SampleLocationsEnable` feature must be enabled.

### Valid Usage (Implicit)

- VUID-vkCmdSetSampleLocationsEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdSetSampleLocationsEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state.

- VUID-vkCmdSetSampleLocationsEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdSetSampleLocationsEnableEXT-videocoding
  This command must only be called outside of a video coding scope.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the sample locations used for rasterization, call:
// Provided by VK_EXT_sample_locations
void vkCmdSetSampleLocationsEXT(
    VkCommandBuffer commandBuffer, 
    const VkSampleLocationsInfoEXT* pSampleLocationsInfo);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pSampleLocationsInfo` is the sample locations state to set.

This command sets the custom sample locations for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and when the `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` property of the bound graphics pipeline is `VK_TRUE`. Otherwise, this state is specified by the `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsInfo` values used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetSampleLocationsEXT-variableSampleLocations-01530

  If `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE` then the current render pass must have been begun by specifying a `VkRenderPassSampleLocationsBeginInfoEXT` structure whose `pPostSubpassSampleLocations` member contains an element with a `subpassIndex` matching the current subpass index and the `sampleLocationsInfo` member of that element must match the sample locations state pointed to by `pSampleLocationsInfo`

**Valid Usage (Implicit)**

- VUID-vkCmdSetSampleLocationsEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetSampleLocationsEXT-pSampleLocationsInfo-parameter
  `pSampleLocationsInfo` must be a valid pointer to a valid `VkSampleLocationsInfoEXT` structure

- VUID-vkCmdSetSampleLocationsEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetSampleLocationsEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetSampleLocationsEXT-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

</tbody>
</table>

27.6. Fragment Shading Rates

The features advertised by `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` allow an application to control the shading rate of a given fragment shader invocation.

The fragment shading rate strongly interacts with Multisampling, and the set of available rates for an implementation may be restricted by sample rate.

To query available shading rates, call:

```c
// Provided by VK_KHR_fragment_shading_rate
VkResult vkGetPhysicalDeviceFragmentShadingRatesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pFragmentShadingRateCount,
    VkPhysicalDeviceFragmentShadingRateKHR* pFragmentShadingRates);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pFragmentShadingRateCount` is a pointer to an integer related to the number of fragment shading rates available or queried, as described below.
- `pFragmentShadingRates` is either `NULL` or a pointer to an array of `VkPhysicalDeviceFragmentShadingRateKHR` structures.

If `pFragmentShadingRates` is `NULL`, then the number of fragment shading rates available is returned in `pFragmentShadingRateCount`. Otherwise, `pFragmentShadingRateCount` must point to a variable set by the user to the number of elements in the `pFragmentShadingRates` array, and on return the variable is overwritten with the number of structures actually written to `pFragmentShadingRates`. If `pFragmentShadingRateCount` is less than the number of fragment shading rates available, at most `pFragmentShadingRateCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available fragment shading rates were returned.
The returned array of fragment shading rates **must** be ordered from largest `fragmentSize.width` value to smallest, and each set of fragment shading rates with the same `fragmentSize.width` value **must** be ordered from largest `fragmentSize.height` to smallest. Any two entries in the array **must** not have the same `fragmentSize` values.

For any entry in the array, the following rules also apply:

- The value of `fragmentSize.width` **must** be less than or equal to `maxFragmentSize.width`
- The value of `fragmentSize.width` **must** be greater than or equal to 1
- The value of `fragmentSize.width` **must** be a power-of-two
- The value of `fragmentSize.height` **must** be less than or equal to `maxFragmentSize.height`
- The value of `fragmentSize.height` **must** be greater than or equal to 1
- The value of `fragmentSize.height` **must** be a power-of-two
- The highest sample count in `sampleCounts` **must** be less than or equal to `maxFragmentShadingRateRasterizationSamples`
- The product of `fragmentSize.width`, `fragmentSize.height`, and the highest sample count in `sampleCounts` **must** be less than or equal to `maxFragmentShadingRateCoverageSamples`

Implementations **must** support at least the following shading rates:

<table>
<thead>
<tr>
<th><code>sampleCounts</code></th>
<th><code>fragmentSize</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SAMPLE_COUNT_1_BIT</td>
<td>2,2</td>
</tr>
<tr>
<td>VK_SAMPLE_COUNT_4_BIT</td>
<td>2,1</td>
</tr>
<tr>
<td>~0</td>
<td>1,1</td>
</tr>
</tbody>
</table>

If `framebufferColorSampleCounts` includes `VK_SAMPLE_COUNT_2_BIT`, the required rates **must** also include `VK_SAMPLE_COUNT_2_BIT`.

**Note**

Including the {1,1} fragment size is done for completeness; it has no actual effect on the support of rendering without setting the fragment size. All sample counts and render pass transforms are supported for this rate.

The returned set of fragment shading rates **must** be returned in the native (rotated) coordinate system. For rasterization using render pass transform not equal to `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, the application **must** transform the returned fragment shading rates into the current (unrotated) coordinate system to get the supported rates for that transform.

**Note**

For example, consider an implementation returning support for 4x2, but not 2x4 in the set of supported fragment shading rates. This means that for transforms `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR` and `VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR`, 2x4 is a supported rate, but 4x2 is an
Unsupported rate.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-physicalDevice-parameter
  - **physicalDevice** must be a valid *VkPhysicalDevice* handle
- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRateCount-parameter
  - **pFragmentShadingRateCount** must be a valid pointer to a *uint32_t* value
- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRates-parameter
  - If the value referenced by **pFragmentShadingRateCount** is not 0, and **pFragmentShadingRates** is not NULL, **pFragmentShadingRates** must be a valid pointer to an array of **pFragmentShadingRateCount** *VkPhysicalDeviceFragmentShadingRateKHR* structures

### Return Codes

**Success**
- *VK_SUCCESS*
- *VK_INCOMPLETE*

**Failure**
- *VK_ERROR_OUT_OF_HOST_MEMORY*

The *VkPhysicalDeviceFragmentShadingRateKHR* structure is defined as

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateKHR {
    VkStructureType sType;
    void* pNext;
    VkSampleCountFlags sampleCounts;
    VkExtent2D fragmentSize;
} VkPhysicalDeviceFragmentShadingRateKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **sampleCounts** is a bitmask of sample counts for which the shading rate described by **fragmentSize** is supported.
- **fragmentSize** is a *VkExtent2D* describing the width and height of a supported shading rate.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShadingRateKHR-sType-sType
Fragment shading rates can be set at three points, with the three rates combined to determine the final shading rate.

### 27.6.1. Pipeline Fragment Shading Rate

The pipeline fragment shading rate can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via `vkCmdSetFragmentShadingRateKHR`.

The `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPipelineFragmentShadingRateStateCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExtent2D fragmentSize;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateStateCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `fragmentSize` specifies a `VkExtent2D` structure containing the fragment size used to define the pipeline fragment shading rate for drawing commands using this pipeline.
- `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` value determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure, then that structure includes parameters controlling the pipeline fragment shading rate.

If this structure is not present, `fragmentSize` is considered to be equal to (1,1), and both elements of `combinerOps` are considered to be equal to `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

### Valid Usage (Implicit)

- VUID-VkPipelineFragmentShadingRateStateCreateInfoKHR-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_STATE_CREATE_INFO_KHR`

To dynamically set the pipeline fragment shading rate and combiner operation, call:

```c
// Provided by VK_KHR_fragment_shading_rate
```
```c
void vkCmdSetFragmentShadingRateKHR
    (VkCommandBuffer commandBuffer,
     const VkExtent2D* pFragmentSize,
     const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pFragmentSize` specifies the pipeline fragment shading rate for subsequent drawing commands.
- `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by subsequent drawing commands.

This command sets the pipeline fragment shading rate and combiner operation for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` set in `VkPipelineDynamicStateCreateInfo`'s `pDynamicStates`. Otherwise, this state is specified by the `VkPipelineFragmentShadingRateStateCreateInfoKHR` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04507**
  If `pipelineFragmentShadingRate` is not enabled, `pFragmentSize->width` must be 1
- **VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04508**
  If `pipelineFragmentShadingRate` is not enabled, `pFragmentSize->height` must be 1
- **VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04509**
  One of `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or `attachmentFragmentShadingRate` must be enabled
- **VUID-vkCmdSetFragmentShadingRateKHR-primitiveFragmentShadingRate-04510**
  If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`
- **VUID-vkCmdSetFragmentShadingRateKHR-attachmentFragmentShadingRate-04511**
  If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`
- **VUID-vkCmdSetFragmentShadingRateKHR-fragmentSizeNonTrivialCombinerOps-04512**
  If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps` must be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`
- **VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04513**
  `pFragmentSize->width` must be greater than or equal to 1
- **VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04514**
  `pFragmentSize->height` must be greater than or equal to 1
- **VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04515**
  `pFragmentSize->width` must be a power-of-two value
VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04516
pFragmentSize->height must be a power-of-two value

VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04517
pFragmentSize->width must be less than or equal to 4

VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04518
pFragmentSize->height must be less than or equal to 4

Valid Usage (Implicit)

VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-parameter
pFragmentSize must be a valid pointer to a valid VkExtent2D structure

VUID-vkCmdSetFragmentShadingRateKHR-combinerOps-parameter
Any given element of combinerOps must be a valid VkFragmentShadingRateCombinerOpKHR value

VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-recording
commandBuffer must be in the recording state

VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics operations

VUID-vkCmdSetFragmentShadingRateKHR-videocoding
This command must only be called outside of a video coding scope

Host Synchronization

Host access to commandBuffer must be externally synchronized

Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

27.6.2. Primitive Fragment Shading Rate

The primitive fragment shading rate can be set via the PrimitiveShadingRateKHR built-in in the last
active pre-rasterization shader stage. If the last pre-rasterization shader stage is using the MeshEXT Execution Model, the rate associated with a given primitive is sourced from the value written to the per-primitive PrimitiveShadingRateKHR. Otherwise the rate associated with a given primitive is sourced from the value written to PrimitiveShadingRateKHR by that primitive’s provoking vertex.

### 27.6.3. Attachment Fragment Shading Rate

The attachment shading rate can be set by including VkFragmentShadingRateAttachmentInfoKHR in a subpass to define a fragment shading rate attachment. Each pixel in the framebuffer is assigned an attachment fragment shading rate by the corresponding texel in the fragment shading rate attachment, according to:

\[
x' = \text{floor}(x / \text{region}_x) \\
y' = \text{floor}(y / \text{region}_y)
\]

where \(x'\) and \(y'\) are the coordinates of a texel in the fragment shading rate attachment, \(x\) and \(y\) are the coordinates of the pixel in the framebuffer, and \(\text{region}_x\) and \(\text{region}_y\) are the size of the region each texel corresponds to, as defined by the shadingRateAttachmentTexelSize member of VkFragmentShadingRateAttachmentInfoKHR.

If multiview is enabled and the shading rate attachment has multiple layers, the shading rate attachment texel is selected from the layer determined by the ViewIndex built-in. If multiview is disabled, and both the shading rate attachment and the framebuffer have multiple layers, the shading rate attachment texel is selected from the layer determined by the Layer built-in. Otherwise, the texel is unconditionally selected from the first layer of the attachment.

The fragment size is encoded into the first component of the identified texel as follows:

\[
\text{size}_w = 2^{((\text{texel}/4)\%3)} \\
\text{size}_h = 2^{(\text{texel}/3)}
\]

where texel is the value in the first component of the identified texel, and \(\text{size}_w\) and \(\text{size}_h\) are the width and height of the fragment size, decoded from the texel.

If no fragment shading rate attachment is specified, this size is calculated as \(\text{size}_w = \text{size}_h = 1\). Applications must not specify a width or height greater than 4 by this method.

The Fragment Shading Rate enumeration in SPIR-V adheres to the above encoding.

### 27.6.4. Combining the Fragment Shading Rates

The final rate \(C_{xy}'\) used for fragment shading must be one of the rates returned by vkGetPhysicalDeviceFragmentShadingRatesKHR for the sample count and render pass transform
used by rasterization.

If any of the following conditions are met, \( C_{xy} \) must be set to \( \{1,1\} \):

- If Sample Shading is enabled.
- The \texttt{fragmentShadingRateWithSampleMask} limit is not supported, and \texttt{VkPipelineMultisampleStateCreateInfo::pSampleMask} contains a zero value in any bit used by fragment operations.
- The \texttt{fragmentShadingRateWithShaderSampleMask} is not supported, and the fragment shader has \texttt{SampleMask} in the input or output interface.
- The \texttt{fragmentShadingRateWithShaderDepthStencilWrites} limit is not supported, and the fragment shader declares the \texttt{FragDepth} or \texttt{FragStencilRefEXT} built-in.
- The \texttt{fragmentShadingRateWithConservativeRasterization} limit is not supported, and \texttt{VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode} is not \texttt{VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT}.
- The \texttt{fragmentShadingRateWithFragmentShaderInterlock} limit is not supported, and the fragment shader declares any of the fragment shader interlock execution modes.
- The \texttt{fragmentShadingRateWithCustomSampleLocations} limit is not supported, and \texttt{VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable} is \texttt{VK_TRUE}.

Otherwise, each of the specified shading rates are combined and then used to derive the value of \( C_{xy} \). As there are three ways to specify shading rates, two combiner operations are specified - between the pipeline and primitive shading rates, and between the result of that and the attachment shading rate.

The equation used for each combiner operation is defined by \texttt{VkFragmentShadingRateCombinerOpKHR}:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef enum VkFragmentShadingRateCombinerOpKHR {
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR = 0,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR = 1,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR = 2,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR = 3,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR = 4,
} VkFragmentShadingRateCombinerOpKHR;
```

- \texttt{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR} specifies a combiner operation of combine(\( A_{xy} \), \( B_{xy} \)) = \( A_{xy} \).
- \texttt{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR} specifies a combiner operation of combine(\( A_{xy}, B_{xy} \)) = \( B_{xy} \).
- \texttt{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR} specifies a combiner operation of combine(\( A_{xy}, B_{xy} \)) = \text{min}(A_{xy}, B_{xy})
- \texttt{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR} specifies a combiner operation of combine(\( A_{xy}, B_{xy} \)) = \text{max}(A_{xy}, B_{xy})
VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR specifies a combiner operation of 
\( \text{combine}(A_{xy}, B_{xy}) = A_{xy} \times B_{xy} \).

where combine\((A_{xy}, B_{xy})\) is the combine operation, and \(A_{xy}\) and \(B_{xy}\) are the inputs to the operation.

If \(\text{fragmentShadingRateStrictMultiplyCombiner} = \text{VK_FALSE}\), using 
VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR with values of 1 for both \(A\) and \(B\) in the same dimension results in the value 2 being produced for that dimension. See the definition of \(\text{fragmentShadingRateStrictMultiplyCombiner}\) for more information.

These operations are performed in a component-wise fashion.

This is used to generate a combined fragment area using the equation:

\[
C_{xy} = \text{combine}(A_{xy}, B_{xy})
\]

where \(C_{xy}\) is the combined fragment area result, and \(A_{xy}\) and \(B_{xy}\) are the fragment areas of the fragment shading rates being combined.

Two combine operations are performed, first with \(A_{xy}\) equal to the pipeline fragment shading rate and \(B_{xy}\) equal to the primitive fragment shading rate, with the combine() operation selected by combinerOps[0]. A second combination is then performed, with \(A_{xy}\) equal to the result of the first combination and \(B_{xy}\) equal to the attachment fragment shading rate, with the combine() operation selected by combinerOps[1]. The result of the second combination is used as the final fragment shading rate, reported via the ShadingRateKHR built-in.

Implementations may clamp the \(C_{xy}\) result of each combiner operation separately, or only after the second combiner operation.

If the final combined rate is one of the rates returned by 
vkGetPhysicalDeviceFragmentShadingRatesKHR for the sample count and render pass transform used by rasterization, \(C'_{xy} = C_{xy}\). Otherwise, \(C'_{xy}\) is selected from the rates returned by 
vkGetPhysicalDeviceFragmentShadingRatesKHR for the sample count and render pass transform used by rasterization. From this list of supported rates, the following steps are applied in order, to select a single value:

1. Keep only rates where \(C'_x \leq C_x\) and \(C'_y \leq C_y\).
   - Implementations may also keep rates where \(C'_x \leq C_y\) and \(C'_y \leq C_x\).
2. Keep only rates with the highest area \((C'_x \times C'_y)\).
3. Keep only rates with the lowest aspect ratio \((C'_x + C'_y)\).
4. In cases where a wide (e.g. 4x1) and tall (e.g. 1x4) rate remain, the implementation may choose either rate. However, it must choose this rate consistently for the same shading rates, render pass transform, and combiner operations for the lifetime of the VkDevice.

27.6.5. Extended Fragment Shading Rates

The features advertised by VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV provide
support for additional fragment shading rates beyond those specifying one fragment shader invocation covering all pixels in a fragment whose size is indicated by the fragment shading rate.

If the `FragmentShadingRateEnums` feature is enabled, fragment shading rates may be specified using the `VkFragmentShadingRateNV` enumerated type defined as:

```c
// Provided by VK_NV_fragment_shading_rate_enums
typedef enum VkFragmentShadingRateNV {
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV = 0,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_1X2_PIXELS_NV = 1,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X1_PIXELS_NV = 4,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X2_PIXELS_NV = 5,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X4_PIXELS_NV = 6,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X2_PIXELS_NV = 9,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X4_PIXELS_NV = 10,
    VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV = 11,
    VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV = 12,
    VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV = 13,
    VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV = 14,
    VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV = 15,
} VkFragmentShadingRateNV;
```

- `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV` specifies a fragment size of 1x1 pixels.
- `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_1X2_PIXELS_NV` specifies a fragment size of 1x2 pixels.
- `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X1_PIXELS_NV` specifies a fragment size of 2x1 pixels.
- `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X2_PIXELS_NV` specifies a fragment size of 2x2 pixels.
- `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X4_PIXELS_NV` specifies a fragment size of 2x4 pixels.
- `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X2_PIXELS_NV` specifies a fragment size of 4x2 pixels.
- `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X4_PIXELS_NV` specifies a fragment size of 4x4 pixels.
- `VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV` specifies a fragment size of 1x1 pixels, with two fragment shader invocations per fragment.
- `VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV` specifies a fragment size of 1x1 pixels, with four fragment shader invocations per fragment.
- `VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV` specifies a fragment size of 1x1 pixels, with eight fragment shader invocations per fragment.
- `VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV` specifies a fragment size of 1x1 pixels, with sixteen fragment shader invocations per fragment.
- `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV` specifies that any portions of a primitive that use
that shading rate should be discarded without invoking any fragment shader.

To use the shading rates 
VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV, 
VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV, 
VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV, 
and 
VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV as a pipeline, primitive, or attachment shading rate, the supersampleFragmentShadingRates feature must be enabled. To use the shading rate 
VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV as a pipeline, primitive, or attachment shading rate, the noInvocationFragmentShadingRates feature must be enabled.

When using fragment shading rate enums, the pipeline fragment shading rate can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via vkCmdSetFragmentShadingRateEnumNV.

The VkPipelineFragmentShadingRateEnumStateCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_fragment_shading_rate Enums
typedef struct VkPipelineFragmentShadingRateEnumStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkFragmentShadingRateTypeNV shadingRateType;
    VkFragmentShadingRateNV shadingRate;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateEnumStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `shadingRateType` specifies a VkFragmentShadingRateTypeNV value indicating whether fragment shading rates are specified using fragment sizes or VkFragmentShadingRateNV enums.
- `shadingRate` specifies a VkFragmentShadingRateNV value indicating the pipeline fragment shading rate.
- `combinerOps` specifies VkFragmentShadingRateCombinerOpKHR values determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the `pNext` chain of VkGraphicsPipelineCreateInfo includes a VkPipelineFragmentShadingRateEnumStateCreateInfoNV structure, then that structure includes parameters controlling the pipeline fragment shading rate.

If this structure is not present, `shadingRateType` is considered to be equal to VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV, `shadingRate` is considered to be equal to VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV, and both elements of `combinerOps` are considered to be equal to VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR.

Valid Usage (Implicit)

- VUID-VkPipelineFragmentShadingRateEnumStateCreateInfoNV-sType-sType
The **VkFragmentShadingRateTypeNV** enumerated type specifies whether a graphics pipeline gets its pipeline fragment shading rates and combiners from the **VkPipelineFragmentShadingRateEnumStateCreateInfoNV** structure or the **VkPipelineFragmentShadingRateStateCreateInfoKHR** structure.

```c
// Provided by VK_NV_fragment_shading_rate_enums
typedef enum VkFragmentShadingRateTypeNV {
    VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV = 0,
    VK_FRAGMENT_SHADING_RATE_TYPE_ENUMS_NV = 1,
} VkFragmentShadingRateTypeNV;
```

- **VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV** specifies that a graphics pipeline should obtain its pipeline fragment shading rate and shading rate combiner state from the **VkPipelineFragmentShadingRateStateCreateInfoKHR** structure and that any state specified by the **VkPipelineFragmentShadingRateEnumStateCreateInfoNV** structure should be ignored.

- **VK_FRAGMENT_SHADING_RATE_TYPE_ENUMS_NV** specifies that a graphics pipeline should obtain its pipeline fragment shading rate and shading rate combiner state from the **VkPipelineFragmentShadingRateEnumStateCreateInfoNV** structure and that any state specified by the **VkPipelineFragmentShadingRateStateCreateInfoKHR** structure should be ignored.

To dynamically set the pipeline fragment shading rate and combiner operation, call:

```c
// Provided by VK_NV_fragment_shading_rate_enums
void vkCmdSetFragmentShadingRateEnumNV(
    VkCommandBuffer commandBuffer,
    VkFragmentShadingRateNV shadingRate,
    const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);
```

- **commandBuffer** is the command buffer into which the command will be recorded.

- **shadingRate** specifies a **VkFragmentShadingRateNV** enum indicating the pipeline fragment shading rate for subsequent drawing commands.

- **combinerOps** specifies a **VkFragmentShadingRateCombinerOpKHR** determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by subsequent drawing commands.

This command sets the pipeline fragment shading rate and combiner operation for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineFragmentShadingRateEnumStateCreateInfoNV** values used to create the currently active pipeline.
Note
This command allows specifying additional shading rates beyond those supported by `vkCmdSetFragmentShadingRateKHR`. For more information, refer to the `VK_NV_fragment_shading_rate Enums` appendix.

Valid Usage

• **VUID-vkCmdSetFragmentShadingRateEnumNV-pipelineFragmentShadingRate-04576**
  If `pipelineFragmentShadingRate` is not enabled, `shadingRate` must be `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV`.

• **VUID-vkCmdSetFragmentShadingRateEnumNV-supersampleFragmentShadingRates-04577**
  If `supersampleFragmentShadingRates` is not enabled, `shadingRate` must not be `VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV`, `VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV`, `VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV`, or `VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV`.

• **VUID-vkCmdSetFragmentShadingRateEnumNV-noInvocationFragmentShadingRates-04578**
  If `noInvocationFragmentShadingRates` is not enabled, `shadingRate` must not be `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`.

• **VUID-vkCmdSetFragmentShadingRateEnumNV-fragmentShadingRate Enums-04579**
  The `fragmentShadingRate Enums` feature must be enabled.

• **VUID-vkCmdSetFragmentShadingRateEnumNV-pipelineFragmentShadingRate-04580**
  One of the `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or `attachmentFragmentShadingRate` features must be enabled.

• **VUID-vkCmdSetFragmentShadingRateEnumNV-primitiveFragmentShadingRate-04581**
  If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

• **VUID-vkCmdSetFragmentShadingRateEnumNV-attachmentFragmentShadingRate-04582**
  If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

• **VUID-vkCmdSetFragmentShadingRateEnumNV-fragmentSizeNonTrivialCombinerOps-04583**
  If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps` must be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`.

Valid Usage (Implicit)

• **VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.
• VUID-vkCmdSetFragmentShadingRateEnumNV-shadingRate-parameter
  shadingRate must be a valid VkFragmentShadingRateNV value

• VUID-vkCmdSetFragmentShadingRateEnumNV-combinerOps-parameter
  Any given element of combinerOps must be a valid
  VkFragmentShadingRateCombinerOpKHR value

• VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics
  operations

• VUID-vkCmdSetFragmentShadingRateEnumNV-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally
  synchronized

When the supersampleFragmentShadingRates or noInvocationFragmentShadingRates features are enabled, the behavior of the shading rate combiner operations is extended to support the shading rates enabled by those features. Primitive and attachment shading rate values are interpreted as VkFragmentShadingRateNV values and the behavior of the combiners is modified as follows:

• For VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR, and
  VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR, if either A_{xy} or B_{xy} is
  VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV, combine(A_{xy},B_{xy}) produces a shading rate of
  VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV, regardless of the other input shading rate.

• For VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR, combine(A_{xy},B_{xy}) produces a shading rate
  whose fragment size is the smaller of the fragment sizes of A_{xy} and B_{xy} and whose invocation
  count is the larger of the invocation counts of A_{xy} and B_{xy}.

• For VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR, combine(A_{xy},B_{xy}) produces a shading rate
  whose fragment size is the larger of the fragment sizes of A_{xy} and B_{xy} and whose invocation
  count is the smaller of the invocation counts of A_{xy} and B_{xy}.
• For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR`, combine($A_{xy}, B_{xy}$) produces a shading rate whose fragment size and invocation count is the product of the fragment sizes and invocation counts, respectively, of $A_{xy}$ and $B_{xy}$. If the resulting shading rate has both multiple pixels and multiple invocations per fragment, an implementation may adjust the shading rate by reducing both the pixel and invocation counts.

If the final shading rate from the combiners is `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`, no fragments will be generated for any portion of a primitive using that shading rate.

If the final shading rate from the combiners specifies multiple fragment shader invocations per fragment, the fragment will be processed with multiple unique samples as in sample shading, where the total number the total number of invocations is taken from the shading rate and then clamped to `rasterizationSamples` and `maxFragmentShadingRateInvocationCount`.

### 27.7. Shading Rate Image

The `shadingRateImage` feature allows pipelines to use a shading rate image to control the fragment area and the minimum number of fragment shader invocations launched for each fragment. When the shading rate image is enabled, the rasterizer determines a base shading rate for each region of the framebuffer covered by a primitive by fetching a value from the shading rate image and translating it to a shading rate using a per-viewport shading rate palette. This base shading rate is then adjusted to derive a final shading rate. The final shading rate specifies the fragment area and fragment shader invocation count to use for fragments generated in the region.

If the `pNext` chain of `VkPipelineViewportStateCreateInfo` includes a `VkPipelineViewportShadingRateImageStateCreateInfoNV` structure, then that structure includes parameters controlling the shading rate.

The `VkPipelineViewportShadingRateImageStateCreateInfoNV` structure is defined as:

```c
typedef struct VkPipelineViewportShadingRateImageStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 shadingRateImageEnable;
    uint32_t viewportCount;
    const VkShadingRatePaletteNV* pShadingRatePalettes;
} VkPipelineViewportShadingRateImageStateCreateInfoNV;
```

• `sType` is the type of this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `shadingRateImageEnable` specifies whether shading rate image and palettes are used during rasterization.

• `viewportCount` specifies the number of per-viewport palettes used to translate values stored in shading rate images.

• `pShadingRatePalettes` is a pointer to an array of `VkShadingRatePaletteNV` structures defining the
palette for each viewport. If the shading rate palette state is dynamic, this member is ignored.

If this structure is not present, shadingRateImageEnable is considered to be VK_FALSE, and the shading rate image and palettes are not used.

Valid Usage

- VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-viewportCount-02054
  If the multiViewport feature is not enabled, viewportCount must be 0 or 1

- VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-viewportCount-02055
  viewportCount must be less than or equal to VkPhysicalDeviceLimits::maxViewports

- VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-shadingRateImageEnable-02056
  If shadingRateImageEnable is VK_TRUE, viewportCount must be greater or equal to the viewportCount member of VkPipelineViewportStateCreateInfo

Valid Usage (Implicit)

- VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_SHADING_RATE_IMAGE_STATE_CREATE_INFO_NV

When shading rate image usage is enabled in the bound pipeline, the pipeline uses a shading rate image specified by the command:

```c
// Provided by VK_NV_shading_rate_image
void vkCmdBindShadingRateImageNV(
    VkCommandBuffer commandBuffer,
    VkImageView imageView,
    VkImageLayout imageLayout);
```

- commandBuffer is the command buffer into which the command will be recorded.
- imageView is an image view handle specifying the shading rate image. imageView may be set to VK_NULL_HANDLE, which is equivalent to specifying a view of an image filled with zero values.
- imageLayout is the layout that the image subresources accessible from imageView will be in when the shading rate image is accessed.

Valid Usage

- VUID-vkCmdBindShadingRateImageNV-None-02058
  The shadingRateImage feature must be enabled

- VUID-vkCmdBindShadingRateImageNV-imageView-02059
  If imageView is not VK_NULL_HANDLE, it must be a valid VkImageView handle of type
**VK_IMAGE_VIEW_TYPE_2D** or **VK_IMAGE_VIEW_TYPE_2D_ARRAY**

- VUID-vkCmdBindShadingRateImageNV-imageView-02060
  If `imageView` is not `VK_NULL_HANDLE`, it must have a format of `VK_FORMAT_R8_UINT`

- VUID-vkCmdBindShadingRateImageNV-imageView-02061
  If `imageView` is not `VK_NULL_HANDLE`, it must have been created with a usage value including `VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV`

- VUID-vkCmdBindShadingRateImageNV-imageView-02062
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must match the actual `VkImageLayout` of each subresource accessible from `imageView` at the time the subresource is accessed

- VUID-vkCmdBindShadingRateImageNV-imageView-02063
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must be `VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV` or `VK_IMAGE_LAYOUT_GENERAL`

**Valid Usage (Implicit)**

- VUID-vkCmdBindShadingRateImageNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindShadingRateImageNV-imageView-parameter
  If `imageView` is not `VK_NULL_HANDLE`, `imageView` must be a valid `VkImageView` handle

- VUID-vkCmdBindShadingRateImageNV-imageLayout-parameter
  `imageLayout` must be a valid `VkImageLayout` value

- VUID-vkCmdBindShadingRateImageNV-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdBindShadingRateImageNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdBindShadingRateImageNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBindShadingRateImageNV-commonparent
  Both of `commandBuffer`, and `imageView` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
When the shading rate image is enabled in the current pipeline, rasterizing a primitive covering the pixel with coordinates \((x, y)\) will fetch a shading rate index value from the shading rate image bound by `vkCmdBindShadingRateImageNV`. If the shading rate image view has a type of `VK_IMAGE_VIEW_TYPE_2D`, the lookup will use texel coordinates \((u, v)\) where \(u = \frac{x}{\text{twidth}}, \ v = \frac{y}{\text{theight}}\), and \text{twidth} and \text{theight} are the width and height of the implementation-dependent shading rate texel size. If the shading rate image view has a type of `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, the lookup will use texel coordinates \((u, v)\) to extract a texel from the layer \(l\), where \(l\) is the layer of the framebuffer being rendered to. If \(l\) is greater than or equal to the number of layers in the image view, layer zero will be used.

If the bound shading rate image view is not `VK_NULL_HANDLE` and contains a texel with coordinates \((u, v)\) in layer \(l\) (if applicable), the single unsigned integer component for that texel will be used as the shading rate index. If the \((u, v)\) coordinate is outside the extents of the subresource used by the shading rate image view, or if the image view is `VK_NULL_HANDLE`, the shading rate index is zero. If the shading rate image view has multiple mipmap levels, the base level identified by `VkImageSubresourceRange::baseMipLevel` will be used.

A shading rate index is mapped to a base shading rate using a lookup table called the shading rate image palette. There is a separate palette for each viewport. The number of entries in each palette is given by the implementation-dependent shading rate image palette size.

To dynamically set the `shadingRateImageEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetShadingRateImageEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 shadingRateImageEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `shadingRateImageEnable` specifies the `shadingRateImageEnable` state.

This command sets the `shadingRateImageEnable` state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportShadingRateImageStateCreateInfoNV::shadingRateImageEnable` value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetShadingRateImageEnableNV-extendedDynamicState3ShadingRateImageEnable-07416
  The extendedDynamicState3ShadingRateImageEnable feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetShadingRateImageEnableNV-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetShadingRateImageEnableNV-commandBuffer-recording commandBuffer must be in the recording state
- VUID-vkCmdSetShadingRateImageEnableNV-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetShadingRateImageEnableNV-videocoding This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the per-viewport shading rate image palettes, call:

```c
// Provided by VK_NV_shading_rate_image
void vkCmdSetViewportShadingRatePaletteNV(
    VkCommandBuffer          commandBuffer,
    uint32_t                  firstViewport,
    uint32_t                  viewportCount,
    const VkShadingRatePaletteNV* pShadingRatePalettes);
```
• **commandBuffer** is the command buffer into which the command will be recorded.

• **firstViewport** is the index of the first viewport whose shading rate palette is updated by the command.

• **viewportCount** is the number of viewports whose shading rate palettes are updated by the command.

• **pShadingRatePalettes** is a pointer to an array of **VkShadingRatePaletteNV** structures defining the palette for each viewport.

This command sets the per-viewport shading rate image palettes for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV** set in **VkPipelineDynamicStateCreateInfo**::*pDynamicStates*. Otherwise, this state is specified by the **VkPipelineViewportShadingRateImageStateCreateInfoNV**::*pShadingRatePalettes* values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetViewportShadingRatePaletteNV-None-02064**
  The **shadingRateImage** feature **must** be enabled

- **VUID-vkCmdSetViewportShadingRatePaletteNV-firstViewport-02067**
  The sum of **firstViewport** and **viewportCount** **must** be between 1 and **VkPhysicalDeviceLimits::maxViewports**, inclusive

- **VUID-vkCmdSetViewportShadingRatePaletteNV-firstViewport-02068**
  If the **multiViewport** feature is not enabled, **firstViewport** **must** be 0

- **VUID-vkCmdSetViewportShadingRatePaletteNV-viewportCount-02069**
  If the **multiViewport** feature is not enabled, **viewportCount** **must** be 1

### Valid Usage (Implicit)

- **VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-parameter**
  The **commandBuffer** **must** be a valid **VkCommandBuffer** handle

- **VUID-vkCmdSetViewportShadingRatePaletteNV-pShadingRatePalettes-parameter**
  The **pShadingRatePalettes** **must** be a valid pointer to an array of **viewportCount** valid **VkShadingRatePaletteNV** structures

- **VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-recording**
  The **commandBuffer** **must** be in the **recording state**

- **VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-cmdpool**
  The **VkCommandPool** that **commandBuffer** was allocated from **must** support graphics operations

- **VUID-vkCmdSetViewportShadingRatePaletteNV-videocoding**
  This command **must** only be called outside of a video coding scope

- **VUID-vkCmdSetViewportShadingRatePaletteNV-viewportCount-arraylength**
viewportCount must be greater than 0

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkShadingRatePaletteNV structure specifies the contents of a single shading rate image palette and is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkShadingRatePaletteNV {
    uint32_t shadingRatePaletteEntryCount;
    const VkShadingRatePaletteEntryNV* pShadingRatePaletteEntries;
} VkShadingRatePaletteNV;
```

- `shadingRatePaletteEntryCount` specifies the number of entries in the shading rate image palette.
- `pShadingRatePaletteEntries` is a pointer to an array of VkShadingRatePaletteEntryNV enums defining the shading rate for each palette entry.

**Valid Usage**

- VUID-VkShadingRatePaletteNV-shadingRatePaletteEntryCount-02071
  shadingRatePaletteEntryCount must be between 1 and VkPhysicalDeviceShadingRateImagePropertiesNV::shadingRatePaletteSize, inclusive

**Valid Usage (Implicit)**

- VUID-VkShadingRatePaletteNV-pShadingRatePaletteEntries-parameter
  pShadingRatePaletteEntries must be a valid pointer to an array of shadingRatePaletteEntryCount valid VkShadingRatePaletteEntryNV values
- VUID-VkShadingRatePaletteNV-shadingRatePaletteEntryCount-arraylength
  shadingRatePaletteEntryCount must be greater than 0
To determine the base shading rate image, a shading rate index $i$ is mapped to array element $i$ in the array $pShadingRatePaletteEntries$ for the palette corresponding to the viewport used for the fragment. If $i$ is greater than or equal to the palette size $shadingRatePaletteEntryCount$, the base shading rate is undefined.

The supported shading rate image palette entries are defined by $VkShadingRatePaletteEntryNV$:

```c
// Provided by VK_NV_shading_rate_image
typedef enum VkShadingRatePaletteEntryNV {
    VK_SHADING_RATE_PALETTE_ENTRY_NO_INVOCATIONS_NV = 0,
    VK_SHADING_RATE_PALETTE_ENTRY_16_INVOCATIONS_PER_PIXEL_NV = 1,
    VK_SHADING_RATE_PALETTE_ENTRY_8_INVOCATIONS_PER_PIXEL_NV = 2,
    VK_SHADING_RATE_PALETTE_ENTRY_4_INVOCATIONS_PER_PIXEL_NV = 3,
    VK_SHADING_RATE_PALETTE_ENTRY_2_INVOCATIONS_PER_PIXEL_NV = 4,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_PIXEL_NV = 5,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X1_PIXELS_NV = 6,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_1X2_PIXELS_NV = 7,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X2_PIXELS_NV = 8,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_4X2_PIXELS_NV = 9,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X4_PIXELS_NV = 10,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_4X4_PIXELS_NV = 11,
} VkShadingRatePaletteEntryNV;
```

The following table indicates the width and height (in pixels) of each fragment generated using the indicated shading rate, as well as the maximum number of fragment shader invocations launched for each fragment. When processing regions of a primitive that have a shading rate of $VK_SHADING_RATE_PALETTE_ENTRY_NO_INVOCATIONS_NV$, no fragments will be generated in that region.

<table>
<thead>
<tr>
<th>Shading Rate</th>
<th>Width</th>
<th>Height</th>
<th>Invocations</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SHADING_RATE_PALETTE_ENTRY_NO_INVOCATIONS_NV</td>
<td>0</td>

</tr>
</tbody>
</table>
When the shading rate image is disabled, a shading rate of 
VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_PIXEL_NV will be used as the base shading rate.

Once a base shading rate has been established, it is adjusted to produce a final shading rate. First, if the base shading rate uses multiple pixels for each fragment, the implementation may reduce the fragment area to ensure that the total number of coverage samples for all pixels in a fragment does not exceed an implementation-dependent maximum.

If sample shading is active in the current pipeline and would result in processing \( n \) (\( n > 1 \)) unique samples per fragment when the shading rate image is disabled, the shading rate is adjusted in an implementation-dependent manner to increase the number of fragment shader invocations spawned by the primitive. If the shading rate indicates \( fs \) pixels per fragment and \( fs \) is greater than \( n \), the fragment area is adjusted so each fragment has approximately \( \frac{n}{f} \) pixels. Otherwise, if the shading rate indicates \( ipf \) invocations per fragment, the fragment area will be adjusted to a single pixel with approximately \( ipf \times \frac{n}{f} \) invocations per fragment.

If sample shading occurs due to the use of a fragment shader input variable decorated with SampleId or SamplePosition, the shading rate is ignored. Each fragment will have a single pixel and will spawn up to rasterizationSamples fragment shader invocations, as when using sample shading without a shading rate image.

Finally, if the shading rate specifies multiple fragment shader invocations per fragment, the total number of invocations in the shading rate is clamped to be no larger than rasterizationSamples.

When the final shading rate for a primitive covering pixel \((x, y)\) has a fragment area of \(fw \times fh\), the fragment for that pixel will cover all pixels with coordinates \((x', y')\) that satisfy the equations:

\[
\left\lfloor \frac{x}{fw} \right\rfloor = \left\lfloor \frac{x'}{fw} \right\rfloor
\]
This combined fragment is considered to have multiple coverage samples; the total number of samples in this fragment is given by \( \text{samples} = \text{fw} \times \text{fh} \times rs \) where \( rs \) indicates the value of \( \text{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} \) specified at pipeline creation time. The set of coverage samples in the fragment is the union of the per-pixel coverage samples in each of the fragment's pixels. The location and order of coverage samples within each pixel in the combined fragment are assigned as described in \text{Multisampling} and \text{Custom Sample Locations}. Each coverage sample in the set of pixels belonging to the combined fragment is assigned a unique coverage index in the range \([0, \text{samples}-1]\). If the \text{shadingRateCoarseSampleOrder} feature is supported, the order of coverage samples can be specified for each combination of fragment area and coverage sample count. If this feature is not supported, the sample order is implementation-dependent.

If the \text{pNext} chain of \text{VkPipelineViewportStateCreateInfo} includes a \text{VkPipelineViewportCoarseSampleOrderStateCreateInfoNV} structure, then that structure includes parameters controlling the order of coverage samples in fragments larger than one pixel.

The \text{VkPipelineViewportCoarseSampleOrderStateCreateInfoNV} structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkPipelineViewportCoarseSampleOrderStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkCoarseSampleOrderTypeNV sampleOrderType;
    uint32_t customSampleOrderCount;
    const VkCoarseSampleOrderCustomNV* pCustomSampleOrders;
} VkPipelineViewportCoarseSampleOrderStateCreateInfoNV;
```

- \text{sType} is the type of this structure.
- \text{pNext} is NULL or a pointer to a structure extending this structure.
- \text{sampleOrderType} specifies the mechanism used to order coverage samples in fragments larger than one pixel.
- \text{customSampleOrderCount} specifies the number of custom sample orderings to use when ordering coverage samples.
- \text{pCustomSampleOrders} is a pointer to an array of \text{customSampleOrderCount} \text{VkCoarseSampleOrderCustomNV} structures, each structure specifying the coverage sample order for a single combination of fragment area and coverage sample count.

If this structure is not present, \text{sampleOrderType} is considered to be \text{VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV}.

If \text{sampleOrderType} is \text{VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV}, the coverage sample order used for any combination of fragment area and coverage sample count not enumerated in \text{pCustomSampleOrders} will be identical to that used for \text{VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV}.

If the pipeline was created with \text{VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV}, the contents of
this structure (if present) are ignored, and the coverage sample order is instead specified by 
vkCmdSetCoarseSampleOrderNV.

Valid Usage

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sampleOrderType-02072
  If sampleOrderType is not VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV, customSamplerOrderCount
  must be 0

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-pCustomSampleOrders-02234
  The array pCustomSampleOrders must not contain two structures with matching values for
  both the shadingRate and sampleCount members

Valid Usage (Implicit)

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sType-sType
  sType must be
  VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_COARSE_SAMPLE_ORDER_STATE_CREATE_INFO_NV

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sampleOrderType-parameter
  sampleOrderType must be a valid VkCoarseSampleOrderTypeNV value

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-pCustomSampleOrders-parameter
  If customSampleOrderCount is not 0, pCustomSampleOrders must be a valid pointer to an array
  of customSampleOrderCount valid VkCoarseSampleOrderCustomNV structures

The type VkCoarseSampleOrderTypeNV specifies the technique used to order coverage samples in
fragments larger than one pixel, and is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef enum VkCoarseSampleOrderTypeNV {
    VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV = 0,
    VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV = 1,
    VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV = 2,
    VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV = 3,
} VkCoarseSampleOrderTypeNV;
```

- VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV specifies that coverage samples will be ordered in an
  implementation-dependent manner.

- VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV specifies that coverage samples will be ordered
  according to the array of custom orderings provided in either the pCustomSampleOrders member
  of VkPipelineViewportCoarseSampleOrderStateCreateInfoNV or the pCustomSampleOrders member
  of vkCmdSetCoarseSampleOrderNV.
• **VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV** specifies that coverage samples will be ordered sequentially, sorted first by pixel coordinate (in row-major order) and then by sample index.

• **VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV** specifies that coverage samples will be ordered sequentially, sorted first by sample index and then by pixel coordinate (in row-major order).

When using a coarse sample order of **VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV** for a fragment with an upper-left corner of $(fx, fy)$ with a width of $fw \times fh$ and $fsc$ samples per pixel, coverage index $cs$ of the fragment will be assigned to sample index $fs$ of pixel $(px, py)$ as follows:

$$
p_x = fx + \lfloor \frac{cs}{fsc} \rfloor \cdot fw
$$

$$
p_y = fy + \lfloor \frac{s}{fsc \cdot fw} \rfloor
$$

$$
fs = \frac{cs}{fsc} \cdot fh
$$

When using a coarse sample order of **VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV**, coverage index $cs$ will be assigned as follows:

$$
p_x = fx + \frac{cs}{fw}
$$

$$
p_y = (fy + \frac{s}{fw}) \cdot fh
$$

$$
fs = \frac{cs}{fw \cdot fh}
$$

The **VkCoarseSampleOrderCustomNV** structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkCoarseSampleOrderCustomNV {
    VkShadingRatePaletteEntryNV shadingRate;
    uint32_t sampleCount;
    uint32_t sampleLocationCount;
    const VkCoarseSampleLocationNV* pSampleLocations;
} VkCoarseSampleOrderCustomNV;
```

• **shadingRate** is a shading rate palette entry that identifies the fragment width and height for the combination of fragment area and per-pixel coverage sample count to control.

• **sampleCount** identifies the per-pixel coverage sample count for the combination of fragment area and coverage sample count to control.

• **sampleLocationCount** specifies the number of sample locations in the custom ordering.

• **pSampleLocations** is a pointer to an array of **VkCoarseSampleLocationNV** structures specifying the location of each sample in the custom ordering.

The **VkCoarseSampleOrderCustomNV** structure is used with a coverage sample ordering type of **VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV** to specify the order of coverage samples for one combination of fragment width, fragment height, and coverage sample count.

When using a custom sample ordering, element $j$ in **pSampleLocations** specifies a specific pixel location and **sample index** that corresponds to coverage index $j$ in the multi-pixel fragment.
Valid Usage

- **VUID-VkCoarseSampleOrderCustomNV-shadingRate-02073**
  
  shadingRate **must** be a shading rate that generates fragments with more than one pixel

- **VUID-VkCoarseSampleOrderCustomNV-sampleCount-02074**
  
  sampleCount **must** correspond to a sample count enumerated in VkSampleCountFlags whose corresponding bit is set in VkPhysicalDeviceLimits::framebufferNoAttachmentsSampleCounts

- **VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-02075**
  
  sampleLocationCount **must** be equal to the product of sampleCount, the fragment width for shadingRate, and the fragment height for shadingRate

- **VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-02076**
  
  sampleLocationCount **must** be less than or equal to the value of VkPhysicalDeviceShadingRateImagePropertiesNV::shadingRateMaxCoarseSamples

- **VUID-VkCoarseSampleOrderCustomNV-pSampleLocations-02077**
  
  The array pSampleLocations **must** contain exactly one entry for every combination of valid values for pixelX, pixelY, and sample in the structure VkCoarseSampleOrderCustomNV

Valid Usage (Implicit)

- **VUID-VkCoarseSampleOrderCustomNV-shadingRate-parameter**
  
  shadingRate **must** be a valid VkShadingRatePaletteEntryNV value

- **VUID-VkCoarseSampleOrderCustomNV-pSampleLocations-parameter**
  
  pSampleLocations **must** be a valid pointer to an array of sampleLocationCount VkCoarseSampleLocationNV structures

- **VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-arraylength**
  
  sampleLocationCount **must** be greater than 0

The VkCoarseSampleLocationNV structure identifies a specific pixel and sample index for one of the coverage samples in a fragment that is larger than one pixel. This structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkCoarseSampleLocationNV {
    uint32_t pixelX;
    uint32_t pixelY;
    uint32_t sample;
} VkCoarseSampleLocationNV;
```

- **pixelX** is added to the x coordinate of the upper-leftmost pixel of each fragment to identify the pixel containing the coverage sample.

- **pixelY** is added to the y coordinate of the upper-leftmost pixel of each fragment to identify the pixel containing the coverage sample.
• `sample` is the number of the coverage sample in the pixel identified by `pixelX` and `pixelY`.

### Valid Usage

- VUID-VkCoarseSampleLocationNV-pixelX-02078  
  `pixelX` must be less than the width (in pixels) of the fragment

- VUID-VkCoarseSampleLocationNV-pixelY-02079  
  `pixelY` must be less than the height (in pixels) of the fragment

- VUID-VkCoarseSampleLocationNV-sample-02080  
  `sample` must be less than the number of coverage samples in each pixel belonging to the fragment

To **dynamically set** the order of coverage samples in fragments larger than one pixel, call:

```c
// Provided by VK_NV_shading_rate_image
void vkCmdSetCoarseSampleOrderNV(
  VkCommandBuffer commandBuffer,
  VkCoarseSampleOrderTypeNV sampleOrderType,
  uint32_t customSampleOrderCount,
  const VkCoarseSampleOrderCustomNV* pCustomSampleOrders);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

- `sampleOrderType` specifies the mechanism used to order coverage samples in fragments larger than one pixel.

- `customSampleOrderCount` specifies the number of custom sample orderings to use when ordering coverage samples.

- `pCustomSampleOrders` is a pointer to an array of `VkCoarseSampleOrderCustomNV` structures, each structure specifying the coverage sample order for a single combination of fragment area and coverage sample count.

If `sampleOrderType` is `VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV`, the coverage sample order used for any combination of fragment area and coverage sample count not enumerated in `pCustomSampleOrders` will be identical to that used for `VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV`.

This command sets the order of coverage samples for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportCoarseSampleOrderStateCreateInfoNV` values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetCoarseSampleOrderNV-sampleOrderType-02081  
  If `sampleOrderType` is not `VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV`, `customSamplerOrderCount`
must be 0

- VUID-vkCmdSetCoarseSampleOrderNV-pCustomSampleOrders-02235
  The array pCustomSampleOrders must not contain two structures with matching values for both the shadingRate and sampleCount members

Valid Usage (Implicit)

- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetCoarseSampleOrderNV-sampleOrderType-parameter
  sampleOrderType must be a valid VkCoarseSampleOrderTypeNV value

- VUID-vkCmdSetCoarseSampleOrderNV-pCustomSampleOrders-parameter
  If customSampleOrderCount is not 0, pCustomSampleOrders must be a valid pointer to an array of customSampleOrderCount valid VkCoarseSampleOrderCustomNV structures

- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetCoarseSampleOrderNV-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

If the final shading rate for a primitive covering pixel \((x,y)\) results in \(n\) invocations per pixel \((n > 1)\), \(n\) separate fragment shader invocations will be generated for the fragment. Each coverage sample in the fragment will be assigned to one of the \(n\) fragment shader invocations in an implementation-dependent manner. The outputs from the fragment output interface of each shader invocation will be broadcast to all of the framebuffer samples associated with the invocation. If none of the
coverage samples associated with a fragment shader invocation is covered by a primitive, the
implementation may discard the fragment shader invocation for those samples.

If the final shading rate for a primitive covering pixel \((x,y)\) results in a fragment containing multiple
pixels, a single set of fragment shader invocations will be generated for all pixels in the combined
fragment. Outputs from the fragment output interface will be broadcast to all covered framebuffer
samples belonging to the fragment. If the fragment shader executes code discarding the fragment,
none of the samples of the fragment will be updated.

### 27.8. Sample Shading

Sample shading can be used to specify a minimum number of unique samples to process for each
fragment. If sample shading is enabled, an implementation must invoke the fragment shader at
least \(\max(\lceil \text{VkPipelineMultisampleStateCreateInfo::minSampleShading} \times \text{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} \rceil, 1)\) times per fragment. If a fragment
shader entry point's interface includes an input variable decorated with a BuiltIn of SampleId or
SamplePosition, a value of 1.0 is used instead of minSampleShading. If the
VK_AMD_mixed_attachment_samples extension is enabled and the subpass uses color attachments, the
samples value used to create each color attachment is used instead of rasterizationSamples.

Sample shading is enabled if at least one of the following conditions is true:

- \(\text{VkPipelineMultisampleStateCreateInfo::sampleShadingEnable} = \text{VK_TRUE}\), or
- the fragment shader’s entry point interface includes input variables decorated with a BuiltIn of
  SampleId or SamplePosition built-ins.

If there are fewer invocations than covered samples, implementations may include those samples
in fragment shader invocations in any manner as long as covered samples are all shaded at least
once.

### 27.9. Barycentric Interpolation

When the fragmentShaderBarycentric feature is enabled, the PerVertexKHR interpolation decoration
can be used with fragment shader inputs to indicate that the decorated inputs do not have
associated data in the fragment. Such inputs can only be accessed in a fragment shader using an
array index whose value (0, 1, or 2) identifies one of the vertices of the primitive that produced the
fragment. Reads of per-vertex values for missing vertices, such as the third vertex of a line
primitive, will return values from the valid vertex with the highest index. This means that the per-
vertex values of indices 1 and 2 for point primitives will be equal to those of index 0, and the per-
vertex values of index 2 for line primitives will be equal to those of index 1.

When tessellation, geometry shading, and mesh shading are not active, fragment shader inputs
decorated with PerVertexKHR will take values from one of the vertices of the primitive that produced
the fragment, identified by the extra index provided in SPIR-V code accessing the input. If the \(n\)
vertices passed to a draw call are numbered 0 through \(n-1\), and the point, line, and triangle
primitives produced by the draw call are numbered with consecutive integers beginning with zero,
the following table indicates the original vertex numbers used when the provoking vertex mode is
VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT for index values of 0, 1, and 2. If an input decorated
with `PerVertexKHR` is accessed with any other vertex index value, or is accessed while rasterizing a polygon when the `VkPipelineRasterizationStateCreateInfo::polygonMode` property of the currently active pipeline is not `VK_POLYGON_MODE_FILL`, an undefined value is returned.

When geometry or mesh shading is active, primitives processed by fragment shaders are assembled from the vertices emitted by the geometry or mesh shader. In this case, the vertices used for fragment shader inputs decorated with `PerVertexKHR` are derived by treating the primitives produced by the shader as though they were specified by a draw call and consulting the table above.

When using tessellation without geometry shading, the tessellator produces primitives in an implementation-dependent manner. While there is no defined vertex ordering for inputs decorated with `PerVertexKHR`, the vertex ordering used in this case will be consistent with the ordering used to derive the values of inputs decorated with `BaryCoordKHR` or `BaryCoordNoPerspKHR`.

Fragment shader inputs decorated with `BaryCoordKHR` or `BaryCoordNoPerspKHR` hold three-component vectors with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive. For point primitives, such variables are always assigned the value (1,0,0). For line primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0 and 1 are (1,0,0) and (0,1,0), respectively. For polygon primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0, 1, and 2 are (1,0,0), (0,1,0), and (0,0,1), respectively. For `BaryCoordKHR`, the values are obtained using perspective interpolation. For `BaryCoordNoPerspKHR`, the values are obtained using linear interpolation. The values of `BaryCoordKHR` and `BaryCoordNoPerspKHR` are undefined while rasterizing a polygon when the `VkPipelineRasterizationStateCreateInfo::polygonMode` property of the currently active pipeline is not `VK_POLYGON_MODE_FILL`.

27.10. Points

A point is drawn by generating a set of fragments in the shape of a square centered around the vertex of the point. Each vertex has an associated point size controlling the width/height of that square. The point size is taken from the (potentially clipped) shader built-in `PointSize` written by:

- the geometry shader, if active;
• the tessellation evaluation shader, if active and no geometry shader is active;
• the vertex shader, otherwise

and clamped to the implementation-dependent point size range \([\text{pointSizeRange}[0],\text{pointSizeRange}[1]]\). The value written to \text{PointSize} must be greater than zero.

Not all point sizes need be supported, but the size 1.0 must be supported. The range of supported sizes and the size of evenly-spaced gradations within that range are implementation-dependent. The range and gradations are obtained from the \text{pointSizeRange} and \text{pointSizeGranularity} members of \text{VkPhysicalDeviceLimits}. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional point sizes may also be supported. There is no requirement that these sizes be equally spaced. If an unsupported size is requested, the nearest supported size is used instead.

Further, if the render pass has a fragment density map attachment, point size may be rounded by the implementation to a multiple of the fragment’s width or height.

### 27.10.1. Basic Point Rasterization

Point rasterization produces a fragment for each fragment area group of framebuffer pixels with one or more sample points that intersect a region centered at the point’s \((x_f, y_f)\). This region is a square with side equal to the current point size. Coverage bits that correspond to sample points that intersect the region are 1, other coverage bits are 0. All fragments produced in rasterizing a point are assigned the same associated data, which are those of the vertex corresponding to the point. However, the fragment shader built-in \text{PointCoord} contains point sprite texture coordinates. The s and t point sprite texture coordinates vary from zero to one across the point horizontally left-to-right and vertically top-to-bottom, respectively. The following formulas are used to evaluate s and t:

\[
\begin{align*}
    s &= \frac{1}{2} + \frac{(x_p - x_f)}{\text{size}} \\
    t &= \frac{1}{2} + \frac{(y_p - y_f)}{\text{size}}
\end{align*}
\]

where size is the point’s size; \((x_p, y_p)\) is the location at which the point sprite coordinates are evaluated - this may be the framebuffer coordinates of the fragment center, or the location of a sample; and \((x_f, y_f)\) is the exact, unrounded framebuffer coordinate of the vertex for the point.

### 27.11. Line Segments

Line segment rasterization options are controlled by the \text{VkPipelineRasterizationLineStateCreateInfoEXT} structure.

The \text{VkPipelineRasterizationLineStateCreateInfoEXT} structure is defined as:

```c
// Provided by VK_EXT_line_rasterization
typedef struct VkPipelineRasterizationLineStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
} VkPipelineRasterizationLineStateCreateInfoEXT;
```
VkPipelineRasterizationLineStateCreateInfoEXT

{ sType, pNext, lineRasterizationMode,
stippledLineEnable, lineStippleFactor,
lineStipplePattern;
} VkPipelineRasterizationLineStateCreateInfoEXT;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **lineRasterizationMode** is a VkLineRasterizationModeEXT value selecting the style of line rasterization.
- **stippledLineEnable** enables stippled line rasterization.
- **lineStippleFactor** is the repeat factor used in stippled line rasterization.
- **lineStipplePattern** is the bit pattern used in stippled line rasterization.

If **stippledLineEnable** is VK_FALSE, the values of **lineStippleFactor** and **lineStipplePattern** are ignored.

### Valid Usage

- **VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02768**
  If **lineRasterizationMode** is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT, then the rectangularLines feature must be enabled.

- **VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02769**
  If **lineRasterizationMode** is VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT, then the bresenhamLines feature must be enabled.

- **VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02770**
  If **lineRasterizationMode** is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT, then the smoothLines feature must be enabled.

- **VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02771**
  If **stippledLineEnable** is VK_TRUE and **lineRasterizationMode** is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT, then the stippledRectangularLines feature must be enabled.

- **VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02772**
  If **stippledLineEnable** is VK_TRUE and **lineRasterizationMode** is VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT, then the stippledBresenhamLines feature must be enabled.

- **VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02773**
  If **stippledLineEnable** is VK_TRUE and **lineRasterizationMode** is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT, then the stippledSmoothLines feature must be enabled.

- **VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02774**
  If **stippledLineEnable** is VK_TRUE and **lineRasterizationMode** is VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT, then the stippledRectangularLines feature must be enabled.
be enabled and \texttt{VkPhysicalDeviceLimits::strictLines must be VK_TRUE}.

### Valid Usage (Implicit)

- \texttt{VUID-VkPipelineRasterizationLineStateCreateInfoEXT-sType-sType must be VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_EXT}
- \texttt{VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-parameter lineRasterizationMode must be a valid VkLineRasterizationModeEXT value}

Possible values of \texttt{VkPipelineRasterizationLineStateCreateInfoEXT::lineRasterizationMode} are:

```c
// Provided by VK_EXT_line_rasterization
typedef enum VkLineRasterizationModeEXT {
    VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT = 0,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT = 1,
    VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT = 2,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT = 3,
} VkLineRasterizationModeEXT;
```

- \texttt{VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT} is equivalent to \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT} if \texttt{VkPhysicalDeviceLimits::strictLines} is \texttt{VK_TRUE}, otherwise lines are drawn as non-\texttt{strictLines} parallelograms. Both of these modes are defined in Basic Line Segment Rasterization.

- \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT} specifies lines drawn as if they were rectangles extruded from the line.

- \texttt{VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT} specifies lines drawn by determining which pixel diamonds the line intersects and exits, as defined in Bresenham Line Segment Rasterization.

- \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT} specifies lines drawn if they were rectangles extruded from the line, with alpha falloff, as defined in Smooth Lines.

To dynamically set the \texttt{lineRasterizationMode} state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetLineRasterizationModeEXT(
    VkCommandBuffer commandBuffer,
    VkLineRasterizationModeEXT lineRasterizationMode);
```

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.

- \texttt{lineRasterizationMode} specifies the \texttt{lineRasterizationMode} state.

This command sets the \texttt{lineRasterizationMode} state for subsequent drawing commands when the graphics pipeline is created with \texttt{VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. Otherwise, this state is specified by the
Valid Usage

- VUID-vkCmdSetLineRasterizationModeEXT-extendedDynamicState3LineRasterizationMode-07417
  The `extendedDynamicState3LineRasterizationMode` feature must be enabled

- VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-07418
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT`, then the `rectangularLines` feature must be enabled

- VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-07419
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`, then the `bresenhamLines` feature must be enabled

- VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-07420
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then the `smoothLines` feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetLineRasterizationModeEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-parameter
  `lineRasterizationMode` must be a valid `VkLineRasterizationModeEXT` value

- VUID-vkCmdSetLineRasterizationModeEXT-commandBuffer-recording
  `commandBuffer` must be in the `recording state`

- VUID-vkCmdSetLineRasterizationModeEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetLineRasterizationModeEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
To dynamically set the `stippledLineEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetLineStippleEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 stippledLineEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stippledLineEnable` specifies the `stippledLineEnable` state.

This command sets the `stippledLineEnable` state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationLineStateCreateInfoEXT::stippledLineEnable` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetLineStippleEnableEXT-extendedDynamicState3LineStippleEnable-07421**
  The `extendedDynamicState3LineStippleEnable` feature must be enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetLineStippleEnableEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetLineStippleEnableEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetLineStippleEnableEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetLineStippleEnableEXT-videocoding**
  This command must only be called outside of a video coding scope
**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

**Command Properties**

Not all line widths need be supported for line segment rasterization, but width 1.0 antialiased segments must be provided. The range and gradations are obtained from the lineWidthRange and lineWidthGranularity members of VkPhysicalDeviceLimits. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional line widths may also be supported. There is no requirement that these widths be equally spaced. If an unsupported width is requested, the nearest supported width is used instead.

Further, if the render pass has a fragment density map attachment, line width may be rounded by the implementation to a multiple of the fragment’s width or height.

27.11.1. Basic Line Segment Rasterization

If the lineRasterizationMode member of VkPipelineRasterizationLineStateCreateInfoEXT is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT, rasterized line segments produce fragments which intersect a rectangle centered on the line segment. Two of the edges are parallel to the specified line segment; each is at a distance of one-half the current width from that segment in directions perpendicular to the direction of the line. The other two edges pass through the line endpoints and are perpendicular to the direction of the specified line segment. Coverage bits that correspond to sample points that intersect the rectangle are 1, other coverage bits are 0.

Next we specify how the data associated with each rasterized fragment are obtained. Let $p_r = (x_d, y_d)$ be the framebuffer coordinates at which associated data are evaluated. This may be the center of a fragment or the location of a sample within the fragment. When rasterizationSamples is VK_SAMPLE_COUNT_1_BIT, the fragment center must be used. Let $p_s = (x_l, y_l)$ and $p_b = (x_u, y_u)$ be initial and final endpoints of the line segment, respectively. Set
\[ t = \frac{(\mathbf{p}_r - \mathbf{p}_a) \cdot (\mathbf{p}_b - \mathbf{p}_a)}{\| \mathbf{p}_b - \mathbf{p}_a \|^2} \]

(Note that \( t = 0 \) at \( \mathbf{p}_a \) and \( t = 1 \) at \( \mathbf{p}_b \). Also note that this calculation projects the vector from \( \mathbf{p}_a \) to \( \mathbf{p}_r \) onto the line, and thus computes the normalized distance of the fragment along the line.)

If \texttt{strictLines} is \texttt{VK_TRUE}, line segments are rasterized using perspective or linear interpolation.

\textit{Perspective interpolation} for a line segment interpolates two values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the line segment’s clip coordinates. An interpolated value \( f \) can be determined by

\[ f = \frac{(1 - t)f_a / w_a + tf_b / w_b}{(1 - t) / w_a + t / w_b} \]

where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively; \( w_a \) and \( w_b \) are the clip w coordinates of the starting and ending endpoints of the segment, respectively.

\textit{Linear interpolation} for a line segment directly interpolates two values, and an interpolated value \( f \) can be determined by

\[ f = (1 - t)f_a + tf_b \]

where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively.

The clip coordinate \( w \) for a sample is determined using perspective interpolation. The depth value \( z \) for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by \textit{Interpolation decorations}.

The above description documents the preferred method of line rasterization, and \textbf{must} be used when \texttt{lineRasterizationMode} is \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT}.

When \texttt{strictLines} is \texttt{VK_FALSE}, and when the \texttt{lineRasterizationMode} is \texttt{VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT}, the edges of the lines are generated as a parallelogram surrounding the original line. The major axis is chosen by noting the axis in which there is the greatest distance between the line start and end points. If the difference is equal in both directions then the X axis is chosen as the major axis. Edges 2 and 3 are aligned to the minor axis and are centered on the endpoints of the line as in \textit{Non strict lines}, and each is \texttt{lineWidth} long. Edges 0 and 1 are parallel to the line and connect the endpoints of edges 2 and 3. Coverage bits that correspond to sample points that intersect the parallelogram are 1, other coverage bits are 0.

Samples that fall exactly on the edge of the parallelogram follow the polygon rasterization rules.

Interpolation occurs as if the parallelogram was decomposed into two triangles where each pair of vertices at each end of the line has identical attributes.
Only when `strictLines` is `VK_FALSE` implementations may deviate from the non-strict line algorithm described above in the following ways:

- Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization using the original line segment endpoints.
- Rasterization of non-antialiased non-strict line segments may be performed using the rules defined in Bresenham Line Segment Rasterization.

### 27.11.2. Bresenham Line Segment Rasterization

If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`, then the following rules replace the line rasterization rules defined in Basic Line Segment Rasterization.

Non-strict lines may also follow these rasterization rules for non-antialiased lines.

Line segment rasterization begins by characterizing the segment as either `x-major` or `y-major`. `x-major` line segments have slope in the closed interval \([-1,1]\); all other line segments are `y-major` (slope is determined by the segment’s endpoints). We specify rasterization only for `x-major` segments except in cases where the modifications for `y-major` segments are not self-evident.

Ideally, Vulkan uses a *diamond-exit* rule to determine those fragments that are produced by rasterizing a line segment. For each fragment \(f\) with center at framebuffer coordinates \(x_f\) and \(y_f\), define a diamond-shaped region that is the intersection of four half planes:

\[
R_f = \{(x, y) | |x - x_f| + |y - y_f| < \frac{1}{2}\}
\]

Essentially, a line segment starting at \(p_a\) and ending at \(p_b\) produces those fragments \(f\) for which the segment intersects \(R_o\), except if \(p_b\) is contained in \(R_c\).
To avoid difficulties when an endpoint lies on a boundary of $R_f$ we (in principle) perturb the supplied endpoints by a tiny amount. Let $p_a$ and $p_b$ have framebuffer coordinates $(x_a, y_a)$ and $(x_b, y_b)$, respectively. Obtain the perturbed endpoints $p'_a$ given by $(x_a, y_a) - (\epsilon, \epsilon)$ and $p'_b$ given by $(x_b, y_b) - (\epsilon, \epsilon^2)$. Rasterizing the line segment starting at $p_a$ and ending at $p_b$ produces those fragments $f$ for which the segment starting at $p'_a$ and ending on $p'_b$ intersects $R_f$, except if $p'_b$ is contained in $R_f$. $\epsilon$ is chosen to be so small that rasterizing the line segment produces the same fragments when $\delta$ is substituted for $\epsilon$ for any $0 < \delta \leq \epsilon$.

When $p_a$ and $p_b$ lie on fragment centers, this characterization of fragments reduces to Bresenham’s algorithm with one modification: lines produced in this description are “half-open”, meaning that the final fragment (corresponding to $p_b$) is not drawn. This means that when rasterizing a series of connected line segments, shared endpoints will be produced only once rather than twice (as would occur with Bresenham’s algorithm).

Implementations may use other line segment rasterization algorithms, subject to the following rules:

- The coordinates of a fragment produced by the algorithm must not deviate by more than one unit in either $x$ or $y$ framebuffer coordinates from a corresponding fragment produced by the diamond-exit rule.
- The total number of fragments produced by the algorithm must not differ from that produced by the diamond-exit rule by no more than one.
- For an $x$-major line, two fragments that lie in the same framebuffer-coordinate column must not be produced (for a $y$-major line, two fragments that lie in the same framebuffer-coordinate row must not be produced).
• If two line segments share a common endpoint, and both segments are either x-major (both left-to-right or both right-to-left) or y-major (both bottom-to-top or both top-to-bottom), then rasterizing both segments must not produce duplicate fragments. Fragments also must not be omitted so as to interrupt continuity of the connected segments.

The actual width \( w \) of Bresenham lines is determined by rounding the line width to the nearest integer, clamping it to the implementation-dependent `lineWidthRange` (with both values rounded to the nearest integer), and clamping it to be no less than 1.

Bresenham line segments of width other than one are rasterized by offsetting them in the minor direction (for an x-major line, the minor direction is y, and for a y-major line, the minor direction is x) and producing a row or column of fragments in the minor direction. If the line segment has endpoints given by \((x_0, y_0)\) and \((x_1, y_1)\) in framebuffer coordinates, the segment with endpoints \((x_0, y_0 - \frac{w-1}{2})\) and \((x_1, y_1 - \frac{w-1}{2})\) is rasterized, but instead of a single fragment, a column of fragments of height \( w \) (a row of fragments of length \( w \) for a y-major segment) is produced at each \( x \) (y for y-major) location. The lowest fragment of this column is the fragment that would be produced by rasterizing the segment of width 1 with the modified coordinates.

The preferred method of attribute interpolation for a wide line is to generate the same attribute values for all fragments in the row or column described above, as if the adjusted line was used for interpolation and those values replicated to the other fragments, except for `FragCoord` which is interpolated as usual. Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization, using the original line segment endpoints.

When Bresenham lines are being rasterized, sample locations may all be treated as being at the pixel center (this may affect attribute and depth interpolation).

Note
The sample locations described above are not used for determining coverage, they are only used for things like attribute interpolation. The rasterization rules that determine coverage are defined in terms of whether the line intersects pixels, as opposed to the point sampling rules used for other primitive types. So these rules are independent of the sample locations. One consequence of this is that Bresenham lines cover the same pixels regardless of the number of rasterization samples, and cover all samples in those pixels (unless masked out or killed).

27.11.3. Line Stipple
If the `stippledLineEnable` member of `VkPipelineRasterizationLineStateCreateInfoEXT` is `VK_TRUE`, then lines are rasterized with a line stipple determined by `lineStippleFactor` and `lineStipplePattern`. `lineStipplePattern` is an unsigned 16-bit integer that determines which fragments are to be drawn or discarded when the line is rasterized. `lineStippleFactor` is a count that is used to modify the effective line stipple by causing each bit in `lineStipplePattern` to be used `lineStippleFactor` times.

Line stippling discards certain fragments that are produced by rasterization. The masking is achieved using three parameters: the 16-bit line stipple pattern \( p \), the line stipple factor \( r \), and an integer stipple counter \( s \). Let
Then a fragment is produced if the \( b \)'th bit of \( p \) is 1, and discarded otherwise. The bits of \( p \) are numbered with 0 being the least significant and 15 being the most significant.

The initial value of \( s \) is zero. For \texttt{VK\_LINE\_RASTERIZATION\_MODE\_BRESENHAM\_EXT} lines, \( s \) is incremented after production of each fragment of a line segment (fragments are produced in order, beginning at the starting point and working towards the ending point). For \texttt{VK\_LINE\_RASTERIZATION\_MODE\_RECTANGULAR\_EXT} and \texttt{VK\_LINE\_RASTERIZATION\_MODE\_RECTANGULAR\_SMOOTH\_EXT} lines, the rectangular region is subdivided into adjacent unit-length rectangles, and \( s \) is incremented once for each rectangle. Rectangles with a value of \( s \) such that the \( b \)'th bit of \( p \) is zero are discarded. If the last rectangle in a line segment is shorter than unit-length, then the remainder \textbf{may} carry over to the next line segment in the line strip using the same value of \( s \) (this is the preferred behavior, for the stipple pattern to appear more consistent through the strip).

\( s \) is reset to 0 at the start of each strip (for line strips), and before every line segment in a group of independent segments.

If the line segment has been clipped, then the value of \( s \) at the beginning of the line segment is implementation-dependent.

To \textit{dynamically set} the line stipple state, call:

```c
// Provided by VK\_EXT\_line\_rasterization
void vkCmdSetLineStippleEXT(
    VkCommandBuffer commandBuffer, 
    uint32_t lineStippleFactor,
    uint16_t lineStipplePattern);
```

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.
- \texttt{lineStippleFactor} is the repeat factor used in stippled line rasterization.
- \texttt{lineStipplePattern} is the bit pattern used in stippled line rasterization.

This command sets the line stipple state for subsequent drawing commands when the graphics pipeline is created with \texttt{VK\_DYNAMIC\_STATE\_LINE\_STIPPLE\_EXT} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. Otherwise, this state is specified by the \texttt{VkPipelineRasterizationLineStateCreateInfoEXT::lineStippleFactor} and \texttt{VkPipelineRasterizationLineStateCreateInfoEXT::lineStipplePattern} values used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetLineStippleEXT-lineStippleFactor-02776 \texttt{lineStippleFactor} \textbf{must} be in the range \([1,256]\)
Valid Usage (Implicit)

- VUID-vkCmdSetLineStippleEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLineStippleEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetLineStippleEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetLineStippleEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

27.11.4. Smooth Lines

If the `lineRasterizationMode` member of `VkPipelineRasterizationLineStateCreateInfoEXT` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then lines are considered to be rectangles using the same geometry as for `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT` lines. The rules for determining which pixels are covered are implementation-dependent, and may include nearby pixels where no sample locations are covered or where the rectangle does not intersect the pixel at all. For each pixel that is considered covered, the fragment computes a coverage value that approximates the area of the intersection of the rectangle with the pixel square, and this coverage value is multiplied into the color location 0’s alpha value after fragment shading, as described in Multisample Coverage.

**Note**

The details of the rasterization rules and area calculation are left intentionally vague, to allow implementations to generate coverage and values that are aesthetically pleasing.
27.12. Polygons

A polygon results from the decomposition of a triangle strip, triangle fan or a series of independent triangles. Like points and line segments, polygon rasterization is controlled by several variables in the `VkPipelineRasterizationStateCreateInfo` structure.

27.12.1. Basic Polygon Rasterization

The first step of polygon rasterization is to determine whether the triangle is back-facing or front-facing. This determination is made based on the sign of the (clipped or unclipped) polygon’s area computed in framebuffer coordinates. One way to compute this area is:

\[
a = -\frac{1}{2} \sum_{i=0}^{n-1} x_i y_{i+1} - x_{i+1} y_i
\]

where \(x_i\) and \(y_i\) are the x and y framebuffer coordinates of the \(i\)th vertex of the \(n\)-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and \(i \oplus 1\) is \((i + 1) \text{ mod } n\).

The interpretation of the sign of \(a\) is determined by the `VkPipelineRasterizationStateCreateInfo` ::`frontFace` property of the currently active pipeline. Possible values are:

- `VK_FRONT_FACE_COUNTER_CLOCKWISE` specifies that a triangle with positive area is considered front-facing.
- `VK_FRONT_FACE_CLOCKWISE` specifies that a triangle with negative area is considered front-facing.

Any triangle which is not front-facing is back-facing, including zero-area triangles.

To dynamically set the front face orientation, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetFrontFace(
    VkCommandBuffer commandBuffer,
    VkFrontFace frontFace);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetFrontFaceEXT(
    VkCommandBuffer commandBuffer,
    VkFrontFace frontFace);
```
• **commandBuffer** is the command buffer into which the command will be recorded.

• **frontFace** is a **VkFrontFace** value specifying the front-facing triangle orientation to be used for culling.

This command sets the front face orientation for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_FRONT_FACE** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineRasterizationStateCreateInfo::frontFace** value used to create the currently active pipeline.

---

**Valid Usage (Implicit)**

- **VUID-vkCmdSetFrontFace-commandBuffer-parameter**
  **commandBuffer** must be a valid **VkCommandBuffer** handle

- **VUID-vkCmdSetFrontFace-frontFace-parameter**
  **frontFace** must be a valid **VkFrontFace** value

- **VUID-vkCmdSetFrontFace-commandBuffer-recording**
  **commandBuffer** must be in the recording state

- **VUID-vkCmdSetFrontFace-commandBuffer-cmdpool**
  The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations

- **VUID-vkCmdSetFrontFace-videocoding**
  This command must only be called outside of a video coding scope

---

**Host Synchronization**

- Host access to **commandBuffer** must be externally synchronized

- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Once the orientation of triangles is determined, they are culled according to the **VkPipelineRasterizationStateCreateInfo::cullMode** property of the currently active pipeline. Possible
values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCullModeFlagBits {
    VK_CULL_MODE_NONE = 0,
    VK_CULL_MODE_FRONT_BIT = 0x00000001,
    VK_CULL_MODE_BACK_BIT = 0x00000002,
    VK_CULL_MODE_FRONT_AND_BACK = 0x00000003,
} VkCullModeFlagBits;
```

- **VK_CULL_MODE_NONE** specifies that no triangles are discarded
- **VK_CULL_MODE_FRONT_BIT** specifies that front-facing triangles are discarded
- **VK_CULL_MODE_BACK_BIT** specifies that back-facing triangles are discarded
- **VK_CULL_MODE_FRONT_AND_BACK** specifies that all triangles are discarded.

Following culling, fragments are produced for any triangles which have not been discarded.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCullModeFlags;
```

**VkCullModeFlags** is a bitmask type for setting a mask of zero or more **VkCullModeFlagBits**.

To **dynamically set** the cull mode, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetCullMode(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetCullModeEXT(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **cullMode** specifies the cull mode property to use for drawing.

This command sets the cull mode for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_CULL_MODE** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineRasterizationStateCreateInfo::cullMode** value used to create the currently active pipeline.
Valid Usage (Implicit)

- **VUID-vkCmdSetCullMode-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetCullMode-cullMode-parameter**
  
  `cullMode` must be a valid combination of `VkCullModeFlagBits` values

- **VUID-vkCmdSetCullMode-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetCullMode-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetCullMode-videocoding**
  
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

</tbody>
</table>

The rule for determining which fragments are produced by polygon rasterization is called *point sampling*. The two-dimensional projection obtained by taking the x and y framebuffer coordinates of the polygon’s vertices is formed. Fragments are produced for any fragment area groups of pixels for which any sample points lie inside of this polygon. Coverage bits that correspond to sample points that satisfy the point sampling criteria are 1, other coverage bits are 0. Special treatment is given to a sample whose sample location lies on a polygon edge. In such a case, if two polygons lie on either side of a common edge (with identical endpoints) on which a sample point lies, then exactly one of the polygons must result in a covered sample for that fragment during rasterization. As for the data associated with each fragment produced by rasterizing a polygon, we begin by specifying how these values are produced for fragments in a triangle.

*Barycentric coordinates* are a set of three numbers, a, b, and c, each in the range [0,1], with \( a + b + c = 1 \). These coordinates uniquely specify any point \( p \) within the triangle or on the triangle’s boundary as
\[ p = a \ p_a + b \ p_b + c \ p_c, \]

where \( p_a, p_b, \) and \( p_c \) are the vertices of the triangle. \( a, b, \) and \( c \) are determined by:

\[
a = \frac{A(p \ p_b \ p_c)}{A(p_a \ p_b \ p_c)}, \quad b = \frac{A(p \ p_a \ p_c)}{A(p_a \ p_b \ p_c)}, \quad c = \frac{A(p \ p_a \ p_b)}{A(p_a \ p_b \ p_c)},
\]

where \( A(lmn) \) denotes the area in framebuffer coordinates of the triangle with vertices \( l, m, \) and \( n. \)

Denote an associated datum at \( p_a, p_b, \) or \( p_c \) as \( f_a, f_b, \) or \( f_c, \) respectively.

**Perspective interpolation** for a triangle interpolates three values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the triangle’s clip coordinates. An interpolated value \( f \) can be determined by

\[
f = \frac{a \ f_a / w_a + b \ f_b / w_b + c \ f_c / w_c}{a / w_a + b / w_b + c / w_c}
\]

where \( w_a, w_b, \) and \( w_c \) are the clip \( w \) coordinates of \( p_a, p_b, \) and \( p_c, \) respectively. \( a, b, \) and \( c \) are the barycentric coordinates of the location at which the data are produced.

**Linear interpolation** for a triangle directly interpolates three values, and an interpolated value \( f \) can be determined by

\[
f = a \ f_a + b \ f_b + c \ f_c
\]

where \( f_a, f_b, \) and \( f_c \) are the data associated with \( p_a, p_b, \) and \( p_c, \) respectively.

The clip coordinate \( w \) for a sample is determined using perspective interpolation. The depth value \( z \) for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by **Interpolation decorations**.

For a polygon with more than three edges, such as are produced by clipping a triangle, a convex combination of the values of the datum at the polygon’s vertices **must** be used to obtain the value assigned to each fragment produced by the rasterization algorithm. That is, it **must** be the case that at every fragment

\[
f = \sum_{i=1}^{n} a_i f_i
\]

where \( n \) is the number of vertices in the polygon and \( f_i \) is the value of \( f \) at vertex \( i. \) For each \( i, 0 \leq a_i \leq 1 \) and \( \sum_{i=1}^{n} a_i = 1. \) The values of \( a_i \) **may** differ from fragment to fragment, but at vertex \( i, a_i = 1 \) and \( a_j = 0 \) for \( j \neq i. \)

**Note**

One algorithm that achieves the required behavior is to triangulate a polygon (without adding any vertices) and then treat each triangle individually as already discussed. A scan-line rasterizer that linearly interpolates data along each edge
and then linearly interpolates data across each horizontal span from edge to edge
also satisfies the restrictions (in this case the numerator and denominator of
perspective interpolation are iterated independently, and a division is performed
for each fragment).

27.12.2. Polygon Mode

Possible values of the VkPipelineRasterizationStateCreateInfo::polygonMode property of the currently
active pipeline, specifying the method of rasterization for polygons, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPolygonMode {
    VK_POLYGON_MODE_FILL = 0,
    VK_POLYGON_MODE_LINE = 1,
    VK_POLYGON_MODE_POINT = 2,

    // Provided by VK_NV_fill_rectangle
    VK_POLYGON_MODE_FILL_RECTANGLE_NV = 1000153000,
} VkPolygonMode;
```

- **VK_POLYGON_MODE_POINT** specifies that polygon vertices are drawn as points.
- **VK_POLYGON_MODE_LINE** specifies that polygon edges are drawn as line segments.
- **VK_POLYGON_MODE_FILL** specifies that polygons are rendered using the polygon rasterization rules
  in this section.
- **VK_POLYGON_MODE_FILL_RECTANGLE_NV** specifies that polygons are rendered using polygon
  rasterization rules, modified to consider a sample within the primitive if the sample location is
  inside the axis-aligned bounding box of the triangle after projection. Note that the barycentric
  weights used in attribute interpolation can extend outside the range [0,1] when these primitives
  are shaded. Special treatment is given to a sample position on the boundary edge of the
  bounding box. In such a case, if two rectangles lie on either side of a common edge (with
  identical endpoints) on which a sample position lies, then exactly one of the triangles must
  produce a fragment that covers that sample during rasterization.

Polygons rendered in **VK_POLYGON_MODE_FILL_RECTANGLE_NV** mode may be clipped by the frustum
or by user clip planes. If clipping is applied, the triangle is culled rather than clipped.

Area calculation and facingness are determined for **VK_POLYGON_MODE_FILL_RECTANGLE_NV** mode
using the triangle's vertices.

These modes affect only the final rasterization of polygons: in particular, a polygon's vertices are
shaded and the polygon is clipped and possibly culled before these modes are applied.

To dynamically set the polygon mode, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetPolygonModeEXT(
    VkCommandBuffer commandBuffer,
```
commandBuffer is the command buffer into which the command will be recorded.

polygonMode specifies polygon mode.

This command sets the polygon mode for subsequent drawing commands when the graphics pipeline is created with \texttt{VK_DYNAMIC_STATE_POLYGON_MODE_EXT} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. Otherwise, this state is specified by the \texttt{VkPipelineRasterizationStateCreateInfo::polygonMode} value used to create the currently active pipeline.

### Valid Usage

- \texttt{VUID-vkCmdSetPolygonModeEXT-extendedDynamicState3PolygonMode-07422}
  The \texttt{extendedDynamicState3PolygonMode} feature \texttt{must} be enabled

- \texttt{VUID-vkCmdSetPolygonModeEXT-fillModeNonSolid-07424}
  If the \texttt{fillTypeNonSolid} feature is not enabled, \texttt{polygonMode} \texttt{must} be \texttt{VK_POLYGON_MODE_FILL} or \texttt{VK_POLYGON_MODE_FILL_RECTANGLE_NV}

- \texttt{VUID-vkCmdSetPolygonModeEXT-polygonMode-07425}
  If the \texttt{VK_NV_fill_rectangle} extension is not enabled, \texttt{polygonMode} \texttt{must} not be \texttt{VK_POLYGON_MODE_FILL_RECTANGLE_NV}

### Valid Usage (Implicit)

- \texttt{VUID-vkCmdSetPolygonModeEXT-commandBuffer-parameter}
  \texttt{commandBuffer} \texttt{must} be a valid \texttt{VkCommandBuffer} handle

- \texttt{VUID-vkCmdSetPolygonModeEXT-polygonMode-parameter}
  \texttt{polygonMode} \texttt{must} be a valid \texttt{VkPolygonMode} value

- \texttt{VUID-vkCmdSetPolygonModeEXT-commandBuffer-recording}
  \texttt{commandBuffer} \texttt{must} be in the \texttt{recording state}

- \texttt{VUID-vkCmdSetPolygonModeEXT-commandBuffer-cmdpool}
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \texttt{must} support graphics operations

- \texttt{VUID-vkCmdSetPolygonModeEXT-videocoding}
  This command \texttt{must} only be called outside of a video coding scope

### Host Synchronization

- Host access to \texttt{commandBuffer} \texttt{must} be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \texttt{must} be externally synchronized
27.12.3. Depth Bias

The depth values of all fragments generated by the rasterization of a polygon can be biased (offset) by a single depth bias value \( a \) that is computed for that polygon.

**Depth Bias Enable**

The depth bias computation is enabled by the `depthBiasEnable` set with `vkCmdSetDepthBiasEnable` and `vkCmdSetDepthBiasEnableEXT`, or the corresponding `VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active pipeline. If the depth bias enable is `VK_FALSE`, no bias is applied and the fragment’s depth values are unchanged.

To dynamically enable whether to bias fragment depth values, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthBiasEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBiasEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetDepthBiasEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBiasEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasEnable` controls whether to bias fragment depth values.

This command sets the depth bias enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active pipeline.
Valid Usage (Implicit)

- VUID-vkCmdSetDepthBiasEnable-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDepthBiasEnable-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetDepthBiasEnable-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetDepthBiasEnable-videocoding
  
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Depth Bias Computation

The depth bias depends on three parameters:

- `depthBiasSlopeFactor` scales the maximum depth slope \( m \) of the polygon

- `depthBiasConstantFactor` scales the minimum resolvable difference \( r \) of the depth attachment

- The scaled terms are summed to produce a value which is then clamped to a minimum or maximum value specified by `depthBiasClamp`

`depthBiasSlopeFactor, depthBiasConstantFactor, and depthBiasClamp can each be positive, negative, or zero. These parameters are set as described for `vkCmdSetDepthBias` below.`

The maximum depth slope \( m \) of a triangle is

\[
m = \sqrt{\left(\frac{\partial Z}{\partial x_f}\right)^2 + \left(\frac{\partial Z}{\partial y_f}\right)^2}
\]
where \((x_0, y_0, z_0)\) is a point on the triangle. \(m\) may be approximated as

\[
m = \max\left(\frac{\partial z_f}{\partial x_f}, \frac{\partial z_f}{\partial y_f}\right).
\]

The minimum resolvable difference \(r\) is a parameter that depends on the depth attachment representation. It is the smallest difference in framebuffer coordinate \(z\) values that is guaranteed to remain distinct throughout polygon rasterization and in the depth attachment. All pairs of fragments generated by the rasterization of two polygons with otherwise identical vertices, but \(z_f\) values that differ by \(r\), will have distinct depth values.

For fixed-point depth attachment representations, \(r\) is constant throughout the range of the entire depth attachment. Its value is implementation-dependent but must be at most

\[r = 2 \times 2^n\]

for an \(n\)-bit buffer. For floating-point depth attachment, there is no single minimum resolvable difference. In this case, the minimum resolvable difference for a given polygon is dependent on the maximum exponent, \(e\), in the range of \(z\) values spanned by the primitive. If \(n\) is the number of bits in the floating-point mantissa, the minimum resolvable difference, \(r\), for the given primitive is defined as

\[r = 2^{e-n}\]

If a triangle is rasterized using the `VK_POLYGON_MODE_FILL_RECTANGLE_NV` polygon mode, then this minimum resolvable difference may not be resolvable for samples outside of the triangle, where the depth is extrapolated.

If no depth attachment is present, \(r\) is undefined.

The bias value \(o\) for a polygon is

\[
o = \text{dbclamp}(m \times \text{depthBiasSlopeFactor} + r \times \text{depthBiasConstantFactor})
\]

where

\[
\text{dbclamp}(x) = \begin{cases} 
  \min(x, \text{depthBiasClamp}) & \text{depthBiasClamp} = 0 \text{ or } \text{NaN} \\
  \max(x, \text{depthBiasClamp}) & \text{depthBiasClamp} > 0 \\
  \min(x, \text{depthBiasClamp}) & \text{depthBiasClamp} < 0
\end{cases}
\]

\(m\) is computed as described above. If the depth attachment uses a fixed-point representation, \(m\) is a function of depth values in the range \([0,1]\), and \(o\) is applied to depth values in the same range.

Depth bias is applied to triangle topology primitives received by the rasterizer regardless of polygon mode. Depth bias may also be applied to line and point topology primitives received by the rasterizer.

To dynamically set the depth bias parameters, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBias()
```
VkCommandBuffer commandBuffer,
float depthBiasConstantFactor,
float depthBiasClamp,
float depthBiasSlopeFactor);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasConstantFactor` is a scalar factor controlling the constant depth value added to each fragment.
- `depthBiasClamp` is the maximum (or minimum) depth bias of a fragment.
- `depthBiasSlopeFactor` is a scalar factor applied to a fragment's slope in depth bias calculations.

This command sets the depth bias parameters for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineRasterizationStateCreateInfo::depthBiasConstantFactor`, `depthBiasClamp`, and `depthBiasSlopeFactor` values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetDepthBias-depthBiasClamp-00790
  If the `depthBiasClamp` feature is not enabled, `depthBiasClamp` must be 0.0

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthBias-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBias-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthBias-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthBias-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
27.12.4. Conservative Rasterization

If the pNext chain of `VkPipelineRasterizationStateCreateInfo` includes a `VkPipelineRasterizationConservativeStateCreateInfoEXT` structure, then that structure includes parameters controlling conservative rasterization.

`VkPipelineRasterizationConservativeStateCreateInfoEXT` is defined as:

```c
// Provided by VK_EXT_conservative_rasterization
typedef struct VkPipelineRasterizationConservativeStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationConservativeStateCreateFlagsEXT flags;
    VkConservativeRasterizationModeEXT conservativeRasterizationMode;
    float extraPrimitiveOverestimationSize;
} VkPipelineRasterizationConservativeStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `conservativeRasterizationMode` is the conservative rasterization mode to use.
- `extraPrimitiveOverestimationSize` is the extra size in pixels to increase the generating primitive during conservative rasterization at each of its edges in X and Y equally in screen space beyond the base overestimation specified in `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize`. If `conservativeRasterizationMode` is not `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, this value is ignored.

If this structure is not included in the `pNext` chain, `conservativeRasterizationMode` is considered to be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`, and and conservative rasterization is disabled.

Polygon rasterization can be made conservative by setting `conservativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` or `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` in `VkPipelineRasterizationConservativeStateCreateInfoEXT`. 

---

Note

1917
If `conservativePointAndLineRasterization` is supported, conservative rasterization can be applied to line and point primitives, otherwise it must be disabled.

## Valid Usage

- **VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-extraPrimitiveOverestimationSize-01769**
  
  `extraPrimitiveOverestimationSize` must be in the range of 0.0 to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::maxExtraPrimitiveOverestimationSize` inclusive

## Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_CONSERVATIVE_STATE_CREATE_INFO_EXT`

- **VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-flags-zerobitmask**
  
  `flags` must be 0

- **VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-conservativeRasterizationMode-parameter**
  
  `conservativeRasterizationMode` must be a valid `VkConservativeRasterizationModeEXT` value

// Provided by VK_EXT_conservative_rasterization

typedef VkFlags VkPipelineRasterizationConservativeStateCreateFlagsEXT;

` VkPipelineRasterizationConservativeStateCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode`, specifying the conservative rasterization mode are:

// Provided by VK_EXT_conservative_rasterization

typedef enum VkConservativeRasterizationModeEXT {
  VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT = 0,
  VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT = 1,
  VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT = 2,
} VkConservativeRasterizationModeEXT;

- **VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT** specifies that conservative rasterization is disabled and rasterization proceeds as normal.

- **VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT** specifies that conservative rasterization is enabled in overestimation mode.
• **VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT** specifies that conservative rasterization is enabled in underestimation mode.

To *dynamically set* the `conservativeRasterizationMode`, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetConservativeRasterizationModeEXT(
    VkCommandBuffer commandBuffer,
    VkConservativeRasterizationModeEXT conservativeRasterizationMode);
```

• `commandBuffer` is the command buffer into which the command will be recorded.

• `conservativeRasterizationMode` specifies the `conservativeRasterizationMode` state.

This command sets the `conservativeRasterizationMode` state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode` value used to create the currently active pipeline.

### Valid Usage

• VUID-vkCmdSetConservativeRasterizationModeEXT-extendedDynamicState3ConservativeRasterizationMode-07426
  The `extendedDynamicState3ConservativeRasterizationMode` feature *must* be enabled

### Valid Usage (Implicit)

• VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-parameter
  `commandBuffer` *must* be a valid `VkCommandBuffer` handle

• VUID-vkCmdSetConservativeRasterizationModeEXT-conservativeRasterizationMode-parameter
  `conservativeRasterizationMode` *must* be a valid `VkConservativeRasterizationModeEXT` value

• VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-recording
  `commandBuffer` *must* be in the recording state

• VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from *must* support graphics operations

• VUID-vkCmdSetConservativeRasterizationModeEXT-videocoding
  This command *must* only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>

<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the `extraPrimitiveOverestimationSize`, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetExtraPrimitiveOverestimationSizeEXT(
    VkCommandBuffer commandBuffer,
    float extraPrimitiveOverestimationSize);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `extraPrimitiveOverestimationSize` specifies the `extraPrimitiveOverestimationSize`.

This command sets the `extraPrimitiveOverestimationSize` for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationConservativeStateCreateInfoEXT::extraPrimitiveOverestimationSize` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-extendedDynamicState3ExtraPrimitiveOverestimationSize-07427
  The `extendedDynamicState3ExtraPrimitiveOverestimationSize` feature must be enabled
- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-extraPrimitiveOverestimationSize-07428
  `extraPrimitiveOverestimationSize` must be in the range of 0.0 to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::maxExtraPrimitiveOverestimationSize` inclusive
Valid Usage (Implicit)

- **VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-videocoding**
  
  This command must only be called outside of a video coding scope.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

When overestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made whether any portion of the pixel (including its edges and corners) is covered by the primitive. If any portion of the pixel is covered, then all bits of the coverage mask for the fragment corresponding to that pixel are enabled. If the render pass has a fragment density map attachment and any bit of the coverage mask for the fragment is enabled, then all bits of the coverage mask for the fragment are enabled.

For the purposes of evaluating which pixels are covered by the primitive, implementations can increase the size of the primitive by up to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize` pixels at each of the primitive edges. This may increase the number of fragments generated by this primitive and represents an overestimation of the pixel coverage.

This overestimation size can be increased further by setting the `extraPrimitiveOverestimationSize` value above 0.0 in steps of `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSizeGranularity` up to and including `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSize`. This may further increase the number of fragments generated by this primitive.
The actual precision of the overestimation size used for conservative rasterization may vary between implementations and produce results that only approximate the `primitiveOverestimationSize` and `extraPrimitiveOverestimationSizeGranularity` properties. Implementations may especially vary these approximations when the render pass has a fragment density map and the fragment area covers multiple pixels.

For triangles if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, fragments will be generated if the primitive area covers any portion of any pixel inside the fragment area, including their edges or corners. The tie-breaking rule described in Basic Polygon Rasterization does not apply during conservative rasterization and coverage is set for all fragments generated from shared edges of polygons. Degenerate triangles that evaluate to zero area after rasterization, even for pixels containing a vertex or edge of the zero-area polygon, will be culled if `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateTrianglesRasterized` is `VK_FALSE` or will generate fragments if `degenerateTrianglesRasterized` is `VK_TRUE`. The fragment input values for these degenerate triangles take their attribute and depth values from the provoking vertex. Degenerate triangles are considered backfacing and the application can enable backface culling if desired. Triangles that are zero area before rasterization may be culled regardless.

For lines if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, and the implementation sets `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization` to `VK_TRUE`, fragments will be generated if the line covers any portion of any pixel inside the fragment area, including their edges or corners. Degenerate lines that evaluate to zero length after rasterization will be culled if `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateLinesRasterized` is `VK_FALSE` or will generate fragments if `degenerateLinesRasterized` is `VK_TRUE`. The fragments input values for these degenerate lines take their attribute and depth values from the provoking vertex. Lines that are zero length before rasterization may be culled regardless.

For points if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, and the implementation sets `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization` to `VK_TRUE`, fragments will be generated if the point square covers any portion of any pixel inside the fragment area, including their edges or corners.

When underestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made whether all of the pixel (including its edges and corners) is covered by the primitive. If the entire pixel is covered, then a fragment is generated with all bits of its coverage mask corresponding to the pixel enabled, otherwise the pixel is not considered covered even if some portion of the pixel is covered. The fragment is discarded if no pixels inside the fragment area are considered covered. If the render pass has a fragment density map attachment and any pixel inside the fragment area is not considered covered, then the fragment is discarded even if some pixels are considered covered.

For triangles, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if any pixel inside the fragment area is fully covered by the generating primitive, including its edges and corners.

For lines, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will be generated if any pixel inside the fragment area, including its edges and corners, are entirely covered by the line.
For points, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if the point square covers the entirety of any pixel square inside the fragment area, including its edges or corners.

If the render pass has a fragment density map and `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if the entirety of all pixels inside the fragment area are covered by the generating primitive, line, or point.

For both overestimate and underestimate conservative rasterization modes a fragment has all of its pixel squares fully covered by the generating primitive **must** set `FullyCoveredEXT` to `VK_TRUE` if the implementation enables the `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::fullyCoveredFragmentShaderInputVariable` feature.

When the use of a shading rate image or setting the fragment shading rate results in fragments covering multiple pixels, coverage for conservative rasterization is still evaluated on a per-pixel basis and may result in fragments with partial coverage. For fragment shader inputs decorated with `FullyCoveredEXT`, a fragment is considered fully covered if and only if all pixels in the fragment are fully covered by the generating primitive.
Chapter 28. Fragment Operations

Fragments produced by rasterization go through a number of operations to determine whether or how values produced by fragment shading are written to the framebuffer.

The following fragment operations adhere to rasterization order, and are typically performed in this order:

1. Discard rectangles test
2. Scissor test
3. Exclusive scissor test
4. Sample mask test
5. Certain Fragment shading operations:
   - Sample Mask Accesses
   - Depth Replacement
   - Stencil Reference Replacement
   - Interlocked Operations
6. Multisample coverage
7. Depth bounds test
8. Stencil test
9. Depth test
10. Representative fragment test
11. Sample counting
12. Coverage to color
13. Coverage reduction
14. Coverage modulation

The coverage mask generated by rasterization describes the initial coverage of each sample covered by the fragment. Fragment operations will update the coverage mask to add or subtract coverage where appropriate. If a fragment operation results in all bits of the coverage mask being 0, the fragment is discarded, and no further operations are performed. Fragments can also be programmatically discarded in a fragment shader by executing one of

- OpTerminateInvocation
- OpDemoteToHelperInvocationEXT
- OpKill.

When one of the fragment operations in this chapter is described as “replacing” a fragment shader output, that output is replaced unconditionally, even if no fragment shader previously wrote to that output.
If there is a fragment shader and it declares the PostDepthCoverage execution mode, the sample mask test is instead performed after the depth test.

If there is a fragment shader and it declares the EarlyFragmentTests execution mode, fragment shading and multisample coverage operations should instead be performed after sample counting.

If there is a fragment shader which declares the EarlyAndLateFragmentTestsAMD execution mode, and it does not declare the DepthReplacing or StencilRefReplacingEXT execution mode, fragment shading and multisample coverage operations are instead performed after sample counting.

For a pipeline with the following properties:

- a fragment shader is specified
- the fragment shader either specifies EarlyAndLateFragmentTestsAMD or does not write to storage resources;
- the fragment shader specifies the StencilRefReplacingEXT execution mode;
- either
  - the fragment shader specifies the StencilRefUnchangedFrontAMD execution mode;
  - the fragment shader specifies the StencilRefGreaterFrontAMD execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::front.compareOp of VK_COMPARE_OP_GREATER or VK_COMPARE_OP_GREATER_OR_EQUAL; or
  - the fragment shader specifies the StencilRefLessFrontAMD execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::front.compareOp of VK_COMPARE_OP_LESS or VK_COMPARE_OP_LESS_OR_EQUAL; and
- either
  - the fragment shader specifies the StencilRefUnchangedBackAMD execution mode;
  - the fragment shader specifies the StencilRefGreaterBackAMD execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::back.compareOp of VK_COMPARE_OP_GREATER or VK_COMPARE_OP_GREATER_OR_EQUAL; or
  - the fragment shader specifies the StencilRefLessBackAMD execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::back.compareOp of VK_COMPARE_OP_LESS or VK_COMPARE_OP_LESS_OR_EQUAL

an additional stencil test may be performed before fragment shading, using the stencil reference value specified by VkPipelineDepthStencilStateCreateInfo::front.reference or VkPipelineDepthStencilStateCreateInfo::back.reference.

For a pipeline with the following properties:

- a fragment shader is specified
- the fragment shader either specifies EarlyAndLateFragmentTestsAMD or does not write to storage resources;
- the fragment shader specifies the DepthReplacing execution mode; and
- either
the fragment shader specifies the **DepthUnchanged** execution mode;

- the fragment shader specifies the **DepthGreater** execution mode and the pipeline uses a `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` of `VK_COMPARE_OP_GREATER` or `VK_COMPARE_OP_GREATER_OR_EQUAL`; or

- the fragment shader specifies the **DepthLess** execution mode and the pipeline uses a `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` of `VK_COMPARE_OP_LESS` or `VK_COMPARE_OP_LESS_OR_EQUAL`.

The implementation may perform depth bounds test before fragment shading and perform an additional **depth test** immediately after that using the interpolated depth value generated by rasterization.

Once all fragment operations have completed, fragment shader outputs for covered color attachment samples pass through framebuffer operations.

### 28.1. Discard Rectangles Test

The discard rectangle test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a set of **discard rectangles**.

Each discard rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineDiscardRectangleStateCreateInfoEXT` structure during pipeline creation, or dynamically by the `vkCmdSetDiscardRectangleEXT` command.

A given sample is considered inside a discard rectangle if the \(x_i\) is in the range \([VkRect2D::offset.x, VkRect2D::offset.x + VkRect2D::extent.x]\), and \(y_i\) is in the range \([VkRect2D::offset.y, VkRect2D::offset.y + VkRect2D::extent.y]\). If the test is set to be inclusive, samples that are not inside any of the discard rectangles will have their coverage set to \(0\). If the test is set to be exclusive, samples that are inside any of the discard rectangles will have their coverage set to \(0\).

If no discard rectangles are specified, the coverage mask is unmodified by this operation.

The `VkPipelineDiscardRectangleStateCreateInfoEXT` structure is defined as:

```c
typedef struct VkPipelineDiscardRectangleStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDiscardRectangleStateCreateFlagsEXT flags;
    VkDiscardRectangleModeEXT discardRectangleMode;
    uint32_t discardRectangleCount;
    const VkRect2D* pDiscardRectangles;
} VkPipelineDiscardRectangleStateCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
• `discardRectangleMode` is a `VkDiscardRectangleModeEXT` value determining whether the discard rectangle test is inclusive or exclusive.
• `discardRectangleCount` is the number of discard rectangles to use.
• `pDiscardRectangles` is a pointer to an array of `VkRect2D` structures defining discard rectangles.

If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is enabled for a pipeline, the `pDiscardRectangles` member is ignored.

When this structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it defines parameters of the discard rectangle test. If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with a `discardRectangleCount` of 0.

### Valid Usage

- `VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleCount-00582`
  
  `discardRectangleCount` must be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`.

### Valid Usage (Implicit)

- `VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-sType-sType`  
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_DISCARD_RECTANGLE_STATE_CREATE_INFO_EXT`.

- `VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-flags-zerobitmask`  
  
  `flags` must be 0.

- `VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleMode-parameter`  
  
  `discardRectangleMode` must be a valid `VkDiscardRectangleModeEXT` value.

```c
// Provided by VK_EXT_discard_rectangles
typedef VkFlags VkPipelineDiscardRectangleStateCreateFlagsEXT;
```

`VkPipelineDiscardRectangleStateCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

`VkDiscardRectangleModeEXT` values are:

```c
// Provided by VK_EXT_discard_rectangles
typedef enum VkDiscardRectangleModeEXT {
    VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT = 0,
    VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT = 1,
} VkDiscardRectangleModeEXT;
```

- `VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT` specifies that the discard rectangle test is inclusive.
- `VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT` specifies that the discard rectangle test is exclusive.
To dynamically set the discard rectangles, call:

```c
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstDiscardRectangle,
    uint32_t discardRectangleCount,
    const VkRect2D* pDiscardRectangles);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstDiscardRectangle` is the index of the first discard rectangle whose state is updated by the command.
- `discardRectangleCount` is the number of discard rectangles whose state are updated by the command.
- `pDiscardRectangles` is a pointer to an array of `VkRect2D` structures specifying discard rectangles.

The discard rectangle taken from element i of `pDiscardRectangles` replace the current state for the discard rectangle at index `firstDiscardRectangle + i`, for i in [0, `discardRectangleCount`).

This command sets the discard rectangles for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDiscardRectangleStateCreateInfoEXT::pDiscardRectangles` values used to create the currently active pipeline.

**Valid Usage**

- **VUID-vkCmdSetDiscardRectangleEXT-firstDiscardRectangle-00585**
  The sum of `firstDiscardRectangle` and `discardRectangleCount` must be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`

- **VUID-vkCmdSetDiscardRectangleEXT-x-00587**
  The x and y member of `offset` in each `VkRect2D` element of `pDiscardRectangles` must be greater than or equal to 0

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00588**
  Evaluation of `(offset.x + extent.width)` in each `VkRect2D` element of `pDiscardRectangles` must not cause a signed integer addition overflow

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00589**
  Evaluation of `(offset.y + extent.height)` in each `VkRect2D` element of `pDiscardRectangles` must not cause a signed integer addition overflow

- **VUID-vkCmdSetDiscardRectangleEXT-viewportScissor2D-04788**
  If this command is recorded in a secondary command buffer with `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled, then this function must not be called
Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDiscardRectangleEXT-pDiscardRectangles-parameter
  `pDiscardRectangles` must be a valid pointer to an array of `discardRectangleCount` `VkRect2D` structures

- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-recording
  `commandBuffer` must be in the `recording` state

- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetDiscardRectangleEXT-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetDiscardRectangleEXT-discardRectangleCount-arraylength
  `discardRectangleCount` must be greater than 0

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>

28.2. Scissor Test

The scissor test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a *scissor rectangle* at the index equal to the fragment’s `ViewportIndex`.

Each scissor rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineViewportStateCreateInfo` structure during pipeline creation, or dynamically by the `vkCmdSetScissor` command.

A given sample is considered inside a scissor rectangle if \(x_f\) is in the range \([VkRect2D::offset.x, VkRect2D::offset.x + VkRect2D::extent.x)\), and \(y_f\) is in the range \([VkRect2D::offset.y, VkRect2D::offset.y + VkRect2D::extent.y)\).
Samples with coordinates outside the scissor rectangle at the corresponding ViewportIndex will have their coverage set to 0.

If a render pass transform is enabled, the (offset.x and offset.y) and (extent.width and extent.height) values are transformed as described in render pass transform before participating in the scissor test.

To dynamically set the scissor rectangles, call:

```cpp
// Provided by VK_VERSION_1_0
void vkCmdSetScissor(
    VkCommandBuffer commandBuffer,  // The command buffer into which the command will be recorded.
    uint32_t firstScissor,           // The index of the first scissor whose state is updated by the command.
    uint32_t scissorCount,           // The number of scissors whose rectangles are updated by the command.
    const VkRect2D* pScissors);      // A pointer to an array of VkRect2D structures defining scissor rectangles.
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstScissor` is the index of the first scissor whose state is updated by the command.
- `scissorCount` is the number of scissors whose rectangles are updated by the command.
- `pScissors` is a pointer to an array of VkRect2D structures defining scissor rectangles.

The scissor rectangles taken from element i of `pScissors` replace the current state for the scissor index `firstScissor + i`, for i in [0, `scissorCount`).

This command sets the scissor rectangles for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportStateCreateInfo::pScissors` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetScissor-firstScissor-00592**
  The sum of `firstScissor` and `scissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive.

- **VUID-vkCmdSetScissor-firstScissor-00593**
  If the `multiViewport` feature is not enabled, `firstScissor` must be 0.

- **VUID-vkCmdSetScissor-scissorCount-00594**
  If the `multiViewport` feature is not enabled, `scissorCount` must be 1.

- **VUID-vkCmdSetScissor-x-00595**
  The x and y members of `offset` member of any element of `pScissors` must be greater than or equal to 0.

- **VUID-vkCmdSetScissor-offset-00596**
  Evaluation of `(offset.x + extent.width)` must not cause a signed integer addition overflow for any element of `pScissors`.

- **VUID-vkCmdSetScissor-offset-00597**

1930
Evaluation of \((\text{offset.y} + \text{extent.height})\) must not cause a signed integer addition overflow for any element of \(p\text{Scissors}\)

- VUID-vkCmdSetScissor-viewportScissor2D-04789
  If this command is recorded in a secondary command buffer with \(\text{VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D}\) enabled, then this function must not be called

### Valid Usage (Implicit)

- VUID-vkCmdSetScissor-commandBuffer-parameter
  \(\text{commandBuffer must}\) be a valid \(\text{VkCommandBuffer}\) handle

- VUID-vkCmdSetScissor-pScissors-parameter
  \(p\text{Scissors must}\) be a valid pointer to an array of \(\text{scissorCount}\) \(\text{VkRect2D}\) structures

- VUID-vkCmdSetScissor-commandBuffer-recording
  \(\text{commandBuffer must}\) be in the recording state

- VUID-vkCmdSetScissor-commandBuffer-cmdpool
  The \(\text{VkCommandPool}\) that \(\text{commandBuffer}\) was allocated from must support graphics operations

- VUID-vkCmdSetScissor-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetScissor-scissorCount-arraylength
  \(\text{scissorCount must}\) be greater than 0

### Host Synchronization

- Host access to \(\text{commandBuffer}\) must be externally synchronized

- Host access to the \(\text{VkCommandPool}\) that \(\text{commandBuffer}\) was allocated from must be externally synchronized

#### 28.3. Exclusive Scissor Test

The exclusive scissor test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against an exclusive scissor rectangle at the index equal to the fragment’s \(\text{ViewportIndex}\).
Each exclusive scissor rectangle is defined by a \texttt{VkRect2D}. These values are either set by the \texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV} structure during pipeline creation, or dynamically by the \texttt{vkCmdSetExclusiveScissorNV} command.

A given sample is considered inside an exclusive scissor rectangle if \( x \) is in the range \([\texttt{VkRect2D}::\text{offset}.x, \texttt{VkRect2D}::\text{offset}.x + \texttt{VkRect2D}::\text{extent}.x]\), and \( y \) is in the range \([\texttt{VkRect2D}::\text{offset}.y, \texttt{VkRect2D}::\text{offset}.y + \texttt{VkRect2D}::\text{extent}.y]\). Samples with coordinates inside the exclusive scissor rectangle at the corresponding \texttt{ViewportIndex} will have their coverage set to 0.

If no exclusive scissor rectangles are specified, the coverage mask is unmodified by this operation.

The \texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV} structure is defined as:

\begin{verbatim}
// Provided by VK_NV_scissor_exclusive
typedef struct VkPipelineViewportExclusiveScissorStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t exclusiveScissorCount;
    const VkRect2D* pExclusiveScissors;
} VkPipelineViewportExclusiveScissorStateCreateInfoNV;
\end{verbatim}

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is NULL or a pointer to a structure extending this structure.
- \texttt{exclusiveScissorCount} is the number of exclusive scissor rectangles.
- \texttt{pExclusiveScissors} is a pointer to an array of \texttt{VkRect2D} structures defining exclusive scissor rectangles.

If the \texttt{VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV} dynamic state is enabled for a pipeline, the \texttt{pExclusiveScissors} member is ignored.

When this structure is included in the \texttt{pNext} chain of \texttt{VkGraphicsPipelineCreateInfo}, it defines parameters of the exclusive scissor test. If this structure is not included in the \texttt{pNext} chain, it is equivalent to specifying this structure with a \texttt{exclusiveScissorCount} of 0.

**Valid Usage**

- VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02027
  If the multiViewport feature is not enabled, \texttt{exclusiveScissorCount} must be 0 or 1.
- VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02028
  \texttt{exclusiveScissorCount} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxViewports}.
- VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02029
  \texttt{exclusiveScissorCount} must be 0 or greater than or equal to the \texttt{viewportCount} member of \texttt{VkPipelineViewportStateCreateInfo}.
Valid Usage (Implicit)

- VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-sType-sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_EXCLUSIVE_SCISSOR_STATE_CREATE_INFO_NV

To **dynamically set** the exclusive scissor rectangles, call:

```c
// Provided by VK_NV_scissor_exclusive
void vkCmdSetExclusiveScissorNV(
    VkCommandBuffer commandBuffer,
    uint32_t firstExclusiveScissor,
    uint32_t exclusiveScissorCount,
    const VkRect2D* pExclusiveScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstExclusiveScissor` is the index of the first exclusive scissor rectangle whose state is updated by the command.
- `exclusiveScissorCount` is the number of exclusive scissor rectangles updated by the command.
- `pExclusiveScissors` is a pointer to an array of `VkRect2D` structures defining exclusive scissor rectangles.

The scissor rectangles taken from element i of `pExclusiveScissors` replace the current state for the scissor index `firstExclusiveScissor + i`, for i in [0, `exclusiveScissorCount`).

This command sets the exclusive scissor rectangles for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportExclusiveScissorStateCreateInfoNV::pExclusiveScissors` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetExclusiveScissorNV-None-02031
  The **exclusiveScissor** feature must be enabled

- VUID-vkCmdSetExclusiveScissorNV-firstExclusiveScissor-02034
  The sum of `firstExclusiveScissor` and `exclusiveScissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- VUID-vkCmdSetExclusiveScissorNV-firstExclusiveScissor-02035
  If the **multiViewport** feature is not enabled, `firstExclusiveScissor` must be 0

- VUID-vkCmdSetExclusiveScissorNV-exclusiveScissorCount-02036
  If the **multiViewport** feature is not enabled, `exclusiveScissorCount` must be 1

- VUID-vkCmdSetExclusiveScissorNV-x-02037
The x and y members of offset in each member of pExclusiveScissors must be greater than or equal to 0

- VUID-vkCmdSetExclusiveScissorNV-offset-02038
  Evaluation of \((\text{offset}.x + \text{extent}.width)\) for each member of pExclusiveScissors must not cause a signed integer addition overflow

- VUID-vkCmdSetExclusiveScissorNV-offset-02039
  Evaluation of \((\text{offset}.y + \text{extent}.height)\) for each member of pExclusiveScissors must not cause a signed integer addition overflow

### Valid Usage (Implicit)

- VUID-vkCmdSetExclusiveScissorNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetExclusiveScissorNV-pExclusiveScissors-parameter
  pExclusiveScissors must be a valid pointer to an array of exclusiveScissorCount VkRect2D structures

- VUID-vkCmdSetExclusiveScissorNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetExclusiveScissorNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetExclusiveScissorNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetExclusiveScissorNV-exclusiveScissorCount-arraylength
  exclusiveScissorCount must be greater than 0

### Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

28.4. Sample Mask Test

The sample mask test compares the coverage mask for a fragment with the sample mask defined by VkPipelineMultisampleStateCreateInfo::pSampleMask.

To dynamically set the sample mask, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetSampleMaskEXT(
    VkCommandBuffer commandBuffer,
    VkSampleCountFlagBits samples,
    const VkSampleMask* pSampleMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `samples` specifies the number of sample bits in the `pSampleMask`.
- `pSampleMask` is a pointer to an array of VkSampleMask values, where the array size is based on the `samples` parameter.

This command sets the sample mask for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_SAMPLE_MASK_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineMultisampleStateCreateInfo::pSampleMask value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetSampleMaskEXT-extendedDynamicState3SampleMask-07342
  The extendedDynamicState3SampleMask feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetSampleMaskEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetSampleMaskEXT-samples-parameter
  samples must be a valid VkSampleCountFlagBits value
- VUID-vkCmdSetSampleMaskEXT-pSampleMask-parameter
  pSampleMask must be a valid pointer to an array of \( \frac{\text{samples}}{2} \) VkSampleMask values
- VUID-vkCmdSetSampleMaskEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetSampleMaskEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetSampleMaskEXT-videocoding
This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to *commandBuffer* **must** be externally synchronized
- Host access to the *VkCommandPool* that *commandBuffer* was allocated from **must** be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Each bit of the coverage mask is associated with a sample index as described in the rasterization chapter. If the bit in *VkPipelineMultisampleStateCreateInfo::pSampleMask* which is associated with that same sample index is set to 0, the coverage mask bit is set to 0.

### 28.5. Fragment Shading

**Fragment shaders** are invoked for each fragment, or as **helper invocations**.

Most operations in the fragment shader are not performed in **rasterization order**, with exceptions called out in the following sections.

For fragment shaders invoked by fragments, the following rules apply:

- A fragment shader **must** not be executed if a **fragment operation** that executes before fragment shading discards the fragment.
- A fragment shader **may** not be executed if:
  - An implementation determines that another fragment shader, invoked by a subsequent primitive in **primitive order**, overwrites all results computed by the shader (including writes to storage resources).
  - Any other **fragment operation** discards the fragment, and the shader does not write to any storage resources.
- Otherwise, at least one fragment shader **must** be executed.
  - If **sample shading** is enabled and multiple invocations per fragment are **required**, additional invocations **must** be executed as specified.
  - If a **shading rate image** is used and multiple invocations per fragment are **required**, additional invocations **must** be executed as specified.
Each covered sample must be included in at least one fragment shader invocation.

If no fragment shader is included in the pipeline, no fragment shader is executed, and undefined values may be written to all color attachment outputs during this fragment operation.

Note

Multiple fragment shader invocations may be executed for the same fragment for any number of implementation-dependent reasons. When there is more than one fragment shader invocation per fragment, the association of samples to invocations is implementation-dependent. Stores and atomics performed by these additional invocations have the normal effect.

For example, if the subpass includes multiple views in its view mask, a fragment shader may be invoked separately for each view.

Similarly, if the render pass has a fragment density map attachment, more than one fragment shader invocation may be invoked for each covered sample. Such additional invocations are only produced if VkPhysicalDeviceFragmentDensityMapPropertiesEXT::fragmentDensityInvocations is VK_TRUE. Implementations may generate these additional fragment shader invocations in order to make transitions between fragment areas with different fragment densities more smooth.

28.5.1. Sample Mask

Reading from the SampleMask built-in in the Input storage class will return the coverage mask for the current fragment as calculated by fragment operations that executed prior to fragment shading.

If sample shading is enabled, fragment shaders will only see values of 1 for samples being shaded - other bits will be 0.

Each bit of the coverage mask is associated with a sample index as described in the rasterization chapter. If the bit in SampleMask which is associated with that same sample index is set to 0, that coverage mask bit is set to 0.

Values written to the SampleMask built-in in the Output storage class will be used by the multisample coverage operation, with the same encoding as the input built-in.

28.5.2. Depth Replacement

Writing to the FragDepth built-in will replace the fragment's calculated depth values for each sample in the input SampleMask. Depth testing performed after the fragment shader for this fragment will use this new value as zf. 

28.5.3. Stencil Reference Replacement

Writing to the FragStencilRefEXT built-in will replace the fragment's stencil reference value for each sample in the input SampleMask. Stencil testing performed after the fragment shader for this fragment will use this new value as sr.
28.5.4. Interlocked Operations

OpBeginInvocationInterlockEXT and OpEndInvocationInterlockEXT define a section of a fragment shader which imposes additional ordering constraints on operations performed within them. These operations are defined as interlocked operations. How interlocked operations are ordered against other fragment shader invocations depends on the specified execution modes.

If the ShadingRateInterlockOrderedEXT execution mode is specified, any interlocked operations in a fragment shader must happen before interlocked operations in fragment shader invocations that execute later in rasterization order and cover at least one sample in the same fragment area, and must happen after interlocked operations in a fragment shader that executes earlier in rasterization order and cover at least one sample in the same fragment area.

If the ShadingRateInterlockUnorderedEXT execution mode is specified, any interlocked operations in a fragment shader must happen before or after interlocked operations in fragment shader invocations that execute earlier or later in rasterization order and cover at least one sample in the same fragment area.

If the PixelInterlockOrderedEXT execution mode is specified, any interlocked operations in a fragment shader must happen before interlocked operations in fragment shader invocations that execute later in rasterization order and cover at least one sample in the same pixel, and must happen after interlocked operations in a fragment shader that executes earlier in rasterization order and cover at least one sample in the same pixel.

If the PixelInterlockUnorderedEXT execution mode is specified, any interlocked operations in a fragment shader must happen before or after interlocked operations in fragment shader invocations that execute earlier or later in rasterization order and cover at least one sample in the same pixel.

If the SampleInterlockOrderedEXT execution mode is specified, any interlocked operations in a fragment shader must happen before interlocked operations in fragment shader invocations that execute later in rasterization order and cover at least one of the same samples, and must happen after interlocked operations in a fragment shader that executes earlier in rasterization order and cover at least one of the same samples.

If the SampleInterlockUnorderedEXT execution mode is specified, any interlocked operations in a fragment shader must happen before or after interlocked operations in fragment shader invocations that execute earlier or later in rasterization order and cover at least one of the same samples.

28.6. Multisample Coverage

If a fragment shader is active and its entry point's interface includes a built-in output variable decorated with SampleMask, but not OverrideCoverageNV, the coverage mask is ANDed with the bits of the SampleMask built-in to generate a new coverage mask. If the SampleMask built-in is also decorated with OverrideCoverageNV, the coverage mask is replaced with the mask bits set in the shader. If sample shading is enabled, bits written to SampleMask corresponding to samples that are not being shaded by the fragment shader invocation are ignored. If no fragment shader is active, or if the active fragment shader does not include SampleMask in its interface, the coverage mask is not
modified.

Next, the fragment alpha value and coverage mask are modified based on the line coverage factor if the `lineRasterizationMode` member of the `VkPipelineRasterizationStateCreateInfo` structure is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, and the `alphaToCoverageEnable` and `alphaToOneEnable` members of the `VkPipelineMultisampleStateCreateInfo` structure.

To **dynamically set** the `alphaToOneEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetAlphaToCoverageEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 alphaToCoverageEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `alphaToCoverageEnable` specifies the `alphaToCoverageEnable` state.

This command sets the `alphaToCoverageEnable` state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::alphaToCoverageEnable` value used to create the currently active pipeline.

**Valid Usage**

- **VUID-vkCmdSetAlphaToCoverageEnableEXT-extendedDynamicState3AlphaToCoverageEnable-07343**
  The `extendedDynamicState3AlphaToCoverageEnable` feature **must** be enabled
- **VUID-vkCmdSetAlphaToCoverageEnableEXT-alphaToOne-07344**
  If the `alphaToOne` feature is not enabled, `alphaToOneEnable` **must** be `VK_FALSE`

**Valid Usage (Implicit)**

- **VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state
- **VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- **VUID-vkCmdSetAlphaToCoverageEnableEXT-videocoding**
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To **dynamically set** the `alphaToOneEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetAlphaToOneEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 alphaToOneEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `alphaToOneEnable` specifies the `alphaToOneEnable` state.

This command sets the `alphaToOneEnable` state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::alphaToOneEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetAlphaToOneEnableEXT-extendedDynamicState3AlphaToOneEnable-07345
  The `extendedDynamicState3AlphaToOneEnable` feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdSetAlphaToOneEnableEXT-videocoding
  This command must only be called outside of a video coding scope.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

All alpha values in this section refer only to the alpha component of the fragment shader output that has a Location and Index decoration of zero (see the Fragment Output Interface section). If that shader output has an integer or unsigned integer type, then these operations are skipped.

If the `lineRasterizationMode` member of the `VkPipelineRasterizationStateCreateInfo` structure is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT` and the fragment came from a line segment, then the alpha value is replaced by multiplying it by the coverage factor for the fragment computed during smooth line rasterization.

If `alphaToCoverageEnable` is enabled, a temporary coverage mask is generated where each bit is determined by the fragment's alpha value, which is ANDed with the fragment coverage mask.

No specific algorithm is specified for converting the alpha value to a temporary coverage mask. It is intended that the number of 1's in this value be proportional to the alpha value (clamped to [0,1]), with all 1's corresponding to a value of 1.0 and all 0's corresponding to 0.0. The algorithm may be different at different framebuffer coordinates.

**Note**

Using different algorithms at different framebuffer coordinates may help to avoid artifacts caused by regular coverage sample locations.

Finally, if `alphaToOneEnable` is enabled, each alpha value is replaced by the maximum representable alpha value for fixed-point color attachments, or by 1.0 for floating-point attachments. Otherwise, the alpha values are not changed.
28.7. Depth and Stencil Operations

Pipeline state controlling the depth bounds tests, stencil test, and depth test is specified through the members of the VkPipelineDepthStencilStateCreateInfo structure.

The VkPipelineDepthStencilStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDepthStencilStateCreateInfo {
    VkStructureType                     sType;
    const void*                          pNext;
    VkPipelineDepthStencilStateCreateFlags flags;
    VkBool32                             depthTestEnable;
    VkBool32                             depthWriteEnable;
    VkCompareOp                          depthCompareOp;
    VkBool32                             depthBoundsTestEnable;
    VkBool32                             stencilTestEnable;
    VkStencilOpState                    front;
    VkStencilOpState                    back;
    float                                minDepthBounds;
    float                                maxDepthBounds;
} VkPipelineDepthStencilStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkPipelineDepthStencilStateCreateFlagBits specifying additional depth/stencil state information.
- `depthTestEnable` controls whether depth testing is enabled.
- `depthWriteEnable` controls whether depth writes are enabled when `depthTestEnable` is VK_TRUE. Depth writes are always disabled when `depthTestEnable` is VK_FALSE.
- `depthCompareOp` is a VkCompareOp value specifying the comparison operator to use in the Depth Comparison step of the depth test.
- `depthBoundsTestEnable` controls whether depth bounds testing is enabled.
- `stencilTestEnable` controls whether stencil testing is enabled.
- `front` and `back` control the parameters of the stencil test.
- `minDepthBounds` is the minimum depth bound used in the depth bounds test.
- `maxDepthBounds` is the maximum depth bound used in the depth bounds test.

Valid Usage

- VUID-VkPipelineDepthStencilStateCreateInfo-depthBoundsTestEnable-00598
  If the depthBounds feature is not enabled, `depthBoundsTestEnable` must be VK_FALSE.
- VUID-VkPipelineDepthStencilStateCreateInfo-separateStencilMaskRef-04453
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::separateStencilMaskRef` is `VK_FALSE`, and the value of `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable` is `VK_TRUE`, and the value of `VkPipelineRasterizationStateCreateInfo::cullMode` is `VK_CULL_MODE_NONE`, the value of `reference` in each of the `VkStencilOpState` structs in `front` and `back` must be the same

- VUID-VkPipelineDepthStencilStateCreateInfo-rasterizationOrderDepthAttachmentAccess-06463
  If the `rasterizationOrderDepthAttachmentAccess` feature is not enabled, flags must not include `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT`

- VUID-VkPipelineDepthStencilStateCreateInfo-rasterizationOrderStencilAttachmentAccess-06464
  If the `rasterizationOrderStencilAttachmentAccess` feature is not enabled, flags must not include `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`

Valid Usage (Implicit)

- VUID-VkPipelineDepthStencilStateCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO`

- VUID-VkPipelineDepthStencilStateCreateInfo-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkPipelineDepthStencilStateCreateInfo-flags-parameter
  `flags` must be a valid combination of `VkPipelineDepthStencilStateCreateFlagBits` values

- VUID-VkPipelineDepthStencilStateCreateInfo-depthCompareOp-parameter
  `depthCompareOp` must be a valid `VkCompareOp` value

- VUID-VkPipelineDepthStencilStateCreateInfo-front-parameter
  `front` must be a valid `VkStencilOpState` structure

- VUID-VkPipelineDepthStencilStateCreateInfo-back-parameter
  `back` must be a valid `VkStencilOpState` structure

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDepthStencilStateCreateFlags;

`VkPipelineDepthStencilStateCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineDepthStencilStateCreateFlagBits`.

Bits which can be set in the `VkPipelineDepthStencilStateCreateInfo::flags` parameter are:

// Provided by VK_EXT_rasterization_order_attachment_access
typedef enum VkPipelineDepthStencilStateCreateFlagBits {
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT = 0x00000002,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_ARM = VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM = VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT,
} VkPipelineDepthStencilStateCreateFlagBits;

• VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT indicates that access to the depth aspects of depth/stencil and input attachments will have implicit framebuffer-local memory dependencies. See renderpass feedback loops for more information.

• VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT indicates that access to the stencil aspects of depth/stencil and input attachments will have implicit framebuffer-local memory dependencies. See renderpass feedback loops for more information.

28.8. Depth Bounds Test

The depth bounds test compares the depth value \( z_a \) in the depth/stencil attachment at each sample's framebuffer coordinates \((x_f, y_f)\) and sample index \(i\) against a set of depth bounds.

The depth bounds are determined by two floating point values defining a minimum \(\text{minDepthBounds}\) and maximum \(\text{maxDepthBounds}\) depth value. These values are either set by the VkPipelineDepthStencilStateCreateInfo structure during pipeline creation, or dynamically by vkCmdSetDepthBoundsTestEnable and vkCmdSetDepthBounds.

A given sample is considered within the depth bounds if \(z_a\) is in the range \([\text{minDepthBounds}, \text{maxDepthBounds}]\). Samples with depth attachment values outside of the depth bounds will have their coverage set to 0.

If the depth bounds test is disabled, or if there is no depth attachment, the coverage mask is unmodified by this operation.
To **dynamically enable or disable** the depth bounds test, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthBoundsTestEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBoundsTestEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthBoundsTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBoundsTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBoundsTestEnable` specifies if the depth bounds test is enabled.

This command sets the depth bounds enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthBoundsTestEnable` value used to create the currently active pipeline.

---

**Valid Usage (Implicit)**

- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetDepthBoundsTestEnable-videocoding
  This command **must** only be called outside of a video coding scope

---

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
To **dynamically set** the depth bounds range, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBounds(
    VkCommandBuffer commandBuffer,
    float minDepthBounds,
    float maxDepthBounds);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `minDepthBounds` is the minimum depth bound.
- `maxDepthBounds` is the maximum depth bound.

This command sets the depth bounds range for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BOUNDS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::minDepthBounds` and `VkPipelineDepthStencilStateCreateInfo::maxDepthBounds` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDepthBounds-minDepthBounds-00600**
  Unless the `VK_EXT_depth_range_unrestricted` extension is enabled, `minDepthBounds` **must** be between 0.0 and 1.0, inclusive

- **VUID-vkCmdSetDepthBounds-maxDepthBounds-00601**
  Unless the `VK_EXT_depth_range_unrestricted` extension is enabled, `maxDepthBounds` **must** be between 0.0 and 1.0, inclusive

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthBounds-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetDepthBounds-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdSetDepthBounds-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

28.9. Stencil Test

The stencil test compares the stencil attachment value $s_a$ in the depth/stencil attachment at each sample’s framebuffer coordinates $(x_f, y_f)$ and sample index $i$ against a stencil reference value.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of coverage samples to stencil attachment samples within the fragment. However, if all samples in the fragment are covered, and the stencil attachment value is updated as a result of this test, all stencil attachment samples will be updated.

If the stencil test is not enabled, as specified by `vkCmdSetStencilTestEnable` or `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable`, or if there is no stencil attachment, the coverage mask is unmodified by this operation.

The stencil test is controlled by one of two sets of stencil-related state, the front stencil state and the back stencil state. Stencil tests and writes use the back stencil state when processing fragments generated by back-facing polygons, and the front stencil state when processing fragments generated by front-facing polygons or any other primitives.

The comparison operation performed is determined by the `VkCompareOp` value set by `vkCmdSetStencilOp::compareOp`, or by `VkStencilOpState::compareOp` during pipeline creation.

The compare mask $s_c$ and stencil reference value $s_r$ of the front or the back stencil state set determine arguments of the comparison operation. $s_c$ is set by the `VkPipelineDepthStencilStateCreateInfo` structure during pipeline creation, or by the `vkCmdSetStencilCompareMask` command. $s_r$ is set by `VkPipelineDepthStencilStateCreateInfo` or by `vkCmdSetStencilReference`. 
s_r and s_a are each independently combined with s_c using a bitwise AND operation to create masked reference and attachment values s'_r and s'_a. s'_r and s'_a are used as the reference and test values, respectively, in the operation specified by the VkCompareOp.

If the comparison evaluates to false, the coverage for the sample is set to 0.

A new stencil value s_g is generated according to a stencil operation defined by VkStencilOp parameters set by vkCmdSetStencilOp or VkPipelineDepthStencilStateCreateInfo. If the stencil test fails, failOp defines the stencil operation used. If the stencil test passes however, the stencil op used is based on the depth test - if it passes, VkPipelineDepthStencilStateCreateInfo::passOp is used, otherwise VkPipelineDepthStencilStateCreateInfo::depthFailOp is used.

The stencil attachment value s_a is then updated with the generated stencil value s_g according to the write mask s_w defined by VkPipelineDepthStencilStateCreateInfo::writeMask as:

\[ s_a = (s_a \& \neg s_w) | (s_g \& s_w) \]

To dynamically enable or disable the stencil test, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetStencilTestEnable(
    VkCommandBuffer commandBuffer,        // Provided by VK_VERSION_1_3
    VkBool32 stencilTestEnable);          // Provided by VK_VERSION_1_3

// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetStencilTestEnableEXT(
    VkCommandBuffer commandBuffer,        // Provided by VK_EXT_extended_dynamic_state
    VkBool32 stencilTestEnable);          // Provided by VK_EXT_extended_dynamic_state

// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetStencilTestEnableEXT(
    VkCommandBuffer commandBuffer,        // Provided by VK_EXT_extended_dynamic_state
    VkBool32 stencilTestEnable);          // Provided by VK_EXT_extended_dynamic_state

// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetStencilTestEnableEXT(
    VkCommandBuffer commandBuffer,        // Provided by VK_EXT_extended_dynamic_state
    VkBool32 stencilTestEnable);          // Provided by VK_EXT_extended_dynamic_state
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stencilTestEnable` specifies if the stencil test is enabled.

This command sets the stencil test enable for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo::stencilTestEnable value used to create the currently active pipeline.

**Valid Usage (Implicit)**

- VUID-vkCmdSetStencilTestEnable-commandBuffer-parameter
  `commandBuffer` must be a valid VkCommandBuffer handle
- VUID-vkCmdSetStencilTestEnable-commandBuffer-recording

1948
**commandBuffer** must be in the **recording state**

- VUID-vkCmdSetStencilTestEnable-commandBuffer-cmdpool
  The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations
- VUID-vkCmdSetStencilTestEnable-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to **commandBuffer** must be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To **dynamically set** the stencil operation, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetStencilOp(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    VkStencilOp failOp,
    VkStencilOp passOp,
    VkStencilOp depthFailOp,
    VkCompareOp compareOp);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetStencilOpEXT(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    VkStencilOp failOp,
    VkStencilOp passOp,
    VkStencilOp depthFailOp,
    VkCompareOp compareOp);
```
• **commandBuffer** is the command buffer into which the command will be recorded.

• **faceMask** is a bitmask of **VkStencilFaceFlagBits** specifying the set of stencil state for which to update the stencil operation.

• **failOp** is a **VkStencilOp** value specifying the action performed on samples that fail the stencil test.

• **passOp** is a **VkStencilOp** value specifying the action performed on samples that pass both the depth and stencil tests.

• **depthFailOp** is a **VkStencilOp** value specifying the action performed on samples that pass the stencil test and fail the depth test.

• **compareOp** is a **VkCompareOp** value specifying the comparison operator used in the stencil test.

This command sets the stencil operation for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_STENCIL_OP** set in **VkPipelineDynamicStateCreateInfo**'s **pDynamicStates**. Otherwise, this state is specified by the corresponding **VkPipelineDepthStencilStateCreateInfo**'s **failOp**, **passOp**, **depthFailOp**, and **compareOp** values used to create the currently active pipeline, for both front and back faces.

### Valid Usage (Implicit)

- **VUID-vkCmdSetStencilOp-commandBuffer-parameter**
  **commandBuffer** must be a valid **VkCommandBuffer** handle

- **VUID-vkCmdSetStencilOp-faceMask-parameter**
  **faceMask** must be a valid combination of **VkStencilFaceFlagBits** values

- **VUID-vkCmdSetStencilOp-faceMask-requiredbitmask**
  **faceMask** must not be 0

- **VUID-vkCmdSetStencilOp-failOp-parameter**
  **failOp** must be a valid **VkStencilOp** value

- **VUID-vkCmdSetStencilOp-passOp-parameter**
  **passOp** must be a valid **VkStencilOp** value

- **VUID-vkCmdSetStencilOp-depthFailOp-parameter**
  **depthFailOp** must be a valid **VkStencilOp** value

- **VUID-vkCmdSetStencilOp-compareOp-parameter**
  **compareOp** must be a valid **VkCompareOp** value

- **VUID-vkCmdSetStencilOp-commandBuffer-recording**
  **commandBuffer** must be in the recording state

- **VUID-vkCmdSetStencilOp-commandBuffer-cmdpool**
  The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations

- **VUID-vkCmdSetStencilOp-videocoding**
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

</tbody>
</table>

The `VkStencilOpState` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkStencilOpState {
    VkStencilOp failOp;
    VkStencilOp passOp;
    VkStencilOp depthFailOp;
    VkCompareOp compareOp;
    uint32_t compareMask;
    uint32_t writeMask;
    uint32_t reference;
} VkStencilOpState;
```

- `failOp` is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- `passOp` is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
- `depthFailOp` is a `VkStencilOp` value specifying the action performed on samples that pass the stencil test and fail the depth test.
- `compareOp` is a `VkCompareOp` value specifying the comparison operator used in the stencil test.
- `compareMask` selects the bits of the unsigned integer stencil values participating in the stencil test.
- `writeMask` selects the bits of the unsigned integer stencil values updated by the stencil test in the stencil framebuffer attachment.
- `reference` is an integer stencil reference value that is used in the unsigned stencil comparison.

Valid Usage (Implicit)

- VUID-VkStencilOpState-failOp-parameter
failOp must be a valid VkStencilOp value

- VUID-VkStencilOpState-passOp-parameter
passOp must be a valid VkStencilOp value

- VUID-VkStencilOpState-depthFailOp-parameter
depthFailOp must be a valid VkStencilOp value

- VUID-VkStencilOpState-compareOp-parameter
compareOp must be a valid VkCompareOp value

To **dynamically set** the stencil compare mask, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilCompareMask(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t compareMask);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **faceMask** is a bitmask of VkStencilFaceFlagBits specifying the set of stencil state for which to update the compare mask.
- **compareMask** is the new value to use as the stencil compare mask.

This command sets the stencil compare mask for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK** set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkStencilOpState::compareMask value used to create the currently active pipeline, for both front and back faces.

**Valid Usage (Implicit)**

- VUID-vkCmdSetStencilCompareMask-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetStencilCompareMask-faceMask-parameter
  faceMask must be a valid combination of VkStencilFaceFlagBits values

- VUID-vkCmdSetStencilCompareMask-faceMask-requiredbitmask
  faceMask must not be \(0\)

- VUID-vkCmdSetStencilCompareMask-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetStencilCompareMask-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetStencilCompareMask-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

`VkStencilFaceFlagBits` values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilFaceFlagBits {
    VK_STENCIL_FACE_FRONT_BIT = 0x00000001,
    VK_STENCIL_FACE_BACK_BIT = 0x00000002,
    VK_STENCIL_FACE_FRONT_AND_BACK = 0x00000003,
    VK_STENCIL_FRONT_AND_BACK = VK_STENCIL_FACE_FRONT_AND_BACK,
} VkStencilFaceFlagBits;
```

- `VK_STENCIL_FACE_FRONT_BIT` specifies that only the front set of stencil state is updated.
- `VK_STENCIL_FACE_BACK_BIT` specifies that only the back set of stencil state is updated.
- `VK_STENCIL_FACE_FRONT_AND_BACK` is the combination of `VK_STENCIL_FACE_FRONT_BIT` and `VK_STENCIL_FACE_BACK_BIT`, and specifies that both sets of stencil state are updated.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkStencilFaceFlags;
```

`VkStencilFaceFlags` is a bitmask type for setting a mask of zero or more `VkStencilFaceFlagBits`.

To dynamically set the stencil write mask, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilWriteMask(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    VkStencilFaceFlags faceMask,    // commandBuffer,   
    uint32_t writeMask);           // faceMask,       
```

- `commandBuffer` is the command buffer into which the command will be recorded.
• `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the write mask, as described above for `vkCmdSetStencilCompareMask`.

• `writeMask` is the new value to use as the stencil write mask.

This command sets the stencil write mask for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::writeMask` value used to create the currently active pipeline, for both front and back faces.

Valid Usage (Implicit)

- VUID-vkCmdSetStencilWriteMask-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetStencilWriteMask-faceMask-parameter
  `faceMask` must be a valid combination of `VkStencilFaceFlagBits` values

- VUID-vkCmdSetStencilWriteMask-faceMask-requiredbitmask
  `faceMask` must not be 0

- VUID-vkCmdSetStencilWriteMask-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetStencilWriteMask-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetStencilWriteMask-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the stencil reference value, call:
void vkCmdSetStencilReference(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t reference);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the reference value, as described above for `vkCmdSetStencilCompareMask`.
- `reference` is the new value to use as the stencil reference value.

This command sets the stencil reference value for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_REFERENCE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::reference` value used to create the currently active pipeline, for both front and back faces.

### Valid Usage (Implicit)

- VUID-vkCmdSetStencilReference-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetStencilReference-faceMask-parameter
  
  `faceMask` must be a valid combination of `VkStencilFaceFlagBits` values

- VUID-vkCmdSetStencilReference-faceMask-required bitmask
  
  `faceMask` must not be 0

- VUID-vkCmdSetStencilReference-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetStencilReference-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetStencilReference-videocoding
  
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
Possible values of the `failOp`, `passOp`, and `depthFailOp` members of `VkStencilOpState`, specifying what happens to the stored stencil value if this or certain subsequent tests fail or pass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilOp {
    VK_STENCIL_OP_KEEP = 0,
    VK_STENCIL_OP_ZERO = 1,
    VK_STENCIL_OP_REPLACE = 2,
    VK_STENCIL_OP_INCREMENT_AND_CLAMP = 3,
    VK_STENCIL_OP_DECREMENT_AND_CLAMP = 4,
    VK_STENCIL_OP_INVERT = 5,
    VK_STENCIL_OP_INCREMENT_AND_WRAP = 6,
    VK_STENCIL_OP_DECREMENT_AND_WRAP = 7
} VkStencilOp;
```

- **VK_STENCIL_OP_KEEP** keeps the current value.
- **VK_STENCIL_OP_ZERO** sets the value to 0.
- **VK_STENCIL_OP_REPLACE** sets the value to `reference`.
- **VK_STENCIL_OP_INCREMENT_AND_CLAMP** increments the current value and clamps to the maximum representable unsigned value.
- **VK_STENCIL_OP_DECREMENT_AND_CLAMP** decrements the current value and clamps to 0.
- **VK_STENCIL_OP_INVERT** bitwise-inverts the current value.
- **VK_STENCIL_OP_INCREMENT_AND_WRAP** increments the current value and wraps to 0 when the maximum value would have been exceeded.
- **VK_STENCIL_OP_DECREMENT_AND_WRAP** decrements the current value and wraps to the maximum possible value when the value would go below 0.

For purposes of increment and decrement, the stencil bits are considered as an unsigned integer.

**28.10. Depth Test**

The depth test compares the depth value $z_a$ in the depth/stencil attachment at each sample's framebuffer coordinates $(x_f, y_f)$ and sample index $i$ against the sample’s depth value $z_f$. If there is no depth attachment then the depth test is skipped.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels,
there is an implementation-dependent association of rasterization samples to depth attachment samples within the fragment. However, if all samples in the fragment are covered, and the depth attachment value is updated as a result of this test, all depth attachment samples will be updated.

The depth test occurs in three stages, as detailed in the following sections.

**28.10.1. Depth Clamping and Range Adjustment**

If \( \text{VkPipelineRasterizationStateCreateInfo} :: \text{depthClampEnable} \) is enabled, \( z_f \) is clamped to \([z_{min}, z_{max}]\), where \( z_{min} = \min(n,f) \), \( z_{max} = \max(n,f) \), and \( n \) and \( f \) are the \( \text{minDepth} \) and \( \text{maxDepth} \) depth range values of the viewport used by this fragment, respectively.

If \( \text{VkPhysicalDeviceDepthClampZeroOneFeaturesEXT} :: \text{depthClampZeroOne} \) is enabled:

- If the depth attachment has a floating-point format and VK_EXT_depth_range_unrestricted is enabled then \( z_f \) is unchanged.
- Otherwise, \( z_f \) is clamped to the range \([0, 1]\).

Otherwise:

- If \( z_f \) is not in the range \([z_{min}, z_{max}]\), then \( z_f \) is undefined following this step.
- If the depth attachment has a fixed-point format and \( z_f \) is not in the range \([0, 1]\), then \( z_f \) is undefined following this step.

**28.10.2. Depth Comparison**

If the depth test is not enabled, as specified by \( \text{vkCmdSetDepthTestEnable} \) or \( \text{VkPipelineDepthStencilStateCreateInfo} :: \text{depthTestEnable} \), then this step is skipped.

The comparison operation performed is determined by the \( \text{VkCompareOp} \) value set by \( \text{vkCmdSetDepthCompareOp} \), or by \( \text{VkPipelineDepthStencilStateCreateInfo} :: \text{depthCompareOp} \) during pipeline creation. \( z_f \) and \( z_a \) are used as the \textit{reference} and \textit{test} values, respectively, in the operation specified by the \( \text{VkCompareOp} \).

If the comparison evaluates to false, the coverage for the sample is set to 0.

**28.10.3. Depth Attachment Writes**

If depth writes are enabled, as specified by \( \text{vkCmdSetDepthWriteEnable} \) or \( \text{VkPipelineDepthStencilStateCreateInfo} :: \text{depthWriteEnable} \), and the comparison evaluated to true, the depth attachment value \( z_a \) is set to the sample’s depth value \( z_f \). If there is no depth attachment, no value is written.

To dynamically enable or disable the depth test, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthTestEnable(
    VkCommandBuffer commandBuffer,
```
or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthTestEnable` specifies if the depth test is enabled.

This command sets the depth test enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthTestEnable` value used to create the currently active pipeline.

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthTestEnable-commandBuffer-parameter**
  
  `commandBuffer must` be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetDepthTestEnable-commandBuffer-recording**
  
  `commandBuffer must` be in the recording state

- **VUID-vkCmdSetDepthTestEnable-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from `must` support graphics operations

- **VUID-vkCmdSetDepthTestEnable-videocoding**
  
  This command `must` only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer must` be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from `must` be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>

</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
To **dynamically set** the depth compare operator, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthCompareOp(
    VkCommandBuffer commandBuffer,
    VkCompareOp depthCompareOp);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthCompareOpEXT(
    VkCommandBuffer commandBuffer,
    VkCompareOp depthCompareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthCompareOp` is a `VkCompareOp` value specifying the comparison operator used for the Depth Comparison step of the depth test.

This command sets the depth comparison operator for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` value used to create the currently active pipeline.

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthCompareOp-commandBuffer-parameter
  - `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthCompareOp-depthCompareOp-parameter
  - `depthCompareOp` must be a valid `VkCompareOp` value
- VUID-vkCmdSetDepthCompareOp-commandBuffer-recording
  - `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthCompareOp-commandBuffer-cmdpool
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthCompareOp-videocoding
  - This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
To dynamically set the depth write enable, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthWriteEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthWriteEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthWriteEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthWriteEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthWriteEnable` specifies if depth writes are enabled.

This command sets the depth write enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthWriteEnable` value used to create the currently active pipeline.

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthWriteEnable-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDepthWriteEnable-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetDepthWriteEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetDepthWriteEnable-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

28.11. Representative Fragment Test

The representative fragment test allows implementations to reduce the amount of rasterization and fragment processing work performed for each point, line, or triangle primitive. For any primitive that produces one or more fragments that pass all prior early fragment tests, the implementation may choose one or more “representative” fragments for processing and discard all other fragments. For draw calls rendering multiple points, lines, or triangles arranged in lists, strips, or fans, the representative fragment test is performed independently for each of those primitives. The set of fragments discarded by the representative fragment test is implementation-dependent. In some cases, the representative fragment test may not discard any fragments for a given primitive.

If the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineRepresentativeFragmentTestStateCreateInfoNV` structure, then that structure includes parameters controlling the representative fragment test.

The `VkPipelineRepresentativeFragmentTestStateCreateInfoNV` structure is defined as:

```c
typedef struct VkPipelineRepresentativeFragmentTestStateCreateInfoNV {
    VkStructureType sType;
    const void*     pNext;
    VkBool32        representativeFragmentTestEnable;
} VkPipelineRepresentativeFragmentTestStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `representativeFragmentTestEnable` controls whether the representative fragment test is enabled.

If this structure is not included in the `pNext` chain, `representativeFragmentTestEnable` is considered to be `VK_FALSE`, and the representative fragment test is disabled.
If the active fragment shader does not specify the `EarlyFragmentTests` execution mode, the representative fragment shader test has no effect, even if enabled.

Valid Usage (Implicit)

- VUID-VkPipelineRepresentativeFragmentTestStateCreateInfoNV-sType-sType must be `VK_STRUCTURE_TYPE_PIPELINE_REPRESENTATIVE_FRAGMENT_TEST_STATE_CREATE_INFO_NV`

To dynamically set the `representativeFragmentTestEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetRepresentativeFragmentTestEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 representativeFragmentTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `representativeFragmentTestEnable` specifies the `representativeFragmentTestEnable` state.

This command sets the `representativeFragmentTestEnable` state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRepresentativeFragmentTestStateCreateInfoNV::representativeFragmentTestEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-extendedDynamicState3RepresentativeFragmentTestEnable-07346

The `extendedDynamicState3RepresentativeFragmentTestEnable` feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-commandBuffer-parameter commandBuffer must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-commandBuffer-recording commandBuffer must be in the recording state
- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-videocoding This command must only be called outside of a video coding scope
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

28.12. Sample Counting

Occlusion queries use query pool entries to track the number of samples that pass all the per-fragment tests. The mechanism of collecting an occlusion query value is described in Occlusion Queries.

The occlusion query sample counter increments by one for each sample with a coverage value of 1 in each fragment that survives all the per-fragment tests, including scissor, exclusive scissor, sample mask, alpha to coverage, stencil, and depth tests.

28.13. Fragment Coverage To Color

The VkPipelineCoverageToColorStateCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_fragment_coverage_to_color
typedef struct VkPipelineCoverageToColorStateCreateInfoNV {
    VkStructureType sType;
    const void*   pNext;
    VkPipelineCoverageToColorStateCreateFlagsNV flags;
    VkBool32 coverageToColorEnable;
    uint32_t coverageToColorLocation;
} VkPipelineCoverageToColorStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `coverageToColorEnable` controls whether the fragment coverage value replaces a fragment color output.
- `coverageToColorLocation` controls which fragment shader color output value is replaced.
If the pNext chain of VkPipelineMultisampleStateCreateInfo includes a VkPipelineCoverageToColorStateCreateInfoNV structure, then that structure controls whether the fragment coverage is substituted for a fragment color output and, if so, which output is replaced.

If coverageToColorEnable is VK_TRUE, the coverage mask replaces the first component of the color value corresponding to the fragment shader output location with Location equal to coverageToColorLocation and Index equal to zero. If the color attachment format has fewer bits than the coverage mask, the low bits of the sample coverage mask are taken without any clamping. If the color attachment format has more bits than the coverage mask, the high bits of the sample coverage mask are filled with zeros.

If coverageToColorEnable is VK_FALSE, these operations are skipped. If this structure is not included in the pNext chain, it is as if coverageToColorEnable is VK_FALSE.

**Valid Usage**

- VUID-VkPipelineCoverageToColorStateCreateInfoNV-coverageToColorEnable-01404

  If coverageToColorEnable is VK_TRUE, then the render pass subpass indicated by VkGraphicsPipelineCreateInfo::renderPass and VkGraphicsPipelineCreateInfo::subpass must have a color attachment at the location selected by coverageToColorLocation, with a VkFormat of VK_FORMAT_R8_UINT, VK_FORMAT_R8_SINT, VK_FORMAT_R16_UINT, VK_FORMAT_R16_SINT, VK_FORMAT_R32_UINT, or VK_FORMAT_R32_SINT.

**Valid Usage (Implicit)**

- VUID-VkPipelineCoverageToColorStateCreateInfoNV-sType-sType

  sType must be VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_TO_COLOR_STATE_CREATE_INFO_NV

- VUID-VkPipelineCoverageToColorStateCreateInfoNV-flags-zerobitmask

  flags must be 0

```c
// Provided by VK_NV_fragment_coverage_to_color
typedef VkFlags VkPipelineCoverageToColorStateCreateFlagsNV;
```

VkPipelineCoverageToColorStateCreateFlagsNV is a bitmask type for setting a mask, but is currently reserved for future use.

To dynamically set the coverageToColorEnable state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetCoverageToColorEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 coverageToColorEnable);
```

- commandBuffer is the command buffer into which the command will be recorded.
• coverageToColorEnable specifies the coverageToColorEnable state.

This command sets the coverageToColorEnable state for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineCoverageToColorStateCreateInfoNV::coverageToColorEnable value used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetCoverageToColorEnableNV-
  extendedDynamicState3CoverageToColorEnable-07347
  The extendedDynamicState3CoverageToColorEnable feature must be enabled

Valid Usage (Implicit)

• VUID-vkCmdSetCoverageToColorEnableNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetCoverageToColorEnableNV-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetCoverageToColorEnableNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetCoverageToColorEnableNV-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

To dynamically set the coverageToColorLocation state, call:
// Provided by VK_EXT_extended_dynamic_state3

```c
void vkCmdSetCoverageToColorLocationNV(
    VkCommandBuffer commandBuffer,
    uint32_t coverageToColorLocation);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageToColorLocation` specifies the `coverageToColorLocation` state.

This command sets the `coverageToColorLocation` state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineSampleLocationsStateCreateInfoEXT::coverageToColorLocation` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetCoverageToColorLocationNV-
  extendedDynamicState3CoverageToColorLocation-07348
  The `extendedDynamicState3CoverageToColorLocation` feature **must** be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetCoverageToColorLocationNV-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetCoverageToColorLocationNV-commandBuffer-recording
  `commandBuffer` **must** be in the **recording state**

- VUID-vkCmdSetCoverageToColorLocationNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetCoverageToColorLocationNV-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Coverage reduction takes the coverage information for a fragment and converts that to a boolean coverage value for each color sample in each pixel covered by the fragment.

Coverage for each pixel is first extracted from the total fragment coverage mask. This consists of \texttt{rasterizationSamples} unique coverage samples for each pixel in the fragment area, each with a unique \texttt{sample index}. If the fragment only contains a single pixel, coverage for the pixel is equivalent to the fragment coverage.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, pixel coverage is generated in an implementation-dependent manner. If all samples in the fragment are covered, all samples will be covered in each pixel coverage.

If a \textit{shading rate image} is used, and the fragment covers multiple pixels, each pixel's coverage consists of the coverage samples corresponding to that pixel, and each sample retains its unique \texttt{sample index} \texttt{i}.

If the \textit{fragment shading rate} is set, and the fragment covers multiple pixels, each pixel's coverage consists of the coverage samples with a \texttt{pixel index} matching that pixel, and each sample retains its unique \texttt{sample index} \texttt{i}.

28.14.2. Color Sample Coverage

Once pixel coverage is determined, coverage for each individual color sample corresponding to that pixel is determined.

If the number of \texttt{rasterizationSamples} is identical to the number of samples in the color attachments, a color sample is covered if the pixel coverage sample with the same \texttt{sample index} \texttt{i} is covered.

Otherwise, the coverage for each color sample is computed from the pixel coverage as follows.

If the \texttt{VK_AMD_mixed_attachment_samples} extension is enabled, for color samples present in the color attachments, a color sample is covered if the pixel coverage sample with the same \texttt{sample index} \texttt{i} is covered; additional pixel coverage samples are discarded.

If the \texttt{pNext} chain of \texttt{VkSubpassDescription2} or \texttt{VkRenderingInfo} includes a
VkMultisampledRenderToSingleSampledInfoEXT structure with the multisampledRenderToSingleSampledEnable field equal to VK_TRUE, sample coverage is calculated as if the attachment has VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples samples.

When the VK_NV_coverage_reduction_mode extension is enabled, the pipeline state controlling coverage reduction is specified through the members of the VkPipelineCoverageReductionStateCreateInfoNV structure.

The VkPipelineCoverageReductionStateCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_coverage_reduction_mode
typedef struct VkPipelineCoverageReductionStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageReductionStateCreateFlagsNV flags;
    VkCoverageReductionModeNV coverageReductionMode;
} VkPipelineCoverageReductionStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `coverageReductionMode` is a VkCoverageReductionModeNV value controlling how color sample coverage is generated from pixel coverage.

If this structure is not included in the `pNext` chain, or if the extension is not enabled, the default coverage reduction mode is inferred as follows:

- If the VK_NV_framebuffer_mixed_samples extension is enabled, then it is as if the `coverageReductionMode` is VK_COVERAGE_REDUCTION_MODE_MERGE_NV.
- If the VK_AMD_mixed_attachment_samples extension is enabled, then it is as if the `coverageReductionMode` is VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV.
- If both VK_NV_framebuffer_mixed_samples and VK_AMD_mixed_attachment_samples are enabled, then the default coverage reduction mode is implementation-dependent.

**Valid Usage (Implicit)**

- VUID-VkPipelineCoverageReductionStateCreateInfoNV-sType-sType `sType` must be VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_REDUCTION_STATE_CREATE_INFO_NV
- VUID-VkPipelineCoverageReductionStateCreateInfoNV-flags-zerobitmask `flags` must be 0
- VUID-VkPipelineCoverageReductionStateCreateInfoNV-coverageReductionMode-parameter `coverageReductionMode` must be a valid VkCoverageReductionModeNV value
VkPipelineCoverageReductionStateCreateFlagsNV is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode, specifying how color sample coverage is generated from pixel coverage, are:

• VK_COVERAGE_REDUCTION_MODE_MERGE_NV specifies that each color sample will be associated with an implementation-dependent subset of samples in the pixel coverage. If any of those associated samples are covered, the color sample is covered.

• VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV specifies that for color samples present in the color attachments, a color sample is covered if the pixel coverage sample with the same sample index i is covered; other pixel coverage samples are discarded.

To dynamically set the coverageReductionMode state, call:

void vkCmdSetCoverageReductionModeNV(
    VkCommandBuffer commandBuffer,             // command buffer into which the command will be recorded.
    VkCoverageReductionModeNV coverageReductionMode); // specifies the coverageReductionMode state.

This command sets the coverageReductionMode state for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode value used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetCoverageReductionModeNV-extendedDynamicState3CoverageReductionMode-07349 The extendedDynamicState3CoverageReductionMode feature must be enabled
Valid Usage (Implicit)

- VUID-vkCmdSetCoverageReductionModeNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetCoverageReductionModeNV-coverageReductionMode-parameter
  `coverageReductionMode` must be a valid `VkCoverageReductionModeNV` value

- VUID-vkCmdSetCoverageReductionModeNV-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetCoverageReductionModeNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetCoverageReductionModeNV-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To query the set of mixed sample combinations of coverage reduction mode, rasterization samples and color, depth, stencil attachment sample counts that are supported by a physical device, call:

```c
// Provided by VK_NV_coverage_reduction_mode
VkResult vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV(
    VkPhysicalDevice physicalDevice,
    uint32_t* pCombinationCount,
    VkFramebufferMixedSamplesCombinationNV* pCombinations);
```

- `physicalDevice` is the physical device from which to query the set of combinations.
- `pCombinationCount` is a pointer to an integer related to the number of combinations available or queried, as described below.
- `pCombinations` is either `NULL` or a pointer to an array of 1970
The `VkFramebufferMixedSamplesCombinationNV` values, indicating the supported combinations of coverage reduction mode, rasterization samples, and color, depth, stencil attachment sample counts.

If `pCombinations` is NULL, then the number of supported combinations for the given `physicalDevice` is returned in `pCombinationCount`. Otherwise, `pCombinationCount` must point to a variable set by the user to the number of elements in the `pCombinations` array, and on return the variable is overwritten with the number of values actually written to `pCombinations`. If the value of `pCombinationCount` is less than the number of combinations supported for the given `physicalDevice`, at most `pCombinationCount` values will be written to `pCombinations`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the supported values were returned.

---

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-pCombinationCount-parameter `pCombinationCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-pCombinations-parameter If the value referenced by `pCombinationCount` is not 0, and `pCombinations` is not NULL, `pCombinations` must be a valid pointer to an array of `pCombinationCount` `VkFramebufferMixedSamplesCombinationNV` structures

---

**Return Codes**

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

---

The `VkFramebufferMixedSamplesCombinationNV` structure is defined as:

```c
// Provided by VK_NV_coverage_reduction_mode
typedef struct VkFramebufferMixedSamplesCombinationNV {
    VkStructureType sType;
    void* pNext;
    VkCoverageReductionModeNV coverageReductionMode;
    VkSampleCountFlagBits rasterizationSamples;
    VkSampleCountFlags depthStencilSamples;
} VkFramebufferMixedSamplesCombinationNV;
```
VkSampleCountFlags colorSamples;
} VkFramebufferMixedSamplesCombinationNV;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `coverageReductionMode` is a `VkCoverageReductionModeNV` value specifying the coverage reduction mode.
- `rasterizationSamples` is a `VkSampleCountFlagBits` specifying the number of rasterization samples in the supported combination.
- `depthStencilSamples` specifies the number of samples in the depth stencil attachment in the supported combination. A value of 0 indicates the combination does not have a depth stencil attachment.
- `colorSamples` specifies the number of color samples in a color attachment in the supported combination. A value of 0 indicates the combination does not have a color attachment.

### Valid Usage (Implicit)

- VUID-VkFramebufferMixedSamplesCombinationNV-sType-sType  
  `sType` must be `VK_STRUCTURE_TYPE_FRAMEBUFFER_MIXED_SAMPLES_COMBINATION_NV`
- VUID-VkFramebufferMixedSamplesCombinationNV-pNext-pNext  
  `pNext` must be `NULL`

#### 28.14.3. Coverage Modulation

As part of coverage reduction, fragment color values **can** also be modulated (multiplied) by a value that is a function of fraction of covered rasterization samples associated with that color sample.

Pipeline state controlling coverage modulation is specified through the members of the `VkPipelineCoverageModulationStateCreateInfoNV` structure.

The `VkPipelineCoverageModulationStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_framebuffer_mixed_samples
typedef struct VkPipelineCoverageModulationStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageModulationStateCreateFlagsNV flags;
    VkCoverageModulationStateCreateFlagsNV coverageModulationMode;
    VkBool32 coverageModulationTableEnable;
    uint32_t coverageModulationTableCount;
    const float* coverageModulationTable;
} VkPipelineCoverageModulationStateCreateInfoNV;
```

- `sType` is the type of this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `coverageModulationMode` is a `VkCoverageModulationModeNV` value controlling which color components are modulated.
• `coverageModulationTableEnable` controls whether the modulation factor is looked up from a table in `pCoverageModulationTable`.
• `coverageModulationTableCount` is the number of elements in `pCoverageModulationTable`.
• `pCoverageModulationTable` is a table of modulation factors containing a value for each number of covered samples.

If `coverageModulationTableEnable` is `VK_FALSE`, then for each color sample the associated bits of the pixel coverage are counted and divided by the number of associated bits to produce a modulation factor `R` in the range (0,1] (a value of zero would have been killed due to a color coverage of 0). Specifically:

- \( N = \text{value of rasterizationSamples} \)
- \( M = \text{value of VkAttachmentDescription::<samples> for any color attachments} \)
- \( R = \text{popcount(associated coverage bits)} / (N / M) \)

If `coverageModulationTableEnable` is `VK_TRUE`, the value `R` is computed using a programmable lookup table. The lookup table has \( N / M \) elements, and the element of the table is selected by:

- \( R = pCoverageModulationTable[\text{popcount(associated coverage bits)}-1] \)

Note that the table does not have an entry for `popcount(associated coverage bits) = 0`, because such samples would have been killed.

The values of `pCoverageModulationTable` may be rounded to an implementation-dependent precision, which is at least as fine as \( 1 / N \), and clamped to \([0,1]\).

For each color attachment with a floating point or normalized color format, each fragment output color value is replicated to \( M \) values which can each be modulated (multiplied) by that color sample’s associated value of `R`. Which components are modulated is controlled by `coverageModulationMode`.

If this structure is not included in the `pNext` chain, it is as if `coverageModulationMode` is `VK_COVERAGE_MODULATION_MODE_NONE_NV`.

If the coverage reduction mode is `VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV`, each color sample is associated with only a single coverage sample. In this case, it is as if `coverageModulationMode` is `VK_COVERAGE_MODULATION_MODE_NONE_NV`.

---

**Valid Usage**

- VUID-VkPipelineCoverageModulationStateCreateInfoNV-coverageModulationTableEnable-01405
  If `coverageModulationTableEnable` is `VK_TRUE`, `coverageModulationTableCount` must be equal to `coverageModulationTableCount`.
to the number of rasterization samples divided by the number of color samples in the subpass

Valid Usage (Implicit)

- **VUID-VkPipelineCoverageModulationStateCreateInfoNV-sType-sType**
  sType must be `VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_MODULATION_STATE_CREATE_INFO_NV`

- **VUID-VkPipelineCoverageModulationStateCreateInfoNV-flags-zerobitmask**
  flags must be 0

- **VUID-VkPipelineCoverageModulationStateCreateInfoNV-coverageModulationMode-parameter**
  coverageModulationMode must be a valid `VkCoverageModulationModeNV` value

```cpp
// Provided by VK_NV_framebuffer_mixed_samples
typedef VkFlags VkPipelineCoverageModulationStateCreateFlagsNV;
```

`VkPipelineCoverageModulationStateCreateFlagsNV` is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of `VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationMode`, specifying which color components are modulated, are:

```cpp
// Provided by VK_NV_framebuffer_mixed_samples
typedef enum VkCoverageModulationModeNV {
    VK_COVERAGE_MODULATION_MODE_NONE_NV = 0,
    VK_COVERAGE_MODULATION_MODE_RGB_NV = 1,
    VK_COVERAGE_MODULATION_MODE_ALPHA_NV = 2,
    VK_COVERAGE_MODULATION_MODE_RGBA_NV = 3,
} VkCoverageModulationModeNV;
```

- **VK_COVERAGE_MODULATION_MODE_NONE_NV** specifies that no components are multiplied by the modulation factor.
- **VK_COVERAGE_MODULATION_MODE_RGB_NV** specifies that the red, green, and blue components are multiplied by the modulation factor.
- **VK_COVERAGE_MODULATION_MODE_ALPHA_NV** specifies that the alpha component is multiplied by the modulation factor.
- **VK_COVERAGE_MODULATION_MODE_RGBA_NV** specifies that all components are multiplied by the modulation factor.

To dynamically set the `coverageModulationMode` state, call:

```cpp
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetCoverageModulationModeNV(
```
• `commandBuffer` is the command buffer into which the command will be recorded.
• `coverageModulationMode` specifies the `coverageModulationMode` state.

This command sets the `coverageModulationMode` state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationMode` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetCoverageModulationModeNV-extendedDynamicState3CoverageModulationMode-07350
  The `extendedDynamicState3CoverageModulationMode` feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetCoverageModulationModeNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetCoverageModulationModeNV-coverageModulationMode-parameter
  `coverageModulationMode` must be a valid `VkCoverageModulationModeNV` value
- VUID-vkCmdSetCoverageModulationModeNV-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetCoverageModulationModeNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetCoverageModulationModeNV-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
To **dynamically set** the `coverageModulationTableEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetCoverageModulationTableEnableNV(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    VkBool32 coverageModulationTableEnable);  // coverageModulationTableEnable specifies the coverageModulationTableEnable state.
```

This command sets the `coverageModulationTableEnable` state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationTableEnable` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetCoverageModulationTableEnableNV-extendedDynamicState3CoverageModulationTableEnable-07351**
  The `extendedDynamicState3CoverageModulationTableEnable` feature **must** be enabled.

### Valid Usage (Implicit)

- **VUID-vkCmdSetCoverageModulationTableEnableNV-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetCoverageModulationTableEnableNV-commandBuffer-recording**
  `commandBuffer` **must** be in the **recording state**.

- **VUID-vkCmdSetCoverageModulationTableEnableNV-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations.

- **VUID-vkCmdSetCoverageModulationTableEnableNV-videocoding**
  This command **must** only be called outside of a video coding scope.
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

</tbody>
</table>

To dynamically set the pCoverageModulationTable state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetCoverageModulationTableNV(
    VkCommandBuffer commandBuffer,
    uint32_t coverageModulationTableCount,
    const float* pCoverageModulationTable);
```

- commandBuffer is the command buffer into which the command will be recorded.
- coverageModulationTableCount specifies the number of elements in pCoverageModulationTable.
- pCoverageModulationTable specifies the table of modulation factors containing a value for each number of covered samples.

This command sets the table of modulation factors for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationTableCount, and VkPipelineCoverageModulationStateCreateInfoNV::pCoverageModulationTable values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetCoverageModulationTableNV-extendedDynamicState3CoverageModulationTable-07352
  The extendedDynamicState3CoverageModulationTable feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetCoverageModulationTableNV-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetCoverageModulationTableNV-pCoverageModulationTable-parameter
  pCoverageModulationTable must be a valid pointer to an array of coverageModulationTableCount float values

- VUID-vkCmdSetCoverageModulationTableNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetCoverageModulationTableNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetCoverageModulationTableNV-coverageModulationTableCount-arraylength
  coverageModulationTableCount must be greater than 0

### Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Chapter 29. The Framebuffer

29.1. Blending

Blending combines the incoming source fragment’s R, G, B, and A values with the destination R, G, B, and A values of each sample stored in the framebuffer at the fragment’s \((x_f, y_f)\) location. Blending is performed for each color sample covered by the fragment, rather than just once for each fragment.

Source and destination values are combined according to the blend operation, quadruplets of source and destination weighting factors determined by the blend factors, and a blend constant, to obtain a new set of R, G, B, and A values, as described below.

Blending is computed and applied separately to each color attachment used by the subpass, with separate controls for each attachment.

Prior to performing the blend operation, signed and unsigned normalized fixed-point color components undergo an implied conversion to floating-point as specified by Conversion from Normalized Fixed-Point to Floating-Point. Blending computations are treated as if carried out in floating-point, and basic blend operations are performed with a precision and dynamic range no lower than that used to represent destination components. Advanced blending operations are performed with a precision and dynamic range no lower than the smaller of that used to represent destination components or that used to represent 16-bit floating-point values.

Note

Blending is only defined for floating-point, UNORM, SNORM, and sRGB formats. Within those formats, the implementation may only support blending on some subset of them. Which formats support blending is indicated by VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT.

The pipeline blend state is included in the VkPipelineColorBlendStateCreateInfo structure during graphics pipeline creation:

The VkPipelineColorBlendStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineColorBlendStateCreateFlags flags;
    VkBool32 logicOpEnable;
    VkLogicOp logicOp;
    uint32_t attachmentCount;
    const VkPipelineColorBlendAttachmentState* pAttachments;
    float blendConstants[4];
} VkPipelineColorBlendStateCreateInfo;
```

• sType is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **flags** is a bitmask of **VkPipelineColorBlendStateCreateFlagBits** specifying additional color blending information.

• **logicOpEnable** controls whether to apply Logical Operations.

• **logicOp** selects which logical operation to apply.

• **attachmentCount** is the number of **VkPipelineColorBlendAttachmentState** elements in **pAttachments**.

• **pAttachments** is a pointer to an array of **VkPipelineColorBlendAttachmentState** structures defining blend state for each color attachment.

• **blendConstants** is a pointer to an array of four values used as the R, G, B, and A components of the blend constant that are used in blending, depending on the **blend factor**.

• **pAttachments** is ignored if all of **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT**, **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT**, and **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** dynamic states set.

---

### Valid Usage

- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-00605**
  If the **independentBlend** feature is not enabled, all elements of **pAttachments** must be identical

- **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00606**
  If the **logicOp** feature is not enabled, **logicOpEnable** must be **VK_FALSE**

- **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00607**
  If **logicOpEnable** is **VK_TRUE**, **logicOp** must be a valid **VkLogicOp** value

- **VUID-VkPipelineColorBlendStateCreateInfo-rasterizationOrderColorAttachmentAccess-06465**
  If the **rasterizationOrderColorAttachmentAccess** feature is not enabled, **flags** must not include **VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT**

- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-07353**
  If any of **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT**, **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT**, or **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** are not set, **pAttachments** must not be **NULL**

---

### Valid Usage (Implicit)

- **VUID-VkPipelineColorBlendStateCreateInfo-sType-sType**
  **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO**

- **VUID-VkPipelineColorBlendStateCreateInfo-pNext-pNext**
  Each **pNext** member of any structure (including this one) in the **pNext** chain must be either **NULL** or a pointer to a valid instance of **VkPipelineColorBlendAdvancedStateCreateInfoEXT** or **VkPipelineColorWriteCreateInfoEXT**
• VUID-VkPipelineColorBlendStateCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkPipelineColorBlendStateCreateInfo-flags-parameter
  flags must be a valid combination of VkPipelineColorBlendStateCreateFlagBits values

• VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-parameter
  If attachmentCount is not 0, and pAttachments is not NULL, pAttachments must be a valid pointer to an array of attachmentCount valid VkPipelineColorBlendAttachmentState structures

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineColorBlendStateCreateFlags;

VkPipelineColorBlendStateCreateFlags is a bitmask type for setting a mask of zero or more VkPipelineColorBlendStateCreateFlagBits.

Bits which can be set in the VkPipelineColorBlendStateCreateInfo::flags parameter are:

// Provided by VK_EXT_rasterization_order_attachment_access
typedef enum VkPipelineColorBlendStateCreateFlagBits {
  // Provided by VK_EXT_rasterization_order_attachment_access
  VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT
  = 0x00000001,
  // Provided by VK_ARM_rasterization_order_attachment_access
  VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_ARM
  = VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT,
} VkPipelineColorBlendStateCreateFlagBits;

• VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT indicates that access to color and input attachments will have implicit framebuffer-local memory dependencies, allowing applications to express custom blending operations in a fragment shader. See renderpass feedback loops for more information.

The VkPipelineColorBlendAttachmentState structure is defined as:

// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendAttachmentState {
  VkBool32 blendEnable;
  VkBlendFactor srcColorBlendFactor;
  VkBlendFactor dstColorBlendFactor;
  VkBlendOp colorBlendOp;
  VkBlendFactor srcAlphaBlendFactor;
  VkBlendFactor dstAlphaBlendFactor;
  VkBlendOp alphaBlendOp;
  VkColorComponentFlags colorWriteMask;
} VkPipelineColorBlendAttachmentState;
• **blendEnable** controls whether blending is enabled for the corresponding color attachment. If blending is not enabled, the source fragment’s color for that attachment is passed through unmodified.

• **srcColorBlendFactor** selects which blend factor is used to determine the source factors \((S_r,S_g,S_b)\).

• **dstColorBlendFactor** selects which blend factor is used to determine the destination factors \((D_r,D_g,D_b)\).

• **colorBlendOp** selects which blend operation is used to calculate the RGB values to write to the color attachment.

• **srcAlphaBlendFactor** selects which blend factor is used to determine the source factor \(S_a\).

• **dstAlphaBlendFactor** selects which blend factor is used to determine the destination factor \(D_a\).

• **alphaBlendOp** selects which blend operation is used to calculate the alpha values to write to the color attachment.

• **colorWriteMask** is a bitmask of `VkColorComponentFlagBits` specifying which of the R, G, B, and/or A components are enabled for writing, as described for the **Color Write Mask**.

---

### Valid Usage

- **VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-00608**
  
  If the `dualSrcBlend` feature is not enabled, `srcColorBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

- **VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-00609**
  
  If the `dualSrcBlend` feature is not enabled, `dstColorBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

- **VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-00610**
  
  If the `dualSrcBlend` feature is not enabled, `srcAlphaBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

- **VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-00611**
  
  If the `dualSrcBlend` feature is not enabled, `dstAlphaBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

- **VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-01406**
  
  If either of `colorBlendOp` or `alphaBlendOp` is an advanced blend operation, then `colorBlendOp` must equal `alphaBlendOp`.

- **VUID-VkPipelineColorBlendAttachmentState-advancedBlendIndependentBlend-01407**
  
  If `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend` is `VK_FALSE` and `colorBlendOp` is an advanced blend operation, then `colorBlendOp` must be the same for all attachments.

- **VUID-VkPipelineColorBlendAttachmentState-advancedBlendIndependentBlend-01408**
  
  If `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT`
• VUID-VkPipelineColorBlendAttachmentState-advancedBlendAllOperations-01409
  If \texttt{VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendAllOperations}
  is \texttt{VK_FALSE}, then \texttt{colorBlendOp} must not be \texttt{VK_BLEND_OP_ZERO_EXT}, \texttt{VK_BLEND_OP_SRC_EXT},
  \texttt{VK_BLEND_OP_DST_EXT}, \texttt{VK_BLEND_OP_SRC_OVER_EXT}, \texttt{VK_BLEND_OP_DST_OVER_EXT},
  \texttt{VK_BLEND_OP_SRC_IN_EXT}, \texttt{VK_BLEND_OP_DST_IN_EXT}, \texttt{VK_BLEND_OP_SRC_ATOP_EXT}, \texttt{VK_BLEND_OP_DST_ATOP_EXT},
  \texttt{VK_BLEND_OP_XOR_EXT}, \texttt{VK_BLEND_OP_INVERT_EXT}, \texttt{VK_BLEND_OP_INVERT_RGB_EXT},
  \texttt{VK_BLEND_OP_LINEARDODGE_EXT}, \texttt{VK_BLEND_OP_LINEARBURNT_EXT}, \texttt{VK_BLEND_OP_VIVIDLIGHT_EXT},
  \texttt{VK_BLEND_OP_LINEARLIGHT_EXT}, \texttt{VK_BLEND_OP_PINLIGHT_EXT}, \texttt{VK_BLEND_OP_HARDMIX_EXT},
  \texttt{VK_BLEND_OP_PLUS_EXT}, \texttt{VK_BLEND_OP_PLUS_CLAMPED_EXT}, \texttt{VK_BLEND_OP_PLUS_CLAMPED_ALPHA_EXT},
  \texttt{VK_BLEND_OP_PLUS_DARKER_EXT}, \texttt{VK_BLEND_OP_MINUS_EXT}, \texttt{VK_BLEND_OP_MINUS_CLAMPED_EXT},
  \texttt{VK_BLEND_OP_CONTRAST_EXT}, \texttt{VK_BLEND_OP_INVERT_OVG_EXT}, \texttt{VK_BLEND_OP_RED_EXT},
  \texttt{VK_BLEND_OP_GREEN_EXT}, or \texttt{VK_BLEND_OP_BLUE_EXT}

• VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-01410
  If \texttt{colorBlendOp} or \texttt{alphaBlendOp} is an advanced blend operation, then \texttt{colorAttachmentCount}
  of the subpass this pipeline is compiled against must be less than or equal to
  \texttt{VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendMaxColorAttachments}

• VUID-VkPipelineColorBlendAttachmentState-constantAlphaColorBlendFactors-04454
  If the \texttt{VK_KHR_portability_subset} extension is enabled, and
  \texttt{VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors} is \texttt{VK_FALSE},
  \texttt{srcColorBlendFactor} must not be \texttt{VK_BLEND_FACTOR_CONSTANT_ALPHA} or
  \texttt{VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA}

• VUID-VkPipelineColorBlendAttachmentState-constantAlphaColorBlendFactors-04455
  If the \texttt{VK_KHR_portability_subset} extension is enabled, and
  \texttt{VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors} is \texttt{VK_FALSE},
  \texttt{dstColorBlendFactor} must not be \texttt{VK_BLEND_FACTOR_CONSTANT_ALPHA} or
  \texttt{VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA}

**Valid Usage (Implicit)**

• VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-parameter
  \texttt{srcColorBlendFactor} must be a valid \texttt{VkBlendFactor} value

• VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-parameter
  \texttt{dstColorBlendFactor} must be a valid \texttt{VkBlendFactor} value

• VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-parameter
  \texttt{colorBlendOp} must be a valid \texttt{VkBlendOp} value

• VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-parameter
  \texttt{srcAlphaBlendFactor} must be a valid \texttt{VkBlendFactor} value

• VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-parameter
  \texttt{dstAlphaBlendFactor} must be a valid \texttt{VkBlendFactor} value
• VUID-VkPipelineColorBlendAttachmentState-alphaBlendOp-parameter
  alphaBlendOp must be a valid VkBlendOp value

• VUID-VkPipelineColorBlendAttachmentState-colorWriteMask-parameter
  colorWriteMask must be a valid combination of VkColorComponentFlagBits values

To dynamically set blendEnable, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetColorBlendEnableEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,
    uint32_t attachmentCount,
    const VkBool32* pColorBlendEnables);
```

- commandBuffer is the command buffer into which the command will be recorded.
- firstAttachment the first color attachment the color blending enable applies.
- attachmentCount the number of color blending enables in the pColorBlendEnables array.
- pColorBlendEnables an array of booleans to indicate whether color blending is enabled for the corresponding attachment.

This command sets the color blending enable of the specified color attachments for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineColorBlendAttachmentState::blendEnable values used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetColorBlendEnableEXT-extendedDynamicState3ColorBlendEnable-07355
  The extendedDynamicState3ColorBlendEnable feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetColorBlendEnableEXT-pColorBlendEnables-parameter
  pColorBlendEnables must be a valid pointer to an array of attachmentCount VkBool32 values

- VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
This command must only be called outside of a video coding scope.

attachmentCount must be greater than 0.

Host Synchronization

- Host access to commandBuffer must be externally synchronized.
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

Command Properties

<table>
<thead>

To dynamically set color blend factors and operations, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetColorBlendEquationEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,
    uint32_t attachmentCount,
    const VkColorBlendEquationEXT* pColorBlendEquations);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the color blend factors and operations apply to.
- `attachmentCount` the number of VkColorBlendEquationEXT elements in the pColorBlendEquations array.
- `pColorBlendEquations` an array of VkColorBlendEquationEXT structs that specify the color blend factors and operations for the corresponding attachments.

This command sets the color blending factors and operations of the specified attachments for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineColorBlendAttachmentState::srcColorBlendFactor, VkPipelineColorBlendAttachmentState::dstColorBlendFactor, VkPipelineColorBlendAttachmentState::colorBlendOp, VkPipelineColorBlendAttachmentState::srcAlphaBlendFactor, VkPipelineColorBlendAttachmentState::dstAlphaBlendFactor, and VkPipelineColorBlendAttachmentState::alphaBlendOp values used to create the currently active...
pipeline.

Valid Usage

- VUID-vkCmdSetColorBlendEquationEXT-extendedDynamicState3ColorBlendEquation-07356
  The `extendedDynamicState3ColorBlendEquation` feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetColorBlendEquationEXT-pColorBlendEquations-parameter
  `pColorBlendEquations` must be a valid pointer to an array of `attachmentCount` valid `VkColorBlendEquationEXT` structures

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-recording
  `commandBuffer` must be in the `recording` state

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetColorBlendEquationEXT-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetColorBlendEquationEXT-attachmentCount-arraylength
  `attachmentCount` must be greater than 0

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tr>
</tbody>
</table>

The `VkColorBlendEquationEXT` structure is defined as:

1986
// Provided by VK_EXT_extended_dynamic_state3

typedef struct VkColorBlendEquationEXT {
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
} VkColorBlendEquationEXT;

• **srcColorBlendFactor** selects which blend factor is used to determine the source factors \((S_r, S_g, S_b)\).
• **dstColorBlendFactor** selects which blend factor is used to determine the destination factors \((D_r, D_g, D_b)\).
• **colorBlendOp** selects which blend operation is used to calculate the RGB values to write to the color attachment.
• **srcAlphaBlendFactor** selects which blend factor is used to determine the source factor \(S_a\).
• **dstAlphaBlendFactor** selects which blend factor is used to determine the destination factor \(D_a\).
• **alphaBlendOp** selects which blend operation is used to calculate the alpha values to write to the color attachment.

### Valid Usage

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07357**
  If the dualSrcBlend feature is not enabled, **srcColorBlendFactor** must not be **VK_BLEND_FACTOR_SRC1_COLOR**, **VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR**, **VK_BLEND_FACTOR_SRC1_ALPHA**, or **VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA**.

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07358**
  If the dualSrcBlend feature is not enabled, **dstColorBlendFactor** must not be **VK_BLEND_FACTOR_SRC1_COLOR**, **VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR**, **VK_BLEND_FACTOR_SRC1_ALPHA**, or **VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA**.

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07359**
  If the dualSrcBlend feature is not enabled, **srcAlphaBlendFactor** must not be **VK_BLEND_FACTOR_SRC1_COLOR**, **VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR**, **VK_BLEND_FACTOR_SRC1_ALPHA**, or **VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA**.

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07360**
  If the dualSrcBlend feature is not enabled, **dstAlphaBlendFactor** must not be **VK_BLEND_FACTOR_SRC1_COLOR**, **VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR**, **VK_BLEND_FACTOR_SRC1_ALPHA**, or **VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA**.

- **VUID-VkColorBlendEquationEXT-colorBlendOp-07361**
VK_BLEND_OP_XOR_EXT, VK_BLEND_OP_INVERT_EXT, VK_BLEND_OP_INVERT_RGB_EXT,
VK_BLEND_OP_LINEAR_DODGE_EXT, VK_BLEND_OP_LINEAR_BURN_EXT, VK_BLEND_OP_VIVID_LIGHT_EXT,
VK_BLEND_OP_LINEAR_LIGHT_EXT, VK_BLEND_OP_PINLIGHT_EXT, VK_BLEND_OP_HARD_MIX_EXT,
VK_BLEND_OP_PLUS_EXT, VK_BLEND_OP_PlUS_CLAMPED_EXT, VK_BLEND_OP_PLUS_CLAMPED_ALPHA_EXT,
VK_BLEND_OP_PLUS_DARKER_EXT, VK_BLEND_OP_MINUS_EXT, VK_BLEND_OP_MINUS_CLAMPED_EXT,
VK_BLEND_OP_CONTRAST_EXT, VK_BLEND_OP_INVERT_OVG_EXT, VK_BLEND_OP_RED_EXT,
VK_BLEND_OP_GREEN_EXT, or VK_BLEND_OP_BLUE_EXT

- VUID-VkColorBlendEquationEXT-constantAlphaColorBlendFactors-07362
  If the VK_KHR_portability_subset extension is enabled, and
  VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors
  is VK_FALSE, srcColorBlendFactor must not be VK_BLEND_FACTOR_CONSTANT_ALPHA or
  VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA

- VUID-VkColorBlendEquationEXT-constantAlphaColorBlendFactors-07363
  If the VK_KHR_portability_subset extension is enabled, and
  VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors
  is VK_FALSE, dstColorBlendFactor must not be VK_BLEND_FACTOR_CONSTANT_ALPHA or
  VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA

**Valid Usage (Implicit)**

- VUID-VkColorBlendEquationEXT-srcColorBlendFactor-parameter
  srcColorBlendFactor must be a valid VkBlendFactor value

- VUID-VkColorBlendEquationEXT-dstColorBlendFactor-parameter
  dstColorBlendFactor must be a valid VkBlendFactor value

- VUID-VkColorBlendEquationEXT-colorBlendOp-parameter
  colorBlendOp must be a valid VkBlendOp value

- VUID-VkColorBlendEquationEXT-srcAlphaBlendFactor-parameter
  srcAlphaBlendFactor must be a valid VkBlendFactor value

- VUID-VkColorBlendEquationEXT-dstAlphaBlendFactor-parameter
  dstAlphaBlendFactor must be a valid VkBlendFactor value

- VUID-VkColorBlendEquationEXT-alphaBlendOp-parameter
  alphaBlendOp must be a valid VkBlendOp value

To dynamically set the color write masks, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetColorWriteMaskEXT(  
    VkCommandBuffer commandBuffer,  
    uint32_t firstAttachment,  
    uint32_t attachmentCount,  
    const VkColorComponentFlags* pColorWriteMasks);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
• **firstAttachment** the first color attachment the color write masks apply to.

• **attachmentCount** the number of *VkColorComponentFlags* values in the *pColorWriteMasks* array.

• **pColorWriteMasks** an array of *VkColorComponentFlags* values that specify the color write masks of the corresponding attachments.

This command sets the color write masks of the specified attachments for subsequent drawing commands when the graphics pipeline is created with *VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT* set in *VkPipelineDynamicStateCreateInfo::pDynamicStates*. Otherwise, this state is specified by the *VkPipelineColorBlendAttachmentState::colorWriteMask* values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetColorWriteMaskEXT-extendedDynamicState3ColorWriteMask-07364**
  The *extendedDynamicState3ColorWriteMask* feature must be enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-parameter**
  *commandBuffer* must be a valid *VkCommandBuffer* handle

- **VUID-vkCmdSetColorWriteMaskEXT-pColorWriteMasks-parameter**
  *pColorWriteMasks* must be a valid pointer to an array of *attachmentCount* valid combinations of *VkColorComponentFlagBits* values

- **VUID-vkCmdSetColorWriteMaskEXT-pColorWriteMasks-requiredbitmask**
  Each element of *pColorWriteMasks* must not be 0

- **VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-recording**
  *commandBuffer* must be in the recording state

- **VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-cmdpool**
  The *VkCommandPool* that *commandBuffer* was allocated from must support graphics operations

- **VUID-vkCmdSetColorWriteMaskEXT-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdSetColorWriteMaskEXT-attachmentCount-arraylength**
  *attachmentCount* must be greater than 0

### Host Synchronization

- Host access to *commandBuffer* must be externally synchronized

- Host access to the *VkCommandPool* that *commandBuffer* was allocated from must be externally synchronized

#### 29.1.1. Blend Factors

The source and destination color and alpha blending factors are selected from the enum:

```c
typedef enum VkBlendFactor {
    VK_BLEND_FACTOR_ZERO = 0,
    VK_BLEND_FACTOR_ONE = 1,
    VK_BLEND_FACTOR_SRC_COLOR = 2,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR = 3,
    VK_BLEND_FACTOR_DST_COLOR = 4,
    VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR = 5,
    VK_BLEND_FACTOR_SRC_ALPHA = 6,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA = 7,
    VK_BLEND_FACTOR_DST_ALPHA = 8,
    VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA = 9,
    VK_BLEND_FACTOR_CONSTANT_COLOR = 10,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR = 11,
    VK_BLEND_FACTOR_CONSTANT_ALPHA = 12,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA = 13,
    VK_BLEND_FACTOR_SRC_ALPHA_SATURATE = 14,
    VK_BLEND_FACTOR_SRC1_COLOR = 15,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR = 16,
    VK_BLEND_FACTOR_SRC1_ALPHA = 17,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA = 18,
} VkBlendFactor;
```

The semantics of the enum values are described in the table below:

**Table 37. Blend Factors**

<table>
<thead>
<tr>
<th>VkBlendFactor</th>
<th>RGB Blend Factors ( (S_r, S_g, S_b) ) or ( (D_r, D_g, D_b) )</th>
<th>Alpha Blend Factor ( (S_a ) or ( D_a) )</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BLEND_FACTOR_ZERO</td>
<td>( (0,0,0) )</td>
<td>0</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE</td>
<td>( (1,1,1) )</td>
<td>1</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC_COLOR</td>
<td>( (R_0, G_0, B_0) )</td>
<td>( A_0 )</td>
</tr>
</tbody>
</table>
In this table, the following conventions are used:

- $R_{s0}, G_{s0}, B_{s0}$ and $A_{s0}$ represent the first source color R, G, B, and A components, respectively, for the fragment output location corresponding to the color attachment being blended.

- $R_{s1}, G_{s1}, B_{s1}$ and $A_{s1}$ represent the second source color R, G, B, and A components, respectively, used in dual source blending modes, for the fragment output location corresponding to the color attachment being blended.

- $R_d, G_d, B_d$ and $A_d$ represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.

- $R_c, G_c, B_c$ and $A_c$ represent the blend constant R, G, B, and A components, respectively.

To dynamically set and change the blend constants, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetBlendConstants(
    VkCommandBuffer commandBuffer,
    const float blendConstants[4]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
• **blendConstants** is a pointer to an array of four values specifying the \(R_c, G_c, B_c,\) and \(A_c\) components of the blend constant color used in blending, depending on the blend factor.

This command sets blend constants for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_BLEND_CONSTANTS** set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::blendConstants` values used to create the currently active pipeline.

### Valid Usage (Implicit)

- **VUID-vkCmdSetBlendConstants-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetBlendConstants-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state
- **VUID-vkCmdSetBlendConstants-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- **VUID-vkCmdSetBlendConstants-videocoding**
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>

<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 29.1.2. Dual-Source Blending

Blend factors that use the secondary color input \((R_{s1}, G_{s1}, B_{s1}, A_{s1})\) (**VK_BLEND_FACTOR_SRC1_COLOR**, **VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR**, **VK_BLEND_FACTOR_SRC1_ALPHA**, **VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA**) may consume implementation resources that could otherwise be used for rendering to multiple color attachments. Therefore, the number of color attachments that can be used in a framebuffer **may** be lower when using dual-source blending.

Dual-source blending is only supported if the `dualSrcBlend` feature is enabled.
The maximum number of color attachments that can be used in a subpass when using dual-source blending functions is implementation-dependent and is reported as the `maxFragmentDualSrcAttachments` member of `VkPhysicalDeviceLimits`.

When using a fragment shader with dual-source blending functions, the color outputs are bound to the first and second inputs of the blender using the `Index` decoration, as described in Fragment Output Interface. If the second color input to the blender is not written in the shader, or if no output is bound to the second input of a blender, the result of the blending operation is not defined.

### 29.1.3. Blend Operations

Once the source and destination blend factors have been selected, they along with the source and destination components are passed to the blending operations. RGB and alpha components can use different operations. Possible values of `VkBlendOp`, specifying the operations, are:

```c
// Provided by VK_VERSION_1_0
type enum VkBlendOp {  
    VK_BLEND_OP_ADD = 0,  
    VK_BLEND_OP_SUBTRACT = 1,  
    VK_BLEND_OP_REVERSE_SUBTRACT = 2,  
    VK_BLEND_OP_MIN = 3,  
    VK_BLEND_OP_MAX = 4,  
    // Provided by VK_EXT_blend_operation_advanced  
    VK_BLEND_OP_ZERO_EXT = 1000148000,  
    // Provided by VK_EXT_blend_operation_advanced  
    VK_BLEND_OP_SRC_EXT = 1000148001,  
    // Provided by VK_EXT_blend_operation_advanced  
    VK_BLEND_OP_DST_EXT = 1000148002,  
    // Provided by VK_EXT_blend_operation_advanced  
    VK_BLEND_OP_SRC_OVER_EXT = 1000148003,  
    // Provided by VK_EXT_blend_operation_advanced  
    VK_BLEND_OP_DST_OVER_EXT = 1000148004,  
    // Provided by VK_EXT_blend_operation_advanced  
    VK_BLEND_OP_SRC_IN_EXT = 1000148005,  
    // Provided by VK_EXT_blend_operation_advanced  
    VK_BLEND_OP_DST_IN_EXT = 1000148006,  
    // Provided by VK_EXT_blend_operation_advanced  
    VK_BLEND_OP_SRC_ATOP_EXT = 1000148007,  
    // Provided by VK_EXT_blend_operation_advanced  
    VK_BLEND_OP_DST_ATOP_EXT = 1000148008,  
    // Provided by VK_EXT_blend_operation_advanced  
    VK_BLEND_OP_XOR_EXT = 1000148009,  
    // Provided by VK_EXT_blend_operation_advanced  
    VK_BLEND_OP_MULTIPLY_EXT = 1000148010,  
    // Provided by VK_EXT_blend_operation_advanced  
    VK_BLEND_OP_SCREEN_EXT = 1000148011,  
    // Provided by VK_EXT_blend_operation_advanced  
    VK_BLEND_OP_ADD_EXT = 1000148012,  
    // Provided by VK_EXT_blend_operation_advanced  
    VK_BLEND_OP_SUBTRACT_EXT = 1000148013,  
}
```
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_OVERLAY_EXT = 1000148014,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_DARKEN_EXT = 1000148015,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LIGHTEN_EXT = 1000148016,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_COLORDODGE_EXT = 1000148017,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_COLORBURN_EXT = 1000148018,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HARDLIGHT_EXT = 1000148019,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_SOFTLIGHT_EXT = 1000148020,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_DIFFERENCE_EXT = 1000148021,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_EXCLUSION_EXT = 1000148022,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_EXT = 1000148023,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_RGB_EXT = 1000148024,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARDODGE_EXT = 1000148025,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARBURN_EXT = 1000148026,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_VIVIDLIGHT_EXT = 1000148027,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARLIGHT_EXT = 1000148028,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PINLIGHT_EXT = 1000148029,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HARDMIX_EXT = 1000148030,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_HUE_EXT = 1000148031,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_SATURATION_EXT = 1000148032,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_COLOR_EXT = 1000148033,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_LUMINOSITY_EXT = 1000148034,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_EXT = 1000148035,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_CLAMPED_EXT = 1000148036,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_CLAMPED_ALPHA_EXT = 1000148037,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_DARKER_EXT = 1000148038,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_HUE_EXT = 1000148031,
VK_BLEND_OP_MINUS_EXT = 1000148039,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_MINUS_CLAMPED_EXT = 1000148040,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_CONTRAST_EXT = 1000148041,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_OVG_EXT = 1000148042,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_RED_EXT = 1000148043,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_GREEN_EXT = 1000148044,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_BLUE_EXT = 1000148045,
} VkBlendOp;
The semantics of the basic blend operations are described in the table below:

**Table 38. Basic Blend Operations**

<table>
<thead>
<tr>
<th>VkBlendOp</th>
<th>RGB Components</th>
<th>Alpha Component</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BLEND_OP_ADD</td>
<td>( R = R_{s0} \times S_r + R_d \times D_r )</td>
<td>( A = A_{s0} \times S_a + A_d \times D_a )</td>
</tr>
<tr>
<td></td>
<td>( G = G_{s0} \times S_g + G_d \times D_g )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = B_{s0} \times S_b + B_d \times D_b )</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_SUBTRACT</td>
<td>( R = R_{s0} \times S_r - R_d \times D_r )</td>
<td>( A = A_{s0} \times S_a - A_d \times D_a )</td>
</tr>
<tr>
<td></td>
<td>( G = G_{s0} \times S_g - G_d \times D_g )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = B_{s0} \times S_b - B_d \times D_b )</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_REVERSE_SUBTRACT</td>
<td>( R = R_d \times D_r - R_{s0} \times S_r )</td>
<td>( A = A_d \times D_a - A_{s0} \times S_a )</td>
</tr>
<tr>
<td></td>
<td>( G = B_d \times D_g - G_{s0} \times S_g )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = B_d \times D_b - B_{s0} \times S_b )</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_MIN</td>
<td>( R = \min(R_{s0},R_d) )</td>
<td>( A = \min(A_{s0},A_d) )</td>
</tr>
<tr>
<td></td>
<td>( G = \min(G_{s0},G_d) )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = \min(B_{s0},B_d) )</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_MAX</td>
<td>( R = \max(R_{s0},R_d) )</td>
<td>( A = \max(A_{s0},A_d) )</td>
</tr>
<tr>
<td></td>
<td>( G = \max(G_{s0},G_d) )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = \max(B_{s0},B_d) )</td>
<td></td>
</tr>
</tbody>
</table>

In this table, the following conventions are used:

- \( R_{s0}, G_{s0}, B_{s0} \) and \( A_{s0} \) represent the first source color R, G, B, and A components, respectively.
- \( R_d, G_d, B_d \) and \( A_d \) represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- \( S_r, S_g, S_b \) and \( S_a \) represent the source blend factor R, G, B, and A components, respectively.
- \( D_r, D_g, D_b \) and \( D_a \) represent the destination blend factor R, G, B, and A components, respectively.

The blending operation produces a new set of values R, G, B, and A, which are written to the framebuffer attachment. If blending is not enabled for this attachment, then R, G, B, and A are assigned \( R_{s0}, G_{s0}, B_{s0} \) and \( A_{s0} \), respectively.

If the color attachment is fixed-point, the components of the source and destination values and blend factors are each clamped to [0,1] or [-1,1] respectively for an unsigned normalized or signed normalized color attachment prior to evaluating the blend operations. If the color attachment is floating-point, no clamping occurs.

If the numeric format of a framebuffer attachment uses sRGB encoding, the R, G, and B destination color values (after conversion from fixed-point to floating-point) are considered to be encoded for the sRGB color space and hence are linearized prior to their use in blending. Each R, G, and B component is converted from nonlinear to linear as described in the “sRGB EOTF” section of the Khronos Data Format Specification. If the format is not sRGB, no linearization is performed.

If the numeric format of a framebuffer attachment uses sRGB encoding, then the final R, G and B values are converted into the nonlinear sRGB representation before being written to the framebuffer attachment as described in the “sRGB EOTF” section of the Khronos Data Format Specifications.
Specification.

If the numeric format of a framebuffer color attachment is not sRGB encoded then the resulting \(c\) values for R, G and B are unmodified. The value of A is never sRGB encoded. That is, the alpha component is always stored in memory as linear.

If the framebuffer color attachment is \texttt{VK_ATTACHMENT_UNUSED}, no writes are performed through that attachment. Writes are not performed to framebuffer color attachments greater than or equal to the \texttt{VkSubpassDescription::colorAttachmentCount} or \texttt{VkSubpassDescription2::colorAttachmentCount} value.

### 29.1.4. Advanced Blend Operations

The \textit{advanced blend operations} are those listed in tables \texttt{f/X/Y/Z Advanced Blend Operations}, \texttt{Hue-Saturation-Luminosity Advanced Blend Operations}, and \texttt{Additional RGB Blend Operations}.

If the \texttt{pNext} chain of \texttt{VkPipelineColorBlendStateCreateInfo} includes a \texttt{VkPipelineColorBlendAdvancedStateCreateInfoEXT} structure, then that structure includes parameters that affect advanced blend operations.

The \texttt{VkPipelineColorBlendAdvancedStateCreateInfoEXT} structure is defined as:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPipelineColorBlendAdvancedStateCreateInfoEXT {
  VkStructureType sType;
  const void* pNext;
  VkBool32 srcPremultiplied;
  VkBool32 dstPremultiplied;
  VkBlendOverlapEXT blendOverlap;
} VkPipelineColorBlendAdvancedStateCreateInfoEXT;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{srcPremultiplied} specifies whether the source color of the blend operation is treated as premultiplied.
- \texttt{dstPremultiplied} specifies whether the destination color of the blend operation is treated as premultiplied.
- \texttt{blendOverlap} is a \texttt{VkBlendOverlapEXT} value specifying how the source and destination sample's coverage is correlated.

If this structure is not present, \texttt{srcPremultiplied} and \texttt{dstPremultiplied} are both considered to be \texttt{VK_TRUE}, and \texttt{blendOverlap} is considered to be \texttt{VK_BLEND_OVERLAP_UNCORRELATED_EXT}.

#### Valid Usage

- **VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-srcPremultiplied-01424**
  If the \textit{non-premultiplied source color} property is not supported, \texttt{srcPremultiplied} must be
VK_TRUE

• VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-dstPremultiplied-01425
  If the non-premultiplied destination color property is not supported, dstPremultiplied must be VK_TRUE

• VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-blendOverlap-01426
  If the correlated overlap property is not supported, blendOverlap must be VK_BLEND_OVERLAP_UNCORRELATED_EXT

Valid Usage (Implicit)

• VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_ADVANCED_STATE_CREATE_INFO_EXT

• VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-blendOverlap-parameter
  blendOverlap must be a valid VkBlendOverlapEXT value

To dynamically set the advanced blend state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetColorBlendAdvancedEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,
    uint32_t attachmentCount,
    const VkColorBlendAdvancedEXT* pColorBlendAdvanced);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the advanced blend parameters apply to.
- `attachmentCount` the number of VkColorBlendAdvancedEXT elements in the pColorBlendAdvanced array.
- `pColorBlendAdvanced` an array of VkColorBlendAdvancedEXT structs that specify the advanced color blend parameters for the corresponding attachments.

This command sets the advanced blend operation parameters of the specified attachments for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineColorBlendAdvancedStateCreateInfoEXT::srcPremultiplied, VkPipelineColorBlendAdvancedStateCreateInfoEXT::dstPremultiplied, and VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap values used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetColorBlendAdvancedEXT-extendedDynamicState3ColorBlendAdvanced-
The extendedDynamicState3ColorBlendAdvanced feature must be enabled

Valid Usage (Implicit)

• VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetColorBlendAdvancedEXT-pColorBlendAdvanced-parameter
  pColorBlendAdvanced must be a valid pointer to an array of attachmentCount valid
  VkColorBlendAdvancedEXT structures

• VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics
  operations

• VUID-vkCmdSetColorBlendAdvancedEXT-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdSetColorBlendAdvancedEXT-attachmentCount-arraylength
  attachmentCount must be greater than 0

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally
  synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkColorBlendAdvancedEXT structure is defined as:

```c
// Provided by VK_EXT_extended_dynamic_state3
typedef struct VkColorBlendAdvancedEXT {
    VkBlendOp advancedBlendOp;
    VkBool32 srcPremultiplied;
    VkBool32 dstPremultiplied;
    VkBlendOverlapEXT blendOverlap;
};
```
 VkBool32 clampResults;
} VkColorBlendAdvancedEXT;

- **advancedBlendOp** selects which blend operation is used to calculate the RGB values to write to the color attachment.
- **srcPremultiplied** specifies whether the source color of the blend operation is treated as premultiplied.
- **dstPremultiplied** specifies whether the destination color of the blend operation is treated as premultiplied.
- **blendOverlap** is a VkBlendOverlapEXT value specifying how the source and destination sample’s coverage is correlated.
- **clampResults** specifies the results must be clamped to the [0,1] range before writing to the attachment, which is useful when the attachment format is not normalized fixed-point.

### Valid Usage

- **VUID-VkColorBlendAdvancedEXT-srcPremultiplied-07505**
  If the non-premultiplied source color property is not supported, **srcPremultiplied** must be **VK_TRUE**

- **VUID-VkColorBlendAdvancedEXT-dstPremultiplied-07506**
  If the non-premultiplied destination color property is not supported, **dstPremultiplied** must be **VK_TRUE**

- **VUID-VkColorBlendAdvancedEXT-blendOverlap-07507**
  If the correlated overlap property is not supported, **blendOverlap** must be **VK_BLEND_OVERLAP_UNCORRELATED_EXT**

### Valid Usage (Implicit)

- **VUID-VkColorBlendAdvancedEXT-advancedBlendOp-parameter**
  **advancedBlendOp** must be a valid VkBlendOp value

- **VUID-VkColorBlendAdvancedEXT-blendOverlap-parameter**
  **blendOverlap** must be a valid VkBlendOverlapEXT value

When using one of the operations in table **f/X/Y/Z Advanced Blend Operations** or **Hue-Saturation-Luminosity Advanced Blend Operations**, blending is performed according to the following equations:

\[
\begin{align*}
R &= f(R_s^\prime, R_d^\prime) \cdot p_0(A_s, A_d) + Y \cdot R_s^\prime \cdot p_1(A_s, A_d) + Z \cdot R_d^\prime \cdot p_2(A_s, A_d) \\
G &= f(G_s^\prime, G_d^\prime) \cdot p_0(A_s, A_d) + Y \cdot G_s^\prime \cdot p_1(A_s, A_d) + Z \cdot G_d^\prime \cdot p_2(A_s, A_d) \\
B &= f(B_s^\prime, B_d^\prime) \cdot p_0(A_s, A_d) + Y \cdot B_s^\prime \cdot p_1(A_s, A_d) + Z \cdot B_d^\prime \cdot p_2(A_s, A_d) \\
A &= X \cdot p_0(A_s, A_d) + Y \cdot p_1(A_s, A_d) + Z \cdot p_2(A_s, A_d)
\end{align*}
\]

where the function f and terms X, Y, and Z are specified in the table. The R, G, and B components of
the source color used for blending are derived according to srcPremultiplied. If srcPremultiplied is
set to VK_TRUE, the fragment color components are considered to have been premultiplied by the A
component prior to blending. The base source color \((R_s', G_s', B_s')\) is obtained by dividing through by
the A component:

\[
(R_s', G_s', B_s') = \begin{cases} 
(0, 0, 0) & A_s = 0 \\
(R_s, G_s, B_s) & \text{otherwise}
\end{cases}
\]

If srcPremultiplied is VK_FALSE, the fragment color components are used as the base color:

\[
(R_s', G_s', B_s') = (R_s, G_s, B_s)
\]

The R, G, and B components of the destination color used for blending are derived according to
dstPremultiplied. If dstPremultiplied is set to VK_TRUE, the destination components are considered to
have been premultiplied by the A component prior to blending. The base destination color \((R_d', G_d', B_d')\) is obtained by dividing through by the A component:

\[
(R_d', G_d', B_d') = \begin{cases} 
(0, 0, 0) & A_d = 0 \\
(R_d, G_d, B_d) & \text{otherwise}
\end{cases}
\]

If dstPremultiplied is VK_FALSE, the destination color components are used as the base color:

\[
(R_d', G_d', B_d') = (R_d, G_d, B_d)
\]

When blending using advanced blend operations, we expect that the R, G, and B components of
premultiplied source and destination color inputs be stored as the product of non-premultiplied R,
G, and B component values and the A component of the color. If any R, G, or B component of a
premultiplied input color is non-zero and the A component is zero, the color is considered ill-
formed, and the corresponding component of the blend result is undefined.

All of the advanced blend operation formulas in this chapter compute the result as a premultiplied
color. If dstPremultiplied is VK_FALSE, that result color’s R, G, and B components are divided by the A
component before being written to the framebuffer. If any R, G, or B component of the color is non-
zero and the A component is zero, the result is considered ill-formed, and the corresponding
component of the blend result is undefined. If all components are zero, that value is unchanged.

If the A component of any input or result color is less than zero, the color is considered ill-formed,
and all components of the blend result are undefined.

The weighting functions \(p_0\), \(p_1\), and \(p_2\) are defined in table *Advanced Blend Overlap Modes*. In these
functions, the A components of the source and destination colors are taken to indicate the portion
of the pixel covered by the fragment (source) and the fragments previously accumulated in the
pixel (destination). The functions \(p_0\), \(p_1\), and \(p_2\) approximate the relative portion of the pixel covered
by the intersection of the source and destination, covered only by the source, and covered only by
the destination, respectively.
Possible values of `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap`, specifying the blend overlap functions, are:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef enum VkBlendOverlapEXT {
    VK_BLEND_OVERLAP_UNCORRELATED_EXT = 0,
    VK_BLEND_OVERLAP_DISJOINT_EXT = 1,
    VK_BLEND_OVERLAP_CONJOINT_EXT = 2,
} VkBlendOverlapEXT;
```

- `VK_BLEND_OVERLAP_UNCORRELATED_EXT` specifies that there is no correlation between the source and destination coverage.
- `VK_BLEND_OVERLAP_CONJOINT_EXT` specifies that the source and destination coverage are considered to have maximal overlap.
- `VK_BLEND_OVERLAP_DISJOINT_EXT` specifies that the source and destination coverage are considered to have minimal overlap.

</table>

When using one of the HSL blend operations in table **Hue-Saturation-Luminosity Advanced Blend Operations** as the blend operation, the RGB color components produced by the function \( f \) are effectively obtained by converting both the non-premultiplied source and destination colors to the HSL (hue, saturation, luminosity) color space, generating a new HSL color by selecting H, S, and L components from the source or destination according to the blend operation, and then converting the result back to RGB. In the equations below, a blended RGB color is produced according to the following pseudocode:
float minv3(vec3 c) {
    return min(min(c.r, c.g), c.b);
}
float maxv3(vec3 c) {
    return max(max(c.r, c.g), c.b);
}
float lumv3(vec3 c) {
    return dot(c, vec3(0.30, 0.59, 0.11));
}
float satv3(vec3 c) {
    return maxv3(c) - minv3(c);
}

// If any color components are outside [0,1], adjust the color to
// get the components in range.
vec3 ClipColor(vec3 color) {
    float lum = lumv3(color);
    float mincol = minv3(color);
    float maxcol = maxv3(color);
    if (mincol < 0.0) {
        color = lum + ((color-lum)*lum) / (lum-mincol);
    }
    if (maxcol > 1.0) {
        color = lum + ((color-lum)*(1-lum)) / (maxcol-lum);
    }
    return color;
}

// Take the base RGB color <cbase> and override its luminosity
// with that of the RGB color <clum>.
vec3 SetLum(vec3 cbase, vec3 clum) {
    float lbase = lumv3(cbase);
    float llum = lumv3(clum);
    float ldiff = llum - lbase;
    vec3 color = cbase + vec3(ldiff);
    return ClipColor(color);
}

// Take the base RGB color <cbase> and override its saturation with
// that of the RGB color <csat>. The override the luminosity of the
// result with that of the RGB color <clum>.
vec3 SetLumSat(vec3 cbase, vec3 csat, vec3 clum) {
    float minbase = minv3(cbase);
    float sbase = satv3(cbase);
    float ssat = satv3(csat);
    vec3 color;
    if (sbase > 0) {
        // Equivalent (modulo rounding errors) to setting the
        // smallest (R,G,B) component to 0, the largest to <ssat>,
        // and then making the luminosity of the result match that
        // of the <clum> color...
    }
    return color;
}
// and interpolating the "middle" component based on its
// original value relative to the smallest/largest.
color = (cbase - minbase) * ssat / sbase;
} else {
    color = vec3(0.0);
}
return SetLum(color, clum);

### 29.2. Logical Operations

The application can enable a logical operation between the fragment’s color values and the existing value in the framebuffer attachment. This logical operation is applied prior to updating the framebuffer attachment. Logical operations are applied only for signed and unsigned integer and normalized integer framebuffers. Logical operations are not applied to floating-point or sRGB format color attachments.

Logical operations are controlled by the `logicOpEnable` and `logicOp` members of `VkPipelineColorBlendStateCreateInfo`. The `logicOpEnable` state can also be controlled by `vkCmdSetLogicOpEnableEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. The `logicOp` state can also be controlled by `vkCmdSetLogicOpEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. If `logicOpEnable` is `VK_TRUE`, then a logical operation selected by `logicOp` is applied between each color attachment and the fragment’s corresponding output value, and blending of all attachments is treated as if it were disabled. Any attachments using color formats for which logical operations are not supported simply pass through the color values unmodified. The logical operation is applied
independently for each of the red, green, blue, and alpha components. The `logicOp` is selected from the following operations:

```c
// Provided by VK_VERSION_1_0
typedef enum VkLogicOp {
    VK_LOGIC_OP_CLEAR = 0,
    VK_LOGIC_OP_AND = 1,
    VK_LOGIC_OP_AND_REVERSE = 2,
    VK_LOGIC_OP_COPY = 3,
    VK_LOGIC_OP_AND_INVERTED = 4,
    VK_LOGIC_OP_NO_OP = 5,
    VK_LOGIC_OP_XOR = 6,
    VK_LOGIC_OP_OR = 7,
    VK_LOGIC_OP_NOR = 8,
    VK_LOGIC_OP_EQUIVALENT = 9,
    VK_LOGIC_OP_INVERT = 10,
    VK_LOGIC_OP_OR_REVERSE = 11,
    VK_LOGIC_OP_COPY_INVERTED = 12,
    VK_LOGIC_OP_OR_INVERTED = 13,
    VK_LOGIC_OP_NAND = 14,
    VK_LOGIC_OP_SET = 15,
} VkLogicOp;
```
The logical operations supported by Vulkan are summarized in the following table in which

- \( \sim \) is bitwise invert,
- \( \& \) is bitwise and,
- \( \lor \) is bitwise or,
- \( \oplus \) is bitwise exclusive or,
- \( s \) is the fragment’s \( R_{s0}, G_{s0}, B_{s0} \) or \( A_{s0} \) component value for the fragment output corresponding to the color attachment being updated, and
- \( d \) is the color attachment’s \( R, G, B \) or \( A \) component value:

<table>
<thead>

</tr>
</tbody>
</table>

The result of the logical operation is then written to the color attachment as controlled by the component write mask, described in Blend Operations.

To dynamically set whether logical operations are enabled, call:

```c
// Provided by VK_EXT_extended_dynamic_state3
void vkCmdSetLogicOpEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 logicOpEnable);
```
• `commandBuffer` is the command buffer into which the command will be recorded.

• `logicOpEnable` specifies whether logical operations are enabled.

This command sets whether logical operations are enabled for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOpEnable` value used to create the currently active pipeline.

---

**Valid Usage**

- VUID-vkCmdSetLogicOpEnableEXT-extendedDynamicState3LogicOpEnable-07365
  The `extendedDynamicState3LogicOpEnable` feature **must** be enabled

- VUID-vkCmdSetLogicOpEnableEXT-logicOp-07366
  If the `logicOp` feature is not enabled, `logicOpEnable` **must** be `VK_FALSE`

---

**Valid Usage (Implicit)**

- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-recording
  `commandBuffer` **must** be in the `recording state`

- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetLogicOpEnableEXT-videocoding
  This command **must** only be called outside of a video coding scope

---

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>
To **dynamically set** the logical operation to apply for blend state, call:

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetLogicOpEXT(
    VkCommandBuffer commandBuffer,
    VkLogicOp logicOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `logicOp` specifies the logical operation to apply for blend state.

This command sets the logical operation for blend state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOp` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLogicOpEXT-None-04867
  The `extendedDynamicState2LogicOp` feature **must** be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetLogicOpEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetLogicOpEXT-logicOp-parameter
  `logicOp` **must** be a valid `VkLogicOp` value

- VUID-vkCmdSetLogicOpEXT-commandBuffer-recording
  `commandBuffer` **must** be in the **recording state**

- VUID-vkCmdSetLogicOpEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetLogicOpEXT-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
29.3. Color Write Mask

Bits which can be set in `VkPipelineColorBlendAttachmentState::colorWriteMask`, determining whether the final color values R, G, B and A are written to the framebuffer attachment, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkColorComponentFlagBits {
    VK_COLOR_COMPONENT_R_BIT = 0x00000001,
    VK_COLOR_COMPONENT_G_BIT = 0x00000002,
    VK_COLOR_COMPONENT_B_BIT = 0x00000004,
    VK_COLOR_COMPONENT_A_BIT = 0x00000008,
} VkColorComponentFlagBits;
```

- `VK_COLOR_COMPONENT_R_BIT` specifies that the R value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_G_BIT` specifies that the G value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_B_BIT` specifies that the B value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_A_BIT` specifies that the A value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.

The color write mask operation is applied regardless of whether blending is enabled.

The color write mask operation is applied only if Color Write Enable is enabled for the respective attachment. Otherwise the color write mask is ignored and writes to all components of the attachment are disabled.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkColorComponentFlags;
```

`VkColorComponentFlags` is a bitmask type for setting a mask of zero or more `VkColorComponentFlagBits`.  

2012
29.4. Color Write Enable

The VkPipelineColorWriteCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_color_write_enable
typedef struct VkPipelineColorWriteCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t            attachmentCount;
    const VkBool32*     pColorWriteEnables;
} VkPipelineColorWriteCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentCount` is the number of `VkBool32` elements in `pColorWriteEnables`.
- `pColorWriteEnables` is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

When this structure is included in the `pNext` chain of `VkPipelineColorBlendStateCreateInfo`, it defines per-attachment color write state. If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with `attachmentCount` equal to the `attachmentCount` member of `VkPipelineColorBlendStateCreateInfo`, and `pColorWriteEnables` pointing to an array of as many `VK_TRUE` values.

If the `colorWriteEnable` feature is not enabled on the device, all `VkBool32` elements in the `pColorWriteEnables` array must be `VK_TRUE`.

Color Write Enable interacts with the Color Write Mask as follows:

- If `colorWriteEnable` is `VK_TRUE`, writes to the attachment are determined by the `colorWriteMask`.
- If `colorWriteEnable` is `VK_FALSE`, the `colorWriteMask` is ignored and writes to all components of the attachment are disabled. This is equivalent to specifying a `colorWriteMask` of 0.

**Valid Usage**

- VUID-VkPipelineColorWriteCreateInfoEXT-pAttachments-04801
  If the `colorWriteEnable` feature is not enabled, all elements of `pColorWriteEnables` must be `VK_TRUE`

- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-04802
  `attachmentCount` must be equal to the `attachmentCount` member of the `VkPipelineColorBlendStateCreateInfo` structure specified during pipeline creation

- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-06655
  `attachmentCount` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`
Valid Usage (Implicit)

• VUID-VkPipelineColorWriteCreateInfoEXT-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PIPELINE_COLOR_WRITE_CREATE_INFO_EXT

• VUID-VkPipelineColorWriteCreateInfoEXT-pColorWriteEnables-parameter
  
  If attachmentCount is not 0, pColorWriteEnables must be a valid pointer to an array of attachmentCount VkBool32 values

To dynamically enable or disable writes to a color attachment, call:

```
// Provided by VK_EXT_color_write_enable

void vkCmdSetColorWriteEnableEXT(
                     VkCommandBuffer commandBuffer,
                     uint32_t attachmentCount,
                     const VkBool32* pColorWriteEnables);
```

- commandBuffer is the command buffer into which the command will be recorded.
- attachmentCount is the number of VkBool32 elements in pColorWriteEnables.
- pColorWriteEnables is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

This command sets the color write enables for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineColorWriteCreateInfoEXT::pColorWriteEnables values used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetColorWriteEnableEXT-None-04803
  
  The colorWriteEnable feature must be enabled

• VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-06656
  
  attachmentCount must be less than or equal to the maxColorAttachments member of VkPhysicalDeviceLimits

Valid Usage (Implicit)

• VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-parameter
  
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetColorWriteEnableEXT-pColorWriteEnables-parameter
  
  pColorWriteEnables must be a valid pointer to an array of attachmentCount VkBool32 values

• VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetColorWriteEnableEXT-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-arraylength
  attachmentCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>

29.5. Framebuffer Query Instructions

To query the tile properties from the attachments in framebuffer, call:

```c
// Provided by VK_QCOM_tile_properties
VkResult vkGetFramebufferTilePropertiesQCOM(
    VkDevice device,
    VkFramebuffer framebuffer,
    uint32_t* pPropertiesCount,
    VkTilePropertiesQCOM* pProperties);
```

- device is a logical device associated with the framebuffer.
- framebuffer is a handle of the framebuffer to query.
- pPropertiesCount is a pointer to an integer related to the number of tile properties available or queried, as described below.
- pProperties is either NULL or a pointer to an array of VkTilePropertiesQCOM structures.

If pProperties is NULL, then the number of tile properties available is returned in pPropertiesCount. Otherwise, pPropertiesCount must point to a variable set by the user to the number of elements in...
the pProperties array, and on return the variable is overwritten with the number of properties actually written to pProperties. If pPropertiesCount is less than the number of tile properties available, at most pPropertiesCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available properties were returned.

The number of tile properties available is determined by the number of merged subpasses, and each tile property is associated with a merged subpass. There will be at most as many properties as there are subpasses within the render pass. To obtain the tile properties for a given merged subpass, the pProperties array can be indexed using the postMergeIndex value provided in VkRenderPassSubpassFeedbackInfoEXT.

Valid Usage (Implicit)

• VUID-vkGetFramebufferTilePropertiesQCOM-device-parameter
  device must be a valid VkDevice handle

• VUID-vkGetFramebufferTilePropertiesQCOM-framebuffer-parameter
  framebuffer must be a valid VkFramebuffer handle

• VUID-vkGetFramebufferTilePropertiesQCOM-pPropertiesCount-parameter
  pPropertiesCount must be a valid pointer to a uint32_t value

• VUID-vkGetFramebufferTilePropertiesQCOM-pProperties-parameter
  If the value referenced by pPropertiesCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertiesCount VkTilePropertiesQCOM structures

• VUID-vkGetFramebufferTilePropertiesQCOM-framebuffer-parent
  framebuffer must have been created, allocated, or retrieved from device

Return Codes

Success

• VK_SUCCESS
• VK_INCOMPLETE

2016
Chapter 30. Dispatching Commands

Dispatching commands (commands with Dispatch in the name) provoke work in a compute pipeline. Dispatching commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound compute pipeline. A compute pipeline must be bound to a command buffer before any dispatching commands are recorded in that command buffer.

To record a dispatch, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatch(
    VkCommandBuffer commandBuffer,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of `groupCountX × groupCountY × groupCountZ` local workgroups is assembled.

Valid Usage

- VUID-vkCmdDispatch-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatch-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatch-None-06479
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- VUID-vkCmdDispatch-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdDispatch-None-02692
If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-vkCmdDispatch-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDispatch-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDispatch-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- VUID-vkCmdDispatch-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatch-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatch-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatch-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatch-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatch-maintenance4-06425
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a
VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatch-None-02699
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command.

- VUID-vkCmdDispatch-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmd Dispatch-commandBuffer-02701
  If the VkPipeline object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdDispatch-None-02702
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

- VUID-vkCmdDispatch-None-02703
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

- VUID-vkCmdDispatch-None-02704
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDispatch-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDispatch-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this
command accesses a storage buffer, and that stage was created without enabling either
VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or
VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers,
and the robustBufferAccess feature is not enabled, that stage must not access values
outside of the range of the buffer as specified in the descriptor set bound to the same
pipeline bind point

- VUID-vkCmdDispatch-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported,
  any resource accessed by the VkPipeline object bound to the pipeline bind point used by
  this command must not be a protected resource

- VUID-vkCmdDispatch-None-06550
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a
  VkSampler or VkImageView object that enables sampler Y’C’R’ conversion, that object must
  only be used with OpImageSample* or OpImageSparseSample* instructions

- VUID-vkCmdDispatch-ConstOffset-06551
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a
  VkSampler or VkImageView object that enables sampler Y’C’R’ conversion, that object must
  not use the ConstOffset and Offset operands

- VUID-vkCmdDispatch-None-04115
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the
  Type of the Texel operand of that instruction must have at least as many components as
  the image view’s format

- VUID-vkCmdDispatch-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the
  Type of the Texel operand of that instruction must have at least as many components as
  the buffer view’s format

- VUID-vkCmdDispatch-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a
  result of this command, the SampledType of the OpTypeImage operand of that instruction
  must have a Width of 64

- VUID-vkCmdDispatch-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is
  accessed as a result of this command, the SampledType of the OpTypeImage operand of that
  instruction must have a Width of 32

- VUID-vkCmdDispatch-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a
  result of this command, the SampledType of the OpTypeImage operand of that instruction
  must have a Width of 64

- VUID-vkCmdDispatch-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is
  accessed as a result of this command, the SampledType of the OpTypeImage operand of that
  instruction must have a Width of 32

- VUID-vkCmdDispatch-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the
**VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** flag **must** not be accessed by atomic instructions through an **OpTypeImage** with a **SampledType** with a **Width** of 64 by this command

- VUID-vkCmdDispatch-sparseImageInt64Atomics-04475
  If the **sparseImageInt64Atomics** feature is not enabled, **VkBuffer** objects created with the **VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT** flag **must** not be accessed by atomic instructions through an **OpTypeImage** with a **SampledType** with a **Width** of 64 by this command

- VUID-vkCmdDispatch-OpImageWeightedSampleQCOM-06971
  If **OpImageWeightedSampleQCOM** is used to sample a **VkImageView** as a result of this command, then the image view's **format features** **must** contain **VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM**

- VUID-vkCmdDispatch-OpImageWeightedSampleQCOM-06972
  If **OpImageWeightedSampleQCOM** uses a **VkImageView** as a sample weight image as a result of this command, then the image view's **format features** **must** contain **VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM**

- VUID-vkCmdDispatch-OpImageBoxFilterQCOM-06973
  If **OpImageBoxFilterQCOM** is used to sample a **VkImageView** as a result of this command, then the image view's **format features** **must** contain **VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM**

- VUID-vkCmdDispatch-OpImageBlockMatchSSDQCOM-06974
  If **OpImageBlockMatchSSDQCOM** is used to read from an **VkImageView** as a result of this command, then the image view's **format features** **must** contain **VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM**

- VUID-vkCmdDispatch-OpImageBlockMatchSADQCOM-06975
  If **OpImageBlockMatchSADQCOM** is used to read from an **VkImageView** as a result of this command, then the specified reference coordinates **must** not fail **integer texel coordinate validation**.

- VUID-vkCmdDispatch-OpImageWeightedSampleQCOM-06976
  If **OpImageWeightedSampleQCOM**, **OpImageBoxFilterQCOM**, **OpImageBlockMatchSSDQCOM**, or **OpImageBlockMatchSADQCOM** uses a **VkSampler** as a result of this command, then the sampler **must** have been created with **VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM**.

- VUID-vkCmdDispatch-OpImageWeightedSampleQCOM-06978
  If any command other than **OpImageWeightedSampleQCOM**, **OpImageBoxFilterQCOM**, **OpImageBlockMatchSSDQCOM**, or **OpImageBlockMatchSADQCOM** uses a **VkSampler** as a result of this command, then the sampler **must** not have been created with **VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM**.

- VUID-vkCmdDispatch-None-07288
  Any shader invocation executed by this command **must** **terminate**

- VUID-vkCmdDispatch-commandBuffer-02712
  If **commandBuffer** is a protected command buffer and **protectedNoFault** is not supported,
any resource written to by the VkPipeline object bound to the pipeline bind point used by this command must not be an unprotected resource

• VUID-vkCmdDispatch-commandBuffer-02713
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, pipeline stages other than the framebuffer-space and compute stages in the VkPipeline object bound to the pipeline bind point used by this command must not write to any resource

• VUID-vkCmdDispatch-commandBuffer-04617
  If any of the shader stages of the VkPipeline bound to the pipeline bind point used by this command uses the RayQueryKHR capability, then commandBuffer must not be a protected command buffer

• VUID-vkCmdDispatch-groupCountX-00386
  groupCountX must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]

• VUID-vkCmdDispatch-groupCountY-00387
  groupCountY must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]

• VUID-vkCmdDispatch-groupCountZ-00388
  groupCountZ must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]

Valid Usage (Implicit)

• VUID-vkCmdDispatch-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdDispatch-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdDispatch-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdDispatch-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdDispatch-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To record an indirect dispatching command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatchIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `buffer` is the buffer containing dispatch parameters.
- `offset` is the byte offset into `buffer` where parameters begin.

`vkCmdDispatchIndirect` behaves similarly to `vkCmdDispatch` except that the parameters are read by the device from a buffer during execution. The parameters of the dispatch are encoded in a `VkDispatchIndirectCommand` structure taken from `buffer` starting at `offset`.

### Valid Usage

- **VUID-vkCmdDispatchIndirect-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatchIndirect-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatchIndirect-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLER_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdDispatchIndirect-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDispatchIndirect-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
image view's format features must contain
VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

• VUID-vkCmdDispatchIndirect-filterCubic-02694
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDispatchIndirect-filterCubicMinmax-02695
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDispatchIndirect-flags-02696
Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdDispatchIndirect-OpTypeImage-07027
For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdDispatchIndirect-OpTypeImage-07028
For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDispatchIndirect-OpTypeImage-07029
For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdDispatchIndirect-OpTypeImage-07030
Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDispatchIndirect-None-02697
For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDispatchIndirect-maintenance4-06425
If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to
create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#).

- **VUID-vkCmdDispatchIndirect-None-02699**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- **VUID-vkCmdDispatchIndirect-None-02700**
  A valid pipeline **must** be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDispatchIndirect-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited (if the [VK_NV_inherited_viewport_scissor](#) extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- **VUID-vkCmdDispatchIndirect-None-02859**
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDispatchIndirect-None-02702**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDispatchIndirect-None-02703**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDispatchIndirect-None-02704**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDispatchIndirect-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchIndirect-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either
or

VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT

for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

• VUID-vkCmdDispatchIndirect-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource.

• VUID-vkCmdDispatchIndirect-None-06550
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

• VUID-vkCmdDispatchIndirect-ConstOffset-06551
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must not use the ConstOffset and Offset operands.

• VUID-vkCmdDispatchIndirect-None-04115
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

• VUID-vkCmdDispatchIndirect-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

• VUID-vkCmdDispatchIndirect-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

• VUID-vkCmdDispatchIndirect-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

• VUID-vkCmdDispatchIndirect-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

• VUID-vkCmdDispatchIndirect-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

• VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE.sparseResidency_bit flag must not be accessed by atomic instructions.
through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDispatchIndirect-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdDispatchIndirect-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdDispatchIndirect-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdDispatchIndirect-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdDispatchIndirect-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSSDQCOM or OpImageBlockMatchSADQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- VUID-vkCmdDispatchIndirect-OpImageWeightedSampleQCOM-06976
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

- VUID-vkCmdDispatchIndirect-OpImageWeightedSampleQCOM-06978
  Any shader invocation executed by this command must terminate

- VUID-vkCmdDispatchIndirect-buffer-02708
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object
• VUID-vkCmdDispatchIndirect-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdDispatchIndirect-offset-02710
  offset must be a multiple of 4

• VUID-vkCmdDispatchIndirect-commandBuffer-02711
  commandBuffer must not be a protected command buffer

• VUID-vkCmdDispatchIndirect-offset-00407
  The sum of offset and the size of VkDispatchIndirectCommand must be less than or equal to the size of buffer

---

Valid Usage (Implicit)

• VUID-vkCmdDispatchIndirect-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdDispatchIndirect-buffer-parameter
  buffer must be a valid VkBuffer handle

• VUID-vkCmdDispatchIndirect-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdDispatchIndirect-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdDispatchIndirect-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdDispatchIndirect-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdDispatchIndirect-commonparent
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice

---

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
Command Properties

<table>

The `VkDispatchIndirectCommand` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDispatchIndirectCommand {
    uint32_t x;
    uint32_t y;
    uint32_t z;
} VkDispatchIndirectCommand;
```

- `x` is the number of local workgroups to dispatch in the X dimension.
- `y` is the number of local workgroups to dispatch in the Y dimension.
- `z` is the number of local workgroups to dispatch in the Z dimension.

The members of `VkDispatchIndirectCommand` have the same meaning as the corresponding parameters of `vkCmdDispatch`.

Valid Usage

- VUID-VkDispatchIndirectCommand-x-00417
  - `x` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`

- VUID-VkDispatchIndirectCommand-y-00418
  - `y` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`

- VUID-VkDispatchIndirectCommand-z-00419
  - `z` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]`

To record a dispatch using non-zero base values for the components of `WorkgroupId`, call:

```c
// Provided by VK_VERSION_1_1
void vkCmdDispatchBase(
    VkCommandBuffer commandBuffer,
    uint32_t baseGroupX,
    uint32_t baseGroupY,
    uint32_t baseGroupZ,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```
or the equivalent command

```c
// Provided by VK_KHR_device_group
void vkCmdDispatchBaseKHR(
    VkCommandBuffer commandBuffer,
    uint32_t baseGroupX,
    uint32_t baseGroupY,
    uint32_t baseGroupZ,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **baseGroupX** is the start value for the X component of WorkgroupId.
- **baseGroupY** is the start value for the Y component of WorkgroupId.
- **baseGroupZ** is the start value for the Z component of WorkgroupId.
- **groupCountX** is the number of local workgroups to dispatch in the X dimension.
- **groupCountY** is the number of local workgroups to dispatch in the Y dimension.
- **groupCountZ** is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of $\text{groupCountX} \times \text{groupCountY} \times \text{groupCountZ}$ local workgroups is assembled, with WorkgroupId values ranging from $[\text{baseGroup}^*, \text{baseGroup}^* + \text{groupCount}^*)$ in each component. `vkCmdDispatch` is equivalent to `vkCmdDispatchBase(0,0,0,\text{groupCountX},\text{groupCountY},\text{groupCountZ})`.

### Valid Usage

- **VUID-vkCmdDispatchBase-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatchBase-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatchBase-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdDispatchBase-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT.

Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2.

Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2.

Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility.

If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push
constant value must have been set for the same pipeline bind point, with a
VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to
create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDispatchBase-None-02699
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be
  valid if they are statically used by the VkPipeline bound to the pipeline bind point used by
  this command

• VUID-vkCmdDispatchBase-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command

• VUID-vkCmdDispatchBase-commandBuffer-02701
  If the VkPipeline object bound to the pipeline bind point used by this command requires
  any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so
  after any previously bound pipeline with the corresponding state not specified as
dynamic

• VUID-vkCmdDispatchBase-None-02859
  There must not have been any calls to dynamic state setting commands for any state not
  specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this
  command, since that pipeline was bound

• VUID-vkCmdDispatchBase-None-02702
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a
  VkSampler object that uses unnormalized coordinates, that sampler must not be used to
  sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D,
  VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or
  VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

• VUID-vkCmdDispatchBase-None-02703
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a
  VkSampler object that uses unnormalized coordinates, that sampler must not be used with
  any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod,
  Dref or Proj in their name, in any shader stage

• VUID-vkCmdDispatchBase-None-02704
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a
  VkSampler object that uses unnormalized coordinates, that sampler must not be used with
  any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD
  bias or any offset values, in any shader stage

• VUID-vkCmdDispatchBase-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either
  VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or
  VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers,
  and the robustBufferAccess feature is not enabled, that stage must not access values
  outside of the range of the buffer as specified in the descriptor set bound to the same
  pipeline bind point

• VUID-vkCmdDispatchBase-storageBuffers-06936
If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchBase-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command must not be a protected resource.

- **VUID-vkCmdDispatchBase-None-06550**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'CbCr` conversion, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

- **VUID-vkCmdDispatchBase-ConstOffset-06551**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'CbCr` conversion, that object must not use the `ConstOffset` and `Offset` operands.

- **VUID-vkCmdDispatchBase-None-04115**
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view's format.

- **VUID-vkCmdDispatchBase-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view's format.

- **VUID-vkCmdDispatchBase-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

- **VUID-vkCmdDispatchBase-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

- **VUID-vkCmdDispatchBase-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

- **VUID-vkCmdDispatchBase-SampledType-04473**
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

- **VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04474**
If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- **VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04475**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- **VUID-vkCmdDispatchBase-OpImageWeightedSampleQCOM-06971**
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

- **VUID-vkCmdDispatchBase-OpImageWeightedSampleQCOM-06972**
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

- **VUID-vkCmdDispatchBase-OpImageBoxFilterQCOM-06973**
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

- **VUID-vkCmdDispatchBase-OpImageBlockMatchSSDQCOM-06974**
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- **VUID-vkCmdDispatchBase-OpImageBlockMatchSADQCOM-06975**
  If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- **VUID-vkCmdDispatchBase-OpImageWeightedSampleQCOM-06977**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdDispatchBase-OpImageWeightedSampleQCOM-06978**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdDispatchBase-None-07288**
  Any shader invocation executed by this command must terminate.
If \texttt{commandBuffer} is a protected command buffer and \texttt{protectedNoFault} is not supported, any resource written to by the \texttt{VkPipeline} object bound to the pipeline bind point used by this command \textbf{must} not be an unprotected resource.

- \textbf{VUID-vkCmdDispatchBase-commandBuffer-02713}
  If \texttt{commandBuffer} is a protected command buffer and \texttt{protectedNoFault} is not supported, pipeline stages other than the framebuffer-space and compute stages in the \texttt{VkPipeline} object bound to the pipeline bind point used by this command \textbf{must} not write to any resource.

- \textbf{VUID-vkCmdDispatchBase-commandBuffer-04617}
  If any of the shader stages of the \texttt{VkPipeline} bound to the pipeline bind point used by this command uses the \texttt{RayQueryKHR} capability, then \texttt{commandBuffer} \textbf{must} not be a protected command buffer.

- \textbf{VUID-vkCmdDispatchBase-baseGroupX-00421}
  \texttt{baseGroupX} \textbf{must} be less than \texttt{VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]}

- \textbf{VUID-vkCmdDispatchBase-baseGroupX-00422}
  \texttt{baseGroupY} \textbf{must} be less than \texttt{VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]}

- \textbf{VUID-vkCmdDispatchBase-baseGroupX-00423}
  \texttt{baseGroupZ} \textbf{must} be less than \texttt{VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]}

- \textbf{VUID-vkCmdDispatchBase-groupCountX-00424}
  \texttt{groupCountX} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]} minus \texttt{baseGroupX}

- \textbf{VUID-vkCmdDispatchBase-groupCountY-00425}
  \texttt{groupCountY} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]} minus \texttt{baseGroupY}

- \textbf{VUID-vkCmdDispatchBase-groupCountZ-00426}
  \texttt{groupCountZ} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]} minus \texttt{baseGroupZ}

- \textbf{VUID-vkCmdDispatchBase-baseGroupX-00427}
  If any of \texttt{baseGroupX}, \texttt{baseGroupY}, or \texttt{baseGroupZ} are not zero, then the bound compute pipeline \textbf{must} have been created with the \texttt{VK_PIPELINE_CREATE_DISPATCH_BASE} flag.

\section*{Valid Usage (Implicit)}

- \textbf{VUID-vkCmdDispatchBase-commandBuffer-parameter}
  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle

- \textbf{VUID-vkCmdDispatchBase-commandBuffer-recording}
  \texttt{commandBuffer} \textbf{must} be in the \texttt{recording} state

- \textbf{VUID-vkCmdDispatchBase-commandBuffer-cmdpool}
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support compute operations

- \textbf{VUID-vkCmdDispatchBase-renderpass}
  This command \textbf{must} only be called outside of a render pass instance
This command must only be called outside of a video coding scope.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>

A subpass shading dispatches a compute pipeline work with the work dimension of render area of the calling subpass and work groups are partitioned by specified work group size. Subpass operations like subpassLoad and subpassLoadMS are allowed to be used.

To record a subpass shading, call:

```c
// Provided by VK_HUAWEI_subpass_shading
void vkCmdSubpassShadingHUAWEI(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

When the command is executed, a global workgroup consisting of ceil (render area size / local workgroup size) local workgroups is assembled.

**Valid Usage**

- **VID-vkCmdDispatchBase-videocoding**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VID-vkCmdDispatchBase-videocoding**
  If a `VkSampler` created with `.mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.
If a VkImageView is sampled with depth comparison, the image view's format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT.

If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT.

If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT.

Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2.

Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2.

Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

For each set n that is statically used by the VkPipeline bound to the pipeline bind point
used by this command, a descriptor set **must** have been bound to \( n \) at the same pipeline bind point, with a \( 
\text{VkPipelineLayout} \) that is compatible for set \( n \), with the \( 
\text{VkPipelineLayout} \) used to create the current \( 
\text{VkPipeline} \), as described in **Pipeline Layout Compatibility**

- **VUID-vkCmdSubpassShadingHUAWEI-maintenance4-06425**
  If the **maintenance4** feature is not enabled, then for each push constant that is statically used by the \( 
\text{VkPipeline} \) bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a \( 
\text{VkPipelineLayout} \) that is compatible for push constants, with the \( 
\text{VkPipelineLayout} \) used to create the current \( 
\text{VkPipeline} \), as described in **Pipeline Layout Compatibility**

- **VUID-vkCmdSubpassShadingHUAWEI-None-02699**
  Descriptors in each bound descriptor set, specified via \( 
\text{vkCmdBindDescriptorSets} \), **must** be valid if they are statically used by the \( 
\text{VkPipeline} \) bound to the pipeline bind point used by this command

- **VUID-vkCmdSubpassShadingHUAWEI-None-02700**
  A valid pipeline **must** be bound to the pipeline bind point used by this command

- **VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-02701**
  If the \( 
\text{VkPipeline} \) object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited (if the **VK_NV_inherited_viewport_scissor** extension is enabled) for \( 
\text{commandBuffer} \), and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- **VUID-vkCmdSubpassShadingHUAWEI-None-02859**
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the \( 
\text{VkPipeline} \) object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdSubpassShadingHUAWEI-None-02702**
  If the \( 
\text{VkPipeline} \) object bound to the pipeline bind point used by this command accesses a \( 
\text{VkSampler} \) object that uses unnormalized coordinates, that sampler **must** not be used to sample from any \( 
\text{VkImage} \) with a \( 
\text{VkImageView} \) of the type \( 
\text{VK_IMAGE_VIEW_TYPE_3D} \), \( 
\text{VK_IMAGE_VIEW_TYPE_CUBE} \), \( 
\text{VK_IMAGE_VIEW_TYPE_1D_ARRAY} \), \( 
\text{VK_IMAGE_VIEW_TYPE_2D_ARRAY} \) or \( 
\text{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY} \), in any shader stage

- **VUID-vkCmdSubpassShadingHUAWEI-None-02703**
  If the \( 
\text{VkPipeline} \) object bound to the pipeline bind point used by this command accesses a \( 
\text{VkSampler} \) object that uses unnormalized coordinates, that sampler **must** not be used with any of the **SPIR-V** \( 
\text{OpImageSample*} \) or \( 
\text{OpImageSparseSample*} \) instructions with \( 
\text{ImplicitLod} \), \( 
\text{Dref} \) or \( 
\text{Proj} \) in their name, in any shader stage

- **VUID-vkCmdSubpassShadingHUAWEI-None-02704**
  If the \( 
\text{VkPipeline} \) object bound to the pipeline bind point used by this command accesses a \( 
\text{VkSampler} \) object that uses unnormalized coordinates, that sampler **must** not be used with any of the **SPIR-V** \( 
\text{OpImageSample*} \) or \( 
\text{OpImageSparseSample*} \) instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdSubpassShadingHUAWEI-uniformBuffers-06935**
  If any stage of the \( 
\text{VkPipeline} \) object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either
VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdSubpassShadingHUAWEI-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource.

- **VUID-vkCmdSubpassShadingHUAWEI-None-06550**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y'CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

- **VUID-vkCmdSubpassShadingHUAWEI-ConstOffset-06551**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y'CbCr conversion, that object must not use the ConstOffset and Offset operands.

- **VUID-vkCmdSubpassShadingHUAWEI-None-04115**
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- **VUID-vkCmdSubpassShadingHUAWEI-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- **VUID-vkCmdSubpassShadingHUAWEI-SampledType-04471**
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- **VUID-vkCmdSubpassShadingHUAWEI-SampledType-04472**
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction
must have a Width of 64

- **VUID-vkCmdSubpassShadingHUAWEI-SampledType-04473**
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a Width of 32

- **VUID-vkCmdSubpassShadingHUAWEI-sparseImageInt64Atomics-04474**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a Width of 64 by this command

- **VUID-vkCmdSubpassShadingHUAWEI-sparseImageInt64Atomics-04475**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a Width of 64 by this command

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageWeightedSampleQCOM-06971**
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageWeightedSampleQCOM-06972**
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageBoxFilterQCOM-06973**
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchSSDQCOM-06974**
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchSADQCOM-06975**
  If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageWeightedSampleQCOM-06977**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, or `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageWeightedSampleQCOM-06978**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, or `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`. 
OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

- VUID-vkCmdSubpassShadingHUAWEI-None-07288
  Any shader invocation executed by this command must terminate

- VUID-vkCmdSubpassShadingHUAWEI-None-04931
  This command must be called in a subpass with bind point VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI. No draw commands can be called in the same subpass. Only one vkCmdSubpassShadingHUAWEI command can be called in a subpass

Valid Usage (Implicit)

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSubpassShadingHUAWEI-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdSubpassShadingHUAWEI-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Chapter 31. Device-Generated Commands

This chapter discusses the generation of command buffer content on the device, for which these principle steps are to be taken:

- Define via `VkIndirectCommandsLayoutNV` the sequence of commands which should be generated.
- Optionally make use of device-bindable Shader Groups.
- Retrieve device addresses by `vkGetBufferDeviceAddressEXT` for setting buffers on the device.
- Fill one or more `VkBuffer` with the appropriate content that gets interpreted by `VkIndirectCommandsLayoutNV`.
- Create a preprocess `VkBuffer` using the allocation information from `vkGetGeneratedCommandsMemoryRequirementsNV`.
- Optionally preprocess the input data using `vkCmdPreprocessGeneratedCommandsNV` in a separate action.
- Generate and execute the actual commands via `vkCmdExecuteGeneratedCommandsNV` passing all required data.

`vkCmdPreprocessGeneratedCommandsNV` executes in a separate logical pipeline from either graphics or compute. When preprocessing commands in a separate step they must be explicitly synchronized against the command execution. When not preprocessing, the preprocessing is automatically synchronized against the command execution.

31.1. Indirect Commands Layout

The device-side command generation happens through an iterative processing of an atomic sequence comprised of command tokens, which are represented by:

```c
// Provided by VK_NV_device_generated_commands
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkIndirectCommandsLayoutNV)
```

31.1.1. Creation and Deletion

Indirect command layouts are created by:

```c
// Provided by VK_NV_device_generated_commands
VkResult vkCreateIndirectCommandsLayoutNV(
    VkDevice device,                     /* device, */
    const VkIndirectCommandsLayoutCreateInfoNV* pCreateInfo, /* pCreateInfo, */
    const VkAllocationCallbacks* pAllocator, /* pAllocator, */
    VkIndirectCommandsLayoutNV* pIndirectCommandsLayout); /* pIndirectCommandsLayout */
```

- `device` is the logical device that creates the indirect command layout.
- `pCreateInfo` is a pointer to a `VkIndirectCommandsLayoutCreateInfoNV` structure containing
parameters affecting creation of the indirect command layout.

- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pIndirectCommandsLayout` is a pointer to a `VkIndirectCommandsLayoutNV` handle in which the resulting indirect command layout is returned.

### Valid Usage

- VUID-vkCreateIndirectCommandsLayoutNV-deviceGeneratedCommands-02929
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCreateIndirectCommandsLayoutNV-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkCreateIndirectCommandsLayoutNV-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkIndirectCommandsLayoutCreateInfoNV` structure
- VUID-vkCreateIndirectCommandsLayoutNV-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateIndirectCommandsLayoutNV-pIndirectCommandsLayout-parameter
  `pIndirectCommandsLayout` must be a valid pointer to a `VkIndirectCommandsLayoutNV` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkIndirectCommandsLayoutCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsLayoutCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkIndirectCommandsLayoutUsageFlagsNV flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t tokenCount;
} VkIndirectCommandsLayoutCreateInfoNV;
```
const VkIndirectCommandsLayoutTokenNV* pTokens;
uint32_t streamCount;
const uint32_t* pStreamStrides;
} VkIndirectCommandsLayoutCreateInfoNV;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **pipelineBindPoint** is the VkPipelineBindPoint that this layout targets.
• **flags** is a bitmask of VkIndirectCommandsLayoutUsageFlagBitsNV specifying usage hints of this layout.
• **tokenCount** is the length of the individual command sequence.
• **pTokens** is an array describing each command token in detail. See VkIndirectCommandsTokenTypeNV and VkIndirectCommandsLayoutTokenNV below for details.
• **streamCount** is the number of streams used to provide the token inputs.
• **pStreamStrides** is an array defining the byte stride for each input stream.

The following code illustrates some of the flags:

```c
void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout,
pIndirectCommandsTokens, sequencesCount, indexbuffer, indexbufferOffset)
{
    for (s = 0; s < sequencesCount; s++)
    {
        sUsed = s;

        if (indirectCommandsLayout.flags &
            VK_INDIVIDUAL_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV) {
            sUsed = indexbuffer.load_uint32( sUsed * sizeof(uint32_t) + indexbufferOffset);
        }

        if (indirectCommandsLayout.flags &
            VK_INDIVIDUAL_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV) {
            sUsed = incoherent_implementation_dependent_permutation[ sUsed ];
        }

        cmdProcessSequence( cmd, pipeline, indirectCommandsLayout,
pIndirectCommandsTokens, sUsed );
    }
}
```

When tokens are consumed, an offset is computed based on token offset and stream stride. The resulting offset is required to be aligned. The alignment for a specific token is equal to the scalar alignment of the data type as defined in Alignment Requirements, or VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment,
whichever is lower.

Note

A `minIndirectCommandsBufferOffsetAlignment` of 4 allows `VkDeviceAddress` to be packed as `uvec2` with scalar layout instead of `uint64_t` with 8 byte alignment. This enables direct compatibility with D3D12 command signature layouts.

Valid Usage

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-02930**
  The `pipelineBindPoint` **must** be `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-tokenCount-02931**
  `tokenCount` **must** be greater than 0 and less than or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenCount`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02932**
  If `pTokens` contains an entry of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV` it **must** be the first element of the array and there **must** be only a single element of such token type.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02933**
  If `pTokens` contains an entry of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV` there **must** be only a single element of such token type.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02934**
  All state tokens in `pTokens` **must** occur before any work provoking tokens (`VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV`).

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02935**
  The content of `pTokens` **must** include one single workprovoking token that is compatible with the `pipelineBindPoint`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-streamCount-02936**
  `streamCount` **must** be greater than 0 and less or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStreamCount`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pStreamStrides-02937**
  Each element of `pStreamStrides` **must** be greater than 0 and less than or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStreamStride`. Furthermore the alignment of each token input **must** be ensured.

Valid Usage (Implicit)

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_CREATE_INFO_NV`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pNext-pNext**
pNext must be NULL

- VUID-VkIndirectCommandsLayoutCreateInfoNV-flags-parameter
  flags must be a valid combination ofVkIndirectCommandsLayoutUsageFlagBitsNV values

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-parameter
  pTokens must be a valid pointer to an array of tokenCount valid
  VkIndirectCommandsLayoutTokenNV structures

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pStreamStrides-parameter
  pStreamStrides must be a valid pointer to an array of streamCount uint32_t values

- VUID-VkIndirectCommandsLayoutCreateInfoNV-tokenCount-arraylength
  tokenCount must be greater than 0

- VUID-VkIndirectCommandsLayoutCreateInfoNV-streamCount-arraylength
  streamCount must be greater than 0

Bits which can be set in VkIndirectCommandsLayoutCreateInfoNV::flags, specifying usage hints of an indirect command layout, are:

```c
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectCommandsLayoutUsageFlagBitsNV {
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV = 0x00000001,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV = 0x00000002,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV = 0x00000004,
} VkIndirectCommandsLayoutUsageFlagBitsNV;
```

- **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV** specifies that the layout is always used with the manual preprocessing step through calling
  vkCmdPreprocessGeneratedCommandsNV and executed by
  vkCmdExecuteGeneratedCommandsNV with isPreprocessed set to VK_TRUE.

- **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV** specifies that the input data for
  the sequences is not implicitly indexed from 0..sequencesUsed but a user provided
  VkBuffer encoding the index is provided.

- **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV** specifies that the processing of
  sequences can happen at an implementation-dependent order, which is not: guaranteed to be
  coherent using the same input data.

```c
// Provided by VK_NV_device_generated_commands
typedef VkFlags VkIndirectCommandsLayoutUsageFlagsNV;
```

VkIndirectCommandsLayoutUsageFlagsNV is a bitmask type for setting a mask of zero or more
VkIndirectCommandsLayoutUsageFlagBitsNV.
Indirect command layouts are destroyed by:

```c
void vkDestroyIndirectCommandsLayoutNV(
    VkDevice     device,     
    VkIndirectCommandsLayoutNV indirectCommandsLayout,     
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the layout.
- **indirectCommandsLayout** is the layout to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02938
  All submitted commands that refer to **indirectCommandsLayout** must have completed execution

- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02939
  If **VkAllocationCallbacks** were provided when **indirectCommandsLayout** was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02940
  If no **VkAllocationCallbacks** were provided when **indirectCommandsLayout** was created, **pAllocator** must be NULL

- VUID-vkDestroyIndirectCommandsLayoutNV-deviceGeneratedCommands-02941
  The **VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands** feature must be enabled

### Valid Usage (Implicit)

- VUID-vkDestroyIndirectCommandsLayoutNV-device-parameter
  **device** must be a valid **VkDevice** handle

- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-parameter
  If **indirectCommandsLayout** is not **VK_NULL_HANDLE**, **indirectCommandsLayout** must be a valid **VkIndirectCommandsLayoutNV** handle

- VUID-vkDestroyIndirectCommandsLayoutNV-pAllocator-parameter
  If **pAllocator** is not NULL, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-parent
  If **indirectCommandsLayout** is a valid handle, it must have been created, allocated, or retrieved from **device**
Host Synchronization

- Host access to indirectCommandsLayout must be externally synchronized

31.1.2. Token Input Streams

The VkIndirectCommandsStreamNV structure specifies the input data for one or more tokens at processing time.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsStreamNV {
    VkBuffer buffer;
    VkDeviceSize offset;
} VkIndirectCommandsStreamNV;
```

- buffer specifies the VkBuffer storing the functional arguments for each sequence. These arguments can be written by the device.
- offset specified an offset into buffer where the arguments start.

Valid Usage

- VUID-VkIndirectCommandsStreamNV-buffer-02942
  The buffer’s usage flag must have the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set
- VUID-VkIndirectCommandsStreamNV-offset-02943
  The offset must be aligned to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment
- VUID-VkIndirectCommandsStreamNV-buffer-02975
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

Valid Usage (Implicit)

- VUID-VkIndirectCommandsStreamNV-buffer-parameter
  buffer must be a valid VkBuffer handle

The input streams can contain raw uint32_t values, existing indirect commands such as:

- VkDrawIndirectCommand
- VkDrawIndexedIndirectCommand
- VkDrawMeshTasksIndirectCommandNV
- VkDrawMeshTasksIndirectCommandEXT
or additional commands as listed below. How the data is used is described in the next section.

The **VkBindShaderGroupIndirectCommandNV** structure specifies the input data for the **VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV** token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindShaderGroupIndirectCommandNV {
    uint32_t  groupIndex;
} VkBindShaderGroupIndirectCommandNV;
```

- **groupIndex** specifies which shader group of the current bound graphics pipeline is used.

**Valid Usage**

- VUID-VkBindShaderGroupIndirectCommandNV-None-02944
  The current bound graphics pipeline, as well as the pipelines it may reference, **must** have been created with **VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV**
- VUID-VkBindShaderGroupIndirectCommandNV-index-02945
  The **index** must be within range of the accessible shader groups of the current bound graphics pipeline. See **vkCmdBindPipelineShaderGroupNV** for further details.

The **VkBindIndexBufferIndirectCommandNV** structure specifies the input data for the **VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV** token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindIndexBufferIndirectCommandNV {
    VkDeviceAddress bufferAddress;
    uint32_t  size;
    VkIndexType indexType;
} VkBindIndexBufferIndirectCommandNV;
```

- **bufferAddress** specifies a physical address of the **VkBuffer** used as index buffer.
- **size** is the byte size range which is available for this operation from the provided address.
- **indexType** is a **VkIndexType** value specifying how indices are treated. Instead of the Vulkan enum values, a custom **uint32_t** value can be mapped to an **VkIndexType** by specifying the **VkIndirectCommandsLayoutTokenNV::pIndexTypes** and **VkIndirectCommandsLayoutTokenNV::pIndexTypeValues** arrays.

**Valid Usage**

- VUID-VkBindIndexBufferIndirectCommandNV-None-02946
  The buffer’s usage flag from which the address was acquired **must** have the **VK_BUFFER_USAGE_INDEX_BUFFER_BIT** bit set
- VUID-VkBindIndexBufferIndirectCommandNV-bufferAddress-02947
The **bufferAddress** must be aligned to the **indexType** used.

- **VUID-VkBindIndexBufferIndirectCommandNV-None-02948**
  Each element of the buffer from which the address was acquired and that is non-sparse **must** be bound completely and contiguously to a single **VkDeviceMemory** object.

---

### Valid Usage (Implicit)

- **VUID-VkBindIndexBufferIndirectCommandNV-indexType-parameter**
  **indexType** must be a valid **VkIndexType** value.

---

The **VkBindVertexBufferIndirectCommandNV** structure specifies the input data for the **VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV** token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindVertexBufferIndirectCommandNV {
    VkDeviceAddress bufferAddress;
    uint32_t size;
    uint32_t stride;
} VkBindVertexBufferIndirectCommandNV;
```

- **bufferAddress** specifies a physical address of the **VkBuffer** used as vertex input binding.
- **size** is the byte size range which is available for this operation from the provided address.
- **stride** is the byte size stride for this vertex input binding as in **VkVertexInputBindingDescription::stride**. It is only used if **VkIndirectCommandsLayoutTokenNV::vertexDynamicStride** was set, otherwise the stride is inherited from the current bound graphics pipeline.

---

### Valid Usage

- **VUID-VkBindVertexBufferIndirectCommandNV-None-02949**
  The buffer's usage flag from which the address was acquired **must** have the **VK_BUFFER_USAGE_VERTEX_BUFFER_BIT** bit set.

- **VUID-VkBindVertexBufferIndirectCommandNV-None-02950**
  Each element of the buffer from which the address was acquired and that is non-sparse **must** be bound completely and contiguously to a single **VkDeviceMemory** object.

---

The **VkSetStateFlagsIndirectCommandNV** structure specifies the input data for the **VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV** token. Which state is changed depends on the **VkIndirectStateFlagBitsNV** specified at **VkIndirectCommandsLayoutNV** creation time.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkSetStateFlagsIndirectCommandNV {
    uint32_t data;
} VkSetStateFlagsIndirectCommandNV;
```

---

2050
A subset of the graphics pipeline state can be altered using indirect state flags:

```c
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectStateFlagBitsNV {
    VK_INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV = 0x00000001,
} VkIndirectStateFlagBitsNV;
```

- `VK_INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV` allows to toggle the `VkFrontFace` rasterization state for subsequent draw operations.

```c
// Provided by VK_NV_device_generated_commands
typedef VkFlags VkIndirectStateFlagsNV;
```

`VkIndirectStateFlagsNV` is a bitmask type for setting a mask of zero or more `VkIndirectStateFlagBitsNV`.

### 31.1.3. Tokenized Command Processing

The processing is in principle illustrated below:

```c
void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s)
{
    for (t = 0; t < indirectCommandsLayout.tokenCount; t++)
    {
        uint32_t stream = indirectCommandsLayout.pTokens[t].stream;
        uint32_t offset = indirectCommandsLayout.pTokens[t].offset;
        uint32_t stride = indirectCommandsLayout.pStreamStrides[stream];
        stream = pIndirectCommandsStreams[stream];
        const void* input = stream.buffer.pointer( stream.offset + stride * s + offset )
        // further details later
        indirectCommandsLayout.pTokens[t].command (cmd, pipeline, input, s);
    }
}
```

```c
void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, sequencesCount)
{
    for (s = 0; s < sequencesCount; s++)
    {
        cmdProcessSequence(cmd, pipeline, indirectCommandsLayout,
```
The processing of each sequence is considered stateless, therefore all state changes must occur prior work provoking commands within the sequence. A single sequence is strictly targeting the VkPipelineBindPoint it was created with.

The primary input data for each token is provided through VkBuffer content at preprocessing using vkCmdPreprocessGeneratedCommandsNV or execution time using vkCmdExecuteGeneratedCommandsNV, however some functional arguments, for example binding sets, are specified at layout creation time. The input size is different for each token.

Possible values of those elements of the VkIndirectCommandsLayoutCreateInfoNV::pTokens array specifying command tokens (other elements of the array specify command parameters) are:

```c
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectCommandsTokenTypeNV {
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV = 0,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV = 1,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV = 2,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV = 3,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV = 4,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV = 5,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV = 6,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV = 7,
    // Provided by VK_EXT_mesh_shader with VK_NV_device_generated_commands
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV = 1000328000,
} VkIndirectCommandsTokenTypeNV;
```

**Table 44. Supported indirect command tokens**

<table>
<thead>

</tbody>
</table>
The `VkIndirectCommandsLayoutTokenNV` structure specifies details to the function arguments that need to be known at layout creation time:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsLayoutTokenNV {
    VkStructureType sType;
    const void* pNext;
    VkIndirectCommandsTokenTypeNV tokenType;
    uint32_t stream;
    uint32_t offset;
    uint32_t vertexBindingUnit;
    VkBool32 vertexDynamicStride;
    VkPipelineLayout pushconstantPipelineLayout;
    VkShaderStageFlags pushconstantShaderStageFlags;
    uint32_t pushconstantOffset;
    uint32_t pushconstantSize;
    VkIndirectStateFlagsNV indirectStateFlags;
    uint32_t indexTypeCount;
    const VkIndexType* pIndexTypes;
    const uint32_t* pIndexTypeValues;
} VkIndirectCommandsLayoutTokenNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `tokenType` specifies the token command type.
- `stream` is the index of the input stream containing the token argument data.
- `offset` is a relative starting offset within the input stream memory for the token argument data.
- `vertexBindingUnit` is used for the vertex buffer binding command.
- `vertexDynamicStride` sets if the vertex buffer stride is provided by the binding command rather than the current bound graphics pipeline state.
- `pushconstantPipelineLayout` is the `VkPipelineLayout` used for the push constant command.
- `pushconstantShaderStageFlags` are the shader stage flags used for the push constant command.
- `pushconstantOffset` is the offset used for the push constant command.
- `pushconstantSize` is the size used for the push constant command.
- `indirectStateFlags` are the active states for the state flag command.
- `indexTypeCount` is the optional size of the `pIndexTypes` and `pIndexTypeValues` array pairings. If not zero, it allows to register a custom `uint32_t` value to be treated as specific `VkIndexType`.
- `pIndexTypes` is the used `VkIndexType` for the corresponding `uint32_t` value entry in
Valid Usage

- **VUID-VkIndirectCommandsLayoutTokenNV-stream-02951**
  stream must be smaller than *VkIndirectCommandsLayoutCreateInfoNV::streamCount*

- **VUID-VkIndirectCommandsLayoutTokenNV-offset-02952**
  offset must be less than or equal to
  *VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenOffset*

- **VUID-VkIndirectCommandsLayoutTokenNV-offset-06888**
  offset must be aligned to the scalar alignment of *tokenType* or
  *minIndirectCommandsBufferOffsetAlignment*, whichever is lower

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02976**
  If *tokenType* is *VK_INDIVIDUAL_FILE_TOKEN_TYPE_VERTEX_BUFFER_NV*,
  *vertexBindingUnit must* stay within device supported limits for the appropriate commands

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02977**
  If *tokenType* is *VK_INDIVIDUAL_FILE_TOKEN_TYPE_PUSH_CONSTANT_NV*,
  *pushconstantPipelineLayout must* be valid

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02978**
  If *tokenType* is *VK_INDIVIDUAL_FILE_TOKEN_TYPE_PUSH_CONSTANT_NV*,
  *pushconstantOffset must* be a multiple of 4

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02979**
  If *tokenType* is *VK_INDIVIDUAL_FILE_TOKEN_TYPE_PUSH_CONSTANT_NV*,
  *pushconstantSize must* be a multiple of 4

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02980**
  If *tokenType* is *VK_INDIVIDUAL_FILE_TOKEN_TYPE_PUSH_CONSTANT_NV*,
  *pushconstantOffset must* be less than
  *VkPhysicalDeviceLimits::maxPushConstantsSize*

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02981**
  If *tokenType* is *VK_INDIVIDUAL_FILE_TOKEN_TYPE_PUSH_CONSTANT_NV*,
  *pushconstantSize must* be less than or equal to
  *VkPhysicalDeviceLimits::maxPushConstantsSize minus pushconstantOffset*

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02982**
  If *tokenType* is *VK_INDIVIDUAL_FILE_TOKEN_TYPE_PUSH_CONSTANT_NV*,
  for each byte in the range specified by *pushconstantOffset* and *pushconstantSize* and for each shader stage in
  *pushconstantShaderStageFlags*, there must be a push constant range in
  *pushconstantPipelineLayout* that includes that byte and that stage

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02983**
  If *tokenType* is *VK_INDIVIDUAL_FILE_TOKEN_TYPE_PUSH_CONSTANT_NV*,
  for each byte in the range specified by *pushconstantOffset* and *pushconstantSize* and for each push constant range
  that overlaps that byte, *pushconstantShaderStageFlags must* include all stages in that
  push constant range's *VkPushConstantRange::stageFlags*

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02984**
  If *tokenType* is *VK_INDIVIDUAL_FILE_TOKEN_TYPE_STATE_FLAGS_NV*,
  *indirectStateFlags must*
Valid Usage (Implicit)

- **VUID-VkIndirectCommandsLayoutTokenNV-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_TOKEN_NV`

- **VUID-VkIndirectCommandsLayoutTokenNV-pNext-pNext**
  - `pNext` must be `NULL`

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-parameter**
  - `tokenType` must be a valid `VkIndirectCommandsTokenTypeNV` value

- **VUID-VkIndirectCommandsLayoutTokenNV-pushconstantPipelineLayout-parameter**
  - If `pushconstantPipelineLayout` is not `VK_NULL_HANDLE`, `pushconstantPipelineLayout` must be a valid `VkPipelineLayout` handle

- **VUID-VkIndirectCommandsLayoutTokenNV-pushconstantShaderStageFlags-parameter**
  - `pushconstantShaderStageFlags` must be a valid combination of `VkShaderStageFlagBits` values

- **VUID-VkIndirectCommandsLayoutTokenNV-indirectStateFlags-parameter**
  - `indirectStateFlags` must be a valid combination of `VkIndirectStateFlagBitsNV` values

- **VUID-VkIndirectCommandsLayoutTokenNV-pIndexTypes-parameter**
  - If `indexTypeCount` is not 0, `pIndexTypes` must be a valid pointer to an array of `indexTypeCount` valid `VkIndexType` values

- **VUID-VkIndirectCommandsLayoutTokenNV-pIndexTypeValues-parameter**
  - If `indexTypeCount` is not 0, `pIndexTypeValues` must be a valid pointer to an array of `indexTypeCount` `uint32_t` values

The following code provides detailed information on how an individual sequence is processed. For valid usage, all restrictions from the regular commands apply.

```c
void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s)
{
  for (uint32_t t = 0; t < indirectCommandsLayout.tokenCount; t++){
    token = indirectCommandsLayout.pTokens[t];

    uint32_t stride = indirectCommandsLayout.pStreamStrides[token.stream];
    stream = pIndirectCommandsStreams[token.stream];
    uint32_t offset = stream.offset + stride * s + token.offset;
    const void* input = stream.buffer.pointer( offset )

    switch(input.type){
      VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV:
        VkBindShaderGroupIndirectCommandNV* bind = input;
        vkCmdBindPipelineShaderGroupNV(cmd, indirectCommandsLayout.pipelineBindPoint,
```
pipeline, bind->groupIndex);
break;

VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV:
VkSetStateFlagsIndirectCommandNV* state = input;

if (token.indirectStateFlags & VK_INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV){
    if (state.data & (1 << 0)){
        set VK_FRONT_FACE_CLOCKWISE;
    } else {
        set VK_FRONT_FACE_COUNTER_CLOCKWISE;
    }
} 
break;

VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV:
uint32_t* data = input;

vkCmdPushConstants(cmd,
    token.pushconstantPipelineLayout
    token.pushconstantStageFlags,
    token.pushconstantOffset,
    token.pushconstantSize, data);
break;

VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV:
VkBindIndexBufferIndirectCommandNV* data = input;

    // the indexType may optionally be remapped
    // from a custom uint32_t value, via
    // VkIndirectCommandsLayoutTokenNV::pIndexTypeValues

    vkCmdBindIndexBuffer(cmd,
        deriveBuffer(data->bufferAddress),
        deriveOffset(data->bufferAddress),
        data->indexType);
break;

VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV:
VkBindVertexBufferIndirectCommandNV* data = input;

    // if token.vertexDynamicStride is VK_TRUE
    // then the stride for this binding is set
    // using data->stride as well

    vkCmdBindVertexBuffers(cmd,
        token.vertexBindingUnit, 1,
        deriveBuffer(data->bufferAddress),
        deriveOffset(data->bufferAddress));
break;
31.2. Indirect Commands Generation And Execution

The generation of commands on the device requires a preprocess buffer. To retrieve the memory size and alignment requirements of a particular execution state call:

```c
// Provided by VK_NV_device_generated_commands
void vkGetGeneratedCommandsMemoryRequirementsNV(
    VkDevice device,
    const VkGeneratedCommandsMemoryRequirementsInfoNV* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `pInfo` is a pointer to a `VkGeneratedCommandsMemoryRequirementsInfoNV` structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

**Valid Usage**

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-deviceGeneratedCommands-02906
The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled

## Valid Usage (Implicit)

- **VUID-vkGetGeneratedCommandsMemoryRequirementsNV-device-parameter**
  - `device` **must** be a valid `VkDevice` handle

- **VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pInfo-parameter**
  - `pInfo` **must** be a valid pointer to a valid `VkGeneratedCommandsMemoryRequirementsInfoNV` structure

- **VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pMemoryRequirements-parameter**
  - `pMemoryRequirements` **must** be a valid pointer to a `VkMemoryRequirements2` structure

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkGeneratedCommandsMemoryRequirementsInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipeline pipeline;
    VkIndirectCommandsLayoutNV indirectCommandsLayout;
    uint32_t maxSequencesCount;
} VkGeneratedCommandsMemoryRequirementsInfoNV;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pipelineBindPoint** is the `VkPipelineBindPoint` of the `pipeline` that this buffer memory is intended to be used with during the execution.
- **pipeline** is the `VkPipeline` that this buffer memory is intended to be used with during the execution.
- **indirectCommandsLayout** is the `VkIndirectCommandsLayoutNV` that this buffer memory is intended to be used with.
- **maxSequencesCount** is the maximum number of sequences that this buffer memory in combination with the other state provided **can** be used with.

## Valid Usage

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-maxSequencesCount-02907**
  - `maxSequencesCount` **must** be less or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount`
Valid Usage (Implicit)

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_GENERATED_COMMANDS_MEMORY_REQUIREMENTS_INFO_NV

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pNext-pNext
  pNext must be NULL

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipeline-parameter
  pipeline must be a valid VkPipeline handle

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-indirectCommandsLayout-parameter
  indirectCommandsLayout must be a valid VkIndirectCommandsLayoutNV handle

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-commonparent
  Both of indirectCommandsLayout, and pipeline must have been created, allocated, or
  retrieved from the same VkDevice

The actual generation of commands as well as their execution on the device is handled as single
action with:

```c
// Provided by VK_NV_device_generated_commands
void vkCmdExecuteGeneratedCommandsNV(
    VkCommandBuffer commandBuffer,
    VkBool32 isPreprocessed,
    const VkGeneratedCommandsInfoNV* pGeneratedCommandsInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `isPreprocessed` represents whether the input data has already been preprocessed on the device.
  If it is VK_FALSE this command will implicitly trigger the preprocessing step, otherwise not.
- `pGeneratedCommandsInfo` is a pointer to a VkGeneratedCommandsInfoNV structure containing
  parameters affecting the generation of commands.

Valid Usage

- VUID-vkCmdExecuteGeneratedCommandsNV-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and
  compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this
  command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-mipmapMode-04770
  If a VkSampler created with.mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and
  compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this
  command, then the image view's format features must contain...
VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-06479
  If a VkImageView is sampled with depth comparison, the image view's format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-vkCmdExecuteGeneratedCommandsNV-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdExecuteGeneratedCommandsNV-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdExecuteGeneratedCommandsNV-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT
For each set $n$ that is statically used by the $VkPipeline$ bound to the pipeline bind point used by this command, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a $VkPipelineLayout$ that is compatible for set $n$, with the $VkPipelineLayout$ used to create the current $VkPipeline$, as described in Pipeline Layout Compatibility.

If the maintenance4 feature is not enabled, then for each push constant that is statically used by the $VkPipeline$ bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a $VkPipelineLayout$ that is compatible for push constants, with the $VkPipelineLayout$ used to create the current $VkPipeline$, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via $vkCmdBindDescriptorSets$, must be valid if they are statically used by the $VkPipeline$ bound to the pipeline bind point used by this command.

A valid pipeline must be bound to the pipeline bind point used by this command.

If the $VkPipeline$ object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for $commandBuffer$, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the $VkPipeline$ object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the $VkPipeline$ object bound to the pipeline bind point used by this command accesses a $VkSampler$ object that uses unnormalized coordinates, that sampler must not be used to sample from any $VkImage$ with a $VkImageView$ of the type $VK_IMAGE_VIEW_TYPE_3D$, $VK_IMAGE_VIEW_TYPE_CUBE$, $VK_IMAGE_VIEW_TYPE_1D_ARRAY$, $VK_IMAGE_VIEW_TYPE_2D_ARRAY$ or $VK_IMAGE_VIEW_TYPE_CUBE_ARRAY$, in any shader stage.

If the $VkPipeline$ object bound to the pipeline bind point used by this command accesses a $VkSampler$ object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V $OpImageSample*$ or $OpImageSparseSample*$ instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If the $VkPipeline$ object bound to the pipeline bind point used by this command accesses a $VkSampler$ object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V $OpImageSample*$ or $OpImageSparseSample*$ instructions that includes a LOD bias or any offset values, in any shader stage.

There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the $VkPipeline$ object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the $VkPipeline$ object bound to the pipeline bind point used by this command accesses a $VkSampler$ object that uses unnormalized coordinates, that sampler must not be used to sample from any $VkImage$ with a $VkImageView$ of the type $VK_IMAGE_VIEW_TYPE_3D$, $VK_IMAGE_VIEW_TYPE_CUBE$, $VK_IMAGE_VIEW_TYPE_1D_ARRAY$, $VK_IMAGE_VIEW_TYPE_2D_ARRAY$ or $VK_IMAGE_VIEW_TYPE_CUBE_ARRAY$, in any shader stage.

If the $VkPipeline$ object bound to the pipeline bind point used by this command accesses a $VkSampler$ object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V $OpImageSample*$ or $OpImageSparseSample*$ instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If the $VkPipeline$ object bound to the pipeline bind point used by this command accesses a $VkSampler$ object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V $OpImageSample*$ or $OpImageSparseSample*$ instructions that includes a LOD bias or any offset values, in any shader stage.
If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdExecuteGeneratedCommandsNV-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource

• VUID-vkCmdExecuteGeneratedCommandsNV-None-06550
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler YCbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

• VUID-vkCmdExecuteGeneratedCommandsNV-ConstOffset-06551
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler YCbCr conversion, that object must not use the ConstOffset and Offset operands

• VUID-vkCmdExecuteGeneratedCommandsNV-None-04115
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format

• VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format

• VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

• VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

• VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04472
If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 64.

- VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04473
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 32.

- VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a SampledType with a Width of 64 by this command.

- VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a SampledType with a Width of 64 by this command.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06971
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06972
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBoxFilterQCOM-06973
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchSSDQCOM-06974
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06977
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`. 
If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

Any shader invocation executed by this command must terminate.

The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it must be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

Input attachment views accessed in a subpass must be created with the same `VkFormat` as the corresponding subpass definition be created with a `VkImageView` that is an attachment in the currently bound `VkFramebuffer` at an index that corresponds to a valid input attachment in the current subpass.

Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

If any recorded command in the current subpass will write to an image subresource as an attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment.

If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment.

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled.

If the current render pass instance uses a depth/stencil attachment with a read-only
layout for the stencil aspect and stencil test is enabled, all stencil ops must be
VK_STENCIL_OP_KEEP

• VUID-vkCmdExecuteGeneratedCommandsNV-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum
  instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

• VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with
  VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and
  the current subpass has a depth/stencil attachment, then that attachment must have been
  created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

• VUID-vkCmdExecuteGeneratedCommandsNV-None-06666
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled then
  vkCmdSetSampleLocationsEXT must have been called in the current command buffer
  prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-03417
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the
  VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then
  vkCmdSetViewportWithCount must have been called in the current command buffer
  prior to this drawing command, and the viewportCount parameter of
  vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

• VUID-vkCmdExecuteGeneratedCommandsNV-scissorCount-03418
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the
  VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then
  vkCmdSetScissorWithCount must have been called in the current command buffer prior
  to this drawing command, and the scissorCount parameter of
  vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

• VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-03419
  If the bound graphics pipeline state was created with both the
  VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic
  states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount
  must have been called in the current command buffer prior to this drawing command, and
  the viewportCount parameter of vkCmdSetViewportWithCount must match the
  scissorCount parameter of vkCmdSetScissorWithCount

• VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04137
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the
  VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics
  pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV
  ::viewportCount greater or equal to the viewportCount parameter in the last call to
  vkCmdSetViewportWithCount
• **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04138**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV`::`viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• **VUID-vkCmdExecuteGeneratedCommandsNV-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV`::`viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• **VUID-vkCmdExecuteGeneratedCommandsNV-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV`::`exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• **VUID-vkCmdExecuteGeneratedCommandsNV-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

• **VUID-vkCmdExecuteGeneratedCommandsNV-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.
• VUID-vkCmdExecuteGeneratedCommandsNV-logicOp-04878
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

• VUID-vkCmdExecuteGeneratedCommandsNV-primitiveFragmentShadingRateWithMultipleViewports-04552
If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

• VUID-vkCmdExecuteGeneratedCommandsNV-blendEnable-04727
If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

• VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-07284
If rasterization is not disabled in the bound graphics pipeline, and none of the `VK_AMD_mixed_attachment_samples` extension, the `VK_NV_framebuffer_mixed_samples` extension, or the `multisampledRenderToSingleSampled` feature are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

• VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06172
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

• VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06173
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

• VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06174
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment.

• VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06175
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.
command **must** not write any values to the stencil attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06176
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment.

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06177
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment.

- VUID-vkCmdExecuteGeneratedCommandsNV-viewMask-06178
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`.

- VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-06179
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`.

- VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-06180
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.

- VUID-vkCmdExecuteGeneratedCommandsNV-attachmentCount-06667
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be greater than or equal to the `attachmentCount` parameter of `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

- VUID-vkCmdExecuteGeneratedCommandsNV-attachmentCount-06815
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

- VUID-vkCmdExecuteGeneratedCommandsNV-pDepthAttachment-06181
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound
The graphics pipeline must be equal to the \texttt{VkFormat} used to create \texttt{VkRenderingInfo::pDepthAttachment->imageView}

- **VUID-vkCmdExecuteGeneratedCommandsNV-pStencilAttachment-06182**
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering} and \texttt{VkRenderingInfo::pStencilAttachment->imageView} was not \texttt{VK_NULL_HANDLE}, the value of \texttt{VkPipelineRenderingCreateInfo::stencilAttachmentFormat} used to create the currently bound graphics pipeline must be equal to the \texttt{VkFormat} used to create \texttt{VkRenderingInfo::pStencilAttachment->imageView}

- **VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06183**
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering} and \texttt{VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView} was not \texttt{VK_NULL_HANDLE}, the currently bound graphics pipeline must have been created with \texttt{VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR}

- **VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06184**
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering} and \texttt{VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView} was not \texttt{VK_NULL_HANDLE}, the currently bound graphics pipeline must have been created with \texttt{VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT}

- **VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-06185**
  If the currently bound pipeline was created with a \texttt{VkAttachmentSampleCountInfoAMD} or \texttt{VkAttachmentSampleCountInfoNV} structure, and the current render pass instance was begun with \texttt{vkCmdBeginRendering} with a \texttt{VkRenderingInfo::colorAttachmentCount} parameter greater than \texttt{0}, then each element of the \texttt{VkRenderingInfo::pColorAttachments} array with a \texttt{imageView} not equal to \texttt{VK_NULL_HANDLE} must have been created with a sample count equal to the corresponding element of the \texttt{pColorAttachmentSamples} member of \texttt{VkAttachmentSampleCountInfoAMD} or \texttt{VkAttachmentSampleCountInfoNV} used to create the currently bound graphics pipeline

- **VUID-vkCmdExecuteGeneratedCommandsNV-pDepthAttachment-06186**
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the currently bound pipeline was created with a \texttt{VkAttachmentSampleCountInfoAMD} or \texttt{VkAttachmentSampleCountInfoNV} structure, and \texttt{VkRenderingInfo::pDepthAttachment->imageView} was not \texttt{VK_NULL_HANDLE}, the value of the \texttt{depthStencilAttachmentSamples} member of \texttt{VkAttachmentSampleCountInfoAMD} or \texttt{VkAttachmentSampleCountInfoNV} used to create the currently bound graphics pipeline must be equal to the sample count used to create \texttt{VkRenderingInfo::pDepthAttachment->imageView}

- **VUID-vkCmdExecuteGeneratedCommandsNV-pStencilAttachment-06187**
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the currently bound pipeline was created with a \texttt{VkAttachmentSampleCountInfoAMD} or \texttt{VkAttachmentSampleCountInfoNV} structure, and \texttt{VkRenderingInfo::pStencilAttachment->imageView} was not \texttt{VK_NULL_HANDLE}, the value of the \texttt{depthStencilAttachmentSamples} member of \texttt{VkAttachmentSampleCountInfoAMD} or \texttt{VkAttachmentSampleCountInfoNV} used to create the currently bound graphics pipeline must be equal to the sample count used to create \texttt{VkRenderingInfo::pStencilAttachment->imageView}

- **VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-07285**

\texttt{2069}
If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline.

- **VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-07286**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-07287**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-renderPass-06198**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-primitivesGeneratedQueryWithRasterizerDiscard-06708**
  If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

- **VUID-vkCmdExecuteGeneratedCommandsNV-primitivesGeneratedQueryWithNonZeroStreams-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-pColorBlendEnables-07470**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last call to
vkCmdSetColorBlendEnableEXT set pColorBlendEnables for any attachment to VK_TRUE, then for those attachments in the subpass the corresponding image view’s format features must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-07471
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT must follow the rules for a zero-attachment subpass

- VUID-vkCmdExecuteGeneratedCommandsNV-samples-07472
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_MASK_EXT state enabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state disabled, then the samples parameter in the last call to vkCmdSetSampleMaskEXT must be greater or equal to the VkPipelineMultisampleStateCreateInfo::rasterizationSamples parameter used to create the bound graphics pipeline

- VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-07475
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and none of the VK_AMD_mixed_attachment_samples extension, VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature is enabled, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07476
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls must specify an enable for all active color attachments in the current subpass

- VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07477
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then vkCmdSetColorBlendEquationEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEquationEXT calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled then `vkCmdSetColorBlendAdvancedEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendAdvancedEXT` calls must specify the advanced blend equations for all active color attachments in the current subpass where blending is enabled.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled and the last calls to `vkCmdSetColorBlendEnableEXT` and `vkCmdSetColorBlendAdvancedEXT` have enabled advanced blending, then the number of active color attachments in the current subpass must not exceed `advancedBlendMaxColorAttachments`.

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to `vkCmdSetRasterizationStreamEXT` must have set the `rasterizationStream` to zero.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` must equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesEXT`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsExt` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesExt`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsExt` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesExt`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsExt` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesExt`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsExt` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesExt`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsExt` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesExt`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsExt` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesExt`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsExt` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesExt`. 

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsExt` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesExt`. 

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsExt` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesExt`. 

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsExt` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesExt`. 

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsExt` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesExt`. 

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsExt` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesExt`. 

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsExt` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesExt`. 

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsExt` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesExt`.
If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07485**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.sampleLocationGridSize.width` in the last call to `vkCmdSetSampleLocationsEXT` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07486**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.sampleLocationGridSize.height` in the last call to `vkCmdSetSampleLocationsEXT` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07487**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, the fragment shader code must not statically use the extended instruction `InterpolateAtSample`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-coverageModulationTableEnable-07488**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` state enabled and the last call to `vkCmdSetCoverageModulationTableEnableNV` set `coverageModulationTableEnable` to `VK_TRUE`, then the `coverageModulationTableCount` parameter in the last call to `vkCmdSetCoverageModulationTableNV` must equal the current `rasterizationSamples` divided by the number of color samples in the current subpass.

- **VUID-vkCmdExecuteGeneratedCommandsNV-coverageToColorEnable-07490**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if current subpass has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled in the currently bound pipeline state, then the current `rasterizationSamples` must be the same as the sample count of the depth/stencil attachment.

- **VUID-vkCmdExecuteGeneratedCommandsNV-coverageToColorEnable-07490**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` state enabled and the last call to
vkCmdSetCoverageToColorEnableNV  set the coverageToColorEnable to VK_TRUE, then the current subpass must have a color attachment at the location selected by the last call to vkCmdSetCoverageToColorLocationNV coverageToColorLocation, with a VkFormat of VK_FORMAT_R8_UINT, VK_FORMAT_R8_SINT, VK_FORMAT_R16_UINT, VK_FORMAT_R16_SINT, VK_FORMAT_R32_UINT, or VK_FORMAT_R32_SINT

• VUID-vkCmdExecuteGeneratedCommandsNV-coverageReductionMode-07491
If this VK_NV_coverage_reduction_mode extension is enabled, the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV and VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT states enabled, the current coverage reduction mode coverageReductionMode, then the current rasterizationSamples, and the sample counts for the color and depth/stencil attachments (if the subpass has them) must be a valid combination returned by vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV

• VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-07492
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV ::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-07493
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportSwizzleNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-07494
If the VK_NV_framebuffer_mixed_samples extension is enabled, and if the current subpass has any color attachments and rasterizationSamples of the last call to vkCmdSetRasterizationSamplesEXT is greater than the number of color samples, then the pipeline sampleShadingEnable must be VK_FALSE

• VUID-vkCmdExecuteGeneratedCommandsNV-stippledLineEnable-07495
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT, then the stippledRectangularLines feature must be enabled

• VUID-vkCmdExecuteGeneratedCommandsNV-stippledLineEnable-07496
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT, then the stippledBresenhamLines feature must be enabled
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then the `stippledSmoothLines` feature must be enabled.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT`, then the `stippledRectangularLines` feature must be enabled and `VkPhysicalDeviceLimits::strictLines` must be `VK_TRUE`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled, conservative point and line rasterization is not supported, and the effective primitive topology output by the last pre-rasterization shader stage is a line or point, then the `conservativeRasterizationMode` set by the last call to `vkCmdSetConservativeRasterizationModeEXT` must be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`.

If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then Mesh Shader Queries must not be active.

All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or `VK_NULL_HANDLE` buffers bound.

If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be `VK_NULL_HANDLE`.

For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled and the `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, then the `primitiveTopology` parameter
in the last call to `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdExecuteGeneratedCommandsNV-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be `NULL`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04914**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled, then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-stage-06481**
  The bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-02970**
  `commandBuffer` must not be a protected command buffer

- **VUID-vkCmdExecuteGeneratedCommandsNV-isPreprocessed-02908**
  If `isPreprocessed` is `VK_TRUE` then `vkCmdPreprocessGeneratedCommandsNV` must have already been executed on the device, using the same `pGeneratedCommandsInfo` content as well as the content of the input buffers it references (all except `VkGeneratedCommandsInfoNV::preprocessBuffer`). Furthermore `pGeneratedCommandsInfo`'s `indirectCommandsLayout` must have been created with the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV` bit set

- **VUID-vkCmdExecuteGeneratedCommandsNV-pipeline-02909**
  `VkGeneratedCommandsInfoNV::pipeline` must match the current bound pipeline at
VkGeneratedCommandsInfoNV::pipelineBindPoint

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02910
  Transform feedback must not be active

- VUID-vkCmdExecuteGeneratedCommandsNV-deviceGeneratedCommands-02911
  The VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdExecuteGeneratedCommandsNV-pGeneratedCommandsInfo-parameter
  pGeneratedCommandsInfo must be a valid pointer to a valid VkGeneratedCommandsInfoNV structure

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdExecuteGeneratedCommandsNV-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdExecuteGeneratedCommandsNV-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

// Provided by VK_NV_device_generated_commands
typedef struct VkGeneratedCommandsInfoNV {
    VkStructureType sType;
const void* pNext;
VkPipelineBindPoint pipelineBindPoint;
VkPipeline pipeline;
VkIndirectCommandsLayoutNV indirectCommandsLayout;
uint32_t
const VkIndirectCommandsStreamNV* pStreams;
uint32_t
VkBuffer preprocessBuffer;
VkDeviceSize preprocessOffset;
VkDeviceSize preprocessSize;
VkBuffer sequencesCountBuffer;
VkDeviceSize sequencesCountOffset;
VkBuffer sequencesIndexBuffer;
VkDeviceSize sequencesIndexOffset;

} VkGeneratedCommandsInfoNV;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pipelineBindPoint** is the VkPipelineBindPoint used for the pipeline.
- **pipeline** is the VkPipeline used in the generation and execution process.
- **indirectCommandsLayout** is the VkIndirectCommandsLayoutNV that provides the command sequence to generate.
- **streamCount** defines the number of input streams
- **pStreams** is a pointer to an array of \(\text{streamCount} \) VkIndirectCommandsStreamNV structures providing the input data for the tokens used in indirectCommandsLayout.
- **sequencesCount** is the maximum number of sequences to reserve. If **sequencesCountBuffer** is VK_NULL_HANDLE, this is also the actual number of sequences generated.
- **preprocessBuffer** is the VkBuffer that is used for preprocessing the input data for execution. If this structure is used with vkCmdExecuteGeneratedCommandsNV with its isPreprocessed set to VK_TRUE, then the preprocessing step is skipped and data is only read from this buffer. The contents and the layout of this buffer is opaque to applications and must not be modified or copied to another buffer for reuse.
- **preprocessOffset** is the byte offset into preprocessBuffer where the preprocessed data is stored.
- **preprocessSize** is the maximum byte size within the preprocessBuffer after the preprocessOffset that is available for preprocessing.
- **sequencesCountBuffer** is a VkBuffer in which the actual number of sequences is provided as single uint32_t value.
- **sequencesCountOffset** is the byte offset into sequencesCountBuffer where the count value is stored.
- **sequencesIndexBuffer** is a VkBuffer that encodes the used sequence indices as uint32_t array.
- **sequencesIndexOffset** is the byte offset into sequencesIndexBuffer where the index values start.
Valid Usage

- VUID-VkGeneratedCommandsInfoNV-pipeline-02912
  The provided pipeline must match the pipeline bound at execution time

- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02913
  If the indirectCommandsLayout uses a token of VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV, then the pipeline must have been created with multiple shader groups

- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02914
  If the indirectCommandsLayout uses a token of VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV, then the pipeline must have been created with VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV set in VkGraphicsPipelineCreateInfo::flags

- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02915
  If the indirectCommandsLayout uses a token of VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, then the pipeline`s VkPipelineLayout must match the VkIndirectCommandsLayoutTokenNV::pushconstantPipelineLayout

- VUID-VkGeneratedCommandsInfoNV-streamCount-02916
  streamCount must match the indirectCommandsLayout's streamCount

- VUID-VkGeneratedCommandsInfoNV-sequencesCount-02917
  sequencesCount must be less or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount and VkGeneratedCommandsMemoryRequirementsInfoNV::maxSequencesCount that was used to determine the preprocessSize

- VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-02918
  preprocessBuffer must have the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set in its usage flag

- VUID-VkGeneratedCommandsInfoNV-preprocessOffset-02919
  preprocessOffset must be aligned to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOff setAlignment

- VUID-VkGeneratedCommandsInfoNV-preprocessSize-02920
  preprocessSize must be at least equal to the memory requirement`s size returned by vkGetGeneratedCommandsMemoryRequirementsNV using the matching inputs (indirectCommandsLayout, ...) as within this structure

- VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02921
  sequencesCountBuffer can be set if the actual used count of sequences is sourced from the provided buffer. In that case the sequencesCount serves as upper bound

- VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02922
  If sequencesCountBuffer is not VK_NULL_HANDLE, its usage flag must have the
VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02923**
  If `sequencesCountBuffer` is not `VK_NULL_HANDLE`, `sequencesCountOffset` **must** be aligned to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minSequencesCountBufferOffsetAlignment`

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02972**
  If `sequencesCountBuffer` is not `VK_NULL_HANDLE` and is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02924**
  If `indirectCommandsLayout`'s `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV` is set, `sequencesIndexBuffer` **must** be set otherwise it **must** be `VK_NULL_HANDLE`

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02925**
  If `sequencesIndexBuffer` is not `VK_NULL_HANDLE`, its usage flag **must** have the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02926**
  If `sequencesIndexBuffer` is not `VK_NULL_HANDLE`, `sequencesIndexOffset` **must** be aligned to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minSequencesIndexBufferOffsetAlignment`

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02973**
  If `sequencesIndexBuffer` is not `VK_NULL_HANDLE` and is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-07078**
  If the `indirectCommandsLayout` uses a token of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV`, then the pipeline **must** contain a shader stage using the `MeshNV Execution Model`.

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-07079**
  If the `indirectCommandsLayout` uses a token of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV`, then the pipeline **must** contain a shader stage using the `MeshEXT Execution Model`.

**Valid Usage (Implicit)**

- **VUID-VkGeneratedCommandsInfoNV-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_GENERATED_COMMANDS_INFO_NV`

- **VUID-VkGeneratedCommandsInfoNV-pNext-pNext**
  `pNext` **must** be NULL

- **VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-parameter**
  `pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value

- **VUID-VkGeneratedCommandsInfoNV-pipeline-parameter**
  `pipeline` **must** be a valid `VkPipeline` handle

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-parameter**
  `indirectCommandsLayout` **must** be a valid `VkIndirectCommandsLayoutNV` handle
• **VUID-VkGeneratedCommandsInfoNV-pStreams-parameter**
  
  `pStreams` must be a valid pointer to an array of `streamCount` valid `VkIndirectCommandsStreamNV` structures

• **VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-parameter**
  
  `preprocessBuffer` must be a valid `VkBuffer` handle

• **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-parameter**
  
  If `sequencesCountBuffer` is not `VK_NULL_HANDLE`, `sequencesCountBuffer` must be a valid `VkBuffer` handle

• **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-parameter**
  
  If `sequencesIndexBuffer` is not `VK_NULL_HANDLE`, `sequencesIndexBuffer` must be a valid `VkBuffer` handle

• **VUID-VkGeneratedCommandsInfoNV-streamCount-arraylength**
  
  `streamCount` must be greater than 0

• **VUID-VkGeneratedCommandsInfoNV-commonparent**
  
  Each of `indirectCommandsLayout`, `pipeline`, `preprocessBuffer`, `sequencesCountBuffer`, and `sequencesIndexBuffer` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

Referencing the functions defined in **Indirect Commands Layout**, `vkCmdExecuteGeneratedCommandsNV` behaves as:

```c
uint32_t sequencesCount = sequencesCountBuffer ?
    min(maxSequencesCount, sequencesCountBuffer.load_uint32(sequencesCountOffset)) :
    maxSequencesCount;

cmdProcessAllSequences(commandBuffer, pipeline,
    indirectCommandsLayout, pIndirectCommandsStreams,
    sequencesCount,
    sequencesIndexBuffer, sequencesIndexOffset);
```

// The stateful commands within indirectCommandsLayout will not
// affect the state of subsequent commands in the target
// command buffer (cmd)

**Note**

It is important to note that the values of all state related to the `pipelineBindPoint` used are undefined after this command.

Commands can be preprocessed prior execution using the following command:

```c
// Provided by VK_NV_device_generated_commands
void vkCmdPreprocessGeneratedCommandsNV(
    VkCommandBuffer commandBuffer,
```
const VkGeneratedCommandsInfoNV* pGeneratedCommandsInfo);

- `commandBuffer` is the command buffer which does the preprocessing.
- `pGeneratedCommandsInfo` is a pointer to a `VkGeneratedCommandsInfoNV` structure containing parameters affecting the preprocessing step.

### Valid Usage

- **VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-02974**  
  `commandBuffer` must not be a protected command buffer

- **VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-02927**  
  `pGeneratedCommandsInfo`'s `indirectCommandsLayout` must have been created with the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV` bit set

- **VUID-vkCmdPreprocessGeneratedCommandsNV-deviceGeneratedCommands-02928**  
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled

### Valid Usage (Implicit)

- **VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-parameter**  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-parameter**  
  `pGeneratedCommandsInfo` must be a valid pointer to a valid `VkGeneratedCommandsInfoNV` structure

- **VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-recording**  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-cmdpool**  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- **VUID-vkCmdPreprocessGeneratedCommandsNV-renderpass**  
  This command must only be called outside of a render pass instance

- **VUID-vkCmdPreprocessGeneratedCommandsNV-videocoding**  
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Chapter 32. Sparse Resources

As documented in Resource Memory Association, VkBuffer and VkImage resources in Vulkan must be bound completely and contiguously to a single VkDeviceMemory object. This binding must be done before the resource is used, and the binding is immutable for the lifetime of the resource.

Sparse resources relax these restrictions and provide these additional features:

• Sparse resources can be bound non-contiguously to one or more VkDeviceMemory allocations.
• Sparse resources can be re-bound to different memory allocations over the lifetime of the resource.
• Sparse resources can have descriptors generated and used orthogonally with memory binding commands.

32.1. Sparse Resource Features

Sparse resources have several features that must be enabled explicitly at resource creation time. The features are enabled by including bits in the flags parameter of VkImageCreateInfo or VkBufferCreateInfo. Each feature also has one or more corresponding feature enables specified in VkPhysicalDeviceFeatures.

• The sparseBinding feature is the base, and provides the following capabilities:
  ◦ Resources can be bound at some defined (sparse block) granularity.
  ◦ The entire resource must be bound to memory before use regardless of regions actually accessed.
  ◦ No specific mapping of image region to memory offset is defined, i.e. the location that each texel corresponds to in memory is implementation-dependent.
  ◦ Sparse buffers have a well-defined mapping of buffer range to memory range, where an offset into a range of the buffer that is bound to a single contiguous range of memory corresponds to an identical offset within that range of memory.
    Requested via the VK_IMAGE_CREATE_SPARSE_BINDING_BIT and VK_BUFFER_CREATE_SPARSE_BINDING_BIT bits.
  ◦ A sparse image created using VK_IMAGE_CREATE_SPARSE_BINDING_BIT (but not VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT) supports all formats that non-sparse usage supports, and supports both VK_IMAGE_TILING_OPTIMAL and VK_IMAGE_TILING_LINEAR tiling.

• Sparse Residency builds on (and requires) the sparseBinding feature. It includes the following capabilities:
  ◦ Resources do not have to be completely bound to memory before use on the device.
  ◦ Images have a prescribed sparse image block layout, allowing specific rectangular regions of the image to be bound to specific offsets in memory allocations.
  ◦ Consistency of access to unbound regions of the resource is defined by the absence or presence of VkPhysicalDeviceSparseProperties::residencyNonResidentStrict. If this property is present, accesses to unbound regions of the resource are well defined and behave as if the
data bound is populated with all zeros; writes are discarded. When this property is absent, accesses are considered safe, but reads will return undefined values.

- Requested via the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` and `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bits.
- Sparse residency support is advertised on a finer grain via the following features:
  - The `sparseResidencyBuffer` feature provides support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE RESIDENCY_BIT`.
  - The `sparseResidencyImage2D` feature provides support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidencyImage3D` feature provides support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency2Samples` feature provides support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency4Samples` feature provides support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency8Samples` feature provides support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency16Samples` feature provides support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

Implementations supporting `sparseResidencyImage2D` are only required to support sparse 2D, single-sampled images. Support for sparse 3D and MSAA images is optional and can be enabled via `sparseResidencyImage3D`, `sparseResidency2Samples`, `sparseResidency4Samples`, `sparseResidency8Samples`, and `sparseResidency16Samples`.

- A sparse image created using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` supports all non-compressed color formats with power-of-two element size that non-sparse usage supports. Additional formats may also be supported and can be queried via `vkGetPhysicalDeviceSparseImageFormatProperties`. `VK_IMAGE_TILING_LINEAR` tiling is not supported.

- The `sparseResidencyAliased` feature provides the following capability that can be enabled per resource:

  Allows physical memory ranges to be shared between multiple locations in the same sparse resource or between multiple sparse resources, with each binding of a memory location observing a consistent interpretation of the memory contents.

  See `Sparse Memory Aliasing` for more information.

### 32.2. Sparse Buffers and Fully-Resident Images

Both `VkBuffer` and `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` or `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bits can be thought of as a linear region of address space. In the `VkImage` case if `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` is not used, this linear region is entirely
opaque, meaning that there is no application-visible mapping between texel location and memory offset.

Unless `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` or `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` are also used, the entire resource must be bound to one or more `VkDeviceMemory` objects before use.

### 32.2.1. Sparse Buffer and Fully-Resident Image Block Size

The sparse block size in bytes for sparse buffers and fully-resident images is reported as `VkMemoryRequirements::alignment`. `alignment` represents both the memory alignment requirement and the binding granularity (in bytes) for sparse resources.

### 32.3. Sparse Partially-Resident Buffers

`VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bit allow the buffer to be made only partially resident. Partially resident `VkBuffer` objects are allocated and bound identically to `VkBuffer` objects using only the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` feature. The only difference is the ability for some regions of the buffer to be unbound during device use.

### 32.4. Sparse Partially-Resident Images

`VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` bit allow specific rectangular regions of the image called sparse image blocks to be bound to specific ranges of memory. This allows the application to manage residency at either image subresource or sparse image block granularity. Each image subresource (outside of the `mip tail`) starts on a sparse block boundary and has dimensions that are integer multiples of the corresponding dimensions of the sparse image block.

**Note**

Applications can use these types of images to control LOD based on total memory consumption. If memory pressure becomes an issue the application can unbind and disable specific mipmap levels of images without having to recreate resources or modify texel data of unaffected levels.

The application can also use this functionality to access subregions of the image in a “megatexture” fashion. The application can create a large image and only populate the region of the image that is currently being used in the scene.

### 32.4.1. Accessing Unbound Regions

The following member of `VkPhysicalDeviceSparseProperties` affects how data in unbound regions of sparse resources are handled by the implementation:

- `residencyNonResidentStrict`

If this property is not present, reads of unbound regions of the image will return undefined values. Both reads and writes are still considered safe and will not affect other resources or populated regions of the image.
If this property is present, all reads of unbound regions of the image will behave as if the region was bound to memory populated with all zeros; writes will be discarded.

**Image operations** performed on unbound memory may still alter some component values in the natural way for those accesses, e.g. substituting a value of one for alpha in formats that do not have an alpha component.

Example: Reading the alpha component of an unbacked `VK_FORMAT_R8_UNORM` image will return a value of 1.0f.

See **Physical Device Enumeration** for instructions for retrieving physical device properties.

### Implementor’s Note

For implementations that cannot natively handle access to unbound regions of a resource, the implementation may allocate and bind memory to the unbound regions. Reads and writes to unbound regions will access the implementation-managed memory instead.

Given that the values resulting from reads of unbound regions are undefined in this scenario, implementations may use the same physical memory for all unbound regions of multiple resources within the same process.

#### 32.4.2. Mip Tail Regions

Sparse images created using `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` (without also using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`) have no specific mapping of image region or image subresource to memory offset defined, so the entire image can be thought of as a linear opaque address region. However, images created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` do have a prescribed sparse image block layout, and hence each image subresource must start on a sparse block boundary. Within each array layer, the set of mip levels that have a smaller size than the sparse block size in bytes are grouped together into a **mip tail region**.

If the `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` flag is present in the flags member of `VkSparseImageFormatProperties`, for the image's format, then any mip level which has dimensions that are not integer multiples of the corresponding dimensions of the sparse image block, and all subsequent mip levels, are also included in the mip tail region.

The following member of `VkPhysicalDeviceSparseProperties` may affect how the implementation places mip levels in the mip tail region:

- `residencyAlignedMipSize`

Each mip tail region is bound to memory as an opaque region (i.e. must be bound using a `VkSparseImageOpaqueMemoryBindInfo` structure) and may be of a size greater than or equal to the sparse block size in bytes. This size is guaranteed to be an integer multiple of the sparse block size in bytes.
An implementation may choose to allow each array-layer's mip tail region to be bound to memory independently or require that all array-layer's mip tail regions be treated as one. This is dictated by `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` in `VkSparseImageMemoryRequirements::flags`.

The following diagrams depict how `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` alter memory usage and requirements.

![Diagram of Sparse Image](image.png)

*Figure 22. Sparse Image*

In the absence of `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, each array layer contains a mip tail region containing texel data for all mip levels smaller than the sparse image block in any dimension.

Mip levels that are as large or larger than a sparse image block in all dimensions can be bound individually. Right-edges and bottom-edges of each level are allowed to have partially used sparse blocks. Any bound partially-used-sparse-blocks must still have their full sparse block size in bytes allocated in memory.
When `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` is present all array layers will share a single mip tail region.
The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` is present the first mip level that would contain partially used sparse blocks begins the mip tail region. This level and all subsequent levels are placed in the mip tail. Only the first \( N \) mip levels whose dimensions are an exact multiple of the sparse image block dimensions can be bound and unbound on a sparse block basis.

![Figure 25. Sparse Image with Aligned Mip Size and Single Mip Tail](image)

**Note**

The mip tail region is presented here in a 2D array simply for figure size reasons. It is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When both `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` are present the constraints from each of these flags are in effect.

### 32.4.3. Standard Sparse Image Block Shapes

Standard sparse image block shapes define a standard set of dimensions for sparse image blocks that depend on the format of the image. Layout of texels or compressed texel blocks within a sparse image block is implementation-dependent. All currently defined standard sparse image block shapes are 64 KB in size.

For block-compressed formats (e.g. `VK_FORMAT_BC5_UNORM_BLOCK`), the texel size is the size of the compressed texel block (e.g. 128-bit for BC5) thus the dimensions of the standard sparse image block...
shapes apply in terms of compressed texel blocks.

**Note**

For block-compressed formats, the dimensions of a sparse image block in terms of texels can be calculated by multiplying the sparse image block dimensions by the compressed texel block dimensions.
Table 45. Standard Sparse Image Block Shapes (Single Sample)

<td>32 × 64 × 1</td>
<td>32 × 32 × 1</td>
</tr>
<tr>
<td>64-Bit</td>
<td>64 × 64 × 1</td>
<td>64 × 32 × 1</td>
<td>32 × 32 × 1</td>
<td>32 × 16 × 1</td>
</tr>
<tr>
<td>128-Bit</td>
<td>32 × 64 × 1</td>
<td>32 × 32 × 1</td>
<td>16 × 32 × 1</td>
<td>16 × 16 × 1</td>
</tr>
</tbody>
</table>

Implementations that support the standard sparse image block shape for all formats listed in the Standard Sparse Image Block Shapes (Single Sample) and Standard Sparse Image Block Shapes (MSAA) tables may advertise the following VkPhysicalDeviceSparseProperties:

- residencyStandard2DBlockShape
- residencyStandard2DMultisampleBlockShape
- residencyStandard3DBlockShape

Reporting each of these features does not imply that all possible image types are supported as sparse. Instead, this indicates that no supported sparse image of the corresponding type will use custom sparse image block dimensions for any formats that have a corresponding standard sparse image block shape.

32.4.4. Custom Sparse Image Block Shapes

An implementation that does not support a standard image block shape for a particular sparse partially-resident image may choose to support a custom sparse image block shape for it instead. The dimensions of such a custom sparse image block shape are reported in VkSparseImageFormatProperties::imageGranularity. As with standard sparse image block shapes, the size in bytes of the custom sparse image block shape will be reported in VkMemoryRequirements::alignment.

Custom sparse image block dimensions are reported through vkGetPhysicalDeviceSparseImageFormatProperties and vkGetImageSparseMemoryRequirements.

An implementation must not support both the standard sparse image block shape and a custom
sparse image block shape for the same image. The standard sparse image block shape must be used if it is supported.

### 32.4.5. Multiple Aspects

Partially resident images are allowed to report separate sparse properties for different aspects of the image. One example is for depth/stencil images where the implementation separates the depth and stencil data into separate planes. Another reason for multiple aspects is to allow the application to manage memory allocation for implementation-private metadata associated with the image. See the figure below:

![Figure 26. Multiple Aspect Sparse Image](image)

*Note*

The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

In the figure above the depth, stencil, and metadata aspects all have unique sparse properties. The
per-texel stencil data is $\frac{1}{4}$ the size of the depth data, hence the stencil sparse blocks include $4 \times$ the number of texels. The sparse block size in bytes for all of the aspects is identical and defined by `VkMemoryRequirements::alignment`.

**Metadata**

The metadata aspect of an image has the following constraints:

- All metadata is reported in the mip tail region of the metadata aspect.
- All metadata must be bound prior to device use of the sparse image.

### 32.5. Sparse Memory Aliasing

By default sparse resources have the same aliasing rules as non-sparse resources. See Memory Aliasing for more information.

`VkDevice` objects that have the `sparseResidencyAliased` feature enabled are able to use the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flags for resource creation. These flags allow resources to access physical memory bound into multiple locations within one or more sparse resources in a *data consistent* fashion. This means that reading physical memory from multiple aliased locations will return the same value.

Care must be taken when performing a write operation to aliased physical memory. Memory dependencies must be used to separate writes to one alias from reads or writes to another alias. Writes to aliased memory that are not properly guarded against accesses to different aliases will have undefined results for all accesses to the aliased memory.

Applications that wish to make use of data consistent sparse memory aliasing must abide by the following guidelines:

- All sparse resources that are bound to aliased physical memory must be created with the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` / `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flag.
- All resources that access aliased physical memory must interpret the memory in the same way. This implies the following:
  - Buffers and images cannot alias the same physical memory in a data consistent fashion. The physical memory ranges must be used exclusively by buffers or used exclusively by images for data consistency to be guaranteed.
  - Memory in sparse image mip tail regions cannot access aliased memory in a data consistent fashion.
  - Sparse images that alias the same physical memory must have compatible formats and be using the same sparse image block shape in order to access aliased memory in a data consistent fashion.

Failure to follow any of the above guidelines will require the application to abide by the normal, non-sparse resource aliasing rules. In this case memory cannot be accessed in a data consistent fashion.
Note

Enabling sparse resource memory aliasing can be a way to lower physical memory use, but it may reduce performance on some implementations. An application developer can test on their target HW and balance the memory / performance trade-offs measured.

32.6. Sparse Resource Implementation Guidelines (Informative)

This section is Informative. It is included to aid in implementors’ understanding of sparse resources.

Device Virtual Address

The basic sparseBinding feature allows the resource to reserve its own device virtual address range at resource creation time rather than relying on a bind operation to set this. Without any other creation flags, no other constraints are relaxed compared to normal resources. All pages must be bound to physical memory before the device accesses the resource.

The sparseResidency features allow sparse resources to be used even when not all pages are bound to memory. Implementations that support access to unbound pages without causing a fault may support residencyNonResidentStrict.

Not faulting on access to unbound pages is not enough to support residencyNonResidentStrict. An implementation must also guarantee that reads after writes to unbound regions of the resource always return data for the read as if the memory contains zeros. Depending on any caching hierarchy of the implementation this may not always be possible.

Any implementation that does not fault, but does not guarantee correct read values must not support residencyNonResidentStrict.

Any implementation that cannot access unbound pages without causing a fault will require the implementation to bind the entire device virtual address range to physical memory. Any pages that the application does not bind to memory may be bound to one (or more) "placeholder" physical page(s) allocated by the implementation. Given the following properties:

- A process must not access memory from another process
- Reads return undefined values

It is sufficient for each host process to allocate these placeholder pages and use them for all resources in that process. Implementations may allocate more often (per instance, per device, or per resource).

Binding Memory

The byte size reported in VkMemoryRequirements::size must be greater than or equal to the amount of physical memory required to fully populate the resource. Some implementations
require “holes” in the device virtual address range that are never accessed. These holes may be included in the size reported for the resource.

Including or not including the device virtual address holes in the resource size will alter how the implementation provides support for VkSparseImageOpaqueMemoryBindInfo. This operation must be supported for all sparse images, even ones created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.

- If the holes are included in the size, this bind function becomes very easy. In most cases the resourceOffset is simply a device virtual address offset and the implementation can easily determine what device virtual address to bind. The cost is that the application may allocate more physical memory for the resource than it needs.

- If the holes are not included in the size, the application can allocate less physical memory than otherwise for the resource. However, in this case the implementation must account for the holes when mapping resourceOffset to the actual device virtual address intended to be mapped.

**Note**

If the application always uses VkSparseImageMemoryBindInfo to bind memory for the non-tail mip levels, any holes that are present in the resource size may never be bound.

Since VkSparseImageMemoryBindInfo uses texel locations to determine which device virtual addresses to bind, it is impossible to bind device virtual address holes with this operation.

**Binding Metadata Memory**

All metadata for sparse images have their own sparse properties and are embedded in the mip tail region for said properties. See the Multiaspect section for details.

Given that metadata is in a mip tail region, and the mip tail region must be reported as contiguous (either globally or per-array-layer), some implementations will have to resort to complicated offset → device virtual address mapping for handling VkSparseImageOpaqueMemoryBindInfo.

To make this easier on the implementation, the VK_SPARSE_MEMORY_BIND_METADATA_BIT explicitly specifies when metadata is bound with VkSparseImageOpaqueMemoryBindInfo. When this flag is not present, the resourceOffset may be treated as a strict device virtual address offset.

When VK_SPARSE_MEMORY_BIND_METADATA_BIT is present, the resourceOffset must have been derived explicitly from the imageMipTailOffset in the sparse resource properties returned for the metadata aspect. By manipulating the value returned for imageMipTailOffset, the resourceOffset does not have to correlate directly to a device virtual address offset, and may instead be whatever value makes it easiest for the implementation to derive the correct device virtual address.
32.7. Sparse Resource API

The APIs related to sparse resources are grouped into the following categories:

- Physical Device Features
- Physical Device Sparse Properties
- Sparse Image Format Properties
- Sparse Resource Creation
- Sparse Resource Memory Requirements
- Binding Resource Memory

32.7.1. Physical Device Features

Some sparse-resource related features are reported and enabled in `VkPhysicalDeviceFeatures`. These features must be supported and enabled on the `VkDevice` object before applications can use them. See Physical Device Features for information on how to get and set enabled device features, and for more detailed explanations of these features.

Sparse Physical Device Features

- `sparseBinding`: Support for creating `VkBuffer` and `VkImage` objects with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` and `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` flags, respectively.
- `sparseResidencyBuffer`: Support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag.
- `sparseResidencyImage2D`: Support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidencyImage3D`: Support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency2Samples`: Support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency4Samples`: Support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency8Samples`: Support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency16Samples`: Support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidencyAliased`: Support for creating `VkBuffer` and `VkImage` objects with the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flags, respectively.

32.7.2. Physical Device Sparse Properties

Some features of the implementation are not possible to disable, and are reported to allow applications to alter their sparse resource usage accordingly. These read-only capabilities are
reported in the `VkPhysicalDeviceProperties::sparseProperties` member, which is a `VkPhysicalDeviceSparseProperties` structure.

The `VkPhysicalDeviceSparseProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceSparseProperties {
    VkBool32 residencyStandard2DBlockShape;
    VkBool32 residencyStandard2DMultisampleBlockShape;
    VkBool32 residencyStandard3DBlockShape;
    VkBool32 residencyAlignedMipSize;
    VkBool32 residencyNonResidentStrict;
} VkPhysicalDeviceSparseProperties;
```

- **residencyStandard2DBlockShape** is `VK_TRUE` if the physical device will access all single-sample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for single-sample 2D images is not required to match the standard sparse image block dimensions listed in the table.

- **residencyStandard2DMultisampleBlockShape** is `VK_TRUE` if the physical device will access all multisample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (MSAA) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for multisample 2D images is not required to match the standard sparse image block dimensions listed in the table.

- **residencyStandard3DBlockShape** is `VK_TRUE` if the physical device will access all 3D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for 3D images is not required to match the standard sparse image block dimensions listed in the table.

- **residencyAlignedMipSize** is `VK_TRUE` if images with mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block may be placed in the mip tail. If this property is not reported, only mip levels with dimensions smaller than the `imageGranularity` member of the `VkSparseImageFormatProperties` structure will be placed in the mip tail. If this property is reported the implementation is allowed to return `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` in the `flags` member of `VkSparseImageFormatProperties`, indicating that mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block will be placed in the mip tail.

- **residencyNonResidentStrict** specifies whether the physical device can consistently access non-resident regions of a resource. If this property is `VK_TRUE`, access to non-resident regions of resources will be guaranteed to return values as if the resource was populated with 0; writes to non-resident regions will be discarded.
32.7.3. Sparse Image Format Properties

Given that certain aspects of sparse image support, including the sparse image block dimensions, may be implementation-dependent, `vkGetPhysicalDeviceSparseImageFormatProperties` can be used to query for sparse image format properties prior to resource creation. This command is used to check whether a given set of sparse image parameters is supported and what the sparse image block shape will be.

**Sparse Image Format Properties API**

The `VkSparseImageFormatProperties` structure is defined as:

```c
typedef struct VkSparseImageFormatProperties {
    VkImageAspectFlags aspectMask;
    VkExtent3D imageGranularity;
    VkSparseImageFormatFlags flags;
} VkSparseImageFormatProperties;
```

- `aspectMask` is a bitmask `VkImageAspectFlagBits` specifying which aspects of the image the properties apply to.
- `imageGranularity` is the width, height, and depth of the sparse image block in texels or compressed texel blocks.
- `flags` is a bitmask of `VkSparseImageFormatFlagBits` specifying additional information about the sparse resource.

Bits which may be set in `VkSparseImageFormatProperties::flags`, specifying additional information about the sparse resource, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSparseImageFormatFlagBits {
    VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT = 0x00000001,
    VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT = 0x00000002,
    VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT = 0x00000004,
} VkSparseImageFormatFlagBits;
```

- `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` specifies that the image uses a single mip tail region for all array layers.
- `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` specifies that the first mip level whose dimensions are not integer multiples of the corresponding dimensions of the sparse image block begins the mip tail region.
- `VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT` specifies that the image uses non-standard sparse image block dimensions, and the `imageGranularity` values do not match the standard sparse image block dimensions for the given format.
VkSparseImageFormatFlags is a bitmask type for setting a mask of zero or more VkSparseImageFormatFlagBits.

vkGetPhysicalDeviceSparseImageFormatProperties returns an array of VkSparseImageFormatProperties. Each element will describe properties for one set of image aspects that are bound simultaneously in the image. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.

void vkGetPhysicalDeviceSparseImageFormatProperties(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkImageType type,
    VkSampleCountFlagBits samples,
    VkImageUsageFlags usage,
    VkImageTiling tiling,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties* pProperties);

- physicalDevice is the physical device from which to query the sparse image format properties.
- format is the image format.
- type is the dimensionality of image.
- samples is a VkSampleCountFlagBits value specifying the number of samples per texel.
- usage is a bitmask describing the intended usage of the image.
- tiling is the tiling arrangement of the texel blocks in memory.
- pPropertyCount is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- pProperties is either NULL or a pointer to an array of VkSparseImageFormatProperties structures.

If pProperties is NULL, then the number of sparse format properties available is returned in pPropertyCount. Otherwise, pPropertyCount must point to a variable set by the user to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If pPropertyCount is less than the number of sparse format properties available, at most pPropertyCount structures will be written.

If VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT is not supported for the given arguments, pPropertyCount will be set to zero upon return, and no data will be written to pProperties.

Multiple aspects are returned for depth/stencil images that are implemented as separate planes by the implementation. The depth and stencil data planes each have unique
Depth/stencil images with depth and stencil data interleaved into a single plane will return a single `VkSparseImageFormatProperties` structure with the `aspectMask` set to `VK_IMAGE_ASPECT_DEPTH_BIT | VK_IMAGE_ASPECT_STENCIL_BIT`.

### Valid Usage

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-01094**
  - `samples` must be a bit value that is set in `VkImageFormatProperties::sampleCounts` returned by `vkGetPhysicalDeviceImageFormatProperties` with `format`, `type`, `tiling`, and `usage` equal to those in this command and `flags` equal to the value that is set in `VkImageCreateInfo::flags` when the image is created.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-format-parameter**
  - `format` must be a valid `VkFormat` value
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-type-parameter**
  - `type` must be a valid `VkImageType` value
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-parameter**
  - `samples` must be a valid `VkSampleCountFlagBits` value
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-parameter**
  - `usage` must be a valid combination of `VkImageUsageFlagBits` values
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-requiredbitmask**
  - `usage` must not be 0
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-tiling-parameter**
  - `tiling` must be a valid `VkImageTiling` value
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pPropertyCount-parameter**
  - `pPropertyCount` must be a valid pointer to a `uint32_t` value
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pProperties-parameter**
  - If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkSparseImageFormatProperties` structures.

`vkGetPhysicalDeviceSparseImageFormatProperties2` returns an array of `VkSparseImageFormatProperties2`. Each element will describe properties for one set of image aspects that are bound simultaneously in the image. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.
or the equivalent command

```c
void vkGetPhysicalDeviceSparseImageFormatProperties2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties2* pProperties);
```

- `physicalDevice` is the physical device from which to query the sparse image format properties.
- `pFormatInfo` is a pointer to a `VkPhysicalDeviceSparseImageFormatInfo2` structure containing input parameters to the command.
- `pPropertyCount` is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkSparseImageFormatProperties2` structures.

`vkGetPhysicalDeviceSparseImageFormatProperties2` behaves identically to `vkGetPhysicalDeviceSparseImageFormatProperties`, with the ability to return extended information by adding extending structures to the `pNext` chain of its `pProperties` parameter.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pFormatInfo-parameter `pFormatInfo` must be a valid pointer to a valid `VkPhysicalDeviceSparseImageFormatInfo2` structure
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pProperties-parameter If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkSparseImageFormatProperties2` structures

The `VkPhysicalDeviceSparseImageFormatInfo2` structure is defined as:
typedef struct VkPhysicalDeviceSparseImageFormatInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
    VkImageType type;
    VkSampleCountFlagBits samples;
    VkImageUsageFlags usage;
    VkImageTiling tiling;
} VkPhysicalDeviceSparseImageFormatInfo2;

or the equivalent

typedef VkPhysicalDeviceSparseImageFormatInfo2 VkPhysicalDeviceSparseImageFormatInfo2KHR;

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **format** is the image format.
• **type** is the dimensionality of image.
• **samples** is a **VkSampleCountFlagBits** value specifying the number of samples per texel.
• **usage** is a bitmask describing the intended usage of the image.
• **tiling** is the tiling arrangement of the texel blocks in memory.

### Valid Usage

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-01095**
  samples must be a bit value that is set in **VkImageFormatProperties::sampleCounts** returned by **vkGetPhysicalDeviceImageFormatProperties** with **format**, **type**, **tiling**, and **usage** equal to those in this command and **flags** equal to the value that is set in **VkImageCreateInfo::flags** when the image is created

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-sType-sType**
  sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SPARSE_IMAGE_FORMAT_INFO_2**
- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-pNext-pNext**
  pNext must be **NULL**
- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-format-parameter**
  format must be a valid **VkFormat** value
- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-type-parameter**
**type must** be a valid `VkImageType` value

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-parameter
  **samples must** be a valid `VkSampleCountFlagBits` value

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-parameter
  **usage must** be a valid combination of `VkImageUsageFlagBits` values

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-requiredbitmask
  **usage** must not be 0

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-tiling-parameter
  **tiling must** be a valid `VkImageTiling` value

The `VkSparseImageFormatProperties2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageFormatProperties2 {
    VkStructureType sType;
    void* pNext;
    VkSparseImageFormatProperties properties;
} VkSparseImageFormatProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkSparseImageFormatProperties2 VkSparseImageFormatProperties2KHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **properties** is a `VkSparseImageFormatProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceSparseImageFormatProperties`.

**Valid Usage (Implicit)**

- VUID-VkSparseImageFormatProperties2-sType-sType
  **sType must** be `VK_STRUCTURE_TYPE_SPARSE_IMAGE_FORMAT_PROPERTIES_2`  

- VUID-VkSparseImageFormatProperties2-pNext-pNext
  **pNext must** be `NULL`

### 32.7.4. Sparse Resource Creation

Sparse resources require that one or more sparse feature flags be specified (as part of the `VkPhysicalDeviceFeatures` structure described previously in the *Physical Device Features* section) when calling `vkCreateDevice`. When the appropriate device features are enabled, the `VK_BUFFER_CREATE_SPARSE_*` and `VK_IMAGE_CREATE_SPARSE_*` flags can be used. See `vkCreateBuffer` and
vkCreateImage for details of the resource creation APIs.

Note
Specifying VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT or VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT requires specifying VK_BUFFER_CREATE_SPARSE_BINDING_BIT or VK_IMAGE_CREATE_SPARSE_BINDING_BIT, respectively, as well. This means that resources must be created with the appropriate *_SPARSE_BINDING_BIT to be used with the sparse binding command (vkQueueBindSparse).

32.7.5. Sparse Resource Memory Requirements

Sparse resources have specific memory requirements related to binding sparse memory. These memory requirements are reported differently for VkBuffer objects and VkImage objects.

Buffer and Fully-Resident Images

Buffers (both fully and partially resident) and fully-resident images can be bound to memory using only the data from VkMemoryRequirements. For all sparse resources the VkMemoryRequirements::alignment member specifies both the bindable sparse block size in bytes and required alignment of VkDeviceMemory.

Partially Resident Images

Partially resident images have a different method for binding memory. As with buffers and fully resident images, the VkMemoryRequirements::alignment field specifies the bindable sparse block size in bytes for the image.

Requesting sparse memory requirements for VkImage objects using vkGetImageSparseMemoryRequirements will return an array of one or more VkSparseImageMemoryRequirements structures. Each structure describes the sparse memory requirements for a group of aspects of the image.

The sparse image must have been created using the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag to retrieve valid sparse image memory requirements.

Sparse Image Memory Requirements

The VkSparseImageMemoryRequirements structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryRequirements {
    VkSparseImageFormatProperties formatProperties;
    uint32_t imageMipTailFirstLod;
    VkDeviceSize imageMipTailSize;
    VkDeviceSize imageMipTailOffset;
    VkDeviceSize imageMipTailStride;
} VkSparseImageMemoryRequirements;
```
• **formatProperties** is a `VkSparseImageFormatProperties` structure specifying properties of the image format.

• **imageMipTailFirstLod** is the first mip level at which image subresources are included in the mip tail region.

• **imageMipTailSize** is the memory size (in bytes) of the mip tail region. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, this is the size of the whole mip tail, otherwise this is the size of the mip tail of a single array layer. This value is guaranteed to be a multiple of the sparse block size in bytes.

• **imageMipTailOffset** is the opaque memory offset used with `VkSparseImageOpaqueMemoryBindInfo` to bind the mip tail region(s).

• **imageMipTailStride** is the offset stride between each array-layer’s mip tail, if `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` (otherwise the value is undefined).

To query sparse memory requirements for an image, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageSparseMemoryRequirements(
    VkDevice device,
    VkImage image,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements* pSparseMemoryRequirements);
```

• **device** is the logical device that owns the image.

• **image** is the `VkImage` object to get the memory requirements for.

• **pSparseMemoryRequirementCount** is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.

• **pSparseMemoryRequirements** is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements` structures.

If `pSparseMemoryRequirements` is `NULL`, then the number of sparse memory requirements available is returned in `pSparseMemoryRequirementCount`. Otherwise, `pSparseMemoryRequirementCount` must point to a variable set by the user to the number of elements in the `pSparseMemoryRequirements` array, and on return the variable is overwritten with the number of structures actually written to `pSparseMemoryRequirements`. If `pSparseMemoryRequirementCount` is less than the number of sparse memory requirements available, at most `pSparseMemoryRequirementCount` structures will be written.

If the image was not created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` then `pSparseMemoryRequirementCount` will be set to zero and `pSparseMemoryRequirements` will not be written to.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>It is legal for an implementation to report a larger value in <code>VkMemoryRequirements::size</code> than would be obtained by adding together memory sizes for all <code>VkSparseImageMemoryRequirements</code> returned by <code>vkGetImageSparseMemoryRequirements</code>.</td>
</tr>
</tbody>
</table>
This may occur when the implementation requires unused padding in the address range describing the resource.

Valid Usage (Implicit)

- VUID-vkGetImageSparseMemoryRequirements-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetImageSparseMemoryRequirements-image-parameter
image must be a valid VkImage handle

- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter
pSparseMemoryRequirementCount must be a valid pointer to a uint32_t value

- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter
If the value referenced by pSparseMemoryRequirementCount is not 0, and pSparseMemoryRequirements is not NULL, pSparseMemoryRequirements must be a valid pointer to an array of pSparseMemoryRequirementCount VkSparseImageMemoryRequirements structures

- VUID-vkGetImageSparseMemoryRequirements-image-parent
image must have been created, allocated, or retrieved from device

To query sparse memory requirements for an image, call:

```c
// Provided by VK_VERSION_1_1
void vkGetImageSparseMemoryRequirements2(
    VkDevice device,
    const VkImageSparseMemoryRequirementsInfo2* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetImageSparseMemoryRequirements2KHR(
    VkDevice device,
    const VkImageSparseMemoryRequirementsInfo2* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- device is the logical device that owns the image.
- pInfo is a pointer to a VkImageSparseMemoryRequirementsInfo2 structure containing parameters required for the memory requirements query.
- pSparseMemoryRequirementCount is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
**Valid Usage (Implicit)**

- **VUID-vkGetImageSparseMemoryRequirements2-device-parameter**
  device must be a valid VkDevice handle

- **VUID-vkGetImageSparseMemoryRequirements2-pInfo-parameter**
  pInfo must be a valid pointer to a valid VkImageSparseMemoryRequirementsInfo2 structure

- **VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirementCount-parameter**
  pSparseMemoryRequirementCount must be a valid pointer to a uint32_t value

- **VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirements-parameter**
  If the value referenced by pSparseMemoryRequirementCount is not 0, and pSparseMemoryRequirements is not NULL, pSparseMemoryRequirements must be a valid pointer to an array of pSparseMemoryRequirementCount VkSparseImageMemoryRequirements2 structures

To determine the sparse memory requirements for an image resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceImageSparseMemoryRequirements(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceImageSparseMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- **device** is the logical device intended to own the image.

- **pInfo** is a pointer to a VkDeviceImageMemoryRequirements structure containing parameters required for the memory requirements query.

- **pSparseMemoryRequirementCount** is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
• pSparseMemoryRequirements is either NULL or a pointer to an array of VkSparseImageMemoryRequirements2 structures.

Valid Usage (Implicit)

• VUID-vkGetDeviceImageSparseMemoryRequirements-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetDeviceImageSparseMemoryRequirements-pInfo-parameter
pInfo must be a valid pointer to a valid VkDeviceImageMemoryRequirements structure

• VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter
pSparseMemoryRequirementCount must be a valid pointer to a uint32_t value

• VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter
If the value referenced by pSparseMemoryRequirementCount is not 0, and pSparseMemoryRequirements is not NULL, pSparseMemoryRequirements must be a valid pointer to an array of pSparseMemoryRequirementCount VkSparseImageMemoryRequirements2 structures

The VkImageSparseMemoryRequirementsInfo2 structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkImageSparseMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageSparseMemoryRequirementsInfo2;
``` or the equivalent

```
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageSparseMemoryRequirementsInfo2 VkImageSparseMemoryRequirementsInfo2KHR;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• image is the image to query.

Valid Usage (Implicit)

• VUID-VkImageSparseMemoryRequirementsInfo2-sType-sType
sType must be VK_STRUCTURE_TYPE_IMAGE_SPARSE_MEMORY_REQUIREMENTS_INFO_2

• VUID-VkImageSparseMemoryRequirementsInfo2-pNext-pNext
pNext must be NULL
The `VkSparseImageMemoryRequirements2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageMemoryRequirements2 {
    VkStructureType sType;
    void* pNext;
    VkSparseImageMemoryRequirements2 memoryRequirements;
} VkSparseImageMemoryRequirements2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkSparseImageMemoryRequirements2 VkSparseImageMemoryRequirements2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryRequirements` is a `VkSparseImageMemoryRequirements` structure describing the memory requirements of the sparse image.

### Valid Usage (Implicit)

- `VUID-VkSparseImageMemoryRequirements2-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_SPARSE_IMAGE_MEMORY_REQUIREMENTS_2`

- `VUID-VkSparseImageMemoryRequirements2-pNext-pNext`  
  `pNext` must be `NULL`

### 32.7.6. Binding Resource Memory

Non-sparse resources are backed by a single physical allocation prior to device use (via `vkBindImageMemory` or `vkBindBufferMemory`), and their backing must not be changed. On the other hand, sparse resources can be bound to memory non-contiguously and these bindings can be altered during the lifetime of the resource.

**Note**

It is important to note that freeing a `VkDeviceMemory` object with `vkFreeMemory` will not cause resources (or resource regions) bound to the memory object to become unbound. Applications must not access resources bound to memory that has been freed.

Sparse memory bindings execute on a queue that includes the `VK_QUEUE_SPARSE_BINDING_BIT` bit.
Applications **must** use synchronization primitives to guarantee that other queues do not access ranges of memory concurrently with a binding change. Applications **can** access other ranges of the same resource while a bind operation is executing.

### Note

Implementations **must** provide a guarantee that simultaneously binding sparse blocks while another queue accesses those same sparse blocks via a sparse resource **must** not access memory owned by another process or otherwise corrupt the system.

While some implementations may include `VK_QUEUE_SPARSE_BINDING_BIT` support in queue families that also include graphics and compute support, other implementations may only expose a `VK_QUEUE_SPARSE_BINDING_BIT`-only queue family. In either case, applications **must** use synchronization primitives to explicitly request any ordering dependencies between sparse memory binding operations and other graphics/compute/transfer operations, as sparse binding operations are not automatically ordered against command buffer execution, even within a single queue.

When binding memory explicitly for the `VK_IMAGE_ASPECT_METADATA_BIT` the application **must** use the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` in the `VkSparseMemoryBind::flags` field when binding memory. Binding memory for metadata is done the same way as binding memory for the mip tail, with the addition of the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` flag.

Binding the mip tail for any aspect **must** only be performed using `VkSparseImageOpaqueMemoryBindInfo`. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, then it **can** be bound with a single `VkSparseMemoryBind` structure, with `resourceOffset = imageMipTailOffset` and `size = imageMipTailSize`.

If `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` then the offset for the mip tail in each array layer is given as:

\[
\text{arrayMipTailOffset} = \text{imageMipTailOffset} + \text{arrayLayer} \times \text{imageMipTailStride};
\]

and the mip tail **can** be bound with `layerCount` `VkSparseMemoryBind` structures, each using `size = imageMipTailSize` and `resourceOffset = arrayMipTailOffset` as defined above.

Sparse memory binding is handled by the following APIs and related data structures.

### Sparse Memory Binding Functions

The `VkSparseMemoryBind` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseMemoryBind {
    VkDeviceSize resourceOffset;
    VkDeviceSize size;
    VkDeviceMemory memory;
} VkSparseMemoryBind;
```
VkDeviceSize memoryOffset;
VkSparseMemoryBindFlags flags;
} VkSparseMemoryBind;

- `resourceOffset` is the offset into the resource.
- `size` is the size of the memory region to be bound.
- `memory` is the `VkDeviceMemory` object that the range of the resource is bound to. If `memory` is `VK_NULL_HANDLE`, the range is unbound.
- `memoryOffset` is the offset into the `VkDeviceMemory` object to bind the resource range to. If `memory` is `VK_NULL_HANDLE`, this value is ignored.
- `flags` is a bitmask of `VkSparseMemoryBindFlagBits` specifying usage of the binding operation.

The binding range `[resourceOffset, resourceOffset + size)` has different constraints based on `flags`. If `flags` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range must be within the mip tail region of the metadata aspect. This metadata region is defined by:

```
metadataRegion = [base, base + imageMipTailSize)
```

```
base = imageMipTailOffset + imageMipTailStride × n
```

and `imageMipTailOffset`, `imageMipTailSize`, and `imageMipTailStride` values are from the `VkSparseImageMemoryRequirements` corresponding to the metadata aspect of the image, and `n` is a valid array layer index for the image,

`imageMipTailStride` is considered to be zero for aspects where `VkSparseImageMemoryRequirements::formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`.

If `flags` does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range must be within the range `[0, VkMemoryRequirements::size)`.

### Valid Usage

- **VUID-VkSparseMemoryBind-memory-01096**
  If `memory` is not `VK_NULL_HANDLE`, `memory` and `memoryOffset` must match the memory requirements of the resource, as described in section `Resource Memory Association`.

- **VUID-VkSparseMemoryBind-memory-01097**
  If `memory` is not `VK_NULL_Handle`, `memory` must not have been created with a memory type that reports `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set.

- **VUID-VkSparseMemoryBind-size-01098**
  `size` must be greater than 0

- **VUID-VkSparseMemoryBind-resourceOffset-01099**
  `resourceOffset` must be less than the size of the resource

- **VUID-VkSparseMemoryBind-size-01100**

2112
Size must be less than or equal to the size of the resource minus `resourceOffset`

- VUID-VkSparseMemoryBind-memoryOffset-01101
  `memoryOffset` must be less than the size of `memory`

- VUID-VkSparseMemoryBind-size-01102
  Size must be less than or equal to the size of `memory` minus `memoryOffset`

- VUID-VkSparseMemoryBind-memory-02730
  If `memory` was created with `VkExportMemoryAllocateInfo::handleTypes` not equal to 0, at least one handle type it contained must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created.

- VUID-VkSparseMemoryBind-memory-02731
  If `memory` was created by a memory import operation, the external handle type of the imported memory must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created.

**Valid Usage (Implicit)**

- VUID-VkSparseMemoryBind-memory-parameter
  If `memory` is not `VK_NULL_HANDLE`, `memory` must be a valid `VkDeviceMemory` handle

- VUID-VkSparseMemoryBind-flags-parameter
  `flags` must be a valid combination of `VkSparseMemoryBindFlagBits` values

Bits which can be set in `VkSparseMemoryBind::flags`, specifying usage of a sparse memory binding operation, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSparseMemoryBindFlagBits {
    VK_SPARSE_MEMORY_BIND_METADATA_BIT = 0x00000001,
} VkSparseMemoryBindFlagBits;
```

- `VK_SPARSE_MEMORY_BIND_METADATA_BIT` specifies that the memory being bound is only for the metadata aspect.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkSparseMemoryBindFlags;
```

`VkSparseMemoryBindFlags` is a bitmask type for setting a mask of zero or more `VkSparseMemoryBindFlagBits`.

Memory is bound to `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` flag using the following structure:
typedef struct VkSparseBufferMemoryBindInfo {
    VkBuffer buffer;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseBufferMemoryBindInfo;

• **buffer** is the VkBuffer object to be bound.

• **bindCount** is the number of VkSparseMemoryBind structures in the pBinds array.

• **pBinds** is a pointer to an array of VkSparseMemoryBind structures.

---

Valid Usage (Implicit)

- VUID-VkSparseBufferMemoryBindInfo-buffer-parameter
  **buffer must** be a valid VkBuffer handle

- VUID-VkSparseBufferMemoryBindInfo-pBinds-parameter
  **pBinds must** be a valid pointer to an array of bindCount valid VkSparseMemoryBind structures

- VUID-VkSparseBufferMemoryBindInfo-bindCount-arraylength
  **bindCount must** be greater than 0

Memory is bound to opaque regions of VkImage objects created with the VK_IMAGE_CREATE_SPARSE_BINDING_BIT flag using the following structure:

typedef struct VkSparseImageOpaqueMemoryBindInfo {
    VkImage image;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseImageOpaqueMemoryBindInfo;

• **image** is the VkImage object to be bound.

• **bindCount** is the number of VkSparseMemoryBind structures in the pBinds array.

• **pBinds** is a pointer to an array of VkSparseMemoryBind structures.

---

Valid Usage

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-01103
  If the **flags** member of any element of pBinds contains
  VK_SPARSE_MEMORY_BIND_METADATA_BIT, the binding range defined **must** be within the mip tail region of the metadata aspect of **image**
**Valid Usage (Implicit)**

- VUID-VkSparseImageOpaqueMemoryBindInfo-image-parameter
  - `image` **must** be a valid `VkImage` handle

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-parameter
  - `pBinds` **must** be a valid pointer to an array of `bindCount` valid `VkSparseMemoryBind` structures

- VUID-VkSparseImageOpaqueMemoryBindInfo-bindCount-arraylength
  - `bindCount` **must** be greater than 0

**Note**

This operation is normally used to bind memory to fully-resident sparse images or for mip tail regions of partially resident images. However, it **can** also be used to bind memory for the entire binding range of partially resident images.

In case `flags` does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the `resourceOffset` is in the range `[0, `VkMemoryRequirements::size`]), This range includes data from all aspects of the image, including metadata. For most implementations this will probably mean that the `resourceOffset` is a simple device address offset within the resource. It is possible for an application to bind a range of memory that includes both resource data and metadata. However, the application would not know what part of the image the memory is used for, or if any range is being used for metadata.

When `flags` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range specified **must** be within the mip tail region of the metadata aspect. In this case the `resourceOffset` is not required to be a simple device address offset within the resource. However, it is defined to be within `[imageMipTailOffset, imageMipTailOffset + imageMipTailSize)` for the metadata aspect. See `VkSparseMemoryBind` for the full constraints on binding region with this flag present.

Memory **can** be bound to sparse image blocks of `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag using the following structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBindInfo {
    VkImage             image;
    uint32_t            bindCount;
    const VkSparseImageMemoryBind*  pBinds;
} VkSparseImageMemoryBindInfo;
```

- `image` is the `VkImage` object to be bound
- `bindCount` is the number of `VkSparseImageMemoryBind` structures in `pBinds` array
• `pBinds` is a pointer to an array of `VkSparseImageMemoryBind` structures

**Valid Usage**

• VUID-VkSparseImageMemoryBindInfo-subresource-01722
  The `subresource.mipLevel` member of each element of `pBinds` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

• VUID-VkSparseImageMemoryBindInfo-subresource-01723
  The `subresource.arrayLayer` member of each element of `pBinds` must be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

• VUID-VkSparseImageMemoryBindInfo-image-02901
  `image` must have been created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set.

**Valid Usage (Implicit)**

• VUID-VkSparseImageMemoryBindInfo-image-parameter
  `image` must be a valid `VkImage` handle.

• VUID-VkSparseImageMemoryBindInfo-pBinds-parameter
  `pBinds` must be a valid pointer to an array of `bindCount` valid `VkSparseImageMemoryBind` structures.

• VUID-VkSparseImageMemoryBindInfo-bindCount-arraylength
  `bindCount` must be greater than 0.

The `VkSparseImageMemoryBind` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBind {
    VkImageSubresource subresource;
    VkOffset3D offset;
    VkExtent3D extent;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    VkSparseMemoryBindFlags flags;
} VkSparseImageMemoryBind;
```

• `subresource` is the image aspect and region of interest in the image.

• `offset` are the coordinates of the first texel within the image subresource to bind.

• `extent` is the size in texels of the region within the image subresource to bind. The extent must be a multiple of the sparse image block dimensions, except when binding sparse image blocks along the edge of an image subresource it can instead be such that any coordinate of `offset + extent` equals the corresponding dimensions of the image subresource.

• `memory` is the `VkDeviceMemory` object that the sparse image blocks of the image are bound to. If `memory` is `VK_NULL_HANDLE`, the sparse image blocks are unbound.
• **memoryOffset** is an offset into **VkDeviceMemory** object. If **memory** is **VK_NULL_HANDLE**, this value is ignored.

• **flags** are sparse memory binding flags.

---

### Valid Usage

- **VUID-VkSparseImageMemoryBind-memory-01104**
  If the **sparseResidencyAliased** feature is not enabled, and if any other resources are bound to ranges of **memory**, the range of **memory** being bound **must** not overlap with those bound ranges.

- **VUID-VkSparseImageMemoryBind-memory-01105**
  **memory** and **memoryOffset** **must** match the memory requirements of the calling command's **image**, as described in section [Resource Memory Association](#).

- **VUID-VkSparseImageMemoryBind-subresource-01106**
  **subresource** **must** be a valid image subresource for **image** (see [Image Views](#)).

- **VUID-VkSparseImageMemoryBind-offset-01107**
  **offset.x** **must** be a multiple of the sparse image block width (**VkSparseImageFormatProperties::imageGranularity.width**) of the image.

- **VUID-VkSparseImageMemoryBind-extent-01108**
  **extent.width** **must** either be a multiple of the sparse image block width of the image, or else (**extent.width + offset.x**) **must** equal the width of the image subresource.

- **VUID-VkSparseImageMemoryBind-offset-01109**
  **offset.y** **must** be a multiple of the sparse image block height (**VkSparseImageFormatProperties::imageGranularity.height**) of the image.

- **VUID-VkSparseImageMemoryBind-extent-01110**
  **extent.height** **must** either be a multiple of the sparse image block height of the image, or else (**extent.height + offset.y**) **must** equal the height of the image subresource.

- **VUID-VkSparseImageMemoryBind-offset-01111**
  **offset.z** **must** be a multiple of the sparse image block depth (**VkSparseImageFormatProperties::imageGranularity.depth**) of the image.

- **VUID-VkSparseImageMemoryBind-extent-01112**
  **extent.depth** **must** either be a multiple of the sparse image block depth of the image, or else (**extent.depth + offset.z**) **must** equal the depth of the image subresource.

- **VUID-VkSparseImageMemoryBind-memory-02732**
  If **memory** was created with **VkExportMemoryAllocateInfo::handleTypes** not equal to 0, at least one handle type it contained **must** also have been set in **VkExternalMemoryImageCreateInfo::handleTypes** when the image was created.

- **VUID-VkSparseImageMemoryBind-memory-02733**
  If **memory** was created by a memory import operation, the external handle type of the imported memory **must** also have been set in **VkExternalMemoryImageCreateInfo::handleTypes** when **image** was created.
Valid Usage (Implicit)

- VUID-VkSparseImageMemoryBind-subresource-parameter
  subresource must be a valid VkImageSubresource structure

- VUID-VkSparseImageMemoryBind-memory-parameter
  If memory is not VK_NULL_HANDLE, memory must be a valid VkDeviceMemory handle

- VUID-VkSparseImageMemoryBind-flags-parameter
  flags must be a valid combination of VkSparseMemoryBindFlagBits values

To submit sparse binding operations to a queue, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkQueueBindSparse(
    VkQueue queue,
    uint32_t bindInfoCount,
    const VkBindSparseInfo* pBindInfo,
    VkFence fence);
```

- `queue` is the queue that the sparse binding operations will be submitted to.
- `bindInfoCount` is the number of elements in the `pBindInfo` array.
- `pBindInfo` is a pointer to an array of VkBindSparseInfo structures, each specifying a sparse binding submission batch.
- `fence` is an optional handle to a fence to be signaled. If `fence` is not VK_NULL_HANDLE, it defines a fence signal operation.

vkQueueBindSparse is a queue submission command, with each batch defined by an element of `pBindInfo` as a VkBindSparseInfo structure. Batches begin execution in the order they appear in `pBindInfo`, but may complete out of order.

Within a batch, a given range of a resource must not be bound more than once. Across batches, if a range is to be bound to one allocation and offset and then to another allocation and offset, then the application must guarantee (usually using semaphores) that the binding operations are executed in the correct order, as well as to order binding operations against the execution of command buffer submissions.

As no operation to vkQueueBindSparse causes any pipeline stage to access memory, synchronization primitives used in this command effectively only define execution dependencies.

Additional information about fence and semaphore operation is described in the synchronization chapter.

Valid Usage

- VUID-vkQueueBindSparse-fence-01113
  If `fence` is not VK_NULL_HANDLE, `fence` must be unsignaled
• VUID-vkQueueBindSparse-fence-01114
  If fence is not VK_NULL_HANDLE, fence must not be associated with any other queue command that has not yet completed execution on that queue.

• VUID-vkQueueBindSparse-pSignalSemaphores-01115
  Each element of the pSignalSemaphores member of each element of pBindInfo must be unsignaled when the semaphore signal operation it defines is executed on the device.

• VUID-vkQueueBindSparse-pWaitSemaphores-01116
  When a semaphore wait operation referring to a binary semaphore defined by any element of the pWaitSemaphores member of any element of pBindInfo executes on queue, there must be no other queues waiting on the same semaphore.

• VUID-vkQueueBindSparse-pWaitSemaphores-01117
  All elements of the pWaitSemaphores member of all elements of the pBindInfo parameter referring to a binary semaphore must be semaphores that are signaled, or have semaphore signal operations previously submitted for execution.

• VUID-vkQueueBindSparse-pWaitSemaphores-03245
  All elements of the pWaitSemaphores member of all elements of pBindInfo created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) must have also been submitted for execution.

Valid Usage (Implicit)

• VUID-vkQueueBindSparse-queue-parameter
  queue must be a valid VkQueue handle.

• VUID-vkQueueBindSparse-pBindInfo-parameter
  If bindInfoCount is not 0, pBindInfo must be a valid pointer to an array of bindInfoCount valid VkBindSparseInfo structures.

• VUID-vkQueueBindSparse-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle.

• VUID-vkQueueBindSparse-queuetype
  The queue must support sparse binding operations.

• VUID-vkQueueBindSparse-commonparent
  Both of fence, and queue that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice.

Host Synchronization

• Host access to queue must be externally synchronized.
• Host access to fence must be externally synchronized.
Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
</table>

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The `VkBindSparseInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBindSparseInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t bufferBindCount;
    const VkSparseBufferMemoryBindInfo* pBufferBinds;
    uint32_t imageOpaqueBindCount;
    const VkSparseImageOpaqueMemoryBindInfo* pImageOpaqueBinds;
    uint32_t imageBindCount;
    const VkSparseImageMemoryBindInfo* pImageBinds;
    uint32_t signalSemaphoreCount;
    const VkSemaphore* pSignalSemaphores;
} VkBindSparseInfo;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **waitSemaphoreCount** is the number of semaphores upon which to wait before executing the sparse binding operations for the batch.
- **pWaitSemaphores** is a pointer to an array of semaphores upon which to wait on before the sparse binding operations for this batch begin execution. If semaphores to wait on are provided, they define a semaphore wait operation.
- **bufferBindCount** is the number of sparse buffer bindings to perform in the batch.
- **pBufferBinds** is a pointer to an array of `VkSparseBufferMemoryBindInfo` structures.
• **imageOpaqueBindCount** is the number of opaque sparse image bindings to perform.

• **pImageOpaqueBinds** is a pointer to an array of **VkSparseImageOpaqueMemoryBindInfo** structures, indicating opaque sparse image bindings to perform.

• **imageBindCount** is the number of sparse image bindings to perform.

• **pImageBinds** is a pointer to an array of **VkSparseImageMemoryBindInfo** structures, indicating sparse image bindings to perform.

• **signalSemaphoreCount** is the number of semaphores to be signaled once the sparse binding operations specified by the structure have completed execution.

• **pSignalSemaphores** is a pointer to an array of semaphores which will be signaled when the sparse binding operations for this batch have completed execution. If semaphores to be signaled are provided, they define a **semaphore signal operation**.

---

### Valid Usage

- **VUID-VkBindSparseInfo-pWaitSemaphores-03246**
  If any element of **pWaitSemaphores** or **pSignalSemaphores** was created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE** then the **pNext** chain must include a **VkTimelineSemaphoreSubmitInfo** structure.

- **VUID-VkBindSparseInfo-pNext-03247**
  If the **pNext** chain of this structure includes a **VkTimelineSemaphoreSubmitInfo** structure and any element of **pWaitSemaphores** was created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE** then its **waitSemaphoreValueCount** member must equal **waitSemaphoreCount**.

- **VUID-VkBindSparseInfo-pNext-03248**
  If the **pNext** chain of this structure includes a **VkTimelineSemaphoreSubmitInfo** structure and any element of **pSignalSemaphores** was created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE** then its **signalSemaphoreValueCount** member must equal **signalSemaphoreCount**.

- **VUID-VkBindSparseInfo-pSignalSemaphores-03249**
  For each element of **pSignalSemaphores** created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE** the corresponding element of **VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues** must have a value greater than the current value of the semaphore when the semaphore signal operation is executed.

- **VUID-VkBindSparseInfo-pWaitSemaphores-03250**
  For each element of **pWaitSemaphores** created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE** the corresponding element of **VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues** must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than **maxTimelineSemaphoreValueDifference**.

- **VUID-VkBindSparseInfo-pSignalSemaphores-03251**
  For each element of **pSignalSemaphores** created with a **VkSemaphoreType** of...
VK_SEMAPHORE_TYPE_TIMELINE the corresponding element of VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than maxTimelineSemaphoreValueDifference

Valid Usage (Implicit)

- **VUID-VkBindSparseInfo-sType-sType**  
  sType must be VK_STRUCTURE_TYPE_BIND_SPARSE_INFO

- **VUID-VkBindSparseInfo-pNext-pNext**  
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceGroupBindSparseInfo or VkTimelineSemaphoreSubmitInfo

- **VUID-VkBindSparseInfo-sType-unique**  
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkBindSparseInfo-pWaitSemaphores-parameter**  
  If waitSemaphoreCount is not 0, pWaitSemaphores must be a valid pointer to an array of waitSemaphoreCount valid VkSemaphore handles

- **VUID-VkBindSparseInfo-pBufferBinds-parameter**  
  If bufferBindCount is not 0, pBufferBinds must be a valid pointer to an array of bufferBindCount valid VkSparseBufferMemoryBindInfo structures

- **VUID-VkBindSparseInfo-pImageOpaqueBinds-parameter**  
  If imageOpaqueBindCount is not 0, pImageOpaqueBinds must be a valid pointer to an array of imageOpaqueBindCount valid VkSparseImageOpaqueMemoryBindInfo structures

- **VUID-VkBindSparseInfo-pImageBinds-parameter**  
  If imageBindCount is not 0, pImageBinds must be a valid pointer to an array of imageBindCount valid VkSparseImageMemoryBindInfo structures

- **VUID-VkBindSparseInfo-pSignalSemaphores-parameter**  
  If signalSemaphoreCount is not 0, pSignalSemaphores must be a valid pointer to an array of signalSemaphoreCount valid VkSemaphore handles

- **VUID-VkBindSparseInfo-commonparent**  
  Both of the elements of pSignalSemaphores, and the elements of pWaitSemaphores that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

To specify the values to use when waiting for and signaling semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, add a VkTimelineSemaphoreSubmitInfo structure to the pNext chain of the VkBindSparseInfo structure.

If the pNext chain of VkBindSparseInfo includes a VkDeviceGroupBindSparseInfo structure, then that structure includes device indices specifying which instance of the resources and memory are bound.
The `VkDeviceGroupBindSparseInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupBindSparseInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t resourceDeviceIndex;
    uint32_t memoryDeviceIndex;
} VkDeviceGroupBindSparseInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupBindSparseInfo VkDeviceGroupBindSparseInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `resourceDeviceIndex` is a device index indicating which instance of the resource is bound.
- `memoryDeviceIndex` is a device index indicating which instance of the memory the resource instance is bound to.

These device indices apply to all buffer and image memory binds included in the batch pointing to this structure. The semaphore waits and signals for the batch are executed only by the physical device specified by the `resourceDeviceIndex`.

If this structure is not present, `resourceDeviceIndex` and `memoryDeviceIndex` are assumed to be zero.

### Valid Usage

- **VUID-VkDeviceGroupBindSparseInfo-resourceDeviceIndex-01118** `resourceDeviceIndex` and `memoryDeviceIndex` must both be valid device indices
- **VUID-VkDeviceGroupBindSparseInfo-memoryDeviceIndex-01119** Each memory allocation bound in this batch must have allocated an instance for `memoryDeviceIndex`

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupBindSparseInfo-sType-sType** `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_BIND_sparse_INFO`
Chapter 33. Window System Integration (WSI)

This chapter discusses the window system integration (WSI) between the Vulkan API and the various forms of displaying the results of rendering to a user. Since the Vulkan API can be used without displaying results, WSI is provided through the use of optional Vulkan extensions. This chapter provides an overview of WSI. See the appendix for additional details of each WSI extension, including which extensions must be enabled in order to use each of the functions described in this chapter.

33.1. WSI Platform

A platform is an abstraction for a window system, OS, etc. Some examples include MS Windows, Android, and Wayland. The Vulkan API may be integrated in a unique manner for each platform.

The Vulkan API does not define any type of platform object. Platform-specific WSI extensions are defined, each containing platform-specific functions for using WSI. Use of these extensions is guarded by preprocessor symbols as defined in the Window System-Specific Header Control appendix.

In order for an application to be compiled to use WSI with a given platform, it must either:

• define the appropriate preprocessor symbol prior to including the vulkan.h header file, or
• include vulkan_core.h and any native platform headers, followed by the appropriate platform-specific header.

The preprocessor symbols and platform-specific headers are defined in the Window System Extensions and Headers table.

Each platform-specific extension is an instance extension. The application must enable instance extensions with vkCreateInstance before using them.

33.2. WSI Surface

Native platform surface or window objects are abstracted by surface objects, which are represented by VkSurfaceKHR handles:

```
// Provided by VK_KHR_surface
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSurfaceKHR)
```

The VK_KHR_surface extension declares the VkSurfaceKHR object, and provides a function for destroying VkSurfaceKHR objects. Separate platform-specific extensions each provide a function for creating a VkSurfaceKHR object for the respective platform. From the application’s perspective this is an opaque handle, just like the handles of other Vulkan objects.
On certain platforms, the Vulkan loader and ICDs may have conventions that treat the handle as a pointer to a structure containing the platform-specific information about the surface. This will be described in the documentation for the loader-ICD interface, and in the `vk_icd.h` header file of the LoaderAndTools source-code repository. This does not affect the loader-layer interface; layers may wrap `VkSurfaceKHR` objects.

### 33.2.1. Android Platform

To create a `VkSurfaceKHR` object for an Android native window, call:

```c
// Provided by VK_KHR_android_surface
VkResult vkCreateAndroidSurfaceKHR(
    VkInstance instance,
    const VkAndroidSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkAndroidSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

During the lifetime of a surface created using a particular `ANativeWindow` handle any attempts to create another surface for the same `ANativeWindow` and any attempts to connect to the same `ANativeWindow` through other platform mechanisms will fail.

**Note**

In particular, only one `VkSurfaceKHR` can exist at a time for a given window. Similarly, a native window cannot be used by both a `VkSurfaceKHR` and `EGLSurface` simultaneously.

If successful, `vkCreateAndroidSurfaceKHR` increments the `ANativeWindow`'s reference count, and `vkDestroySurfaceKHR` will decrement it.

On Android, when a swapchain's `imageExtent` does not match the surface's `currentExtent`, the presentable images will be scaled to the surface's dimensions during presentation. `minImageExtent` is (1,1), and `maxImageExtent` is the maximum image size supported by the consumer. For the system compositor, `currentExtent` is the window size (i.e. the consumer's preferred size).

**Valid Usage (Implicit)**

- VUID-vkCreateAndroidSurfaceKHR-instance-parameter
  - `instance` must be a valid `VkInstance` handle
• VUID-vkCreateAndroidSurfaceKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkAndroidSurfaceCreateInfoKHR structure

• VUID-vkCreateAndroidSurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateAndroidSurfaceKHR-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkAndroidSurfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_android_surface
typedef struct VkAndroidSurfaceCreateInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkAndroidSurfaceCreateFlagsKHR flags;
  struct ANativeWindow* window;
} VkAndroidSurfaceCreateInfoKHR;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• window is a pointer to the ANativeWindow to associate the surface with.

Valid Usage

• VUID-VkAndroidSurfaceCreateInfoKHR-window-01248
  window must point to a valid Android ANativeWindow

Valid Usage (Implicit)

• VUID-VkAndroidSurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ANDROID_SURFACE_CREATE_INFO_KHR
• VUID-VkAndroidSurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL
• VUID-VkAndroidSurfaceCreateInfoKHR-flags-zero bitmask
  flags must be 0

To remove an unnecessary compile-time dependency, an incomplete type definition of `ANativeWindow` is provided in the Vulkan headers:

```c
// Provided by VK_KHR_android_surface
struct ANativeWindow;
```

The actual `ANativeWindow` type is defined in Android NDK headers.

```c
// Provided by VK_KHR_android_surface
typedef VkFlags VkAndroidSurfaceCreateFlagsKHR;
```

`VkAndroidSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.2. Wayland Platform

To create a `VkSurfaceKHR` object for a Wayland surface, call:

```c
// Provided by VK_KHR_wayland_surface
VkResult vkCreateWaylandSurfaceKHR(
    VkInstance instance,
    const VkWaylandSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkWaylandSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

**Valid Usage (Implicit)**

- VUID-vkCreateWaylandSurfaceKHR-instance-parameter
  instance must be a valid `VkInstance` handle
- VUID-vkCreateWaylandSurfaceKHR-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkWaylandSurfaceCreateInfoKHR` structure
If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

`pSurface` must be a valid pointer to a `VkSurfaceKHR` handle.

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkWaylandSurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_wayland_surface
typedef struct VkWaylandSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWaylandSurfaceCreateFlagsKHR flags;
    struct wl_display* display;
    struct wl_surface* surface;
} VkWaylandSurfaceCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `display` and `surface` are pointers to the Wayland `wl_display` and `wl_surface` to associate the surface with.

### Valid Usage

- VUID-VkWaylandSurfaceCreateInfoKHR-display-01304
  `display` must point to a valid Wayland `wl_display`

- VUID-VkWaylandSurfaceCreateInfoKHR-surface-01305
  `surface` must point to a valid Wayland `wl_surface`

### Valid Usage (Implicit)

- VUID-VkWaylandSurfaceCreateInfoKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_WAYLAND_SURFACE_CREATE_INFO_KHR

- VUID-VkWaylandSurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkWaylandSurfaceCreateInfoKHR-flags-zerobitmask
  flags must be 0

On Wayland, `currentExtent` is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface. Whatever the application sets a swapchain’s `imageExtent` to will be the size of the window, after the first image is presented. `minImageExtent` is (1,1), and `maxImageExtent` is the maximum supported surface size. Any calls to `vkGetPhysicalDeviceSurfacePresentModesKHR` on a surface created with `vkCreateWaylandSurfaceKHR` are required to return `VK_PRESENT_MODE_MAILBOX_KHR` as one of the valid present modes.

Some Vulkan functions may send protocol over the specified `wl_display` connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to a `wl_surface`. Applications must therefore ensure that both the `wl_display` and the `wl_surface` remain valid for the lifetime of any `VkSwapchainKHR` objects created from a particular `wl_display` and `wl_surface`. Also, calling `vkQueuePresentKHR` will result in Vulkan sending `wl_surface.commit` requests to the underlying `wl_surface` of each `VkSwapchainKHR` objects referenced by `pPresentInfo`. If the swapchain is created with a present mode of `VK_PRESENT_MODE_MAILBOX_KHR` or `VK_PRESENT_MODE_IMMEDIATE_KHR`, then the corresponding `wl_surface.attach`, `wl_surface.damage`, and `wl_surface.commit` request must be issued by the implementation during the call to `vkQueuePresentKHR` and must not be issued by the implementation outside of `vkQueuePresentKHR`. This ensures that any Wayland requests sent by the client after the call to `vkQueuePresentKHR` returns will be received by the compositor after the `wl_surface.commit`. Regardless of the mode of swapchain creation, a new `wl_event_queue` must be created for each successful `vkCreateWaylandSurfaceKHR` call, and every Wayland object created by the implementation must be assigned to this event queue. If the platform provides Wayland 1.11 or greater, this must be implemented by the use of Wayland proxy object wrappers, to avoid race conditions.

If the application wishes to synchronize any window changes with a particular frame, such requests must be sent to the Wayland display server prior to calling `vkQueuePresentKHR`. For full control over interactions between Vulkan rendering and other Wayland protocol requests and events, a present mode of `VK_PRESENT_MODE_MAILBOX_KHR` should be used.

```c
// Provided by VK_KHR_wayland_surface
typedef VkFlags VkWaylandSurfaceCreateFlagsKHR;
```

`VkWaylandSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.3. Win32 Platform

To create a `VkSurfaceKHR` object for a Win32 window, call:
VkResult vkCreateWin32SurfaceKHR(
    VkInstance instance,
    const VkWin32SurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkWin32SurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateWin32SurfaceKHR-instance-parameter `instance` must be a valid `VkInstance` handle
- VUID-vkCreateWin32SurfaceKHR-pCreateInfo-parameter `pCreateInfo` must be a valid pointer to a valid `VkWin32SurfaceCreateInfoKHR` structure
- VUID-vkCreateWin32SurfaceKHR-pAllocator-parameter If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateWin32SurfaceKHR-pSurface-parameter `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkWin32SurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_win32_surface
typedef struct VkWin32SurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWin32SurfaceCreateFlagsKHR flags;
} VkWin32SurfaceCreateInfoKHR;
```
- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **hinstance** is the Win32 **HINSTANCE** for the window to associate the surface with.
- **hwnd** is the Win32 **HWND** for the window to associate the surface with.

### Valid Usage

- VUID-VkWin32SurfaceCreateInfoKHR-hinstance-01307
  
  **hinstance** **must** be a valid Win32 **HINSTANCE**

- VUID-VkWin32SurfaceCreateInfoKHR hwnd-01308
  
  **hwnd** **must** be a valid Win32 **HWND**

### Valid Usage (Implicit)

- VUID-VkWin32SurfaceCreateInfoKHR-sType-sType
  
  **sType** **must** be **VK_STRUCTURE_TYPE_WIN32_SURFACE_CREATE_INFO_KHR**

- VUID-VkWin32SurfaceCreateInfoKHR-pNext-pNext
  
  **pNext** **must** be **NULL**

- VUID-VkWin32SurfaceCreateInfoKHR-flags-zero bitmask
  
  **flags** **must** be **0**

With Win32, **minImageExtent**, **maxImageExtent**, and **currentExtent** **must** always equal the window size.

The **currentExtent** of a Win32 surface **must** have both **width** and **height** greater than 0, or both of them 0.

**Note**

Due to above restrictions, it is only possible to create a new swapchain on this platform with **imageExtent** being equal to the current size of the window.

The window size **may** become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

```c
// Provided by VK_KHR_win32_surface
typedef VkFlags VkWin32SurfaceCreateFlagsKHR;
```

**VkWin32SurfaceCreateFlagsKHR** is a bitmask type for setting a mask, but is currently reserved for
future use.

33.2.4. XCB Platform

To create a `VkSurfaceKHR` object for an X11 window, using the XCB client-side library, call:

```c
// Provided by VK_KHR_xcb_surface
VkResult vkCreateXcbSurfaceKHR(
    VkInstance instance,
    const VkXcbSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkXcbSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- `VUID-vkCreateXcbSurfaceKHR-instance-parameter` instance must be a valid `VkInstance` handle
- `VUID-vkCreateXcbSurfaceKHR-pCreateInfo-parameter` `pCreateInfo` must be a valid pointer to a valid `VkXcbSurfaceCreateInfoKHR` structure
- `VUID-vkCreateXcbSurfaceKHR-pAllocator-parameter` If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- `VUID-vkCreateXcbSurfaceKHR-pSurface-parameter` `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkXcbSurfaceCreateInfoKHR` structure is defined as:
typedef struct VkXcbSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkXcbSurfaceCreateFlagsKHR flags;
    xcb_connection_t* connection;
    xcb_window_t window;
} VkXcbSurfaceCreateInfoKHR;

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- connection is a pointer to an xcb_connection_t to the X server.
- window is the xcb_window_t for the X11 window to associate the surface with.

Valid Usage

- VUID-VkXcbSurfaceCreateInfoKHR-connection-01310
  connection must point to a valid X11 xcb_connection_t

- VUID-VkXcbSurfaceCreateInfoKHR-window-01311
  window must be a valid X11 xcb_window_t

Valid Usage (Implicit)

- VUID-VkXcbSurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_XCB_SURFACE_CREATE_INFO_KHR

- VUID-VkXcbSurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkXcbSurfaceCreateInfoKHR-flags-zerobitmask
  flags must be 0

With Xcb, minImageExtent, maxImageExtent, and currentExtent must always equal the window size.

The currentExtent of an Xcb surface must have both width and height greater than 0, or both of them 0.

Note

Due to above restrictions, it is only possible to create a new swapchain on this platform with imageExtent being equal to the current size of the window.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.
Some Vulkan functions may send protocol over the specified xcb connection when using a swapchain or presentable images created from a VkSurfaceKHR referring to an xcb window. Applications must therefore ensure the xcb connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with xcb-based swapchains must

- Avoid holding a server grab on an xcb connection while waiting for Vulkan operations to complete using a swapchain derived from a different xcb connection referring to the same X server instance. Failing to do so may result in deadlock.

```c
// Provided by VK_KHR_xcb_surface
typedef VkFlags VkXcbSurfaceCreateFlagsKHR;
```

VkXcbSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.5. Xlib Platform

To create a VkSurfaceKHR object for an X11 window, using the Xlib client-side library, call:

```c
// Provided by VK_KHR_xlib_surface
VkResult vkCreateXlibSurfaceKHR(
    VkInstance instance,
    const VkXlibSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a VkXlibSurfaceCreateInfoKHR structure containing the parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

<table>
<thead>
<tr>
<th>Valid Usage (Implicit)</th>
</tr>
</thead>
<tbody>
<tr>
<td>• VUID-vkCreateXlibSurfaceKHR-instance-parameter</td>
</tr>
<tr>
<td>instance must be a valid VkInstance handle</td>
</tr>
<tr>
<td>• VUID-vkCreateXlibSurfaceKHR-pCreateInfo-parameter</td>
</tr>
<tr>
<td>pCreateInfo must be a valid pointer to a valid VkXlibSurfaceCreateInfoKHR structure</td>
</tr>
<tr>
<td>• VUID-vkCreateXlibSurfaceKHR-pAllocator-parameter</td>
</tr>
<tr>
<td>If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure</td>
</tr>
</tbody>
</table>
pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkXlibSurfaceCreateInfoKHR structure is defined as:

```c
typedef struct VkXlibSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkXlibSurfaceCreateFlagsKHR flags;
    Display* dpy;
    Window window;
} VkXlibSurfaceCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **dpy** is a pointer to an Xlib Display connection to the X server.
- **window** is an Xlib Window to associate the surface with.

Valid Usage

- VUID-VkXlibSurfaceCreateInfoKHR-dpy-01313
  dpy must point to a valid Xlib Display

- VUID-VkXlibSurfaceCreateInfoKHR-window-01314
  window must be a valid Xlib Window

Valid Usage (Implicit)

- VUID-VkXlibSurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_XLIB_SURFACE_CREATE_INFO_KHR

- VUID-VkXlibSurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL
With Xlib, \texttt{minImageExtent}, \texttt{maxImageExtent}, and \texttt{currentExtent} must always equal the window size.

The \texttt{currentExtent} of an Xlib surface must have both \texttt{width} and \texttt{height} greater than 0, or both of them 0.

\begin{quote}
\textit{Note}

Due to above restrictions, it is only possible to create a new swapchain on this platform with \texttt{imageExtent} being equal to the current size of the window.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.
\end{quote}

Some Vulkan functions may send protocol over the specified Xlib Display connection when using a swapchain or presentable images created from a \texttt{VkSurfaceKHR} referring to an Xlib window. Applications must therefore ensure the display connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with Xlib-based swapchains must

- Avoid holding a server grab on a display connection while waiting for Vulkan operations to complete using a swapchain derived from a different display connection referring to the same X server instance. Failing to do so may result in deadlock.

Some implementations may require threads to implement some presentation modes so applications must call \texttt{XInitThreads()} before calling any other Xlib functions.

\begin{verbatim}
// Provided by VK_KHR_xlib_surface
typedef VkFlags VkXlibSurfaceCreateFlagsKHR;
\end{verbatim}

\texttt{VkXlibSurfaceCreateFlagsKHR} is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.6. DirectFB Platform

To create a \texttt{VkSurfaceKHR} object for a DirectFB surface, call:

\begin{verbatim}
// Provided by VK_EXT_directfb_surface
VkResult vkCreateDirectFBSurfaceEXT(
    VkInstance instance,
    const VkDirectFBSurfaceCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
\end{verbatim}

- \texttt{instance} is the instance to associate the surface with.
• **pCreateInfo** is a pointer to a `VkDirectFBSurfaceCreateInfoEXT` structure containing parameters affecting the creation of the surface object.

• **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

• **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateDirectFBSurfaceEXT-instance-parameter**
  
  *instance* must be a valid `VkInstance` handle

- **VUID-vkCreateDirectFBSurfaceEXT-pCreateInfo-parameter**
  
  *pCreateInfo* must be a valid pointer to a valid `VkDirectFBSurfaceCreateInfoEXT` structure

- **VUID-vkCreateDirectFBSurfaceEXT-pAllocator-parameter**
  
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateDirectFBSurfaceEXT-pSurface-parameter**
  
  *pSurface* must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkDirectFBSurfaceCreateInfoEXT` structure is defined as:

```c
typedef struct VkDirectFBSurfaceCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkDirectFBSurfaceCreateFlagsEXT flags;
    IDirectFB*               dfb;
    IDirectFBSurface*        surface;
} VkDirectFBSurfaceCreateInfoEXT;
```

• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **flags** is reserved for future use.

• **dfb** is a pointer to the **IDirectFB** main interface of DirectFB.
• surface is a pointer to a IDirectFBSurface surface interface.

Valid Usage

• VUID-VkDirectFBSurfaceCreateInfoEXT-dfb-04117
dfb must point to a valid DirectFB IDirectFBSurface

• VUID-VkDirectFBSurfaceCreateInfoEXT-surface-04118
surface must point to a valid DirectFB IDirectFBSurface

Valid Usage (Implicit)

• VUID-VkDirectFBSurfaceCreateInfoEXT-sType-sType
sType must be VK_STRUCTURE_TYPE_DIRECTFB_SURFACE_CREATE_INFO_EXT

• VUID-VkDirectFBSurfaceCreateInfoEXT-pNext-pNext
pNext must be NULL

• VUID-VkDirectFBSurfaceCreateInfoEXT-flags-zerobitmask
flags must be 0

With DirectFB, minImageExtent, maxImageExtent, and currentExtent must always equal the surface size.

// Provided by VK_EXT_directfb_surface
typedef VkFlags VkDirectFBSurfaceCreateFlagsEXT;

VkDirectFBSurfaceCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.7. Fuchsia Platform

To create a VkSurfaceKHR object for a Fuchsia ImagePipe, call:

// Provided by VK_FUCHSIA_imagepipe_surface
VkResult vkCreateImagePipeSurfaceFUCHSIA(
    VkInstance instance,
    const VkImagePipeSurfaceCreateInfoFUCHSIA* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);

• instance is the instance to associate with the surface.

• pCreateInfo is a pointer to a VkImagePipeSurfaceCreateInfoFUCHSIA structure containing parameters affecting the creation of the surface object.

• pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
• `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateImagePipeSurfaceFUCHSIA-instance-parameter
  - `instance` must be a valid `VkInstance` handle

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkImagePipeSurfaceCreateInfoFUCHSIA` structure

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pAllocator-parameter
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pSurface-parameter
  - `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkImagePipeSurfaceCreateInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_imagepipe_surface
typedef struct VkImagePipeSurfaceCreateInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkImagePipeSurfaceCreateFlagsFUCHSIA flags;
    zx_handle_t imagePipeHandle;
} VkImagePipeSurfaceCreateInfoFUCHSIA;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `imagePipeHandle` is a `zx_handle_t` referring to the ImagePipe to associate with the surface.

### Valid Usage

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-imagePipeHandle-04863
imagePipeHandle must be a valid zx_handle_t

Valid Usage (Implicit)

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGEPIPE_SURFACE_CREATE_INFO_FUCHSIA
- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-pNext-pNext
  pNext must be NULL
- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-flags-zerobitmask
  flags must be 0

On Fuchsia, the surface currentExtent is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

```c
// Provided by VK_FUCHSIA_imagepipe_surface
typedef VkFlags VkImagePipeSurfaceCreateFlagsFUCHSIA;
```

VkImagePipeSurfaceCreateFlagsFUCHSIA is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.8. Google Games Platform

To create a VkSurfaceKHR object for a Google Games Platform stream descriptor, call:

```c
// Provided by VK_GGP_stream_descriptor_surface
VkResult vkCreateStreamDescriptorSurfaceGGP(
    VkInstance instance,
    const VkStreamDescriptorSurfaceCreateInfoGGP* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- instance is the instance to associate with the surface.
- pCreateInfo is a pointer to a VkStreamDescriptorSurfaceCreateInfoGGP structure containing parameters that affect the creation of the surface object.
- pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateStreamDescriptorSurfaceGGP-instance-parameter
  instance must be a valid VkInstance handle
pCreateInfo must be a valid pointer to a valid VkStreamDescriptorSurfaceCreateInfoGGP structure.

If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure.

pSurface must be a valid pointer to a VkSurfaceKHR handle.

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkStreamDescriptorSurfaceCreateInfoGGP structure is defined as:

```cpp
// Provided by VK_GGP_stream_descriptor_surface
typedef struct VkStreamDescriptorSurfaceCreateInfoGGP {
    VkStructureType sType;
    const void* pNext;
    VkStreamDescriptorSurfaceCreateFlagsGGP flags;
    GgpStreamDescriptor streamDescriptor;
} VkStreamDescriptorSurfaceCreateInfoGGP;
```

• sType is the type of this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• flags is reserved for future use.

• streamDescriptor is a GgpStreamDescriptor referring to the GGP stream descriptor to associate with the surface.

Valid Usage

• VUID-VkStreamDescriptorSurfaceCreateInfoGGP-streamDescriptor-02681 streamDescriptor must be a valid GgpStreamDescriptor.
Valid Usage (Implicit)

- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_STREAM_DESCRIPTOR_SURFACE_CREATE_INFO_GGP

- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-pNext-pNext
  
  pNext must be NULL

- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-flags-zerobitmask
  
  flags must be 0

On Google Games Platform, the surface extents are dynamic. The minImageExtent will never be greater than 1080p and the maxImageExtent will never be less than 1080p. The currentExtent will reflect the current optimal resolution.

Applications are expected to choose an appropriate size for the swapchain's imageExtent, within the bounds of the surface. Using the surface's currentExtent will offer the best performance and quality. When a swapchain's imageExtent does not match the surface's currentExtent, the presentable images are scaled to the surface's dimensions during presentation if possible and VK_SUBOPTIMAL_KHR is returned, otherwise presentation fails with VK_ERROR_OUT_OF_DATE_KHR.

```c
// Provided by VK_GGP_stream_descriptor_surface
typedef VkFlags VkStreamDescriptorSurfaceCreateFlagsGGP;
```

VkStreamDescriptorSurfaceCreateFlagsGGP is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.9. iOS Platform

To create a VkSurfaceKHR object for an iOS UIView or CAMetalLayer, call:

```c
// Provided by VK_MVK_ios_surface
VkResult vkCreateIOSSurfaceMVK(
    VkInstance instance,
    const VkIOSSurfaceCreateInfoMVK* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

**Note**

The vkCreateIOSSurfaceMVK function is considered deprecated and has been superseded by vkCreateMetalSurfaceEXT from the VK_EXT_metal_surface extension.

- instance is the instance with which to associate the surface.
- pCreateInfo is a pointer to a VkIOSSurfaceCreateInfoMVK structure containing parameters affecting the creation of the surface object.
- pAllocator is the allocator used for host memory allocated for the surface object when there is
no more specific allocator available (see Memory Allocation).

• *pSurface* is a pointer to a *VkSurfaceKHR* handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateIOSSurfaceMVK-instance-parameter
  
  *instance* **must** be a valid *VkInstance* handle

- VUID-vkCreateIOSSurfaceMVK-pCreateInfo-parameter
  
  *pCreateInfo* **must** be a valid pointer to a valid *VkIOSSurfaceCreateInfoMVK* structure

- VUID-vkCreateIOSSurfaceMVK-pAllocator-parameter
  
  If *pAllocator* is not **NULL**, *pAllocator** must** be a valid pointer to a valid *VkAllocationCallbacks* structure

- VUID-vkCreateIOSSurfaceMVK-pSurface-parameter
  
  *pSurface** must** be a valid pointer to a *VkSurfaceKHR* handle

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR**

The *VkIOSSurfaceCreateInfoMVK* structure is defined as:

```c
// Provided by VK_MVK_ios_surface
typedef struct VkIOSSurfaceCreateInfoMVK {
    VkStructureType sType;
    const void* pNext;
    VkIOSSurfaceCreateFlagsMVK flags;
    const void* pView;
} VkIOSSurfaceCreateInfoMVK;
```

• *sType* is the type of this structure.

• *pNext* is **NULL** or a pointer to a structure extending this structure.

• *flags* is reserved for future use.

• *pView* is a reference to either a *CAMetalLayer* object or a *UIView* object.
Valid Usage

• VUID-VkIOSSurfaceCreateInfoMVK-pView-04143
  If `pView` is a `CAMetalLayer` object, it **must** be a valid `CAMetalLayer`.

• VUID-VkIOSSurfaceCreateInfoMVK-pView-01316
  If `pView` is a `UIView` object, it **must** be a valid `UIView`, **must** be backed by a `CALayer` object of type `CAMetalLayer`, and `vkCreateIOSSurfaceMVK` **must** be called on the main thread.

Valid Usage (Implicit)

• VUID-VkIOSSurfaceCreateInfoMVK-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_IOS_SURFACE_CREATE_INFO_MVK`.

• VUID-VkIOSSurfaceCreateInfoMVK-pNext-pNext
  `pNext` **must** be `NULL`.

• VUID-VkIOSSurfaceCreateInfoMVK-flags-zerobitmask
  `flags` **must** be `0`.

```
// Provided by VK_MVK_ios_surface
typedef VkFlags VkIOSSurfaceCreateFlagsMVK;
```

`VkIOSSurfaceCreateFlagsMVK` is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.10. macOS Platform

To create a `VkSurfaceKHR` object for a macOS `NSView` or `CAMetalLayer`, call:

```
// Provided by VK_MVK_macos_surface
VkResult vkCreateMacOSSurfaceMVK(
    VkInstance instance,
    const VkMacOSSurfaceCreateInfoMVK* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

*Note*

The `vkCreateMacOSSurfaceMVK` function is considered deprecated and has been superseded by `vkCreateMetalSurfaceEXT` from the `VK_EXT_metal_surface` extension.

*instance* is the instance with which to associate the surface.

*pCreateInfo* is a pointer to a `VkMacOSSurfaceCreateInfoMVK` structure containing parameters affecting the creation of the surface object.

*pAllocator* is the allocator used for host memory allocated for the surface object when there is...
no more specific allocator available (see Memory Allocation).

- **pSurface** is a pointer to a **VkSurfaceKHR** handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateMacOSSurfaceMVK-instance-parameter
  - `instance` **must** be a valid **VkInstance** handle
- VUID-vkCreateMacOSSurfaceMVK-pCreateInfo-parameter
  - `pCreateInfo` **must** be a valid pointer to a valid **VkMacOSSurfaceCreateInfoMVK** structure
- VUID-vkCreateMacOSSurfaceMVK-pAllocator-parameter
  - If `pAllocator` is not **NULL**, `pAllocator` **must** be a valid pointer to a valid **VkAllocationCallbacks** structure
- VUID-vkCreateMacOSSurfaceMVK-pSurface-parameter
  - `pSurface` **must** be a valid pointer to a **VkSurfaceKHR** handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR**

The **VkMacOSSurfaceCreateInfoMVK** structure is defined as:

```c
// Provided by VK_MVK_macos_surface
typedef struct VkMacOSSurfaceCreateInfoMVK {
    VkStructureType sType;
    const void* pNext;
    VkMacOSSurfaceCreateFlagsMVK flags;
    const void* pView;
} VkMacOSSurfaceCreateInfoMVK;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **pView** is a reference to either a **CAMetalLayer** object or an **NSView** object.
Valid Usage

- **VUID-VkMacOSSurfaceCreateInfoMVK-pView-04144**
  If `pView` is a `CAMetalLayer` object, it must be a valid `CAMetalLayer`.

- **VUID-VkMacOSSurfaceCreateInfoMVK-pView-01317**
  If `pView` is an `NSView` object, it must be a valid `NSView`, must be backed by a `CALayer` object of type `CAMetalLayer`, and `vkCreateMacOSSurfaceMVK` must be called on the main thread.

Valid Usage (Implicit)

- **VUID-VkMacOSSurfaceCreateInfoMVK-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_MACOS_SURFACE_CREATE_INFO_MVK`.

- **VUID-VkMacOSSurfaceCreateInfoMVK-pNext-pNext**
  `pNext` must be `NULL`.

- **VUID-VkMacOSSurfaceCreateInfoMVK-flags-zeroBitmask**
  `flags` must be `0`.

```c
// Provided by VK_MVK_macos_surface
typedef VkFlags VkMacOSSurfaceCreateFlagsMVK;
```

`VkMacOSSurfaceCreateFlagsMVK` is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.11. VI Platform

To create a `VkSurfaceKHR` object for an `nn::vi::Layer`, query the layer's native handle using `nn::vi::GetNativeWindow`, and then call:

```c
// Provided by VK_NN_vi_surface
VkResult vkCreateViSurfaceNN(
    VkInstance instance,
    const VkViSurfaceCreateInfoNN* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a `VkViSurfaceCreateInfoNN` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.
During the lifetime of a surface created using a particular \texttt{nn\::vi\::NativeWindowHandle}, applications \textbf{must} not attempt to create another surface for the same \texttt{nn\::vi\::Layer} or attempt to connect to the same \texttt{nn\::vi\::Layer} through other platform mechanisms.

If the native window is created with a specified size, \texttt{currentExtent} will reflect that size. In this case, applications should use the same size for the swapchain's \texttt{imageExtent}. Otherwise, the \texttt{currentExtent} will have the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that applications are expected to choose an appropriate size for the swapchain's \texttt{imageExtent} (e.g., by matching the result of a call to \texttt{nn\::vi\::GetDisplayResolution}).

### Valid Usage (Implicit)

- \textbf{VUID-vkCreateViSurfaceNN-instance-parameter} \texttt{instance} \textbf{must} be a valid \texttt{VkInstance} handle
- \textbf{VUID-vkCreateViSurfaceNN-pCreateInfo-parameter} \texttt{pCreateInfo} \textbf{must} be a valid pointer to a valid \texttt{VkViSurfaceCreateInfoNN} structure
- \textbf{VUID-vkCreateViSurfaceNN-pAllocator-parameter} If \texttt{pAllocator} is not \texttt{NULL}, \texttt{pAllocator} \textbf{must} be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure
- \textbf{VUID-vkCreateViSurfaceNN-pSurface-parameter} \texttt{pSurface} \textbf{must} be a valid pointer to a \texttt{VkSurfaceKHR} handle

### Return Codes

#### Success
- \texttt{VK_SUCCESS}

#### Failure
- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}
- \texttt{VK_ERROR_NATIVE_WINDOW_IN_USE_KHR}

The \texttt{VkViSurfaceCreateInfoNN} structure is defined as:

```c
// Provided by VK_NN_vi_surface
typedef struct VkViSurfaceCreateInfoNN {
    VkStructureType sType;
    const void* pNext;
    VkViSurfaceCreateFlagsNN flags;
    void* window;
} VkViSurfaceCreateInfoNN;
```

- \texttt{sType} is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• window is the nn::vi::NativeWindowHandle for the nn::vi::Layer with which to associate the surface.

Valid Usage

• VUID-VkViSurfaceCreateInfoNN-window-01318
  window must be a valid nn::vi::NativeWindowHandle

Valid Usage (Implicit)

• VUID-VkViSurfaceCreateInfoNN-sType-sType
  sType must be VK_STRUCTURE_TYPE_VI_SURFACE_CREATE_INFO_NN
• VUID-VkViSurfaceCreateInfoNN-pNext-pNext
  pNext must be NULL
• VUID-VkViSurfaceCreateInfoNN-flags-zerobitmask
  flags must be 0

// Provided by VK_NN_vi_surface
typedef VkFlags VkViSurfaceCreateFlagsNN;

VkViSurfaceCreateFlagsNN is a bitmask type for setting a mask, but is currently reserved for future use.

33.2.12. Metal Platform

To create a VkSurfaceKHR object for a CAMetalLayer, call:

// Provided by VK_EXT_metal_surface
VkResult vkCreateMetalSurfaceEXT(
    VkInstance instance,           // Provided by VK_EXT_metal_surface
    const VkMetalSurfaceCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);

• instance is the instance with which to associate the surface.
• pCreateInfo is a pointer to a VkMetalSurfaceCreateInfoEXT structure specifying parameters affecting the creation of the surface object.
• pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
• pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.
Valid Usage (Implicit)

- VUID-vkCreateMetalSurfaceEXT-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkCreateMetalSurfaceEXT-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkMetalSurfaceCreateInfoEXT structure

- VUID-vkCreateMetalSurfaceEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateMetalSurfaceEXT-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
  - VK_SUCCESS

Failure
  - VK_ERROR_OUT_OF_HOST_MEMORY
  - VK_ERROR_OUT_OF_DEVICE_MEMORY
  - VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkMetalSurfaceCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_metal_surface
typedef struct VkMetalSurfaceCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMetalSurfaceCreateFlagsEXT flags;
    const CAMetalLayer* pLayer;
} VkMetalSurfaceCreateInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- pLayer is a reference to a CAMetalLayer object representing a renderable surface.

Valid Usage (Implicit)

- VUID-VkMetalSurfaceCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_METAL_SURFACE_CREATE_INFO_EXT
To remove an unnecessary compile-time dependency, an incomplete type definition of `CAMetalLayer` is provided in the Vulkan headers:

```c
// Provided by VK_EXT_metal_surface
#ifdef __OBJC__
@class CAMetalLayer;
#else
typedef void CAMetalLayer;
#endif
```

The actual `CAMetalLayer` type is defined in the QuartzCore framework.

```c
// Provided by VK_EXT_metal_surface
typedef VkFlags VkMetalSurfaceCreateFlagsEXT;
```

`VkMetalSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

### 33.2.13. QNX Screen Platform

To create a `VkSurfaceKHR` object for a QNX Screen surface, call:

```c
// Provided by VK_QNX_screen_surface
VkResult vkCreateScreenSurfaceQNX(
    VkInstance instance,                      instance,
    const VkScreenSurfaceCreateInfoQNX* pCreateInfo,   pCreateInfo,
    const VkAllocationCallbacks* pAllocator,        pAllocator,
    VkSurfaceKHR* pSurface);                    pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a ` VkScreenSurfaceCreateInfoQNX` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

**Valid Usage (Implicit)**

- VUID-vkCreateScreenSurfaceQNX-instance-parameter
instance must be a valid VkInstance handle

- VUID-vkCreateScreenSurfaceQNX-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkScreenSurfaceCreateInfoQNX structure

- VUID-vkCreateScreenSurfaceQNX-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateScreenSurfaceQNX-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkScreenSurfaceCreateInfoQNX structure is defined as:

```c
// Provided by VK_QNX_screen_surface
typedef struct VkScreenSurfaceCreateInfoQNX {
    VkStructureType sType;
    const void* pNext;
    VkScreenSurfaceCreateFlagsQNX flags;
    struct _screen_context* context;
    struct _screen_window* window;
} VkScreenSurfaceCreateInfoQNX;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- context and window are QNX Screen struct _screen_context and window to associate the surface with.

Valid Usage

- VUID-VkScreenSurfaceCreateInfoQNX-context-04741
  context must point to a valid QNX Screen struct _screen_context

- VUID-VkScreenSurfaceCreateInfoQNX-window-04742
  window must point to a valid QNX Screen struct _screen_window
33.2.14. Platform-Independent Information

Once created, VkSurfaceKHR objects can be used in this and other extensions, in particular the VK_KHR_swapchain extension.

Several WSI functions return VK_ERROR_SURFACE_LOST_KHR if the surface becomes no longer available. After such an error, the surface (and any child swapchain, if one exists) should be destroyed, as there is no way to restore them to a not-lost state. Applications may attempt to create a new VkSurfaceKHR using the same native platform window object, but whether such re-creation will succeed is platform-dependent and may depend on the reason the surface became unavailable. A lost surface does not otherwise cause devices to be lost.

To destroy a VkSurfaceKHR object, call:

```c
void vkDestroySurfaceKHR(
    VkInstance instance,          // Provided by VK_KHR_surface
    VkSurfaceKHR surface,        // Provided by VK_KHR_surface
    const VkAllocationCallbacks* pAllocator);
```

- `instance` is the instance used to create the surface.
- `surface` is the surface to destroy.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

Destroying a VkSurfaceKHR merely severs the connection between Vulkan and the native surface, and does not imply destroying the native surface, closing a window, or similar behavior.
Valid Usage

- VUID-vkDestroySurfaceKHR-surface-01266
  All `VkSwapchainKHR` objects created for `surface` must have been destroyed prior to destroying `surface`.

- VUID-vkDestroySurfaceKHR-surface-01267
  If `VkAllocationCallbacks` were provided when `surface` was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroySurfaceKHR-surface-01268
  If no `VkAllocationCallbacks` were provided when `surface` was created, `pAllocator` must be `NULL`.

Valid Usage (Implicit)

- VUID-vkDestroySurfaceKHR-instance-parameter
  `instance` must be a valid `VkInstance` handle.

- VUID-vkDestroySurfaceKHR-surface-parameter
  If `surface` is not `VK_NULL_HANDLE`, `surface` must be a valid `VkSurfaceKHR` handle.

- VUID-vkDestroySurfaceKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- VUID-vkDestroySurfaceKHR-surface-parent
  If `surface` is a valid handle, it must have been created, allocated, or retrieved from `instance`.

Host Synchronization

- Host access to `surface` must be externally synchronized.

33.3. Presenting Directly to Display Devices

In some environments applications can also present Vulkan rendering directly to display devices without using an intermediate windowing system. This can be useful for embedded applications, or implementing the rendering/presentation backend of a windowing system using Vulkan. The `VK_KHR_display` extension provides the functionality necessary to enumerate display devices and create `VkSurfaceKHR` objects that target displays.

33.3.1. Display Enumeration

Displays are represented by `VkDisplayKHR` handles:

```c
// Provided by VK_KHR_display
```
Various functions are provided for enumerating the available display devices present on a Vulkan physical device. To query information about the available displays, call:

```c
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPropertiesKHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display devices available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display devices for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

### Valid Usage (Implicit)
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pProperties-parameter If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPropertiesKHR` structures

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
The `VkDisplayPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPropertiesKHR {
    VkDisplayKHR display;
    const char* displayName;
    VkExtent2D physicalDimensions;
    VkExtent2D physicalResolution;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkBool32 planeReorderPossible;
    VkBool32 persistentContent;
} VkDisplayPropertiesKHR;
```

- **display** is a handle that is used to refer to the display described here. This handle will be valid for the lifetime of the Vulkan instance.

- **displayName** is NULL or a pointer to a null-terminated UTF-8 string containing the name of the display. Generally, this will be the name provided by the display’s EDID. If NULL, no suitable name is available. If not NULL, the string pointed to must remain accessible and unmodified as long as `display` is valid.

- **physicalDimensions** describes the physical width and height of the visible portion of the display, in millimeters.

- **physicalResolution** describes the physical, native, or preferred resolution of the display.

```
Note
For devices which have no natural value to return here, implementations should return the maximum resolution supported.
```

- **supportedTransforms** is a bitmask of `VkSurfaceTransformFlagBitsKHR` describing which transforms are supported by this display.

- **planeReorderPossible** tells whether the planes on this display can have their z order changed. If this is `VK_TRUE`, the application can re-arrange the planes on this display in any order relative to each other.

- **persistentContent** tells whether the display supports self-refresh/internal buffering. If this is true, the application can submit persistent present operations on swapchains created against this display.

```
Note
Persistent presents may have higher latency, and may use less power when the screen content is updated infrequently, or when only a portion of the screen needs to be updated in most frames.
```

To query information about the available displays, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayProperties2KHR(
```
VkPhysicalDevice

uint32_t*
pPropertyCount,

VkDisplayProperties2KHR*
pProperties);
• pNext is NULL or a pointer to a structure extending this structure.
• displayProperties is a VkDisplayPropertiesKHR structure.

Valid Usage (Implicit)

• VUID-VkDisplayProperties2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR
• VUID-VkDisplayProperties2KHR-pNext-pNext
  pNext must be NULL

Acquiring and Releasing Displays

On some platforms, access to displays is limited to a single process or native driver instance. On such platforms, some or all of the displays may not be available to Vulkan if they are already in use by a native windowing system or other application.

To acquire permission to directly access a display in Vulkan from an X11 server, call:

```c
// Provided by VK_EXT_acquire_xlib_display
VkResult vkAcquireXlibDisplayEXT(
    VkPhysicalDevice physicalDevice,
    Display* dpy,
    VkDisplayKHR display);
```

• physicalDevice The physical device the display is on.
• dpy A connection to the X11 server that currently owns display.
• display The display the caller wishes to control in Vulkan.

All permissions necessary to control the display are granted to the Vulkan instance associated with physicalDevice until the display is released or the X11 connection specified by dpy is terminated. Permission to access the display may be temporarily revoked during periods when the X11 server from which control was acquired itself loses access to display. During such periods, operations which require access to the display must fail with an appropriate error code. If the X11 server associated with dpy does not own display, or if permission to access it has already been acquired by another entity, the call must return the error code VK_ERROR_INITIALIZATION_FAILED.

Note

One example of when an X11 server loses access to a display is when it loses ownership of its virtual terminal.

Valid Usage (Implicit)

• VUID-vkAcquireXlibDisplayEXT-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
When acquiring displays from an X11 server, an application may also wish to enumerate and identify them using a native handle rather than a `VkDisplayKHR` handle. To determine the `VkDisplayKHR` handle corresponding to an X11 RandR Output, call:

```c
// Provided by VK_EXT_acquire_xlib_display
VkResult vkGetRandROutputDisplayEXT(
    VkPhysicalDevice physicalDevice,
    Display* dpy,
    RROutput rrOutput,
    VkDisplayKHR* pDisplay);
```

- **physicalDevice** The physical device to query the display handle on.
- **dpy** A connection to the X11 server from which `rrOutput` was queried.
- **rrOutput** An X11 RandR output ID.
- **pDisplay** The corresponding `VkDisplayKHR` handle will be returned here.

If there is no `VkDisplayKHR` corresponding to `rrOutput` on `physicalDevice`, `VK_NULL_HANDLE` must be returned in `pDisplay`.

**Valid Usage (Implicit)**

- VUID-vkGetRandROutputDisplayEXT-physicalDevice-parameter physicalDevice must be a valid `VkPhysicalDevice` handle
- VUID-vkGetRandROutputDisplayEXT-dpy-parameter dpy must be a valid pointer to a `Display` value
- VUID-vkGetRandROutputDisplayEXT-pDisplay-parameter pDisplay must be a valid pointer to a `VkDisplayKHR` handle
### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY

To acquire permission to directly access a display in Vulkan on Windows 10, call:

```c
// Provided by VK_NV_acquire_winrt_display
VkResult vkAcquireWinrtDisplayNV(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display);
```

- **physicalDevice** The physical device the display is on.
- **display** The display the caller wishes to control in Vulkan.

All permissions necessary to control the display are granted to the Vulkan instance associated with `physicalDevice` until the display is released or the application is terminated. Permission to access the display **may** be revoked by events that cause Windows 10 itself to lose access to `display`. If this has happened, operations which require access to the display **must** fail with an appropriate error code. If permission to access `display` has already been acquired by another entity, the call **must** return the error code `VK_ERROR_INITIALIZATION_FAILED`.

**Note**

The Vulkan instance acquires control of a “winrt::Windows::Devices::Display::Core::DisplayTarget” by performing an operation equivalent to “winrt::Windows::Devices::Display::Core::DisplayManager.TryAcquireTarget()” on the “DisplayTarget”.

**Note**

One example of when Windows 10 loses access to a display is when the display is hot-unplugged.

**Note**

One example of when a display has already been acquired by another entity is when the Windows desktop compositor (DWM) is in control of the display. Beginning with Windows 10 version 2004 it is possible to cause DWM to release a display by using the “Advanced display settings” sub-page of the “Display settings” control panel. `vkAcquireWinrtDisplayNV` does not itself cause DWM to release a display; this action must be performed outside of Vulkan.
Valid Usage (Implicit)

- VUID-vkAcquireWinrtDisplayNV-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkAcquireWinrtDisplayNV-display-parameter
  display must be a valid VkDisplayKHR handle
- VUID-vkAcquireWinrtDisplayNV-display-parent
  display must have been created, allocated, or retrieved from physicalDevice

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_INITIALIZATION_FAILED

When acquiring displays on Windows 10, an application may also wish to enumerate and identify them using a native handle rather than a VkDisplayKHR handle.

To determine the VkDisplayKHR handle corresponding to a “winrt::Windows::Devices::Display::Core::DisplayTarget”, call:

```c
// Provided by VK_NV_acquire_winrt_display
VkResult vkGetWinrtDisplayNV(
    VkPhysicalDevice physicalDevice,
    uint32_t deviceRelativeId,
    VkDisplayKHR* pDisplay);
```

- physicalDevice The physical device on which to query the display handle.
- deviceRelativeId The value of the “AdapterRelativeId” property of a “DisplayTarget” that is enumerated by a “DisplayAdapter” with an “Id” property matching the deviceUID property of a VkPhysicalDeviceIDProperties for physicalDevice.
- pDisplay The corresponding VkDisplayKHR handle will be returned here.

If there is no VkDisplayKHR corresponding to deviceRelativeId on physicalDevice, VK_NULL_HANDLE must be returned in pDisplay.

Valid Usage (Implicit)

- VUID-vkGetWinrtDisplayNV-physicalDevice-parameter
**physicalDevice** must be a valid VkPhysicalDevice handle

- VUID-vkGetWinrtDisplayNV-pDisplay-parameter
  
  pDisplay must be a valid pointer to a VkDisplayKHR handle

---

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_INITIALIZATION_FAILED

To acquire permission to directly a display in Vulkan from the Direct Rendering Manager (DRM) interface, call:

```c
// Provided by VK_EXT_acquire_drm_display
VkResult vkAcquireDrmDisplayEXT(
    VkPhysicalDevice physicalDevice,
    int32_t drmFd,
    VkDisplayKHR display);
```

- **physicalDevice** The physical device the display is on.
- **drmFd** DRM primary file descriptor.
- **display** The display the caller wishes Vulkan to control.

All permissions necessary to control the display are granted to the Vulkan instance associated with the provided `physicalDevice` until the display is either released or the connector is unplugged. The provided `drmFd` must correspond to the one owned by the `physicalDevice`. If not, the error code VK_ERROR_UNKNOWN must be returned. The DRM FD must have DRM master permissions. If any error is encountered during the acquisition of the display, the call must return the error code VK_ERROR_INITIALIZATION_FAILED.

The provided DRM fd should not be closed before the display is released, attempting to do it may result in undefined behaviour.

---

### Valid Usage (Implicit)

- VUID-vkAcquireDrmDisplayEXT-physicalDevice-parameter
  
  `physicalDevice` must be a valid VkPhysicalDevice handle

- VUID-vkAcquireDrmDisplayEXT-display-parameter
  
  `display` must be a valid VkDisplayKHR handle
Before acquiring a display from the DRM interface, the caller may want to select a specific \texttt{VkDisplayKHR} handle by identifying it using a \texttt{connectorId}. To do so, call:

```c
// Provided by VK_EXT_acquire_drm_display
VkResult vkGetDrmDisplayEXT(
    VkPhysicalDevice physicalDevice,
    int32_t drmFd,
    uint32_t connectorId,
    VkDisplayKHR* display);
```

- \texttt{physicalDevice} The physical device to query the display from.
- \texttt{drmFd} DRM primary file descriptor.
- \texttt{connectorId} Identifier of the specified DRM connector.
- \texttt{display} The corresponding \texttt{VkDisplayKHR} handle will be returned here.

If there is no \texttt{VkDisplayKHR} corresponding to the \texttt{connectorId} on the \texttt{physicalDevice}, the returning \texttt{display} must be set to \texttt{VK_NULL_HANDLE}. The provided \texttt{drmFd} must correspond to the one owned by the \texttt{physicalDevice}. If not, the error code \texttt{VK_ERROR_UNKNOWN} must be returned. Master permissions are not required, because the file descriptor is just used for information gathering purposes. The given \texttt{connectorId} must be a resource owned by the provided \texttt{drmFd}. If not, the error code \texttt{VK_ERROR_UNKNOWN} must be returned. If any error is encountered during the identification of the display, the call must return the error code \texttt{VK_ERROR_INITIALIZATION_FAILED}.

### Valid Usage (Implicit)

- **VUID-vkAcquireDrmDisplayEXT-display-parent**
  \texttt{display must} have been created, allocated, or retrieved from \texttt{physicalDevice}

- **Return Codes**
  **Success**
  - \texttt{VK_SUCCESS}

  **Failure**
  - \texttt{VK_ERROR_INITIALIZATION_FAILED}
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY

To release a previously acquired display, call:

```c
// Provided by VK_EXT_direct_mode_display
VkResult vkReleaseDisplayEXT(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display);
```

- `physicalDevice` The physical device the display is on.
- `display` The display to release control of.

Valid Usage (Implicit)

- VUID-vkReleaseDisplayEXT-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkReleaseDisplayEXT-display-parameter
  `display` must be a valid `VkDisplayKHR` handle

- VUID-vkReleaseDisplayEXT-display-parent
  `display` must have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success
- VK_SUCCESS

Display Planes

Images are presented to individual planes on a display. Devices must support at least one plane on each display. Planes can be stacked and blended to composite multiple images on one display. Devices may support only a fixed stacking order and fixed mapping between planes and displays, or they may allow arbitrary application specified stacking orders and mappings between planes and displays. To query the properties of device display planes, call:

```c
// Provided by VK_KHR_display
```
VkResult vkGetPhysicalDeviceDisplayPlanePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPlanePropertiesKHR* pProperties);

- **physicalDevice** is a physical device.
- **pPropertyCount** is a pointer to an integer related to the number of display planes available or queried, as described below.
- **pProperties** is either NULL or a pointer to an array of VkDisplayPlanePropertiesKHR structures.

If pProperties is NULL, then the number of display planes available for physicalDevice is returned in pPropertyCount. Otherwise, pPropertyCount must point to a variable set by the user to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If the value of pPropertyCount is less than the number of display planes for physicalDevice, at most pPropertyCount structures will be written.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pProperties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayPlanePropertiesKHR structures

### Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayPlanePropertiesKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlanePropertiesKHR {
    VkDisplayKHR currentDisplay;
    uint32_t currentStackIndex;
} VkDisplayPlanePropertiesKHR;
```
VkDisplayPlanePropertiesKHR;

- **currentDisplay** is the handle of the display the plane is currently associated with. If the plane is not currently attached to any displays, this will be **VK_NULL_HANDLE**.
- **currentStackIndex** is the current z-order of the plane. This will be between 0 and the value returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` in `pPropertyCount`.

To query the properties of a device’s display planes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayPlaneProperties2KHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPlaneProperties2KHR* pProperties);
```

- **physicalDevice** is a physical device.
- **pPropertyCount** is a pointer to an integer related to the number of display planes available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of ` VkDisplayPlaneProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayPlaneProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`, with the ability to return extended information via chained output structures.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- **VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pPropertyCount-parameter**
  - `pPropertyCount` must be a valid pointer to a `uint32_t` value
- **VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pProperties-parameter**
  - If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not **NULL**, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPlaneProperties2KHR` structures

### Return Codes

#### Success
- **VK_SUCCESS**
- **VK_INCOMPLETE**

#### Failure
- **VK_ERROR_OUT_OF_HOST_MEMORY**
The `VkDisplayPlaneProperties2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlanePropertiesKHR displayPlaneProperties;
} VkDisplayPlaneProperties2KHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `displayPlaneProperties` is a `VkDisplayPlanePropertiesKHR` structure.

### Valid Usage (Implicit)

- VUID-VkDisplayPlaneProperties2KHR-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR`
- VUID-VkDisplayPlaneProperties2KHR-pNext-pNext
  - `pNext` must be NULL

To determine which displays a plane is usable with, call

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneSupportedDisplaysKHR(
    VkPhysicalDevice physicalDevice,  // a physical device.
    uint32_t planeIndex,              // the plane which the application wishes to use, and must be in the range [0, physical device plane count - 1].
    uint32_t* pDisplayCount,          // a pointer to an integer related to the number of displays available or queried, as described below.
    VkDisplayKHR* pDisplays)          // either NULL or a pointer to an array of VkDisplayKHR handles.
```

- `physicalDevice` is a physical device.
- `planeIndex` is the plane which the application wishes to use, and must be in the range [0, physical device plane count - 1].
- `pDisplayCount` is a pointer to an integer related to the number of displays available or queried, as described below.
- `pDisplays` is either NULL or a pointer to an array of `VkDisplayKHR` handles.

If `pDisplays` is NULL, then the number of displays usable with the specified `planeIndex` for `physicalDevice` is returned in `pDisplayCount`. Otherwise, `pDisplayCount` must point to a variable set by the user to the number of elements in the `pDisplays` array, and on return the variable is overwritten with the number of handles actually written to `pDisplays`. If the value of `pDisplayCount` is less than the number of usable display-plane pairs for `physicalDevice`, at most `pDisplayCount`
handles will be written, and \texttt{VK\_INCOMPLETE} will be returned instead of \texttt{VK\_SUCCESS}, to indicate that not all the available pairs were returned.

### Valid Usage

- \texttt{VUID-vkGetDisplayPlaneSupportedDisplaysKHR-planeIndex-01249} for \texttt{planeIndex} must be less than the number of display planes supported by the device as determined by calling \texttt{vkGetPhysicalDeviceDisplayPlanePropertiesKHR}

### Valid Usage (Implicit)

- \texttt{VUID-vkGetDisplayPlaneSupportedDisplaysKHR-physicalDevice-parameter} for \texttt{physicalDevice} must be a valid \texttt{VkPhysicalDevice} handle
- \texttt{VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplayCount-parameter} for \texttt{pDisplayCount} must be a valid pointer to a \texttt{uint32\_t} value
- \texttt{VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplays-parameter} for \texttt{pDisplays} is not \texttt{NULL}. \texttt{pDisplays} must be a valid pointer to an array of \texttt{pDisplayCount} \texttt{VkDisplayKHR} handles

### Return Codes

**Success**
- \texttt{VK\_SUCCESS}
- \texttt{VK\_INCOMPLETE}

**Failure**
- \texttt{VK\_ERROR\_OUT\_OF\_HOST\_MEMORY}
- \texttt{VK\_ERROR\_OUT\_OF\_DEVICE\_MEMORY}

Additional properties of displays are queried using specialized query functions.

### Display Modes

Display modes are represented by \texttt{VkDisplayModeKHR} handles:

```c
// Provided by VK\_KHR\_display
VK\_DEFINE\_NON\_DISPATCHABLE\_HANDLE(VkDisplayModeKHR)
```

Each display has one or more supported modes associated with it by default. These built-in modes are queried by calling:

```c
// Provided by VK\_KHR\_display
VkResult \texttt{vkGetDisplayModePropertiesKHR}()
```
### VkGetDisplayModePropertiesKHR

```c
VkGetDisplayModePropertiesKHR(
    VkPhysicalDevice
    VkDisplayKHR
    uint32_t*
    VkDisplayModePropertiesKHR*
);
```

- **physicalDevice** is the physical device associated with **display**.
- **display** is the display to query.
- **pPropertyCount** is a pointer to an integer related to the number of display modes available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of **VkDisplayModePropertiesKHR** structures.

If **pProperties** is **NULL**, then the number of display modes available on the specified **display** for **physicalDevice** is returned in **pPropertyCount**. Otherwise, **pPropertyCount** must point to a variable set by the user to the number of elements in the **pProperties** array, and on return the variable is overwritten with the number of structures actually written to **pProperties**. If the value of **pPropertyCount** is less than the number of display modes for **physicalDevice**, at most **pPropertyCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available display modes were returned.

### Valid Usage (Implicit)

- VUID-vkGetDisplayModePropertiesKHR-physicalDevice-parameter
  **physicalDevice** must be a valid **VkPhysicalDevice** handle
- VUID-vkGetDisplayModePropertiesKHR-display-parameter
  **display** must be a valid **VkDisplayKHR** handle
- VUID-vkGetDisplayModePropertiesKHR-pPropertyCount-parameter
  **pPropertyCount** must be a valid pointer to a **uint32_t** value
- VUID-vkGetDisplayModePropertiesKHR-pProperties-parameter
  If the value referenced by **pPropertyCount** is not 0, and **pProperties** is not **NULL**, **pProperties** must be a valid pointer to an array of **pPropertyCount** **VkDisplayModePropertiesKHR** structures
- VUID-vkGetDisplayModePropertiesKHR-display-parent
  **display** must have been created, allocated, or retrieved from **physicalDevice**

### Return Codes

**Success**
- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
The `VkDisplayModePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModePropertiesKHR {
    VkDisplayModeKHR displayMode;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModePropertiesKHR;
```

- `displayMode` is a handle to the display mode described in this structure. This handle will be valid for the lifetime of the Vulkan instance.
- `parameters` is a `VkDisplayModeParametersKHR` structure describing the display parameters associated with `displayMode`.

```c
// Provided by VK_KHR_display
typedef VkFlags VkDisplayModeCreateFlagsKHR;
```

`VkDisplayModeCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To query the properties of a device’s built-in display modes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayModeProperties2KHR(
    VkPhysicalDevice physicalDevice,  // physicalDevice
    VkDisplayKHR display,              // display
    uint32_t*pPropertyCount,           // pPropertyCount
    VkDisplayModeProperties2KHR*pProperties);  // pProperties
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModeProperties2KHR` structures.

`vkGetDisplayModeProperties2KHR` behaves similarly to `vkGetDisplayModePropertiesKHR`, with the ability to return extended information via chained output structures.

**Valid Usage (Implicit)**

- VUID-vkGetDisplayModeProperties2KHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayModeProperties2KHR-display-parameter `display` must be a valid `VkDisplayKHR` handle
- VUID-vkGetDisplayModeProperties2KHR-pPropertyCount-parameter
pPropertyCount must be a valid pointer to a uint32_t value

- VUID-vkGetDisplayModeProperties2KHR-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayModeProperties2KHR structures

- VUID-vkGetDisplayModeProperties2KHR-display-parent
display must have been created, allocated, or retrieved from physicalDevice

### Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayModeProperties2KHR structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayModeProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayModePropertiesKHR displayModeProperties;
} VkDisplayModeProperties2KHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- displayModeProperties is a VkDisplayModePropertiesKHR structure.

### Valid Usage (Implicit)

- VUID-VkDisplayModeProperties2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR

- VUID-VkDisplayModeProperties2KHR-pNext-pNext
  pNext must be NULL

The VkDisplayModeParametersKHR structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayModeParametersKHR {
```

2170
VkExtent2D  visibleRegion;
uint32_t  refreshRate;
} VkDisplayModeParametersKHR;

• **visibleRegion** is the 2D extents of the visible region.
• **refreshRate** is a **uint32_t** that is the number of times the display is refreshed each second multiplied by 1000.

**Note**
For example, a 60Hz display mode would report a **refreshRate** of 60,000.

### Valid Usage

- VUID-VkDisplayModeParametersKHR-width-01990
  The **width** member of **visibleRegion** must be greater than 0

- VUID-VkDisplayModeParametersKHR-height-01991
  The **height** member of **visibleRegion** must be greater than 0

- VUID-VkDisplayModeParametersKHR-refreshRate-01992
  **refreshRate** must be greater than 0

Additional modes **may** also be created by calling:

```c
// Provided by VK_KHR_display
VkResult  vkCreateDisplayModeKHR(
    VkPhysicalDevice  physicalDevice,  // physicalDevice is the physical device associated with display.
    VkDisplayKHR     display,           // display is the display to create an additional mode for.
    const           VkDisplayModeCreateInfoKHR* pCreateInfo,  // pCreateInfo is a pointer to a VkDisplayModeCreateInfoKHR structure describing the new mode to create.
    const           VkAllocationCallbacks* pAllocator,  // pAllocator is the allocator used for host memory allocated for the display mode object when there is no more specific allocator available (see Memory Allocation).
    VkDisplayModeKHR* pMode);  // pMode is a pointer to a VkDisplayModeKHR handle in which the mode created is returned.
```

- **physicalDevice** is the physical device associated with **display**.
- **display** is the display to create an additional mode for.
- **pCreateInfo** is a pointer to a **VkDisplayModeCreateInfoKHR** structure describing the new mode to create.
- **pAllocator** is the allocator used for host memory allocated for the display mode object when there is no more specific allocator available (see Memory Allocation).
- **pMode** is a pointer to a **VkDisplayModeKHR** handle in which the mode created is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDisplayModeKHR-physicalDevice-parameter
  **physicalDevice** must be a valid **VkPhysicalDevice** handle
- VUID-vkCreateDisplayModeKHR-display-parameter
  display must be a valid VkDisplayKHR handle

- VUID-vkCreateDisplayModeKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkDisplayModeCreateInfoKHR structure

- VUID-vkCreateDisplayModeKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateDisplayModeKHR-pMode-parameter
  pMode must be a valid pointer to a VkDisplayModeKHR handle

- VUID-vkCreateDisplayModeKHR-display-parent
  display must have been created, allocated, or retrieved from physicalDevice

---

**Host Synchronization**

- Host access to display must be externally synchronized

---

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED

The VkDisplayModeCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModeCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplayModeCreateFlagsKHR flags;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModeCreateInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use, and must be zero.
- parameters is a VkDisplayModeParametersKHR structure describing the display parameters to use in creating the new mode. If the parameters are not compatible with the specified display,
the implementation must return VK_ERROR_INITIALIZATION_FAILED.

Valid Usage (Implicit)

- VUID-VkDisplayModeCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR
- VUID-VkDisplayModeCreateInfoKHR-pNext-pNext
  pNext must be NULL
- VUID-VkDisplayModeCreateInfoKHR-flags-zerobitmask
  flags must be 0
- VUID-VkDisplayModeCreateInfoKHR-parameters-parameter
  parameters must be a valid VkDisplayModeParametersKHR structure

Applications that wish to present directly to a display must select which layer, or “plane” of the display they wish to target, and a mode to use with the display. Each display supports at least one plane. The capabilities of a given mode and plane combination are determined by calling:

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayModeKHR mode,
    uint32_t planeIndex,
    VkDisplayPlaneCapabilitiesKHR* pCapabilities);
```

- `physicalDevice` is the physical device associated with the display specified by `mode`
- `mode` is the display mode the application intends to program when using the specified plane. Note this parameter also implicitly specifies a display.
- `planeIndex` is the plane which the application intends to use with the display, and is less than the number of display planes supported by the device.
- `pCapabilities` is a pointer to a VkDisplayPlaneCapabilitiesKHR structure in which the capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneCapabilitiesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parameter
  mode must be a valid VkDisplayModeKHR handle
- VUID-vkGetDisplayPlaneCapabilitiesKHR-pCapabilities-parameter
  pCapabilities must be a valid pointer to a VkDisplayPlaneCapabilitiesKHR structure
Host Synchronization

- Host access to mode must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayPlaneCapabilitiesKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlaneCapabilitiesKHR {
    VkDisplayPlaneAlphaFlagsKHR supportedAlpha;
    VkOffset2D minSrcPosition;
    VkOffset2D maxSrcPosition;
    VkExtent2D minSrcExtent;
    VkExtent2D maxSrcExtent;
    VkOffset2D minDstPosition;
    VkOffset2D maxDstPosition;
    VkExtent2D minDstExtent;
    VkExtent2D maxDstExtent;
} VkDisplayPlaneCapabilitiesKHR;
```

- **supportedAlpha** is a bitmask of VkDisplayPlaneAlphaFlagBitsKHR describing the supported alpha blending modes.
- **minSrcPosition** is the minimum source rectangle offset supported by this plane using the specified mode.
- **maxSrcPosition** is the maximum source rectangle offset supported by this plane using the specified mode. The x and y components of maxSrcPosition must each be greater than or equal to the x and y components of minSrcPosition, respectively.
- **minSrcExtent** is the minimum source rectangle size supported by this plane using the specified mode.
- **maxSrcExtent** is the maximum source rectangle size supported by this plane using the specified mode.
- **minDstPosition, maxDstPosition, minDstExtent, maxDstExtent** all have similar semantics to their corresponding *Src* equivalents, but apply to the output region within the mode rather than the input region within the source image. Unlike the *Src* offsets, minDstPosition and maxDstPosition may contain negative values.
The minimum and maximum position and extent fields describe the implementation limits, if any, as they apply to the specified display mode and plane. Vendors may support displaying a subset of a swapchain’s presentable images on the specified display plane. This is expressed by returning \texttt{minSrcPosition, maxSrcPosition, minSrcExtent, and maxSrcExtent} values that indicate a range of possible positions and sizes which may be used to specify the region within the presentable images that source pixels will be read from when creating a swapchain on the specified display mode and plane.

Vendors may also support mapping the presentable images' content to a subset or superset of the visible region in the specified display mode. This is expressed by returning \texttt{minDstPosition, maxDstPosition, minDstExtent and maxDstExtent} values that indicate a range of possible positions and sizes which may be used to describe the region within the display mode that the source pixels will be mapped to.

Other vendors may support only a 1-1 mapping between pixels in the presentable images and the display mode. This may be indicated by returning \texttt{(0,0)} for \texttt{minSrcPosition, maxSrcPosition, minDstPosition, and maxDstPosition}, and \texttt{(display mode width, display mode height)} for \texttt{minSrcExtent, maxSrcExtent, minDstExtent, and maxDstExtent}.

The value \texttt{supportedAlpha} must contain at least one valid \texttt{VkDisplayPlaneAlphaFlagBitsKHR} bit.

These values indicate the limits of the implementation's individual fields. Not all combinations of values within the offset and extent ranges returned in \texttt{VkDisplayPlaneCapabilitiesKHR} are guaranteed to be supported. Presentation requests specifying unsupported combinations may fail.

To query the capabilities of a given mode and plane combination, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayPlaneCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkDisplayPlaneInfo2KHR* pDisplayPlaneInfo,
    VkDisplayPlaneCapabilities2KHR* pCapabilities);
```

- \texttt{physicalDevice} is the physical device associated with \texttt{pDisplayPlaneInfo}.
- \texttt{pDisplayPlaneInfo} is a pointer to a \texttt{VkDisplayPlaneInfo2KHR} structure describing the plane and mode.
- \texttt{pCapabilities} is a pointer to a \texttt{VkDisplayPlaneCapabilities2KHR} structure in which the capabilities are returned.

\texttt{vkGetDisplayPlaneCapabilities2KHR} behaves similarly to \texttt{vkGetDisplayPlaneCapabilitiesKHR}, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

**Valid Usage (Implicit)**

- VUID-vkGetDisplayPlaneCapabilities2KHR-physicalDevice-parameter \texttt{physicalDevice} must be a valid \texttt{VkPhysicalDevice} handle
• VUID-vkGetDisplayPlaneCapabilities2KHR-pDisplayPlaneInfo-parameter
  pDisplayPlaneInfo must be a valid pointer to a valid VkDisplayPlaneInfo2KHR structure
• VUID-vkGetDisplayPlaneCapabilities2KHR-pCapabilities-parameter
  pCapabilities must be a valid pointer to a VkDisplayPlaneCapabilities2KHR structure

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayPlaneInfo2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneInfo2KHR {
  VkStructureType sType;
  const void* pNext;
  VkDisplayModeKHR mode;
  uint32_t planeIndex;
} VkDisplayPlaneInfo2KHR;
```

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **mode** is the display mode the application intends to program when using the specified plane.

**Note**
This parameter also implicitly specifies a display.

• **planeIndex** is the plane which the application intends to use with the display.

The members of `VkDisplayPlaneInfo2KHR` correspond to the arguments to `vkGetDisplayPlaneCapabilitiesKHR`, with `sType` and `pNext` added for extensibility.

Valid Usage (Implicit)

• VUID-VkDisplayPlaneInfo2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR
• VUID-VkDisplayPlaneInfo2KHR-pNext-pNext
  pNext must be NULL
• VUID-VkDisplayPlaneInfo2KHR-mode-parameter

2176
mode must be a valid VkDisplayModeKHR handle

Host Synchronization

- Host access to mode must be externally synchronized

The VkDisplayPlaneCapabilities2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlaneCapabilitiesKHR capabilities;
} VkDisplayPlaneCapabilities2KHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `capabilities` is a VkDisplayPlaneCapabilitiesKHR structure.

Valid Usage (Implicit)

- VUID-VkDisplayPlaneCapabilities2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR
- VUID-VkDisplayPlaneCapabilities2KHR-pNext-pNext
  pNext must be NULL

33.3.2. Display Control

To set the power state of a display, call:

```c
// Provided by VK_EXT_display_control
VkResult vkDisplayPowerControlEXT(
    VkDevice device,
    VkDisplayKHR display,
    const VkDisplayPowerInfoEXT* pDisplayPowerInfo);
```

- `device` is a logical device associated with display.
- `display` is the display whose power state is modified.
- `pDisplayPowerInfo` is a pointer to a VkDisplayPowerInfoEXT structure specifying the new power state of display.
Valid Usage (Implicit)

- VUID-vkDisplayPowerControlEXT-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkDisplayPowerControlEXT-display-parameter
  
  display must be a valid VkDisplayKHR handle

- VUID-vkDisplayPowerControlEXT-pDisplayPowerInfo-parameter
  
  pDisplayPowerInfo must be a valid pointer to a valid VkDisplayPowerInfoEXT structure

- VUID-vkDisplayPowerControlEXT-commonparent
  
  Both of device, and display must have been created, allocated, or retrieved from the same VkPhysicalDevice

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkDisplayPowerInfoEXT structure is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkDisplayPowerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDisplayPowerStateEXT powerState;
} VkDisplayPowerInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- powerState is a VkDisplayPowerStateEXT value specifying the new power state of the display.

Valid Usage (Implicit)

- VUID-VkDisplayPowerInfoEXT-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT

- VUID-VkDisplayPowerInfoEXT-pNext-pNext
  
  pNext must be NULL

- VUID-VkDisplayPowerInfoEXT-powerState-parameter
  
  powerState must be a valid VkDisplayPowerStateEXT value
Possible values of `VkDisplayPowerInfoEXT::powerState`, specifying the new power state of a display, are:

```c
// Provided by VK_EXT_display_control
typedef enum VkDisplayPowerStateEXT {
    VK_DISPLAY_POWER_STATE_OFF_EXT = 0,
    VK_DISPLAY_POWER_STATE_SUSPEND_EXT = 1,
    VK_DISPLAY_POWER_STATE_ON_EXT = 2,
} VkDisplayPowerStateEXT;
```

- `VK_DISPLAY_POWER_STATE_OFF_EXT` specifies that the display is powered down.
- `VK_DISPLAY_POWER_STATE_SUSPEND_EXT` specifies that the display is put into a low power mode, from which it **may** be able to transition back to `VK_DISPLAY_POWER_STATE_ON_EXT` more quickly than if it were in `VK_DISPLAY_POWER_STATE_OFF_EXT`. This state **may** be the same as `VK_DISPLAY_POWER_STATE_OFF_EXT`.
- `VK_DISPLAY_POWER_STATE_ON_EXT` specifies that the display is powered on.

### 33.3.3. Display Surfaces

A complete display configuration includes a mode, one or more display planes and any parameters describing their behavior, and parameters describing some aspects of the images associated with those planes. Display surfaces describe the configuration of a single plane within a complete display configuration. To create a `VkSurfaceKHR` object for a display plane, call:

```c
// Provided by VK_KHR_display
VkResult vkCreateDisplayPlaneSurfaceKHR(  
    VkInstance instance,  
    const VkDisplaySurfaceCreateInfoKHR* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance corresponding to the physical device the targeted display is on.
- `pCreateInfo` is a pointer to a `VkDisplaySurfaceCreateInfoKHR` structure specifying which mode, plane, and other parameters to use, as described below.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDisplayPlaneSurfaceKHR-instance-parameter `instance` **must** be a valid `VkInstance` handle
- VUID-vkCreateDisplayPlaneSurfaceKHR-pCreateInfo-parameter `pCreateInfo` **must** be a valid pointer to a valid `VkDisplaySurfaceCreateInfoKHR` structure
• VUID-vkCreateDisplayPlaneSurfaceKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

• VUID-vkCreateDisplayPlaneSurfaceKHR-pSurface-parameter
  `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplaySurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplaySurfaceCreateInfoKHR {
  VkStructureType         sType;
  const void*             pNext;
  VkDisplaySurfaceCreateFlagsKHR flags;
  VkDisplayModeKHR        displayMode;
  uint32_t                 planeIndex;
  uint32_t                 planeStackIndex;
  VkSurfaceTransformFlagBitsKHR transform;
  float                    globalAlpha;
  VkDisplayPlaneAlphaFlagBitsKHR alphaMode;
  VkExtent2D              imageExtent;
} VkDisplaySurfaceCreateInfoKHR;
```

• `sType` is the type of this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `flags` is reserved for future use, and must be zero.

• `displayMode` is a `VkDisplayModeKHR` handle specifying the mode to use when displaying this surface.

• `planeIndex` is the plane on which this surface appears.

• `planeStackIndex` is the z-order of the plane.

• `transform` is a `VkSurfaceTransformFlagBitsKHR` value specifying the transformation to apply to images as part of the scanout operation.

• `globalAlpha` is the global alpha value. This value is ignored if `alphaMode` is not `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR`.
- **alphaMode** is a `VkDisplayPlaneAlphaFlagBitsKHR` value specifying the type of alpha blending to use.

- **imageExtent** is the size of the presentable images to use with the surface.

**Note**

Creating a display surface **must** not modify the state of the displays, planes, or other resources it names. For example, it **must** not apply the specified mode to be set on the associated display. Application of display configuration occurs as a side effect of presenting to a display surface.

## Valid Usage

- **VUID-VkDisplaySurfaceCreateInfoKHR-planeIndex-01252**
  `planeIndex` **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-planeReorderPossible-01253**
  If the `planeReorderPossible` member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display corresponding to `displayMode` is `VK_TRUE` then `planeStackIndex` **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`; otherwise, `planeStackIndex` **must** equal the `currentStackIndex` member of `VkDisplayPlanePropertiesKHR` returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` for the display plane corresponding to `displayMode`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01254**
  If `alphaMode` is `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR` then `globalAlpha` **must** be between 0 and 1, inclusive.

- **VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01255**
  `alphaMode` **must** be one of the bits present in the `supportedAlpha` member of `VkDisplayPlaneCapabilitiesKHR` for the display plane corresponding to `displayMode`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-transform-06740**
  `transform` **must** be one of the bits present in the `supportedTransforms` member of `VkDisplayPropertiesKHR` for the display corresponding to `displayMode`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-width-01256**
  The `width` and `height` members of `imageExtent` **must** be less than or equal to `VkPhysicalDeviceLimits::maxImageDimension2D`.

## Valid Usage (Implicit)

- **VUID-VkDisplaySurfaceCreateInfoKHR-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-pNext-pNext**
  `pNext` **must** be `NULL`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-flags-zerobitmask**
  2181
flags must be 0

- VUID-VkDisplaySurfaceCreateInfoKHR-displayMode-parameter
displayMode must be a valid VkDisplayModeKHR handle
- VUID-VkDisplaySurfaceCreateInfoKHR-transform-parameter
transform must be a valid VkSurfaceTransformFlagBitsKHR value
- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-parameter
alphaMode must be a valid VkDisplayPlaneAlphaFlagBitsKHR value

// Provided by VK_KHR_display
typedef VkFlags VkDisplaySurfaceCreateFlagsKHR;

VkDisplaySurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

Bits which can be set in VkDisplaySurfaceCreateInfoKHR::alphaMode, specifying the type of alpha blending to use on a display, are:

// Provided by VK_KHR_display
typedef enum VkDisplayPlaneAlphaFlagBitsKHR {
    VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR = 0x00000002,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR = 0x00000004,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR = 0x00000008,
} VkDisplayPlaneAlphaFlagBitsKHR;

- VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR specifies that the source image will be treated as opaque.
- VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR specifies that a global alpha value must be specified that will be applied to all pixels in the source image.
- VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR specifies that the alpha value will be determined by the alpha component of the source image's pixels. If the source format contains no alpha values, no blending will be applied. The source alpha values are not premultiplied into the source image's other color components.
- VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR is equivalent to VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR, except the source alpha values are assumed to be premultiplied into the source image's other color components.

// Provided by VK_KHR_display
typedef VkFlags VkDisplayPlaneAlphaFlagsKHR;

VkDisplayPlaneAlphaFlagsKHR is a bitmask type for setting a mask of zero or more VkDisplayPlaneAlphaFlagBitsKHR.
### 33.3.4. Presenting to headless surfaces

Vulkan rendering can be presented to a headless surface, where the presentation operation is a no-op producing no externally-visible result.

**Note**

Because there is no real presentation target, the headless presentation engine may be extended to impose an arbitrary or customisable set of restrictions and features. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

The usual surface query mechanisms must be used to determine the actual restrictions and features of the implementation.

To create a headless `VkSurfaceKHR` object, call:

```c
// Provided by VK_EXT_headless_surface
VkResult vkCreateHeadlessSurfaceEXT(
    VkInstance instance,
    const VkHeadlessSurfaceCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkHeadlessSurfaceCreateInfoEXT` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

#### Valid Usage (Implicit)

- `VUID-vkCreateHeadlessSurfaceEXT-instance-parameter`
  - `instance` must be a valid `VkInstance` handle
- `VUID-vkCreateHeadlessSurfaceEXT-pCreateInfo-parameter`
  - `pCreateInfo` must be a valid pointer to a valid `VkHeadlessSurfaceCreateInfoEXT` structure
- `VUID-vkCreateHeadlessSurfaceEXT-pAllocator-parameter`
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- `VUID-vkCreateHeadlessSurfaceEXT-pSurface-parameter`
  - `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle
Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkHeadlessSurfaceCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_headless_surface
typedef struct VkHeadlessSurfaceCreateInfoEXT {
  VkStructureType sType;
  const void* pNext;
  VkHeadlessSurfaceCreateFlagsEXT flags;
} VkHeadlessSurfaceCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

**Valid Usage (Implicit)**

- **VUID-VkHeadlessSurfaceCreateInfoEXT-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_HEADLESS_SURFACE_CREATE_INFO_EXT`

- **VUID-VkHeadlessSurfaceCreateInfoEXT-pNext-pNext**
  `pNext` **must** be `NULL`

- **VUID-VkHeadlessSurfaceCreateInfoEXT-flags-zerobitmask**
  `flags` **must** be `0`

For headless surfaces, `currentExtent` is the reserved value (0xFFFFFFFF, 0xFFFFFFFF). Whatever the application sets a swapchain's `imageExtent` to will be the size of the surface, after the first image is presented.

```c
// Provided by VK_EXT_headless_surface
typedef VkFlags VkHeadlessSurfaceCreateFlagsEXT;
```

`VkHeadlessSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.
33.4. Querying for WSI Support

Not all physical devices will include WSI support. Within a physical device, not all queue families will support presentation. WSI support and compatibility can be determined in a platform-neutral manner (which determines support for presentation to a particular surface object) and additionally may be determined in platform-specific manners (which determine support for presentation on the specified physical device but do not guarantee support for presentation to a particular surface object).

To determine whether a queue family of a physical device supports presentation to a given surface, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    VkSurfaceKHR surface,
    VkBool32* pSupported);
```

- **physicalDevice** is the physical device.
- **queueFamilyIndex** is the queue family.
- **surface** is the surface.
- **pSupported** is a pointer to a `VkBool32`, which is set to `VK_TRUE` to indicate support, and `VK_FALSE` otherwise.

### Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-queueFamilyIndex-01269
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-physicalDevice-parameter
  physicalDevice must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-surface-parameter
  surface must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-pSupported-parameter
  pSupported must be a valid pointer to a `VkBool32` value

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-commonparent
  Both of physicalDevice, and surface must have been created, allocated, or retrieved from the same `VkInstance`
### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

### 33.4.1. Android Platform

On Android, all physical devices and queue families **must** be capable of presentation with any native window. As a result there is no Android-specific query for these capabilities.

### 33.4.2. Wayland Platform

To determine whether a queue family of a physical device supports presentation to a Wayland compositor, call:

```c
// Provided by VK_KHR_wayland_surface

VkBool32 vkGetPhysicalDeviceWaylandPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    struct wl_display* display);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `display` is a pointer to the `wl_display` associated with a Wayland compositor.

This platform-specific function **can** be called prior to creating a surface.

### Valid Usage

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-queueFamilyIndex-01306
  - `queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-physicalDevice-parameter
  - `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-display-parameter
33.4.3. Win32 Platform

To determine whether a queue family of a physical device supports presentation to the Microsoft Windows desktop, call:

```c
// Provided by VK_KHR_win32_surface
VkBool32 vkGetPhysicalDeviceWin32PresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-queueFamilyIndex-01309
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by
  vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

33.4.4. XCB Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the XCB client-side library, call:

```c
// Provided by VK_KHR_xcb_surface
VkBool32 vkGetPhysicalDeviceXcbPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    xcb_connection_t* connection,
    xcb_visualid_t visual_id);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `connection` is a pointer to an xcb_connection_t to the X server.
• visual_id is an X11 visual (xcb_visualid_t).

This platform-specific function can be called prior to creating a surface.

Valid Usage

• VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-queueFamilyIndex-01312 queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
• VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-connection-parameter connection must be a valid pointer to an xcb_connection_t value

33.4.5. Xlib Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the Xlib client-side library, call:

```c
// Provided by VK_KHR_xlib_surface
VkBool32 vkGetPhysicalDeviceXlibPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    Display* dpy,
    VisualID visualId);
```

• physicalDevice is the physical device.
• queueFamilyIndex is the queue family index.
• dpy is a pointer to an Xlib Display connection to the server.
• visualId is an X11 visual (VisualID).

This platform-specific function can be called prior to creating a surface.

Valid Usage

• VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-queueFamilyIndex-01315 queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-dpy-parameter
  dpy must be a valid pointer to a Display value

33.4.6. DirectFB Platform

To determine whether a queue family of a physical device supports presentation with DirectFB library, call:

```c
// Provided by VK_EXT_directfb_surface
VkBool32 vkGetPhysicalDeviceDirectFBPresentationSupportEXT(?
    VkPhysicalDevice physicalDevice, ?
    uint32_t queueFamilyIndex, ?
    IDirectFB* dfb);
```

- physicalDevice is the physical device.
- queueFamilyIndex is the queue family index.
- dfb is a pointer to the IDirectFB main interface of DirectFB.

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-queueFamilyIndex-04119
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by
  vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-dfb-parameter
  dfb must be a valid pointer to an IDirectFB value

33.4.7. Fuchsia Platform

On Fuchsia, all physical devices and queue families must be capable of presentation with any ImagePipe. As a result there is no Fuchsia-specific query for these capabilities.
33.4.8. Google Games Platform

On Google Games Platform, all physical devices and queue families with the `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT` capabilities must be capable of presentation with any Google Games Platform stream descriptor. As a result, there is no query specific to Google Games Platform for these capabilities.

33.4.9. iOS Platform

On iOS, all physical devices and queue families must be capable of presentation with any layer. As a result there is no iOS-specific query for these capabilities.

33.4.10. macOS Platform

On macOS, all physical devices and queue families must be capable of presentation with any layer. As a result there is no macOS-specific query for these capabilities.

33.4.11. VI Platform

On VI, all physical devices and queue families must be capable of presentation with any layer. As a result there is no VI-specific query for these capabilities.

33.4.12. QNX Screen Platform

To determine whether a queue family of a physical device supports presentation to a QNX Screen compositor, call:

```c
// Provided by VK_QNX_screen_surface
def vkGetPhysicalDeviceScreenPresentationSupportQNX(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    struct _screen_window* window);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `window` is the QNX Screen window object.

This platform-specific function can be called prior to creating a surface.

**Valid Usage**

- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-queueFamilyIndex-04743 queueFamilyIndex must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`. 
33.5. Surface Queries

The capabilities of a swapchain targeting a surface are the intersection of the capabilities of the WSI platform, the native window or display, and the physical device. The resulting capabilities can be obtained with the queries listed below in this section.

Note
In addition to the surface capabilities as obtained by surface queries below, swapchain images are also subject to ordinary image creation limits as reported by `vkGetPhysicalDeviceImageFormatProperties`. As an application is instructed by the appropriate Valid Usage sections, both the surface capabilities and the image creation limits have to be satisfied whenever swapchain images are created.

33.5.1. Surface Capabilities

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```cpp
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    VkSurfaceCapabilitiesKHR* pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilitiesKHR` structure in which the capabilities are returned.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06523
  `surface` must be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06211
  `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism
## Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-parameter**
  - `surface` must be a valid `VkSurfaceKHR` handle

- **VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-pSurfaceCapabilities-parameter**
  - `pSurfaceCapabilities` must be a valid pointer to a `VkSurfaceCapabilitiesKHR` structure

- **VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-commonparent**
  - Both of `physicalDevice`, and `surface` must have been created, allocated, or retrieved from the same `VkInstance`

## Return Codes

### Success
- **VK_SUCCESS**

### Failure
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_SURFACE_LOST_KHR**

The `VkSurfaceCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_surface
typedef struct VkSurfaceCapabilitiesKHR {
    uint32_t minImageCount;
    uint32_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
} VkSurfaceCapabilitiesKHR;
```

- **minImageCount** is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.

- **maxImageCount** is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to `minImageCount`. A value of 0 means that there is no limit on the number of images, though there may be limits related to...
the total amount of memory used by presentable images.

- \textit{currentExtent} is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

- \textit{minImageExtent} contains the smallest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be less than or equal to the corresponding width and height of \textit{currentExtent}, unless \textit{currentExtent} has the special value described above.

- \textit{maxImageExtent} contains the largest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be greater than or equal to the corresponding width and height of \textit{minImageExtent}. The width and height of the extent will each be greater than or equal to the corresponding width and height of \textit{currentExtent}, unless \textit{currentExtent} has the special value described above.

- \textit{maxImageArrayLayers} is the maximum number of layers presentable images can have for a swapchain created for this device and surface, and will be at least one.

- \textit{supportedTransforms} is a bitmask of \textit{VkSurfaceTransformFlagBitsKHR} indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.

- \textit{currentTransform} is \textit{VkSurfaceTransformFlagBitsKHR} value indicating the surface's current transform relative to the presentation engine's natural orientation.

- \textit{supportedCompositeAlpha} is a bitmask of \textit{VkCompositeAlphaFlagBitsKHR}, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition can be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

- \textit{supportedUsageFlags} is a bitmask of \textit{VkImageUsageFlagBits} representing the ways the application can use the presentable images of a swapchain created with \textit{VkPresentModeKHR} set to \texttt{VK_PRESENT_MODE_IMMEDIATE_KHR}, \texttt{VK_PRESENT_MODE_MAILBOX_KHR}, \texttt{VK_PRESENT_MODE_FIFO_KHR} or \texttt{VK_PRESENT_MODE_FIFO_RELAXED_KHR} for the surface on the specified device. \texttt{VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT} must be included in the set. Implementations may support additional usages.

\begin{itemize}
  \item \textbf{Note} Supported usage flags of a presentable image when using \texttt{VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR} or \texttt{VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR} presentation mode are provided by \textit{VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags}.
  \item \textbf{Note} Formulas such as \texttt{min(N, maxImageCount)} are not correct, since \texttt{maxImageCount} may be zero.
\end{itemize}

To query the basic capabilities of a surface defined by the core or extensions, call:
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkSurfaceCapabilities2KHR* pSurfaceCapabilities);

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilities2KHR` structure in which the capabilities are returned.

`vkGetPhysicalDeviceSurfaceCapabilities2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

### Valid Usage

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06520**
  `pSurfaceInfo->surface` must be a valid `VkSurfaceKHR` handle

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06210**
  `pSurfaceInfo->surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-02671**
  If a `VkSurfaceCapabilitiesFullScreenExclusiveEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure must be included in the `pNext` chain of `pSurfaceInfo`

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-physicalDevice-parameter**
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-parameter**
  `pSurfaceInfo` must be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceCapabilities-parameter**
  `pSurfaceCapabilities` must be a valid pointer to a `VkSurfaceCapabilities2KHR` structure
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_SURFACE_LOST_KHR

The `VkPhysicalDeviceSurfaceInfo2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkPhysicalDeviceSurfaceInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceKHR surface;
} VkPhysicalDeviceSurfaceInfo2KHR;
```

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `surface` is the surface that will be associated with the swapchain.

The members of `VkPhysicalDeviceSurfaceInfo2KHR` correspond to the arguments to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with `sType` and `pNext` added for extensibility.

Additional capabilities of a surface **may** be available to swapchains created with different full-screen exclusive settings - particularly if exclusive full-screen access is application controlled. These additional capabilities **can** be queried by adding a `VkSurfaceFullScreenExclusiveInfoEXT` structure to the `pNext` chain of this structure when used to query surface properties. Additionally, for Win32 surfaces with application controlled exclusive full-screen access, chaining a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure **may** also report additional surface capabilities. These additional capabilities only apply to swapchains created with the same parameters included in the `pNext` chain of `VkSwapchainCreateInfoKHR`.

Valid Usage

• VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-02672
  If the `pNext` chain includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure with its `fullScreenExclusive` member set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, and `surface` was created using `vkCreateWin32SurfaceKHR`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure **must** be included in the `pNext` chain

• VUID-VkPhysicalDeviceSurfaceInfo2KHR-pSurfaceInfo-0652

When passed as the `pSurfaceInfo` parameter of `vkGetPhysicalDeviceSurfaceCapabilities2KHR`, if the `VK_GOOGLE_surfaceless_query` extension is enabled and the `pNext` chain of the `pSurfaceCapabilities` parameter includes `VkSurfaceProtectedCapabilitiesKHR`, then `surface` can be `VK_NULL_HANDLE`. Otherwise, `surface` must be a valid `VkSurfaceKHR` handle.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-pSurfaceInfo-06527**
  When passed as the `pSurfaceInfo` parameter of `vkGetPhysicalDeviceSurfaceFormats2KHR`, if the `VK_GOOGLE_surfaceless_query` extension is enabled, then `surface` can be `VK_NULL_HANDLE`. Otherwise, `surface` must be a valid `VkSurfaceKHR` handle.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-pSurfaceInfo-06528**
  When passed as the `pSurfaceInfo` parameter of `vkGetPhysicalDeviceSurfacePresentModes2EXT`, if the `VK_GOOGLE_surfaceless_query` extension is enabled, then `surface` can be `VK_NULL_HANDLE`. Otherwise, `surface` must be a valid `VkSurfaceKHR` handle.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-sType**
  The `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR`.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkSurfaceFullScreenExclusiveInfoEXT` or `VkSurfaceFullScreenExclusiveWin32InfoEXT`.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-parameter**
  If `surface` is not `VK_NULL_HANDLE`, `surface` must be a valid `VkSurfaceKHR` handle.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure, then that structure specifies the application’s preferred full-screen transition behavior.

The `VkSurfaceFullScreenExclusiveInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_full_screen-exclusive
typedef struct VkSurfaceFullScreenExclusiveInfoEXT {
    VkStructureType          sType;
    void*                    pNext;
    VkFullScreenExclusiveEXT fullScreenExclusive;
} VkSurfaceFullScreenExclusiveInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **fullScreenExclusive** is a ` VkFullScreenExclusiveEXT` value specifying the preferred full-screen
transition behavior.

If this structure is not present, `fullscreenExclusive` is considered to be `VK_FULLSCREEN_EXCLUSIVE_DEFAULT_EXT`.

### Valid Usage (Implicit)

- **VUID-VkSurfaceFullScreenExclusiveInfoEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_INFO_EXT`

- **VUID-VkSurfaceFullScreenExclusiveInfoEXT-fullScreenExclusive-parameter**
  - `fullscreenExclusive` must be a valid `VkFullScreenExclusiveEXT` value

Possible values of `VkSurfaceFullScreenExclusiveInfoEXT::fullscreenExclusive` are:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef enum VkFullScreenExclusiveEXT {
    VK_FULLSCREEN_EXCLUSIVE_DEFAULT_EXT = 0,
    VK_FULLSCREEN_EXCLUSIVE_ALLOWED_EXT = 1,
    VK_FULLSCREEN_EXCLUSIVE_DISALLOWED_EXT = 2,
    VK_FULLSCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT = 3,
} VkFullScreenExclusiveEXT;
```

- **VK_FULLSCREEN_EXCLUSIVE_DEFAULT_EXT** indicates the implementation should determine the appropriate full-screen method by whatever means it deems appropriate.
- **VK_FULLSCREEN_EXCLUSIVE_ALLOWED_EXT** indicates the implementation may use full-screen exclusive mechanisms when available. Such mechanisms may result in better performance and/or the availability of different presentation capabilities, but may require a more disruptive transition during swapchain initialization, first presentation and/or destruction.
- **VK_FULLSCREEN_EXCLUSIVE_DISALLOWED_EXT** indicates the implementation should avoid using full-screen mechanisms which rely on disruptive transitions.
- **VK_FULLSCREEN_EXCLUSIVEAPPLICATION_CONTROLLED_EXT** indicates the application will manage full-screen exclusive mode by using the `vkAcquireFullScreenExclusiveModeEXT` and `vkReleaseFullScreenExclusiveModeEXT` commands.

The `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure is defined as:

```c
// Provided by VK_KHR_win32_surface with VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveWin32InfoEXT {
    VkStructureType sType;
    const void* pNext;
    HMONITOR hmonitor;
} VkSurfaceFullScreenExclusiveWin32InfoEXT;
```

- `sType` is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• hmonitor is the Win32 HMONITOR handle identifying the display to create the surface with.

**Note**
If hmonitor is invalidated (e.g. the monitor is unplugged) during the lifetime of a swapchain created with this structure, operations on that swapchain will return VK_ERROR_OUT_OF_DATE_KHR.

**Note**
It is the responsibility of the application to change the display settings of the targeted Win32 display using the appropriate platform APIs. Such changes may alter the surface capabilities reported for the created surface.

### Valid Usage

• VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-hmonitor-02673

  hmonitor must be a valid HMONITOR

### Valid Usage (Implicit)

• VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-sType-sType

  sType must be VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_WIN32_INFO_EXT

The VkSurfaceCapabilities2KHR structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceCapabilities2KHR {
    VkStructureType          sType;
    void*                    pNext;
    VkSurfaceCapabilitiesKHR surfaceCapabilities;
} VkSurfaceCapabilities2KHR;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• surfaceCapabilities is a VkSurfaceCapabilitiesKHR structure describing the capabilities of the specified surface.

If the VK_GOOGLE_surfaceless_query extension is enabled and VkPhysicalDeviceSurfaceInfo2KHR::surface in the vkGetPhysicalDeviceSurfaceCapabilities2KHR call is VK_NULL_HANDLE, the values returned in minImageCount, maxImageCount, currentExtent, and currentTransform will not reflect that of any surface and will instead be as such:

• minImageCount and maxImageCount will be 0xFFFFFFFF
• `currentExtent` will be (0xFFFFFFFF, 0xFFFFFFFF)
• `currentTransform` will be `VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR`

### Valid Usage (Implicit)

- **VUID-VkSurfaceCapabilities2KHR-sType-sType**
  
  **sType** must be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR`

- **VUID-VkSurfaceCapabilities2KHR-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDisplayNativeHdrSurfaceCapabilitiesAMD`, `VkSharedPresentSurfaceCapabilitiesKHR`, `VkSurfaceCapabilitiesFullScreenExclusiveEXT`, `VkSurfaceCapabilitiesPresentBarrierNV`, or `VkSurfaceProtectedCapabilitiesKHR`

- **VUID-VkSurfaceCapabilities2KHR-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique

An application queries if a protected `VkSurfaceKHR` is displayable on a specific windowing system using `VkSurfaceProtectedCapabilitiesKHR`, which can be passed in `pNext` parameter of `VkSurfaceCapabilities2KHR`.

The `VkSurfaceProtectedCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_surface_protected_capabilities
typedef struct VkSurfaceProtectedCapabilitiesKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 supportsProtected;
} VkSurfaceProtectedCapabilitiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supportsProtected` specifies whether a protected swapchain created from `VkPhysicalDeviceSurfaceInfo2KHR::surface` for a particular windowing system can be displayed on screen or not. If `supportsProtected` is `VK_TRUE`, then creation of swapchains with the `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR` flag set must be supported for `surface`.

If the `VK_GOOGLE_surfaceless_query` extension is enabled, the value returned in `supportsProtected` will be identical for every valid surface created on this physical device, and so in the `vkGetPhysicalDeviceSurfaceCapabilities2KHR` call, `VkPhysicalDeviceSurfaceInfo2KHR::surface` can be `VK_NULL_HANDLE`. In that case, the contents of `VkSurfaceCapabilities2KHR::surfaceCapabilities` as well as any other struct chained to it will be undefined.

### Valid Usage (Implicit)

- **VUID-VkSurfaceProtectedCapabilitiesKHR-sType-sType**
The `VkSharedPresentSurfaceCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_shared_presentable_image
typedef struct VkSharedPresentSurfaceCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkImageUsageFlags sharedPresentSupportedUsageFlags;
} VkSharedPresentSurfaceCapabilitiesKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **sharedPresentSupportedUsageFlags** is a bitmask of `VkImageUsageFlagBits` representing the ways the application can use the shared presentable image from a swapchain created with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` for the surface on the specified device. `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` must be included in the set but implementations may support additional usages.

### Valid Usage (Implicit)

- VUID-VkSharedPresentSurfaceCapabilitiesKHR-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR`

The `VkDisplayNativeHdrSurfaceCapabilitiesAMD` structure is defined as:

```c
// Provided by VK_AMD_display_native_hdr
typedef struct VkDisplayNativeHdrSurfaceCapabilitiesAMD {
    VkStructureType sType;
    void* pNext;
    VkBool32 localDimmingSupport;
} VkDisplayNativeHdrSurfaceCapabilitiesAMD;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **localDimmingSupport** specifies whether the surface supports local dimming. If this is `VK_TRUE`, `VkSwapchainDisplayNativeHdrCreateInfoAMD` can be used to explicitly enable or disable local dimming for the surface. Local dimming may also be overridden by `vkSetLocalDimmingAMD` during the lifetime of the swapchain.
Valid Usage (Implicit)

- VUID-VkDisplayNativeHdrSurfaceCapabilitiesAMD-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_NATIVE_HDR_SURFACE_CAPABILITIES_AMD

The VkSurfaceCapabilitiesFullScreenExclusiveEXT structure is defined as:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceCapabilitiesFullScreenExclusiveEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 fullScreenExclusiveSupported;
} VkSurfaceCapabilitiesFullScreenExclusiveEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- fullScreenExclusiveControlSupported is a boolean describing whether the surface is able to make use of exclusive full-screen access.

This structure can be included in the pNext chain of VkSurfaceCapabilities2KHR to determine support for exclusive full-screen access. If fullScreenExclusiveSupported is VK_FALSE, it indicates that exclusive full-screen access is not obtainable for this surface.

Applications must not attempt to create swapchains with VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT set if fullScreenExclusiveSupported is VK_FALSE.

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilitiesFullScreenExclusiveEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_FULL_SCREEN_EXCLUSIVE_EXT

The VkSurfaceCapabilitiesPresentBarrierNV structure is defined as:

```c
// Provided by VK_NV_present_barrier
typedef struct VkSurfaceCapabilitiesPresentBarrierNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 presentBarrierSupported;
} VkSurfaceCapabilitiesPresentBarrierNV;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- presentBarrierSupported is a boolean describing whether the surface is able to make use of the
present barrier feature.

This structure can be included in the pNext chain of VkSurfaceCapabilities2KHR to determine support for present barrier access. If presentBarrierSupported is VK_FALSE, it indicates that the present barrier feature is not obtainable for this surface.

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilitiesPresentBarrierNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_PRESENT_BARRIER_NV

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_EXT_display_surface_counter
VkResult vkGetPhysicalDeviceSurfaceCapabilities2EXT(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    VkSurfaceCapabilities2EXT* pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceCapabilities` is a pointer to a VkSurfaceCapabilities2EXT structure in which the capabilities are returned.

vkGetPhysicalDeviceSurfaceCapabilities2EXT behaves similarly to vkGetPhysicalDeviceSurfaceCapabilitiesKHR, with the ability to return extended information by adding extending structures to the pNext chain of its pSurfaceCapabilities parameter.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-surface-06523
  surface must be a valid VkSurfaceKHR handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-surface-06211
  surface must be supported by physicalDevice, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-parameter
  surface must be a valid VkSurfaceKHR handle
VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-pSurfaceCapabilities-parameter

**pSurfaceCapabilities must** be a valid pointer to a `VkSurfaceCapabilities2EXT` structure.

VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-commonparent

Both of `physicalDevice`, and `surface` **must** have been created, allocated, or retrieved from the same `VkInstance`.

## Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkSurfaceCapabilities2EXT` structure is defined as:

```c
// Provided by VK_EXT_display_surface_counter
typedef struct VkSurfaceCapabilities2EXT {
    VkStructureType          sType;
    void*                    pNext;
    uint32_t                 minImageCount;
    uint32_t                 maxImageCount;
    VkExtent2D               currentExtent;
    VkExtent2D               minImageExtent;
    VkExtent2D               maxImageExtent;
    uint32_t                 maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags        supportedUsageFlags;
    VkSurfaceCounterFlagsEXT supportedSurfaceCounters;
} VkSurfaceCapabilities2EXT;
```

- `sType` is the type of this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `minImageCount` is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.

- `maxImageCount` is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to `minImageCount`. A value of 0 means that there is no limit on the number of images, though there **may** be limits related to the total amount of memory used by presentable images.

- `currentExtent` is the current width and height of the surface, or the special value (0xFFFFFFFF,
indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

- **minImageExtent** contains the smallest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be less than or equal to the corresponding width and height of **currentExtent**, unless **currentExtent** has the special value described above.

- **maxImageExtent** contains the largest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be greater than or equal to the corresponding width and height of **minImageExtent**. The width and height of the extent will each be greater than or equal to the corresponding width and height of **currentExtent**, unless **currentExtent** has the special value described above.

- **maxImageArrayLayers** is the maximum number of layers presentable images can have for a swapchain created for this device and surface, and will be at least one.

- **supportedTransforms** is a bitmask of **VkSurfaceTransformFlagBitsKHR** indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.

- **currentTransform** is **VkSurfaceTransformFlagBitsKHR** value indicating the surface's current transform relative to the presentation engine's natural orientation.

- **supportedCompositeAlpha** is a bitmask of **VkCompositeAlphaFlagBitsKHR**, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition can be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

- **supportedUsageFlags** is a bitmask of **VkImageUsageFlagBits** representing the ways the application can use the presentable images of a swapchain created with **VkPresentModeKHR** set to **VK_PRESENT_MODE_IMMEDIATE_KHR**, **VK_PRESENT_MODE_MAILBOX_KHR**, **VK_PRESENT_MODE_FIFO_KHR** or **VK_PRESENT_MODE_FIFO_RELAXED_KHR** for the surface on the specified device. **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** must be included in the set. Implementations may support additional usages.

- **supportedSurfaceCounters** is a bitmask of **VkSurfaceCounterFlagBitsEXT** indicating the supported surface counter types.

### Valid Usage

- VUID-VkSurfaceCapabilities2EXT-supportedSurfaceCounters-01246

  **supportedSurfaceCounters** must not include **VK_SURFACE_COUNTER_VBLANK_BIT_EXT** unless the surface queried is a **display surface**

### Valid Usage (Implicit)

- VUID-VkSurfaceCapabilities2EXT-sType-sType

  **sType** must be **VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_EXT**

- VUID-VkSurfaceCapabilities2EXT-pNext-pNext

  **pNext** must be NULL
Bits which can be set in `VkSurfaceCapabilities2EXT::supportedSurfaceCounters`, indicating supported surface counter types, are:

```c
// Provided by VK_EXT_display_surface_counter
typedef enum VkSurfaceCounterFlagBitsEXT {
    VK_SURFACE_COUNTER_VBLANK_BIT_EXT = 0x00000001,
    VK_SURFACE_COUNTER_VBLANK_EXT = VK_SURFACE_COUNTER_VBLANK_BIT_EXT,
} VkSurfaceCounterFlagBitsEXT;
```

- `VK_SURFACE_COUNTER_VBLANK_BIT_EXT` specifies a counter incrementing once every time a vertical blanking period occurs on the display associated with the surface.

```c
// Provided by VK_EXT_display_surface_counter
typedef VkFlags VkSurfaceCounterFlagsEXT;
```

`VkSurfaceCounterFlagsEXT` is a bitmask type for setting a mask of zero or more `VkSurfaceCounterFlagBitsEXT`.

Bits which may be set in `VkSurfaceCapabilitiesKHR::supportedTransforms` indicating the presentation transforms supported for the surface on the specified device, and possible values of `VkSurfaceCapabilitiesKHR::currentTransform` indicating the surface's current transform relative to the presentation engine's natural orientation, are:

```c
// Provided by VK_KHR_surface
typedef enum VkSurfaceTransformFlagBitsKHR {
    VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR = 0x00000001,
    VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR = 0x00000002,
    VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR = 0x00000004,
    VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR = 0x00000008,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR = 0x00000010,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR = 0x00000020,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR = 0x00000040,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR = 0x00000080,
    VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR = 0x00000100,
} VkSurfaceTransformFlagBitsKHR;
```

- `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR` specifies that image content is presented without being transformed.
- `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR` specifies that image content is rotated 90 degrees clockwise.
- `VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR` specifies that image content is rotated 180 degrees clockwise.
- `VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR` specifies that image content is rotated 270 degrees clockwise.
- `VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR` specifies that image content is mirrored horizontally.
- `VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR` specifies that image content is mirrored horizontally and rotated 90 degrees clockwise.
- `VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR` specifies that image content is mirrored horizontally and rotated 180 degrees clockwise.
- `VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR` specifies that image content is mirrored horizontally and rotated 270 degrees clockwise.
- `VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR` specifies that image content is presented in the natural orientation of the display.
horizontally.

- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 90 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 180 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 270 degrees clockwise.
- **VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR** specifies that the presentation transform is not specified, and is instead determined by platform-specific considerations and mechanisms outside Vulkan.

```cpp
// Provided by VK_KHR_display
typedef VkFlags VkSurfaceTransformFlagsKHR;
```

**VkSurfaceTransformFlagsKHR** is a bitmask type for setting a mask of zero or more **VkSurfaceTransformFlagBitsKHR**.

The **supportedCompositeAlpha** member is of type **VkCompositeAlphaFlagBitsKHR**, containing the following values:

```cpp
// Provided by VK_KHR_surface
typedef enum VkCompositeAlphaFlagBitsKHR {
    VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR = 0x00000002,
    VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR = 0x00000004,
    VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR = 0x00000008,
} VkCompositeAlphaFlagBitsKHR;
```

These values are described as follows:

- **VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR**: The alpha component, if it exists, of the images is ignored in the compositing process. Instead, the image is treated as if it has a constant alpha of 1.0.
- **VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR**: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are expected to already be multiplied by the alpha component by the application.
- **VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR**: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are not expected to already be multiplied by the alpha component by the application; instead, the compositor will multiply the non-alpha components of the image by the alpha component during compositing.
- **VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR**: The way in which the presentation engine treats the alpha component in the images is unknown to the Vulkan API. Instead, the application is responsible for setting the composite alpha blending mode using native window system commands. If the application does not set the blending mode using native window system commands, then a platform-specific default will be used.
typedef VkFlags VkCompositeAlphaFlagsKHR;

VkCompositeAlphaFlagsKHR is a bitmask type for setting a mask of zero or more VkCompositeAlphaFlagBitsKHR.

### 33.5.2. Surface Format Support

To query the supported swapchain format-color space pairs for a surface, call:

```c
VkResult vkGetPhysicalDeviceSurfaceFormatsKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pSurfaceFormatCount,
    VkSurfaceFormatKHR* pSurfaceFormats);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceFormatCount` is a pointer to an integer related to the number of format pairs available or queried, as described below.
- `pSurfaceFormats` is either `NULL` or a pointer to an array of `VkSurfaceFormatKHR` structures.

If `pSurfaceFormats` is `NULL`, then the number of format pairs supported for the given `surface` is returned in `pSurfaceFormatCount`. Otherwise, `pSurfaceFormatCount` must point to a variable set by the user to the number of elements in the `pSurfaceFormats` array, and on return the variable is overwritten with the number of structures actually written to `pSurfaceFormats`. If the value of `pSurfaceFormatCount` is less than the number of format pairs supported, at most `pSurfaceFormatCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available format pairs were returned.

The number of format pairs supported must be greater than or equal to 1. `pSurfaceFormats` must not contain an entry whose value for `format` is `VK_FORMAT_UNDEFINED`.

If `pSurfaceFormats` includes an entry whose value for `colorSpace` is `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR` and whose value for `format` is a UNORM (or SRGB) format and the corresponding SRGB (or UNORM) format is a color renderable format for `VK_IMAGE_TILING_OPTIMAL`, then `pSurfaceFormats` must also contain an entry with the same value for `colorSpace` and `format` equal to the corresponding SRGB (or UNORM) format.

If the `VK_GOOGLE_surfaceless_query` extension is enabled, the values returned in `pSurfaceFormats` will be identical for every valid surface created on this physical device, and so `surface` can be `VK_NULL_HANDLE`. 
Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06524
  If the VK_GOOGLE_surfaceless_query extension is not enabled, surface must be a valid VkSurfaceKHR handle

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06525
  If surface is not VK_NULL_HANDLE, it must be supported by physicalDevice, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-parameter
  If surface is not VK_NULL_HANDLE, surface must be a valid VkSurfaceKHR handle

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormatCount-parameter
  pSurfaceFormatCount must be a valid pointer to a uint32_t value

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormats-parameter
  If the value referenced by pSurfaceFormatCount is not 0, and pSurfaceFormats is not NULL, pSurfaceFormats must be a valid pointer to an array of pSurfaceFormatCount VkSurfaceFormatKHR structures

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-commonparent
  Both of physicalDevice, and surface that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceFormatKHR structure is defined as:

```
// Provided by VK_KHR_surface
typedef struct VkSurfaceFormatKHR {
```
• **format** is a `VkFormat` that is compatible with the specified surface.

• **colorSpace** is a presentation `VkColorSpaceKHR` that is compatible with the surface.

To query the supported swapchain format tuples for a surface, call:

```c
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceFormats2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    uint32_t* pSurfaceFormatCount,
    VkSurfaceFormat2KHR* pSurfaceFormats);
```

• **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.

• **pSurfaceInfo** is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.

• **pSurfaceFormatCount** is a pointer to an integer related to the number of format tuples available or queried, as described below.

• **pSurfaceFormats** is either `NULL` or a pointer to an array of `VkSurfaceFormat2KHR` structures.

`vkGetPhysicalDeviceSurfaceFormats2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceFormatsKHR`, with the ability to be extended via `pNext` chains.

If **pSurfaceFormats** is `NULL`, then the number of format tuples supported for the given surface is returned in **pSurfaceFormatCount**. Otherwise, **pSurfaceFormatCount** must point to a variable set by the user to the number of elements in the **pSurfaceFormats** array, and on return the variable is overwritten with the number of structures actually written to **pSurfaceFormats**. If the value of **pSurfaceFormatCount** is less than the number of format tuples supported, at most **pSurfaceFormatCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available values were returned.

### Valid Usage

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06521**
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, **pSurfaceInfo->surface** must be a valid `VkSurfaceKHR` handle

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06522**
  If **pSurfaceInfo->surface** is not `VK_NULL_HANDLE`, it must be supported by **physicalDevice**, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism
**Valid Usage (Implicit)**

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-physicalDevice-parameter**
  *physicalDevice* must be a valid *VkPhysicalDevice* handle

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-parameter**
  *pSurfaceInfo* must be a valid pointer to a valid *VkPhysicalDeviceSurfaceInfo2KHR* structure

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormatCount-parameter**
  *pSurfaceFormatCount* must be a valid pointer to a *uint32_t* value

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormats-parameter**
  If the value referenced by *pSurfaceFormatCount* is not 0, and *pSurfaceFormats* is not NULL, *pSurfaceFormats* must be a valid pointer to an array of *pSurfaceFormatCount* *VkSurfaceFormat2KHR* structures

**Return Codes**

**Success**
- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_SURFACE_LOST_KHR**

The *VkSurfaceFormat2KHR* structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceFormat2KHR {
    VkStructureType   sType;
    void*             pNext;
    VkSurfaceFormatKHR surfaceFormat;
} VkSurfaceFormat2KHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **surfaceFormat** is a *VkSurfaceFormatKHR* structure describing a format-color space pair that is compatible with the specified surface.

**Valid Usage**

- **VUID-VkSurfaceFormat2KHR-pNext-06750**
If the `imageCompressionControlSwapchain` feature is not enabled, the `pNext` chain must not include an `VkImageCompressionPropertiesEXT` structure.

**Valid Usage (Implicit)**

- **VUID-VkSurfaceFormat2KHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR`
- **VUID-VkSurfaceFormat2KHR-pNext-pNext**
  - `pNext` must be `NULL` or a pointer to a valid instance of `VkImageCompressionPropertiesEXT`
- **VUID-VkSurfaceFormat2KHR-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique

If the `imageCompressionControlSwapchain` feature is supported and a `VkImageCompressionPropertiesEXT` structure is included in the `pNext` chain of this structure, then it will be filled with the compression properties that are supported for the `surfaceFormat`.

While the `format` of a presentable image refers to the encoding of each pixel, the `colorSpace` determines how the presentation engine interprets the pixel values. A color space in this document refers to a specific color space (defined by the chromaticities of its primaries and a white point in CIE Lab), and a transfer function that is applied before storing or transmitting color data in the given color space.

Possible values of `VkSurfaceFormatKHR::colorSpace`, specifying supported color spaces of a presentation engine, are:

```c
// Provided by VK_KHR_surface
typedef enum VkColorSpaceKHR {
    VK_COLOR_SPACE_SRGB_NONLINEAR_KHR = 0,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT = 1000104001,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT = 1000104002,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT = 1000104003,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT = 1000104004,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_LINEAR_EXT = 1000104005,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_NONLINEAR_EXT = 1000104006,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT2020_LINEAR_EXT = 1000104007,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_HDR10_ST2084_EXT = 1000104008,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DOLBYVISION_EXT = 1000104009,
};
```
• **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** specifies support for the sRGB color space.

• **VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT** specifies support for the Display-P3 color space to be displayed using an sRGB-like EOTF (defined below).

• **VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT** specifies support for the extended sRGB color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT** specifies support for the extended sRGB color space to be displayed using an sRGB EOTF.

• **VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT** specifies support for the Display-P3 color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT** specifies support for the DCI-P3 color space to be displayed using the DCI-P3 EOTF. Note that values in such an image are interpreted as XYZ encoded color data by the presentation engine.

• **VK_COLOR_SPACE_BT709_LINEAR_EXT** specifies support for the BT709 color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_BT709_NONLINEAR_EXT** specifies support for the BT709 color space to be displayed using the SMPTE 170M EOTF.

• **VK_COLOR_SPACE_BT2020_LINEAR_EXT** specifies support for the BT2020 color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_HDR10_ST2084_EXT** specifies support for the HDR10 (BT2020 color) space to be displayed using the SMPTE ST2084 Perceptual Quantizer (PQ) EOTF.

• **VK_COLOR_SPACE_DOLBYVISION_EXT** specifies support for the Dolby Vision (BT2020 color space), proprietary encoding, to be displayed using the SMPTE ST2084 EOTF.

• **VK_COLOR_SPACE_HDR10_HLG_EXT** specifies support for the HDR10 (BT2020 color space) to be displayed using the Hybrid Log Gamma (HLG) EOTF.

• **VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT** specifies support for the AdobeRGB color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT** specifies support for the AdobeRGB color space to be
displayed using the Gamma 2.2 EOTF.

- **VK_COLOR_SPACE_PASS_THROUGH_EXT** specifies that color components are used “as is”. This is intended to allow applications to supply data for color spaces not described here.

- **VK_COLOR_SPACE_DISPLAY_NATIVE_AMD** specifies support for the display's native color space. This matches the color space expectations of AMD’s FreeSync2 standard, for displays supporting it.

  **Note**

  In the initial release of the **VK_KHR_surface** and **VK_KHR_swapchain** extensions, the token **VK_COLORSPACE_SRGB_NONLINEAR_KHR** was used. Starting in the 2016-05-13 updates to the extension branches, matching release 1.0.13 of the core API specification, **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** is used instead for consistency with Vulkan naming rules. The older enum is still available for backwards compatibility.

  **Note**

  In older versions of this extension **VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT** was misnamed **VK_COLOR_SPACE_DCI_P3_LINEAR_EXT**. This has been updated to indicate that it uses RGB color encoding, not XYZ. The old name is deprecated but is maintained for backwards compatibility.

  **Note**

  For a traditional "Linear" or non-gamma transfer function color space use **VK_COLOR_SPACE_PASS_THROUGH_EXT**.

The color components of non-linear color space swap chain images must have had the appropriate transfer function applied. The color space selected for the swap chain image will not affect the processing of data written into the image by the implementation. Vulkan requires that all implementations support the sRGB transfer function by use of an SRGB pixel format. Other transfer functions, such as SMPTE 170M or SMPTE2084, can be performed by the application shader. This extension defines enums for **VkColorSpaceKHR** that correspond to the following color spaces:

**Table 47. Color Spaces and Attributes**

<table>

</tbody>
</table>

The transfer functions are described in the “Transfer Functions” chapter of the Khronos Data Format Specification.

Except Display-P3 OETF, which is:

\[
E = \begin{cases} 
1.055 \times L^{\frac{1}{2.4}} - 0.055 & \text{for } 0.0030186 \leq L \leq 1 \\
12.92 \times L & \text{for } 0 \leq L < 0.0030186
\end{cases}
\]

where \(L\) is the linear value of a color component and \(E\) is the encoded value (as stored in the image in memory).

**Note**

For most uses, the sRGB OETF is equivalent.

### 33.5.3. Surface Presentation Mode Support

To query the supported presentation modes for a surface, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfacePresentModesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pPresentModeCount,
    VkPresentModeKHR* pPresentModes);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- **surface** is the surface that will be associated with the swapchain.
- **pPresentModeCount** is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- **pPresentModes** is either NULL or a pointer to an array of `VkPresentModeKHR` values, indicating the supported presentation modes.
If `pPresentModes` is NULL, then the number of presentation modes supported for the given surface is returned in `pPresentModeCount`. Otherwise, `pPresentModeCount` must point to a variable set by the user to the number of elements in the `pPresentModes` array, and on return the variable is overwritten with the number of values actually written to `pPresentModes`. If the value of `pPresentModeCount` is less than the number of presentation modes supported, at most `pPresentModeCount` values will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available modes were returned.

If the VK_GOOGLE_surfaceless_query extension is enabled and `surface` is VK_NULL_HANDLE, the values returned in `pPresentModes` will only indicate support for VK_PRESENT_MODE_FIFO_KHR, VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR, and VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR. To query support for any other present mode, a valid handle must be provided in `surface`.

---

### Valid Usage

- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06524**
  If the VK_GOOGLE_surfaceless_query extension is not enabled, `surface` must be a valid VkSurfaceKHR handle

- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06525**
  If `surface` is not VK_NULL_HANDLE, it must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

---

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-physicalDevice-parameter**
  `physicalDevice` must be a valid VkPhysicalDevice handle

- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-parameter**
  If `surface` is not VK_NULL_HANDLE, `surface` must be a valid VkSurfaceKHR handle

- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModeCount-parameter**
  `pPresentModeCount` must be a valid pointer to a uint32_t value

- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModes-parameter**
  If the value referenced by `pPresentModeCount` is not 0, and `pPresentModes` is not NULL, `pPresentModes` must be a valid pointer to an array of `pPresentModeCount` VkPresentModeKHR values

- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-commonparent**
  Both of `physicalDevice`, and `surface` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkInstance

---

### Return Codes

**Success**
- VK_SUCCESS
Alternatively, to query the supported presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```c
// Provided by VK_EXT_full_screen_exclusive
VkResult vkGetPhysicalDeviceSurfacePresentModes2EXT(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    uint32_t* pPresentModeCount,
    VkPresentModeKHR* pPresentModes);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- `pPresentModeCount` is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- `pPresentModes` is either `NULL` or a pointer to an array of `VkPresentModeKHR` values, indicating the supported presentation modes.

`vkGetPhysicalDeviceSurfacePresentModes2EXT` behaves similarly to `vkGetPhysicalDeviceSurfacePresentModesKHR`, with the ability to specify extended inputs via chained input structures.

**Valid Usage**

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06521
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `pSurfaceInfo->surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06522
  If `pSurfaceInfo->surface` is not `VK_NULL_HANDLE`, it **must** be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-physicalDevice-parameter
**physicalDevice** must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-parameter
  pSurfaceInfo must be a valid pointer to a valid VkPhysicalDeviceSurfaceInfo2KHR structure

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModeCount-parameter
  pPresentModeCount must be a valid pointer to a uint32_t value

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModes-parameter
  If the value referenced by pPresentModeCount is not 0, and pPresentModes is not NULL, pPresentModes must be a valid pointer to an array of pPresentModeCount VkPresentModeKHR values

**Return Codes**

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

Possible values of elements of the VkGetPhysicalDeviceSurfacePresentModesKHR::pPresentModes array, indicating the supported presentation modes for a surface, are:

```c
// Provided by VK_KHR_surface
typedef enum VkPresentModeKHR {
  VK_PRESENT_MODE_IMMEDIATE_KHR = 0,
  VK_PRESENT_MODE_MAILBOX_KHR = 1,
  VK_PRESENT_MODE_FIFO_KHR = 2,
  VK_PRESENT_MODE_FIFO_RELAXED_KHR = 3,
  // Provided by VK_KHR_shared_presentable_image
  VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR = 1000111000,
  // Provided by VK_KHR_shared_presentable_image
  VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR = 1000111001,
} VkPresentModeKHR;
```

- **VK_PRESENT_MODE_IMMEDIATE_KHR** specifies that the presentation engine does not wait for a vertical blanking period to update the current image, meaning this mode may result in visible tearing. No internal queuing of presentation requests is needed, as the requests are applied immediately.

- **VK_PRESENT_MODE_MAILBOX_KHR** specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing cannot be observed. An internal single-
entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for re-use by the application. One request is removed from the queue and processed during each vertical blanking period in which the queue is non-empty.

- **VK_PRESENT_MODE_FIFO_KHR** specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing cannot be observed. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty. This is the only value of `presentMode` that is required to be supported.

- **VK_PRESENT_MODE_FIFO_RELAXED_KHR** specifies that the presentation engine generally waits for the next vertical blanking period to update the current image. If a vertical blanking period has already passed since the last update of the current image then the presentation engine does not wait for another vertical blanking period for the update, meaning this mode may result in visible tearing in this case. This mode is useful for reducing visual stutter with an application that will mostly present a new image before the next vertical blanking period, but may occasionally be late, and present a new image just after the next vertical blanking period. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during or after each vertical blanking period in which the queue is non-empty.

- **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a *shared presentable image*. The presentation engine is only required to update the current image after a new presentation request is received. Therefore the application must make a presentation request whenever an update is required. However, the presentation engine may update the current image at any point, meaning this mode may result in visible tearing.

- **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a *shared presentable image*. The presentation engine periodically updates the current image on its regular refresh cycle. The application is only required to make one initial presentation request, after which the presentation engine must update the current image without any need for further presentation requests. The application can indicate the image contents have been updated by making a presentation request, but this does not guarantee the timing of when it will be updated. This mode may result in visible tearing if rendering to the image is not timed correctly.

The supported `VkImageUsageFlagBits` of the presentable images of a swapchain created for a surface may differ depending on the presentation mode, and can be determined as per the table below:

<table>
<thead>
<tr>
<th>Presentation mode</th>
<th>Image usage flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_PRESENT_MODE_IMMEDIATE_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_MAILBOX_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
</tbody>
</table>
### Presentation mode

<table>
<thead>
<tr>
<th>VK_PRESENT_MODE_FIFO_KHR</th>
<th>VkSurfaceCapabilitiesKHR::supportedUsageFlags</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_PRESENT_MODE_FIFO_RELAXED_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR</td>
<td>VkSharedPresentSurfaceCapabilitiesKHR::shared PresentSupportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR</td>
<td>VkSharedPresentSurfaceCapabilitiesKHR::shared PresentSupportedUsageFlags</td>
</tr>
</tbody>
</table>

**Note**

For reference, the mode indicated by `VK_PRESENT_MODE_FIFO_KHR` is equivalent to the behavior of `{wgl|glX|egl}SwapBuffers with a swap interval of 1, while the mode indicated by `VK_PRESENT_MODE_FIFO_RELAXED_KHR` is equivalent to the behavior of `{wgl|glX}SwapBuffers with a swap interval of -1 (from the `{WGL|GLX}_EXT_swap_control_tear extensions).`

### 33.6. Full Screen Exclusive Control

Swapchains created with `fullScreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` must acquire and release exclusive full-screen access explicitly, using the following commands.

To acquire exclusive full-screen access for a swapchain, call:

```c
// Provided by VK_EXT_full_screen-exclusive
VkResult vkAcquireFullScreenExclusiveModeEXT(
    VkDevice device,
    VkSwapchainKHR swapchain);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to acquire exclusive full-screen access for.

**Valid Usage**

- `VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02674` `swapchain` must not be in the retired state
- `VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02675` `swapchain` must be a swapchain created with a `VkSurfaceFullScreenExclusiveInfoEXT` structure, with `fullScreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`
- `VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02676` `swapchain` must not currently have exclusive full-screen access

A return value of `VK_SUCCESS` indicates that the `swapchain` successfully acquired exclusive full-screen access.
access. The swapchain will retain this exclusivity until either the application releases exclusive full-screen access with `vkReleaseFullScreenExclusiveModeEXT`, destroys the swapchain, or if any of the swapchain commands return `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` indicating that the mode was lost because of platform-specific changes.

If the swapchain was unable to acquire exclusive full-screen access to the display then `VK_ERROR_INITIALIZATION_FAILED` is returned. An application can attempt to acquire exclusive full-screen access again for the same swapchain even if this command fails, or if `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` has been returned by a swapchain command.

### Valid Usage (Implicit)

- **VUID-vkAcquireFullScreenExclusiveModeEXT-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parameter**
  - `swapchain` must be a valid `VkSwapchainKHR` handle
- **VUID-vkAcquireFullScreenExclusiveModeEXT-commonparent**
  - Both of `device`, and `swapchain` must have been created, allocated, or retrieved from the same `VkInstance`

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_SURFACE_LOST_KHR`

To release exclusive full-screen access from a swapchain, call:

```c
// Provided by VK_EXT_full_screen_exclusive
VkResult vkReleaseFullScreenExclusiveModeEXT(
    VkDevice device,          // Provided by VK_EXT_full_screen_exclusive
    VkSwapchainKHR swapchain); // Provided by VK_EXT_full_screen_exclusive
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to release exclusive full-screen access from.

**Note**

Applications will not be able to present to `swapchain` after this call until exclusive...
full-screen access is reacquired. This is usually useful to handle when an application is minimised or otherwise intends to stop presenting for a time.

### Valid Usage

- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02677
  
  `swapchain must` not be in the retired state

- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02678
  
  `swapchain must` be a swapchain created with a `VkSurfaceFullScreenExclusiveInfoEXT` structure, with `fullScreenExclusive` set to `VK_FULL_SCREEN EXCLUSIVE_APPLICATION_CONTROLLED_EXT`

### 33.7. Device Group Queries

A logical device that represents multiple physical devices may support presenting from images on more than one physical device, or combining images from multiple physical devices.

To query these capabilities, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
VkResult vkGetDeviceGroupPresentCapabilitiesKHR(
    VkDevice device,
    VkDeviceGroupPresentCapabilitiesKHR* pDeviceGroupPresentCapabilities);
```

- `device` is the logical device.
- `pDeviceGroupPresentCapabilities` is a pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure in which the device's capabilities are returned.

### Valid Usage (Implicit)

- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-device-parameter
  
  `device must` be a valid `VkDevice` handle

- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-pDeviceGroupPresentCapabilities-parameter
  
  `pDeviceGroupPresentCapabilities must` be a valid pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure

### Return Codes

**Success**

- `VK_SUCCESS`
Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDeviceGroupPresentCapabilitiesKHR structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
typedef struct VkDeviceGroupPresentCapabilitiesKHR {
    VkStructureType          sType;
    void*                    pNext;
    uint32_t                 presentMask[VK_MAX_DEVICE_GROUP_SIZE];
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupPresentCapabilitiesKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **presentMask** is an array of **VK_MAX_DEVICE_GROUP_SIZE** `uint32_t` masks, where the mask at element `i` is non-zero if physical device `i` has a presentation engine, and where bit `j` is set in element `i` if physical device `i` can present swapchain images from physical device `j`. If element `i` is non-zero, then bit `i` must be set.
- **modes** is a bitmask of `VkDeviceGroupPresentModeFlagBitsKHR` indicating which device group presentation modes are supported.

**modes** always has **VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR** set.

The present mode flags are also used when presenting an image, in `VkDeviceGroupPresentInfoKHR::mode`.

If a device group only includes a single physical device, then **modes** must equal **VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR**.

Valid Usage (Implicit)

- VUID-VkDeviceGroupPresentCapabilitiesKHR-sType-sType
  `sType` must be **VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR**
- VUID-VkDeviceGroupPresentCapabilitiesKHR-pNext-pNext
  `pNext` must be NULL

Bits which **may** be set in `VkDeviceGroupPresentCapabilitiesKHR::modes`, indicating which device group presentation modes are supported, are:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
```
typedef enum VkDeviceGroupPresentModeFlagBitsKHR {
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR = 0x00000001,
    VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR = 0x00000002,
    VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR = 0x00000004,
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR = 0x00000008,
} VkDeviceGroupPresentModeFlagBitsKHR;

• VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR specifies that any physical device with a presentation engine can present its own swapchain images.

• VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR specifies that any physical device with a presentation engine can present swapchain images from any physical device in its presentMask.

• VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR specifies that any physical device with a presentation engine can present the sum of swapchain images from any physical devices in its presentMask.

• VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR specifies that multiple physical devices with a presentation engine can each present their own swapchain images.

// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
typedef VkFlags VkDeviceGroupPresentModeFlagsKHR;

VkDeviceGroupPresentModeFlagsKHR is a bitmask type for setting a mask of zero or more VkDeviceGroupPresentModeFlagBitsKHR.

Some surfaces may not be capable of using all the device group present modes.

To query the supported device group present modes for a particular surface, call:

// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
VkResult vkGetDeviceGroupSurfacePresentModesKHR(
    VkDevice device,
    VkSurfaceKHR surface,
    VkDeviceGroupPresentModeFlagsKHR* pModes);

• device is the logical device.

• surface is the surface.

• pModes is a pointer to a VkDeviceGroupPresentModeFlagsKHR in which the supported device group present modes for the surface are returned.

The modes returned by this command are not invariant, and may change in response to the surface being moved, resized, or occluded. These modes must be a subset of the modes returned by vkGetDeviceGroupPresentCapabilitiesKHR.
Valid Usage

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-06212
  surface must be supported by all physical devices associated with device, as reported by
  vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-parameter
  surface must be a valid VkSurfaceKHR handle
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-pModes-parameter
  pModes must be a valid pointer to a VkDeviceGroupPresentModeFlagsKHR value
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-commonparent
  Both of device, and surface must have been created, allocated, or retrieved from the same
  VkInstance

Host Synchronization

- Host access to surface must be externally synchronized

Return Codes

Success
-VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

Alternatively, to query the supported device group presentation modes for a surface combined with
select other fixed swapchain creation parameters, call:

```c
// Provided by VK_VERSION_1_1 with VK_EXT_full_screen-exclusive, VK_KHR_device_group
// with VK_EXT_full_screen-exclusive

VkResult vkGetDeviceGroupSurfacePresentModes2EXT(
    VkDevice device, const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkDeviceGroupPresentModeFlagsKHR* pModes);
```
• **device** is the logical device.

• **pSurfaceInfo** is a pointer to a *VkPhysicalDeviceSurfaceInfo2KHR* structure describing the surface and other fixed parameters that would be consumed by *vkCreateSwapchainKHR*.

• **pModes** is a pointer to a *VkDeviceGroupPresentModeFlagsKHR* in which the supported device group present modes for the surface are returned.

`vkGetDeviceGroupSurfacePresentModes2EXT` behaves similarly to `vkGetDeviceGroupSurfacePresentModesKHR`, with the ability to specify extended inputs via chained input structures.

### Valid Usage

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-06213
  
  `pSurfaceInfo->surface` **must** be supported by all physical devices associated with **device**, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-device-parameter
  
  **device** **must** be a valid *VkDevice* handle

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-parameter
  
  `pSurfaceInfo` **must** be a valid pointer to a valid *VkPhysicalDeviceSurfaceInfo2KHR* structure

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pModes-parameter
  
  `pModes` **must** be a valid pointer to a *VkDeviceGroupPresentModeFlagsKHR* value

### Return Codes

- **Success**
  - `VK_SUCCESS`

- **Failure**
  - `VK_ERROR_OUT_OF_HOST_MEMORY`
  - `VK_ERROR_OUT_OF_DEVICE_MEMORY`
  - `VK_ERROR_SURFACE_LOST_KHR`

When using `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, the application **may** need to know which regions of the surface are used when presenting locally on each physical device. Presentation of swapchain images to this surface need only have valid contents in the regions returned by this command.

To query a set of rectangles used in presentation on the physical device, call:
• `physicalDevice` is the physical device.
• `surface` is the surface.
• `pRectCount` is a pointer to an integer related to the number of rectangles available or queried, as described below.
• `pRects` is either `NULL` or a pointer to an array of `VkRect2D` structures.

If `pRects` is `NULL`, then the number of rectangles used when presenting the given `surface` is returned in `pRectCount`. Otherwise, `pRectCount` must point to a variable set by the user to the number of elements in the `pRects` array, and on return the variable is overwritten with the number of structures actually written to `pRects`. If the value of `pRectCount` is less than the number of rectangles, at most `pRectCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available rectangles were returned.

The values returned by this command are not invariant, and may change in response to the surface being moved, resized, or occluded.

The rectangles returned by this command must not overlap.

**Valid Usage**

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06523
  `surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06211
  `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-parameter
  `surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRectCount-parameter
  `pRectCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRects-parameter
  If the value referenced by `pRectCount` is not 0, and `pRects` is not `NULL`, `pRects` must be a
valid pointer to an array of `pRectCount VkRect2D` structures

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-commonparent
  Both of `physicalDevice`, and `surface must` have been created, allocated, or retrieved from the same `VkInstance`

### Host Synchronization

- Host access to `surface must` be externally synchronized

### Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

### 33.8. Display Timing Queries

Traditional game and real-time-animation applications frequently use `VK_PRESENT_MODE_FIFO_KHR` so that presentable images are updated during the vertical blanking period of a given refresh cycle (RC) of the presentation engine's display. This avoids the visual anomaly known as tearing.

However, synchronizing the presentation of images with the RC does not prevent all forms of visual anomalies. Stuttering occurs when the geometry for each presentable image is not accurately positioned for when that image will be displayed. The geometry may appear to move too little some RCs, and too much for others. Sometimes the animation appears to freeze, when the same image is used for more than one RC.

In order to minimize stuttering, an application needs to correctly position their geometry for when the presentable image will be displayed to the user. To accomplish this, applications need various timing information about the presentation engine’s display. They need to know when presentable images were actually presented, and when they could have been presented. Applications also need to tell the presentation engine to display an image no sooner than a given time. This can allow the application’s animation to look smooth to the user, with no stuttering. The `VK_GOOGLE_display_timing` extension allows an application to satisfy these needs.

The presentation engine's display typically refreshes the pixels that are displayed to the user on a periodic basis. The period may be fixed or variable. In many cases, the presentation engine is associated with fixed refresh rate (FRR) display technology, with a fixed refresh rate (RR, e.g. 60Hz). In some cases, the presentation engine is associated with variable refresh rate (VRR) display technology, where each refresh cycle (RC) can vary in length. This extension treats VRR displays as
To query the duration of a refresh cycle (RC) for the presentation engine's display, call:

```c
// Provided by VK_GOOGLE_display_timing
VkResult vkGetRefreshCycleDurationGOOGLE(
    VkDevice device, 
    VkSwapchainKHR swapchain, 
    VkRefreshCycleDurationGOOGLE* pDisplayTimingProperties);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to obtain the refresh duration for.
- `pDisplayTimingProperties` is a pointer to a `VkRefreshCycleDurationGOOGLE` structure.

### Valid Usage (Implicit)

- **VUID-vkGetRefreshCycleDurationGOOGLE-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetRefreshCycleDurationGOOGLE-swapchain-parameter**
  `swapchain` must be a valid `VkSwapchainKHR` handle

- **VUID-vkGetRefreshCycleDurationGOOGLE-pDisplayTimingProperties-parameter**
  `pDisplayTimingProperties` must be a valid pointer to a `VkRefreshCycleDurationGOOGLE` structure

- **VUID-vkGetRefreshCycleDurationGOOGLE-commonparent**
  Both of `device`, and `swapchain` must have been created, allocated, or retrieved from the same `VkInstance`

### Host Synchronization

- Host access to `swapchain` must be externally synchronized

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkRefreshCycleDurationGOOGLE` structure is defined as:
typedef struct VkRefreshCycleDurationGOOGLE {
    uint64_t refreshDuration;
} VkRefreshCycleDurationGOOGLE;

- `refreshDuration` is the number of nanoseconds from the start of one refresh cycle to the next.

**Note**

The rate at which an application renders and presents new images is known as the image present rate (IPR, aka frame rate). The inverse of IPR, or the duration between each image present, is the image present duration (IPD). In order to provide a smooth, stutter-free animation, an application will want its IPD to be a multiple of `refreshDuration`. For example, if a display has a 60Hz refresh rate, `refreshDuration` will be a value in nanoseconds that is approximately equal to 16.67ms. In such a case, an application will want an IPD of 16.67ms (1X multiplier of `refreshDuration`), or 33.33ms (2X multiplier of `refreshDuration`), or 50.0ms (3X multiplier of `refreshDuration`), etc.

In order to determine a target IPD for a display (i.e. a multiple of `refreshDuration`), an application needs to determine when its images are actually displayed. Suppose an application has an initial target IPD of 16.67ms (1X multiplier of `refreshDuration`). It will therefore position the geometry of a new image 16.67ms later than the previous image. But suppose this application is running on slower hardware, so that it actually takes 20ms to render each new image. This will create visual anomalies, because the images will not be displayed to the user every 16.67ms, nor every 20ms. In this case, it is better for the application to adjust its target IPD to 33.33ms (i.e. a 2X multiplier of `refreshDuration`), and tell the presentation engine to not present images any sooner than every 33.33ms. This will allow the geometry to be correctly positioned for each presentable image.

Adjustments to an application’s IPD may be needed because different views of an application’s geometry can take different amounts of time to render. For example, looking at the sky may take less time to render than looking at multiple, complex items in a room. In general, it is good to not frequently change IPD, as that can cause visual anomalies. Adjustments to a larger IPD because of late images should happen quickly, but adjustments to a smaller IPD should only happen if the `actualPresentTime` and `earliestPresentTime` members of the `VkPastPresentationTimingGOOGLE` structure are consistently different, and if `presentMargin` is consistently large, over multiple images.

The implementation will maintain a limited amount of history of timing information about previous presents. Because of the asynchronous nature of the presentation engine, the timing information for a given `vkQueuePresentKHR` command will become available some time later. These time values can be asynchronously queried, and will be returned if available. All time values are in nanoseconds, relative to a monotonically-increasing clock (e.g. `CLOCK_MONOTONIC` (see `clock_gettime(2)`) on Android and Linux).
To asynchronously query the presentation engine, for newly-available timing information about
one or more previous presents to a given swapchain, call:

```c
// Provided by VK_GOOGLE_display_timing
VkResult vkGetPastPresentationTimingGOOGLE(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint32_t*pPresentationTimingCount,
    VkPastPresentationTimingGOOGLE*pPresentationTimings);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to obtain presentation timing information duration for.
- `pPresentationTimingCount` is a pointer to an integer related to the number of `VkPastPresentationTimingGOOGLE` structures to query, as described below.
- `pPresentationTimings` is either `NULL` or a pointer to an array of `VkPastPresentationTimingGOOGLE` structures.

If `pPresentationTimings` is `NULL`, then the number of newly-available timing records for the given swapchain is returned in `pPresentationTimingCount`. Otherwise, `pPresentationTimingCount` must point to a variable set by the user to the number of elements in the `pPresentationTimings` array, and on return the variable is overwritten with the number of structures actually written to `pPresentationTimings`. If the value of `pPresentationTimingCount` is less than the number of newly-available timing records, at most `pPresentationTimingCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available timing records were returned.

**Valid Usage (Implicit)**

- VUID-vkGetPastPresentationTimingGOOGLE-device-parameter
  - `device must be a valid VkDevice handle`
- VUID-vkGetPastPresentationTimingGOOGLE-swapchain-parameter
  - `swapchain must be a valid VkSwapchainKHR handle`
- VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimingCount-parameter
  - `pPresentationTimingCount must be a valid pointer to a uint32_t value`
- VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimings-parameter
  - If the value referenced by `pPresentationTimingCount` is not 0, and `pPresentationTimings` is not `NULL`, `pPresentationTimings must be a valid pointer to an array of `pPresentationTimingCount` `VkPastPresentationTimingGOOGLE` structures`
- VUID-vkGetPastPresentationTimingGOOGLE-commonparent
  - Both of `device`, and `swapchain must have been created, allocated, or retrieved from the same VkInstance`
Host Synchronization

- Host access to swapchain must be externally synchronized

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR

The VkPastPresentationTimingGOOGLE structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPastPresentationTimingGOOGLE {
    uint32_t presentID;
    uint64_t desiredPresentTime;
    uint64_t actualPresentTime;
    uint64_t earliestPresentTime;
    uint64_t presentMargin;
} VkPastPresentationTimingGOOGLE;
```

- **presentID** is an application-provided value that was given to a previous vkQueuePresentKHR command via VkPresentTimeGOOGLE::presentID (see below). It can be used to uniquely identify a previous present with the vkQueuePresentKHR command.
- **desiredPresentTime** is an application-provided value that was given to a previous vkQueuePresentKHR command via VkPresentTimeGOOGLE::desiredPresentTime. If non-zero, it was used by the application to indicate that an image not be presented any sooner than desiredPresentTime.
- **actualPresentTime** is the time when the image of the swapchain was actually displayed.
- **earliestPresentTime** is the time when the image of the swapchain could have been displayed. This may differ from actualPresentTime if the application requested that the image be presented no sooner than VkPresentTimeGOOGLE::desiredPresentTime.
- **presentMargin** is an indication of how early the vkQueuePresentKHR command was processed compared to how soon it needed to be processed, and still be presented at earliestPresentTime.

The results for a given swapchain and presentID are only returned once from
vkGetPastPresentationTimingGOOGLE.

The application can use the VkPastPresentationTimingGOOGLE values to occasionally adjust its timing. For example, if actualPresentTime is later than expected (e.g. one refreshDuration late), the application may increase its target IPD to a higher multiple of refreshDuration (e.g. decrease its frame rate from 60Hz to 30Hz). If actualPresentTime and earliestPresentTime are consistently different, and if presentMargin is consistently large enough, the application may decrease its target IPD to a smaller multiple of refreshDuration (e.g. increase its frame rate from 30Hz to 60Hz). If actualPresentTime and earliestPresentTime are same, and if presentMargin is consistently high, the application may delay the start of its input-render-present loop in order to decrease the latency between user input and the corresponding present (always leaving some margin in case a new image takes longer to render than the previous image). An application that desires its target IPD to always be the same as refreshDuration, can also adjust features until actualPresentTime is never late and presentMargin is satisfactory.

The full VK_GOOGLE_display_timing extension semantics are described for swapchains created with VK_PRESENT_MODE_FIFO_KHR. For example, non-zero values of VkPresentTimeGOOGLE::desiredPresentTime must be honored, and vkGetPastPresentationTimingGOOGLE should return a VkPastPresentationTimingGOOGLE structure with valid values for all images presented with vkQueuePresentKHR. The semantics for other present modes are as follows:

- **VK_PRESENT_MODE_IMMEDIATE_KHR.** The presentation engine may ignore non-zero values of VkPresentTimeGOOGLE::desiredPresentTime in favor of presenting immediately. The value of VkPastPresentationTimingGOOGLE::earliestPresentTime must be the same as VkPastPresentationTimingGOOGLE::actualPresentTime, which should be when the presentation engine displayed the image.

- **VK_PRESENT_MODE_MAILBOX_KHR.** The intention of using this present mode with this extension is to handle cases where an image is presented late, and the next image is presented soon enough to replace it at the next vertical blanking period. For images that are displayed to the user, the value of VkPastPresentationTimingGOOGLE::actualPresentTime must be when the image was displayed. For images that are not displayed to the user, vkGetPastPresentationTimingGOOGLE may not return a VkPastPresentationTimingGOOGLE structure, or it may return a VkPastPresentationTimingGOOGLE structure with the value of zero for both VkPastPresentationTimingGOOGLE::actualPresentTime and VkPastPresentationTimingGOOGLE::earliestPresentTime. It is possible that an application can submit images with VkPresentTimeGOOGLE::desiredPresentTime values such that new images may not be displayed. For example, if VkPresentTimeGOOGLE::desiredPresentTime is far enough in the future that an image is not presented before vkQueuePresentKHR is called to present another image, the first image will not be displayed to the user. If the application continues to do that, the presentation may not display new images.

- **VK_PRESENT_MODE_FIFO_RELAXED_KHR.** For images that are presented in time to be displayed at the next vertical blanking period, the semantics are identical as for VK_PRESENT_MODE_FIFO_RELAXED_KHR. For images that are presented late, and are displayed after the start of the vertical blanking period (i.e. with tearing), the values of VkPastPresentationTimingGOOGLE may be treated as if the image was displayed at the start of the vertical blanking period, or may be treated the same as for VK_PRESENT_MODE_IMMEDIATE_KHR.
33.9. Present Wait

Applications wanting to control the pacing of the application by monitoring when presentation processes have completed to limit the number of outstanding images queued for presentation, need to have a method of being signaled during the presentation process.

Using the `VK_GOOGLE_display_timing` extension applications can discover when images were presented, but only asynchronously.

Providing a mechanism which allows applications to block, waiting for a specific step of the presentation process to complete allows them to control the amount of outstanding work (and hence the potential lag in responding to user input or changes in the rendering environment).

The `VK_KHR_present_wait` extension allows applications to tell the presentation engine at the `vkQueuePresentKHR` call that it plans on waiting for presentation by passing a `VkPresentIdKHR` structure. The `presentId` passed in that structure may then be passed to a future `vkWaitForPresentKHR` call to cause the application to block until that presentation is finished.

33.10. WSI Swapchain

A swapchain object (a.k.a. swapchain) provides the ability to present rendering results to a surface. Swapchain objects are represented by `VkSwapchainKHR` handles:

```c
// Provided by VK_KHR_swapchain
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSwapchainKHR)
```

A swapchain is an abstraction for an array of presentable images that are associated with a surface. The presentable images are represented by `VkImage` objects created by the platform. One image (which can be an array image for multiview/stereoscopic-3D surfaces) is displayed at a time, but multiple images can be queued for presentation. An application renders to the image, and then queues the image for presentation to the surface.

A native window cannot be associated with more than one non-retired swapchain at a time. Further, swapchains cannot be created for native windows that have a non-Vulkan graphics API surface associated with them.

---

**Note**

The presentation engine is an abstraction for the platform's compositor or display engine.

The presentation engine may be synchronous or asynchronous with respect to the application and/or logical device.

Some implementations may use the device's graphics queue or dedicated presentation hardware to perform presentation.

The presentable images of a swapchain are owned by the presentation engine. An application cannot...
acquire use of a presentable image from the presentation engine. Use of a presentable image must occur only after the image is returned by `vkAcquireNextImageKHR`, and before it is released by `vkQueuePresentKHR`. This includes transitioning the image layout and rendering commands.

An application can acquire use of a presentable image with `vkAcquireNextImageKHR`. After acquiring a presentable image and before modifying it, the application must use a synchronization primitive to ensure that the presentation engine has finished reading from the image. The application can then transition the image's layout, queue rendering commands to it, etc. Finally, the application presents the image with `vkQueuePresentKHR`, which releases the acquisition of the image.

The presentation engine controls the order in which presentable images are acquired for use by the application.

Note
This allows the platform to handle situations which require out-of-order return of images after presentation. At the same time, it allows the application to generate command buffers referencing all of the images in the swapchain at initialization time, rather than in its main loop.

How this all works is described below.

If a swapchain is created with `presentMode` set to either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, a single presentable image can be acquired, referred to as a shared presentable image. A shared presentable image may be concurrently accessed by the application and the presentation engine, without transitioning the image's layout after it is initially presented.

- With `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR`, the presentation engine is only required to update to the latest contents of a shared presentable image after a present. The application must call `vkQueuePresentKHR` to guarantee an update. However, the presentation engine may update from it at any time.

- With `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, the presentation engine will automatically present the latest contents of a shared presentable image during every refresh cycle. The application is only required to make one initial call to `vkQueuePresentKHR`, after which the presentation engine will update from it without any need for further present calls. The application can indicate the image contents have been updated by calling `vkQueuePresentKHR`, but this does not guarantee the timing of when updates will occur.

The presentation engine may access a shared presentable image at any time after it is first presented. To avoid tearing, an application should coordinate access with the presentation engine. This requires presentation engine timing information through platform-specific mechanisms and ensuring that color attachment writes are made available during the portion of the presentation engine’s refresh cycle they are intended for.

Note
The `VK_KHR_shared_presentable_image` extension does not provide functionality for determining the timing of the presentation engine’s refresh cycles.
In order to query a swapchain's status when rendering to a shared presentable image, call:

```cpp
// Provided by VK_KHR_shared_presentable_image
VkResult vkGetSwapchainStatusKHR(
    VkDevice device,
    VkSwapchainKHR swapchain);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to query.

### Valid Usage (Implicit)

- VUID-vkGetSwapchainStatusKHR-device-parameter
  - **device** must be a valid **VkDevice** handle
- VUID-vkGetSwapchainStatusKHR-swapchain-parameter
  - **swapchain** must be a valid **VkSwapchainKHR** handle
- VUID-vkGetSwapchainStatusKHR-commonparent
  - Both of **device**, and **swapchain** must have been created, allocated, or retrieved from the same **VkInstance**

### Host Synchronization

- Host access to **swapchain** must be externally synchronized

### Return Codes

**Success**

- VK_SUCCESS
- VK_SUBOPTIMAL_KHR

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

The possible return values for **vkGetSwapchainStatusKHR** should be interpreted as follows:

- **VK_SUCCESS** specifies the presentation engine is presenting the contents of the shared presentable
image, as per the swapchain’s `VkPresentModeKHR`.

- **VK_SUBOPTIMAL_KHR** the swapchain no longer matches the surface properties exactly, but the presentation engine is presenting the contents of the shared presentable image, as per the swapchain’s `VkPresentModeKHR`.
- **VK_ERROR_OUT_OF_DATE_KHR** the surface has changed in such a way that it is no longer compatible with the swapchain.
- **VK_ERROR_SURFACE_LOST_KHR** the surface is no longer available.

**Note**
The swapchain state may be cached by implementations, so applications should regularly call `vkGetSwapchainStatusKHR` when using a swapchain with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

To create a swapchain, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkCreateSwapchainKHR(
    VkDevice device, 
    const VkSwapchainCreateInfoKHR* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkSwapchainKHR* pSwapchain);
```

- **device** is the device to create the swapchain for.
- **pCreateInfo** is a pointer to a `VkSwapchainCreateInfoKHR` structure specifying the parameters of the created swapchain.
- **pAllocator** is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).
- **pSwapchain** is a pointer to a `VkSwapchainKHR` handle in which the created swapchain object will be returned.

As mentioned above, if `vkCreateSwapchainKHR` succeeds, it will return a handle to a swapchain containing an array of at least `pCreateInfo->minImageCount` presentable images.

While acquired by the application, presentable images can be used in any way that equivalent non-presentable images can be used. A presentable image is equivalent to a non-presentable image created with the following `VkImageCreateInfo` parameters:
<table>
<thead>
<tr>
<th>VkImageCreateInfo Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>flags</td>
<td>VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT is set if VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR is set&lt;br&gt;VK_IMAGE_CREATE_PROTECTED_BIT is set if VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR is set&lt;br.VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR are both set if VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR is set&lt;br&gt;all other bits are unset</td>
</tr>
<tr>
<td>imageType</td>
<td>VK_IMAGE_TYPE_2D</td>
</tr>
<tr>
<td>format</td>
<td>pCreateInfo-&gt;imageFormat</td>
</tr>
<tr>
<td>extent</td>
<td>{pCreateInfo-&gt;imageExtent.width, pCreateInfo-&gt;imageExtent.height, 1}</td>
</tr>
<tr>
<td>mipLevels</td>
<td>1</td>
</tr>
<tr>
<td>arrayLayers</td>
<td>pCreateInfo-&gt;imageArrayLayers</td>
</tr>
<tr>
<td>samples</td>
<td>VK_SAMPLE_COUNT_1_BIT</td>
</tr>
<tr>
<td>tiling</td>
<td>VK_IMAGE_TILING_OPTIMAL</td>
</tr>
<tr>
<td>usage</td>
<td>pCreateInfo-&gt;imageUsage</td>
</tr>
<tr>
<td>sharingMode</td>
<td>pCreateInfo-&gt;imageSharingMode</td>
</tr>
<tr>
<td>queueFamilyIndexCount</td>
<td>pCreateInfo-&gt;queueFamilyIndexCount</td>
</tr>
<tr>
<td>pQueueFamilyIndices</td>
<td>pCreateInfo-&gt;pQueueFamilyIndices</td>
</tr>
<tr>
<td>initialLayout</td>
<td>VK_IMAGE_LAYOUT_UNDEFINED</td>
</tr>
</tbody>
</table>

The pCreateInfo->surface must not be destroyed until after the swapchain is destroyed.

If pCreateInfo->oldSwapchain is VK_NULL_HANDLE, and the native window referred to by pCreateInfo->surface is already associated with a Vulkan swapchain, VK_ERROR_NATIVE_WINDOW_IN_USE_KHR must be returned.

If the native window referred to by pCreateInfo->surface is already associated with a non-Vulkan graphics API surface, VK_ERROR_NATIVE_WINDOW_IN_USE_KHR must be returned.

The native window referred to by pCreateInfo->surface must not become associated with a non-Vulkan graphics API surface before all associated Vulkan swapchains have been destroyed.

vkCreateSwapchainKHR will return VK_ERROR_DEVICE_LOST if the logical device was lost. The VkSwapchainKHR is a child of the device, and must be destroyed before the device. However, VkSurfaceKHR is not a child of any VkDevice and is not affected by the lost device. After successfully recreating a VkDevice, the same VkSurfaceKHR can be used to create a new VkSwapchainKHR, provided
the previous one was destroyed.

If the `oldSwapchain` parameter of `pCreateInfo` is a valid swapchain, which has exclusive full-screen access, that access is released from `pCreateInfo->oldSwapchain`. If the command succeeds in this case, the newly created swapchain will automatically acquire exclusive full-screen access from `pCreateInfo->oldSwapchain`.

**Note**

This implicit transfer is intended to avoid exiting and entering full-screen exclusive mode, which may otherwise cause unwanted visual updates to the display.

In some cases, swapchain creation **may** fail if exclusive full-screen mode is requested for application control, but for some implementation-specific reason exclusive full-screen access is unavailable for the particular combination of parameters provided. If this occurs, `VK_ERROR_INITIALIZATION_FAILED` will be returned.

**Note**

In particular, it will fail if the `imageExtent` member of `pCreateInfo` does not match the extents of the monitor. Other reasons for failure may include the app not being set as high-dpi aware, or if the physical device and monitor are not compatible in this mode.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSwapchainPresentBarrierCreateInfoNV` structure, then that structure includes additional swapchain creation parameters specific to the present barrier. Swapchain creation **may** fail if the state of the current system restricts the usage of the present barrier feature `VkSurfaceCapabilitiesPresentBarrierNV`, or a swapchain itself does not satisfy all the required conditions. In this scenario `VK_ERROR_INITIALIZATION_FAILED` is returned.

When the `VkSurfaceKHR` in `VkSwapchainCreateInfoKHR` is a display surface, then the `VkDisplayModeKHR` in display surface's `VkDisplaySurfaceCreateInfoKHR` is associated with a particular `VkDisplayKHR`. Swapchain creation **may** fail if that `VkDisplayKHR` is not acquired by the application. In this scenario `VK_ERROR_INITIALIZATION_FAILED` is returned.

### Valid Usage (Implicit)

- VUID-vkCreateSwapchainKHR-device-parameter
  - `device` **must** be a valid `VkDevice` handle

- VUID-vkCreateSwapchainKHR-pCreateInfo-parameter
  - `pCreateInfo` **must** be a valid pointer to a valid `VkSwapchainCreateInfoKHR` structure

- VUID-vkCreateSwapchainKHR-pAllocator-parameter
  - If `pAllocator` is not NULL, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateSwapchainKHR-pSwapchain-parameter
  - `pSwapchain` **must** be a valid pointer to a `VkSwapchainKHR` handle
Host Synchronization

• Host access to `pCreateInfo->surface` must be externally synchronized
• Host access to `pCreateInfo->oldSwapchain` must be externally synchronized

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_DEVICE_LOST
• VK_ERROR_SURFACE_LOST_KHR
• VK_ERROR_NATIVE_WINDOW_IN_USE_KHR
• VK_ERROR_INITIALIZATION_FAILED
• VK_ERROR_COMPRESSION_EXHAUSTED_EXT

The `VkSwapchainCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_swapchain
typedef struct VkSwapchainCreateInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkSwapchainCreateFlagsKHR flags;
    VkSurfaceKHR              surface;
    uint32_t                   minImageCount;
    VkFormat                   imageFormat;
    VkColorSpaceKHR            imageColorSpace;
    VkExtent2D                 imageExtent;
    uint32_t                   imageArrayLayers;
    VkImageUsageFlags         imageUsage;
    VkSharingMode             imageSharingMode;
    uint32_t                   queueFamilyIndexCount;
    const uint32_t*            pQueueFamilyIndices;
    VkSurfaceTransformFlagBitsKHR preTransform;
    VkCompositeAlphaFlagBitsKHR compositeAlpha;
    VkPresentModeKHR          presentMode;
    VkBool32                   clipped;
    VkSwapchainKHR            oldSwapchain;
} VkSwapchainCreateInfoKHR;
```
• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is a bitmask of `VkSwapchainCreateFlagBitsKHR` indicating parameters of the swapchain creation.

• **surface** is the surface onto which the swapchain will present images. If the creation succeeds, the swapchain becomes associated with `surface`.

• **minImageCount** is the minimum number of presentable images that the application needs. The implementation will either create the swapchain with at least that many images, or it will fail to create the swapchain.

• **imageFormat** is a `VkFormat` value specifying the format the swapchain image(s) will be created with.

• **imageColorSpace** is a `VkColorSpaceKHR` value specifying the way the swapchain interprets image data.

• **imageExtent** is the size (in pixels) of the swapchain image(s). The behavior is platform-dependent if the image extent does not match the surface's `currentExtent` as returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`.

  **Note**

  On some platforms, it is normal that `maxImageExtent` may become (0, 0), for example when the window is minimized. In such a case, it is not possible to create a swapchain due to the Valid Usage requirements.

• **imageArrayLayers** is the number of views in a multiview/stereo surface. For non-stereoscopic-3D applications, this value is 1.

• **imageUsage** is a bitmask of `VkImageUsageFlagBits` describing the intended usage of the (acquired) swapchain images.

• **imageSharingMode** is the sharing mode used for the image(s) of the swapchain.

• **queueFamilyIndexCount** is the number of queue families having access to the image(s) of the swapchain when `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`.

• **pQueueFamilyIndices** is a pointer to an array of queue family indices having access to the images(s) of the swapchain when `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`.

• **preTransform** is a `VkSurfaceTransformFlagBitsKHR` value describing the transform, relative to the presentation engine's natural orientation, applied to the image content prior to presentation. If it does not match the `currentTransform` value returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, the presentation engine will transform the image content as part of the presentation operation.

• **compositeAlpha** is a `VkCompositeAlphaFlagBitsKHR` value indicating the alpha compositing mode to use when this surface is composited together with other surfaces on certain window systems.

• **presentMode** is the presentation mode the swapchain will use. A swapchain's present mode determines how incoming present requests will be processed and queued internally.

• **clipped** specifies whether the Vulkan implementation is allowed to discard rendering operations that affect regions of the surface that are not visible.
If set to VK_TRUE, the presentable images associated with the swapchain may not own all of their pixels. Pixels in the presentable images that correspond to regions of the target surface obscured by another window on the desktop, or subject to some other clipping mechanism will have undefined content when read back. Fragment shaders may not execute for these pixels, and thus any side effects they would have had will not occur. Setting VK_TRUE does not guarantee any clipping will occur, but allows more efficient presentation methods to be used on some platforms.

If set to VK_FALSE, presentable images associated with the swapchain will own all of the pixels they contain.

Note
Applications should set this value to VK_TRUE if they do not expect to read back the content of presentable images before presenting them or after reacquiring them, and if their fragment shaders do not have any side effects that require them to run for all pixels in the presentable image.

- oldSwapchain is VK_NULL_HANDLE, or the existing non-retired swapchain currently associated with surface. Providing a valid oldSwapchain may aid in the resource reuse, and also allows the application to still present any images that are already acquired from it.

Upon calling vkCreateSwapchainKHR with an oldSwapchain that is not VK_NULL_HANDLE, oldSwapchain is retired — even if creation of the new swapchain fails. The new swapchain is created in the non-retired state whether or not oldSwapchain is VK_NULL_HANDLE.

Upon calling vkCreateSwapchainKHR with an oldSwapchain that is not VK_NULL_HANDLE, any images from oldSwapchain that are not acquired by the application may be freed by the implementation, which may occur even if creation of the new swapchain fails. The application can destroy oldSwapchain to free all memory associated with oldSwapchain.

Note
Multiple retired swapchains can be associated with the same VkSurfaceKHR through multiple uses of oldSwapchain that outnumber calls to vkDestroySwapchainKHR.

After oldSwapchain is retired, the application can pass to vkQueuePresentKHR any images it had already acquired from oldSwapchain. E.g., an application may present an image from the old swapchain before an image from the new swapchain is ready to be presented. As usual, vkQueuePresentKHR may fail if oldSwapchain has entered a state that causes VK_ERROR_OUT_OF_DATE_KHR to be returned.

The application can continue to use a shared presentable image obtained from oldSwapchain until a presentable image is acquired from the new swapchain, as long as it has not entered a state that causes it to return VK_ERROR_OUT_OF_DATE_KHR.

Valid Usage

- VUID-VkSwapchainCreateInfoKHR-surface-01270

  surface must be a surface that is supported by the device as determined using
vkGetPhysicalDeviceSurfaceSupportKHR

- **VUID-VkSwapchainCreateInfoKHR-minImageCount-01272**
  
  `minImageCount` **must** be less than or equal to the value returned in the `maxImageCount` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface if the returned `maxImageCount` is not zero.

- **VUID-VkSwapchainCreateInfoKHR-presentMode-02839**
  If `presentMode` is not `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` nor `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, then `minImageCount` **must** be greater than or equal to the value returned in the `minImageCount` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface.

- **VUID-VkSwapchainCreateInfoKHR-minImageCount-01383**
  `minImageCount` **must** be 1 if `presentMode` is either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

- **VUID-VkSwapchainCreateInfoKHR-imageFormat-01273**
  `imageFormat` and `imageColorSpace` **must** match the format and color space members, respectively, of one of the `VkSurfaceFormatKHR` structures returned by `vkGetPhysicalDeviceSurfaceFormatsKHR` for the surface.

- **VUID-VkSwapchainCreateInfoKHR-imageExtent-01274**
  `imageExtent` **must** be between `minImageExtent` and `maxImageExtent`, inclusive, where `minImageExtent` and `maxImageExtent` are members of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface.

- **VUID-VkSwapchainCreateInfoKHR-imageExtent-01689**
  `imageExtent` members `width` and `height` **must** both be non-zero.

- **VUID-VkSwapchainCreateInfoKHR-imageArrayLayers-01275**
  `imageArrayLayers` **must** be greater than 0 and less than or equal to the `maxImageArrayLayers` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface.

- **VUID-VkSwapchainCreateInfoKHR-presentMode-01427**
  If `presentMode` is `VK_PRESENT_MODE_IMMEDIATE_KHR`, `VK_PRESENT_MODE_MAILBOX_KHR`, `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR`, `imageUsage` **must** be a subset of the supported usage flags present in the `supportedUsageFlags` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for surface.

- **VUID-VkSwapchainCreateInfoKHR-imageUsage-01384**
  If `presentMode` is `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, `imageUsage` **must** be a subset of the supported usage flags present in the `sharedPresentSupportedUsageFlags` member of the `VkSharedPresentSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilities2KHR` for surface.

- **VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01277**
  If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, `pQueueFamilyIndices` **must** be a valid
pointer to an array of queueFamilyIndexCount uint32_t values

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01278
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, queueFamilyIndexCount must be greater than 1

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01428
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, each element of pQueueFamilyIndices must be unique and must be less than pQueueFamilyPropertyCount returned by either vkGetPhysicalDeviceQueueFamilyProperties or vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to create device

- VUID-VkSwapchainCreateInfoKHR-preTransform-01279
  preTransform must be one of the bits present in the supportedTransforms member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-compositeAlpha-01280
  compositeAlpha must be one of the bits present in the supportedCompositeAlpha member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-presentMode-01281
  presentMode must be one of the VkPresentModeKHR values returned by vkGetPhysicalDeviceSurfacePresentModesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-physicalDeviceCount-01429
  If the logical device was created with VkDeviceGroupDeviceCreateInfo::physicalDeviceCount equal to 1, flags must not contain VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR

- VUID-VkSwapchainCreateInfoKHR-oldSwapchain-01933
  If oldSwapchain is not VK_NULL_HANDLE, oldSwapchain must be a non-retired swapchain associated with native window referred to by surface

- VUID-VkSwapchainCreateInfoKHR-imageFormat-01778
  The implied image creation parameters of the swapchain must be supported as reported by vkGetPhysicalDeviceImageFormatProperties

- VUID-VkSwapchainCreateInfoKHR-flags-03168
  If flags contains VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR then the pNext chain must include a VkImageFormatListCreateInfo structure with a viewFormatCount greater than zero and pViewFormats must have an element equal to imageFormat

- VUID-VkSwapchainCreateInfoKHR-pNext-04099
  If a VkImageFormatListCreateInfo structure was included in the pNext chain and VkImageFormatListCreateInfo::viewFormatCount is not zero then all of the formats in VkImageFormatListCreateInfo::pViewFormats must be compatible with the format as described in the compatibility table

- VUID-VkSwapchainCreateInfoKHR-flags-04100
  If flags does not contain VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR and the pNext chain include a VkImageFormatListCreateInfo structure then VkImageFormatListCreateInfo
viewFormatCount must be 0 or 1

- **VUID-VkSwapchainCreateInfoKHR-flags-03187**
  
  If flags contains [VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR], then
  
  VkSurfaceProtectedCapabilitiesKHR::supportsProtected must be VK_TRUE in the
  
  VkSurfaceProtectedCapabilitiesKHR structure returned by
  
  vkGetPhysicalDeviceSurfaceCapabilities2KHR for surface

- **VUID-VkSwapchainCreateInfoKHR-pNext-02679**
  
  If the pNext chain includes a [VkSurfaceFullScreenExclusiveInfoEXT] structure with its
  
  fullScreenExclusive member set to [VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT],
  and surface was created using [vkCreateWin32SurfaceKHR], a
  
  VkSurfaceFullScreenExclusiveWin32InfoEXT structure must be included in the pNext chain

- **VUID-VkSwapchainCreateInfoKHR-pNext-06752**
  
  If the imageCompressionControlSwapchain feature is not enabled, the pNext chain must not
  
  include an [VkImageCompressionControlEXT] structure

---

**Valid Usage (Implicit)**

- **VUID-VkSwapchainCreateInfoKHR-sType-sType**
  
  sType must be [VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR]

- **VUID-VkSwapchainCreateInfoKHR-pNext-pNext**
  
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or
  
  a pointer to a valid instance of [VkDeviceGroupSwapchainCreateInfoKHR],
  
  [VkImageCompressionControlEXT], [VkImageFormatListCreateInfo],
  
  [VkSurfaceFullScreenExclusiveInfoEXT], [VkSurfaceFullScreenExclusiveWin32InfoEXT],
  
  [VkSwapchainCounterCreateInfoEXT], [VkSwapchainDisplayNativeHdrCreateInfoAMD],
  or
  
  [VkSwapchainPresentBarrierCreateInfoNV]

- **VUID-VkSwapchainCreateInfoKHR-sType-unique**
  
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkSwapchainCreateInfoKHR-flags-parameter**
  
  flags must be a valid combination of [VkSwapchainCreateFlagBitsKHR] values

- **VUID-VkSwapchainCreateInfoKHR-surface-parameter**
  
  surface must be a valid [VkSurfaceKHR] handle

- **VUID-VkSwapchainCreateInfoKHR-imageFormat-parameter**
  
  imageFormat must be a valid [VkFormat] value

- **VUID-VkSwapchainCreateInfoKHR-imageColorSpace-parameter**
  
  imageColorSpace must be a valid [VkColorSpaceKHR] value

- **VUID-VkSwapchainCreateInfoKHR-imageUsage-parameter**
  
  imageUsage must be a valid combination of [VkImageUsageFlagBits] values

- **VUID-VkSwapchainCreateInfoKHR-imageUsage-requiredbitmask**
  
  imageUsage must not be 0

- **VUID-VkSwapchainCreateInfoKHR-imageSharingMode-parameter**
**imageSharingMode** must be a valid *VkSharingMode* value

- **VUID-VkSwapchainCreateInfoKHR-preTransform-parameter**
  
  `preTransform` must be a valid *VkSurfaceTransformFlagBitsKHR* value

- **VUID-VkSwapchainCreateInfoKHR-compositeAlpha-parameter**
  
  `compositeAlpha` must be a valid *VkCompositeAlphaFlagBitsKHR* value

- **VUID-VkSwapchainCreateInfoKHR-presentMode-parameter**
  
  `presentMode` must be a valid *VkPresentModeKHR* value

- **VUID-VkSwapchainCreateInfoKHR-oldSwapchain-parameter**
  
  If `oldSwapchain` is not *VK_NULL_HANDLE*, `oldSwapchain` must be a valid *VkSwapchainKHR* handle.

- **VUID-VkSwapchainCreateInfoKHR-oldSwapchain-parent**
  
  If `oldSwapchain` is a valid handle, it must have been created, allocated, or retrieved from *surface*.

- **VUID-VkSwapchainCreateInfoKHR-commonparent**
  
  Both of `oldSwapchain`, and *surface* that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same *VkInstance*.

Bits which can be set in *VkSwapchainCreateInfoKHR::flags*, specifying parameters of swapchain creation, are:

```c
// Provided by VK_KHR_swapchain
typedef enum VkSwapchainCreateFlagBitsKHR {
  // Provided by VK_VERSION_1_1 with VK_KHR_swapchain
  VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = 0x00000001,
  // Provided by VK_VERSION_1_1 with VK_KHR_swapchain
  VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR = 0x00000002,
  // Provided by VK_KHR_swapchain_mutable_format
  VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR = 0x00000004,
} VkSwapchainCreateFlagBitsKHR;
```

- **VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR** specifies that images created from the swapchain (i.e. with the `swapchain` member of *VkImageSwapchainCreateInfoKHR* set to this swapchain’s handle) must use *VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT*.

- **VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR** specifies that images created from the swapchain are protected images.

- **VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR** specifies that the images of the swapchain can be used to create a *VkImageView* with a different format than what the swapchain was created with. The list of allowed image view formats is specified by adding a *VkImageFormatListCreateInfo* structure to the *pNext* chain of *VkSwapchainCreateInfoKHR*. In addition, this flag also specifies that the swapchain can be created with usage flags that are not supported for the format the swapchain is created with but are supported for at least one of the allowed image view formats.
typedef VkFlags VkSwapchainCreateFlagsKHR;

VkSwapchainCreateFlagsKHR is a bitmask type for setting a mask of zero or more VkSwapchainCreateInfoKHR.

If the pNext chain of VkSwapchainCreateInfoKHR includes a VkDeviceGroupSwapchainCreateInfoKHR structure, then that structure includes a set of device group present modes that the swapchain can be used with.

The VkDeviceGroupSwapchainCreateInfoKHR structure is defined as:

```c
typedef struct VkDeviceGroupSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupSwapchainCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **modes** is a bitfield of modes that the swapchain can be used with.

If this structure is not present, modes is considered to be VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR.

**Valid Usage (Implicit)**

- VUID-VkDeviceGroupSwapchainCreateInfoKHR-sType-sType sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-parameter modes must be a valid combination of VkDeviceGroupPresentModeFlagBitsKHR values
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-requiredbitmask modes must not be 0

If the pNext chain of VkSwapchainCreateInfoKHR includes a VkSwapchainDisplayNativeHdrCreateInfoAMD structure, then that structure includes additional swapchain creation parameters specific to display native HDR support.

The VkSwapchainDisplayNativeHdrCreateInfoAMD structure is defined as:

```c
typedef struct VkSwapchainDisplayNativeHdrCreateInfoAMD {
```
VkStructureType sType;
const void* pNext;
VkBool32 localDimmingEnable;
} VkSwapchainDisplayNativeHdrCreateInfoAMD;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **localDimmingEnable** specifies whether local dimming is enabled for the swapchain.

If the **pNext** chain of **VkSwapchainCreateInfoKHR** does not include this structure, the default value for **localDimmingEnable** is **VK_TRUE**, meaning local dimming is initially enabled for the swapchain.

**Valid Usage (Implicit)**

- VUID-VkSwapchainDisplayNativeHdrCreateInfoAMD-sType-sType
  sType must be **VK_STRUCTURE_TYPE_SWAPCHAIN_DISPLAY_NATIVE_HDR_CREATE_INFO_AMD**

**Valid Usage**

- VUID-VkSwapchainDisplayNativeHdrCreateInfoAMD-localDimmingEnable-04449
  It is only valid to set **localDimmingEnable** to **VK_TRUE** if **VkDisplayNativeHdrSurfaceCapabilitiesAMD**:localDimmingSupport is supported

The local dimming HDR setting may also be changed over the life of a swapchain by calling:

```c
// Provided by VK_AMD_display_native_hdr
void vkSetLocalDimmingAMD(
    VkDevice device,
    VkSwapchainKHR swapChain,
    VkBool32 localDimmingEnable);
```

- **device** is the device associated with **swapChain**.
- **swapChain** handle to enable local dimming.
- **localDimmingEnable** specifies whether local dimming is enabled for the swapchain.

**Valid Usage (Implicit)**

- VUID-vkSetLocalDimmingAMD-device-parameter
  device must be a valid **VkDevice** handle
- VUID-vkSetLocalDimmingAMD-swapChain-parameter
  swapChain must be a valid **VkSwapchainKHR** handle
- VUID-vkSetLocalDimmingAMD-commonparent
Both of device, and swapChain must have been created, allocated, or retrieved from the same VkInstance.

Valid Usage

- VUID-vkSetLocalDimmingAMD-localDimmingSupport-04618
  VkDisplayNativeHdrSurfaceCapabilitiesAMD::localDimmingSupport must be supported.

If the pNext chain of VkSwapchainCreateInfoKHR includes a VkSurfaceFullScreenExclusiveInfoEXT structure, then that structure specifies the application's preferred full-screen presentation behavior. If this structure is not present, fullScreenExclusive is considered to be VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT.

To enable surface counters when creating a swapchain, add a VkSwapchainCounterCreateInfoEXT structure to the pNext chain of VkSwapchainCreateInfoKHR. VkSwapchainCounterCreateInfoEXT is defined as:

```c
typedef struct VkSwapchainCounterCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceCounterFlagsEXT surfaceCounters;
} VkSwapchainCounterCreateInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- surfaceCounters is a bitmask of VkSurfaceCounterFlagBitsEXT specifying surface counters to enable for the swapchain.

Valid Usage

- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-01244
  The bits in surfaceCounters must be supported by VkSwapchainCreateInfoKHR::surface, as reported by vkGetPhysicalDeviceSurfaceCapabilities2EXT.

Valid Usage (Implicit)

- VUID-VkSwapchainCounterCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT.

- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-parameter
  surfaceCounters must be a valid combination of VkSurfaceCounterFlagBitsEXT values.

The requested counters become active when the first presentation command for the associated
swapchain is processed by the presentation engine. To query the value of an active counter, use:

```c
// Provided by VK_EXT_display_control
VkResult vkGetSwapchainCounterEXT(
    VkDevice device,
    VkSwapchainKHR swapchain,
    VkSurfaceCounterFlagBitsEXT counter,
    uint64_t* pCounterValue);
```

- `device` is the `VkDevice` associated with `swapchain`.
- `swapchain` is the swapchain from which to query the counter value.
- `counter` is a `VkSurfaceCounterFlagBitsEXT` value specifying the counter to query.
- `pCounterValue` will return the current value of the counter.

If a counter is not available because the swapchain is out of date, the implementation may return `VK_ERROR_OUT_OF_DATE_KHR`.

### Valid Usage

- VUID-vkGetSwapchainCounterEXT-swapchain-01245
  One or more present commands on `swapchain` must have been processed by the presentation engine

### Valid Usage (Implicit)

- VUID-vkGetSwapchainCounterEXT-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetSwapchainCounterEXT-swapchain-parameter
  `swapchain` must be a valid `VkSwapchainKHR` handle
- VUID-vkGetSwapchainCounterEXT-counter-parameter
  `counter` must be a valid `VkSurfaceCounterFlagBitsEXT` value
- VUID-vkGetSwapchainCounterEXT-pCounterValue-parameter
  `pCounterValue` must be a valid pointer to a `uint64_t` value
- VUID-vkGetSwapchainCounterEXT-commonparent
  Both of `device`, and `swapchain` must have been created, allocated, or retrieved from the same `VkInstance`

### Return Codes

**Success**

- `VK_SUCCESS`
Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR

To specify compression properties for the swapchain images in this swapchain, add a `VkImageCompressionControlEXT` structure to the `pNext` chain of the `VkSwapchainCreateInfoKHR` structure.

To destroy a swapchain object call:

```c
// Provided by VK_KHR_swapchain
void vkDestroySwapchainKHR(
    VkDevice device,           // device
    VkSwapchainKHR swapchain,  // swapchain
    const VkAllocationCallbacks* pAllocator);  // pAllocator
```

- `device` is the `VkDevice` associated with `swapchain`.
- `swapchain` is the swapchain to destroy.
- `pAllocator` is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).

The application must not destroy a swapchain until after completion of all outstanding operations on images that were acquired from the swapchain. `swapchain` and all associated `VkImage` handles are destroyed, and must not be acquired or used any more by the application. The memory of each `VkImage` will only be freed after that image is no longer used by the presentation engine. For example, if one image of the swapchain is being displayed in a window, the memory for that image may not be freed until the window is destroyed, or another swapchain is created for the window. Destroying the swapchain does not invalidate the parent `VkSurfaceKHR`, and a new swapchain can be created with it.

When a swapchain associated with a display surface is destroyed, if the image most recently presented to the display surface is from the swapchain being destroyed, then either any display resources modified by presenting images from any swapchain associated with the display surface must be reverted by the implementation to their state prior to the first present performed on one of these swapchains, or such resources must be left in their current state.

If `swapchain` has exclusive full-screen access, it is released before the swapchain is destroyed.

Valid Usage

- VUID-vkDestroySwapchainKHR-swapchain-01282
  All uses of presentable images acquired from `swapchain` must have completed execution
- VUID-vkDestroySwapchainKHR-swapchain-01283
  If `VkAllocationCallbacks` were provided when `swapchain` was created, a compatible set of
callbacks must be provided here

• VUID-vkDestroySwapchainKHR-swapchain-01284
  If no VkAllocationCallbacks were provided when swapchain was created, pAllocator must be NULL.

Valid Usage (Implicit)

• VUID-vkDestroySwapchainKHR-device-parameter
device must be a valid VkDevice handle

• VUID-vkDestroySwapchainKHR-swapchain-parameter
  If swapchain is not VK_NULL_HANDLE, swapchain must be a valid VkSwapchainKHR handle

• VUID-vkDestroySwapchainKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkDestroySwapchainKHR-commonparent
  Both of device, and swapchain that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkInstance

Host Synchronization

• Host access to swapchain must be externally synchronized

When the VK_KHR_display_swapchain extension is enabled, multiple swapchains that share presentable images are created by calling:

```c
// Provided by VK_KHR_display_swapchain
VkResult vkCreateSharedSwapchainsKHR(
  VkDevice device,                      // device
  uint32_t swapchainCount,              // swapchainCount
  const VkSwapchainCreateInfoKHR* pCreateInfos, // pCreateInfos
  const VkAllocationCallbacks* pAllocator, // pAllocator
  VkSwapchainKHR* pSwapchains           // pSwapchains
);
```

• device is the device to create the swapchains for.

• swapchainCount is the number of swapchains to create.

• pCreateInfos is a pointer to an array of VkSwapchainCreateInfoKHR structures specifying the parameters of the created swapchains.

• pAllocator is the allocator used for host memory allocated for the swapchain objects when there is no more specific allocator available (see Memory Allocation).

• pSwapchains is a pointer to an array of VkSwapchainKHR handles in which the created
swapchain objects will be returned.

\texttt{vkCreateSharedSwapchainsKHR} is similar to \texttt{vkCreateSwapchainKHR}, except that it takes an array of \texttt{VkSwapchainCreateInfoKHR} structures, and returns an array of swapchain objects.

The swapchain creation parameters that affect the properties and number of presentable images must match between all the swapchains. If the displays used by any of the swapchains do not use the same presentable image layout or are incompatible in a way that prevents sharing images, swapchain creation will fail with the result code \texttt{VK_ERROR_INCOMPATIBLE_DISPLAY_KHR}. If any error occurs, no swapchains will be created. Images presented to multiple swapchains must be re-acquired from all of them before transitioning away from \texttt{VK_IMAGE_LAYOUT_PRESENT_SRC_KHR}. After destroying one or more of the swapchains, the remaining swapchains and the presentable images can continue to be used.

### Valid Usage (Implicit)

- VUID-vkCreateSharedSwapchainsKHR-device-parameter
  - \texttt{device} must be a valid \texttt{VkDevice} handle

- VUID-vkCreateSharedSwapchainsKHR-pCreateInfos-parameter
  - \texttt{pCreateInfos} must be a valid pointer to an array of \texttt{swapchainCount} valid \texttt{VkSwapchainCreateInfoKHR} structures

- VUID-vkCreateSharedSwapchainsKHR-pAllocator-parameter
  - If \texttt{pAllocator} is not \texttt{NULL}, \texttt{pAllocator} must be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure

- VUID-vkCreateSharedSwapchainsKHR-pSwapchains-parameter
  - \texttt{pSwapchains} must be a valid pointer to an array of \texttt{swapchainCount} \texttt{VkSwapchainKHR} handles

- VUID-vkCreateSharedSwapchainsKHR-swapchainCount-arraylength
  - \texttt{swapchainCount} must be greater than 0

### Host Synchronization

- Host access to \texttt{pCreateInfos[\].surface} must be externally synchronized
- Host access to \texttt{pCreateInfos[\].oldSwapchain} must be externally synchronized

### Return Codes

**Success**

- \texttt{VK_SUCCESS}

**Failure**

- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}
To obtain the array of presentable images associated with a swapchain, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkGetSwapchainImagesKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint32_t* pSwapchainImageCount,
    VkImage* pSwapchainImages);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to query.
- `pSwapchainImageCount` is a pointer to an integer related to the number of presentable images available or queried, as described below.
- `pSwapchainImages` is either `NULL` or a pointer to an array of `VkImage` handles.

If `pSwapchainImages` is `NULL`, then the number of presentable images for `swapchain` is returned in `pSwapchainImageCount`. Otherwise, `pSwapchainImageCount` must point to a variable set by the user to the number of elements in the `pSwapchainImages` array, and on return the variable is overwritten with the number of structures actually written to `pSwapchainImages`. If the value of `pSwapchainImageCount` is less than the number of presentable images for `swapchain`, at most `pSwapchainImageCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available presentable images were returned.

**Valid Usage (Implicit)**

- VUID-vkGetSwapchainImagesKHR-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetSwapchainImagesKHR-swapchain-parameter
  `swapchain` must be a valid `VkSwapchainKHR` handle
- VUID-vkGetSwapchainImagesKHR-pSwapchainImageCount-parameter
  `pSwapchainImageCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetSwapchainImagesKHR-pSwapchainImages-parameter
  If the value referenced by `pSwapchainImageCount` is not 0, and `pSwapchainImages` is not `NULL`, `pSwapchainImages` must be a valid pointer to an array of `pSwapchainImageCount` `VkImage` handles
- VUID-vkGetSwapchainImagesKHR-commonparent
  Both of `device`, and `swapchain` must have been created, allocated, or retrieved from the same `VkInstance`
Images returned by `vkGetSwapchainImagesKHR` are fully backed by memory before they are passed to the application. All presentable images are initially in the `VK_IMAGE_LAYOUT_UNDEFINED` layout, thus before using presentable images, the application must transition them to a valid layout for the intended use.

Further, the lifetime of presentable images is controlled by the implementation, so applications must not destroy a presentable image. See `vkDestroySwapchainKHR` for further details on the lifetime of presentable images.

Images can also be created by using `vkCreateImage` with `VkImageSwapchainCreateInfoKHR` and bound to swapchain memory using `vkBindImageMemory2` with `VkBindImageMemorySwapchainInfoKHR`. These images can be used anywhere swapchain images are used, and are useful in logical devices with multiple physical devices to create peer memory bindings of swapchain memory. These images and bindings have no effect on what memory is presented. Unlike images retrieved from `vkGetSwapchainImagesKHR`, these images must be destroyed with `vkDestroyImage`.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkAcquireNextImageKHR(
    VkDevice device,         /* device is the device associated with swapchain. */
    VkSwapchainKHR swapchain, /* swapchain is the non-retired swapchain from which an image is being acquired. */
    uint64_t timeout,
    VkSemaphore semaphore,
    VkFence fence,
    uint32_t* pImageIndex);
```
timeout specifies how long the function waits, in nanoseconds, if no image is available.

semaphore is VK_NULL_HANDLE or a semaphore to signal.

fence is VK_NULL_HANDLE or a fence to signal.

pImageIndex is a pointer to a uint32_t in which the index of the next image to use (i.e. an index into the array of images returned by vkGetSwapchainImagesKHR) is returned.

Valid Usage

- VUID-vkAcquireNextImageKHR-swapchain-01285
  swapchain must not be in the retired state
- VUID-vkAcquireNextImageKHR-semaphore-01286
  If semaphore is not VK_NULL_HANDLE it must be unsignaled
- VUID-vkAcquireNextImageKHR-semaphore-01779
  If semaphore is not VK_NULL_HANDLE it must not have any uncompleted signal or wait operations pending
- VUID-vkAcquireNextImageKHR-fence-01287
  If fence is not VK_NULL_HANDLE it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue
- VUID-vkAcquireNextImageKHR-semaphore-01780
  semaphore and fence must not both be equal to VK_NULL_HANDLE
- VUID-vkAcquireNextImageKHR-swapchain-01802
  If the number of currently acquired images is greater than the difference between the number of images in swapchain and the value of VkSurfaceCapabilitiesKHR::minImageCount as returned by a call to vkGetPhysicalDeviceSurfaceCapabilities2KHR with the surface used to create swapchain, timeout must not be UINT64_MAX
- VUID-vkAcquireNextImageKHR-semaphore-03265
  semaphore must have a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY

Valid Usage (Implicit)

- VUID-vkAcquireNextImageKHR-device-parameter
  device must be a valid VkDevice handle
- VUID-vkAcquireNextImageKHR-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle
- VUID-vkAcquireNextImageKHR-semaphore-parameter
  If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle
- VUID-vkAcquireNextImageKHR-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle
- VUID-vkAcquireNextImageKHR-pImageIndex-parameter
  pImageIndex must be a valid pointer to a uint32_t value
- VUID-vkAcquireNextImageKHR-semaphore-parent
  2255
If semaphore is a valid handle, it must have been created, allocated, or retrieved from device.

- VUID-vkAcquireNextImageKHR-fence-parent

If fence is a valid handle, it must have been created, allocated, or retrieved from device.

- VUID-vkAcquireNextImageKHR-commonparent

Both of device, and swapchain that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkInstance.

### Host Synchronization

- Host access to swapchain must be externally synchronized
- Host access to semaphore must be externally synchronized
- Host access to fence must be externally synchronized

### Return Codes

**Success**

- VK_SUCCESS
- VK_TIMEOUT
- VK_NOT_READY
- VK_SUBOPTIMAL_KHR

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

When successful, vkAcquireNextImageKHR acquires a presentable image from swapchain that an application can use, and sets pImageIndex to the index of that image within the swapchain. The presentation engine may not have finished reading from the image at the time it is acquired, so the application must use semaphore and/or fence to ensure that the image layout and contents are not modified until the presentation engine reads have completed. If semaphore is not VK_NULL_HANDLE, the application may assume that, once vkAcquireNextImageKHR returns, the semaphore signal operation referenced by semaphore has been submitted for execution. The order in which images are acquired is implementation-dependent, and may be different than the order the images were presented.

If timeout is zero, then vkAcquireNextImageKHR does not wait, and will either successfully acquire an
image, or fail and return `VK_NOT_READY` if no image is available.

If the specified timeout period expires before an image is acquired, `vkAcquireNextImageKHR` returns `VK_TIMEOUT`. If `timeout` is `UINT64_MAX`, the timeout period is treated as infinite, and `vkAcquireNextImageKHR` will block until an image is acquired or an error occurs.

`vkAcquireNextImageKHR` should not be called if the number of images that the application has currently acquired is greater than the difference between the number of images in `swapchain` and the value of `VkSurfaceCapabilitiesKHR::minImageCount`. If `vkAcquireNextImageKHR` is called when the number of images that the application has currently acquired is less or equal than the difference between the number of images in `swapchain` and the value of `VkSurfaceCapabilitiesKHR::minImageCount`, `vkAcquireNextImageKHR` must return in finite time with an allowed `VkResult` code.

**Note**

Returning a result in finite time guarantees that the implementation cannot deadlock an application, or suspend its execution indefinitely with correct API usage. Acquiring too many images at once may block indefinitely, which is covered by valid usage when attempting to use `UINT64_MAX`. For example, a scenario here is when a compositor holds on to images which are currently being presented, and there are not any vacant images left to be acquired.

If an image is acquired successfully, `vkAcquireNextImageKHR` must either return `VK_SUCCESS` or `VK_SUBOPTIMAL_KHR`. The implementation may return `VK_SUBOPTIMAL_KHR` if the swapchain no longer matches the surface properties exactly, but can still be used for presentation.

**Note**

`VK_SUBOPTIMAL_KHR` may happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain in this state, or to re-create the swapchain to better match the platform surface properties.

If the swapchain images no longer match native surface properties, either `VK_SUBOPTIMAL_KHR` or `VK_ERROR_OUT_OF_DATE_KHR` must be returned. If `VK_ERROR_OUT_OF_DATE_KHR` is returned, no image is acquired and attempts to present previously acquired images to the swapchain will also fail with `VK_ERROR_OUT_OF_DATE_KHR`. Applications need to create a new swapchain for the surface to continue presenting if `VK_ERROR_OUT_OF_DATE_KHR` is returned.

If device loss occurs (see Lost Device) before the timeout has expired, `vkAcquireNextImageKHR` must return in finite time with either one of the allowed success codes, or `VK_ERROR_DEVICE_LOST`.

If `semaphore` is not `VK_NULL_HANDLE`, the semaphore must be unsignaled, with no signal or wait operations pending. It will become signaled when the application can use the image.

**Note**

Use of `semaphore` allows rendering operations to be recorded and submitted before the presentation engine has completed its use of the image.
If `fence` is not equal to `VK_NULL_HANDLE`, the fence must be unsignaled, with no signal operations pending. It will become signaled when the application can use the image.

**Note**

Applications should not rely on `vkAcquireNextImageKHR` blocking in order to meter their rendering speed. The implementation may return from this function immediately regardless of how many presentation requests are queued, and regardless of when queued presentation requests will complete relative to the call. Instead, applications can use `fence` to meter their frame generation work to match the presentation rate.

An application must wait until either the semaphore or `fence` is signaled before accessing the image’s data.

**Note**

When the presentable image will be accessed by some stage S, the recommended idiom for ensuring correct synchronization is:

- The `VkSubmitInfo` used to submit the image layout transition for execution includes `vkAcquireNextImageKHR::semaphore` in its `pWaitSemaphores` member, with the corresponding element of `pWaitDstStageMask` including S.
- The synchronization command that performs any necessary image layout transition includes S in both the `srcStageMask` and `dstStageMask`.

After a successful return, the image indicated by `pImageIndex` and its data will be unmodified compared to when it was presented.

**Note**

Exclusive ownership of presentable images corresponding to a swapchain created with `VK_SHARING_MODE_EXCLUSIVE` as defined in Resource Sharing is not altered by a call to `vkAcquireNextImageKHR`. That means upon the first acquisition from such a swapchain presentable images are not owned by any queue family, while at subsequent acquisitions the presentable images remain owned by the queue family the image was previously presented on.

The possible return values for `vkAcquireNextImageKHR` depend on the `timeout` provided:

- `VK_SUCCESS` is returned if an image became available.
- `VK_ERROR_SURFACE_LOST_KHR` is returned if the surface becomes no longer available.
- `VK_NOT_READY` is returned if `timeout` is zero and no image was available.
- `VK_TIMEOUT` is returned if `timeout` is greater than zero and less than `UINT64_MAX`, and no image became available within the time allowed.
- `VK_SUBOPTIMAL_KHR` is returned if an image became available, and the swapchain no longer matches the surface properties exactly, but can still be used to present to the surface successfully.
Note
This may happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain indefinitely or temporarily in this state, or to recreate the swapchain to better match the platform surface properties.

• VK_ERROR_OUT_OF_DATE_KHR is returned if the surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications must query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.

If the native surface and presented image sizes no longer match, presentation may fail. If presentation does succeed, the mapping from the presented image to the native surface is implementation-defined. It is the application’s responsibility to detect surface size changes and react appropriately. If presentation fails because of a mismatch in the surface and presented image sizes, a VK_ERROR_OUT_OF_DATE_KHR error will be returned.

Note
For example, consider a 4x3 window/surface that gets resized to be 3x4 (taller than wider). On some window systems, the portion of the window/surface that was previously and still is visible (the 3x3 part) will contain the same contents as before, while the remaining parts of the window will have undefined contents. Other window systems may squash/stretch the image to fill the new window size without any undefined contents, or apply some other mapping.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```cpp
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
VkResult vkAcquireNextImage2KHR(
    VkDevice device, const VkAcquireNextImageInfoKHR* pAcquireInfo, uint32_t* pImageIndex);
```

• device is the device associated with swapchain.

• pAcquireInfo is a pointer to a VkAcquireNextImageInfoKHR structure containing parameters of the acquire.

• pImageIndex is a pointer to a uint32_t that is set to the index of the next image to use.

Valid Usage

• VUID-vkAcquireNextImage2KHR-swapchain-01803
If the number of currently acquired images is greater than the difference between the number of images in the swapchain member of pAcquireInfo and the value of
VkSurfaceCapabilitiesKHR::minImageCount as returned by a call to vkGetPhysicalDeviceSurfaceCapabilities2KHR with the surface used to create swapchain, the timeout member of pAcquireInfo must not be UINT64_MAX

Valid Usage (Implicit)

- VUID-vkAcquireNextImage2KHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkAcquireNextImage2KHR-pAcquireInfo-parameter
  pAcquireInfo must be a valid pointer to a valid VkAcquireNextImageInfoKHR structure

- VUID-vkAcquireNextImage2KHR-pImageIndex-parameter
  pImageIndex must be a valid pointer to a uint32_t value

Return Codes

Success

- VK_SUCCESS
- VK_TIMEOUT
- VK_NOT_READY
- VK_SUBOPTIMAL_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

The VkAcquireNextImageInfoKHR structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkAcquireNextImageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
    uint64_t timeout;
    VkSemaphore semaphore;
    VkFence fence;
    uint32_t deviceMask;
} VkAcquireNextImageInfoKHR;
```
• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **swapchain** is a non-retired swapchain from which an image is acquired.
• **timeout** specifies how long the function waits, in nanoseconds, if no image is available.
• **semaphore** is **VK_NULL_HANDLE** or a semaphore to signal.
• **fence** is **VK_NULL_HANDLE** or a fence to signal.
• **deviceMask** is a mask of physical devices for which the swapchain image will be ready to use when the semaphore or fence is signaled.

If **vkAcquireNextImageKHR** is used, the device mask is considered to include all physical devices in the logical device.

---

**Note**

**vkAcquireNextImage2KHR** signals at most one semaphore, even if the application requests waiting for multiple physical devices to be ready via the **deviceMask**. However, only a single physical device **can** wait on that semaphore, since the semaphore becomes unsignaled when the wait succeeds. For other physical devices to wait for the image to be ready, it is necessary for the application to submit semaphore signal operation(s) to that first physical device to signal additional semaphore(s) after the wait succeeds, which the other physical device(s) **can** wait upon.

---

### Valid Usage

- **VUID-VkAcquireNextImageInfoKHR-swapchain-01675**
  
  **swapchain** **must** not be in the retired state

- **VUID-VkAcquireNextImageInfoKHR-semaphore-01288**
  
  If **semaphore** is not **VK_NULL_HANDLE** it **must** be unsignaled

- **VUID-VkAcquireNextImageInfoKHR-semaphore-01781**
  
  If **semaphore** is not **VK_NULL_HANDLE** it **must** not have any uncompleted signal or wait operations pending

- **VUID-VkAcquireNextImageInfoKHR-fence-01289**
  
  If **fence** is not **VK_NULL_HANDLE** it **must** be unsignaled and **must** not be associated with any other queue command that has not yet completed execution on that queue

- **VUID-VkAcquireNextImageInfoKHR-semaphore-01782**
  
  **semaphore** and **fence** **must** not both be equal to **VK_NULL_HANDLE**

- **VUID-VkAcquireNextImageInfoKHR-deviceMask-01290**
  
  **deviceMask** **must** be a valid device mask

- **VUID-VkAcquireNextImageInfoKHR-deviceMask-01291**
  
  **deviceMask** **must** not be zero
• VUID-VkAcquireNextImageInfoKHR-semaphore-03266
  
  **semaphore must** have a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_BINARY**

---

**Valid Usage (Implicit)**

• VUID-VkAcquireNextImageInfoKHR-sType-sType
  
  **sType must** be **VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR**

• VUID-VkAcquireNextImageInfoKHR-pNext-pNext
  
  **pNext must** be **NULL**

• VUID-VkAcquireNextImageInfoKHR-swapchain-parameter
  
  **swapchain must** be a valid **VkSwapchainKHR** handle

• VUID-VkAcquireNextImageInfoKHR-semaphore-parameter
  
  If **semaphore** is not **VK_NULL_HANDLE**, **semaphore must** be a valid **VkSemaphore** handle

• VUID-VkAcquireNextImageInfoKHR-fence-parameter
  
  If **fence** is not **VK_NULL_HANDLE**, **fence must** be a valid **VkFence** handle

• VUID-VkAcquireNextImageInfoKHR-commonparent
  
  Each of **fence**, **semaphore**, and **swapchain** that are valid handles of non-ignored parameters
  **must** have been created, allocated, or retrieved from the same **VkInstance**

---

**Host Synchronization**

• Host access to **swapchain** **must** be externally synchronized

• Host access to **semaphore** **must** be externally synchronized

• Host access to **fence** **must** be externally synchronized

---

After queueing all rendering commands and transitioning the image to the correct layout, to queue an image for presentation, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkQueuePresentKHR(
    VkQueue queue,
    const VkPresentInfoKHR* pPresentInfo);
```

• **queue** is a queue that is capable of presentation to the target surface’s platform on the same device as the image’s swapchain.

• **pPresentInfo** is a pointer to a **VkPresentInfoKHR** structure specifying parameters of the presentation.

---

**Note**

There is no requirement for an application to present images in the same order that they were acquired - applications can arbitrarily present any image that is
Valid Usage

- **VUID-vkQueuePresentKHR-pSwapchains-01292**
  Each element of `pSwapchains` member of `pPresentInfo` must be a swapchain that is created for a surface for which presentation is supported from `queue` as determined using a call to `vkGetPhysicalDeviceSurfaceSupportKHR`.

- **VUID-vkQueuePresentKHR-pSwapchains-01293**
  If more than one member of `pSwapchains` was created from a display surface, all display surfaces referenced that refer to the same display must use the same display mode.

- **VUID-vkQueuePresentKHR-pWaitSemaphores-01294**
  When a semaphore wait operation referring to a binary semaphore defined by the elements of the `pWaitSemaphores` member of `pPresentInfo` executes on `queue`, there must be no other queues waiting on the same semaphore.

- **VUID-vkQueuePresentKHR-pWaitSemaphores-01295**
  All elements of the `pWaitSemaphores` member of `pPresentInfo` must be semaphores that are signaled, or have semaphore signal operations previously submitted for execution.

- **VUID-vkQueuePresentKHR-pWaitSemaphores-03267**
  All elements of the `pWaitSemaphores` member of `pPresentInfo` must be created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`.

- **VUID-vkQueuePresentKHR-pWaitSemaphores-03268**
  All elements of the `pWaitSemaphores` member of `pPresentInfo` must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) must have also been submitted for execution.

Any writes to memory backing the images referenced by the `pImageIndices` and `pSwapchains` members of `pPresentInfo`, that are available before `vkQueuePresentKHR` is executed, are automatically made visible to the read access performed by the presentation engine. This automatic visibility operation for an image happens-after the semaphore signal operation, and happens-before the presentation engine accesses the image.

Queueing an image for presentation defines a set of `queue operations`, including waiting on the semaphores and submitting a presentation request to the presentation engine. However, the scope of this set of `queue operations` does not include the actual processing of the image by the presentation engine.

**Note**

The origin of the native orientation of the surface coordinate system is not specified in the Vulkan specification; it depends on the platform. For most platforms the origin is by default upper-left, meaning the pixel of the presented `VkImage` at coordinates (0,0) would appear at the upper left pixel of the platform surface (assuming `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, and the display standing the right way up).

```plaintext
2263
```
If `vkQueuePresentKHR` fails to enqueue the corresponding set of queue operations, it **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation **must** ensure that the state and contents of any resources or synchronization primitives referenced is unaffected by the call or its failure.

If `vkQueuePresentKHR` fails in such a way that the implementation is unable to make that guarantee, the implementation **must** return `VK_ERROR_DEVICE_LOST`.

However, if the presentation request is rejected by the presentation engine with an error `VK_ERROR_OUT_OF_DATE_KHR`, `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`, or `VK_ERROR_SURFACE_LOST_KHR`, the set of queue operations are still considered to be enqueued and thus any semaphore wait operation specified in `VkPresentInfoKHR` will execute when the corresponding queue operation is complete.

Calls to `vkQueuePresentKHR` **may** block, but **must** return in finite time.

If any swapchain member of `pPresentInfo` was created with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATIONCONTROLLED_EXT`, `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` will be returned if that swapchain does not have exclusive full-screen access, possibly for implementation-specific reasons outside of the application’s control.

### Valid Usage (Implicit)

- VUID-vkQueuePresentKHR-queue-parameter
  
  queue **must** be a valid `VkQueue` handle

- VUID-vkQueuePresentKHR-pPresentInfo-parameter
  
  `pPresentInfo` **must** be a valid pointer to a valid `VkPresentInfoKHR` structure

### Host Synchronization

- Host access to `queue` **must** be externally synchronized
- Host access to `pPresentInfo->pWaitSemaphores[]` **must** be externally synchronized
- Host access to `pPresentInfo->pSwapchains[]` **must** be externally synchronized

### Command Properties

2264
Return Codes

Success

- VK_SUCCESS
- VK_SUBOPTIMAL_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

The VkPresentInfoKHR structure is defined as:

```c
// Provided by VK_KHR_swapchain
typedef struct VkPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t swapchainCount;
    const VkSwapchainKHR* pSwapchains;
    const uint32_t* pImageIndices;
    VkResult* pResults;
} VkPresentInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores to wait for before issuing the present request. The number may be zero.
- `pWaitSemaphores` is `NULL` or a pointer to an array of `VkSemaphore` objects with `waitSemaphoreCount` entries, and specifies the semaphores to wait for before issuing the present request.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pSwapchains` is a pointer to an array of `VkSwapchainKHR` objects with `swapchainCount` entries. A given swapchain must not appear in this list more than once.
- `pImageIndices` is a pointer to an array of indices into the array of each swapchain's presentable images, with `swapchainCount` entries. Each entry in this array identifies the image to present on the corresponding entry in the `pSwapchains` array.
- `pResults` is a pointer to an array of `VkResult` typed elements with `swapchainCount` entries. Applications that do not need per-swapchain results can use `NULL` for `pResults`. If non-NULL, each
entry in pResults will be set to the VkResult for presenting the swapchain corresponding to the same index in pSwapchains.

Before an application can present an image, the image's layout must be transitioned to the VK_IMAGE_LAYOUT_PRESENT_SRC_KHR layout, or for a shared presentable image the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR layout.

Note
When transitioning the image to VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR or VK_IMAGE_LAYOUT_PRESENT_SRC_KHR, there is no need to delay subsequent processing, or perform any visibility operations (as vkQueuePresentKHR performs automatic visibility operations). To achieve this, the dstAccessMask member of the VkImageMemoryBarrier should be set to 0, and the dstStageMask parameter should be set to VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT.

Valid Usage

• VUID-VkPresentInfoKHR-pImageIndices-01430
  Each element of pImageIndices must be the index of a presentable image acquired from the swapchain specified by the corresponding element of the pSwapchains array, and the presented image subresource must be in the VK_IMAGE_LAYOUT_PRESENT_SRC_KHR or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR layout at the time the operation is executed on a VkDevice.

• VUID-VkPresentInfoKHR-pNext-06235
  If a VkPresentIdKHR structure is included in the pNext chain, and the presentId feature is not enabled, each presentIds entry in that structure must be NULL.

Valid Usage (Implicit)

• VUID-VkPresentInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PRESENT_INFO_KHR

• VUID-VkPresentInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceGroupPresentInfoKHR, VkDisplayPresentInfoKHR, VkPresentFrameTokenGGP, VkPresentIdKHR, VkPresentRegionsKHR, or VkPresentTimesInfoGOOGLE.

• VUID-VkPresentInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique.

• VUID-VkPresentInfoKHR-pWaitSemaphores-parameter
  If waitSemaphoreCount is not 0, pWaitSemaphores must be a valid pointer to an array of waitSemaphoreCount valid VkSemaphore handles.

• VUID-VkPresentInfoKHR-pSwapchains-parameter
  pSwapchains must be a valid pointer to an array of swapchainCount valid VkSwapchainKHR handles.
When the `VK_KHR_incremental_present` extension is enabled, additional fields can be specified that allow an application to specify that only certain rectangular regions of the presentable images of a swapchain are changed. This is an optimization hint that a presentation engine may use to only update the region of a surface that is actually changing. The application still must ensure that all pixels of a presented image contain the desired values, in case the presentation engine ignores this hint. An application can provide this hint by adding a `VkPresentRegionsKHR` structure to the `pNext` chain of the `VkPresentInfoKHR` structure.

The `VkPresentRegionsKHR` structure is defined as:

```c
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionsKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentRegionKHR* pRegions;
} VkPresentRegionsKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pRegions` is `NULL` or a pointer to an array of `VkPresentRegionKHR` elements with `swapchainCount` entries. If not `NULL`, each element of `pRegions` contains the region that has changed since the last present to the swapchain in the corresponding entry in the `VkPresentInfoKHR::pSwapchains` array.

### Valid Usage

- **VUID-VkPresentRegionsKHR-swapchainCount-01260**
  swapchainCount must be the same value as `VkPresentInfoKHR::swapchainCount`, where `VkPresentInfoKHR` is included in the `pNext` chain of this `VkPresentRegionsKHR` structure
Valid Usage (Implicit)

- VUID-VkPresentRegionsKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR

- VUID-VkPresentRegionsKHR-pRegions-parameter
  If pRegions is not NULL, pRegions must be a valid pointer to an array of swapchainCount valid VkPresentRegionKHR structures

- VUID-VkPresentRegionsKHR-swapchainCount-arraylength
  swapchainCount must be greater than 0

For a given image and swapchain, the region to present is specified by the VkPresentRegionKHR structure, which is defined as:

```c
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionKHR {
    uint32_t rectangleCount;
    const VkRectLayerKHR* pRectangles;
} VkPresentRegionKHR;
```

- rectangleCount is the number of rectangles in pRectangles, or zero if the entire image has changed and should be presented.

- pRectangles is either NULL or a pointer to an array of VkRectLayerKHR structures. The VkRectLayerKHR structure is the framebuffer coordinates, plus layer, of a portion of a presentable image that has changed and must be presented. If non-NULL, each entry in pRectangles is a rectangle of the given image that has changed since the last image was presented to the given swapchain. The rectangles must be specified relative to VkSurfaceCapabilitiesKHR::currentTransform, regardless of the swapchain’s preTransform. The presentation engine will apply the preTransform transformation to the rectangles, along with any further transformation it applies to the image content.

Valid Usage (Implicit)

- VUID-VkPresentRegionKHR-pRectangles-parameter
  If rectangleCount is not 0, and pRectangles is not NULL, pRectangles must be a valid pointer to an array of rectangleCount valid VkRectLayerKHR structures

The VkRectLayerKHR structure is defined as:

```c
// Provided by VK_KHR_incremental_present
typedef struct VkRectLayerKHR {
    VkOffset2D offset;
    VkExtent2D extent;
    uint32_t layer;
} VkRectLayerKHR;
```
• **offset** is the origin of the rectangle, in pixels.
• **extent** is the size of the rectangle, in pixels.
• **layer** is the layer of the image. For images with only one layer, the value of **layer** must be 0.

Some platforms allow the size of a surface to change, and then scale the pixels of the image to fit the surface. **VkRectLayerKHR** specifies pixels of the swapchain's image(s), which will be constant for the life of the swapchain.

**Valid Usage**

- VUID-VkRectLayerKHR-offset-04864
  The sum of **offset** and **extent**, after being transformed according to the **preTransform** member of the **VkSwapchainCreateInfoKHR** structure, must be no greater than the **imageExtent** member of the **VkSwapchainCreateInfoKHR** structure passed to **vkCreateSwapchainKHR**

- VUID-VkRectLayerKHR-layer-01262
  **layer** must be less than the **imageArrayLayers** member of the **VkSwapchainCreateInfoKHR** structure passed to **vkCreateSwapchainKHR**

When the **VK_KHR_display_swapchain** extension is enabled, additional fields can be specified when presenting an image to a swapchain by setting **VkPresentInfoKHR::pNext** to point to a **VkDisplayPresentInfoKHR** structure.

The **VkDisplayPresentInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_display_swapchain
typedef struct VkDisplayPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkRect2D srcRect;
    VkRect2D dstRect;
    VkBool32 persistent;
} VkDisplayPresentInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcRect** is a rectangular region of pixels to present. It must be a subset of the image being presented. If **VkDisplayPresentInfoKHR** is not specified, this region will be assumed to be the entire presentable image.
- **dstRect** is a rectangular region within the visible region of the swapchain's display mode. If **VkDisplayPresentInfoKHR** is not specified, this region will be assumed to be the entire visible region of the swapchain's mode. If the specified rectangle is a subset of the display mode's
Visible region, content from display planes below the swapchain's plane will be visible outside the rectangle. If there are no planes below the swapchain’s, the area outside the specified rectangle will be black. If portions of the specified rectangle are outside of the display’s visible region, pixels mapping only to those portions of the rectangle will be discarded.

- **Persistent**: If this is `VK_TRUE`, the display engine will enable buffered mode on displays that support it. This allows the display engine to stop sending content to the display until a new image is presented. The display will instead maintain a copy of the last presented image. This allows less power to be used, but may increase presentation latency. If `VkDisplayPresentInfoKHR` is not specified, persistent mode will not be used.

If the extent of the `srcRect` and `dstRect` are not equal, the presented pixels will be scaled accordingly.

### Valid Usage

- **VUID-VkDisplayPresentInfoKHR-srcRect-01257**
  - `srcRect` must specify a rectangular region that is a subset of the image being presented

- **VUID-VkDisplayPresentInfoKHR-dstRect-01258**
  - `dstRect` must specify a rectangular region that is a subset of the `visibleRegion` parameter of the display mode the swapchain being presented uses

- **VUID-VkDisplayPresentInfoKHR-persistentContent-01259**
  - If the `persistentContent` member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display the present operation targets is `VK_FALSE`, then `persistent` must be `VK_FALSE`

### Valid Usage (Implicit)

- **VUID-VkDisplayPresentInfoKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR`

If the `pNext` chain of `VkPresentInfoKHR` includes a `VkDeviceGroupPresentInfoKHR` structure, then that structure includes an array of device masks and a device group present mode.

The `VkDeviceGroupPresentInfoKHR` structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkDeviceGroupPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const uint32_t* pDeviceMasks;
    VkDeviceGroupPresentModeFlagBitsKHR mode;
} VkDeviceGroupPresentInfoKHR;
```
- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **swapchainCount** is zero or the number of elements in **pDeviceMasks**.
- **pDeviceMasks** is a pointer to an array of device masks, one for each element of VkPresentInfoKHR::pSwapchains.
- **mode** is a VkDeviceGroupPresentModeFlagBitsKHR value specifying the device group present mode that will be used for this present.

If **mode** is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR, then each element of **pDeviceMasks** selects which instance of the swapchain image is presented. Each element of **pDeviceMasks** must have exactly one bit set, and the corresponding physical device must have a presentation engine as reported by VkDeviceGroupPresentCapabilitiesKHR.

If **mode** is VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR, then each element of **pDeviceMasks** selects which instance of the swapchain image is presented. Each element of **pDeviceMasks** must have exactly one bit set, and some physical device in the logical device must include that bit in its VkDeviceGroupPresentCapabilitiesKHR::presentMask.

If **mode** is VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR, then each element of **pDeviceMasks** selects which instances of the swapchain image are component-wise summed and the sum of those images is presented. If the sum in any component is outside the representable range, the value of that component is undefined. Each element of **pDeviceMasks** must have a value for which all set bits are set in one of the elements of VkDeviceGroupPresentCapabilitiesKHR::presentMask.

If **mode** is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR, then each element of **pDeviceMasks** selects which instance(s) of the swapchain images are presented. For each bit set in each element of **pDeviceMasks**, the corresponding physical device must have a presentation engine as reported by VkDeviceGroupPresentCapabilitiesKHR.

If VkDeviceGroupPresentInfoKHR is not provided or swapchainCount is zero then the masks are considered to be 1. If VkDeviceGroupPresentInfoKHR is not provided, **mode** is considered to be VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR.

## Valid Usage

- VUID-VkDeviceGroupPresentInfoKHR-swapchainCount-01297
  swapchainCount must equal 0 or VkPresentInfoKHR::swapchainCount

- VUID-VkDeviceGroupPresentInfoKHR-mode-01298
  If **mode** is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR, then each element of **pDeviceMasks** must have exactly one bit set, and the corresponding element of VkDeviceGroupPresentCapabilitiesKHR::presentMask must be non-zero

- VUID-VkDeviceGroupPresentInfoKHR-mode-01299
  If **mode** is VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR, then each element of **pDeviceMasks** must have exactly one bit set, and some physical device in the logical device must include that bit in its VkDeviceGroupPresentCapabilitiesKHR::presentMask

- VUID-VkDeviceGroupPresentInfoKHR-mode-01300
If mode is VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR, then each element of pDeviceMasks must have a value for which all set bits are set in one of the elements of VkDeviceGroupPresentCapabilitiesKHR::presentMask

• VUID-VkDeviceGroupPresentInfoKHR-mode-01301
  If mode is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR, then for each bit set in each element of pDeviceMasks, the corresponding element of VkDeviceGroupPresentCapabilitiesKHR::presentMask must be non-zero

• VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-01302
  The value of each element of pDeviceMasks must be equal to the device mask passed in VkAcquireNextImageInfoKHR::deviceMask when the image index was last acquired

• VUID-VkDeviceGroupPresentInfoKHR-mode-01303
  mode must have exactly one bit set, and that bit must have been included in VkDeviceGroupSwapchainCreateInfoKHR::modes

Valid Usage (Implicit)

• VUID-VkDeviceGroupPresentInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR

• VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-parameter
  If swapchainCount is not 0, pDeviceMasks must be a valid pointer to an array of swapchainCount uint32_t values

• VUID-VkDeviceGroupPresentInfoKHR-mode-parameter
  mode must be a valid VkDeviceGroupPresentModeFlagBitsKHR value

When the VK_GOOGLE_display_timing extension is enabled, additional fields can be specified that allow an application to specify the earliest time that an image should be displayed. This allows an application to avoid stutter that is caused by an image being displayed earlier than planned. Such stuttering can occur with both fixed and variable-refresh-rate displays, because stuttering occurs when the geometry is not correctly positioned for when the image is displayed. An application can instruct the presentation engine that an image should not be displayed earlier than a specified time by adding a VkPresentTimesInfoGOOGLE structure to the pNext chain of the VkPresentInfoKHR structure.

The VkPresentTimesInfoGOOGLE structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPresentTimesInfoGOOGLE {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentTimeGOOGLE* pTimes;
} VkPresentTimesInfoGOOGLE;
```

• sType is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.

• **swapchainCount** is the number of swapchains being presented to by this command.

• **pTimes** is NULL or a pointer to an array of **VkPresentTimeGOOGLE** elements with **swapchainCount** entries. If not NULL, each element of **pTimes** contains the earliest time to present the image corresponding to the entry in the **VkPresentInfoKHR::pImageIndices** array.

## Valid Usage

- VUID-VkPresentTimesInfoGOOGLE-swapchainCount-01247
  
  **swapchainCount** must be the same value as **VkPresentInfoKHR::swapchainCount**, where **VkPresentInfoKHR** is included in the **pNext** chain of this **VkPresentTimesInfoGOOGLE** structure.

## Valid Usage (Implicit)

- VUID-VkPresentTimesInfoGOOGLE-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_PRESENT_TIMES_INFO_GOOGLE**

- VUID-VkPresentTimesInfoGOOGLE-pTimes-parameter
  
  If **pTimes** is not NULL, **pTimes** must be a valid pointer to an array of **swapchainCount** **VkPresentTimeGOOGLE** structures

- VUID-VkPresentTimesInfoGOOGLE-swapchainCount-arraylength
  
  **swapchainCount** must be greater than 0

The **VkPresentTimeGOOGLE** structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPresentTimeGOOGLE {
    uint32_t presentID;
    uint64_t desiredPresentTime;
} VkPresentTimeGOOGLE;
```

• **presentID** is an application-provided identification value, that can be used with the results of **vkGetPastPresentationTimingGOOGLE**, in order to uniquely identify this present. In order to be useful to the application, it should be unique within some period of time that is meaningful to the application.

• **desiredPresentTime** specifies that the image given should not be displayed to the user any earlier than this time. **desiredPresentTime** is a time in nanoseconds, relative to a monotonically-increasing clock (e.g. **CLOCK_MONOTONIC** (see **clock_gettime(2)**) on Android and Linux). A value of zero specifies that the presentation engine may display the image at any time. This is useful when the application desires to provide **presentID**, but does not need a specific **desiredPresentTime**.

The **VkPresentIdKHR** structure is defined as:
typedef struct VkPresentIdKHR {
    VkStructureType     sType;
    const void*          pNext;
    uint32_t             swapchainCount;
    const uint64_t*      pPresentIds;
} VkPresentIdKHR;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• swapchainCount is the number of swapchains being presented to the vkQueuePresentKHR command.
• pPresentIds is NULL or a pointer to an array of uint64_t with swapchainCount entries. If not NULL, each non-zero value in pPresentIds specifies the present id to be associated with the presentation of the swapchain with the same index in the vkQueuePresentKHR call.

For applications to be able to reference specific presentation events queued by a call to vkQueuePresentKHR, an identifier needs to be associated with them. When the presentId feature is enabled, applications can include the VkPresentIdKHR structure in the pNext chain of the VkPresentInfoKHR structure to supply identifiers.

Each VkSwapchainKHR has a presentId associated with it. This value is initially set to zero when the VkSwapchainKHR is created.

When a VkPresentIdKHR structure with a non-NULL pPresentIds is included in the pNext chain of a VkPresentInfoKHR structure, each pSwapchains entry has a presentId associated in the pPresentIds array at the same index as the swapchain in the pSwapchains array. If this presentId is non-zero, then the application can later use this value to refer to that image presentation. A value of zero indicates that this presentation has no associated presentId. A non-zero presentId must be greater than any non-zero presentId passed previously by the application for the same swapchain.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the presentId value, but implementations should make this as close as possible to the presentation of the first pixel in the new image to the user.

Valid Usage

• VUID-VkPresentIdKHR-swapchainCount-04998
  swapchainCount must be the same value as VkPresentInfoKHR::swapchainCount, where this VkPresentIdKHR is in the pNext chain of the VkPresentInfoKHR structure

• VUID-VkPresentIdKHR-presentIds-04999
  Each presentIds entry must be greater than any previous presentIds entry passed for the associated pSwapchains entry
Valid Usage ( Implicit)

- **VUID-VkPresentIdKHR-sType** sType **must** be **VK_STRUCTURE_TYPE_PRESENT_ID_KHR**

- **VUID-VkPresentIdKHR-pPresentIds**  
  If pPresentIds is not NULL, pPresentIds **must** be a valid pointer to an array of swapchainCount uint64_t values

- **VUID-VkPresentIdKHR-swapchainCount** arraylength swapchainCount **must** be greater than 0

When the **presentWait** feature is enabled, an application **can** wait for an image to be presented to the user by first specifying a presentId for the target presentation by adding a VkPresentIdKHR structure to the pNext chain of the VkPresentInfoKHR structure and then waiting for that presentation to complete by calling:

```c
// Provided by VK_KHR_present_wait
VkResult vkWaitForPresentKHR(VkDevice device, VkSwapchainKHR swapchain, uint64_t presentId, uint64_t timeout);
```

- **device** is the device associated with swapchain.
- **swapchain** is the non-retired swapchain on which an image was queued for presentation.
- **presentId** is the presentation presentId to wait for.
- **timeout** is the timeout period in units of nanoseconds. timeout is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and may be longer than the requested period.

vkWaitForPresentKHR waits for the presentId associated with swapchain to be increased in value so that it is at least equal to presentId.

For **VK_PRESENT_MODE_MAILBOX_KHR** (or other present mode where images may be replaced in the presentation queue) any wait of this type associated with such an image **must** be signaled no later than a wait associated with the replacing image would be signaled.

When the presentation has completed, the presentId associated with the related pSwapchains entry will be increased in value so that it is at least equal to the value provided in the VkPresentIdKHR structure.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the presentId value, but implementations **should** make this as close as possible to the presentation of the first pixel in the new image to the user.

The call to vkWaitForPresentKHR will block until either the presentId associated with swapchain is
greater than or equal to \( \text{presentId} \), or \( \text{timeout} \) nanoseconds passes. When the swapchain becomes OUT_OF_DATE, the call will either return \( \text{VK_SUCCESS} \) (if the image was delivered to the presentation engine and may have been presented to the user) or will return early with status \( \text{VK_ERROR_OUT_OF_DATE_KHR} \) (if the image was not presented to the user).

As an exception to the normal rules for objects which are externally synchronized, the swapchain passed to \( \text{vkWaitForPresentKHR} \) may be simultaneously used by other threads in calls to functions other than \( \text{vkDestroySwapchainKHR} \). Access to the swapchain data associated with this extension must be atomic within the implementation.

### Valid Usage

- VUID-vkWaitForPresentKHR-swapchain-04997
  - swapchain must not be in the retired state
- VUID-vkWaitForPresentKHR-presentWait-06234
  - The presentWait feature must be enabled

### Valid Usage (Implicit)

- VUID-vkWaitForPresentKHR-device-parameter
  - device must be a valid \( \text{VkDevice} \) handle
- VUID-vkWaitForPresentKHR-swapchain-parameter
  - swapchain must be a valid \( \text{VkSwapchainKHR} \) handle
- VUID-vkWaitForPresentKHR-commonparent
  - Both of device, and swapchain must have been created, allocated, or retrieved from the same \( \text{VkInstance} \)

### Host Synchronization

- Host access to swapchain must be externally synchronized

### Return Codes

**Success**

- \( \text{VK_SUCCESS} \)
- \( \text{VK_TIMEOUT} \)
- \( \text{VK_SUBOPTIMAL_KHR} \)

**Failure**

- \( \text{VK_ERROR_OUT_OF_HOST_MEMORY} \)
- \( \text{VK_ERROR_OUT_OF_DEVICE_MEMORY} \)
- \( \text{VK_ERROR_DEVICE_LOST} \)
When the `VK_GGP_frame_token` extension is enabled, a Google Games Platform frame token can be specified when presenting an image to a swapchain by adding a `VkPresentFrameTokenGGP` structure to the `pNext` chain of the `VkPresentInfoKHR` structure.

The `VkPresentFrameTokenGGP` structure is defined as:

```c
// Provided by VK_GGP_frame_token
typedef struct VkPresentFrameTokenGGP {
    VkStructureType sType;
    const void* pNext;
    GgpFrameToken frameToken;
} VkPresentFrameTokenGGP;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `frameToken` is the Google Games Platform frame token.

**Valid Usage**

- `VUID-VkPresentFrameTokenGGP-frameToken-02680`
  
  `frameToken` must be a valid `GgpFrameToken`

**Valid Usage (Implicit)**

- `VUID-VkPresentFrameTokenGGP-sType-sType`
  
  `sType` must be `VK_STRUCTURE_TYPE_PRESENT_FRAME_TOKEN_GGP`

`vkQueuePresentKHR`, releases the acquisition of the images referenced by `imageIndices`. The queue family corresponding to the queue `vkQueuePresentKHR` is executed on must have ownership of the presented images as defined in Resource Sharing. `vkQueuePresentKHR` does not alter the queue family ownership, but the presented images must not be used again before they have been reacquired using `vkAcquireNextImageKHR`.

The processing of the presentation happens in issue order with other queue operations, but semaphores have to be used to ensure that prior rendering and other commands in the specified queue complete before the presentation begins. The presentation command itself does not delay processing of subsequent commands on the queue, however, presentation requests sent to a particular queue are always performed in order. Exact presentation timing is controlled by the semantics of the presentation engine and native platform in use.
If an image is presented to a swapchain created from a display surface, the mode of the associated display will be updated, if necessary, to match the mode specified when creating the display surface. The mode switch and presentation of the specified image will be performed as one atomic operation.

The result codes `VK_ERROR_OUT_OF_DATE_KHR` and `VK_SUBOPTIMAL_KHR` have the same meaning when returned by `vkQueuePresentKHR` as they do when returned by `vkAcquireNextImageKHR`. If multiple swapchains are presented, the result code is determined applying the following rules in order:

- If the device is lost, `VK_ERROR_DEVICE_LOST` is returned.
- If any of the target surfaces are no longer available the error `VK_ERROR_SURFACE_LOST_KHR` is returned.
- If any of the presents would have a result of `VK_ERROR_OUT_OF_DATE_KHR` if issued separately then `VK_ERROR_OUT_OF_DATE_KHR` is returned.
- If any of the presents would have a result of `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` if issued separately then `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` is returned.
- If any of the presents would have a result of `VK_SUBOPTIMAL_KHR` if issued separately then `VK_SUBOPTIMAL_KHR` is returned.
- Otherwise `VK_SUCCESS` is returned.

Presentation is a read-only operation that will not affect the content of the presentable images. Upon reacquiring the image and transitioning it away from the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, the contents will be the same as they were prior to transitioning the image to the present source layout and presenting it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>The application can continue to present any acquired images from a retired swapchain as long as the swapchain has not entered a state that causes <code>vkQueuePresentKHR</code> to return <code>VK_ERROR_OUT_OF_DATE_KHR</code>.</td>
</tr>
</tbody>
</table>

### 33.11. Hdr Metadata

This section describes how to improve color reproduction of content to better reproduce colors as seen on the reference monitor. Definitions below are from the associated SMPTE 2086, CTA 861.3 and CIE 15:2004 specifications.

To provide Hdr metadata to an implementation, call:

```c
// Provided by VK_EXT_hdr_metadata
void vkSetHdrMetadataEXT(
    VkDevice device,
    uint32_t swapchainCount,
    const VkSwapchainKHR* pSwapchains,
)
```

2278
const VkHdrMetadataEXT* pMetadata);

- `device` is the logical device where the swapchain(s) were created.
- `swapchainCount` is the number of swapchains included in `pSwapchains`.
- `pSwapchains` is a pointer to an array of `swapchainCount` `VkSwapchainKHR` handles.
- `pMetadata` is a pointer to an array of `swapchainCount` `VkHdrMetadataEXT` structures.

The metadata will be applied to the specified `VkSwapchainKHR` objects at the next `vkQueuePresentKHR` call using that `VkSwapchainKHR` object. The metadata will persist until a subsequent `vkSetHdrMetadataEXT` changes it.

### Valid Usage (Implicit)

- **VUID-vkSetHdrMetadataEXT-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkSetHdrMetadataEXT-pSwapchains-parameter**
  
  `pSwapchains` must be a valid pointer to an array of `swapchainCount` valid `VkSwapchainKHR` handles

- **VUID-vkSetHdrMetadataEXT-pMetadata-parameter**
  
  `pMetadata` must be a valid pointer to an array of `swapchainCount` valid `VkHdrMetadataEXT` structures

- **VUID-vkSetHdrMetadataEXT-swapchainCount-arraylength**
  
  `swapchainCount` must be greater than 0

- **VUID-vkSetHdrMetadataEXT-commonparent**
  
  Both of `device`, and the elements of `pSwapchains` must have been created, allocated, or retrieved from the same `VkInstance`

The `VkHdrMetadataEXT` structure is defined as:

```c
// Provided by VK_EXT_hdr_metadata
typedef struct VkHdrMetadataEXT {
    VkStructureType sType;
    const void* pNext;
    VkXYColorEXT displayPrimaryRed;
    VkXYColorEXT displayPrimaryGreen;
    VkXYColorEXT displayPrimaryBlue;
    VkXYColorEXT whitePoint;
    float maxLuminance;
    float minLuminance;
    float maxContentLightLevel;
    float maxFrameAverageLightLevel;
} VkHdrMetadataEXT;
```

- `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `displayPrimaryRed` is a `VkXYColorEXT` structure specifying the reference monitor’s red primary in chromaticity coordinates
• `displayPrimaryGreen` is a `VkXYColorEXT` structure specifying the reference monitor’s green primary in chromaticity coordinates
• `displayPrimaryBlue` is a `VkXYColorEXT` structure specifying the reference monitor’s blue primary in chromaticity coordinates
• `whitePoint` is a `VkXYColorEXT` structure specifying the reference monitor’s white-point in chromaticity coordinates
• `maxLuminance` is the maximum luminance of the reference monitor in nits
• `minLuminance` is the minimum luminance of the reference monitor in nits
• `maxContentLightLevel` is content’s maximum luminance in nits
• `maxFrameAverageLightLevel` is the maximum frame average light level in nits

Valid Usage (Implicit)

- `VUID-VkHdrMetadataEXT-sType-sType`
  `sType` must be `VK_STRUCTURE_TYPE_HDR_METADATA_EXT`
- `VUID-VkHdrMetadataEXT-pNext-pNext`
  `pNext` must be `NULL`

Note
The validity and use of this data is outside the scope of Vulkan.

The `VkXYColorEXT` structure is defined as:

```c
// Provided by VK_EXT_hdr_metadata
typedef struct VkXYColorEXT {
    float x;
    float y;
} VkXYColorEXT;
```

• `x` is the `x` chromaticity coordinate.
• `y` is the `y` chromaticity coordinate.

Chromaticity coordinates are as specified in CIE 15:2004 “Calculation of chromaticity coordinates” (Section 7.3) and are limited to between 0 and 1 for real colors for the reference monitor.

### 33.12. Present Barrier

The `VK_NV_present_barrier` extension allows applications to synchronize corresponding presentation requests across multiple swapchains using the `present barrier`. A swapchain is said to
be using the *present barrier* if the swapchain is created by adding a
*VkSwapchainPresentBarrierCreateInfoNV* structure to the *pNext* chain of the
*slink::VkSwapchainCreateInfoKHR* structure, and setting
*VkSwapchainPresentBarrierCreateInfoNV::*presentBarrierEnable* to true.

A set of corresponding presentation requests is defined as exactly one queued presentation request
associated with each swapchain using the present barrier, whether or not that queued request has
executed. A given presentation request is added, when created by calling
*flink::vkQueuePresentKHR* and specifying a swapchain using the present barrier, either to the
oldest existing set of corresponding requests for which there is no existing member associated with
the request's swapchain, or to a new set of corresponding requests if no such set exists.

A set of corresponding requests is said to be *full* when it contains one request from each swapchain
using the present barrier. Queued presentation of an image to a swapchain using the *present barrier*
is *deferred* by the implementation until the set of corresponding requests is full, and the
visibility operations associated with all requests in that set, as described by *vkQueuePresentKHR*,
have completed.

Additionally, the set of swapchains using the present barrier can be in the same process, or
different processes running under the same operating system. And if the required synchronization
hardware is connected and correctly configured, this extension also supports applications to
synchronize corresponding presentation requests using the *present barrier* across distributed
systems. However, the configuration mechanism of the required hardware is outside the scope of
the Vulkan specification and this extension.

The *VkSwapchainPresentBarrierCreateInfoNV* structure is defined as:

```c
// Provided by VK_NV_presentBarrier
typedef struct VkSwapchainPresentBarrierCreateInfoNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 presentBarrierEnable;
} VkSwapchainPresentBarrierCreateInfoNV;
```

- *sType* is the type of this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- *presentBarrierEnable* is a boolean value indicating a request for using the *present barrier*.

If the *pNext* chain of *VkSwapchainCreateInfoKHR* does not include this structure, the default value
for *presentBarrierEnable* is *VK_FALSE*, meaning the swapchain does not request to use the present
barrier. Additionally, when recreating a swapchain that was using the present barrier, and the
*pNext* chain of *VkSwapchainCreateInfoKHR* does not include this structure, it means the swapchain
will stop using the present barrier.

### Valid Usage (Implicit)

- VUID-VkSwapchainPresentBarrierCreateInfoNV-sType-sType
sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_BARRIER_CREATE_INFO_NV
Chapter 34. Deferred Host Operations

Certain Vulkan commands are inherently expensive for the host CPU to execute. It is often desirable to offload such work onto background threads, and to parallelize the work across multiple CPUs. The concept of deferred operations allows applications and drivers to coordinate the execution of expensive host commands using an application-managed thread pool.

The VK_KHR_deferred_host_operations extension defines the infrastructure and usage patterns for deferrable commands, but does not specify any commands as deferrable. This is left to additional dependent extensions. Commands must not be deferred unless the deferral is specifically allowed by another extension which depends on VK_KHR_deferred_host_operations. This specification will refer to such extensions as deferral extensions.

34.1. Requesting Deferral

When an application requests an operation deferral, the implementation may defer the operation. When deferral is requested and the implementation defers any operation, the implementation must return VK_OPERATION_DEFERRED_KHR as the success code if no errors occurred. When deferral is requested, the implementation should defer the operation when the workload is significant, however if the implementation chooses not to defer any of the requested operations and instead executes all of them immediately, the implementation must return VK_OPERATION_NOT_DEFERRED_KHR as the success code if no errors occurred.

A deferred operation is created complete with an initial result value of VK_SUCCESS. The deferred operation becomes pending when an operation has been successfully deferred with that deferred operation object.

A deferred operation is considered pending until the deferred operation completes. A pending deferred operation becomes complete when it has been fully executed by one or more threads. Pending deferred operations will never complete until they are joined by an application thread, using vkDeferredOperationJoinKHR. Applications can join multiple threads to the same deferred operation, enabling concurrent execution of subtasks within that operation.

The application can query the status of a VkDeferredOperationKHR using the vkGetDeferredOperationMaxConcurrencyKHR or vkGetDeferredOperationResultKHR commands.

Parameters to the command requesting a deferred operation may be accessed at any time until the deferred operation enters the pending state. While a deferred operation is pending:

- Externally synchronized parameters must not be accessed.
- Pointer parameters must not be modified (e.g. reallocated/freed).
- The contents of pointer parameters which may be read by the command must not be modified.
- The contents of pointer parameters which may be written by the command must not be read.
- Vulkan object parameters must not be passed as externally synchronized parameters to any other command.

When the deferred operation is complete, the application should call
vkGetDeferredOperationResultKHR to obtain the VkResult indicating success or failure of the operation. The VkResult value returned will be one of the values that the command requesting the deferred operation is able to return. Writes to output parameters of the requesting command will happen-before the deferred operation is complete.

34.2. Deferred Host Operations API

The VkDeferredOperationKHR handle is defined as:

```c
// Provided by VK_KHR_deferred_host_operations
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeferredOperationKHR)
```

This handle refers to a tracking structure which manages the execution state for a deferred command.

To construct the tracking object for a deferred command, call:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkCreateDeferredOperationKHR(
    VkDevice device,
    const VkAllocationCallbacks* pAllocator,
    VkDeferredOperationKHR* pDeferredOperation);
```

- **device** is the device which owns operation.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pDeferredOperation** is a pointer to a handle in which the created VkDeferredOperationKHR is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDeferredOperationKHR-device-parameter
  - device must be a valid VkDevice handle
- VUID-vkCreateDeferredOperationKHR-pAllocator-parameter
  - If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateDeferredOperationKHR-pDeferredOperation-parameter
  - pDeferredOperation must be a valid pointer to a VkDeferredOperationKHR handle

### Return Codes

**Success**
- **VK_SUCCESS**
To assign a thread to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkDeferredOperationJoinKHR(
    VkDevice device,
    VkDeferredOperationKHR operation);
```

- `device` is the device which owns `operation`.
- `operation` is the deferred operation that the calling thread should work on.

The `vkDeferredOperationJoinKHR` command will execute a portion of the deferred operation on the calling thread.

The return value will be one of the following:

- A return value of `VK_SUCCESS` indicates that `operation` is complete. The application should use `vkGetDeferredOperationResultKHR` to retrieve the result of `operation`.
- A return value of `VK_THREAD_DONE_KHR` indicates that the deferred operation is not complete, but there is no work remaining to assign to threads. Future calls to `vkDeferredOperationJoinKHR` are not necessary and will simply harm performance. This situation may occur when other threads executing `vkDeferredOperationJoinKHR` are about to complete `operation`, and the implementation is unable to partition the workload any further.
- A return value of `VK_THREAD_IDLE_KHR` indicates that the deferred operation is not complete, and there is no work for the thread to do at the time of the call. This situation may occur if the operation encounters a temporary reduction in parallelism. By returning `VK_THREAD_IDLE_KHR`, the implementation is signaling that it expects that more opportunities for parallelism will emerge as execution progresses, and that future calls to `vkDeferredOperationJoinKHR` can be beneficial. In the meantime, the application can perform other work on the calling thread.

Implementations must guarantee forward progress by enforcing the following invariants:

1. If only one thread has invoked `vkDeferredOperationJoinKHR` on a given operation, that thread must execute the operation to completion and return `VK_SUCCESS`.
2. If multiple threads have concurrently invoked `vkDeferredOperationJoinKHR` on the same operation, then at least one of them must complete the operation and return `VK_SUCCESS`.

Valid Usage (Implicit)

- `device must` be a valid `VkDevice` handle
- `operation must` be a valid `VkDeferredOperationKHR` handle
Return Codes

Success
- VK_SUCCESS
- VK_THREAD_DONE_KHR
- VK_THREAD_IDLE_KHR

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

When a deferred operation is completed, the application can destroy the tracking object by calling:

```c
// Provided by VK_KHR_deferred_host_operations
void vkDestroyDeferredOperationKHR(
    VkDevice device,
    VkDeferredOperationKHR operation,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the device which owns `operation`.
- `operation` is the completed operation to be destroyed.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyDeferredOperationKHR-operation-03434
  If `VkAllocationCallbacks` were provided when `operation` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyDeferredOperationKHR-operation-03435
  If no `VkAllocationCallbacks` were provided when `operation` was created, `pAllocator` must be NULL

- VUID-vkDestroyDeferredOperationKHR-operation-03436
  `operation` must be completed

Valid Usage (Implicit)

- VUID-vkDestroyDeferredOperationKHR-device-parameter
  `device` must be a valid `VkDevice` handle
Host Synchronization

- Host access to operation must be externally synchronized.

To query the number of additional threads that can usefully be joined to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
uint32_t vkGetDeferredOperationMaxConcurrencyKHR(
    VkDevice device,
    VkDeferredOperationKHR operation);
```

- `device` is the device which owns operation.
- `operation` is the deferred operation to be queried.

The returned value is the maximum number of threads that can usefully execute a deferred operation concurrently, reported for the state of the deferred operation at the point this command is called. This value is intended to be used to better schedule work onto available threads. Applications can join any number of threads to the deferred operation and expect it to eventually complete, though excessive joins may return `VK_THREAD_DONE_KHR` immediately, performing no useful work.

If operation is complete, `vkGetDeferredOperationMaxConcurrencyKHR` returns zero.

If operation is currently joined to any threads, the value returned by this command may immediately be out of date.

If operation is pending, implementations must not return zero unless at least one thread is currently executing `vkDeferredOperationJoinKHR` on operation. If there are such threads, the implementation should return an estimate of the number of additional threads which it could profitably use.

Implementations may return $2^{32-1}$ to indicate that the maximum concurrency is unknown and cannot be easily derived. Implementations may return values larger than the maximum concurrency available on the host CPU. In these situations, an application should clamp the return value rather than oversubscribing the machine.
Note
The recommended usage pattern for applications is to query this value once, after
deferral, and schedule no more than the specified number of threads to join the
operation. Each time a joined thread receives VK_THREAD_IDLE_KHR, the application
should schedule an additional join at some point in the future, but is not required
to do so.

Valid Usage (Implicit)

- VUID-vkGetDeferredOperationMaxConcurrencyKHR-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parameter
operation must be a valid VkDeferredOperationKHR handle
- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parent
operation must have been created, allocated, or retrieved from device

The vkGetDeferredOperationResultKHR function is defined as:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkGetDeferredOperationResultKHR(
    VkDevice device,
    VkDeferredOperationKHR operation);
```

- device is the device which owns operation.
- operation is the operation whose deferred result is being queried.

If no command has been deferred on operation, vkGetDeferredOperationResultKHR returns
VK_SUCCESS.

If the deferred operation is pending, vkGetDeferredOperationResultKHR returns VK_NOT_READY.

If the deferred operation is complete, it returns the appropriate return value from the original
command. This value must be one of the VkResult values which could have been returned by the
original command if the operation had not been deferred.

Valid Usage (Implicit)

- VUID-vkGetDeferredOperationResultKHR-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetDeferredOperationResultKHR-operation-parameter
operation must be a valid VkDeferredOperationKHR handle
- VUID-vkGetDeferredOperationResultKHR-operation-parent
operation must have been created, allocated, or retrieved from device
Return Codes

Success

- VK_SUCCESS
- VK_NOT_READY
Chapter 35. Private Data

The private data extension provides a way for users to associate arbitrary user defined data with Vulkan objects. This association is accomplished by storing 64-bit unsigned integers of user defined data in private data slots. A private data slot represents a storage allocation for one data item for each child object of the device.

An application can reserve private data slots at device creation. To reserve private data slots, insert a VkDevicePrivateDataCreateInfo in the pNext chain in VkDeviceCreateInfo before device creation. Multiple VkDevicePrivateDataCreateInfo structures can be chained together, and the sum of the requested slots will be reserved. This is an exception to the specified valid usage for structure pointer chains. Reserving slots in this manner is not strictly necessary but it may improve performance.

Private data slots are represented by VkPrivateDataSlot handles:

```c
// Provided by VK_VERSION_1_3
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPrivateDataSlot)
```
or the equivalent

```c
// Provided by VK_EXT_private_data
typedef VkPrivateDataSlot VkPrivateDataSlotEXT;
```

To create a private data slot, call:

```c
// Provided by VK_VERSION_1_3
VkResult vkCreatePrivateDataSlot(
    VkDevice device,
    const VkPrivateDataSlotCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkPrivateDataSlot* pPrivateDataSlot);
```
or the equivalent command

```c
// Provided by VK_EXT_private_data
VkResult vkCreatePrivateDataSlotEXT(
    VkDevice device,
    const VkPrivateDataSlotCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkPrivateDataSlot* pPrivateDataSlot);
```

- `device` is the logical device associated with the creation of the object(s) holding the private data slot.
- `pCreateInfo` is a pointer to a `VkPrivateDataSlotCreateInfo`.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPrivateDataSlot` is a pointer to a `VkPrivateDataSlot` handle in which the resulting private data slot is returned.

### Valid Usage

- `VUID-vkCreatePrivateDataSlot-privateData-04564
  The privateData feature must be enabled`

### Valid Usage (Implicit)

- `VUID-vkCreatePrivateDataSlot-device-parameter
  device must be a valid VkDevice handle`
- `VUID-vkCreatePrivateDataSlot-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkPrivateDataSlotCreateInfo structure`
- `VUID-vkCreatePrivateDataSlot-pAllocator-parameter
  If pAlloc is not NULL, pAlloc must be a valid pointer to a valid VkAllocationCallbacks structure`
- `VUID-vkCreatePrivateDataSlot-pPrivateDataSlot-parameter
  pPrivateDataSlot must be a valid pointer to a VkPrivateDataSlot handle`

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkPrivateDataSlotCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPrivateDataSlotCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPrivateDataSlotCreateFlags flags;
} VkPrivateDataSlotCreateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_private_data
```
typedef VkPrivateDataSlotCreateInfo VkPrivateDataSlotCreateInfoEXT;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.

### Valid Usage (Implicit)

- VUID-VkPrivateDataSlotCreateInfo-sType-sType
  - sType must be VK_STRUCTURE_TYPE_PRIVATE_DATA_SLOT_CREATE_INFO
- VUID-VkPrivateDataSlotCreateInfo-pNext-pNext
  - pNext must be NULL
- VUID-VkPrivateDataSlotCreateInfo-flags-zerobitmask
  - flags must be 0

// Provided by VK_VERSION_1_3
typedef VkFlags VkPrivateDataSlotCreateFlags;

or the equivalent

// Provided by VK_EXT_private_data
typedef VkPrivateDataSlotCreateFlags VkPrivateDataSlotCreateFlagsEXT;

**VkPrivateDataSlotCreateFlags** is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a private data slot, call:

// Provided by VK_VERSION_1_3
void vkDestroyPrivateDataSlot(VkDevice device, VkPrivateDataSlot privateDataSlot, const VkAllocationCallbacks* pAllocator);

or the equivalent command

// Provided by VK_EXT_private_data
void vkDestroyPrivateDataSlotEXT(VkDevice device, VkPrivateDataSlot privateDataSlot, const VkAllocationCallbacks* pAllocator);
• **device** is the logical device associated with the creation of the object(s) holding the private data slot.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

• **privateDataSlot** is the private data slot to destroy.

---

### Valid Usage

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-04062**
  If VkAllocationCallbacks were provided when privateDataSlot was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-04063**
  If no VkAllocationCallbacks were provided when privateDataSlot was created, pAllocator must be NULL.

---

### Valid Usage (Implicit)

- **VUID-vkDestroyPrivateDataSlot-device-parameter**
  device must be a valid VkDevice handle.

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-parameter**
  If privateDataSlot is not VK_NULL_HANDLE, privateDataSlot must be a valid VkPrivateDataSlot handle.

- **VUID-vkDestroyPrivateDataSlot-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure.

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-parent**
  If privateDataSlot is a valid handle, it must have been created, allocated, or retrieved from device.

---

### Host Synchronization

- Host access to privateDataSlot must be externally synchronized.

---

To store user defined data in a slot associated with a Vulkan object, call:

```c
// Provided by VK_VERSION_1_3
VkResult vkSetPrivateData(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t data);
```
or the equivalent command

```c
// Provided by VK_EXT_private_data
VkResult vkSetPrivateDataEXT(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t data);
```

- `device` is the device that created the object.
- `objectType` is a `VkObjectType` specifying the type of object to associate data with.
- `objectHandle` is a handle to the object to associate data with.
- `privateDataSlot` is a handle to a `VkPrivateDataSlot` specifying location of private data storage.
- `data` is user defined data to associate the object with. This data will be stored at `privateDataSlot`.

### Valid Usage

- VUID-vkSetPrivateData-objectHandle-04016
  `objectHandle must be device or a child of device`
- VUID-vkSetPrivateData-objectHandle-04017
  `objectHandle must be a valid handle to an object of type `objectType`

### Valid Usage (Implicit)

- VUID-vkSetPrivateData-device-parameter
  `device must be a valid `VkDevice` handle`
- VUID-vkSetPrivateData-objectType-parameter
  `objectType must be a valid `VkObjectType` value`
- VUID-vkSetPrivateData-privateDataSlot-parameter
  `privateDataSlot must be a valid `VkPrivateDataSlot` handle`
- VUID-vkSetPrivateData-privateDataSlot-parent
  `privateDataSlot must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
To retrieve user defined data from a slot associated with a Vulkan object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetPrivateData(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t* pData);
```

or the equivalent command

```c
// Provided by VK_EXT_private_data
void vkGetPrivateDataEXT(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t* pData);
```

- **device** is the device that created the object
- **objectType** is a `VkObjectType` specifying the type of object data is associated with.
- **objectHandle** is a handle to the object data is associated with.
- **privateDataSlot** is a handle to a `VkPrivateDataSlot` specifying location of private data pointer storage.
- **pData** is a pointer to specify where user data is returned. 0 will be written in the absence of a previous call to `vkSetPrivateData` using the object specified by `objectHandle`.

**Note**

Due to platform details on Android, implementations might not be able to reliably return 0 from calls to `vkGetPrivateData` for `VkSwapchainKHR` objects on which `vkSetPrivateData` has not previously been called. This erratum is exclusive to the Android platform and objects of type `VkSwapchainKHR`.

**Valid Usage**

- VUID-vkGetPrivateData-objectType-04018
  objectType must be `VK_OBJECT_TYPE_DEVICE`, or an object type whose parent is `VkDevice`

**Valid Usage (Implicit)**

- VUID-vkGetPrivateData-device-parameter
  device must be a valid `VkDevice` handle
• VUID-vkGetPrivateData-objectType-parameter
  
  `objectType` must be a valid `VkObjectType` value

• VUID-vkGetPrivateData-privateDataSlot-parameter
  
  `privateDataSlot` must be a valid `VkPrivateDataSlot` handle

• VUID-vkGetPrivateData-pData-parameter
  
  `pData` must be a valid pointer to a `uint64_t` value

• VUID-vkGetPrivateData-privateDataSlot-parent
  
  `privateDataSlot` must have been created, allocated, or retrieved from `device`
Chapter 36. Acceleration Structures

36.1. Acceleration Structures

*Acceleration structures* are data structures used by the implementation to efficiently manage scene geometry as it is traversed during a ray tracing query. The application is responsible for managing acceleration structure objects (see *Acceleration Structures*), including allocation, destruction, executing builds or updates, and synchronizing resources used during ray tracing queries.

There are two types of acceleration structures, *top level acceleration structures* and *bottom level acceleration structures*.

An acceleration structure is considered to be constructed if an *acceleration structure build command* or *copy command* has been executed with the given acceleration structure as the destination.

![Diagram of Acceleration Structure](image)

*Figure 27. Acceleration Structure*

The diagram shows the relationship between top and bottom level acceleration structures.

### 36.1.1. Geometry

*Geometries* refer to a triangle or axis-aligned bounding box.
36.1.2. Top Level Acceleration Structures

Opaque acceleration structure for an array of instances. The descriptor or device address referencing this is the starting point for traversal.

The top level acceleration structure takes a reference to any bottom level acceleration structure referenced by its instances. Those bottom level acceleration structure objects must be valid when the top level acceleration structure is accessed.

36.1.3. Bottom Level Acceleration Structures

Opaque acceleration structure for an array of geometries.

36.1.4. Acceleration Structure Update Rules

The API defines two types of operations to produce acceleration structures from geometry:

- A build operation is used to construct an acceleration structure.
- An update operation is used to modify an existing acceleration structure.

An update operation imposes certain constraints on the input, in exchange for considerably faster execution. When performing an update, the application is required to provide a full description of the acceleration structure, but is prohibited from changing anything other than instance definitions, transform matrices, and vertex or AABB positions. All other aspects of the description must exactly match the one from the original build.

More precisely, the application must not use an update operation to do any of the following:

- Change primitives or instances from active to inactive, or vice versa (as defined in Inactive Primitives and Instances).
- Change the index or vertex formats of triangle geometry.
- Change triangle geometry transform pointers from null to non-null or vice versa.
- Change the number of geometries or instances in the structure.
- Change the geometry flags for any geometry in the structure.
- Change the number of vertices or primitives for any geometry in the structure.

If the original acceleration structure was built using opacity micromaps and VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT was set in flags, the application must provide the corresponding micromap information to the update operation. The application is prohibited from changing anything other than the specific opacity values assigned to the triangles.

More precisely, the application must not use an update operation to do any of the following:

- Remove micromaps or VkOpacityMicromapSpecialIndexEXT values from a geometry which previously had them, or vice versa.
- Change between use of VkOpacityMicromapSpecialIndexEXT values and explicit micro-map
triangles.

- Change the subdivision level or format of the micromap triangle associated with any acceleration-structure triangle.

If the original acceleration structure was built using opacity micromaps and `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT` was set in flags, the application must provide a micromap to the update operation.

If the original acceleration structure was built using opacity micromaps and neither opacity micromap update flag is set the application must provide the original micromap to the update operation.

### 36.1.5. Inactive Primitives and Instances

Acceleration structures allow the use of particular input values to signal inactive primitives or instances.

An inactive triangle is one for which the first (X) component of any vertex is NaN. If any other vertex component is NaN, and the first is not, the behavior is undefined. If the vertex format does not have a NaN representation, then all triangles are considered active.

An inactive instance is one whose acceleration structure handle is `VK_NULL_HANDLE`.

An inactive AABB is one for which the minimum X coordinate is NaN. If any other component is NaN, and the first is not, the behavior is undefined.

In the above definitions, “NaN” refers to any type of NaN. Signaling, non-signaling, quiet, loud, or otherwise.

An inactive object is considered invisible to all rays, and should not be represented in the acceleration structure. Implementations should ensure that the presence of inactive objects does not seriously degrade traversal performance.

Inactive objects are counted in the auto-generated index sequences which are provided to shaders via `InstanceId` and `PrimitiveId` SPIR-V decorations. This allows objects in the scene to change freely between the active and inactive states, without affecting the layout of any arrays which are being indexed using the ID values.

Any transition between the active and inactive states requires a full acceleration structure rebuild. Applications must not perform an acceleration structure update where an object is active in the source acceleration structure but would be inactive in the destination, or vice versa.

### 36.1.6. Building Acceleration Structures

To build an acceleration structure call:

```c
// Provided by VK_NV_ray_tracing
void vkCmdBuildAccelerationStructureNV(
    VkCommandBuffer commandBuffer,
```
```cpp
const VkAccelerationStructureInfoNV* pInfo,
VkBuffer instanceData,
VkDeviceSize instanceOffset,
VkBool32 update,
VkAccelerationStructureNV dst,
VkAccelerationStructureNV src,
VkBuffer scratch,
VkDeviceSize scratchOffset);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **pInfo** contains the shared information for the acceleration structure's structure.
- **instanceData** is the buffer containing an array of `VkAccelerationStructureInstanceKHR` structures defining acceleration structures. This parameter must be `NULL` for bottom level acceleration structures.
- **instanceOffset** is the offset in bytes (relative to the start of `instanceData`) at which the instance data is located.
- **update** specifies whether to update the `dst` acceleration structure with the data in `src`.
- **dst** is a pointer to the target acceleration structure for the build.
- **src** is a pointer to an existing acceleration structure that is to be used to update the `dst` acceleration structure.
- **scratch** is the `VkBuffer` that will be used as scratch memory for the build.
- **scratchOffset** is the offset in bytes relative to the start of `scratch` that will be used as a scratch memory.

Accesses to `dst`, `src`, and `scratch` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`.

### Valid Usage

- VUID-vkCmdBuildAccelerationStructureNV-geometryCount-02241
  `geometryCount` must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxGeometryCount`

- VUID-vkCmdBuildAccelerationStructureNV-dst-02488
  `dst` must have been created with compatible `VkAccelerationStructureInfoNV` where `VkAccelerationStructureInfoNV::type` and `VkAccelerationStructureInfoNV::flags` are identical, `VkAccelerationStructureInfoNV::instanceCount` and `VkAccelerationStructureInfoNV::geometryCount` for `dst` are greater than or equal to the build size and each geometry in `VkAccelerationStructureInfoNV::pGeometries` for `dst` has greater than or equal to the number of vertices, indices, and AABBs

- VUID-vkCmdBuildAccelerationStructureNV-update-02489
  If `update` is `VK_TRUE`, `src` must not be `VK_NULL_HANDLE`

- VUID-vkCmdBuildAccelerationStructureNV-update-02490
If `update` is `VK_TRUE`, `src` must have previously been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_NV` set in `VkAccelerationStructureInfoNV::flags` in the original build.

- **VUID-vkCmdBuildAccelerationStructureNV-update-02491**
  If `update` is `VK_FALSE`, the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `VkAccelerationStructureMemoryRequirementsInfoNV::accelerationStructure` set to `dst` and `VkAccelerationStructureMemoryRequirementsInfoNV::type` set to `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV` must be less than or equal to the size of `scratch` minus `scratchOffset`.

- **VUID-vkCmdBuildAccelerationStructureNV-update-02492**
  If `update` is `VK_TRUE`, the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `VkAccelerationStructureMemoryRequirementsInfoNV::accelerationStructure` set to `dst` and `VkAccelerationStructureMemoryRequirementsInfoNV::type` set to `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV` must be less than or equal to the size of `scratch` minus `scratchOffset`.

- **VUID-vkCmdBuildAccelerationStructureNV-scratch-03522**
  `scratch` must have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag.

- **VUID-vkCmdBuildAccelerationStructureNV-instanceData-03523**
  If `instanceData` is not `VK_NULL_HANDLE`, `instanceData` must have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag.

- **VUID-vkCmdBuildAccelerationStructureNV-accelerationStructureReference-03786**
  Each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `instanceData` must be a valid device address containing a value obtained from `vkGetAccelerationStructureHandleNV`.

- **VUID-vkCmdBuildAccelerationStructureNV-update-03524**
  If `update` is `VK_TRUE`, then objects that were previously active must not be made inactive as per Inactive Primitives and Instances.

- **VUID-vkCmdBuildAccelerationStructureNV-update-03525**
  If `update` is `VK_TRUE`, then objects that were previously inactive must not be made active as per Inactive Primitives and Instances.

- **VUID-vkCmdBuildAccelerationStructureNV-update-03526**
  If `update` is `VK_TRUE`, the `src` and `dst` objects must either be the same object or not have any memory aliasing.

---

**Valid Usage (Implicit)**

- **VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdBuildAccelerationStructureNV-pInfo-parameter**
  `pInfo` must be a valid pointer to a valid `VkAccelerationStructureInfoNV` structure.

- **VUID-vkCmdBuildAccelerationStructureNV-instanceData-parameter**
If `instanceData` is not `VK_NULL_HANDLE`, `instanceData` **must** be a valid `VkBuffer` handle.

- VUID-vkCmdBuildAccelerationStructureNV-dst-parameter
dst **must** be a valid `VkAccelerationStructureNV` handle.

- VUID-vkCmdBuildAccelerationStructureNV-src-parameter
If `src` is not `VK_NULL_HANDLE`, `src` **must** be a valid `VkAccelerationStructureNV` handle.

- VUID-vkCmdBuildAccelerationStructureNV-scratch-parameter
`scratch` **must** be a valid `VkBuffer` handle.

- VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-recording
`commandBuffer` **must** be in the recording state.

- VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations.

- VUID-vkCmdBuildAccelerationStructureNV-renderpass
This command **must** only be called outside of a render pass instance.

- VUID-vkCmdBuildAccelerationStructureNV-videoencoding
This command **must** only be called outside of a video coding scope.

- VUID-vkCmdBuildAccelerationStructureNV-commonparent
Each of `commandBuffer`, `dst`, `instanceData`, `scratch`, and `src` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`.

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>

<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To build acceleration structures call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdBuildAccelerationStructuresKHR(  
    VkCommandBuffer commandBuffer,  
    uint32_t infoCount,  
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
```
• **commandBuffer** is the command buffer into which the command will be recorded.

• **infoCount** is the number of acceleration structures to build. It specifies the number of the **pInfos** structures and **ppBuildRangeInfos** pointers that must be provided.

• **pInfos** is a pointer to an array of **infoCount** VkAccelerationStructureBuildGeometryInfoKHR structures defining the geometry used to build each acceleration structure.

• **ppBuildRangeInfos** is a pointer to an array of **infoCount** pointers to arrays of VkAccelerationStructureBuildRangeInfoKHR structures. Each **ppBuildRangeInfos[i]** is a pointer to an array of **pInfos[i]**, **geometryCount** VkAccelerationStructureBuildRangeInfoKHR structures defining dynamic offsets to the addresses where geometry data is stored, as defined by **pInfos[i]**.

The **vkCmdBuildAccelerationStructuresKHR** command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

**Note**
This means that an application cannot build a top-level acceleration structure in the same **vkCmdBuildAccelerationStructuresKHR** call as the associated bottom-level or instance acceleration structures are being built. There also cannot be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

Accesses to the acceleration structure scratch buffers as identified by the VkAccelerationStructureBuildGeometryInfoKHR::**scratchData** buffer device addresses must be synchronized with the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR or VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR. Similarly for accesses to each VkAccelerationStructureBuildGeometryInfoKHR::**srcAccelerationStructure** and VkAccelerationStructureBuildGeometryInfoKHR::**dstAccelerationStructure**.

Accesses to other input buffers as identified by any used values of VkAccelerationStructureGeometryMotionTrianglesDataNV::**vertexData**, VkAccelerationStructureGeometryTrianglesDataKHR::**vertexData**, VkAccelerationStructureGeometryTrianglesDataKHR::**indexData**, VkAccelerationStructureGeometryTrianglesDataKHR::**transformData**, VkAccelerationStructureGeometryAabbsDataKHR::**data**, and VkAccelerationStructureGeometryInstancesDataKHR::**data** must be synchronized with the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of VK_ACCESS_SHADER_READ_BIT.

**Valid Usage**

• VUID-vkCmdBuildAccelerationStructuresKHR-mode-04628
The mode member of each element of **pInfos** must be a valid VkBuildAccelerationStructureModeKHR value
If the srcAccelerationStructure member of any element of pInfos is not VK_NULL_HANDLE, the srcAccelerationStructure member must be a valid VkAccelerationStructureKHR handle.

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member must not be VK_NULL_HANDLE.

The srcAccelerationStructure member of any element of pInfos must not be the same acceleration structure as the dstAccelerationStructure member of any other element of pInfos.

The dstAccelerationStructure member of any element of pInfos must not be the same acceleration structure as the dstAccelerationStructure member of any other element of pInfos.

The dstAccelerationStructure member of any element of pInfos must be a valid VkAccelerationStructureKHR handle.

For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, its dstAccelerationStructure member must have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR.

For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR, its dstAccelerationStructure member must have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR.

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, inactive primitives in its srcAccelerationStructure member must not be made active.

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, active primitives in its srcAccelerationStructure member must not be made inactive.

The dstAccelerationStructure member of any element of pInfos must not be referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos.
The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `srcAccelerationStructure` member of any other element of `pInfos` with a mode equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, which is accessed by this command.

- **VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03702**
  The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `dstAccelerationStructure` member of any other element of `pInfos`, which is accessed by this command.

- **VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03703**
  The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command.

- **VUID-vkCmdBuildAccelerationStructuresKHR-scratchData-03704**
  The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command.

- **VUID-vkCmdBuildAccelerationStructuresKHR-scratchData-03705**
  The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `srcAccelerationStructure` member of any element of `pInfos` with a mode equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` (including the same element), which is accessed by this command.

- **VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03706**
  The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`, which is accessed by this command.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03667**
  For each element of `pInfos`, if its mode member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must have previously been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` in the build.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03668**
  For each element of `pInfos`, if its mode member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` and `dstAccelerationStructure` members must either be the same `VkAccelerationStructureKHR`, or not have any memory aliasing.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03758**
  For each element of `pInfos`, if its mode member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `geometryCount` member must have the same value which was specified when `srcAccelerationStructure` was last built.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `flags` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `type` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `geometryType` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `flags` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.vertexFormat` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.maxVertex` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.indexType` member must have the same value which was specified when `srcAccelerationStructure` was last built.
members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its
gamey.triangles.transformData address was NULL when srcAccelerationStructure was
last built, then it **must** be NULL

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03767
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
  VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
  ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its
gamey.triangles.transformData address was not NULL when srcAccelerationStructure was
last built, then it **must not be NULL**

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03768
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
  VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
  ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR and
gamey.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, then the value of each index
  referenced **must** be the same as the corresponding index value when
  srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresKHR-primitiveCount-03769
  For each VkAccelerationStructureBuildRangeInfoKHR referenced by this command, its
  primitiveCount member **must** have the same value which was specified when
  srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresKHR-firstVertex-03770
  For each VkAccelerationStructureBuildRangeInfoKHR referenced by this command, if the
  corresponding geometry uses indices, its firstVertex member **must** have the same value
  which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03801
  For each element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of
  VK_GEOMETRY_TYPE_INSTANCES_KHR, the corresponding ppBuildRangeInfos[i][j].primitiveCount
  **must** be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::
  maxInstanceCount

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03707
  For each element of pInfos, the buffer used to create its dstAccelerationStructure member
  **must** be bound to device memory

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03708
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR the buffer used to create its
  srcAccelerationStructure member **must** be bound to device memory

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03709
  For each element of pInfos, the buffer used to create each acceleration structure
  referenced by the geometry.instances.data member of any element of pGeometries or
  ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR **must** be bound to
  device memory

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03671
If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where N is given by the `build ScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03672**
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where N is given by the `update ScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

- **VUID-vkCmdBuildAccelerationStructuresKHR-geometry-03673**
  The buffers from which the buffer device addresses for all of the `geometry.triangles.vertexData`, `geometry.triangles.indexData`, `geometry.triangles.transformData`, `geometry.aabbs.data`, and `geometry.instances.data` members of all `pInfos[i].pGeometries` and `pInfos[i].ppGeometries` are queried must have been created with the `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` usage flag.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03674**
  The buffer from which the buffer device address `pInfos[i].scratchData.deviceAddress` is queried must have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03802**
  For each element of `pInfos`, its `scratchData.deviceAddress` member must be a valid device address obtained from `vkGetBufferDeviceAddress`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03803**
  For each element of `pInfos`, if `scratchData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03710**
  For each element of `pInfos`, its `scratchData.deviceAddress` member must be a multiple of `VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03804**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.deviceAddress` must be a valid device address obtained from `vkGetBufferDeviceAddress`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03805**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.vertexData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkDeviceMemory**
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.deviceAddress` must be aligned to the size in bytes of the smallest component of the format in `vertexFormat`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03806**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.deviceAddress` must be a valid device address obtained from `vkGetBufferDeviceAddress`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03807**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, if `geometry.triangles.indexData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03712**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and with `geometry.triangles.indexType` not equal to `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.deviceAddress` must be aligned to the size in bytes of the type in `indexType`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03808**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not 0, it must be a valid device address obtained from `vkGetBufferDeviceAddress`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03809**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03810**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not 0, it must be aligned to 16 bytes.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03811**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.deviceAddress` must be a valid device address obtained from `vkGetBufferDeviceAddress`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03812**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, if `geometry.aabbs.data.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03714**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.deviceAddress` must be aligned to 8 bytes.
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_FALSE`, `geometry.instances.data.deviceAddress` must be aligned to 16 bytes.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_TRUE`, each element of `geometry.instances.data.deviceAddress` in device memory must be aligned to 16 bytes.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.instances.data.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

For each `pInfos[i]`, `dStAccelerationStructure` must have been created with a value of `VkAccelerationStructureCreateInfoKHR::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetAccelerationStructureBuildSizesKHR` with `pBuildInfo = pInfos[i]` and with each element of the `pMaxPrimitiveCounts` array greater than or equal to the equivalent `ppBuildRangeInfos[i][j].primitiveCount` values for `j` in `[0,pInfos[i].geometryCount)`

Each element of `ppBuildRangeInfos[i]` must be a valid pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures.

### Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pInfos` parameter.

2310
The function `vkCmdBuildAccelerationStructuresIndirectKHR` is used to build acceleration structures with some parameters sourced on the device. The function signature is as follows:

```c
void vkCmdBuildAccelerationStructuresIndirectKHR(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkDeviceAddress* pIndirectDeviceAddresses,
    const uint32_t* pIndirectStrides,
    const uint32_t* const* ppMaxPrimitiveCounts);
```

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To build acceleration structures with some parameters sourced on the device call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdBuildAccelerationStructuresIndirectKHR(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkDeviceAddress* pIndirectDeviceAddresses,
    const uint32_t* pIndirectStrides,
    const uint32_t* const* ppMaxPrimitiveCounts);
```
• **commandBuffer** is the command buffer into which the command will be recorded.
• **infoCount** is the number of acceleration structures to build.
• **pInfos** is a pointer to an array of infoCount VkAccelerationStructureBuildGeometryInfoKHR structures defining the geometry used to build each acceleration structure.
• **pIndirectDeviceAddresses** is a pointer to an array of infoCount buffer device addresses which point to pInfos[i].geometryCount VkAccelerationStructureBuildRangeInfoKHR structures defining dynamic offsets to the addresses where geometry data is stored, as defined by pInfos[i].
• **pIndirectStrides** is a pointer to an array of infoCount byte strides between elements of pIndirectDeviceAddresses.
• **ppMaxPrimitiveCounts** is a pointer to an array of infoCount pointers to arrays of pInfos[i].geometryCount values indicating the maximum number of primitives that will be built by this command for each geometry.

Accesses to acceleration structures, scratch buffers, vertex buffers, index buffers, and instance buffers must be synchronized as with vkCmdBuildAccelerationStructuresKHR.

Accesses to any element of **pIndirectDeviceAddresses** must be synchronized with the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of VK_ACCESS_INDIRECT_COMMAND_READ_BIT.

### Valid Usage

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-mode-04628**
  The **mode** member of each element of **pInfos** must be a valid VkBuildAccelerationStructureModeKHR value

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-srcAccelerationStructure-04629**
  If the *srcAccelerationStructure* member of any element of **pInfos** is not VK_NULL_HANDLE, the **srcAccelerationStructure** member must be a valid VkAccelerationStructureKHR handle

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-04630**
  For each element of **pInfos**, if its **mode** member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its **srcAccelerationStructure** member must not be VK_NULL_HANDLE

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03403**
  The **srcAccelerationStructure** member of any element of **pInfos** must not be the same acceleration structure as the **dstAccelerationStructure** member of any other element of **pInfos**

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03698**
  The **dstAccelerationStructure** member of any element of **pInfos** must not be the same acceleration structure as the **dstAccelerationStructure** member of any other element of **pInfos**

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03800**
  The **dstAccelerationStructure** member of any element of **pInfos** must be a valid VkAccelerationStructureKHR handle
For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, inactive primitives in its `srcAccelerationStructure` member must not be made active.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, active primitives in its `srcAccelerationStructure` member must not be made inactive.

The `dstAccelerationStructure` member of any element of `pInfos` must not be referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `srcAccelerationStructure` member of any other element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, which is accessed by this command.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `dstAccelerationStructure` member of any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos`, which is accessed by this command.
The range of memory backing the scratchData member of any element of pInfo that is accessed by this command must not overlap the memory backing the srcAccelerationStructure member of any element of pInfo with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR (including the same element), which is accessed by this command.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03706
  The range of memory backing the dstAccelerationStructure member of any element of pInfo that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfo, which is accessed by this command.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03667
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member must have previously been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR set in VkAccelerationStructureBuildGeometryInfoKHR::flags in the build.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03668
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure and dstAccelerationStructure members must either be the same VkAccelerationStructureKHR, or not have any memory aliasing.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03758
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its geometryCount member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03759
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its flags member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03760
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its type member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03761
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its geometryType member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03762
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its flags member must have the same value which was specified...
when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03763
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.vertexFormat member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03764
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.maxVertex member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03765
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.indexType member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03766
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was NULL when srcAccelerationStructure was last built, then it must be NULL

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03767
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, and geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, then the value of each index referenced must be the same as the corresponding index value when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-primitiveCount-03769
For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, its `primitiveCount` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-firstVertex-03770
  For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, if the corresponding geometry uses indices, its `firstVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03801
  For each element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the corresponding `ppMaxPrimitiveCounts[i][j]` **must** be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03707
  For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member **must** be bound to device memory

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03708
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member **must** be bound to device memory

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03709
  For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` **must** be bound to device memory

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03671
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` **must** be in the buffer device address range of the same buffer, where N is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03672
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` **must** be in the buffer device address range of the same buffer, where N is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-geometry-03673
  The buffers from which the buffer device addresses for all of the `geometry.triangles.vertexData`, `geometry.triangles.indexData`, `geometry.triangles.transformData`, `geometry.aabbs.data`, and `geometry.instances.data` members of all `pInfos[i].pGeometries` and `pInfos[i].ppGeometries` are queried **must** have been created with the `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` usage flag
The buffer from which the buffer device address \( pInfos[i].\text{scratchData.deviceAddress} \) is queried must have been created with \( \text{VK_BUFFER_USAGE_STORAGE_BUFFER_BIT} \) usage flag.

For each element of \( pInfos \), its \( \text{scratchData.deviceAddress} \) member must be a valid device address obtained from \( \text{vkGetBufferDeviceAddress} \).

For each element of \( pInfos \), if \( \text{scratchData.deviceAddress} \) is the address of a non-sparse buffer then it must be bound completely and contiguously to a single \( \text{VkDeviceMemory} \) object.

For each element of \( pInfos \), its \( \text{scratchData.deviceAddress} \) member must be a multiple of \( \text{VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment} \).

For any element of \( pInfos[i].\text{pGeometries} \) or \( pInfos[i].\text{ppGeometries} \) with a \( \text{geometryType} \) of \( \text{VK_GEOMETRY_TYPE_TRIANGLES_KHR} \), \( \text{geometry.triangles.vertexData.deviceAddress} \) must be a valid device address obtained from \( \text{vkGetBufferDeviceAddress} \).

For any element of \( pInfos[i].\text{pGeometries} \) or \( pInfos[i].\text{ppGeometries} \) with a \( \text{geometryType} \) of \( \text{VK_GEOMETRY_TYPE_TRIANGLES_KHR} \), if \( \text{geometry.triangles.vertexData.deviceAddress} \) is the address of a non-sparse buffer then it must be bound completely and contiguously to a single \( \text{VkDeviceMemory} \) object.

For any element of \( pInfos[i].\text{pGeometries} \) or \( pInfos[i].\text{ppGeometries} \) with a \( \text{geometryType} \) of \( \text{VK_GEOMETRY_TYPE_TRIANGLES_KHR} \), \( \text{geometry.triangles.vertexData.deviceAddress} \) must be aligned to the size in bytes of the smallest component of the format in \( \text{vertexFormat} \).

For any element of \( pInfos[i].\text{pGeometries} \) or \( pInfos[i].\text{ppGeometries} \) with a \( \text{geometryType} \) of \( \text{VK_GEOMETRY_TYPE_TRIANGLES_KHR} \), if \( \text{geometry.triangles.indexType} \) is not \( \text{VK_INDEX_TYPE_NONE_KHR} \), \( \text{geometry.triangles.indexData.deviceAddress} \) must be a valid device address obtained from \( \text{vkGetBufferDeviceAddress} \).

For any element of \( pInfos[i].\text{pGeometries} \) or \( pInfos[i].\text{ppGeometries} \) with a \( \text{geometryType} \) of \( \text{VK_GEOMETRY_TYPE_TRIANGLES_KHR} \), if \( \text{geometry.triangles.indexType} \) is not equal to \( \text{VK_INDEX_TYPE_NONE_KHR} \), \( \text{geometry.triangles.indexData.deviceAddress} \) must be aligned to the size in bytes of the type in \( \text{indexType} \).
For any element of \( p\text{Infos}[i].p\text{Geometries} \) or \( p\text{Infos}[i].pp\text{Geometries} \) with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_TRIANGLES\_KHR}, if \texttt{geometry.triangles.transformData.deviceAddress} is not 0, it \textbf{must} be a valid device address obtained from \texttt{vkGetBufferDeviceAddress}.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03809
  For any element of \( p\text{Infos}[i].p\text{Geometries} \) or \( p\text{Infos}[i].pp\text{Geometries} \) with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_TRIANGLES\_KHR}, if \texttt{geometry.triangles.transformData.deviceAddress} is the address of a non-sparse buffer then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03810
  For any element of \( p\text{Infos}[i].p\text{Geometries} \) or \( p\text{Infos}[i].pp\text{Geometries} \) with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_TRIANGLES\_KHR}, if \texttt{geometry.triangles.transformData.deviceAddress} is not 0, it \textbf{must} be aligned to 16 bytes.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03811
  For any element of \( p\text{Infos}[i].p\text{Geometries} \) or \( p\text{Infos}[i].pp\text{Geometries} \) with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_AABBS\_KHR}, \texttt{geometry.aabbs.data.deviceAddress} \textbf{must} be a valid device address obtained from \texttt{vkGetBufferDeviceAddress}.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03714
  For any element of \( p\text{Infos}[i].p\text{Geometries} \) or \( p\text{Infos}[i].pp\text{Geometries} \) with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_AABBS\_KHR}, \texttt{geometry.aabbs.data.deviceAddress} \textbf{must} be aligned to 8 bytes.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03715
  For any element of \( p\text{Infos}[i].p\text{Geometries} \) or \( p\text{Infos}[i].pp\text{Geometries} \) with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR}, if \texttt{geometry.arrayOfPointers} is \texttt{VK\_FALSE}, \texttt{geometry.instances.data.deviceAddress} \textbf{must} be aligned to 16 bytes.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03716
  For any element of \( p\text{Infos}[i].p\text{Geometries} \) or \( p\text{Infos}[i].pp\text{Geometries} \) with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR}, if \texttt{geometry.arrayOfPointers} is \texttt{VK\_TRUE}, \texttt{geometry.instances.data.deviceAddress} \textbf{must} be aligned to 8 bytes.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03717
  For any element of \( p\text{Infos}[i].p\text{Geometries} \) or \( p\text{Infos}[i].pp\text{Geometries} \) with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR}, if \texttt{geometry.arrayOfPointers} is \texttt{VK\_TRUE}, each element of \texttt{geometry.instances.data.deviceAddress} in device memory \textbf{must} be aligned to 16 bytes.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03813
  For any element of \( p\text{Infos}[i].p\text{Geometries} \) or \( p\text{Infos}[i].pp\text{Geometries} \) with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR}, \texttt{geometry.instances.data.deviceAddress} \textbf{must} be a valid device address obtained from \texttt{vkGetBufferDeviceAddress}.

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03814
  For any element of \( p\text{Infos}[i].p\text{Geometries} \) or \( p\text{Infos}[i].pp\text{Geometries} \) with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR}, if \texttt{geometry.instances.data.deviceAddress} is the address of a non-sparse buffer then it \textbf{must} be bound completely and contiguously to a single
• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-06707**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `geometry.instances.data.deviceAddress` must be a valid device address containing a value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or 0.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03645**
  For any element of `pIndirectDeviceAddresses`, if the buffer from which it was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03646**
  For any element of `pIndirectDeviceAddresses[i]`, all device addresses between `pIndirectDeviceAddresses[i]` and `pIndirectDeviceAddresses[i] + (pInfos[i].geometryCount * pIndirectStrides[i]) - 1` must be in the buffer device address range of the same buffer.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03647**
  For any element of `pIndirectDeviceAddresses`, the buffer from which it was queried must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03648**
  Each element of `pIndirectDeviceAddresses` must be a multiple of 4.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-03787**
  Each element of `pIndirectStrides` must be a multiple of 4.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-03649**
  `commandBuffer` must not be a protected command buffer.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-accelerationStructureIndirectBuild-03650**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureIndirectBuild` feature must be enabled.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03651**
  Each `VkAccelerationStructureBuildRangeInfoKHR` structure referenced by any element of `pIndirectDeviceAddresses` must be a valid `VkAccelerationStructureBuildRangeInfoKHR` structure.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03652**
  `pInfos[i].dstAccelerationStructure` must have been created with a value of `VkAccelerationStructureCreateInfoKHR::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetAccelerationStructureBuildSizesKHR` with `pBuildInfo = pInfos[i]` and `pMaxPrimitiveCounts = ppMaxPrimitiveCounts[i]`.

• **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-03653**
  Each `ppMaxPrimitiveCounts[i][j]` must be greater than or equal to the the `primitiveCount` value specified by the `VkAccelerationStructureBuildRangeInfoKHR` structure located at `pIndirectDeviceAddresses[i] + (j * pIndirectStrides[i])`. 
Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-parameter
  pInfos must be a valid pointer to an array of infoCount valid
  VkAccelerationStructureBuildGeometryInfoKHR structures

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-parameter
  pIndirectDeviceAddresses must be a valid pointer to an array of infoCount
  VkDeviceAddress values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-parameter
  pIndirectStrides must be a valid pointer to an array of infoCount uint32_t values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-parameter
  ppMaxPrimitiveCounts must be a valid pointer to an array of infoCount uint32_t values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute
  operations

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-infoCount-arraylength
  infoCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally
  synchronized

The `VkAccelerationStructureBuildGeometryInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildGeometryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureTypeKHR type;
    VkBuildAccelerationStructureFlagsKHR flags;
    VkBuildAccelerationStructureModeKHR mode;
    VkAccelerationStructureKHR srcAccelerationStructure;
    VkAccelerationStructureKHR dstAccelerationStructure;
    uint32_t geometryCount;
    const VkAccelerationStructureGeometryKHR* pGeometries;
    const VkAccelerationStructureGeometryKHR* const* ppGeometries;
    VkDeviceOrHostAddressKHR scratchData;
} VkAccelerationStructureBuildGeometryInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `type` is a `VkAccelerationStructureTypeKHR` value specifying the type of acceleration structure being built.
- `flags` is a bitmask of `VkBuildAccelerationStructureFlagBitsKHR` specifying additional parameters of the acceleration structure.
- `mode` is a `VkBuildAccelerationStructureModeKHR` value specifying the type of operation to perform.
- `srcAccelerationStructure` is a pointer to an existing acceleration structure that is to be used to update the `dst` acceleration structure when `mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`.
- `dstAccelerationStructure` is a pointer to the target acceleration structure for the build.
- `geometryCount` specifies the number of geometries that will be built into `dstAccelerationStructure`.
- `pGeometries` is a pointer to an array of `VkAccelerationStructureGeometryKHR` structures.
- `ppGeometries` is a pointer to an array of pointers to `VkAccelerationStructureGeometryKHR` structures.
- `scratchData` is the device or host address to memory that will be used as scratch memory for the build.

Only one of `pGeometries` or `ppGeometries` can be a valid pointer, the other must be `NULL`. Each element of the non-`NULL` array describes the data used to build each acceleration structure geometry.

The index of each element of the `pGeometries` or `ppGeometries` members of `VkAccelerationStructureBuildGeometryInfoKHR` is used as the `geometry index` during ray traversal. The geometry index is available in ray shaders via the `RayGeometryIndexKHR` built-in, and is used to
determine hit and intersection shaders executed during traversal. The geometry index is available to ray queries via the `OpRayQueryGetIntersectionGeometryIndexKHR` instruction.

Setting `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in `flags` indicates that this build is a motion top level acceleration structure. A motion top level uses instances of format `VkAccelerationStructureMotionInstanceNV` if `VkAccelerationStructureGeometryInstancesDataKHR::arrayOfPointers` is `VK_FALSE`.

If `VkAccelerationStructureGeometryInstancesDataKHR::arrayOfPointers` is `VK_TRUE`, the pointer for any given element of the array of instance pointers consists of 4 bits of `VkAccelerationStructureMotionInstanceTypeNV` in the low 4 bits of the pointer identifying the type of structure at the pointer. The device address accessed is the value in the array with the low 4 bits set to zero. The structure at the pointer is one of `VkAccelerationStructureInstanceKHR`, `VkAccelerationStructureMatrixMotionInstanceNV` or `VkAccelerationStructureSRTMotionInstanceNV`, depending on the type value encoded in the low 4 bits.

A top level acceleration structure with either motion instances or vertex motion in its instances must set `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in `flags`.

Members `srcAccelerationStructure` and `dstAccelerationStructure` may be the same or different for an update operation (when `mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`). If they are the same, the update happens in-place. Otherwise, the target acceleration structure is updated and the source is not modified.

### Valid Usage

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03654: `type` must not be `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-03788: Only one of `pGeometries` or `ppGeometries` can be a valid pointer, the other must be `NULL`

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03789: If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, the `geometryType` member of elements of either `pGeometries` or `ppGeometries` must be `VK_GEOMETRY_TYPE_INSTANCES_KHR`

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03790: If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, `geometryCount` must be `1`

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03791: If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` the `geometryType` member of elements of either `pGeometries` or `ppGeometries` must not be `VK_GEOMETRY_TYPE_INSTANCES_KHR`

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03792: If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` then the `geometryType` member of each geometry in either `pGeometries` or `ppGeometries` must be the same

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03793: If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` then `geometryCount` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR`
If \( \text{type} \) is \( \text{VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR} \) and the \( \text{geometryType} \) member of either \( \text{pGeometries} \) or \( \text{ppGeometries} \) is \( \text{VK_GEOMETRY_TYPE_AABBS_KHR} \), the total number of AABBs in all geometries must be less than or equal to \( \text{VkPhysicalDeviceAccelerationStructurePropertiesKHR} :: \text{maxPrimitiveCount} \).

If \( \text{type} \) is \( \text{VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR} \) and the \( \text{geometryType} \) member of either \( \text{pGeometries} \) or \( \text{ppGeometries} \) is \( \text{VK_GEOMETRY_TYPE_TRIANGLES_KHR} \), the total number of triangles in all geometries must be less than or equal to \( \text{VkPhysicalDeviceAccelerationStructurePropertiesKHR} :: \text{maxPrimitiveCount} \).

If \( \text{flags} \) has the \( \text{VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR} \) bit set, then it must not have the \( \text{VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR} \) bit set.

If \( \text{flags} \) has the \( \text{VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT} \) bit set then it must not have the \( \text{VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT} \) bit set.

Valid Usage (Implicit)

- \( \text{VkAccelerationStructureCreateInfoKHR} :: \text{flags} \) must be a valid combination of \( \text{VkBuildAccelerationStructureFlagBitsKHR} \) values.

- \( \text{VkAccelerationStructureCreateInfoKHR} :: \text{flags} \) must have the \( \text{VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR} \) type.

- \( \text{VkAccelerationStructureCreateInfoKHR} :: \text{flags} \) must not have the \( \text{VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT} \) bit set.
If `geometryCount` is not 0, and `pGeometries` is not NULL, `pGeometries` must be a valid pointer to an array of `geometryCount` valid `VkAccelerationStructureGeometryKHR` structures.

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-ppGeometries-parameter
  If `geometryCount` is not 0, and `ppGeometries` is not NULL, `ppGeometries` must be a valid pointer to an array of `geometryCount` valid pointers to valid `VkAccelerationStructureGeometryKHR` structures.

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-commonparent
  Both of `dstAccelerationStructure`, and `srcAccelerationStructure` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

The `VkBuildAccelerationStructureModeKHR` enumeration is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureModeKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR = 0,
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR = 1,
} VkBuildAccelerationStructureModeKHR;
```

- `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR` specifies that the destination acceleration structure will be built using the specified geometries.
- `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` specifies that the destination acceleration structure will be built using data in a source acceleration structure, updated by the specified geometries.

The `VkDeviceOrHostAddressKHR` union is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressKHR {
    VkDeviceAddress deviceAddress;
    void* hostAddress;
} VkDeviceOrHostAddressKHR;
```

- `deviceAddress` is a buffer device address as returned by the `vkGetBufferDeviceAddressKHR` command.
- `hostAddress` is a host memory address.

The `VkDeviceOrHostAddressConstKHR` union is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressConstKHR {
    VkDeviceAddress deviceAddress;
    const void* hostAddress;
} VkDeviceOrHostAddressConstKHR;
```
• **deviceAddress** is a buffer device address as returned by the `vkGetBufferDeviceAddressKHR` command.

• **hostAddress** is a const host memory address.

The `VkAccelerationStructureGeometryKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryKHR {
    VkStructureType sType;
    const void* pNext;
    VkGeometryTypeKHR geometryType;
    VkAccelerationStructureGeometryDataKHR geometry;
    VkGeometryFlagsKHR flags;
} VkAccelerationStructureGeometryKHR;
```

• **sType** is the type of this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **geometryType** describes which type of geometry this `VkAccelerationStructureGeometryKHR` refers to.

• **geometry** is a `VkAccelerationStructureGeometryGeometryDataKHR` union describing the geometry data for the relevant geometry type.

• **flags** is a bitmask of `VkGeometryFlagBitsKHR` values describing additional properties of how the geometry should be built.

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureGeometryKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_KHR`.

- **VUID-VkAccelerationStructureGeometryKHR-pNext-pNext**
  
  `pNext` must be `NULL`.

- **VUID-VkAccelerationStructureGeometryKHR-geometryType-parameter**
  
  `geometryType` must be a valid `VkGeometryTypeKHR` value.

- **VUID-VkAccelerationStructureGeometryKHR-triangles-parameter**
  
  If `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the `triangles` member of `geometry` must be a valid `VkAccelerationStructureGeometryTrianglesDataKHR` structure.

- **VUID-VkAccelerationStructureGeometryKHR-aabbs-parameter**
  
  If `geometryType` is `VK_GEOMETRY_TYPE_AABBS_KHR`, the `aabbs` member of `geometry` must be a valid `VkAccelerationStructureGeometryAabbsDataKHR` structure.

- **VUID-VkAccelerationStructureGeometryKHR-instances-parameter**
  
  If `geometryType` is `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the `instances` member of `geometry` must be a valid `VkAccelerationStructureGeometryInstancesDataKHR` structure.

- **VUID-VkAccelerationStructureGeometryKHR-flags-parameter**
  
  `flags` must be a valid combination of `VkGeometryFlagBitsKHR` values.
The `VkAccelerationStructureGeometryDataKHR` union is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef union VkKHR_acceleration_structure {  
    VkAccelerationStructureGeometryTrianglesDataKHR triangles;
    VkAccelerationStructureGeometryAabbsDataKHR aabbs;
    VkAccelerationStructureGeometryInstancesDataKHR instances;
} VkAccelerationStructureGeometryDataKHR;
```

- `triangles` is a `VkAccelerationStructureGeometryTrianglesDataKHR` structure.
- `aabbs` is a `VkAccelerationStructureGeometryAabbsDataKHR` structure.
- `instances` is a `VkAccelerationStructureGeometryInstancesDataKHR` structure.

The `VkAccelerationStructureGeometryTrianglesDataKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkKHR_acceleration_structure {  
    VkStructureType sType;
    const void* pNext;
    VkFormat vertexFormat;
    VkDeviceOrHostAddressConstKHR vertexData;
    VkDeviceSize vertexStride;
    uint32_t maxVertex;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexData;
    VkDeviceOrHostAddressConstKHR transformData;
} VkAccelerationStructureGeometryTrianglesDataKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexFormat` is the `VkFormat` of each vertex element.
- `vertexData` is a device or host address to memory containing vertex data for this geometry.
- `maxVertex` is the highest index of a vertex that will be addressed by a build command using this structure.
- `vertexStride` is the stride in bytes between each vertex.
- `indexType` is the `VkIndexType` of each index element.
- `indexData` is a device or host address to memory containing index data for this geometry.
- `transformData` is a device or host address to memory containing an optional reference to a `VkTransformMatrixKHR` structure describing a transformation from the space in which the vertices in this geometry are described to the space in which the acceleration structure is defined.

---

**Note**
Unlike the stride for vertex buffers in `VkVertexInputBindingDescription` for graphics pipelines which must not exceed `maxVertexInputBindingStride`, `vertexStride` for acceleration structure geometry is instead restricted to being a 32-bit value.

### Valid Usage

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03735**
  - `vertexStride` must be a multiple of the size in bytes of the smallest component of `vertexFormat`

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03819**
  - `vertexStride` must be less than or equal to $2^{32} - 1$

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-03797**
  - `vertexFormat` must support the `VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR` in `VkFormatProperties::bufferFeatures` as returned by `vkGetPhysicalDeviceFormatProperties2`

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-03789**
  - `indexType` must be `VK_INDEX_TYPE_UINT16`, `VK_INDEX_TYPE_UINT32`, or `VK_INDEX_TYPE_NONE_KHR`

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_TRIANGLES_DATA_KHR`

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-pNext-pNext**
  - Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkAccelerationStructureGeometryMotionTrianglesDataNV` or `VkAccelerationStructureTrianglesOpacityMicromapEXT`

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-parameter**
  - `vertexFormat` must be a valid `VkFormat` value

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-parameter**
  - `indexType` must be a valid `VkIndexType` value

The `VkAccelerationStructureGeometryMotionTrianglesDataNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureGeometryMotionTrianglesDataNV {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR vertexData;
};
```
VkAccelerationStructureGeometryMotionTrianglesDataNV

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **vertexData** is a pointer to vertex data for this geometry at time 1.0

If `VkAccelerationStructureGeometryMotionTrianglesDataNV` is included in the `pNext` chain of a `VkAccelerationStructureGeometryTrianglesDataKHR` structure, the basic vertex positions are used for the position of the triangles in the geometry at time 0.0 and the `vertexData` in `VkAccelerationStructureGeometryMotionTrianglesDataNV` is used for the vertex positions at time 1.0, with positions linearly interpolated at intermediate times.

Indexing for `VkAccelerationStructureGeometryMotionTrianglesDataNV vertexData` is equivalent to the basic vertex position data.

**Valid Usage (Implicit)**

- VUID-VkAccelerationStructureGeometryMotionTrianglesDataNV-sType-sType must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_MOTION_TRIANGLES_DATA_NV`

The `VkAccelerationStructureTrianglesOpacityMicromapEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkAccelerationStructureTrianglesOpacityMicromapEXT {
    VkStructureType sType;
    void* pNext;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexBuffer;
    VkDeviceSize indexStride;
    uint32_t baseTriangle;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
    VkMicromapEXT micromap;
} VkAccelerationStructureTrianglesOpacityMicromapEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **indexType** is the type of triangle indices used when indexing this micromap
- **indexBuffer** is the address containing the triangle indices
- **indexStride** is the byte stride between triangle indices
- **baseTriangle** is the base value added to the non-negative triangle indices
- **usageCountsCount** specifies the number of usage counts structures that will be used to determine
the size of this micromap.

- **pUsageCounts** is a pointer to an array of *VkMicromapUsageEXT* structures.
- **ppUsageCounts** is a pointer to an array of pointers to *VkMicromapUsageEXT* structures.
- **micromap** is the handle to the micromap object to include in this geometry.

If `VkAccelerationStructureTrianglesOpacityMicromapEXT` is included in the **pNext** chain of a `VkAccelerationStructureGeometryTrianglesDataKHR` structure, that geometry will reference that micromap.

For each triangle in the geometry, the acceleration structure build fetches an index from `indexBuffer` using `indexType` and `indexStride`. If that value is the unsigned cast of one of the values from `VkOpacityMicromapSpecialIndexEXT` then that triangle behaves as described for that special value in **Ray Opacity Micromap**. Otherwise that triangle uses the opacity micromap information from `micromap` at that index plus `baseTriangle`.

Only one of **pUsageCounts** or **ppUsageCounts** can be a valid pointer, the other must be **NULL**. The elements of the non-NULL array describe the total count used to build this geometry. For a given **format** and **subdivisionLevel** the number of triangles in this geometry matching those values after indirection and special index handling must be equal to the sum of matching **count** provided.

If **micromap** is **VK_NULL_HANDLE**, then every value read from `indexBuffer` must be one of the values in `VkOpacityMicromapSpecialIndexEXT`.

### Valid Usage

- **VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-pUsageCounts-07335**
  
  Only one of **pUsageCounts** or **ppUsageCounts** can be a valid pointer, the other must be **NULL**.

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_TRIANGLES_OPACITY_MICROMAP_EXT**

- **VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-indexType-parameter**
  
  **indexType** must be a valid **VkIndexType** value

- **VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-pUsageCounts-parameter**
  
  If **usageCountsCount** is not 0, and **pUsageCounts** is not **NULL**, **pUsageCounts** must be a valid pointer to an array of **usageCountsCount** **VkMicromapUsageEXT** structures

- **VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-ppUsageCounts-parameter**
  
  If **usageCountsCount** is not 0, and **ppUsageCounts** is not **NULL**, **ppUsageCounts** must be a valid pointer to an array of **usageCountsCount** valid pointers to **VkMicromapUsageEXT** structures

- **VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-micromap-parameter**
  
  **micromap** must be a valid **VkMicromapEXT** handle

The **VkOpacityMicromapSpecialIndexEXT** enumeration is defined as:
// Provided by VK_EXT_opacity_micromap

typedef enum VkOpacityMicromapSpecialIndexEXT {
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT = -1,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT = -2,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT = -3,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_OPAQUE_EXT = -4,
} VkOpacityMicromapSpecialIndexEXT;

- VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT specifies that the entire triangle is fully transparent.
- VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT specifies that the entire triangle is fully opaque.
- VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT specifies that the entire triangle is unknown-transparent.
- VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_OPAQUE_EXT specifies that the entire triangle is unknown-opaque.

The VkTransformMatrixKHR structure is defined as:

// Provided by VK_KHR_acceleration_structure
typedef struct VkTransformMatrixKHR {
    float matrix[3][4];
} VkTransformMatrixKHR;

or the equivalent

// Provided by VK_NV_ray_tracing
typedef VkTransformMatrixKHR VkTransformMatrixNV;

- matrix is a 3x4 row-major affine transformation matrix.

Valid Usage

- VUID-VkTransformMatrixKHR-matrix-03799
  The first three columns of matrix must define an invertible 3x3 matrix.

The VkAccelerationStructureGeometryAabbsDataKHR structure is defined as:

// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryAabbsDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR data;
    VkDeviceSize stride;
}
• \texttt{sType} is the type of this structure.
• \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
• \texttt{data} is a device or host address to memory containing \texttt{VkAabbPositionsKHR} structures containing position data for each axis-aligned bounding box in the geometry.
• \texttt{stride} is the stride in bytes between each entry in \texttt{data}. The stride \textbf{must} be a multiple of 8.

### Valid Usage

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03545
  \texttt{stride} \textbf{must} be a multiple of 8
- VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03820
  \texttt{stride} \textbf{must} be less than or equal to $2^{31}-1$

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-sType-sType
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_AABBS_DATA_KHR}
- VUID-VkAccelerationStructureGeometryAabbsDataKHR-pNext-pNext
  \texttt{pNext} \textbf{must} be \texttt{NULL}

The \texttt{VkAabbPositionsKHR} structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAabbPositionsKHR {
    float minX;
    float minY;
    float minZ;
    float maxX;
    float maxY;
    float maxZ;
} VkAabbPositionsKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkAabbPositionsKHR VkAabbPositionsNV;
```

• \texttt{minX} is the x position of one opposing corner of a bounding box.
• \texttt{minY} is the y position of one opposing corner of a bounding box.
• \texttt{minZ} is the z position of one opposing corner of a bounding box.
• \texttt{maxX} is the x position of the other opposing corner of a bounding box.
• \texttt{maxY} is the y position of the other opposing corner of a bounding box.
• \texttt{maxZ} is the z position of the other opposing corner of a bounding box.

\textbf{Valid Usage}

- VUID-VkAabbPositionsKHR-minX-03546
  \texttt{minX} must be less than or equal to \texttt{maxX}
- VUID-VkAabbPositionsKHR-minY-03547
  \texttt{minY} must be less than or equal to \texttt{maxY}
- VUID-VkAabbPositionsKHR-minZ-03548
  \texttt{minZ} must be less than or equal to \texttt{maxZ}

The \texttt{VkAccelerationStructureGeometryInstancesDataKHR} structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryInstancesDataKHR {
  VkStructureType sType;
  const void* pNext;
  VkBool32 arrayOfPointers;
  VkDeviceOrHostAddressConstKHR data;
} VkAccelerationStructureGeometryInstancesDataKHR;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{arrayOfPointers} specifies whether \texttt{data} is used as an array of addresses or just an array.
- \texttt{data} is either the address of an array of device or host addresses referencing individual \texttt{VkAccelerationStructureInstanceKHR} structures or packed motion instance information as described in motion instances if \texttt{arrayOfPointers} is \texttt{VK_TRUE}, or the address of an array of \texttt{VkAccelerationStructureInstanceKHR} or \texttt{VkAccelerationStructureMotionInstanceNV} structures. Addresses and \texttt{VkAccelerationStructureInstanceKHR} structures are tightly packed. \texttt{VkAccelerationStructureMotionInstanceNV} structures have a stride of 160 bytes.

\textbf{Valid Usage (Implicit)}

- VUID-VkAccelerationStructureGeometryInstancesDataKHR-sType-sType
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_INSTANCES_DATA_KHR}
- VUID-VkAccelerationStructureGeometryInstancesDataKHR-pNext-pNext
  \texttt{pNext} must be \texttt{NULL}

\textit{Acceleration structure instances} can be built into top-level acceleration structures. Each
acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location. Multiple instances can point to the same bottom level acceleration structure.

An acceleration structure instance is defined by the structure:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureInstanceKHR {
    VkTransformMatrixKHR transform;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureInstanceKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkAccelerationStructureInstanceKHR VkAccelerationStructureInstanceNV;
```

- **transform** is a `VkTransformMatrixKHR` structure describing a transformation to be applied to the acceleration structure.
- **instanceCustomIndex** is a 24-bit user-specified index value accessible to ray shaders in the InstanceCustomIndexKHR built-in.
- **mask** is an 8-bit visibility mask for the geometry. The instance may only be hit if `Cull Mask & instance.mask != 0`
- **instanceShaderBindingTableRecordOffset** is a 24-bit offset used in calculating the hit shader binding table index.
- **flags** is an 8-bit mask of `VkGeometryInstanceFlagBitsKHR` values to apply to this instance.
- **accelerationStructureReference** is either:
  - a device address containing the value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or `vkGetAccelerationStructureHandleNV` (used by device operations which reference acceleration structures) or,
  - a `VkAccelerationStructureKHR` object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- **instanceCustomIndex** and **mask** occupy the same memory as if a single `uint32_t` was specified in their place
  - **instanceCustomIndex** occupies the 24 least significant bits of that memory
  - **mask** occupies the 8 most significant bits of that memory
• `instanceShaderBindingTableRecordOffset` and `flags` occupy the same memory as if a single `uint32_t` was specified in their place
  • `instanceShaderBindingTableRecordOffset` occupies the 24 least significant bits of that memory
  • `flags` occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications must employ another method to set values according to the correct bit pattern.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureInstanceKHR-flags-parameter
  - `flags` must be a valid combination of `VkGeometryInstanceFlagBitsKHR` values

Possible values of `flags` in the instance modifying the behavior of that instance are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryInstanceFlagBitsKHR {
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR = 0x00000002,
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR = 0x00000004,
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR = 0x00000008,
    // Provided by VK_EXT_opacity_micromap
    VK_GEOMETRY_INSTANCE_FORCE_OPACITY_MICROMAP_2_STATE_EXT = 0x00000010,
    // Provided by VK_EXT_opacity_micromap
    VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT = 0x00000020,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_NV = VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_NV = VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR,
} VkGeometryInstanceFlagBitsKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkGeometryInstanceFlagBitsKHR VkGeometryInstanceFlagBitsNV;
```
• **VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR** disables face culling for this instance.

• **VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR** indicates that the facing determination for geometry in this instance is inverted. Because the facing is determined in object space, an instance transform does not change the winding, but a geometry transform does.

• **VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR** causes this instance to act as though **VK_GEOMETRY_OPAQUE_BIT_KHR** were specified on all geometries referenced by this instance. This behavior can be overridden by the SPIR-V **NoOpaqueKHR** ray flag.

• **VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR** causes this instance to act as though **VK_GEOMETRY_OPAQUE_BIT_KHR** were not specified on all geometries referenced by this instance. This behavior can be overridden by the SPIR-V **OpaqueKHR** ray flag.

**VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR** and **VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR** must not be used in the same flag.

```c
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkGeometryInstanceFlagsKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkGeometryInstanceFlagsKHR VkGeometryInstanceFlagsNV;
```

**VkGeometryInstanceFlagsKHR** is a bitmask type for setting a mask of zero or more **VkGeometryInstanceFlagBitsKHR**.

**Acceleration structure motion instances** can be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location including a type of motion and parameters to determine the motion of the instance over time.

An acceleration structure motion instance is defined by the structure:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureMotionInstanceNV {
    VkAccelerationStructureMotionInstanceTypeNV type;
    VkAccelerationStructureMotionInstanceFlagsNV flags;
    VkAccelerationStructureMotionInstanceDataNV data;
} VkAccelerationStructureMotionInstanceNV;
```

• **type** is a **VkAccelerationStructureMotionInstanceTypeNV** enumerant identifying which type of motion instance this is and which type of the union is valid.

• **flags** is currently unused, but is required to keep natural alignment of **data**.

• **data** is a **VkAccelerationStructureMotionInstanceDataNV** containing motion instance data for
Note

If writing this other than with a standard C compiler, note that the final structure should be 152 bytes in size.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureMotionInstanceNV-type-parameter
  type must be a valid VkAccelerationStructureMotionInstanceTypeNV value
- VUID-VkAccelerationStructureMotionInstanceNV-flags-zero bitmask
  flags must be 0
- VUID-VkAccelerationStructureMotionInstanceNV-staticInstance-parameter
  If type is VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV, the staticInstance member of data must be a valid VkAccelerationStructureInstanceKHR structure
- VUID-VkAccelerationStructureMotionInstanceNV-matrixMotionInstance-parameter
  If type is VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV, the matrixMotionInstance member of data must be a valid VkAccelerationStructureMatrixMotionInstanceNV structure
- VUID-VkAccelerationStructureMotionInstanceNV-srtMotionInstance-parameter
  If type is VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV, the srtMotionInstance member of data must be a valid VkAccelerationStructureSRTMotionInstanceNV structure

Acceleration structure motion instance is defined by the union:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef union VkAccelerationStructureMotionInstanceDataNV {
    VkAccelerationStructureInstanceKHR staticInstance;
    VkAccelerationStructureMatrixMotionInstanceNV matrixMotionInstance;
    VkAccelerationStructureSRTMotionInstanceNV srtMotionInstance;
} VkAccelerationStructureMotionInstanceDataNV;
```

- staticInstance is a VkAccelerationStructureInstanceKHR structure containing data for a static instance.
- matrixMotionInstance is a VkAccelerationStructureMatrixMotionInstanceNV structure containing data for a matrix motion instance.
- srtMotionInstance is a VkAccelerationStructureSRTMotionInstanceNV structure containing data for an SRT motion instance.

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef VkFlags VkAccelerationStructureMotionInstanceFlagsNV;
```
VkAccelerationStructureMotionInstanceFlagsNV is a bitmask type for setting a mask, but is currently reserved for future use.

The VkAccelerationStructureMotionInstanceTypeNV enumeration is defined as:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef enum VkAccelerationStructureMotionInstanceTypeNV {
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV = 0,
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV = 1,
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV = 2,
} VkAccelerationStructureMotionInstanceTypeNV;
```

- **VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV** specifies that the instance is a static instance with no instance motion.
- **VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV** specifies that the instance is a motion instance with motion specified by interpolation between two matrices.
- **VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV** specifies that the instance is a motion instance with motion specified by interpolation in the SRT decomposition.

An acceleration structure matrix motion instance is defined by the structure:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureMatrixMotionInstanceNV {
    VkTransformMatrixKHR transformT0;
    VkTransformMatrixKHR transformT1;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureMatrixMotionInstanceNV;
```

- **transformT0** is a VkTransformMatrixKHR structure describing a transformation to be applied to the acceleration structure at time 0.
- **transformT1** is a VkTransformMatrixKHR structure describing a transformation to be applied to the acceleration structure at time 1.
- **instanceCustomIndex** is a 24-bit user-specified index value accessible to ray shaders in the InstanceCustomIndexKHR built-in.
- **mask** is an 8-bit visibility mask for the geometry. The instance may only be hit if Cull Mask & instance.mask != 0
- **instanceShaderBindingTableRecordOffset** is a 24-bit offset used in calculating the hit shader binding table index.
- **flags** is an 8-bit mask of VkGeometryInstanceFlagBitsKHR values to apply to this instance.
- **accelerationStructureReference** is either:
• a device address containing the value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or `vkGetAccelerationStructureHandleNV` (used by device operations which reference acceleration structures) or,
• a `VkAccelerationStructureKHR` object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

• `instanceCustomIndex` and `mask` occupy the same memory as if a single `uint32_t` was specified in their place
  ◦ `instanceCustomIndex` occupies the 24 least significant bits of that memory
  ◦ `mask` occupies the 8 most significant bits of that memory
• `instanceShaderBindingTableRecordOffset` and `flags` occupy the same memory as if a single `uint32_t` was specified in their place
  ◦ `instanceShaderBindingTableRecordOffset` occupies the 24 least significant bits of that memory
  ◦ `flags` occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications must employ another method to set values according to the correct bit pattern.

The transform for a matrix motion instance at a point in time is derived by component-wise linear interpolation of the two transforms. That is, for a `time` in [0,1] the resulting transform is

\[
\text{transformT0} \times (1 - \text{time}) + \text{transformT1} \times \text{time}
\]

Valid Usage (Implicit)

• VUID-VkAccelerationStructureMatrixMotionInstanceNV-flags-parameter
  `flags` must be a valid combination of `VkGeometryInstanceFlagBitsKHR` values

An acceleration structure SRT motion instance is defined by the structure:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureSRTMotionInstanceNV {
    VkSRTDataNV transformT0;
    VkSRTDataNV transformT1;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureSRTMotionInstanceNV;
```
• \texttt{transformT0} is a 	exttt{VkSRTDataNV} structure describing a transformation to be applied to the acceleration structure at time 0.

• \texttt{transformT1} is a 	exttt{VkSRTDataNV} structure describing a transformation to be applied to the acceleration structure at time 1.

• \texttt{instanceCustomIndex} is a 24-bit user-specified index value accessible to ray shaders in the \texttt{InstanceCustomIndexKHR} built-in.

• \texttt{mask} is an 8-bit visibility mask for the geometry. The instance \textit{may} only be hit if \texttt{Cull Mask} & \texttt{instance.mask} \neq 0.

• \texttt{instanceShaderBindingTableRecordOffset} is a 24-bit offset used in calculating the hit shader binding table index.

• \texttt{flags} is an 8-bit mask of \texttt{VkGeometryInstanceFlagBitsKHR} values to apply to this instance.

• \texttt{accelerationStructureReference} is either:
  ◦ a device address containing the value obtained from \texttt{vkGetAccelerationStructureDeviceAddressKHR} or \texttt{vkGetAccelerationStructureHandleNV} (used by device operations which reference acceleration structures) or,
  ◦ a \texttt{VkAccelerationStructureKHR} object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

• \texttt{instanceCustomIndex} and \texttt{mask} occupy the same memory as if a single \texttt{uint32_t} was specified in their place
  ◦ \texttt{instanceCustomIndex} occupies the 24 least significant bits of that memory
  ◦ \texttt{mask} occupies the 8 most significant bits of that memory

• \texttt{instanceShaderBindingTableRecordOffset} and \texttt{flags} occupy the same memory as if a single \texttt{uint32_t} was specified in their place
  ◦ \texttt{instanceShaderBindingTableRecordOffset} occupies the 24 least significant bits of that memory
  ◦ \texttt{flags} occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications \textbf{must} employ another method to set values according to the correct bit pattern.

The transform for a SRT motion instance at a point in time is derived from component-wise linear interpolation of the two SRT transforms. That is, for a \texttt{time} in \([0,1]\) the resulting transform is

\[
\texttt{transformT0} \times (1 - \texttt{time}) + \texttt{transformT1} \times \texttt{time}
\]
An acceleration structure SRT transform is defined by the structure:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkSRTDataNV {
    float sx;
    float a;
    float b;
    float pvx;
    float sy;
    float c;
    float pvy;
    float sz;
    float pvz;
    float qx;
    float qy;
    float qz;
    float qw;
    float tx;
    float ty;
    float tz;
} VkSRTDataNV;
```

- `sx` is the x component of the scale of the transform
- `a` is one component of the shear for the transform
- `b` is one component of the shear for the transform
- `pvx` is the x component of the pivot point of the transform
- `sy` is the y component of the scale of the transform
- `c` is one component of the shear for the transform
- `pvy` is the y component of the pivot point of the transform
- `sz` is the z component of the scale of the transform
- `pvz` is the z component of the pivot point of the transform
- `qx` is the x component of the rotation quaternion
- `qy` is the y component of the rotation quaternion
- `qz` is the z component of the rotation quaternion
- `qw` is the w component of the rotation quaternion
- `tx` is the x component of the post-rotation translation
- `ty` is the y component of the post-rotation translation
- `tz` is the z component of the post-rotation translation

This transform decomposition consists of three elements. The first is a matrix $S$, consisting of a scale, shear, and translation, usually used to define the pivot point of the following rotation. This matrix is constructed from the parameters above by:
The rotation quaternion is defined as:

\[
R = [qx, qy, qz, qw]
\]

This is a rotation around a conceptual normalized axis \([ax, ay, az]\) of amount \(\theta\) such that:

\[
[qx, qy, qz] = \sin(\theta/2) \times [ax, ay, az]
\]

and

\[
qw = \cos(\theta/2)
\]

Finally, the transform has a translation \(T\) constructed from the parameters above by:

\[
T = \begin{pmatrix}
1 & 0 & 0 & tx \\
0 & 1 & 0 & ty \\
0 & 0 & 1 & tz
\end{pmatrix}
\]

The effective derived transform is then given by

\[T \times R \times S\]

\(\text{VkAccelerationStructureBuildRangeInfoKHR}\) is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildRangeInfoKHR {
    uint32_t primitiveCount;
    uint32_t primitiveOffset;
    uint32_t firstVertex;
    uint32_t transformOffset;
} VkAccelerationStructureBuildRangeInfoKHR;
```

- \(\text{primitiveCount}\) defines the number of primitives for a corresponding acceleration structure geometry.
- \(\text{primitiveOffset}\) defines an offset in bytes into the memory where primitive data is defined.
- \(\text{firstVertex}\) is the index of the first vertex to build from for triangle geometry.
- \(\text{transformOffset}\) defines an offset in bytes into the memory where a transform matrix is defined.

The primitive count and primitive offset are interpreted differently depending on the \(\text{VkGeometryTypeKHR}\) used:
• For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `primitiveCount` is the number of triangles to be built, where each triangle is treated as 3 vertices.
  ◦ If the geometry uses indices, `primitiveCount × 3` indices are consumed from `VkAccelerationStructureGeometryTrianglesDataKHR::indexData`, starting at an offset of `primitiveOffset`. The value of `firstVertex` is added to the index values before fetching vertices.
  ◦ If the geometry does not use indices, `primitiveCount × 3` vertices are consumed from `VkAccelerationStructureGeometryTrianglesDataKHR::vertexData`, starting at an offset of `primitiveOffset + VkAccelerationStructureGeometryTrianglesDataKHR::vertexStride × firstVertex`.
  ◦ If `VkAccelerationStructureGeometryTrianglesDataKHR::transformData` is not `NULL`, a single `VkTransformMatrixKHR` structure is consumed from `VkAccelerationStructureGeometryTrianglesDataKHR::transformData`, at an offset of `transformOffset`. This matrix describes a transformation from the space in which the vertices for all triangles in this geometry are described to the space in which the acceleration structure is defined.

• For geometries of type `VK_GEOMETRY_TYPE_AABBS_KHR`, `primitiveCount` is the number of axis-aligned bounding boxes. `primitiveCount` `VkAabbPositionsKHR` structures are consumed from `VkAccelerationStructureGeometryAabbsDataKHR::data`, starting at an offset of `primitiveOffset`.

• For geometries of type `VK_GEOMETRY_TYPE_INSTANCES_KHR`, `primitiveCount` is the number of acceleration structures. `primitiveCount` `VkAccelerationStructureInstanceKHR` or `VkAccelerationStructureMotionInstanceNV` structures are consumed from `VkAccelerationStructureGeometryInstancesDataKHR::data`, starting at an offset of `primitiveOffset`.

**Valid Usage**

• VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03656
  For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if the geometry uses indices, the offset `primitiveOffset` from `VkAccelerationStructureGeometryTrianglesDataKHR::indexData` must be a multiple of the element size of `VkAccelerationStructureGeometryTrianglesDataKHR::indexType`

• VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03657
  For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if the geometry does not use indices, the offset `primitiveOffset` from `VkAccelerationStructureGeometryTrianglesDataKHR::vertexData` must be a multiple of the component size of `VkAccelerationStructureGeometryTrianglesDataKHR::vertexFormat`

• VUID-VkAccelerationStructureBuildRangeInfoKHR-transformOffset-03658
  For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the offset `transformOffset` from `VkAccelerationStructureGeometryTrianglesDataKHR::transformData` must be a multiple of 16

• VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03659
  For geometries of type `VK_GEOMETRY_TYPE_AABBS_KHR`, the offset `primitiveOffset` from `VkAccelerationStructureGeometryAabbsDataKHR::data` must be a multiple of 8
36.1.7. Copying Acceleration Structures

An additional command exists for copying acceleration structures without updating their contents. The acceleration structure object can be compacted in order to improve performance. Before copying, an application must query the size of the resulting acceleration structure.

To query acceleration structure size parameters call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdWriteAccelerationStructuresPropertiesKHR(
    VkCommandBuffer commandBuffer,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureKHR* pAccelerationStructures,
    VkQueryType queryType,
    VkQueryPool queryPool,
    uint32_t firstQuery);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `accelerationStructureCount` is the count of acceleration structures for which to query the property.
- `pAccelerationStructures` is a pointer to an array of existing previously built acceleration structures.
- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
- `queryPool` is the query pool that will manage the results of the query.
- `firstQuery` is the first query index within the query pool that will contain the `accelerationStructureCount` number of results.

Accesses to any of the acceleration structures listed in `pAccelerationStructures` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`.

- If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then the value written out is the number of bytes required by a compacted acceleration structure.
- If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`, then the value written out is the number of bytes required by a serialized acceleration structure.

Valid Usage

- `VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02493` `queryPool` must have been created with a `queryType` matching `queryType`
The queries identified by `queryPool` and `firstQuery` must be unavailable.

The buffer used to create each acceleration structure in `pAccelerationStructures` must be bound to device memory.

The sum of `query` plus `accelerationStructureCount` must be less than or equal to the number of queries in `queryPool`.

All acceleration structures in `pAccelerationStructures` must have been built prior to the execution of this command.

All acceleration structures in `pAccelerationStructures` must have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`.

`queryType` must be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`.

Valid Usage (Implicit)

CommandBuffer must be a valid `VkCommandBuffer` handle.

`pAccelerationStructures` must be a valid pointer to an array of `accelerationStructureCount` valid `VkAccelerationStructureKHR` handles.

`queryType` must be a valid `VkQueryType` value.

`queryPool` must be a valid `VkQueryPool` handle.

CommandBuffer must be in the recording state.

The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.

This command must only be called outside of a render pass instance.

This command must only be called outside of a video coding scope.
• VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructureCount-arraylength
  accelerationStructureCount must be greater than 0

• VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commonparent
  Each of commandBuffer, queryPool, and the elements of pAccelerationStructures must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

To query acceleration structure size parameters call:

```c
// Provided by VK_NV_ray_tracing
void vkCmdWriteAccelerationStructuresPropertiesNV(
    VkCommandBuffer commandBuffer,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureNV* pAccelerationStructures,
    VkQueryType queryType,
    VkQueryPool queryPool,
    uint32_t firstQuery);
```

• commandBuffer is the command buffer into which the command will be recorded.
• accelerationStructureCount is the count of acceleration structures for which to query the property.
• pAccelerationStructures is a pointer to an array of existing previously built acceleration structures.
• queryType is a VkQueryType value specifying the type of queries managed by the pool.
• queryPool is the query pool that will manage the results of the query.
• firstQuery is the first query index within the query pool that will contain the accelerationStructureCount number of results.
Accesses to any of the acceleration structures listed in `pAccelerationStructures` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`.

**Valid Usage**

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-03755 `queryPool` must have been created with a `queryType` matching `queryType`

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-03756 The queries identified by `queryPool` and `firstQuery` must be unavailable

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-accelerationStructure-03757 `accelerationStructure` must be bound completely and contiguously to a single `VkDeviceMemory` object via `vkBindAccelerationStructureMemoryNV`

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-pAccelerationStructures-04958 All acceleration structures in `pAccelerationStructures` must have been built prior to the execution of this command

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-pAccelerationStructures-06215 All acceleration structures in `pAccelerationStructures` must have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryType-06216 `queryType` must be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`

**Valid Usage (Implicit)**

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-pAccelerationStructures-parameter `pAccelerationStructures` must be a valid pointer to an array of `accelerationStructureCount` valid `VkAccelerationStructureNV` handles

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryType-parameter `queryType` must be a valid `VkQueryType` value

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-parameter `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commandBuffer-recording `commandBuffer` must be in the recording state

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-renderpass This command must only be called outside of a render pass instance
This command must only be called outside of a video coding scope.

accelerationStructureCount must be greater than 0.

Each of commandBuffer, queryPool, and the elements of pAccelerationStructures must have been created, allocated, or retrieved from the same VkDevice.

Host Synchronization

Host access to commandBuffer must be externally synchronized.

Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

To copy an acceleration structure call:

```c
// Provided by VK_NV_ray_tracing
void vkCmdCopyAccelerationStructureNV(
    VkCommandBuffer commandBuffer, 
    VkAccelerationStructureNV dst, 
    VkAccelerationStructureNV src, 
    VkCopyAccelerationStructureModeKHR mode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `dst` is the target acceleration structure for the copy.
- `src` is the source acceleration structure for the copy.
- `mode` is a VkCopyAccelerationStructureModeKHR value specifying additional operations to perform during the copy.

Accesses to `src` and `dst` must be synchronized with the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR or VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR as appropriate.
**Valid Usage**

- VUID-vkCmdCopyAccelerationStructureNV-mode-03410
  
  mode must be VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR or VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR

- VUID-vkCmdCopyAccelerationStructureNV-src-04963
  
  The source acceleration structure src must have been constructed prior to the execution of this command

- VUID-vkCmdCopyAccelerationStructureNV-src-03411
  
  If mode is VK_COPY ACCELERATION_STRUCTURE_MODE_COMPACT_KHR, src must have been constructed with VK_BUILD ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR in the build

- VUID-vkCmdCopyAccelerationStructureNV-buffer-03718
  
  The buffer used to create src must be bound to device memory

- VUID-vkCmdCopyAccelerationStructureNV-buffer-03719
  
  The buffer used to create dst must be bound to device memory

**Valid Usage (Implicit)**

- VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-parameter
  
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyAccelerationStructureNV-dst-parameter
  
  dst must be a valid VkAccelerationStructureNV handle

- VUID-vkCmdCopyAccelerationStructureNV-src-parameter
  
  src must be a valid VkAccelerationStructureNV handle

- VUID-vkCmdCopyAccelerationStructureNV-mode-parameter
  
  mode must be a valid VkCopyAccelerationStructureModeKHR value

- VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-recording
  
  commandBuffer must be in the recording state

- VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-cmdpool
  
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdCopyAccelerationStructureNV-renderpass
  
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyAccelerationStructureNV-videocoding
  
  This command must only be called outside of a video coding scope

- VUID-vkCmdCopyAccelerationStructureNV-commonparent
  
  Each of commandBuffer, dst, and src must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

To copy an acceleration structure call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyAccelerationStructureKHR(
    VkCommandBuffer commandBuffer,  // Provided by VK_KHR_acceleration_structure
    const VkCopyAccelerationStructureInfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a `VkCopyAccelerationStructureInfoKHR` structure defining the copy operation.

This command copies the `pInfo->src` acceleration structure to the `pInfo->dst` acceleration structure in the manner specified by `pInfo->mode`.

Accesses to `pInfo->src` and `pInfo->dst` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR` as appropriate.

Valid Usage

- VUID-vkCmdCopyAccelerationStructureKHR-buffer-03737
  The `buffer` used to create `pInfo->src` must be bound to device memory
- VUID-vkCmdCopyAccelerationStructureKHR-buffer-03738
  The `buffer` used to create `pInfo->dst` must be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyAccelerationStructureKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyAccelerationStructureInfoKHR structure
- VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations
- VUID-vkCmdCopyAccelerationStructureKHR-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdCopyAccelerationStructureKHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>

The VkCopyAccelerationStructureInfoKHR structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyAccelerationStructureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR src;
    VkAccelerationStructureKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyAccelerationStructureInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `src` is the source acceleration structure for the copy.
dst is the target acceleration structure for the copy.

mode is a VkCopyAccelerationStructureModeKHR value specifying additional operations to perform during the copy.

Valid Usage

- VUID-VkCopyAccelerationStructureInfoKHR-mode-03410
  
  mode must be VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR or VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR

- VUID-VkCopyAccelerationStructureInfoKHR-src-04963
  
  The source acceleration structure src must have been constructed prior to the execution of this command

- VUID-VkCopyAccelerationStructureInfoKHR-src-03411
  
  If mode is VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR, src must have been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR in the build

- VUID-VkCopyAccelerationStructureInfoKHR-buffer-03718
  
  The buffer used to create src must be bound to device memory

- VUID-VkCopyAccelerationStructureInfoKHR-buffer-03719
  
  The buffer used to create dst must be bound to device memory

Valid Usage (Implicit)

- VUID-VkCopyAccelerationStructureInfoKHR-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_INFO_KHR

- VUID-VkCopyAccelerationStructureInfoKHR-pNext-pNext
  
  pNext must be NULL

- VUID-VkCopyAccelerationStructureInfoKHR-src-parameter
  
  src must be a valid VkAccelerationStructureKHR handle

- VUID-VkCopyAccelerationStructureInfoKHR-dst-parameter
  
  dst must be a valid VkAccelerationStructureKHR handle

- VUID-VkCopyAccelerationStructureInfoKHR-mode-parameter
  
  mode must be a valid VkCopyAccelerationStructureModeKHR value

- VUID-VkCopyAccelerationStructureInfoKHR-commonparent
  
  Both of dst, and src must have been created, allocated, or retrieved from the same VkDevice

Possible values of mode specifying additional operations to perform during the copy, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkCopyAccelerationStructureModeKHR {
  VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR = 0,
  VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR = 1,
};
```
VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR = 2,
VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR = 3,
// Provided by VK_NV_ray_tracing
VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_NV = VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR,
// Provided by VK_NV_ray_tracing
VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_NV = VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR,
} VkCopyAccelerationStructureModeKHR;

or the equivalent

// Provided by VK_NV_ray_tracing
typedef VkCopyAccelerationStructureModeKHR VkCopyAccelerationStructureModeNV;

• **VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR** creates a direct copy of the acceleration structure specified in *src* into the one specified by *dst*. The *dst* acceleration structure **must** have been created with the same parameters as *src*. If *src* contains references to other acceleration structures, *dst* will reference the same acceleration structures.

• **VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR** creates a more compact version of an acceleration structure *src* into *dst*. The acceleration structure *dst** must** have been created with a size at least as large as that returned by `vkCmdWriteAccelerationStructuresPropertiesKHR` or `vkWriteAccelerationStructuresPropertiesKHR` after the build of the acceleration structure specified by *src*. If *src* contains references to other acceleration structures, *dst* will reference the same acceleration structures.

• **VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR** serializes the acceleration structure to a semi-opaque format which can be reloaded on a compatible implementation.

• **VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR** deserializes the semi-opaque serialization format in the buffer to the acceleration structure.

To copy an acceleration structure to device memory call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyAccelerationStructureToMemoryKHR(
    VkCommandBuffer commandBuffer,
    const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

• *commandBuffer* is the command buffer into which the command will be recorded.

• *pInfo* is an a pointer to a `VkCopyAccelerationStructureToMemoryInfoKHR` structure defining the copy operation.

Accesses to *pInfo->src* **must** be synchronized with the *VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR* pipeline stage and an access type of *VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR*. Accesses to the buffer indicated by *pInfo->dst.deviceAddress* **must** be synchronized with the
VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of VK_ACCESS_TRANSFER_WRITE_BIT.

This command produces the same results as vkCopyAccelerationStructureToMemoryKHR, but writes its result to a device address, and is executed on the device rather than the host. The output may not necessarily be bit-for-bit identical, but it can be equally used by either vkCmdCopyMemoryToAccelerationStructureKHR or vkCopyMemoryToAccelerationStructureKHR.

The defined header structure for the serialized data consists of:

- VK_UUID_SIZE bytes of data matching VkPhysicalDeviceIDProperties::driverUUID
- VK_UUID_SIZE bytes of data identifying the compatibility for comparison using vkGetDeviceAccelerationStructureCompatibilityKHR
- A 64-bit integer of the total size matching the value queried using VK_QUERY_TYPE_ACCELERATION_STRUCTURE.Serialization_SIZE_KHR
- A 64-bit integer of the deserialized size to be passed in to VkAccelerationStructureCreateInfoKHR::size
- A 64-bit integer of the count of the number of acceleration structure handles following. This value matches the value queried using VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR. This will be zero for a bottom-level acceleration structure. For top-level acceleration structures this number is implementation-dependent; the number of and ordering of the handles may not match the instance descriptions which were used to build the acceleration structure.

The corresponding handles matching the values returned by vkGetAccelerationStructureDeviceAddressKHR or vkGetAccelerationStructureHandleNV are tightly packed in the buffer following the count. The application is expected to store a mapping between those handles and the original application-generated bottom-level acceleration structures to provide when deserializing. The serialized data is written to the buffer (or read from the buffer) according to the host endianness.

### Valid Usage

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03739 pInfo->dst.deviceAddress must be a valid device address for a buffer bound to device memory
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03740 pInfo->dst.deviceAddress must be aligned to 256 bytes
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03741 If the buffer pointed to by pInfo->dst.deviceAddress is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-None-03559 The buffer used to create pInfo->src must be bound to device memory
Valid Usage (Implicit)

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyAccelerationStructureToMemoryInfoKHR structure

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>

// Provided by VK_KHR_acceleration_structure

typedef struct VkCopyAccelerationStructureToMemoryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR src;
    VkDeviceOrHostAddressKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyAccelerationStructureToMemoryInfoKHR;

- sType is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `src` is the source acceleration structure for the copy

• `dst` is the device or host address to memory which is the target for the copy

• `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-04959**
  The source acceleration structure `src` must have been constructed prior to the execution of this command

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-dst-03561**
  The memory pointed to by `dst` must be at least as large as the serialization size of `src`, as reported by `vkWriteAccelerationStructuresPropertiesKHR` or `vkCmdWriteAccelerationStructuresPropertiesKHR` with a query type of `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-03412**
  `mode` must be `VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR`

### Valid Usage (Implicit)

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_TO_MEMORY_INFO_KHR`

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-pNext-pNext**
  `pNext` must be `NULL`

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-parameter**
  `src` must be a valid `VkAccelerationStructureKHR` handle

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-parameter**
  `mode` must be a valid `VkCopyAccelerationStructureModeKHR` value

To copy device memory to an acceleration structure call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyMemoryToAccelerationStructureKHR(
    VkCommandBuffer commandBuffer,
    const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

- `pInfo` is a pointer to a `VkCopyMemoryToAccelerationStructureInfoKHR` structure defining the copy operation.

Accesses to `pInfo->dst` must be synchronized with the
VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR. Accesses to the buffer indicated by pInfo->src.deviceAddress must be synchronized with the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage and an access type of VK_ACCESS_TRANSFER_READ_BIT.

This command can accept acceleration structures produced by either vkCmdCopyAccelerationStructureToMemoryKHR or vkCopyAccelerationStructureToMemoryKHR.

The structure provided as input to deserialize is as described in vkCmdCopyAccelerationStructureToMemoryKHR, with any acceleration structure handles filled in with the newly-queried handles to bottom level acceleration structures created before deserialization. These do not need to be built at deserialize time, but must be created.

**Valid Usage**

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03742 pInfo->src.deviceAddress must be a valid device address for a buffer bound to device memory
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03743 pInfo->src.deviceAddress must be aligned to 256 bytes
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03744 If the buffer pointed to by pInfo->src.deviceAddress is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-buffer-03745 The buffer used to create pInfo->dst must be bound to device memory

**Valid Usage (Implicit)**

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-parameter pInfo must be a valid pointer to a valid VkCopyMemoryToAccelerationStructureInfoKHR structure
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-recording commandBuffer must be in the recording state
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support compute operations
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-renderpass This command must only be called outside of a render pass instance
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-videocoding This command must only be called outside of a video coding scope
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkCopyMemoryToAccelerationStructureInfoKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyMemoryToAccelerationStructureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR src;
    VkAccelerationStructureKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyMemoryToAccelerationStructureInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **src** is the device or host address to memory containing the source data for the copy.
- **dst** is the target acceleration structure for the copy.
- **mode** is a VkCopyAccelerationStructureModeKHR value specifying additional operations to perform during the copy.

Valid Usage

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-src-04960**
  The source memory pointed to by src must contain data previously serialized using vkCmdCopyAccelerationStructureToMemoryKHR, potentially modified to relocate acceleration structure references as described in that command.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-03413**
  mode must be VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pInfo-03414**
  The data in src must have a format compatible with the destination physical device as
To check if a serialized acceleration structure is compatible with the current device call:

```c
// Provided by VK_KHR_acceleration_structure
void vkGetDeviceAccelerationStructureCompatibilityKHR(
    VkDevice device,
    const VkAccelerationStructureVersionInfoKHR* pVersionInfo,
    VkAccelerationStructureCompatibilityKHR* pCompatibility);
```

- `device` is the device to check the version against.
- `pVersionInfo` is a pointer to a `VkAccelerationStructureVersionInfoKHR` structure specifying version information to check against the device.
- `pCompatibility` is a pointer to a `VkAccelerationStructureCompatibilityKHR` value in which compatibility information is returned.

Valid Usage

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-rayTracingPipeline-03661
  
  The `rayTracingPipeline` or `rayQuery` feature must be enabled

Valid Usage (Implicit)

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pVersionInfo-parameter
  
  `pVersionInfo` must be a valid pointer to a valid `VkAccelerationStructureVersionInfoKHR`
structure

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pCompatibility-parameter
  
  pCompatibility must be a valid pointer to a VkAccelerationStructureCompatibilityKHR value

The VkAccelerationStructureVersionInfoKHR structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureVersionInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    const uint8_t*           pVersionData;
} VkAccelerationStructureVersionInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pVersionData is a pointer to the version header of an acceleration structure as defined in vkCmdCopyAccelerationStructureToMemoryKHR

Note

pVersionData is a pointer to an array of $2 \times \text{VK_UUID_SIZE}$ uint8_t values instead of two VK_UUID_SIZE arrays as the expected use case for this member is to be pointed at the header of a previously serialized acceleration structure (via vkCmdCopyAccelerationStructureToMemoryKHR or vkCopyAccelerationStructureToMemoryKHR) that is loaded in memory. Using arrays would necessitate extra memory copies of the UUIDs.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureVersionInfoKHR-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_INFO_KHR

- VUID-VkAccelerationStructureVersionInfoKHR-pNext-pNext
  
  pNext must be NULL

- VUID-VkAccelerationStructureVersionInfoKHR-pVersionData-parameter
  
  pVersionData must be a valid pointer to an array of $2 \times \text{VK_UUID_SIZE}$ uint8_t values

Possible values of pCompatibility returned by vkGetDeviceAccelerationStructureCompatibilityKHR are:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureCompatibilityKHR {
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR = 0,
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR = 1,
};
```
```
} VkAccelerationStructureCompatibilityKHR;
```

- **VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR** if the `pVersionData` version acceleration structure is compatible with `device`.
- **VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR** if the `pVersionData` version acceleration structure is not compatible with `device`.

### 36.2. Host Acceleration Structure Operations

Implementations are also required to provide host implementations of the acceleration structure operations if the `accelerationStructureHostCommands` feature is enabled:

- **vkBuildAccelerationStructuresKHR** corresponding to **vkCmdBuildAccelerationStructuresKHR**
- **vkCopyAccelerationStructureKHR** corresponding to **vkCmdCopyAccelerationStructureKHR**
- **vkCopyAccelerationStructureToMemoryKHR** corresponding to **vkCmdCopyAccelerationStructureToMemoryKHR**
- **vkCopyMemoryToAccelerationStructureKHR** corresponding to **vkCmdCopyMemoryToAccelerationStructureKHR**
- **vkWriteAccelerationStructuresPropertiesKHR** corresponding to **vkCmdWriteAccelerationStructuresPropertiesKHR**

These commands are functionally equivalent to their device counterparts, except that they are executed on the host timeline, rather than being enqueued into command buffers.

All acceleration structures used by the host commands **must** be bound to host-visible memory, and all input data for acceleration structure builds **must** be referenced using host addresses instead of device addresses. Applications are not required to map acceleration structure memory when using the host commands.

---

**Note**

The **vkBuildAccelerationStructuresKHR** and **vkCmdBuildAccelerationStructuresKHR** may use different algorithms, and thus are not required to produce identical structures. The structures produced by these two commands **may** exhibit different memory footprints or traversal performance, but should strive to be similar where possible.

Apart from these details, the host and device operations are interchangeable. For example, an application **can** use **vkBuildAccelerationStructuresKHR** to build a structure, compact it on the device using **vkCmdCopyAccelerationStructureKHR**, and serialize the result using **vkCopyAccelerationStructureToMemoryKHR**.

---

**Note**

For efficient execution, acceleration structures manipulated using these commands should always be bound to host cached memory, as the implementation may need to repeatedly read and write this memory during the execution of the
To build acceleration structures on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkBuildAccelerationStructuresKHR(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);
```

- `device` is the `VkDevice` for which the acceleration structures are being built.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `infoCount` is the number of acceleration structures to build. It specifies the number of the `pInfos` structures and `ppBuildRangeInfos` pointers that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- `ppBuildRangeInfos` is a pointer to an array of `infoCount` pointers to arrays of `VkAccelerationStructureBuildRangeInfoKHR` structures. Each `ppBuildRangeInfos[i]` is a pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i].` geometryCount.

This command fulfills the same task as `vkCmdBuildAccelerationStructuresKHR` but is executed by the host.

The `vkBuildAccelerationStructuresKHR` command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

**Note**

This means that an application **cannot** build a top-level acceleration structure in the same `vkBuildAccelerationStructuresKHR` call as the associated bottom-level or instance acceleration structures are being built. There also **cannot** be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

**Valid Usage**

- VUID-vkBuildAccelerationStructuresKHR-mode-04628
  The `mode` member of each element of `pInfos` must be a valid `VkBuildAccelerationStructureModeKHR` value
- VUID-vkBuildAccelerationStructuresKHR-srcAccelerationStructure-04629
  If the `srcAccelerationStructure` member of any element of `pInfos` is not
VK_NULL_HANDLE, the srcAccelerationStructure member must be a valid VkAccelerationStructureKHR handle

- VUID-vkBuildAccelerationStructuresKHR-pInfos-04630
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member must not be VK_NULL_HANDLE

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03403
  The srcAccelerationStructure member of any element of pInfos must not be the same acceleration structure as the dstAccelerationStructure member of any other element of pInfos

- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03698
  The dstAccelerationStructure member of any element of pInfos must not be the same acceleration structure as the dstAccelerationStructure member of any other element of pInfos

- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03800
  The dstAccelerationStructure member of any element of pInfos must be a valid VkAccelerationStructureKHR handle

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03699
  For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, its dstAccelerationStructure member must have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE GENERIC_KHR

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03700
  For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR, its dstAccelerationStructure member must have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE BOTTOM_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE GENERIC_KHR

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03663
  For each element of pInfos, if its mode member is VK_BUILD ACCELERATION_STRUCTURE MODE UPDATE_KHR, inactive primitives in its srcAccelerationStructure member must not be made active

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03664
  For each element of pInfos, if its mode member is VK_BUILD ACCELERATION STRUCTURE MODE UPDATE_KHR, active primitives in its srcAccelerationStructure member must not be made inactive

- VUID-vkBuildAccelerationStructuresKHR-None-03407
  The dstAccelerationStructure member of any element of pInfos must not be referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY TYPE INSTANCES_KHR in any other element of pInfos

- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03701
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the
srcAccelerationStructure member of any other element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, which is accessed by this command

- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03702
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the dstAccelerationStructure member of any other element of pInfos, which is accessed by this command

- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03703
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any element of pInfos (including the same element), which is accessed by this command

- VUID-vkBuildAccelerationStructuresKHR-scratchData-03704
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any other element of pInfos, which is accessed by this command

- VUID-vkBuildAccelerationStructuresKHR-scratchData-03705
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the srcAccelerationStructure member of any element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR (including the same element), which is accessed by this command

- VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03706
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos, which is accessed by this command

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03667
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member must have previously been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR set in VkAccelerationStructureBuildGeometryInfoKHR::flags in the build

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03668
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure and dstAccelerationStructure members must either be the same VkAccelerationStructureKHR, or not have any memory aliasing

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03758
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its geometryCount member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03759
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `flags` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03760**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `type` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03761**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `geometryType` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03762**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `flags` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03763**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.vertexFormat` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03764**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.maxVertex` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03765**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.indexType` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03766**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its...
geometry.triangles.transformData address was NULL when srcAccelerationStructure was last built, then it **must** be NULL

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03767**
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was not NULL when srcAccelerationStructure was last built, then it **must** not be NULL

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03768**
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, and geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, then the value of each index referenced **must** be the same as the corresponding index value when srcAccelerationStructure was last built

- **VUID-vkBuildAccelerationStructuresKHR-primitiveCount-03769**
  For each VkAccelerationStructureBuildRangeInfoKHR referenced by this command, its primitiveCount member **must** have the same value which was specified when srcAccelerationStructure was last built

- **VUID-vkBuildAccelerationStructuresKHR-firstVertex-03770**
  For each VkAccelerationStructureBuildRangeInfoKHR referenced by this command, if the corresponding geometry uses indices, its firstVertex member **must** have the same value which was specified when srcAccelerationStructure was last built

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03801**
  For each element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, the corresponding ppBuildRangeInfos[i][j].primitiveCount **must** be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03675**
  For each pInfos[i], dstAccelerationStructure **must** have been created with a value of VkAccelerationStructureCreateInfoKHR::size greater than or equal to the memory size required by the build operation, as returned by vkGetAccelerationStructureBuildSizesKHR with pBuildInfo = pInfos[i] and with each element of the pMaxPrimitiveCounts array greater than or equal to the equivalent ppBuildRangeInfos[i][j].primitiveCount values for j in [0,pInfos[i].geometryCount)

- **VUID-vkBuildAccelerationStructuresKHR-ppBuildRangeInfos-03676**
  Each element of ppBuildRangeInfos[i] **must** be a valid pointer to an array of pInfos[i].geometryCount VkAccelerationStructureBuildRangeInfoKHR structures

- **VUID-vkBuildAccelerationStructuresKHR-deferredOperation-03677**
  If deferredOperation is not VK_NULL_HANDLE, it **must** be a valid VkDeferredOperationKHR object
Any previous deferred operation that was associated with `deferredOperation` must be complete.

For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member must be bound to host-visible device memory.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member must be bound to host-visible device memory.

For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` must be bound to host-visible device memory.

The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature must be enabled.

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` must be valid host memory, where `N` is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` must be valid host memory, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.hostAddress` must be a valid host address.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.hostAddress` must be a valid host address.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.hostAddress` is not 0,
it must be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03774
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.hostAddress` must be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03775
  For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member must be bound to memory that was not allocated with multiple instances

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03776
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member must be bound to memory that was not allocated with multiple instances

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03777
  For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` must be bound to memory that was not allocated with multiple instances

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03778
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `geometry.instances.data.hostAddress` must be a valid `VkAccelerationStructureKHR` object

- VUID-vkBuildAccelerationStructuresKHR-pInfos-04930
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` with `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` set, each `accelerationStructureReference` in any structure in `VkAccelerationStructureMotionInstanceNV` value in `geometry.instances.data.hostAddress` must be a valid `VkAccelerationStructureKHR` object

Valid Usage (Implicit)

- VUID-vkBuildAccelerationStructuresKHR-device-parameter
device must be a valid `VkDevice` handle

- VUID-vkBuildAccelerationStructuresKHR-deferredOperation-parameter
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle

- VUID-vkBuildAccelerationStructuresKHR-pInfos-parameter
  `pInfos` must be a valid pointer to an array of `infoCount` valid `VkAccelerationStructureBuildGeometryInfoKHR` structures
• VUID-vkBuildAccelerationStructuresKHR-ppBuildRangeInfos-parameter
  `ppBuildRangeInfos` **must** be a valid pointer to an array of `infoCount VkAccelerationStructureBuildRangeInfoKHR` structures

• VUID-vkBuildAccelerationStructuresKHR-infoCount-arraylength
  `infoCount` **must** be greater than `0`

• VUID-vkBuildAccelerationStructuresKHR-deferredOperation-parent
  If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To copy or compact an acceleration structure on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureKHR(VkDevice device, VkDeferredOperationKHR deferredOperation, const VkCopyAccelerationStructureInfoKHR* pInfo);
```

• `device` is the device which owns the acceleration structures.

• `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.

• `pInfo` is a pointer to a `VkCopyAccelerationStructureInfoKHR` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyAccelerationStructureKHR` but is executed by the host.

### Valid Usage

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-03677
  If `deferredOperation` is not `VK_NULL_HANDLE`, it **must** be a valid `VkDeferredOperationKHR` object
• **VUID-vkCopyAccelerationStructureKHR-deferredOperation-03678**
  Any previous deferred operation that was associated with `deferredOperation` must be complete.

• **VUID-vkCopyAccelerationStructureKHR-buffer-03727**
  The buffer used to create `pInfo->src` must be bound to host-visible device memory.

• **VUID-vkCopyAccelerationStructureKHR-buffer-03728**
  The buffer used to create `pInfo->dst` must be bound to host-visible device memory.

• **VUID-vkCopyAccelerationStructureKHR-accelerationStructureHostCommands-03582**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature must be enabled.

• **VUID-vkCopyAccelerationStructureKHR-buffer-03780**
  The buffer used to create `pInfo->src` must be bound to memory that was not allocated with multiple instances.

• **VUID-vkCopyAccelerationStructureKHR-buffer-03781**
  The buffer used to create `pInfo->dst` must be bound to memory that was not allocated with multiple instances.

### Valid Usage (Implicit)

• **VUID-vkCopyAccelerationStructureKHR-device-parameter**
  `device` must be a valid `VkDevice` handle.

• **VUID-vkCopyAccelerationStructureKHR-deferredOperation-parameter**
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle.

• **VUID-vkCopyAccelerationStructureKHR-pInfo-parameter**
  `pInfo` must be a valid pointer to a valid `VkCopyAccelerationStructureInfoKHR` structure.

• **VUID-vkCopyAccelerationStructureKHR-deferredOperation-parent**
  If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`.

### Return Codes

#### Success

- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

#### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
To copy host accessible memory to an acceleration structure, call:

```
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyMemoryToAccelerationStructureKHR(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);
```

- `device` is the device which owns `pInfo->dst`.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `pInfo` is a pointer to a `VkCopyMemoryToAccelerationStructureInfoKHR` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMemoryToAccelerationStructureKHR` but is executed by the host.

This command can accept acceleration structures produced by either `vkCmdCopyAccelerationStructureToMemoryKHR` or `vkCopyAccelerationStructureToMemoryKHR`.

### Valid Usage

- **VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-03677**
  If `deferredOperation` is not `VK_NULL_HANDLE`, it **must** be a valid `VkDeferredOperationKHR` object.

- **VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-03678**
  Any previous deferred operation that was associated with `deferredOperation` **must** be complete.

- **VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03729**
  `pInfo->src.hostAddress` **must** be a valid host pointer.

- **VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03750**
  `pInfo->src.hostAddress` **must** be aligned to 16 bytes.

- **VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03730**
  The buffer used to create `pInfo->dst` **must** be bound to host-visible device memory.

- **VUID-vkCopyMemoryToAccelerationStructureKHR-accelerationStructureHostCommands-03583**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature **must** be enabled.

- **VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03782**
  The buffer used to create `pInfo->dst` **must** be bound to memory that was not allocated with multiple instances.
Valid Usage (Implicit)

- VUID-vkCopyMemoryToAccelerationStructureKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid
  VkDeferredOperationKHR handle

- VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyMemoryToAccelerationStructureInfoKHR
  structure

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved
  from device

Return Codes

**Success**
- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy an acceleration structure to host accessible memory, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureToMemoryKHR(
  VkDevice device,
  VkDeferredOperationKHR deferredOperation,
  const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

- device is the device which owns pInfo->src.
- deferredOperation is an optional VkDeferredOperationKHR to request deferral for this
  command.
- pInfo is a pointer to a VkCopyAccelerationStructureToMemoryInfoKHR structure defining the
  copy operation.

This command fulfills the same task as vkCmdCopyAccelerationStructureToMemoryKHR but is
executed by the host.
This command produces the same results as \texttt{vkCmdCopyAccelerationStructureToMemoryKHR}, but writes its result directly to a host pointer, and is executed on the host rather than the device. The output \textbf{may} not necessarily be bit-for-bit identical, but it can be equally used by either \texttt{vkCmdCopyMemoryToAccelerationStructureKHR} or \texttt{vkCopyMemoryToAccelerationStructureKHR}.

### Valid Usage

- \textbf{VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-03677}
  
  If `\texttt{deferredOperation}` is not \texttt{VK_NULL_HANDLE}, it \textbf{must} be a valid \texttt{VkDeferredOperationKHR} object.

- \textbf{VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-03678}
  
  Any previous deferred operation that was associated with `\texttt{deferredOperation}` \textbf{must} be complete.

- \textbf{VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03731}
  
  The \texttt{buffer} used to create `\texttt{pInfo->src}` \textbf{must} be bound to host-visible device memory.

- \textbf{VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03732}
  
  `\texttt{pInfo->dst.hostAddress}` \textbf{must} be a valid host pointer.

- \textbf{VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03751}
  
  `\texttt{pInfo->dst.hostAddress}` \textbf{must} be aligned to 16 bytes.

- \textbf{VUID-vkCopyAccelerationStructureToMemoryKHR-accelerationStructureHostCommands-03584}
  
  The \texttt{VkPhysicalDeviceAccelerationStructureFeaturesKHR.accelerationStructureHostCommands} feature \textbf{must} be enabled.

- \textbf{VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03783}
  
  The \texttt{buffer} used to create `\texttt{pInfo->src}` \textbf{must} be bound to memory that was not allocated with multiple instances.

### Valid Usage (Implicit)

- \textbf{VUID-vkCopyAccelerationStructureToMemoryKHR-device-parameter}
  
  `\texttt{device}` \textbf{must} be a valid \texttt{VkDevice} handle.

- \textbf{VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-parameter}
  
  If `\texttt{deferredOperation}` is not \texttt{VK_NULL_HANDLE}, `\texttt{deferredOperation}` \textbf{must} be a valid \texttt{VkDeferredOperationKHR} handle.

- \textbf{VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-parameter}
  
  `\texttt{pInfo}` \textbf{must} be a valid pointer to a valid \texttt{VkCopyAccelerationStructureToMemoryInfoKHR} structure.

- \textbf{VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-parent}
  
  If `\texttt{deferredOperation}` is a valid handle, it \textbf{must} have been created, allocated, or retrieved from `\texttt{device}`.
Return Codes

**Success**
- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query acceleration structure size parameters on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkWriteAccelerationStructuresPropertiesKHR(
    VkDevice device,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureKHR* pAccelerationStructures,
    VkQueryType queryType,
    size_t dataSize,
    void* pData,
    size_t stride);
```

- **device** is the device which owns the acceleration structures in `pAccelerationStructures`.
- **accelerationStructureCount** is the count of acceleration structures for which to query the property.
- **pAccelerationStructures** is a pointer to an array of existing previously built acceleration structures.
- **queryType** is a `VkQueryType` value specifying the property to be queried.
- **dataSize** is the size in bytes of the buffer pointed to by `pData`.
- **pData** is a pointer to a user-allocated buffer where the results will be written.
- **stride** is the stride in bytes between results for individual queries within `pData`.

This command fulfills the same task as `vkCmdWriteAccelerationStructuresPropertiesKHR` but is executed by the host.

**Valid Usage**

- VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-04964
  All acceleration structures in `pAccelerationStructures` must have been built prior to the execution of this command

- VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructures-03431
  All acceleration structures in `pAccelerationStructures` must have been built with
• VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06742
  queryType must be VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR, 
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIAL柠ATION_BOTTOM_LEVEL_POINTERS_KHR, 
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR 
  or 
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIAL柠ATION_SIZE_KHR

• VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03448
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR, then stride must be a multiple of the size of VkDeviceSize

• VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03449
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR, then pData must point to a VkDeviceSize

• VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03450
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIAL柠ATION_SIZE_KHR, then stride must be a multiple of the size of VkDeviceSize

• VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03451
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIAL柠ATION_SIZE_KHR, then pData must point to a VkDeviceSize

• VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06731
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR, then stride must be a multiple of the size of VkDeviceSize

• VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06732
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR, then pData must point to a VkDeviceSize

• VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06733
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIAL柠ATION_BOTTOM_LEVEL_POINTERS_KHR, then stride must be a multiple of the size of VkDeviceSize

• VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06734
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIAL柠ATION_BOTTOM_LEVEL_POINTERS_KHR, then pData must point to a VkDeviceSize

• VUID-vkWriteAccelerationStructuresPropertiesKHR-dataSize-03452
  dataSize must be greater than or equal to accelerationStructureCount*stride

• VUID-vkWriteAccelerationStructuresPropertiesKHR-buffer-03733
  The buffer used to create each acceleration structure in pAccelerationStructures must be bound to host-visible device memory

• VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructureHostCommands-03585
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands feature must be enabled

• VUID-vkWriteAccelerationStructuresPropertiesKHR-buffer-03784
  2374
The buffer used to create each acceleration structure in `pAccelerationStructures` must be bound to memory that was not allocated with multiple instances.

### Valid Usage (Implicit)

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parameter**
  - `pAccelerationStructures` must be a valid pointer to an array of `accelerationStructureCount` valid `VkAccelerationStructureKHR` handles

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-parameter**
  - `queryType` must be a valid `VkQueryType` value

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-pData-parameter**
  - `pData` must be a valid pointer to an array of `dataSize` bytes

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructureCount-arraylength**
  - `accelerationStructureCount` must be greater than 0

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-dataSize-arraylength**
  - `dataSize` must be greater than 0

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parent**
  - Each element of `pAccelerationStructures` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
Chapter 37. Micromap

37.1. Micromaps

*Acceleration structures* store and organize geometry for ray tracing, but in some cases it is beneficial to include some information within the geometry, particularly for triangles. A *micromap* organizes this data around a map of values corresponding to subdivided microtriangles which can be added to a triangle geometry when building a *bottom level acceleration structure*.

An *opacity micromap* is a type of micromap which stores information to control intersection opacity as described in Ray Opacity Micromap.

A micromap is considered to be constructed if a *micromap build command* or *copy command* has been executed with the given acceleration structure as the destination.

37.1.1. Building Micromaps

To build micromaps call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdBuildMicromapsEXT(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkMicromapBuildInfoEXT* pInfos);
```

- *commandBuffer* is the command buffer into which the command will be recorded.
- *infoCount* is the number of micromaps to build. It specifies the number of the *pInfos* structures that must be provided.
- *pInfos* is a pointer to an array of *infoCount* VkMicromapBuildInfoEXT structures defining the data used to build each micromap.

The vkCmdBuildMicromapsEXT command provides the ability to initiate multiple micromaps builds, however there is no ordering or synchronization implied between any of the individual micromap builds.

*Note*

This means that there cannot be any memory aliasing between any micromap memories or scratch memories being used by any of the builds.

Accesses to the micromap scratch buffers as identified by the VkMicromapBuildInfoEXT::scratchData buffer device addresses must be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_2_MICROMAP_READ_BIT_EXT or VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT. Similarly for accesses to VkMicromapBuildInfoEXT::dstMicromap.

Accesses to other input buffers as identified by any used values of VkMicromapBuildInfoEXT::data
triangleArray must be synchronized with the pipeline stage and an access type of VK_ACCESS_SHADER_READ_BIT.

**Valid Usage**

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07461**
  For each pInfos[i], dstMicromap must have been created with a value of VkMicromapCreateInfoEXT::size greater than or equal to the memory size required by the build operation, as returned by vkGetMicromapBuildSizesEXT with pBuildInfo = pInfos[i]

- **VUID-vkCmdBuildMicromapsEXT-mode-07462**
  The mode member of each element of pInfos must be a valid VkBuildMicromapModeEXT value

- **VUID-vkCmdBuildMicromapsEXT-dstMicromap-07463**
  The dstMicromap member of any element of pInfos must be a valid VkMicromapEXT handle

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07464**
  For each element of pInfos its type member must match the value of VkMicromapCreateInfoEXT::type when its dstMicromap was created

- **VUID-vkCmdBuildMicromapsEXT-dstMicromap-07465**
  The range of memory backing the dstMicromap member of any element of pInfos that is accessed by this command must not overlap the memory backing the dstMicromap member of any other element of pInfos, which is accessed by this command

- **VUID-vkCmdBuildMicromapsEXT-scratchData-07466**
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any other element of pInfos (including the same element), which is accessed by this command

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07508**
  For each element of pInfos, the buffer used to create its dstMicromap member must be bound to device memory

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07509**
  If pInfos[i].mode is VK_BUILD_MICROMAP_MODE_BUILD_EXT, all addresses between pInfos[i].scratchData.deviceAddress and pInfos[i].scratchData.deviceAddress + N - 1 must be in the buffer device address range of the same buffer, where N is given by the buildScratchSize member of the VkMicromapBuildSizesInfoEXT structure returned from a call to vkGetMicromapBuildSizesEXT with an identical VkMicromapBuildInfoEXT structure and primitive count
The buffers from which the buffer device addresses for all of the `data` and `triangleArray` members of all `pInfos[i]` are queried **must** have been created with the `VK_BUFFER_USAGE_MICROMAP_BUILD_INPUT_READ_ONLY_BIT_EXT` usage flag.

For each element of `pInfos[i]` the buffer from which the buffer device address `pInfos[i].scratchData.deviceAddress` is queried **must** have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag.

For each element of `pInfos`, its `scratchData.deviceAddress`, `data.deviceAddress`, and `triangleArray.deviceAddress` members **must** be valid device addresses obtained from `vkGetBufferDeviceAddress`.

For each element of `pInfos`, if `scratchData.deviceAddress`, `data.deviceAddress`, or `triangleArray.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

For each element of `pInfos`, its `scratchData.deviceAddress` member **must** be a multiple of `VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment`.

For each element of `pInfos`, its `triangleArray.deviceAddress` and `data.deviceAddress` members **must** be a multiple of 256.

---

**Valid Usage (Implicit)**

- **VUID-vkCmdBuildMicromapsEXT-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdBuildMicromapsEXT-pInfos-parameter**
  `pInfos` **must** be a valid pointer to an array of `infoCount` valid `VkMicromapBuildInfoEXT` structures.

- **VUID-vkCmdBuildMicromapsEXT-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state.

- **VUID-vkCmdBuildMicromapsEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations.

- **VUID-vkCmdBuildMicromapsEXT-renderpass**
  This command **must** only be called outside of a render pass instance.

- **VUID-vkCmdBuildMicromapsEXT-videocoding**
  This command **must** only be called outside of a video coding scope.

- **VUID-vkCmdBuildMicromapsEXT-infoCount-arraylength**
  `infoCount` **must** be greater than 0.
Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>

<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Formats which can be set in VkMicromapUsageEXT::format and VkMicromapTriangleEXT::format for micromap builds, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkOpacityMicromapFormatEXT {
    VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT = 1,
    VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT = 2,
} VkOpacityMicromapFormatEXT;
```

• `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` indicates that the given micromap format has one bit per subtriangle encoding either fully opaque or fully transparent.
• `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` indicates that the given micromap format has two bits per subtriangle encoding four modes which can be interpreted as described in ray traversal.

**Note**
For compactness, these values are stored as 16-bit in some structures.

The VkMicromapBuildInfoEXT structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapBuildInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapTypeEXT type;
    VkBuildMicromapFlagsEXT flags;
    VkBuildMicromapModeEXT mode;
    VkMicromapEXT dstMicromap;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
};
```
 VkDeviceOrHostAddressConstKHR data;
VkDeviceOrHostAddressKHR scratchData;
VkDeviceOrHostAddressConstKHR triangleArray;
VkDeviceSize triangleArrayStride;
} VkMicromapBuildInfoEXT;

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **type** is a **VkMicromapTypeEXT** value specifying the type of micromap being built.
• **flags** is a bitmask of **VkBuildMicromapFlagBitsEXT** specifying additional parameters of the micromap.
• **mode** is a **VkBuildMicromapModeEXT** value specifying the type of operation to perform.
• **dstMicromap** is a pointer to the target micromap for the build.
• **usageCountsCount** specifies the number of usage counts structures that will be used to determine the size of this micromap.
• **pUsageCounts** is a pointer to an array of **VkMicromapUsageEXT** structures.
• **ppUsageCounts** is a pointer to an array of pointers to **VkMicromapUsageEXT** structures.
• **data** is the device or host address to memory which contains the data for the micromap.
• **scratchData** is the device or host address to memory that will be used as scratch memory for the build.
• **triangleArray** is the device or host address to memory containing the **VkMicromapTriangleEXT** data
• **triangleArrayStride** is the stride in bytes between each element of **triangleArray**

Only one of **pUsageCounts** or **ppUsageCounts** can be a valid pointer, the other must be **NULL**. The elements of the non-**NULL** array describe the total counts used to build each micromap. Each element contains a **count** which is the number of micromap triangles of that **format** and **subdivisionLevel** contained in the micromap. Multiple elements with the same **format** and **subdivisionLevel** are allowed and the total count for that **format** and **subdivisionLevel** is the sum of the **count** for each element.

Each micromap triangle refers to one element in **triangleArray** which contains the **format** and **subdivisionLevel** for that particular triangle as well as a **dataOffset** in bytes which is the location relative to **data** where that triangle's micromap data begins. The data at **triangleArray** is laid out as a 4 byte unsigned integer for the **dataOffset** followed by a 2 byte unsigned integer for the subdivision level then a 2 byte unsigned integer for the format. In practice, compilers compile **VkMicromapTriangleEXT** to match this pattern.

The data at **data** is packed as either one bit per element for **VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT** or two bits per element for **VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT** and is packed from LSB to MSB in each byte. The data at each index in those bytes is interpreted as discussed in **Ray Opacity Micromap**.
Valid Usage

- VUID-VkMicromapBuildInfoEXT-pUsageCounts-07516
  Only one of pUsageCounts or ppUsageCounts can be a valid pointer, the other must be NULL.

- VUID-VkMicromapBuildInfoEXT-type-07517
  If type is VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT the format member of VkMicromapUsageEXT must be a valid value from VkOpacityMicromapFormatEXT

- VUID-VkMicromapBuildInfoEXT-type-07518
  If type is VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT the format member of VkMicromapTriangleEXT must be a valid value from VkOpacityMicromapFormatEXT

Valid Usage (Implicit)

- VUID-VkMicromapBuildInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_MICROMAP_BUILD_INFO_EXT

- VUID-VkMicromapBuildInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkMicromapBuildInfoEXT-type-parameter
  type must be a valid VkMicromapTypeEXT value

- VUID-VkMicromapBuildInfoEXT-flags-parameter
  flags must be a valid combination of VkBuildMicromapFlagBitsEXT values

The VkBuildMicromapModeEXT enumeration is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkBuildMicromapModeEXT {
    VK_BUILD_MICROMAP_MODE_BUILD_EXT = 0,
} VkBuildMicromapModeEXT;
```

- VK_BUILD_MICROMAP_MODE_BUILD_EXT specifies that the destination micromap will be built using the specified data.

The VkMicromapUsageEXT structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapUsageEXT {
```
uint32_t count;
uint32_t subdivisionLevel;
uint32_t format;
} VkMicromapUsageEXT;

- **count** is the number of triangles in the usage format defined by the **subdivisionLevel** and **format** below in the micromap
- **subdivisionLevel** is the subdivision level of this usage format
- **format** is the format of this usage format

**Valid Usage**

- VUID-VkMicromapUsageEXT-format-07519
  If the **VkMicromapTypeEXT** of the micromap is **VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT**
  then **format** **must** be **VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT** or **VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT**.

- VUID-VkMicromapUsageEXT-format-07520
  If the **VkMicromapTypeEXT** of the micromap is **VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT**
  and **format** is **VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT** then **subdivisionLevel** **must** be less than or equal to **maxOpacity2StateSubdivisionLevel** of **VkPhysicalDeviceOpacityMicromapPropertiesEXT**

- VUID-VkMicromapUsageEXT-format-07521
  If the **VkMicromapTypeEXT** of the micromap is **VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT**
  and **format** is **VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT** then **subdivisionLevel** **must** be less than or equal to **maxOpacity4StateSubdivisionLevel** of **VkPhysicalDeviceOpacityMicromapPropertiesEXT**

The **format** is interpreted based on the **type** of the micromap using it.

The **VkMicromapTriangleEXT** structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapTriangleEXT {
    uint32_t dataOffset;
    uint16_t subdivisionLevel;
    uint16_t format;
} VkMicromapTriangleEXT;
```

- **dataOffset** is the offset in bytes of the start of the data for this triangle. This is a byte aligned value.
- **subdivisionLevel** is the subdivision level of this triangle
- **format** is the format of this triangle
Valid Usage

- VUID-VkMicromapTriangleEXT-format-07522
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` then `format` must be `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` or `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT`.

- VUID-VkMicromapTriangleEXT-format-07523
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` and `format` is `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` then `subdivisionLevel` must be less than or equal to `maxOpacity2StateSubdivisionLevel` of `VkPhysicalDeviceOpacityMicromapPropertiesEXT`.

- VUID-VkMicromapTriangleEXT-format-07524
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` and `format` is `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` then `subdivisionLevel` must be less than or equal to `maxOpacity4StateSubdivisionLevel` of `VkPhysicalDeviceOpacityMicromapPropertiesEXT`.

The `format` is interpreted based on the `type` of the micromap using it.

37.1.2. Copying Micromaps

An additional command exists for copying micromaps without updating their contents. Before copying, an application must query the size of the resulting micromap.

To query micromap size parameters call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdWriteMicromapsPropertiesEXT(
    VkCommandBuffer commandBuffer,
    uint32_t micromapCount,
    const VkMicromapEXT* pMicromaps,
    VkQueryType queryType,
    VkQueryPool queryPool,
    uint32_t firstQuery);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `micromapCount` is the count of micromaps for which to query the property.
- `pMicromaps` is a pointer to an array of existing previously built micromaps.
- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
- `queryPool` is the query pool that will manage the results of the query.
- `firstQuery` is the first query index within the query pool that will contain the `micromapCount` number of results.

Accesses to any of the micromaps listed in `pMicromaps` must be synchronized with the
VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_2_MICROMAP_READ_BIT_EXT.

• If queryType is VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT, then the value written out is the number of bytes required by a serialized micromap.

• If queryType is VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT, then the value written out is the number of bytes required by a compacted micromap.

Valid Usage

• VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-07525 queryPool must have been created with a queryType matching queryType

• VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-07526 The queries identified by queryPool and firstQuery must be unavailable

• VUID-vkCmdWriteMicromapsPropertiesEXT-buffer-07527 The buffer used to create each micromap in pMicrmaps must be bound to device memory

• VUID-vkCmdWriteMicromapsPropertiesEXT-query-07528 The sum of query plus micromapCount must be less than or equal to the number of queries in queryPool

• VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-07501 All micromaps in pMicromaps must have been constructed prior to the execution of this command

• VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-07502 All micromaps in pMicromaps must have been constructed with VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT if queryType is VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT

• VUID-vkCmdWriteMicromapsPropertiesEXT-queryType-07503 queryType must be VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT or VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT

Valid Usage (Implicit)

• VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-parameter pMicromaps must be a valid pointer to an array of micromapCount valid VkMicromapEXT handles

• VUID-vkCmdWriteMicromapsPropertiesEXT-queryType-parameter queryType must be a valid VkQueryType value

• VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-parameter queryPool must be a valid VkQueryPool handle

• VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdWriteMicromapsPropertiesEXT-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdWriteMicromapsPropertiesEXT-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdWriteMicromapsPropertiesEXT-micromapCount-arraylength
  micromapCount must be greater than 0

- VUID-vkCmdWriteMicromapsPropertiesEXT-commonparent
  Each of commandBuffer, queryPool, and the elements of pMicromaps must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To copy a micromap call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMicromapEXT(
    VkCommandBuffer commandBuffer,
    const VkCopyMicromapInfoEXT* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a VkCopyMicromapInfoEXT structure defining the copy operation.

This command copies the pInfo->src micromap to the pInfo->dst micromap in the manner specified by pInfo->mode.

Accesses to pInfo->src and pInfo->dst must be synchronized with the
VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_2_MICROMAP_READ_BIT_EXT or VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT as appropriate.

**Valid Usage**

- VUID-vkCmdCopyMicromapEXT-buffer-07529
  The buffer used to create pInfo->src must be bound to device memory
- VUID-vkCmdCopyMicromapEXT-buffer-07530
  The buffer used to create pInfo->dst must be bound to device memory

**Valid Usage (Implicit)**

- VUID-vkCmdCopyMicromapEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdCopyMicromapEXT-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyMicromapInfoEXT structure
- VUID-vkCmdCopyMicromapEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdCopyMicromapEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations
- VUID-vkCmdCopyMicromapEXT-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdCopyMicromapEXT-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

The VkCopyMicromapInfoEXT structure is defined as:
// Provided by VK_EXT_opacity_micromap

typedef struct VkCopyMicromapInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapEXT src;
    VkMicromapEXT dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMicromapInfoEXT;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **src** is the source micromap for the copy.
- **dst** is the target micromap for the copy.
- **mode** is a **VkCopyMicromapModeEXT** value specifying additional operations to perform during the copy.

**Valid Usage**

- **VUID-VkCopyMicromapInfoEXT-mode-07531**
  
  **mode** must be **VK_COPY_MICROMAP_MODE_COMPACT_EXT** or **VK_COPY_MICROMAP_MODE_CLONE_EXT**

- **VUID-VkCopyMicromapInfoEXT-src-07532**
  
  The source acceleration structure src must have been constructed prior to the execution of this command.

- **VUID-VkCopyMicromapInfoEXT-mode-07533**
  
  If **mode** is **VK_COPY_MICROMAP_MODE_COMPACT_EXT**, src must have been constructed with **VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT** in the build.

- **VUID-VkCopyMicromapInfoEXT-buffer-07534**
  
  The buffer used to create src must be bound to device memory.

- **VUID-VkCopyMicromapInfoEXT-buffer-07535**
  
  The buffer used to create dst must be bound to device memory.

**Valid Usage (Implicit)**

- **VUID-VkCopyMicromapInfoEXT-sType-sType**
  
  sType must be **VK_STRUCTURE_TYPE_COPY_MICROMAP_INFO_EXT**

- **VUID-VkCopyMicromapInfoEXT-pNext-pNext**
  
  pNext must be **NULL**

- **VUID-VkCopyMicromapInfoEXT-src-parameter**
  
  src must be a valid **VkMicromapEXT** handle

- **VUID-VkCopyMicromapInfoEXT-dst-parameter**
  
  dst must be a valid **VkMicromapEXT** handle
Possible values of `mode` specifying additional operations to perform during the copy, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkCopyMicromapModeEXT {
    VK_COPY_MICROMAP_MODE_CLONE_EXT = 0,
    VK_COPY_MICROMAP_MODE_SERIALIZE_EXT = 1,
    VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT = 2,
    VK_COPY_MICROMAP_MODE_COMPACT_EXT = 3,
} VkCopyMicromapModeEXT;
```

- `VK_COPY_MICROMAP_MODE_CLONE_EXT` creates a direct copy of the micromap specified in `src` into the one specified by `dst`. The `dst` micromap must have been created with the same parameters as `src`.
- `VK_COPY_MICROMAP_MODE_SERIALIZE_EXT` serializes the micromap to a semi-opaque format which can be reloaded on a compatible implementation.
- `VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT` deserializes the semi-opaque serialization format in the buffer to the micromap.
- `VK_COPY_MICROMAP_MODE_COMPACT_EXT` creates a more compact version of a micromap `src` into `dst`. The micromap `dst` must have been created with a size at least as large as that returned by `vkCmdWriteMicromapsPropertiesEXT` after the build of the micromap specified by `src`.

To copy a micromap to device memory call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMicromapToMemoryEXT(
    VkCommandBuffer commandBuffer,            // Provided by VK_EXT_opacity_micromap
    const VkCopyMicromapToMemoryInfoEXT* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is an a pointer to a `VkCopyMicromapToMemoryInfoEXT` structure defining the copy operation.

Accesses to `pInfo->src` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`. Accesses to the buffer indicated by `pInfo->dst.deviceAddress` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_TRANSFER_WRITE_BIT`.

This command produces the same results as `vkCopyMicromapToMemoryEXT`, but writes its result
to a device address, and is executed on the device rather than the host. The output may not
necessarily be bit-for-bit identical, but it can be equally used by either
vkCmdCopyMemoryToMicromapEXT or vkCopyMemoryToMicromapEXT.

The defined header structure for the serialized data consists of:

- **VK_UUID_SIZE** bytes of data matching VkPhysicalDeviceIDProperties::driverUUID
- **VK_UUID_SIZE** bytes of data identifying the compatibility for comparison using
  vkGetDeviceMicromapCompatibilityEXT The serialized data is written to the buffer (or read
  from the buffer) according to the host endianness.

### Valid Usage

- **VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07536**
  pInfo->dst.deviceAddress must be a valid device address for a buffer bound to device memory
- **VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07537**
  pInfo->dst.deviceAddress must be aligned to 256 bytes
- **VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07538**
  If the buffer pointed to by pInfo->dst.deviceAddress is non-sparse then it must be bound
  completely and contiguously to a single VkDeviceMemory object
- **VUID-vkCmdCopyMicromapToMemoryEXT-buffer-07539**
  The buffer used to create pInfo->src must be bound to device memory

### Valid Usage (Implicit)

- **VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-parameter**
  commandBuffer must be a valid VkCommandBuffer handle
- **VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-parameter**
  pInfo must be a valid pointer to a valid VkCopyMicromapToMemoryInfoEXT structure
- **VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-recording**
  commandBuffer must be in the recording state
- **VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support compute operations
- **VUID-vkCmdCopyMicromapToMemoryEXT-renderpass**
  This command must only be called outside of a render pass instance
- **VUID-vkCmdCopyMicromapToMemoryEXT-videocoding**
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>

// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMicromapToMemoryInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapEXT src;
    VkDeviceOrHostAddressKHR dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMicromapToMemoryInfoEXT;

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `src` is the source micromap for the copy
- `dst` is the device or host address to memory which is the target for the copy
- `mode` is a `VkCopyMicromapModeEXT` value specifying additional operations to perform during the copy.

Valid Usage

- VUID-VkCopyMicromapToMemoryInfoEXT-src-07540
  The source micromap `src` must have been constructed prior to the execution of this command
- VUID-VkCopyMicromapToMemoryInfoEXT-dst-07541
  The memory pointed to by `dst` must be at least as large as the serialization size of `src`, as reported by `vkWriteMicromapsPropertiesEXT` or `vkCmdWriteMicromapsPropertiesEXT` with a query type of `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`
- VUID-VkCopyMicromapToMemoryInfoEXT-mode-07542
  `mode` must be `VK_COPY_MICROMAP_MODE_SERIALIZE_EXT`
Valid Usage (Implicit)

- VUID-VkCopyMicromapToMemoryInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_MICROMAP_TO_MEMORY_INFO_EXT

- VUID-VkCopyMicromapToMemoryInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkCopyMicromapToMemoryInfoEXT-src-parameter
  src must be a valid VkMicromapEXT handle

- VUID-VkCopyMicromapToMemoryInfoEXT-mode-parameter
  mode must be a valid VkCopyMicromapModeEXT value

To copy device memory to a micromap call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMemoryToMicromapEXT(
    VkCommandBuffer commandBuffer,
    const VkCopyMicromapToMemoryInfoEXT* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a VkCopyMicromapToMemoryInfoEXT structure defining the copy operation.

Accesses to `pInfo->dst` must be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_2_MICROMAP_READ_BIT_EXT. Accesses to the buffer indicated by `pInfo->src.deviceAddress` must be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_TRANSFER_READ_BIT.

This command can accept micromaps produced by either `vkCmdCopyMicromapToMemoryEXT` or `vkCopyMicromapToMemoryEXT`.

Valid Usage

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07543
  pInfo->src.deviceAddress must be a valid device address for a buffer bound to device memory

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07544
  pInfo->src.deviceAddress must be aligned to 256 bytes

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07545
  If the buffer pointed to by `pInfo->src.deviceAddress` is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyMemoryToMicromapEXT-buffer-07546
  The buffer used to create `pInfo->dst` must be bound to device memory
Valid Usage (Implicit)

- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid `VkCopyMemoryToMicromapInfoEXT` structure

- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

- VUID-vkCmdCopyMemoryToMicromapEXT-renderpass
  This command **must** only be called outside of a render pass instance

- VUID-vkCmdCopyMemoryToMicromapEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

The `VkCopyMemoryToMicromapInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMemoryToMicromapInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR src;
    VkMicromapEXT dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMemoryToMicromapInfoEXT;
```

- **sType** is the type of this structure.
pNext is NULL or a pointer to a structure extending this structure.

src is the device or host address to memory containing the source data for the copy.

dst is the target micromap for the copy.

mode is a VkCopyMicromapModeEXT value specifying additional operations to perform during the copy.

---

**Valid Usage**

- VUID-VkCopyMemoryToMicromapInfoEXT-src-07547
  The source memory pointed to by src must contain data previously serialized using vkCmdCopyMicromapToMemoryEXT

- VUID-VkCopyMemoryToMicromapInfoEXT-mode-07548
  mode must be VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT

- VUID-VkCopyMemoryToMicromapInfoEXT-src-07549
  The data in src must have a format compatible with the destination physical device as returned by vkGetDeviceMicromapCompatibilityEXT

- VUID-VkCopyMemoryToMicromapInfoEXT-dst-07550
  dst must have been created with a size greater than or equal to that used to serialize the data in src

---

**Valid Usage (Implicit)**

- VUID-VkCopyMemoryToMicromapInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_MEMORY_TO_MICROMAP_INFO_EXT

- VUID-VkCopyMemoryToMicromapInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkCopyMemoryToMicromapInfoEXT-dst-parameter
  dst must be a valid VkMicromapEXT handle

- VUID-VkCopyMemoryToMicromapInfoEXT-mode-parameter
  mode must be a valid VkCopyMicromapModeEXT value

---

To check if a serialized micromap is compatible with the current device call:

```c
// Provided by VK_EXT_opacity_micromap
void vkGetDeviceMicromapCompatibilityEXT(
  VkDevice device,
  const VkMicromapVersionInfoEXT* pVersionInfo,
  VkAccelerationStructureCompatibilityKHR* pCompatibility);
```

- device is the device to check the version against.

- pVersionInfo is a pointer to a VkMicromapVersionInfoEXT structure specifying version
information to check against the device.

- `pCompatibility` is a pointer to a `VkAccelerationStructureCompatibilityKHR` value in which compatibility information is returned.

**Valid Usage**

- VUID-vkGetDeviceMicromapCompatibilityEXT-micromap-07551
  The micromap feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkGetDeviceMicromapCompatibilityEXT-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetDeviceMicromapCompatibilityEXT-pVersionInfo-parameter
  `pVersionInfo` must be a valid pointer to a valid `VkMicromapVersionInfoEXT` structure

- VUID-vkGetDeviceMicromapCompatibilityEXT-pCompatibility-parameter
  `pCompatibility` must be a valid pointer to a `VkAccelerationStructureCompatibilityKHR` value

The `VkMicromapVersionInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapVersionInfoEXT {
    VkStructureType sType;
    const void* pNext;
    const uint8_t* pVersionData;
} VkMicromapVersionInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pVersionData` is a pointer to the version header of a micromap as defined in `vkCmdCopyMicromapToMemoryEXT`

**Note**

`pVersionData` is a pointer to an array of 2×`VK_UUID_SIZE` `uint8_t` values instead of two `VK_UUID_SIZE` arrays as the expected use case for this member is to be pointed at the header of a previously serialized micromap (via `vkCmdCopyMicromapToMemoryEXT` or `vkCopyMicromapToMemoryEXT`) that is loaded in memory. Using arrays would necessitate extra memory copies of the UUIDs.
Valid Usage (Implicit)

- VUID-VkMicromapVersionInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_MICROMAP_VERSION_INFO_EXT
- VUID-VkMicromapVersionInfoEXT-pNext-pNext
  pNext must be NULL
- VUID-VkMicromapVersionInfoEXT-pVersionData-parameter
  pVersionData must be a valid pointer to an array of \(2 \times VK_UUID_SIZE\) uint8_t values

37.2. Host Micromap Operations

Implementations are also required to provide host implementations of the micromap operations if the micromapHostCommands feature is enabled:

- vkBuildMicromapsEXT corresponding to vkCmdBuildMicromapsEXT
- vkCopyMicromapEXT corresponding to vkCmdCopyMicromapEXT
- vkCopyMicromapToMemoryEXT corresponding to vkCmdCopyMicromapToMemoryEXT
- vkCopyMemoryToMicromapEXT corresponding to vkCmdCopyMemoryToMicromapEXT
- vkWriteMicromapsPropertiesEXT corresponding to vkCmdWriteMicromapsPropertiesEXT

These commands are functionally equivalent to their device counterparts, except that they are executed on the host timeline, rather than being enqueued into command buffers.

All micromaps used by the host commands must be bound to host-visible memory, and all input data for micromap builds must be referenced using host addresses instead of device addresses. Applications are not required to map micromap memory when using the host commands.

Note

The vkBuildMicromapsEXT and vkCmdBuildMicromapsEXT may use different algorithms, and thus are not required to produce identical structures.

Apart from these details, the host and device operations are interchangeable.

Note

For efficient execution, micromaps manipulated using these commands should always be bound to host cached memory, as the implementation may need to repeatedly read and write this memory during the execution of the command.

To build micromaps on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkBuildMicromapsEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
```
uint32_t
const VkMicromapBuildInfoEXT* infoCount,
pInfos);

• **device** is the **VkDevice** for which the micromaps are being built.

• **deferredOperation** is an optional **VkDeferredOperationKHR** to request deferral for this command.

• **infoCount** is the number of micromaps to build. It specifies the number of the **pInfos** that **must** be provided.

• **pInfos** is a pointer to an array of **infoCount** **VkMicromapBuildInfoEXT** structures defining the geometry used to build each micromap.

This command fulfills the same task as **vkCmdBuildMicromapsEXT** but is executed by the host.

The **vkBuildMicromapsEXT** command provides the ability to initiate multiple micromaps builds, however there is no ordering or synchronization implied between any of the individual micromap builds.

**Note**

This means that there **cannot** be any memory aliasing between any micromap memories or scratch memories being used by any of the builds.

**Valid Usage**

- **VUID-vkBuildMicromapsEXT-pInfos-07461**
  For each **pInfos[i]**, **dstMicromap** **must** have been created with a value of **VkMicromapCreateInfoEXT::size** greater than or equal to the memory size required by the build operation, as returned by **vkGetMicromapBuildSizesEXT** with **pBuildInfo = pInfos[i]**

- **VUID-vkBuildMicromapsEXT-mode-07462**
  The **mode** member of each element of **pInfos** **must** be a valid **VkBuildMicromapModeEXT** value

- **VUID-vkBuildMicromapsEXT-dstMicromap-07463**
  The **dstMicromap** member of any element of **pInfos** **must** be a valid **VkMicromapEXT** handle

- **VUID-vkBuildMicromapsEXT-pInfos-07464**
  For each element of **pInfos** its **type** member **must** match the value of **VkMicromapCreateInfoEXT::type** when its **dstMicromap** was created

- **VUID-vkBuildMicromapsEXT-dstMicromap-07465**
  The range of memory backing the **dstMicromap** member of any element of **pInfos** that is accessed by this command **must** not overlap the memory backing the **dstMicromap** member of any other element of **pInfos**, which is accessed by this command

- **VUID-vkBuildMicromapsEXT-dstMicromap-07466**
  The range of memory backing the **dstMicromap** member of any element of **pInfos** that is accessed by this command **must** not overlap the memory backing the **scratchData**
member of any element of `pInfos` (including the same element), which is accessed by this command

- VUID-vkBuildMicromapsEXT-scratchData-07467
  The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command

- VUID-vkBuildMicromapsEXT-pInfos-07552
  For each element of `pInfos`, the `buffer` used to create its `dstMicromap` member **must** be bound to host-visible device memory

- VUID-vkBuildMicromapsEXT-pInfos-07553
  For each element of `pInfos`, all referenced addresses of `pInfos[i].data.hostAddress` **must** be valid host memory

- VUID-vkBuildMicromapsEXT-pInfos-07554
  For each element of `pInfos`, all referenced addresses of `pInfos[i].triangleArray.hostAddress` **must** be valid host memory

- VUID-vkBuildMicromapsEXT-micromapHostCommands-07555
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature **must** be enabled

- VUID-vkBuildMicromapsEXT-pInfos-07556
  If `pInfos[i].mode` is `VK_BUILD_MICROMAP_MODE_BUILD_EXT`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` **must** be valid host memory, where `N` is given by the `buildScratchSize` member of the `VkMicromapBuildSizesInfoEXT` structure returned from a call to `vkGetMicromapBuildSizesEXT` with an identical `VkMicromapBuildInfoEXT` structure and primitive count

- VUID-vkBuildMicromapsEXT-pInfos-07557
  For each element of `pInfos`, the `buffer` used to create its `dstMicromap` member **must** be bound to memory that was not allocated with multiple instances

---

**Valid Usage (Implicit)**

- VUID-vkBuildMicromapsEXT-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkBuildMicromapsEXT-deferredOperation-parameter
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` **must** be a valid `VkDeferredOperationKHR` handle

- VUID-vkBuildMicromapsEXT-pInfos-parameter
  `pInfos` **must** be a valid pointer to an array of `infoCount` valid `VkMicromapBuildInfoEXT` structures

- VUID-vkBuildMicromapsEXT-infoCount-arraylength
  `infoCount` **must** be greater than 0

- VUID-vkBuildMicromapsEXT-deferredOperation-parent
If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`.

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To copy or compact a micromap on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMicromapEXT(
    VkDevice device, 
    VkDeferredOperationKHR deferredOperation, 
    const VkCopyMicromapInfoEXT* pInfo);
```

- `device` is the device which owns the micromaps.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `pInfo` is a pointer to a `VkCopyMicromapInfoEXT` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMicromapEXT` but is executed by the host.

### Valid Usage

- VUID-vkCopyMicromapEXT-deferredOperation-03677
  If `deferredOperation` is not `VK_NULL_HANDLE`, it **must** be a valid `VkDeferredOperationKHR` object
- VUID-vkCopyMicromapEXT-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` **must** be complete
- VUID-vkCopyMicromapEXT-buffer-07558
  The `buffer` used to create `pInfo->src` **must** be bound to host-visible device memory
- VUID-vkCopyMicromapEXT-buffer-07559
  The `buffer` used to create `pInfo->dst` **must** be bound to host-visible device memory
- VUID-vkCopyMicromapEXT-micromapHostCommands-07560
The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature must be enabled

- **VUID-vkCopyMicromapEXT-buffer-07561**
  The buffer used to create `pInfo->src` must be bound to memory that was not allocated with multiple instances

- **VUID-vkCopyMicromapEXT-buffer-07562**
  The buffer used to create `pInfo->dst` must be bound to memory that was not allocated with multiple instances

### Valid Usage (Implicit)

- **VUID-vkCopyMicromapEXT-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkCopyMicromapEXT-deferredOperation-parameter**
  - If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle

- **VUID-vkCopyMicromapEXT-pInfo-parameter**
  - `pInfo` must be a valid pointer to a valid `VkCopyMicromapInfoEXT` structure

- **VUID-vkCopyMicromapEXT-deferredOperation-parent**
  - If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To copy host accessible memory to a micromap, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMemoryToMicromapEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMemoryToMicromapInfoEXT* pInfo);
```
• **device** is the device which owns pInfo->dst.

• **deferredOperation** is an optional VkDeferredOperationKHR to request deferral for this command.

• **pInfo** is a pointer to a VkCopyMemoryToMicromapInfoEXT structure defining the copy operation.

This command fulfills the same task as vkCmdCopyMemoryToMicromapEXT but is executed by the host.

This command can accept micromaps produced by either vkCmdCopyMicromapToMemoryEXT or vkCopyMicromapToMemoryEXT.

### Valid Usage

- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-03677
  
  If deferredOperation is not VK_NULL_HANDLE, it must be a valid VkDeferredOperationKHR object

- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-03678
  
  Any previous deferred operation that was associated with deferredOperation must be complete

- VUID-vkCopyMemoryToMicromapEXT-pInfo-07563
  
  pInfo->src.hostAddress must be a valid host pointer

- VUID-vkCopyMemoryToMicromapEXT-pInfo-07564
  
  pInfo->src.hostAddress must be aligned to 16 bytes

- VUID-vkCopyMemoryToMicromapEXT-buffer-07565
  
  The buffer used to create pInfo->dst must be bound to host-visible device memory

- VUID-vkCopyMemoryToMicromapEXT-micromapHostCommands-07566
  
  The VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands feature must be enabled

- VUID-vkCopyMemoryToMicromapEXT-buffer-07567
  
  The buffer used to create pInfo->dst must be bound to memory that was not allocated with multiple instances

### Valid Usage (Implicit)

- VUID-vkCopyMemoryToMicromapEXT-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-parameter
  
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

- VUID-vkCopyMemoryToMicromapEXT-pInfo-parameter
  
  pInfo must be a valid pointer to a valid VkCopyMemoryToMicromapInfoEXT structure
If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`.

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To copy a micromap to host accessible memory, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMicromapToMemoryEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMicromapToMemoryInfoEXT* pInfo);
```

- `device` is the device which owns `pInfo->src`.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `pInfo` is a pointer to a `VkCopyMicromapToMemoryInfoEXT` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMicromapToMemoryEXT` but is executed by the host.

This command produces the same results as `vkCmdCopyMicromapToMemoryEXT`, but writes its result directly to a host pointer, and is executed on the host rather than the device. The output may not necessarily be bit-for-bit identical, but it can be equally used by either `vkCmdCopyMemoryToMicromapEXT` or `vkCopyMemoryToMicromapEXT`.

### Valid Usage

- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-03677
  If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object
- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-03678
Any previous deferred operation that was associated with `deferredOperation` must be complete

- VUID-vkCopyMicromapToMemoryEXT-buffer-07568
  The buffer used to create `pInfo->src` must be bound to host-visible device memory

- VUID-vkCopyMicromapToMemoryEXT-pInfo-07569
  `pInfo->dst.hostAddress` must be a valid host pointer

- VUID-vkCopyMicromapToMemoryEXT-pInfo-07570
  `pInfo->dst.hostAddress` must be aligned to 16 bytes

- VUID-vkCopyMicromapToMemoryEXT-micromapHostCommands-07571
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature must be enabled

- VUID-vkCopyMicromapToMemoryEXT-buffer-07572
  The buffer used to create `pInfo->src` must be bound to memory that was not allocated with multiple instances

---

### Valid Usage (Implicit)

- VUID-vkCopyMicromapToMemoryEXT-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-parameter
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle

- VUID-vkCopyMicromapToMemoryEXT-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkCopyMicromapToMemoryInfoEXT` structure

- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-parent
  If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`

---

### Return Codes

#### Success
- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

#### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To query micromap size parameters on the host, call:
// Provided by VK_EXT_opacity_micromap

VkResult vkWriteMicromapsPropertiesEXT(
    VkDevice device,                  
    uint32_t micromapCount,           
    const VkMicromapEXT* pMicromaps, 
    VkQueryType queryType,            
    size_t dataSize,                  
    void* pData,                      
    size_t stride);

• device is the device which owns the micromaps in pMicromaps.
• micromapCount is the count of micromaps for which to query the property.
• pMicromaps is a pointer to an array of existing previously built micromaps.
• queryType is a VkQueryType value specifying the property to be queried.
• dataSize is the size in bytes of the buffer pointed to by pData.
• pData is a pointer to a user-allocated buffer where the results will be written.
• stride is the stride in bytes between results for individual queries within pData.

This command fulfills the same task as vkCmdWriteMicromapsPropertiesEXT but is executed by the host.

Valid Usage

• VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-07501
  All micromaps in pMicromaps must have been constructed prior to the execution of this command.

• VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-07502
  All micromaps in pMicromaps must have been constructed with
  VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT if queryType is
  VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT

• VUID-vkWriteMicromapsPropertiesEXT-queryType-07503
  queryType must be VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT or
  VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT

• VUID-vkWriteMicromapsPropertiesEXT-queryType-07573
  If queryType is VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT, then stride must be a
  multiple of the size of VkDeviceSize

• VUID-vkWriteMicromapsPropertiesEXT-queryType-07574
  If queryType is VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT, then pData must point to a
  VkDeviceSize

• VUID-vkWriteMicromapsPropertiesEXT-queryType-07575
  If queryType is

• VUID-vkWriteMicromapsPropertiesEXT-dataSize-07576
**dataSize** must be greater than or equal to **micromapCount** * stride

- **VUID-vkWriteMicromapsPropertiesEXT-buffer-07577**
  The buffer used to create each micromap in **pMicromaps** must be bound to host-visible device memory

- **VUID-vkWriteMicromapsPropertiesEXT-micromapHostCommands-07578**
  The **VkPhysicalDeviceOpacityMicromapFeaturesEXT**:micromapHostCommands feature must be enabled

- **VUID-vkWriteMicromapsPropertiesEXT-buffer-07579**
  The buffer used to create each micromap in **pMicromaps** must be bound to memory that was not allocated with multiple instances

---

**Valid Usage ( Implicit )**

- **VUID-vkWriteMicromapsPropertiesEXT-device-parameter**
  device must be a valid **VkDevice** handle

- **VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-parameter**
  pMicromaps must be a valid pointer to an array of **micromapCount** valid **VkMicromapEXT** handles

- **VUID-vkWriteMicromapsPropertiesEXT-queryType-parameter**
  queryType must be a valid **VkQueryType** value

- **VUID-vkWriteMicromapsPropertiesEXT-pData-parameter**
  pData must be a valid pointer to an array of **dataSize** bytes

- **VUID-vkWriteMicromapsPropertiesEXT-micromapCount-arraylength**
  micromapCount must be greater than 0

- **VUID-vkWriteMicromapsPropertiesEXT-dataSize-arraylength**
  dataSize must be greater than 0

- **VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-parent**
  Each element of **pMicromaps** must have been created, allocated, or retrieved from device

---

**Return Codes**

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
Chapter 38. Ray Traversal

The ray traversal process identifies and handles intersections between a ray and geometries in an acceleration structure.

Ray traversal cannot be started by a Vulkan API command directly - a shader must execute `OpRayQueryProceedKHR` or `OpTraceRayKHR`. When the `rayTracingPipeline` feature is enabled, `OpTraceRayKHR` can be used for ray tracing in a ray tracing pipeline. When the `rayQuery` feature is enabled, `OpRayQueryProceedKHR` can be used in any shader stage.

38.1. Ray Intersection Candidate Determination

Once tracing begins, rays are first tested against instances in a top-level acceleration structure. A ray that intersects an instance will be transformed into the space of the instance to continue traversal within that instance; therefore the transform matrix stored in the instance must be invertible.

Next, rays are tested against geometries in an bottom-level acceleration structure to determine if a hit occurred between them, initially based only on their geometric properties (i.e. their vertices). The implementation performs similar operations to that of rasterization, but with the effective viewport determined by the parameters of the ray, and the geometry transformed into a space determined by that viewport.

The vertices of each primitive are transformed from acceleration structure space to ray space according to the ray origin and direction as follows:

\[
\begin{pmatrix}
x_r \\
y_r \\
z_r
\end{pmatrix} =
\begin{pmatrix}
a_x^2(1-c) + c & a_xa_y(1-c) - sa_z & a_xa_z(1-c) + sa_y \\
a_xa_y(1-c) + sa_z & a_y^2(1-c) + c & a_ya_z(1-c) - sa_x \\
a_xa_z(1-c) - sa_y & a_ya_z(1-c) + sa_x & a_z^2(1-c) + c
\end{pmatrix}^{-1}
\begin{pmatrix}
x_{as} - o_x \\
y_{as} - o_y \\
z_{as} - o_z
\end{pmatrix}
\]

\(a\) is the axis of rotation from the unnormalized ray direction vector \(d\) to the axis vector \(k\):

\[
a = \begin{cases} 
\frac{d \times k}{||d \times k||} & \text{if } ||d \times k|| \neq 0 \\
\begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} & \text{if } ||d \times k|| = 0 
\end{cases}
\]

\(s\) and \(c\) are the sine and cosine of the angle of rotation about \(a\) from \(d\) to \(k\):

\[
c = \frac{d \cdot k}{||d||} \\
s = \sqrt{1 - c^2}
\]

\(k\) is the unit vector:
\[ \mathbf{k} = \begin{pmatrix} 0 \\ 0 \\ -1 \end{pmatrix} \]

\( \mathbf{o} \) and \( \mathbf{d} \) are the ray origin and unnormalized direction, respectively; the vector described by \( x_{\text{as}}, y_{\text{as}}, \) and \( z_{\text{as}} \) is any position in acceleration structure space; and the vector described by \( x_r, y_r, \) and \( z_r \) is the same position in ray space.

An intersection candidate is a unique point of intersection between a ray and a geometric primitive. For any primitive that has within its bounds a position \( \mathbf{x y z}_{\text{as}} \) such that

\[
\begin{align*}
x_r &= 0 \\
y_r &= 0 \\
t_{\text{min}} &< -\frac{z_r}{\|\mathbf{d}\|} < t_{\text{max}} & \text{if the primitive is a triangle,} \\
t_{\text{min}} &\leq -\frac{z_r}{\|\mathbf{d}\|} \leq t_{\text{max}} & \text{otherwise}
\end{align*}
\]

(where \( t = -\frac{z_r}{\|\mathbf{d}\|} \)), an intersection candidate exists.

Triangle primitive bounds consist of all points on the plane formed by the three vertices and within the bounds of the edges between the vertices, subject to the watertightness constraints below. AABB primitive bounds consist of all points within an implementation-defined bound which includes the specified box.

**Note**
The bounds of the AABB including all points internal to the bound implies that a ray started within the AABB will hit that AABB.

**Figure 28. Ray intersection candidate**

The determination of this condition is performed in an implementation specific manner, and may be performed with floating point operations. Due to the complexity and number of operations involved, inaccuracies are expected, particularly as the scale of values involved begins to diverge. Implementations should take efforts to maintain as much precision as possible.

**Note**
One very common case is when geometries are close to each other at some distance from the origin in acceleration structure space, where an effect similar to “z-fighting” is likely to be observed. Applications can mitigate this by ensuring their detailed geometries remain close to the origin.
Another likely case is when the origin of a ray is set to a position on a previously intersected surface, and its $t_{\text{min}}$ is zero or near zero; an intersection may be detected on the emitting surface. This case can usually be mitigated by offsetting $t_{\text{min}}$ slightly.

For a motion primitive or a motion instance, the positions for intersection are evaluated at the time specified in the `\text{time}` parameter to \text{OpTraceRayMotionNV} by interpolating between the two endpoints as specified for the given motion type. If a motion acceleration structure is traced with \text{OpTraceRayKHR}, it behaves as a \text{OpTraceRayMotionNV} with `\text{time}` of 0.0.

In the case of AABB geometries, implementations \textbf{may} increase their size in an acceleration structure in order to mitigate precision issues. This \textbf{may} result in false positive intersections being reported to the application.

For triangle intersection candidates, the \textbf{b} and \textbf{c} \textit{barycentric coordinates} on the triangle where the above condition is met are made available to future shading. If the ray was traced with \text{OpTraceRayKHR}, these values are available as a vector of 2 32-bit floating point values in the \text{HitAttributeKHR} storage class.

Once an intersection candidate is determined, it proceeds through the following operations, in order:

1. Ray Intersection Culling
2. Ray Intersection Confirmation
3. Ray Closest Hit Determination
4. Ray Result Determination

The sections below describe the exact details of these tests. There is no ordering guarantee between operations performed on different intersection candidates.

\section*{38.1.1. Watertightness}

For a set of triangles with identical transforms, within a single instance:

- Any set of two or more triangles where all triangles have one vertex with an identical position value, that vertex is a \textit{shared vertex}.
- Any set of two triangles with two shared vertices that were specified in the same \textit{winding order} in each triangle have a \textit{shared edge} defined by those vertices.

A \textit{closed fan} is a set of three or more triangles where:

- All triangles in the set have the same shared vertex as one of their vertices.
- All edges that include the above vertex are shared edges.
- All above shared edges are shared by exactly two triangles from the set.
- No two triangles in the set intersect, except at shared edges.
- Every triangle in the set is joined to every other triangle in the set by a series of the above shared edges.
Implementations should not double-hit or miss when a ray intersects a shared edge, or a shared vertex of a closed fan.

### 38.2. Ray Intersection Culling

Candidate intersections go through several phases of culling before confirmation as an actual hit. There is no particular ordering dependency between the different culling operations.

#### 38.2.1. Ray Primitive Culling

If the `rayTraversalPrimitiveCulling` or `rayQuery` features are enabled, the `SkipTrianglesKHR` and `SkipAABBsKHR` ray flags can be specified when tracing a ray. `SkipTrianglesKHR` and `SkipAABBsKHR` are mutually exclusive. `SkipTrianglesKHR` is also mutually exclusive with `CullBackFacingTrianglesKHR` and `CullFrontFacingTrianglesKHR`.

If `SkipTrianglesKHR` was included in the Ray Flags operand of the ray trace instruction, and the intersection is with a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs. If `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR` was included in the pipeline, traversal with `OpTraceRayKHR` calls will all behave as if `SkipTrianglesKHR` was included in its Ray Flags operand.

If `SkipAABBsKHR` was included in the Ray Flags operand of the ray trace instruction, and the intersection is with an AABB primitive, the intersection is dropped, and no further processing of this intersection occurs. If `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR` was included in the pipeline, traversal with `OpTraceRayKHR` calls will all behave as if `SkipAABBsKHR` was included in its Ray Flags operand.

#### 38.2.2. Ray Mask Culling

Instances can be made invisible to particular rays based on the value of `VkAccelerationStructureInstanceKHR::mask` used to add that instance to a top-level acceleration structure, and the Cull Mask parameter used to trace the ray.

For the instance which is intersected, if `mask & Cull Mask` == 0, the intersection is dropped, and no further processing occurs.

#### 38.2.3. Ray Face Culling

As in polygon rasterization, one of the stages of ray traversal is to determine if a triangle primitive is back- or front-facing, and primitives can be culled based on that facing.

If the intersection candidate is with an AABB primitive, this operation is skipped.

_Determination_

When a ray intersects a triangle primitive, the order that vertices are specified for the polygon affects whether the ray intersects the front or back face. Front or back facing is determined in the same way as they are for rasterization, based on the sign of the polygon's area but using the ray space coordinates instead of framebuffer coordinates. One way to compute this area is:
where $x^i_r$ and $y^i_r$ are the x and y ray space coordinates of the $i^{th}$ vertex of the $n$-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and $i \oplus 1$ is $(i + 1) \mod n$.

By default, if $a$ is negative then the intersection is with the front face of the triangle, otherwise it is with the back face. If `VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR` is included in `VkAccelerationStructureInstanceKHR::flags` for the instance containing the intersected triangle, this determination is reversed. Additionally, if $a$ is 0, the intersection candidate is treated as not intersecting with any face, irrespective of the sign.

**Note**

In a left-handed coordinate system, an intersection will be with the front face of a triangle if the vertices of the triangle, as defined in index order, appear from the ray's perspective in a clockwise rotation order. `VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR` was previously annotated as `VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR` because of this.

If the ray was traced with `OpTraceRayKHR`, the `HitKindKHR` built-in is set to `HitKindFrontFacingTriangleKHR` if the intersection is with front-facing geometry, and `HitKindBackFacingTriangleKHR` if the intersection is with back-facing geometry, for shader stages considering this intersection.

If the ray was traced with `OpRayQueryProceedKHR`, `OpRayQueryGetIntersectionFrontFaceKHR` will return true for intersection candidates with front faces, or false for back faces.

**Culling**

If `CullBackFacingTrianglesKHR` was included in the Ray Flags parameter of the ray trace instruction, and the intersection is determined as with the back face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

If `CullFrontFacingTrianglesKHR` was included in the Ray Flags parameter of the ray trace instruction, and the intersection is determined as with the front face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

This culling is disabled if `VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR` was included in `VkAccelerationStructureInstanceKHR::flags` for the instance which the intersected geometry belongs to.

Intersection candidates that have not intersected with any face ($a == 0$) are unconditionally culled, irrespective of ray flags and geometry instance flags.

The `CullBackFacingTrianglesKHR` and `CullFrontFacingTrianglesKHR` Ray Flags are mutually exclusive.

### 38.2.4. Ray Opacity Culling

Each geometry in the acceleration structure may be considered either opaque or not. Opaque
geometries continue through traversal as normal, whereas non-opaque geometries need to be either confirmed or discarded by shader code. Intersection candidates can also be culled based on their opacity.

**Determination**

Each individual intersection candidate is initially determined as opaque if `VK_GEOMETRY_OPAQUE_BIT_KHR` was included in the `VkAccelerationStructureGeometryKHR::flags` when the geometry it intersected with was built, otherwise it is considered non-opaque.

If the geometry includes an opacity micromap, the opacity of the intersection at this point is instead derived as described in Ray Opacity Micromap.

If the intersection candidate was generated by an intersection shader, the intersection is initially considered to have opacity matching the AABB candidate that it was generated from.

However, this opacity can be overridden when it is built into an instance. Setting `VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR` in `VkAccelerationStructureInstanceKHR::flags` will force all geometries in the instance to be considered opaque. Similarly, setting `VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR` will force all geometries in the instance to be considered non-opaque.

This can again be overridden by including `OpaqueKHR` or `NoOpaqueKHR` in the Ray Flags parameter when tracing a ray. `OpaqueKHR` forces all geometries to behave as if they are opaque, regardless of their build parameters. Similarly, `NoOpaqueKHR` forces all geometries to behave as if they are non-opaque.

If the ray was traced with `OpRayQueryProceedKHR`, to determine the opacity of AABB intersection candidates, `OpRayQueryGetIntersectionCandidateAABBOpaqueKHR` can be used. This instruction will return `true` for opaque intersection candidates, and `false` for non-opaque intersection candidates.

**Culling**

If `CullOpaqueKHR` is included in the Ray Flags parameter when tracing a ray, an intersection with a geometry that is considered opaque is dropped, and no further processing occurs.

If `CullNoOpaqueKHR` is included in the Ray Flags parameter when tracing a ray, an intersection with a geometry that is considered non-opaque is dropped, and no further processing occurs.

The `OpaqueKHR`, `NoOpaqueKHR`, `CullOpaqueKHR`, and `CullNoOpaqueKHR` Ray Flags are mutually exclusive.

### 38.2.5. Ray Opacity Micromap

A `VK_GEOMETRY_TYPE_TRIANGLES_KHR` geometry in the acceleration structure may have an opacity micromap associated with it to give finer-grained opacity information.

If the intersection candidate is with a geometry with an associated opacity micromap and `VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT` is not set in its instance then the micromap is used to determine geometry opacity instead of the `VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR` and `VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR` values in the geometry.

The opacity information in the micromap object is accessed using the candidate intersection u and
v coordinates. The integer $u$ and $v$ are computed from $\left\lfloor u \right\rfloor$ $\left\lfloor v \right\rfloor$, clamping $\left\lfloor u \right\rfloor$ as needed to keep the sum less than or equal to $1 << \text{subdivisionlevel}$. These values are mapped into a linear index with a space filling curve which is defined recursively by traversing into the sub-triangle nearest vertex 0, then the middle triangle with ordering flipped, then nearest vertex 1 then nearest vertex 2.

![Diagram](image)

*Figure 29. Example ordering for micromap data*

**Note**

This encoding is spatially coherent, purely hierarchical, and allows a bit-parallel conversion between barycentric address and index values.

See the appendix for reference code implementing this mapping.

The result of the opacity micromap lookup and operations is to treat the intersection as opaque, non-opaque, or ignored. The interpretation of the values depends on `VK_GEOMETRY_INSTANCE_FORCE_OPAcity_MICROMAP_2_STATE_EXT` in the instance of the candidate intersection or `ForceOpacityMicromap2StateEXT` ray flags on the ray. If either is set, the opacity micromap information is interpreted in 2 state override mode.

If the associated opacity micromap has format `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT`, each element of the micromap is represented by a single bit at the index derived above.

If the associated opacity micromap has format `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT`, each element is represented by a two bit value at the index derived above.

### 38.3. Ray Intersection Confirmation

Depending on the opacity of intersected geometry and whether it is a triangle or an AABB, candidate intersections are further processed to determine the eventual hit result. Candidates generated from AABB intersections run through the same confirmation process as triangle hits.

#### 38.3.1. AABB Intersection Candidates

For an intersection candidate with an AABB geometry generated by Ray Intersection Candidate Determination, shader code is executed to determine whether any hits should be reported to the traversal infrastructure; no further processing of this intersection candidate occurs. The occurrence of an AABB intersection candidate does not guarantee the ray intersects the primitive bounds. To avoid propagating false intersections the application should verify the intersection candidate before reporting any hits.

If the ray was traced with OpTraceRayKHR, an intersection shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. If this shader calls OpReportIntersectionKHR, a new intersection candidate is generated as described below. If the intersection shader is VK_SHADER_UNUSED_KHR (which is only allowed for a zero shader group) then no further processing of the intersection candidate occurs.
Each new candidate generated as a result of this processing is a generated intersection candidate that intersects the AABB geometry, with a \( t \) value equal to the Hit parameter of the \texttt{OpReportIntersectionKHR} instruction. The new generated candidate is then independently run through \texttt{Ray Intersection Confirmation} as a generated intersection.

If the ray was traced with \texttt{OpRayQueryProceedKHR}, control is returned to the shader which executed \texttt{OpRayQueryProceedKHR}, returning \texttt{true}. The resulting ray query has a candidate intersection type of \texttt{RayQueryCandidateIntersectionAABBKHR}. \texttt{OpRayQueryGenerateIntersectionKHR} can be called to commit a new intersection candidate with committed intersection type of \texttt{RayQueryCommittedIntersectionGeneratedKHR}. Further ray query processing can be continued by executing \texttt{OpRayQueryProceedKHR} with the same ray query, or intersection can be terminated with \texttt{OpRayQueryTerminateKHR}. Unlike rays traced with \texttt{OpTraceRayKHR}, candidates generated in this way skip generated intersection candidate confirmation; applications should make this determination before generating the intersection.

This operation may be executed multiple times for the same intersection candidate.

### 38.3.2. Triangle and Generated Intersection Candidates

For triangle and generated intersection candidates, additional shader code may be executed based on the intersection’s opacity.

If the intersection is opaque, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

For non-opaque intersection candidates, shader code is executed to determine whether a hit occurred or not.

If the ray was traced with \texttt{OpTraceRayKHR}, an any-hit shader is invoked from the Shader Binding Table according to the specified indexing. If this shader calls \texttt{OpIgnoreIntersectionKHR}, the candidate is dropped and no further processing of the candidate occurs. If the any-hit shader identified is \texttt{VK_SHADER_UNUSED_KHR}, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

If the ray was traced with \texttt{OpRayQueryProceedKHR}, control is returned to the shader which executed \texttt{OpRayQueryProceedKHR}, returning \texttt{true}. As only triangle candidates participate in this operation with ray queries, the resulting candidate intersection type is always \texttt{RayQueryCandidateIntersectionTriangleKHR}. \texttt{OpRayQueryConfirmIntersectionKHR} can be called on the ray query to confirm the candidate as a hit with committed intersection type of \texttt{RayQueryCommittedIntersectionTriangleKHR}. Further ray query processing can be continued by executing \texttt{OpRayQueryProceedKHR} with the same ray query, or intersection can be terminated with \texttt{OpRayQueryTerminateKHR}. If \texttt{OpRayQueryConfirmIntersectionKHR} has not been executed, the candidate is dropped and no further processing of the candidate occurs.

This operation may be executed multiple times for the same intersection candidate unless \texttt{VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR} was specified for the intersected geometry.
38.4. Ray Closest Hit Determination

Unless the ray was traced with the TerminateOnFirstHitKHR ray flag, the implementation must track the closest confirmed hit until all geometries have been tested and either confirmed or dropped.

After an intersection candidate is confirmed, its t value is compared to $t_{\text{max}}$ to determine which intersection is closer, where t is the parametric distance along the ray at which the intersection occurred.

- If $t < t_{\text{max}}$, $t_{\text{max}}$ is set to t and the candidate is set as the current closest hit.
- If $t > t_{\text{max}}$, the candidate is dropped and no further processing of that candidate occurs.
- If $t = t_{\text{max}}$, the candidate may be set as the current closest hit or dropped.

If TerminateOnFirstHitKHR was included in the Ray Flags used to trace the ray, once the first hit is confirmed, the ray trace is terminated.

38.5. Ray Result Determination

Once all candidates have finished processing the prior stages, or if the ray is forcibly terminated, the final result of the ray trace is determined.

If a closest hit result was identified by Ray Closest Hit Determination, a closest hit has occurred, otherwise the final result is a miss.

For rays traced with OpTraceRayKHR, if a closest hit result was identified, a closest hit shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. Control returns to the shader that executed OpTraceRayKHR once this shader returns. This shader is skipped if either the ray flags included SkipClosestHitShaderKHR, or if the closest hit shader identified is VK_SHADER_UNUSED_KHR.

For rays traced with OpTraceRayKHR where no hit result was identified, the miss shader identified by the Miss Index parameter of OpTraceRayKHR is invoked. Control returns to the shader that executed OpTraceRayKHR once this shader returns. This shader is skipped if the miss shader identified is VK_SHADER_UNUSED_KHR.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed OpRayQueryProceedKHR, returning false. If a closest hit was identified by Ray Closest Hit Determination, the ray query will now have a committed intersection type of RayQueryCommittedIntersectionGeneratedKHR or RayQueryCommittedIntersectionTriangleKHR. If no closest hit was identified, the committed intersection type will be RayQueryCommittedIntersectionNoneKHR.

No further processing of a ray query occurs after this result is determined.
Chapter 39. Ray Tracing

Ray tracing uses a separate rendering pipeline from both the graphics and compute pipelines (see Ray Tracing Pipeline).

![Ray tracing pipeline execution](image)

**Figure 30. Ray tracing pipeline execution**

Interaction between the different shader stages in the ray tracing pipeline

Within the ray tracing pipeline, `OpTraceRayKHR` or `OpTraceRayMotionNV` can be called to perform a ray traversal that invokes the various ray tracing shader stages during its execution. The relationship between the ray tracing pipeline object and the geometries present in the acceleration structure traversed is passed into the ray tracing command in a `VkBuffer` object known as a *shader binding table*. `OpExecuteCallableKHR` can also be used in ray tracing pipelines to invoke a *callable shader*.

During execution, control alternates between scheduling and other operations. The scheduling functionality is implementation-specific and is responsible for workload execution. The shader stages are programmable. *Traversal*, which refers to the process of traversing acceleration structures to find potential intersections of rays with geometry, is fixed function.

The programmable portions of the pipeline are exposed in a single-ray programming model, with each invocation handling one ray at a time. Memory operations can be synchronized using standard memory barriers. The *Workgroup* scope and variables with a storage class of *Workgroup* must not be used in the ray tracing pipeline.

### 39.1. Shader Call Instructions

A *shader call* is an instruction which may cause execution to continue elsewhere by creating one or more invocations that execute a different shader stage.

The shader call instructions are:

- `OpTraceRayKHR` which may invoke intersection, any-hit, closest hit, or miss shaders,
• **OpTraceRayMotionNV** which *may* invoke intersection, any-hit, closest hit, or miss shaders,
• **OpReportIntersectionKHR** which *may* invoke any-hit shaders, and
• **OpExecuteCallableKHR** which will invoke a callable shader.

The invocations created by shader call instructions are grouped into subgroups by the implementation. Those subgroups *may* be unrelated to the subgroup of the parent invocation.

**Pipeline trace ray instructions** *can* be used recursively; invoked shaders *can* themselves execute pipeline trace ray instructions, to a maximum depth defined by the `maxRecursionDepth` or `maxRayRecursionDepth` limit.

Shaders directly invoked from the API always have a recursion depth of 0; each shader executed by a pipeline trace ray instruction has a recursion depth one higher than the recursion depth of the shader which invoked it. Applications *must* not invoke a shader with a recursion depth greater than the value of `maxRecursionDepth` or `maxPipelineRayRecursionDepth` specified in the pipeline.

There is no explicit recursion limit for other shader call instructions which may recurse (e.g. **OpExecuteCallableKHR**) but there is an upper bound determined by the stack size.

An **invocation repack instruction** is a ray tracing shader call instruction where the implementation *may* change the set of invocations that are executing. When a repack instruction is encountered, the invocation is suspended and a new invocation begins and executes the instruction. After executing the repack instruction (which *may* result in other ray tracing shader stages executing) the new invocation ends and the original invocation is resumed, but it *may* be resumed in a different subgroup or at a different `SubgroupLocalInvocationId` within the same subgroup. When a subset of invocations in a subgroup execute the invocation repack instruction, those that do not execute it remain in the same subgroup at the same `SubgroupLocalInvocationId`.

The invocations that are executing before an invocation repack instruction, after the instruction, or are created by the instruction, are *shader-call-related*.

If the implementation changes the composition of subgroups, the values of `SubgroupSize`, `SubgroupLocalInvocationId`, `SMIDNV`, `WarpIDNV`, and builtin variables that are derived from them (`SubgroupEqMask`, `SubgroupGeMask`, `SubgroupGtMask`, `SubgroupLeMask`, `SubgroupLtMask`) *must* be changed accordingly by the invocation repack instruction. The application *must* use **Volatile semantics** on these **BuiltIn** variables when used in the ray generation, closest hit, miss, intersection, and callable shaders. Similarly, the application *must* use **Volatile semantics** on any `RayTmaxKHR` decorated **Builtin** used in an intersection shader.

---

**Note**

**Subgroup operations** are permitted in the programmable ray tracing shader stages. However, shader call instructions place a bound on where results of subgroup instructions or subgroup-scoped instructions that execute the dynamic instance of that instruction are potentially valid. For example, care *must* be taken when using the result of a ballot operation that was computed before an
invocation repack instruction, after that repack instruction. The ballot may be incorrect as the set of invocations could have changed.

While the SubgroupSize built-in is required to be declared Volatile, its value will never change unless
VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT is set on
pipeline creation, as without that bit set, its value is required to match that of
VkPhysicalDeviceSubgroupProperties::subgroupSize.

For clock operations, the value of a Subgroup scoped OpReadClockKHR read before the
dynamic instance of a repack instruction should not be compared to the result of
that clock instruction after the repack instruction.

When a ray tracing shader executes a dynamic instance of an invocation repack instruction which
results in another ray tracing shader being invoked, their instructions are related by shader-call-
order.

For ray tracing invocations that are shader-call-related:

• memory operations on StorageBuffer, Image, and ShaderRecordBufferKHR storage classes can be
synchronized using the ShaderCallKHR scope.

• the CallableDataKHR, IncomingCallableDataKHR, RayPayloadKHR, HitAttributeKHR, and
IncomingRayPayloadKHR storage classes are system-synchronized and no application availability
and visibility operations are required.

• memory operations within a single invocation before and after the invocation repack
instruction are ordered by program-order and do not require explicit synchronization.

39.2. Ray Tracing Commands

Ray tracing commands provoke work in the ray tracing pipeline. Ray tracing commands are
recorded into a command buffer and when executed by a queue will produce work that executes
according to the currently bound ray tracing pipeline. A ray tracing pipeline must be bound to a
command buffer before any ray tracing commands are recorded in that command buffer.

To dispatch ray tracing use:

```c
// Provided by VK_NV_ray_tracing
void vkCmdTraceRaysNV(
    VkCommandBuffer commandBuffer,
    VkBuffer raygenShaderBindingTableBuffer,
    VkDeviceSize raygenShaderBindingOffset,
    VkBuffer missShaderBindingTableBuffer,
    VkDeviceSize missShaderBindingOffset,
    VkDeviceSize missShaderBindingStride,
    VkBuffer hitShaderBindingTableBuffer,
    VkDeviceSize hitShaderBindingOffset,
    VkDeviceSize hitShaderBindingStride,
    VkBuffer callableShaderBindingTableBuffer,
    VkDeviceSize callableShaderBindingOffset,
    VkDeviceSize callableShaderBindingStride,
    VkBuffer traversalShaderBindingTableBuffer,
```
• `commandBuffer` is the command buffer into which the command will be recorded.

• `raygenShaderBindingTableBuffer` is the buffer object that holds the shader binding table data for the ray generation shader stage.

• `raygenShaderBindingOffset` is the offset in bytes (relative to `raygenShaderBindingTableBuffer`) of the ray generation shader being used for the trace.

• `missShaderBindingTableBuffer` is the buffer object that holds the shader binding table data for the miss shader stage.

• `missShaderBindingOffset` is the offset in bytes (relative to `missShaderBindingTableBuffer`) of the miss shader being used for the trace.

• `missShaderBindingStride` is the size in bytes of each shader binding table record in `missShaderBindingTableBuffer`.

• `hitShaderBindingTableBuffer` is the buffer object that holds the shader binding table data for the hit shader stages.

• `hitShaderBindingOffset` is the offset in bytes (relative to `hitShaderBindingTableBuffer`) of the hit shader group being used for the trace.

• `hitShaderBindingStride` is the size in bytes of each shader binding table record in `hitShaderBindingTableBuffer`.

• `callableShaderBindingTableBuffer` is the buffer object that holds the shader binding table data for the callable shader stage.

• `callableShaderBindingOffset` is the offset in bytes (relative to `callableShaderBindingTableBuffer`) of the callable shader being used for the trace.

• `callableShaderBindingStride` is the size in bytes of each shader binding table record in `callableShaderBindingTableBuffer`.

• `width` is the width of the ray trace query dimensions.

• `height` is height of the ray trace query dimensions.

• `depth` is depth of the ray trace query dimensions.

When the command is executed, a ray generation group of `width × height × depth` rays is assembled.

**Valid Usage**

- **VUID-vkCmdTraceRaysNV-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.
Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's `buffer features` must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdTraceRaysNV-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in *Pipeline Layout Compatibility*

- **VUID-vkCmdTraceRaysNV-maintenance4-06425**
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in *Pipeline Layout Compatibility*

- **VUID-vkCmdTraceRaysNV-None-02699**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command

- **VUID-vkCmdTraceRaysNV-None-02700**
  A valid pipeline must be bound to the pipeline bind point used by this command

- **VUID-vkCmdTraceRaysNV-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- **VUID-vkCmdTraceRaysNV-None-02859**
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdTraceRaysNV-None-02702**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

- **VUID-vkCmdTraceRaysNV-None-02703**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- **VUID-vkCmdTraceRaysNV-None-02704**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with
any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdTraceRaysNV-uniformBuffers-06935**
  If any stage of the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT} or \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT} for \texttt{uniformBuffers}, and the \textit{robustBufferAccess} feature is not enabled, that stage \textit{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysNV-storageBuffers-06936**
  If any stage of the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT} or \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT} for \texttt{storageBuffers}, and the \textit{robustBufferAccess} feature is not enabled, that stage \textit{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysNV-commandBuffer-02707**
  If \texttt{commandBuffer} is an unprotected command buffer and \texttt{protectedNoFault} is not supported, any resource accessed by the \texttt{VkPipeline} object bound to the pipeline bind point used by this command \textit{must} not be a protected resource

- **VUID-vkCmdTraceRaysNV-None-06550**
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} or \texttt{VkImageView} object that enables \textit{sampler YC}_{B,C}R conversion, that object \textit{must} only be used with \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions

- **VUID-vkCmdTraceRaysNV-ConstOffset-06551**
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} or \texttt{VkImageView} object that enables \textit{sampler YC}_{B,C}R conversion, that object \textit{must} not use the \texttt{ConstOffset} and \texttt{Offset} operands

- **VUID-vkCmdTraceRaysNV-None-04115**
  If a \texttt{VkImageView} is accessed using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that instruction \textit{must} have at least as many components as the image view’s format

- **VUID-vkCmdTraceRaysNV-OpImageWrite-04469**
  If a \texttt{VkBufferView} is accessed using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that instruction \textit{must} have at least as many components as the buffer view’s format

- **VUID-vkCmdTraceRaysNV-SampledType-04470**
  If a \texttt{VkImageView} with a \texttt{VkFormat} that has a 64-bit component width is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction \textit{must} have a \texttt{Width} of 64

- **VUID-vkCmdTraceRaysNV-SampledType-04471**
  If a \texttt{VkImageView} with a \texttt{VkFormat} that has a component width less than 64-bit is
accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- **VUID-vkCmdTraceRaysNV-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- **VUID-vkCmdTraceRaysNV-SampledType-04473**
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- **VUID-vkCmdTraceRaysNV-sparseImageInt64Atomics-04474**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- **VUID-vkCmdTraceRaysNV-sparseImageInt64Atomics-04475**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- **VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06971**
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`

- **VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06972**
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view’s `format features` **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`

- **VUID-vkCmdTraceRaysNV-OpImageBoxFilterQCOM-06973**
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` **must** contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`

- **VUID-vkCmdTraceRaysNV-OpImageBlockMatchSSDQCOM-06974**
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation.

- **VUID-vkCmdTraceRaysNV-OpImageBlockMatchSADQCOM-06975**
  If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation.

- **VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06977**
If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06978**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdTraceRaysNV-None-07288**
  Any shader invocation executed by this command **must** terminate

- **VUID-vkCmdTraceRaysNV-None-03429**
  Any shader group handle referenced by this call **must** have been queried from the currently bound ray tracing pipeline

- **VUID-vkCmdTraceRaysNV-commandBuffer-04624**
  `commandBuffer` **must** not be a protected command buffer

- **VUID-vkCmdTraceRaysNV-maxRecursionDepth-03625**
  This command **must** not cause a pipeline trace ray instruction to be executed from a shader invocation with a *recursion depth* greater than the value of `maxRecursionDepth` used to create the bound ray tracing pipeline

- **VUID-vkCmdTraceRaysNV-raygenShaderBindingTableBuffer-04042**
  If `raygenShaderBindingTableBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdTraceRaysNV-raygenShaderBindingOffset-02455**
  `raygenShaderBindingOffset` **must** be less than the size of `raygenShaderBindingTableBuffer`

- **VUID-vkCmdTraceRaysNV-raygenShaderBindingOffset-02456**
  `raygenShaderBindingOffset` **must** be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysNV-missShaderBindingTableBuffer-04043**
  If `missShaderBindingTableBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdTraceRaysNV-missShaderBindingOffset-02457**
  `missShaderBindingOffset` **must** be less than the size of `missShaderBindingTableBuffer`

- **VUID-vkCmdTraceRaysNV-missShaderBindingOffset-02458**
  `missShaderBindingOffset` **must** be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysNV-hitShaderBindingTableBuffer-04044**
  If `hitShaderBindingTableBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdTraceRaysNV-hitShaderBindingOffset-02459**
  `hitShaderBindingOffset` **must** be less than the size of `hitShaderBindingTableBuffer`

- **VUID-vkCmdTraceRaysNV-hitShaderBindingOffset-02460**
  `hitShaderBindingOffset` **must** be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV`
shaderGroupBaseAlignment

- VUID-vkCmdTraceRaysNV-callableShaderBindingTableBuffer-04045
  If callableShaderBindingTableBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- VUID-vkCmdTraceRaysNV-callableShaderBindingOffset-02461
callableShaderBindingOffset must be less than the size of callableShaderBindingTableBuffer

- VUID-vkCmdTraceRaysNV-callableShaderBindingOffset-02462
callableShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment

- VUID-vkCmdTraceRaysNV-missShaderBindingStride-02463
  missShaderBindingStride must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize

- VUID-vkCmdTraceRaysNV-hitShaderBindingStride-02464
  hitShaderBindingStride must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize

- VUID-vkCmdTraceRaysNV-callableShaderBindingStride-02465
callableShaderBindingStride must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize

- VUID-vkCmdTraceRaysNV-missShaderBindingStride-02466
  missShaderBindingStride must be less than or equal to VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride

- VUID-vkCmdTraceRaysNV-hitShaderBindingStride-02467
  hitShaderBindingStride must be less than or equal to VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride

- VUID-vkCmdTraceRaysNV-callableShaderBindingStride-02468
callableShaderBindingStride must be less than or equal to VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride

- VUID-vkCmdTraceRaysNV-width-02469
  width must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]

- VUID-vkCmdTraceRaysNV-height-02470
  height must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]

- VUID-vkCmdTraceRaysNV-depth-02471
  depth must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]

Valid Usage (Implicit)

- VUID-vkCmdTraceRaysNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdTraceRaysNV-raygenShaderBindingTableBuffer-parameter
  raygenShaderBindingTableBuffer must be a valid VkBuffer handle
• VUID-vkCmdTraceRaysNV-missShaderBindingTableBuffer-parameter
  If missShaderBindingTableBuffer is not VK_NULL_HANDLE, missShaderBindingTableBuffer must be a valid VkBuffer handle

• VUID-vkCmdTraceRaysNV-hitShaderBindingTableBuffer-parameter
  If hitShaderBindingTableBuffer is not VK_NULL_HANDLE, hitShaderBindingTableBuffer must be a valid VkBuffer handle

• VUID-vkCmdTraceRaysNV-callableShaderBindingTableBuffer-parameter
  If callableShaderBindingTableBuffer is not VK_NULL_HANDLE, callableShaderBindingTableBuffer must be a valid VkBuffer handle

• VUID-vkCmdTraceRaysNV-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdTraceRaysNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdTraceRaysNV-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdTraceRaysNV-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdTraceRaysNV-commonparent
  Each of callableShaderBindingTableBuffer, commandBuffer, hitShaderBindingTableBuffer, missShaderBindingTableBuffer, and raygenShaderBindingTableBuffer that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

---

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

To dispatch ray tracing use:

```c
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdTraceRaysKHR(
```
VkCommandBuffer commandBuffer,
const VkStridedDeviceAddressRegionKHR* pRaygenShaderBindingTable,
const VkStridedDeviceAddressRegionKHR* pMissShaderBindingTable,
const VkStridedDeviceAddressRegionKHR* pHitShaderBindingTable,
const VkStridedDeviceAddressRegionKHR* pCallableShaderBindingTable,
uint32_t width,
uint32_t height,
uint32_t depth);

• commandBuffer is the command buffer into which the command will be recorded.

• pRaygenShaderBindingTable is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the ray generation shader stage.

• pMissShaderBindingTable is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the miss shader stage.

• pHitShaderBindingTable is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the hit shader stage.

• pCallableShaderBindingTable is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the callable shader stage.

• width is the width of the ray trace query dimensions.

• height is height of the ray trace query dimensions.

• depth is depth of the ray trace query dimensions.

When the command is executed, a ray generation group of \( width \times height \times depth \) rays is assembled.

Valid Usage

• VUID-vkCmdTraceRaysKHR-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdTraceRaysKHR-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdTraceRaysKHR-None-06479
  If a VkImageView is sampled with depth comparison, the image view’s format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

• VUID-vkCmdTraceRaysKHR-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

• VUID-vkCmdTraceRaysKHR-None-02692

2426
If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdTraceRaysKHR-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdTraceRaysKHR-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdTraceRaysKHR-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdTraceRaysKHR-OpTypeImage-07027**
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdTraceRaysKHR-OpTypeImage-07028**
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdTraceRaysKHR-OpTypeImage-07029**
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdTraceRaysKHR-OpTypeImage-07030**
  For any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdTraceRaysKHR-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdTraceRaysKHR-maintenance4-06425**
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a
VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdTraceRaysKHR-None-02699
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysKHR-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysKHR-None-02701
  If the VkPipeline object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- VUID-vkCmdTraceRaysKHR-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdTraceRaysKHR-None-02702
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY in any shader stage

- VUID-vkCmdTraceRaysKHR-None-02703
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- VUID-vkCmdTraceRaysKHR-None-02704
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdTraceRaysKHR-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdTraceRaysKHR-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this
command accesses a storage buffer, and that stage was created without enabling either
VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or
VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdTraceRaysKHR-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource

• VUID-vkCmdTraceRaysKHR-None-06550
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y'CBCR conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

• VUID-vkCmdTraceRaysKHR-ConstOffset-06551
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y'CBCR conversion, that object must not use the ConstOffset and Offset operands

• VUID-vkCmdTraceRaysKHR-None-04115
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format

• VUID-vkCmdTraceRaysKHR-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format

• VUID-vkCmdTraceRaysKHR-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

• VUID-vkCmdTraceRaysKHR-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

• VUID-vkCmdTraceRaysKHR-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

• VUID-vkCmdTraceRaysKHR-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

• VUID-vkCmdTraceRaysKHR-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the

VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

• VUID-vkCmdTraceRaysKHR-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

• VUID-vkCmdTraceRaysKHR-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM.

• VUID-vkCmdTraceRaysKHR-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM.

• VUID-vkCmdTraceRaysKHR-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM.

• VUID-vkCmdTraceRaysKHR-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

• VUID-vkCmdTraceRaysKHR-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

• VUID-vkCmdTraceRaysKHR-OpImageBlockMatchSSDQCOM or OpImageBlockMatchSADQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

• VUID-vkCmdTraceRaysKHR-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdTraceRaysKHR-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdTraceRaysKHR-None-07288
  Any shader invocation executed by this command must terminate.

• VUID-vkCmdTraceRaysKHR-None-03429
  Any shader group handle referenced by this call must have been queried from the
currently bound ray tracing pipeline

- VUID-vkCmdTraceRaysKHR-maxPipelineRayRecursionDepth-03679
  This command **must** not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of `maxPipelineRayRecursionDepth` used to create the bound ray tracing pipeline

- VUID-vkCmdTraceRaysKHR-commandBuffer-03635
  `commandBuffer` **must** not be a protected command buffer

- VUID-vkCmdTraceRaysKHR-size-04023
  The `size` member of `pRayGenShaderBindingTable` **must** be equal to its `stride` member

- VUID-vkCmdTraceRaysKHR-pRayGenShaderBindingTable-03680
  If the buffer from which `pRayGenShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdTraceRaysKHR-pRayGenShaderBindingTable-03681
  The buffer from which the `pRayGenShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- VUID-vkCmdTraceRaysKHR-pRayGenShaderBindingTable-03682
  `pRayGenShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-03683
  If the buffer from which `pMissShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-03684
  The buffer from which the `pMissShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-03685
  `pMissShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- VUID-vkCmdTraceRaysKHR-stride-03686
  `pMissShaderBindingTable->stride` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`

- VUID-vkCmdTraceRaysKHR-stride-04029
  `pMissShaderBindingTable->stride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`

- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03687
  If the buffer from which `pHitShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03688
  The buffer from which the `pHitShaderBindingTable->deviceAddress` is queried **must** have
been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

- **VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03689**
  \(\text{pHitShaderBindingTable->deviceAddress} \text{ must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment} \)

- **VUID-vkCmdTraceRaysKHR-stride-03690**
  \(\text{pHitShaderBindingTable->stride} \text{ must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment} \)

- **VUID-vkCmdTraceRaysKHR-stride-04035**
  \(\text{pHitShaderBindingTable->stride} \text{ must be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride} \)

- **VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03691**
  If the buffer from which \(\text{pCallableShaderBindingTable->deviceAddress}\) was queried is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03692**
  The buffer from which the \(\text{pCallableShaderBindingTable->deviceAddress}\) is queried **must** have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

- **VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03693**
  \(\text{pCallableShaderBindingTable->deviceAddress} \text{ must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment} \)

- **VUID-vkCmdTraceRaysKHR-stride-03694**
  \(\text{pCallableShaderBindingTable->stride} \text{ must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment} \)

- **VUID-vkCmdTraceRaysKHR-stride-04041**
  \(\text{pCallableShaderBindingTable->stride} \text{ must be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride} \)

- **VUID-vkCmdTraceRaysKHR-flags-03696**
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, \(\text{pHitShaderBindingTable->deviceAddress} \text{ must not be zero} \)

- **VUID-vkCmdTraceRaysKHR-flags-03697**
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR, \(\text{pHitShaderBindingTable->deviceAddress} \text{ must not be zero} \)

- **VUID-vkCmdTraceRaysKHR-flags-03511**
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR, the shader group handle identified by \(\text{pMissShaderBindingTable->deviceAddress}\) **must** not be set to zero

- **VUID-vkCmdTraceRaysKHR-flags-03512**
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR, entries in the table identified by \(\text{pHitShaderBindingTable->deviceAddress}\) accessed as a result of this command in order to execute an any-hit shader **must** not be set to zero
If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed as a result of this command in order to execute a closest hit shader must not be set to zero.

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed as a result of this command in order to execute an intersection shader must not be set to zero.

Any non-zero hit shader group entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR` must have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR`.

Any non-zero hit shader group entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR` must have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`.

`width` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]`.

`height` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]`.

`width × height × depth` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount`.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pRaygenShaderBindingTable` must be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure.
- `pMissShaderBindingTable` must be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure.
• **VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-parameter**
  \( p\text{HitShaderBindingTable} \) **must** be a valid pointer to a valid \( \text{VkStridedDeviceAddressRegionKHR} \) structure

• **VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-parameter**
  \( p\text{CallableShaderBindingTable} \) **must** be a valid pointer to a valid \( \text{VkStridedDeviceAddressRegionKHR} \) structure

• **VUID-vkCmdTraceRaysKHR-commandBuffer-recording**
  \( \text{commandBuffer} \) **must** be in the **recording state**

• **VUID-vkCmdTraceRaysKHR-commandBuffer-cmdpool**
  The \( \text{VkCommandPool} \) that \( \text{commandBuffer} \) was allocated from **must** support compute operations

• **VUID-vkCmdTraceRaysKHR-renderpass**
  This command **must** only be called outside of a render pass instance

• **VUID-vkCmdTraceRaysKHR-videocoding**
  This command **must** only be called outside of a video coding scope

---

**Host Synchronization**

• Host access to \( \text{commandBuffer} \) **must** be externally synchronized

• Host access to the \( \text{VkCommandPool} \) that \( \text{commandBuffer} \) was allocated from **must** be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>

<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The \( \text{VkStridedDeviceAddressRegionKHR} \) structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkStridedDeviceAddressRegionKHR {
    VkDeviceAddress    deviceAddress;
    VkDeviceSize       stride;
    VkDeviceSize       size;
} VkStridedDeviceAddressRegionKHR;
```

• **deviceAddress** is the device address (as returned by the \( \text{vkGetBufferDeviceAddress} \) command) at which the region starts, or zero if the region is unused.

• **stride** is the byte stride between consecutive elements.
• **size** is the size in bytes of the region starting at **deviceAddress**.

### Valid Usage

- **VUID-VkStridedDeviceAddressRegionKHR-size-04631**
  If **size** is not zero, all addresses between **deviceAddress** and **deviceAddress + size - 1** must be in the buffer device address range of the same buffer

- **VUID-VkStridedDeviceAddressRegionKHR-size-04632**
  If **size** is not zero, **stride** must be less than or equal to the size of the buffer from which **deviceAddress** was queried

When invocation mask image usage is enabled in the bound ray tracing pipeline, the pipeline uses an invocation mask image specified by the command:

```c
// Provided by VK_HUAWEI_invocation_mask
void vkCmdBindInvocationMaskHUAWEI(
    VkCommandBuffer commandBuffer,
    VkImageView imageView,
    VkImageLayout imageLayout);
```

- **commandBuffer** is the command buffer into which the command will be recorded
- **imageView** is an image view handle specifying the invocation mask image **imageView** may be set to **VK_NULL_HANDLE**, which is equivalent to specifying a view of an image filled with ones value.
- **imageLayout** is the layout that the image subresources accessible from **imageView** will be in when the invocation mask image is accessed

### Valid Usage

- **VUID-vkCmdBindInvocationMaskHUAWEI-None-04976**
  The **invocationMask** feature must be enabled

- **VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04977**
  If **imageView** is not **VK_NULL_HANDLE**, it must be a valid **VkImageView** handle of type **VK_IMAGE_VIEW_TYPE_2D**

- **VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04978**
  If **imageView** is not **VK_NULL_HANDLE**, it must have a format of **VK_FORMAT_R8_UINT**

- **VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04979**
  If **imageView** is not **VK_NULL_HANDLE**, it must have been created with **VK_IMAGE_USAGE_INVOCATION_MASK_BIT_HUAWEI** set

- **VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04980**
  If **imageView** is not **VK_NULL_HANDLE**, **imageLayout** must be **VK_IMAGE_LAYOUT_GENERAL**

- **VUID-vkCmdBindInvocationMaskHUAWEI-width-04981**
  Thread mask image resolution must match the **width** and **height** in **vkCmdTraceRaysKHR**
Each element in the invocation mask image must have the value 0 or 1. The value 1 means the invocation is active.

width in vkCmdTraceRaysKHR should be 1.

Valid Usage (Implicit)

commandBuffer must be a valid VkCommandBuffer handle.

If imageView is not VK_NULL_HANDLE, imageView must be a valid VkImageView handle.

imageLayout must be a valid VkImageLayout value.

commandBuffer must be in the recording state.

The VkCommandPool that commandBuffer was allocated from must support compute operations.

This command must only be called outside of a render pass instance.

This command must only be called outside of a video coding scope.

Both of commandBuffer, and imageView that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice.

Host Synchronization

Host access to commandBuffer must be externally synchronized.

Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
To dispatch ray tracing, with some parameters sourced on the device, use:

```c
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdTraceRaysIndirectKHR(
    VkCommandBuffer commandBuffer,
    const VkStridedDeviceAddressRegionKHR* pRaygenShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pMissShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pHitShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pCallableShaderBindingTable,
    VkDeviceAddress indirectDeviceAddress);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pRaygenShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the ray generation shader stage.
- `pMissShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the miss shader stage.
- `pHitShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the hit shader stage.
- `pCallableShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the callable shader stage.
- `indirectDeviceAddress` is a buffer device address which is a pointer to a `VkTraceRaysIndirectCommandKHR` structure containing the trace ray parameters.

`vkCmdTraceRaysIndirectKHR` behaves similarly to `vkCmdTraceRaysKHR` except that the ray trace query dimensions are read by the device from `indirectDeviceAddress` during execution.

**Valid Usage**

- **VUID-vkCmdTraceRaysIndirectKHR-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdTraceRaysIndirectKHR-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdTraceRaysIndirectKHR-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdTraceRaysIndirectKHR-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
• VUID-vkCmdTraceRaysIndirectKHR-None-02692
If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT.

• VUID-vkCmdTraceRaysIndirectKHR-filterCubic-02694
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2.

• VUID-vkCmdTraceRaysIndirectKHR-filterCubicMinmax-02695
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2.

• VUID-vkCmdTraceRaysIndirectKHR-flags-02696
Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

• VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07027
For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

• VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07028
For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

• VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07029
For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

• VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07030
Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

• VUID-vkCmdTraceRaysIndirectKHR-None-02697
For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility.

• VUID-vkCmdTraceRaysIndirectKHR-maintenance4-06425
If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push
constant value **must** have been set for the same pipeline bind point, with a
**VkPipelineLayout** that is compatible for push constants, with the **VkPipelineLayout** used to
create the current **VkPipeline**, as described in **Pipeline Layout Compatibility**

- **VUID-vkCmdTraceRaysIndirectKHR-None-02699**
  Descriptors in each bound descriptor set, specified via **vkCmdBindDescriptorSets**, **must** be
  valid if they are statically used by the **VkPipeline** bound to the pipeline bind point used by
  this command

- **VUID-vkCmdTraceRaysIndirectKHR-None-02700**
  A valid pipeline **must** be bound to the pipeline bind point used by this command

- **VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-02701**
  If the **VkPipeline** object bound to the pipeline bind point used by this command requires
  any dynamic state, that state **must** have been set or inherited (if the
  **VK_NV_inherited_viewport_scissor** extension is enabled) for **commandBuffer**, and done so
  after any previously bound pipeline with the corresponding state not specified as dynamic

- **VUID-vkCmdTraceRaysIndirectKHR-None-02859**
  There **must** not have been any calls to dynamic state setting commands for any state not
  specified as dynamic in the **VkPipeline** object bound to the pipeline bind point used by this
  command, since that pipeline was bound

- **VUID-vkCmdTraceRaysIndirectKHR-None-02702**
  If the **VkPipeline** object bound to the pipeline bind point used by this command accesses a
  **VkSampler** object that uses unnormalized coordinates, that sampler **must** not be used to
  sample from any **VkImage** with a **VkImageView** of the type **VK_IMAGE_VIEW_TYPE_3D**, **VK_IMAGE_VIEW_TYPE_CUBE**, **VK_IMAGE_VIEW_TYPE_1D_ARRAY**, **VK_IMAGE_VIEW_TYPE_2D_ARRAY** or **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**, in any shader stage

- **VUID-vkCmdTraceRaysIndirectKHR-None-02703**
  If the **VkPipeline** object bound to the pipeline bind point used by this command accesses a
  **VkSampler** object that uses unnormalized coordinates, that sampler **must** not be used with
  any of the **SPIR-V OpImageSample** or **OpImageSparseSample** instructions with **ImplicitLod**, **Dref** or **Proj** in their name, in any shader stage

- **VUID-vkCmdTraceRaysIndirectKHR-None-02704**
  If the **VkPipeline** object bound to the pipeline bind point used by this command accesses a
  **VkSampler** object that uses unnormalized coordinates, that sampler **must** not be used with
  any of the **SPIR-V OpImageSample** or **OpImageSparseSample** instructions that includes a LOD
  bias or any offset values, in any shader stage

- **VUID-vkCmdTraceRaysIndirectKHR-uniformBuffers-06935**
  If any stage of the **VkPipeline** object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either
  **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT** or
  **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT** for **uniformBuffers**, and the **robustBufferAccess** feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysIndirectKHR-storageBuffers-06936**
If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command **must** not be a protected resource

- **VUID-vkCmdTraceRaysIndirectKHR-None-06550**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y'CbCr conversion, that object **must** only be used with OpImageSample* or OpImageSparseSample* instructions

- **VUID-vkCmdTraceRaysIndirectKHR-ConstOffset-06551**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y'CbCr conversion, that object **must** not use the ConstOffset and Offset operands

- **VUID-vkCmdTraceRaysIndirectKHR-None-04115**
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the image view's format

- **VUID-vkCmdTraceRaysIndirectKHR-OpaqueWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the buffer view's format

- **VUID-vkCmdTraceRaysIndirectKHR-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 64

- **VUID-vkCmdTraceRaysIndirectKHR-SampledType-04471**
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 32

- **VUID-vkCmdTraceRaysIndirectKHR-SampledType-04472**
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 64

- **VUID-vkCmdTraceRaysIndirectKHR-SampledType-04473**
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 32

- **VUID-vkCmdTraceRaysIndirectKHR-sparseImageInt64Atomics-04474**
If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- **VUID-vkCmdTraceRaysIndirectKHR-sparseImageInt64Atomics-04475**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06971**
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06972**
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageBoxFilterQCOM-06973**
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchSSDQCOM-06974**
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchSADQCOM-06975**
  If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchSADQCOM-06976**
  If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06977**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06978**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdTraceRaysIndirectKHR-None-07288**
  Any shader invocation executed by this command must terminate.

- **VUID-vkCmdTraceRaysIndirectKHR-None-03429**
Any shader group handle referenced by this call **must** have been queried from the currently bound ray tracing pipeline

- **VUID-vkCmdTraceRaysIndirectKHR-maxPipelineRayRecursionDepth-03679**
  This command **must** not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of `maxPipelineRayRecursionDepth` used to create the bound ray tracing pipeline

- **VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-03635**
  `commandBuffer` **must** not be a protected command buffer

- **VUID-vkCmdTraceRaysIndirectKHR-size-04023**
  The `size` member of `pRayGenShaderBindingTable` **must** be equal to its `stride` member

- **VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03680**
  If the buffer from which `pRayGenShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03681**
  The buffer from which the `pRayGenShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03682**
  `pRayGenShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03683**
  If the buffer from which `pMissShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03684**
  The buffer from which the `pMissShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03685**
  `pMissShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-stride-03686**
  `pMissShaderBindingTable->stride` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-stride-04029**
  `pMissShaderBindingTable->stride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03687**
  If the buffer from which `pHitShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03688**
The buffer from which the `pHitShaderBindingTable->deviceAddress` is queried must have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag.

### VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03689

- `pHitShaderBindingTable->deviceAddress` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

### VUID-vkCmdTraceRaysIndirectKHR-stride-03690

- `pHitShaderBindingTable->stride` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

### VUID-vkCmdTraceRaysIndirectKHR-stride-04035

- `pHitShaderBindingTable->stride` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`

### VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03691

If the buffer from which `pCallableShaderBindingTable->deviceAddress` was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

### VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03692

The buffer from which the `pCallableShaderBindingTable->deviceAddress` is queried must have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag.

### VUID-vkCmdTraceRaysIndirectKHR-stride-03693

- `pCallableShaderBindingTable->deviceAddress` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

### VUID-vkCmdTraceRaysIndirectKHR-stride-04041

- `pCallableShaderBindingTable->deviceAddress` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`

### VUID-vkCmdTraceRaysIndirectKHR-flags-03696

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, `pHitShaderBindingTable->deviceAddress` must not be zero.

### VUID-vkCmdTraceRaysIndirectKHR-flags-03697

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, `pHitShaderBindingTable->deviceAddress` must not be zero.

### VUID-vkCmdTraceRaysIndirectKHR-flags-03511

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`, the shader group handle identified by `pMissShaderBindingTable->deviceAddress` must not be set to zero.

### VUID-vkCmdTraceRaysIndirectKHR-flags-03512

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed as a result of this command...
in order to execute an any-hit shader **must** not be set to zero

- **VUID-vkCmdTraceRaysIndirectKHR-flags-03513**
  If the currently bound ray tracing pipeline was created with **flags** that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed as a result of this command in order to execute a closest hit shader **must** not be set to zero

- **VUID-vkCmdTraceRaysIndirectKHR-flags-03514**
  If the currently bound ray tracing pipeline was created with **flags** that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed as a result of this command in order to execute an intersection shader **must** not be set to zero

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-04735**
  Any non-zero hit shader group entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR` **must** have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR`

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-04736**
  Any non-zero hit shader group entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR` **must** have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`

- **VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03632**
  If the buffer from which `indirectDeviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03633**
  The buffer from which `indirectDeviceAddress` was queried **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- **VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03634**
  `indirectDeviceAddress` **must** be a multiple of 4

- **VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03636**
  All device addresses between `indirectDeviceAddress` and `indirectDeviceAddress + sizeof(VkTraceRaysIndirectCommandKHR) - 1` **must** be in the buffer device address range of the same buffer

- **VUID-vkCmdTraceRaysIndirectKHR-rayTracingPipelineTraceRaysIndirect-03637**
  The `rayTracingPipelineTraceRaysIndirect` feature **must** be enabled

- **VUID-vkCmdTraceRaysIndirectKHR-rayTracingMotionBlurPipelineTraceRaysIndirect-04951**
  If the bound ray tracing pipeline was created with `VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV` `VkPhysicalDeviceRayTracingMotionBlurFeaturesNV::rayTracingMotionBlurPipelineTraceRaysIndirect` feature **must** be enabled
Valid Usage (Implicit)

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdTraceRaysIndirectKHR-pRaygenShaderBindingTable-parameter
  pRaygenShaderBindingTable must be a valid pointer to a valid
  VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-parameter
  pMissShaderBindingTable must be a valid pointer to a valid
  VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-parameter
  pHitShaderBindingTable must be a valid pointer to a valid
  VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-parameter
  pCallableShaderBindingTable must be a valid pointer to a valid
  VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdTraceRaysIndirectKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdTraceRaysIndirectKHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

<td></td>
</tr>
</tbody>
</table>

The VkTraceRaysIndirectCommandKHR structure is defined as:
typedef struct VkTraceRaysIndirectCommandKHR {
    uint32_t width;
    uint32_t height;
    uint32_t depth;
} VkTraceRaysIndirectCommandKHR;

- `width` is the width of the ray trace query dimensions.
- `height` is height of the ray trace query dimensions.
- `depth` is depth of the ray trace query dimensions.

The members of `VkTraceRaysIndirectCommandKHR` have the same meaning as the similarly named parameters of `vkCmdTraceRaysKHR`.

### Valid Usage

- **VUID-VkTraceRaysIndirectCommandKHR-width-03638**
  
  `width` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]` × `VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]`

- **VUID-VkTraceRaysIndirectCommandKHR-height-03639**
  
  `height` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]` × `VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]`

- **VUID-VkTraceRaysIndirectCommandKHR-depth-03640**
  
  `depth` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]` × `VkPhysicalDeviceLimits::maxComputeWorkGroupSize[2]`

- **VUID-VkTraceRaysIndirectCommandKHR-width-03641**
  
  `width` × `height` × `depth` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount`

To dispatch ray tracing, with some parameters sourced on the device, use:

```c
// Provided by VK_KHR_ray_tracing_maintenance1 with VK_KHR_ray_tracing_pipeline
void vkCmdTraceRaysIndirect2KHR(
    VkCommandBuffer commandBuffer,   
    VkDeviceAddress indirectDeviceAddress);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `indirectDeviceAddress` is a buffer device address which is a pointer to a `VkTraceRaysIndirectCommand2KHR` structure containing the trace ray parameters.

`vkCmdTraceRaysIndirect2KHR` behaves similarly to `vkCmdTraceRaysIndirectKHR` except that shader binding table parameters as well as dispatch dimensions are read by the device from `indirectDeviceAddress` during execution.
Valid Usage

- VUID-vkCmdTraceRaysIndirect2KHR-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdTraceRaysIndirect2KHR-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdTraceRaysIndirect2KHR-None-06479
  If a `VkImageView` is sampled with depth comparison, the image view’s format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- VUID-vkCmdTraceRaysIndirect2KHR-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdTraceRaysIndirect2KHR-filterCubic-02694
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- VUID-vkCmdTraceRaysIndirect2KHR-filterCubicMinmax-02695
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- VUID-vkCmdTraceRaysIndirect2KHR-flags-02696
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07027
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07028
  For any `VkImageView` being read as a storage image where the image format field of the
OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdTraceRaysIndirect2KHR-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdTraceRaysIndirect2KHR-maintenance4-06425
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdTraceRaysIndirect2KHR-None-02699
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysIndirect2KHR-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-02701
  If the VkPipeline object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- VUID-vkCmdTraceRaysIndirect2KHR-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdTraceRaysIndirect2KHR-None-02702
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdTraceRaysIndirect2KHR-None-02703
If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

• VUID-vkCmdTraceRaysIndirect2KHR-None-02704
If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

• VUID-vkCmdTraceRaysIndirect2KHR-uniformBuffers-06935
If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdTraceRaysIndirect2KHR-storageBuffers-06936
If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-02707
If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource

• VUID-vkCmdTraceRaysIndirect2KHR-None-06550
If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler YCbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

• VUID-vkCmdTraceRaysIndirect2KHR-ConstOffset-06551
If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler YCbCr conversion, that object must not use the ConstOffset and Offset operands

• VUID-vkCmdTraceRaysIndirect2KHR-None-04115
If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format

• VUID-vkCmdTraceRaysIndirect2KHR-OpImageWrite-04469
If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format
If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM.

If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM.

If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM.

If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.
If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

Any shader invocation executed by this command must terminate.

Any shader group handle referenced by this call must have been queried from the currently bound ray tracing pipeline.

This command must not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of `maxPipelineRayRecursionDepth` used to create the bound ray tracing pipeline.

The buffer from which `indirectDeviceAddress` was queried must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

`indirectDeviceAddress` must be a multiple of 4.

All device addresses between `indirectDeviceAddress` and `indirectDeviceAddress + sizeof(VkTraceRaysIndirectCommand2KHR) - 1` must be in the buffer device address range of the same buffer.

The `rayTracingPipelineTraceRaysIndirect2` feature must be enabled.

If the bound ray tracing pipeline was created with `VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV`.
Valid Usage (Implicit)

- VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdTraceRaysIndirect2KHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdTraceRaysIndirect2KHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The VkTraceRaysIndirectCommand2KHR structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_maintenance1 with VK_KHR_ray_tracing_pipeline
typedef struct VkTraceRaysIndirectCommand2KHR {
    VkDeviceAddress raygenShaderRecordAddress;
    VkDeviceSize raygenShaderRecordSize;
    VkDeviceAddress missShaderBindingTableAddress;
    VkDeviceSize missShaderBindingTableSize;
    VkDeviceSize missShaderBindingTableStride;
    VkDeviceAddress hitShaderBindingTableAddress;
    VkDeviceSize hitShaderBindingTableSize;
} VkTraceRaysIndirectCommand2KHR;
```
VkDeviceSize hitShaderBindingTableStride;
VkDeviceAddress callableShaderBindingTableAddress;
VkDeviceSize callableShaderBindingTableSize;
VkDeviceSize callableShaderBindingTableStride;
uint32_t width;
uint32_t height;
uint32_t depth;
} VkTraceRaysIndirectCommand2KHR;

• raygenShaderRecordAddress is a VkDeviceAddress of the ray generation shader binding table record used by this command.

• raygenShaderRecordSize is a VkDeviceSize number of bytes corresponding to the ray generation shader binding table record at base address raygenShaderRecordAddress.

• missShaderBindingTableAddress is a VkDeviceAddress of the first record in the miss shader binding table used by this command.

• missShaderBindingTableSize is a VkDeviceSize number of bytes corresponding to the total size of the miss shader binding table at missShaderBindingTableAddress that may be accessed by this command.

• missShaderBindingTableStride is a VkDeviceSize number of bytes between records of the miss shader binding table.

• hitShaderBindingTableAddress is a VkDeviceAddress of the first record in the hit shader binding table used by this command.

• hitShaderBindingTableSize is a VkDeviceSize number of bytes corresponding to the total size of the hit shader binding table at hitShaderBindingTableAddress that may be accessed by this command.

• hitShaderBindingTableStride is a VkDeviceSize number of bytes between records of the hit shader binding table.

• callableShaderBindingTableAddress is a VkDeviceAddress of the first record in the callable shader binding table used by this command.

• callableShaderBindingTableSize is a VkDeviceSize number of bytes corresponding to the total size of the callable shader binding table at callableShaderBindingTableAddress that may be accessed by this command.

• callableShaderBindingTableStride is a VkDeviceSize number of bytes between records of the callable shader binding table.

• width is the width of the ray trace query dimensions.

• height is height of the ray trace query dimensions.

• depth is depth of the ray trace query dimensions.

The members of VkTraceRaysIndirectCommand2KHR have the same meaning as the similarly named parameters of vkCmdTraceRaysKHR.

Indirect shader binding table buffer parameters must satisfy the same memory alignment and binding requirements as their counterparts in vkCmdTraceRaysIndirectKHR and
Valid Usage

- VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03680
  If the buffer from which `raygenShaderRecordAddress` was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03681
  The buffer from which the `raygenShaderRecordAddress` is queried must have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03682
  `raygenShaderRecordAddress` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03683
  If the buffer from which `missShaderBindingTableAddress` was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03684
  The buffer from which the `missShaderBindingTableAddress` is queried must have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03685
  `missShaderBindingTableAddress` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- VUID-VkTraceRaysIndirectCommand2KHR-stride-03686
  `missShaderBindingTableStride` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- VUID-VkTraceRaysIndirectCommand2KHR-stride-04029
  `missShaderBindingTableStride` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`

- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-03687
  If the buffer from which `hitShaderBindingTableAddress` was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-03688
  The buffer from which the `hitShaderBindingTableAddress` is queried must have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-03689
  `hitShaderBindingTableAddress` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- VUID-VkTraceRaysIndirectCommand2KHR-stride-03690
  `hitShaderBindingTableStride` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- VUID-VkTraceRaysIndirectCommand2KHR-stride-04035
  `hitShaderBindingTableStride` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`
If the buffer from which `callableShaderBindingTableAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

The buffer from which the `callableShaderBindingTableAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag.

`callableShaderBindingTableAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`.

`callableShaderBindingTableStride` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`.

`callableShaderBindingTableStride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`.

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, `hitShaderBindingTableAddress` **must** not be zero.

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, `hitShaderBindingTableAddress` **must** not be zero.

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`, the shader group handle identified by `missShaderBindingTableAddress` **must** not be set to zero.

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, entries in the table identified by `hitShaderBindingTableAddress` accessed as a result of this command in order to execute an any-hit shader **must** not be set to zero.

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, entries in the table identified by `hitShaderBindingTableAddress` accessed as a result of this command in order to execute a closest hit shader **must** not be set to zero.

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, entries in the table identified by `hitShaderBindingTableAddress` accessed as a result of this command in order to execute an intersection shader **must** not be set to zero.

If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, entries in the table identified by `hitShaderBindingTableAddress` accessed as a result of this command in order to execute an intersection shader **must** not be set to zero.
Any non-zero hit shader group entries in the table identified by `hitShaderBindingTableAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR` must have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR`

- **VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-04736**
  Any non-zero hit shader group entries in the table identified by `hitShaderBindingTableAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR` must have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`

- **VUID-VkTraceRaysIndirectCommand2KHR-width-03638**
  `width` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]`

- **VUID-VkTraceRaysIndirectCommand2KHR-height-03639**
  `height` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]`

- **VUID-VkTraceRaysIndirectCommand2KHR-depth-03640**
  `depth` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[2]`

- **VUID-VkTraceRaysIndirectCommand2KHR-width-03641**
  `width × height × depth` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount`

### 39.3. Shader Binding Table

A shader binding table is a resource which establishes the relationship between the ray tracing pipeline and the acceleration structures that were built for the ray tracing pipeline. It indicates the shaders that operate on each geometry in an acceleration structure. In addition, it contains the resources accessed by each shader, including indices of textures, buffer device addresses, and constants. The application allocates and manages shader binding tables as `VkBuffer` objects.

Each entry in the shader binding table consists of `shaderGroupHandleSize` bytes of data, either as queried by `vkGetRayTracingShaderGroupHandlesKHR` to refer to those specified shaders, or all zeros to refer to a zero shader group. A zero shader group behaves as though it is a shader group consisting entirely of `VK_SHADER_UNUSED_KHR`. The remainder of the data specified by the stride is application-visible data that can be referenced by a `ShaderRecordBufferKHR` block in the shader.

The shader binding tables to use in a ray tracing pipeline are passed to the `vkCmdTraceRaysNV`, `vkCmdTraceRaysKHR`, or `vkCmdTraceRaysIndirectKHR` commands. Shader binding tables are read-only in shaders that are executing on the ray tracing pipeline.

Shader variables identified with the `ShaderRecordBufferKHR` storage class are used to access the provided shader binding table. Such variables **must** be:

- **typed as** `OpTypeStruct`, or an array of this type,
- **identified with a** `Block` decoration, and
• laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

The Offset decoration for any member of a Block-decorated variable in the ShaderRecordBufferKHR storage class must not cause the space required for that variable to extend outside the range \([0, \text{maxStorageBufferRange})\).

Accesses to the shader binding table from ray tracing pipelines must be synchronized with the VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR pipeline stage and an access type of VK_ACCESS_SHADER_READ_BIT.

Note
Because different shader record buffers can be associated with the same shader, a shader variable with ShaderRecordBufferKHR storage class will not be dynamically uniform if different invocations of the same shader can reference different data in the shader record buffer, such as if the same shader occurs twice in the shader binding table with a different shader record buffer. In this case, indexing resources based on values in the ShaderRecordBufferKHR storage class, the index should be decorated as NonUniform.

39.3.1. Indexing Rules

In order to execute the correct shaders and access the correct resources during a ray tracing dispatch, the implementation must be able to locate shader binding table entries at various stages of execution. This is accomplished by defining a set of indexing rules that compute shader binding table record positions relative to the buffer's base address in memory. The application must organize the contents of the shader binding table's memory in a way that application of the indexing rules will lead to correct records.

Ray Generation Shaders

Only one ray generation shader is executed per ray tracing dispatch.

For vkCmdTraceRaysKHR, the location of the ray generation shader is specified by the pRaygenShaderBindingTable->deviceAddress parameter—there is no indexing. All data accessed must be less than pRaygenShaderBindingTable->size bytes from deviceAddress. pRaygenShaderBindingTable->stride is unused, and must be equal to pRaygenShaderBindingTable->size.

For vkCmdTraceRaysNV, the location of the ray generation shader is specified by the raygenShaderBindingTableBuffer and raygenShaderBindingOffset parameters—there is no indexing.

Hit Shaders

The base for the computation of intersection, any-hit, and closest hit shader locations is the instanceShaderBindingTableRecordOffset value stored with each instance of a top-level acceleration structure (VkAccelerationStructureInstanceKHR). This value determines the beginning of the shader binding table records for a given instance.
In the following rule, \texttt{geometryIndex} refers to the \textit{geometry index} of the intersected geometry within the instance.

The \texttt{sbtRecordOffset} and \texttt{sbtRecordStride} values are passed in as parameters to \texttt{traceNV()} or \texttt{traceRayEXT()} calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, these correspond to the \texttt{SBTOffset} and \texttt{SBTStride} parameters to the \texttt{OpTraceRayNV} or \texttt{OpTraceRayKHR} or \texttt{OpTraceRayMotionNV} instruction.

The result of this computation is then added to \texttt{pHitShaderBindingTable->deviceAddress}, a device address passed to \texttt{vkCmdTraceRaysKHR}, or \texttt{hitShaderBindingOffset}, a base offset passed to \texttt{vkCmdTraceRaysNV}.

For \texttt{vkCmdTraceRaysKHR}, the complete rule to compute a hit shader binding table record address in the \texttt{pHitShaderBindingTable} is:

\[
p\texttt{HitShaderBindingTable->deviceAddress} + p\texttt{HitShaderBindingTable->stride} \times (\text{instanceShaderBindingTableRecordOffset} + \text{geometryIndex} \times \text{sbtRecordStride} + \text{sbtRecordOffset})
\]

All data accessed \textbf{must} be less than \texttt{pHitShaderBindingTable->size} bytes from the base address.

For \texttt{vkCmdTraceRaysNV}, the offset and stride come from direct parameters, so the full rule to compute a hit shader binding table record address in the \texttt{hitShaderBindingTableBuffer} is:

\[
\text{hitShaderBindingOffset} + \text{hitShaderBindingStride} \times (\text{instanceShaderBindingTableRecordOffset} + \text{geometryIndex} \times \text{sbtRecordStride} + \text{sbtRecordOffset})
\]

**Miss Shaders**

A miss shader is executed whenever a ray query fails to find an intersection for the given scene geometry. Multiple miss shaders \textbf{may} be executed throughout a ray tracing dispatch.

The base for the computation of miss shader locations is \texttt{pMissShaderBindingTable->deviceAddress}, a device address passed into \texttt{vkCmdTraceRaysKHR}, or \texttt{missShaderBindingOffset}, a base offset passed into \texttt{vkCmdTraceRaysNV}.

The \texttt{missIndex} value is passed in as a parameter to \texttt{traceNV()} or \texttt{traceRayEXT()} calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, this corresponds to the \texttt{MissIndex} parameter to the \texttt{OpTraceRayNV} or \texttt{OpTraceRayKHR} or \texttt{OpTraceRayMotionNV} instruction.

For \texttt{vkCmdTraceRaysKHR}, the complete rule to compute a miss shader binding table record address in the \texttt{pMissShaderBindingTable} is:

\[
p\texttt{MissShaderBindingTable->deviceAddress} + p\texttt{MissShaderBindingTable->stride} \times \text{missIndex}
\]

All data accessed \textbf{must} be less than \texttt{pMissShaderBindingTable->size} bytes from the base address.
For `vkCmdTraceRaysNV`, the offset and stride come from direct parameters, so the full rule to compute a miss shader binding table record address in the `missShaderBindingTableBuffer` is:

\[
\text{missShaderBindingOffset} + \text{missShaderBindingStride} \times \text{missIndex}
\]

**Callable Shaders**

A callable shader is executed when requested by a ray tracing shader. Multiple callable shaders may be executed throughout a ray tracing dispatch.

The base for the computation of callable shader locations is `pCallableShaderBindingTable->deviceAddress`, a device address passed into `vkCmdTraceRaysKHR`, or `callableShaderBindingOffset`, a base offset passed into `vkCmdTraceRaysNV`.

The `sbtRecordIndex` value is passed in as a parameter to `executeCallableNV()` or `executeCallableEXT()` calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, this corresponds to the `SBTIndex` parameter to the `OpExecuteCallableNV` or `OpExecute CallableKHR` instruction.

For `vkCmdTraceRaysKHR`, the complete rule to compute a callable shader binding table record address in the `pCallableShaderBindingTable` is:

\[
p\text{CallableShaderBindingTable->deviceAddress} + p\text{CallableShaderBindingTable->stride} \times \text{sbtRecordIndex}
\]

All data accessed must be less than `pCallableShaderBindingTable->size` bytes from the base address.

For `vkCmdTraceRaysNV`, the offset and stride come from direct parameters, so the full rule to compute a callable shader binding table record address in the `callableShaderBindingTableBuffer` is:

\[
callableShaderBindingOffset + callableShaderBindingStride \times sbtRecordIndex
\]

### 39.4. Ray Tracing Pipeline Stack

Ray tracing pipelines have a potentially large set of shaders which may be invoked in various call chain combinations to perform ray tracing. To store parameters for a given shader execution, an implementation may use a stack of data in memory. This stack must be sized to the sum of the stack sizes of all shaders in any call chain executed by the application.

If the stack size is not set explicitly, the stack size for a pipeline is:

\[
\text{rayGenStackMax} + \min(1, \text{maxPipelineRayRecursionDepth}) \times \max(\text{closestHitStackMax}, \text{missStackMax}, \text{intersectionStackMax} + \text{anyHitStackMax}) + \max(0, \text{maxPipelineRayRecursionDepth} - 1) \times \max(\text{closestHitStackMax}, \text{missStackMax}) + 2 \times \text{callableStackMax}
\]
where \( \text{rayGenStackMax} \), \( \text{closestHitStackMax} \), \( \text{missStackMax} \), \( \text{anyHitStackMax} \),
\( \text{intersectionStackMax} \), and \( \text{callableStackMax} \) are the maximum stack values queried by the respective shader stages for any shaders in any shader groups defined by the pipeline.

This stack size is potentially significant, so an application \textbf{may} want to provide a more accurate stack size after pipeline compilation. The value that the application provides is the maximum value of the sum of all shaders in a call chain across all possible call chains, taking into account any application specific knowledge about the properties of the call chains.

\textbf{Note}

For example, if an application has two types of closest hit and miss shaders that it can use but the first level of rays will only use the first kind (possibly reflection) and the second level will only use the second kind (occlusion or shadow ray, for example) then the application can compute the stack size by something similar to:

\[
\text{rayGenStack} + \max(\text{closestHit1Stack}, \text{miss1Stack}) + \max(\text{closestHit2Stack}, \\
\text{miss2Stack})
\]

This is guaranteed to be no larger than the default stack size computation which assumes that both call levels may be the larger of the two.
Chapter 40. Video Decode and Encode Operations

Vulkan implementations may expose one or more queue families supporting video decode and/or encode operations. These operations are performed by recording them into a command buffer within a Video Coding Scope, and submitting them to queues with video decode or encode capabilities, respectively.

The Vulkan video functionalities are designed to be made available through a set of APIs built on top of each other, consisting of:

- A core API providing common video coding functionalities,
- APIs providing codec-independent video decode and video encode related functionalities, respectively,
- Additional codec-specific APIs built on top of those.

This chapter details the fundamental components and operations of these.

40.1. Technical Terminology and Semantics

40.1.1. Video Picture Resources

*Video Picture Resources* represent multidimensional arrays of image data which can be used as the source or target of video coding operations. They may have associated metadata that can include implementation-private details required for the decode or encode operations and application managed color-space related information.

In Vulkan, a video picture resource is represented by a *VkImage*. Individual *VkImageView* objects created from such resources can be used as Decode Output Pictures, Encode Input Pictures, Reconstructed Pictures, and/or Reference Pictures.

40.1.2. Decoded Output Picture

The pixels resulting from the video decoding process are stored in a Decoded Output Picture, represented by a *VkImageView*. This may be shared with the Decoded Picture Buffer. It may also be used as an input for video encode, graphics, or compute operations, or with Window System Integration APIs.

40.1.3. Encode Input Picture

The primary source of input pixels for the video encoding process is the Encode Input Picture, represented by a *VkImageView*. It may also be a direct target of video decode, graphics, or compute operations, or with Window System Integration APIs.
40.1.4. Reconstructed Picture

An integral part of the video decoding pipeline is the reconstruction of pictures from the compressed stream. A similar stage exists in the video encoding pipeline as well. A Reconstructed Picture is a Video Picture Resource resulting from this process.

Such reconstructed pictures can be used as Reference Pictures for subsequently decoded or encoded pictures. The correct use of decoded pictures and/or reconstructed pictures as reference pictures is driven by the video compression standard, the implementation, and the application-specific use cases.

40.1.5. Decoded Picture Buffer (DPB)

Previously reconstructed pictures can be used by video codecs to provide predictions of the values of samples in the subsequently decoded or encoded pictures in which case they are referred to as Reference Pictures.

The Decoded Picture Buffer (DPB) is an indexed set of such reference pictures corresponding to a particular Video Session.

Individual indexed entries of the DPB are referred to as the Decoded Picture Buffer (DPB) Slots. A valid DPB slot index starts from zero and goes up to the maximum of \( N - 1 \), where \( N \) is the number of Reference Picture entries requested for a video session. Each DPB slot can hold a Reference Picture.

The DPB may be represented by a single multi-layer image where subsequent layers correspond to subsequent DPB slots, or by individual layers of multiple images each separately associated with a particular DPB slot.

40.1.6. Reference Picture Metadata

The opaque DPB Slot state managed by the implementation may contain Reference Picture Metadata, present when the video picture resource associated with the DPB slot is used as a Reference Picture in one or more video decode or encode operations.

An implementation or application may maintain other metadata related to the video picture resource or the DPB slot, but such data is outside the scope of this specification.

Note:

The video decode or encode implementation does not maintain internal references to the reference pictures, beyond the reference picture metadata. It is the responsibility of the Vulkan Application to create, manage, and destroy, as well as to provide those video picture resources, when required, during the decoding or encoding process.

40.1.7. Color Space Metadata

Color Space Metadata is the additional static or dynamic state associated with a Video Picture Resource specifying the color volume (the color primaries, white point, and luminance range) of the display that was used in mastering the video content. The use of color space metadata is outside the
40.2. Introduction

This chapter discusses extensions supporting Video Decode or Encode operations. Video Decode and Encode operations are supported by queues with an advertised queue capability of `VK_QUEUE_VIDEO_DECODE_BIT_KHR` and `VK_QUEUE_VIDEO_ENCODE_BIT_KHR`, respectively. Video Decode or Encode queue operation support allows for Vulkan applications to cooperate closely with other graphics or compute operations seamlessly and efficiently, therefore improving the overall application performance.

40.2.1. Video Decode Queue

`VK_KHR_video_decode_queue` adds a video decode queue type bit `VK_QUEUE_VIDEO_DECODE_BIT_KHR` to `VkQueueFlagBits`. As in the case of other queue types, an application must use `vkGetPhysicalDeviceQueueFamilyProperties` to query whether the physical device has support for the Video Decode Queue. When the implementation reports the `VK_QUEUE_VIDEO_DECODE_BIT_KHR` bit for a queue family, it advertises general support for Vulkan queue operations described in Devices and Queues.

40.2.2. Video Encode Queue

`VK_KHR_video_encode_queue` adds a video encode queue type bit `VK_QUEUE_VIDEO_ENCODE_BIT_KHR` to `VkQueueFlagBits`. As in the case of other queue types, an application must use `vkGetPhysicalDeviceQueueFamilyProperties` to query whether the physical device has support for the Video Encode Queue. When the implementation reports the `VK_QUEUE_VIDEO_ENCODE_BIT_KHR` bit for a queue family, it advertises general support for Vulkan queue operations described in Devices and Queues.

The rest of the chapter focuses, specifically, on Video Decode and Encode queue operations.

40.2.3. Video Session

Before performing any video decoding or encoding operations, the application must create a Video Session instance, of type `VkVideoSessionKHR`. A Video Session instance is an immutable object and supports a single compression standard (for example, H.264, H.265, VP9, AV1, etc.). The implementation uses the `VkVideoSessionKHR` object to maintain the video state for the video decode or video encode operation. A Video Session instance is created specifically:

- For a particular video compression standard;
- For video decoding or video encoding;
- With maximum supported decoded or encoded picture width/height;
- With the maximum number of supported DPB or Reconstructed Picture slots that can be allocated;
- With the maximum number of Reference Pictures that can be used simultaneously for video decode or encode operations;
- Codec color and features profile;
- Color Space format description (not supported with this version of the specification);

`VkVideoSessionKHR` represents a single video decode or encode stream. For each concurrently used stream, a separate instance of `VkVideoSessionKHR` is required. After the application has finished with the processing of a stream, it can reuse the Video Session instance for another, provided that the configuration parameters between the two usages are compatible (as determined by the video compression standard in use). Once the `VkVideoSessionKHR` instance has been created, the video compression standard and profiles, Input / Output / DPB formats, and the settings like the maximum extent cannot be changed.

The values of the following `VkVideoSessionKHR` parameters can be updated each frame, subject to the restrictions imposed on parameter updates by the video compression standard in use:

- decoded or encoded picture size
- number of active DPB or Reconstructed Picture slots
- number of Reference Pictures in use,
- color space and color space metadata
- color space metadata.

The updated parameters must not exceed the maximum limits specified when creating the `VkVideoSessionKHR` instance.

### 40.2.4. Video Session Device Memory Heaps

After creating a Video Session instance, and before the object can be used for any of the decode or encode operations, the application must allocate and bind device memory resources to the Video Session object. An implementation may require one or more device memory heaps of different memory types, as reported by the `vkGetVideoSessionMemoryRequirementsKHR` function, to be bound with the `vkBindVideoSessionMemoryKHR` function to the Video Session. For more information about the Video Session Device Memory, please refer to the Binding the Session Object Device Memory section, below.

### 40.2.5. Video Session Parameters

A lot of codec standards require parameters that are in use for the entire video stream. For example, H.264/AVC and HEVC standards require sequence and picture parameter sets (SPS and PPS) that apply to multiple Video Decode and Encode frames, layers, and sub-layers. Vulkan Video uses Video Session Parameters objects to store such standard parameters. The application creates one or more Video Session Parameters Objects against a Video Session, with a set of common Video Parameters that are required for the processing of the video content. During the object creation, the implementation stores the parameters to the created instance. During command buffer recording, it is the responsibility of the application to provide the Video Session Parameters object containing the parameters that are necessary for the processing the portion of the stream under consideration.
40.2.6. Video Picture Subresources

For Video Picture Resources, an application has the option to use single or multi-layer images for image views. The layer to be used during decode or encode operations can be specified when the image view is being created with the VkImageSubresourceRange::baseArrayLayer parameter, and/or within the resource binding operations in command buffer by using the VkVideoPictureResourceInfoKHR::baseArrayLayer parameter.

Note:
Both Video Decode and Encode operations only work with a single layer at the time.

The Image views representing the Input / Output / DPB Video Picture Resources could have been created with sizes bigger than the coded size that is used with Video Decode and Encode operations. This allows for the same Video Picture Resources to be reused when there is a change in the input video content resolution. The effective coded size of the Video Picture Resources used for Video Decode and Encode operations is provided with VkVideoPictureResourceInfoKHR::extent parameter of each resource in use.

Note:
Many codec standards require the coded and Video Picture Resources’ sizes to match.

Video Session DPB and Reconstructed Video Picture Resources

The video compression standard chosen may require the use of Reference Pictures. In Vulkan Video, like any other Video Picture Resources, the Reference Pictures are represented with Image Views.

When an application requires Reference Picture Resources, it creates and then associates image views, representing these resources, with Video Session DPB or Reconstructed slots while recording the command buffer.

Decoded output pictures may be used as reference pictures in future video decode operations. The same pictures may be used in texture sampling operations or in the (WSI) presentation pipeline. Representing the DPB’s Video Picture Resources by image views makes it possible to accommodate all these use cases in a “zero-copy” fashion. Also, it provides more fine-grained control of the application over the efficient usage of the DPB and Reconstructed Device Memory Resources.

Video Session DPB and Reconstructed Slot Resource Management

Before Video Picture Resources can be used as Reference Picture Resources, Video Session DPB or Reconstructed Slots must be associated with those resources.

The application allocates a DPB or Reconstructed Slot and associates it with a Video Picture Resource and then sets up the resource as a target of decode or encode operation. After successfully decoding or encoding a picture with the targeted DPB or Reconstructed Slot, in addition to the Reference Picture pixel data, the implementation may generate an opaque Reference Picture.
Metadata for that video session Slot and its associated Video Picture Resource.

Subsequently, one or more DPB or Reconstructed video session Slots, along with their associated Video Picture Resources, can be used as Reference Picture's source for the video decode or encode operations.

If Reference Pictures were to be required for decoding or encoding of the video bitstream, the VkVideoSessionCreateInfoKHR::maxDpbSlots must be set to a value bigger than 0 when the instance of the Video Session object is created.

Up to VkVideoSessionCreateInfoKHR::maxDpbSlots slots can be activated with Video Picture Resources for a video session and up to VkVideoSessionCreateInfoKHR::maxActiveReferencePictures active slots can be used as DPB or Reconstructed Reference Pictures within a single decode or encode operation.

When the implementation is associating Reference Picture Metadata with the Video Picture Resources themselves, such data must be independent of the Video Session to allow for those Video Picture Resources to be shared with other Video Session instances. All of the Video Session-dependent Reference Picture Metadata must only be associated with the Video Session DPB or Reconstructed Slots.

The application with the help of the implementation is responsible for managing the individual DPB, or Reconstructed Slots that belong to a single Video Session DPB set:

- The application maintains the Slot allocation and per-slot Reference Picture Resources;
- Implementation maintains global and per-slot opaque Reference Picture Metadata;

The application also manages the mapping between the codec-specific picture IDs and DPB Slots.

When a Video Picture is decoded and is set as a Reference Picture against a Video Session DPB Slot, or is encoded and a Reconstructed Video Picture Resource is associated with a Video Session DPB Slot then:

- The Video Picture Resource associated with the Slot is filled with the decoded or reconstructed pixel data;
- The implementation generates the DPB Slot’s Reference Picture Metadata;

When a DPB's Slot is deactivated, or a different Video Picture Resource is used with the Slot, or the content of the Video Picture Resource is modified, the Reference Picture Metadata associated with the DPB Slot gets invalidated by the implementation. Subsequent attempts to use such, invalidated, DPB Slot as a Reference source would produce undefined results.

**Video Session DPB Slot subresources**

DPB Reference Picture's coded width and height can change, dynamically, via VkVideoPictureResourceInfoKHR::extent, and the picture parameters from the codec-specific extensions. When a DPB Slot is activated as a Reference Picture and a decode or encode operation is performed against that slot, the coded extent can be recorded by the implementation to the corresponding DPB Slot's metadata state. Subsequently, when the Reference Pictures are used with the decoded Output or encoded Input Picture, their coded extent can differ. Decoding or encoding
pictures, using picture sizes, different from the previously produced Reference Pictures should be used with care, not to conflict with the codec standard and the implementation’s support for that. It is the responsibility of the application to ensure that valid DPB Set of Reference Pictures are in use, according to the codec standard.

In addition, the Video Picture Resources extent cannot exceed the VkVideoSessionCreateInfoKHR::maxCodedExtent.

Note:
Coding Standards such as VP9 and AV1 allow for images with different sizes to be used as Reference Pictures. Others, like H.264 and H.265, do not support Reference Pictures with different sizes. Using Reference Pictures with incompatible sizes with such standards would render undefined results.

The application is in control of the allocation and use of the system resource

In Vulkan Video, the application has complete control over how and when system resources are used. The Vulkan Video framework provides the following tools to ensure that device and host memory resources are used in an optimal way:

- The video application can allocate or destroy the number of allocated Output or Input Pictures, and can grow, or shrink the DPB set of Reference Pictures, dynamically, based on the changing video content requirement.
- Reference Pictures can be shared with the decoded Output or encoded Input pictures.
- The application can use sparse memory for the images, representing Video Picture Resources. The use of sparse memory would allow the application to remove the Device Memory backing of the image resources when the DPB Slot is not in active use. Furthermore, if the sparseResidency feature is supported by the implementation (see Sparse Resources), then images can be, partially, bound with the resource memory. This feature is particularly important when using video content with a significant change of decoded or encoded resolution.
- If the implementation supports image arrays, and sparse memory resources, then the application can remove the Device Memory backing of image array layers that are not used by any DPB Slots.

Using DPB and Reconstructed Slot’s Associated Resources

Before a DPB Slot is to become Valid for use with a Reference Picture, it requires memory resources to be bound to it.

Some of the memory resources required for the DPB Slot, are opaquely managed by the implementation and, internally, allocated from the Session’s Device Memory Heaps. The application provides the image resources of one or more Reference Pictures, in the VkVideoBeginCodingInfoKHR::pReferenceSlots as part of the vkCmdBeginVideoCodingKHR command.

If a DPB Slot was already used with an image view, and a new image view or a VK_NULL_HANDLE handle is used with that Slot, then the DPB Slot’s state will be invalidated by the implementation. If a DPB Slot were to be reused with the same image view, the state of the Slot would not change.
Video Session Activating DPB Slot as a Reference

Before a DPB Slot is to be used for a Reference Pictures index, it must be activated. The activation of a DPB Slot is done within the vkCmdDecodeVideoKHR command’s VkVideoDecodeInfoKHR::slotIndex field for the decode operations, and within the vkCmdEncodeVideoKHR command’s VkVideoEncodeInfoKHR::slotIndex field for the encode operations.

While activating a Slot for DPB, it must already have an associated image view, within the VkVideoBeginCodingInfoKHR::pReferenceSlots in the vkCmdBeginVideoCodingKHR command and Device Memory backing of the image resources must be resident.

When a DPB Slot were to be activated, the VkVideoDecodeInfoKHR::slotIndex for decode, or VkVideoEncodeInfoKHR::slotIndex for encode, must be set to the application’s allocated DPB Slot’s index. When activating a DPB Slot, the application will perform a decode or encode operation against its Slot’s index in order to enable its state as a Valid Picture Reference. If a DPB Slot is activated, but a decode or encode operation is not performed against that Slot’s index, or the decode or encode operation was unsuccessful, then the DPB Slot would remain in the Invalid Picture Reference state (see below the DPB Slot States).

By just providing a Video Picture Resources for a DPB Slot within the VkVideoBeginCodingInfoKHR::pReferenceSlots, and without successfully performing a decode or encode operation against that Slot, the DPB Slot’s state cannot be changed to Valid Picture Reference. If the DPB Slots were already in Valid Picture Reference, and there is no Video Picture Resources associated with the DPB Slot for a decode or encode operation, the state DPB Slot would not change. However, if an application is referring to a valid DPB Slot in its current decode or encode operations, then a valid image view must be provided for that Slot within VkVideoPictureResourceInfoKHR::imageViewBinding for that decode or encode operation.

Video Session Invalidating DPB Slot’s Reference State

When a DPB Slot is invalidated, its state is set to Invalid Picture Reference. Using a DPB Slot as a Reference Picture index for video decode or encode operations while the Slot is in Invalid Picture Reference state would render undefined results.

Video Session DPB Slot States

To help understand the valid use of the Video Session DPB and its resource management, this section aims to explain the different states and correct usage of DPB Slots.

There are four (4) states that a DPB Slot could be in:

- Picture Reference Unused;
- Invalid Picture Reference;
- Updating Picture Reference;
- Valid Picture Reference;

The different states are outlined within the DPB Slot States and DPB Slot States Flow Diagram below.

All DPB Slot management operations are performed via the VkVideoDecodeInfoKHR::slotIndex or
VkVideoEncodeInfoKHR::slotIndex field.

All DPB resource binding, invalidating, and activating Slot management operations are performed, by the implementation, before the decoding or encoding commands, based on the VkVideoDecodeInfoKHR::slotIndex or VkVideoEncodeInfoKHR::slotIndex field and the entries from the VkVideoBeginCodingInfoKHR::pReferenceSlots. The application cannot move a DPB Slot from a Picture Reference Unused to Updating Picture Reference state, implicitly, within a decode or encode command operation. Such a DPB Slot must first be transitioned to an Invalid Picture Reference state using VkVideoDecodeInfoKHR::slotIndex or VkVideoEncodeInfoKHR::slotIndex, as part of a decode command. For more details, see Video Picture Decode Modes.

When using sparse memory resources, it would be acceptable and valid behavior for the application to unbind the memory while the DPB Slot is any of the DPB Slot states, provided the command buffers, in a pending state, do not reference any such Video Picture Resources.

Accessing unbound regions of the sparse memory resources by the decoder or encoder, regardless if those are used as Output, Input, DPB or Reconstructed Video Picture Resources, would render undefined results. The VkPhysicalDeviceSparseProperties::residencyNonResidentStrict property reported by the implementation does not offer guarantees on the behavior of decode or encode operations when it comes to accessing unbound regions. However, both reads and writes are still considered safe and will not affect other resources or populated regions of the image.

**Figure 31. DPB Slot States Flow Diagram**

### 40.3. Video Physical Device Capabilities

#### 40.3.1. Supported Video Codec Operations Enumeration

The structure `VkQueueFamilyVideoPropertiesKHR` may be chained to `VkQueueFamilyProperties2` when calling `vkGetPhysicalDeviceQueueFamilyProperties2` to retrieve the video codec operations supported for the physical device queue family index.

The `VkQueueFamilyVideoPropertiesKHR` structure is defined as:
typedef struct VkQueueFamilyVideoPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoCodecOperationFlagsKHR videoCodecOperations;
} VkQueueFamilyVideoPropertiesKHR;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **videoCodecOperations** is a bitmask of VkVideoCodecOperationFlagBitsKHR specifying supported video codec operation(s).

**Valid Usage (Implicit)**

• VUID-VkQueueFamilyVideoPropertiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUEUE_FAMILY_VIDEO_PROPERTIES_KHR

The codec operations are defined with the VkVideoCodecOperationFlagBitsKHR enum:

```
// Provided by VK_KHR_video_queue
typedef enum VkVideoCodecOperationFlagBitsKHR {
    VK_VIDEO_CODEC_OPERATION_NONE_KHR = 0,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_queue
    VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT = 0x00010000,
    #endif
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_queue
    VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_EXT = 0x00000001,
    #endif
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_queue
    VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT = 0x00020000,
    #endif
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_queue
    VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_EXT = 0x00000002,
    #endif
} VkVideoCodecOperationFlagBitsKHR;
```

Each decode or encode codec-specific extension extends this enumeration with the appropriate bit corresponding to the extension’s codec operation:

• **VK_VIDEO_CODEC_OPERATION_NONE_KHR** indicates no support for any video codec operations.
• **VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_EXT** specifies support for H.264 video decode...
operations.

- **VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_EXT** specifies support for H.265 video decode operations.
- **VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT** specifies support for H.264 video encode operations.
- **VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT** specifies support for H.265 video encode operations.

// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCodecOperationFlagsKHR;

**VkVideoCodecOperationFlagsKHR** is a bitmask type for setting a mask of zero or more **VkVideoCodecOperationFlagBitsKHR**.

### 40.3.2. Video Profiles

A video profile is defined by **VkVideoProfileInfoKHR** structure as:

// Provided by VK_KHR_video_queue
typedef struct VkVideoProfileInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoCodecOperationFlagBitsKHR videoCodecOperation;
    VkVideoChromaSubsamplingFlagBitsKHR chromaSubsampling;
    VkVideoComponentBitDepthFlagBitsKHR lumaBitDepth;
    VkVideoComponentBitDepthFlagBitsKHR chromaBitDepth;
} VkVideoProfileInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **videoCodecOperation** is a **VkVideoCodecOperationFlagBitsKHR** value specifying a video codec operation.
- **chromaSubsampling** is a bitmask of **VkVideoChromaSubsamplingFlagBitsKHR** specifying video chroma subsampling information.
- **lumaBitDepth** is a bitmask of **VkVideoComponentBitDepthFlagBitsKHR** specifying video luma bit depth information.
- **chromaBitDepth** is a bitmask of **VkVideoComponentBitDepthFlagBitsKHR** specifying video chroma bit depth information.

When a **VkVideoProfileInfoKHR** structure is specified through the **pProfiles** member of an **VkVideoProfileListInfoKHR** structure in the **pNext** chain of the input parameter of a query command such as **vkGetPhysicalDeviceVideoCapabilitiesKHR**, **vkGetPhysicalDeviceVideoFormatPropertiesKHR**, or **vkGetPhysicalDeviceImageFormatProperties2**, the following error codes indicate specific causes of the failure of the query operation:
• **VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR** The requested video picture layout (e.g., through the `pictureLayout` member of a `VkVideoDecodeH264ProfileInfoEXT` structure included in the `pNext` chain of `VkVideoProfileInfoKHR`) is not supported.

• **VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR** A video profile operation specified by `videoCodecOperation` is not supported.

• **VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR** Format parameters specified by `chromaSubsampling`, `lumaBitDepth`, or `chromaBitDepth` are not supported.

• **VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR** Codec-specific parameters corresponding to the `videoCodecOperation` are not provided through the `pNext` chain of `VkVideoProfileInfoKHR`, or the specified parameters are not supported.

---

**Valid Usage**

- **VUID-VkVideoProfileInfoKHR-chromaSubsampling-07013**
  `chromaSubsampling` must have a single bit set

- **VUID-VkVideoProfileInfoKHR-lumaBitDepth-07014**
  `lumaBitDepth` must have a single bit set

- **VUID-VkVideoProfileInfoKHR-chromaSubsampling-07015**
  If `chromaSubsampling` is not `VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR`, then `chromaBitDepth` must have a single bit set

---

**Valid Usage (Implicit)**

- **VUID-VkVideoProfileInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_PROFILE_INFO_KHR`

- **VUID-VkVideoProfileInfoKHR-videoCodecOperation-parameter**
  `videoCodecOperation` must be a valid `VkVideoCodecOperationFlagBitsKHR` value

- **VUID-VkVideoProfileInfoKHR-chromaSubsampling-parameter**
  `chromaSubsampling` must be a valid combination of `VkVideoChromaSubsamplingFlagBitsKHR` values

- **VUID-VkVideoProfileInfoKHR-chromaSubsampling-requiredbitmask**
  `chromaSubsampling` must not be 0

- **VUID-VkVideoProfileInfoKHR-lumaBitDepth-parameter**
  `lumaBitDepth` must be a valid combination of `VkVideoComponentBitDepthFlagBitsKHR` values

- **VUID-VkVideoProfileInfoKHR-lumaBitDepth-requiredbitmask**
  `lumaBitDepth` must not be 0

- **VUID-VkVideoProfileInfoKHR-chromaBitDepth-parameter**
  `chromaBitDepth` must be a valid combination of `VkVideoComponentBitDepthFlagBitsKHR` values
The video format chroma subsampling is defined with the following enums:

```c
typedef enum VkVideoChromaSubsamplingFlagBitsKHR {
    VK_VIDEO_CHROMA_SUBSAMPLING_INVALID_KHR = 0,
    VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR = 0x00000001,
    VK_VIDEO_CHROMA_SUBSAMPLING_420_BIT_KHR = 0x00000002,
    VK_VIDEO_CHROMA_SUBSAMPLING_422_BIT_KHR = 0x00000004,
    VK_VIDEO_CHROMA_SUBSAMPLING_444_BIT_KHR = 0x00000008,
} VkVideoChromaSubsamplingFlagBitsKHR;
```

- **VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR** - the format is monochrome.
- **VK_VIDEO_CHROMA_SUBSAMPLING_420_BIT_KHR** - the format is 4:2:0 chroma subsampled. The two chroma components are each subsampled at a factor of 2 both horizontally and vertically.
- **VK_VIDEO_CHROMA_SUBSAMPLING_422_BIT_KHR** - the format is 4:2:2 chroma subsampled. The two chroma components are sampled at half the sample rate of luma. The horizontal chroma resolution is halved.
- **VK_VIDEO_CHROMA_SUBSAMPLING_444_BIT_KHR** - the format is 4:4:4 chroma sampled. Each of the three YCbCr components have the same sample rate, thus there is no chroma subsampling.

```c
typedef VkFlags VkVideoChromaSubsamplingFlagsKHR;

VkVideoChromaSubsamplingFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoChromaSubsamplingFlagBitsKHR.
```

The video format component bit depth is defined with the following enums:

```c
typedef enum VkVideoComponentBitDepthFlagBitsKHR {
    VK_VIDEO_COMPONENT_BIT_DEPTH_INVALID_KHR = 0,
    VK_VIDEO_COMPONENT_BIT_DEPTH_8_BIT_KHR = 0x00000001,
    VK_VIDEO_COMPONENT_BIT_DEPTH_10_BIT_KHR = 0x00000004,
    VK_VIDEO_COMPONENT_BIT_DEPTH_12_BIT_KHR = 0x00000010,
} VkVideoComponentBitDepthFlagBitsKHR;
```

- **VK_VIDEO_COMPONENT_BIT_DEPTH_8_BIT_KHR** - the format component bit depth is 8 bits.
- **VK_VIDEO_COMPONENT_BIT_DEPTH_10_BIT_KHR** - the format component bit depth is 10 bits.
- **VK_VIDEO_COMPONENT_BIT_DEPTH_12_BIT_KHR** - the format component bit depth is 12 bits.

```c
typedef VkFlags VkVideoComponentBitDepthFlagsKHR;
```
VkVideoComponentBitDepthFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoComponentBitDepthFlagBitsKHR.

A video profile is provided when querying capabilities or image formats for video using vkGetPhysicalDeviceVideoCapabilitiesKHR or vkGetPhysicalDeviceVideoFormatPropertiesKHR, respectively. A video profile is also provided when creating resources (images, video sessions, etc.) used by video queues. Each instance of VkVideoProfileInfoKHR must chain a codec-operation specific video profile extension structure, corresponding to the codec-operation specified in VkVideoProfileInfoKHR::videoCodecOperation. Additional information is provided in each codec-operation-specific video extension.

Additional information about the video decode use case can be provided by adding a VkVideoDecodeUsageInfoKHR structure to the pNext chain of VkVideoProfileInfoKHR.

The VkVideoDecodeUsageInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeUsageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoDecodeUsageFlagsKHR videoUsageHints;
} VkVideoDecodeUsageInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **videoUsageHints** is a bitmask of VkVideoDecodeUsageFlagBitsKHR specifying hints about the intended use of the video decode profile.

### Valid Usage (Implicit)

- VUID-VkVideoDecodeUsageInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_USAGE_INFO_KHR
- VUID-VkVideoDecodeUsageInfoKHR-videoUsageHints-parameter
  videoUsageHints must be a valid combination of VkVideoDecodeUsageFlagBitsKHR values

The following bits can be specified in VkVideoDecodeUsageInfoKHR::videoUsageHints as a hint about the video decode use case:

```c
// Provided by VK_KHR_video_decode_queue
typedef enum VkVideoDecodeUsageFlagBitsKHR {
    VK_VIDEO_DECODE_USAGE_DEFAULT_KHR = 0,
    VK_VIDEO_DECODE_USAGE_TRANSCODING_BIT_KHR = 0x00000001,
    VK_VIDEO_DECODE_USAGE_OFFLINE_BIT_KHR = 0x00000002,
    VK_VIDEO_DECODE_USAGE_STREAMING_BIT_KHR = 0x00000004,
} VkVideoDecodeUsageFlagBitsKHR;
```
• **VK_VIDEO_DECODE_USAGE_TRANSCODING_BIT_KHR** specifies that video decoding is intended to be used in conjunction with video encoding to transcode a video bitstream with the same and/or different codecs.

• **VK_VIDEO_DECODE_USAGE_OFFLINE_BIT_KHR** specifies that video decoding is intended to be used to consume a local video bitstream.

• **VK_VIDEO_DECODE_USAGE_STREAMING_BIT_KHR** specifies that video decoding is intended to be used to consume a video bitstream received as a continuous flow over network.

**Note**
There are no restrictions on the combination of bits that can be specified by the application. However, applications should use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular use case.

```c
// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeUsageFlagsKHR;
```

**VkVideoDecodeUsageFlagsKHR** is a bitmask type for setting a mask of zero or more **VkVideoDecodeUsageFlagBitsKHR**.

Additional information about the video encode use case can be provided by adding a **VkVideoEncodeUsageInfoKHR** structure to the **pNext** chain of **VkVideoProfileInfoKHR**.

The **VkVideoEncodeUsageInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeUsageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeUsageFlagsKHR videoUsageHints;
    VkVideoEncodeContentFlagsKHR videoContentHints;
    VkVideoEncodeTuningModeKHR tuningMode;
} VkVideoEncodeUsageInfoKHR;
```

• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **videoUsageHints** is a bitmask of **VkVideoEncodeUsageFlagBitsKHR** specifying hints about the intended use of the video encode profile.

• **videoContentHints** is a bitmask of **VkVideoEncodeContentFlagBitsKHR** specifying hints about the content to be encoded using the video encode profile.

• **tuningMode** is a **VkVideoEncodeTuningModeKHR** value specifying the tuning mode to use when encoding with the video profile.
Valid Usage (Implicit)

- **VUID-VkVideoEncodeUsageInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_USAGE_INFO_KHR`.

- **VUID-VkVideoEncodeUsageInfoKHR-videoUsageHints-parameter**
  
  `videoUsageHints` must be a valid combination of `VkVideoEncodeUsageFlagBitsKHR` values.

- **VUID-VkVideoEncodeUsageInfoKHR-videoContentHints-parameter**
  
  `videoContentHints` must be a valid combination of `VkVideoEncodeContentFlagBitsKHR` values.

- **VUID-VkVideoEncodeUsageInfoKHR-tuningMode-parameter**
  
  If `tuningMode` is not 0, `tuningMode` must be a valid `VkVideoEncodeTuningModeKHR` value.

The following bits can be specified in `VkVideoEncodeUsageInfoKHR::videoUsageHints` as a hint about the video encode use case:

```c
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeUsageFlagBitsKHR {
    VK_VIDEO_ENCODE_USAGE_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_USAGE_TRANSCODING_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_USAGE_STREAMING_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_USAGE_RECORDING_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_USAGE_CONFERENCING_BIT_KHR = 0x00000008,
} VkVideoEncodeUsageFlagBitsKHR;
```

- **VK_VIDEO_ENCODE_USAGE_TRANSCODING_BIT_KHR** specifies that video encoding is intended to be used in conjunction with video decoding to transcode a video bitstream with the same and/or different codecs.

- **VK_VIDEO_ENCODE_USAGE_STREAMING_BIT_KHR** specifies that video encoding is intended to be used to produce a video bitstream that is expected to be sent as a continuous flow over network.

- **VK_VIDEO_ENCODE_USAGE_RECORDING_BIT_KHR** specifies that video encoding is intended to be used for real-time recording for offline consumption.

- **VK_VIDEO_ENCODE_USAGE_CONFERENCING_BIT_KHR** specifies that video encoding is intended to be used in a video conferencing scenario.

**Note**

There are no restrictions on the combination of bits that can be specified by the application. However, applications should use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular use case.

```c
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeUsageFlagsKHR;
```
VkVideoEncodeUsageFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeUsageFlagBitsKHR.

The following bits can be specified in VkVideoEncodeUsageInfoKHR::videoContentHints as a hint about the encoded video content:

```
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeContentFlagBitsKHR {
    VK_VIDEO_ENCODE_CONTENT_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_CONTENT_CAMERA_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_CONTENT_DESKTOP_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_CONTENT_RENDERED_BIT_KHR = 0x00000004,
} VkVideoEncodeContentFlagBitsKHR;
```

- **VK_VIDEO_ENCODE_CONTENT_CAMERA_BIT_KHR** specifies that video encoding is intended to be used to encode camera content.
- **VK_VIDEO_ENCODE_CONTENT_DESKTOP_BIT_KHR** specifies that video encoding is intended to be used to encode desktop content.
- **VK_VIDEO_ENCODE_CONTENT_RENDERED_BIT_KHR** specifies that video encoding is intended to be used to encode rendered (e.g. game) content.

**Note**

There are no restrictions on the combination of bits that can be specified by the application. However, applications should use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular content type.

```
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeContentFlagsKHR;
```

VkVideoEncodeContentFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeContentFlagBitsKHR.

Possible video encode tuning mode values are as follows:

```
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeTuningModeKHR {
    VKVIDEO_ENCODE_TUNING_MODE_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_TUNING_MODE_HIGH_QUALITY_KHR = 1,
    VK_VIDEO_ENCODE_TUNING_MODE_LOW_LATENCY_KHR = 2,
    VK_VIDEO_ENCODE_TUNING_MODE_ULTRA_LOW_LATENCY_KHR = 3,
    VK_VIDEO_ENCODE_TUNING_MODE_LOSSLESS_KHR = 4,
} VkVideoEncodeTuningModeKHR;
```

- **VK_VIDEO_ENCODE_TUNING_MODE_DEFAULT_KHR** specifies the default tuning mode.
• **VK_VIDEO_ENCODE_TUNING_MODE_HIGH_QUALITY_KHR** specifies that video encoding is tuned for high quality. When using this tuning mode, the implementation may compromise the latency of video encoding operations to improve quality.

• **VK_VIDEO_ENCODE_TUNING_MODE_LOW_LATENCY_KHR** specifies that video encoding is tuned for low latency. When using this tuning mode, the implementation may compromise quality to increase the performance and lower the latency of video encode operations.

• **VK_VIDEO_ENCODE_TUNING_MODE_ULTRA_LOW_LATENCY_KHR** specifies that video encoding is tuned for ultra-low latency. When using this tuning mode, the implementation may compromise quality to maximize the performance and minimize the latency of video encoding operations.

• **VK_VIDEO_ENCODE_TUNING_MODE_LOSSLESS_KHR** specifies that video encoding is tuned for lossless encoding. When using this tuning mode, video encode operations produce lossless output.

### 40.3.3. Supported Video Decode or Encode Capabilities

To query video decode or encode capabilities for a specific codec, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkGetPhysicalDeviceVideoCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkVideoProfileInfoKHR* pVideoProfile,
    VkVideoCapabilitiesKHR* pCapabilities);
```

- `physicalDevice` is the physical device whose video decode or encode capabilities will be queried.
- `pVideoProfile` is a pointer to a `VkVideoProfileInfoKHR` structure with a chained codec-operation specific video profile structure.
- `pCapabilities` is a pointer to a `VkVideoCapabilitiesKHR` structure in which the capabilities are returned.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-physicalDevice-parameter** `physicalDevice` must be a valid `VkPhysicalDevice` handle
- **VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-parameter** `pVideoProfile` must be a valid pointer to a valid `VkVideoProfileInfoKHR` structure
- **VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pCapabilities-parameter** `pCapabilities` must be a valid pointer to a `VkVideoCapabilitiesKHR` structure

### Return Codes

**Success**

- **VK_SUCCESS**
If `pVideoProfile` and the chained codec-specific parameters are not supported, then one of the video-profile-specific error codes are returned.

Otherwise, the implementation will fill `pCapabilities` with capabilities associated with this video profile.

The `VkVideoCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoCapabilityFlagsKHR flags;
    VkDeviceSize minBitstreamBufferOffsetAlignment;
    VkDeviceSize minBitstreamBufferSizeAlignment;
    VkExtent2D pictureAccessGranularity;
    VkExtent2D minCodedExtent;
    VkExtent2D maxCodedExtent;
    uint32_t maxDpbSlots;
    uint32_t maxActiveReferencePictures;
    VkExtensionProperties stdHeaderVersion;
} VkVideoCapabilitiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkVideoCapabilityFlagBitsKHR` specifying capability flags.
- `minBitstreamBufferOffsetAlignment` is the minimum alignment for the input or output bitstream buffer offset.
- `minBitstreamBufferSizeAlignment` is the minimum alignment for the input or output bitstream buffer size.
- `pictureAccessGranularity` is the granularity at which image access to video picture resources happen.
- `minCodedExtent` is the minimum width and height of the decoded or encoded video.
- `maxCodedExtent` is the maximum width and height of the decoded or encoded video.
• `maxDpbSlots` is the maximum number of DPB Slots supported by the implementation for a single video session instance.

• `maxActiveReferencePictures` is the maximum slots that can be used as Reference Pictures with a single decode or encode operation.

• `stdHeaderVersion` is a `VkExtensionProperties` structure reporting the Video Std header version supported for the `codecOperation` requested in `vkGetPhysicalDeviceVideoCapabilitiesKHR ::pVideoProfile`.

---

### Valid Usage (Implicit)

- **VUID-VkVideoCapabilitiesKHR-sType-sType**
  - The `sType` must be `VK_STRUCTURE_TYPE_VIDEO_CAPABILITIES_KHR`.

- **VUID-VkVideoCapabilitiesKHR-pNext-pNext**
  - Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoDecodeCapabilitiesKHR`, `VkVideoDecodeH264CapabilitiesEXT`, `VkVideoDecodeH265CapabilitiesEXT`, `VkVideoEncodeCapabilitiesKHR`, `VkVideoEncodeH264CapabilitiesEXT`, or `VkVideoEncodeH265CapabilitiesEXT`.

- **VUID-VkVideoCapabilitiesKHR-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique.

---

The `VkVideoCapabilitiesKHR` flags are defined with the following enumeration:

```c
// Provided by VK_KHR_video_queue
typedef enum VkVideoCapabilityFlagBitsKHR {
    VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR = 0x00000001,
    VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR = 0x00000002,
} VkVideoCapabilityFlagBitsKHR;
```

- **`VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR`** - the decode or encode session supports protected content.

- **`VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR`** - the DPB or Reconstructed Video Picture Resources for the video session may be created as a separate `VkImage` for each DPB picture. If not supported, the DPB must be created as single multi-layered image where each layer represents one of the DPB Video Picture Resources.

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCapabilityFlagsKHR;
```

`VkVideoCapabilityFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoCapabilityFlagBitsKHR`.
40.3.4. Enumeration of Supported Video Output, Input and DPB Formats

To enumerate the supported output, input and DPB image formats for a specific codec operation and video profile, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkGetPhysicalDeviceVideoFormatPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceVideoFormatInfoKHR* pVideoFormatInfo,
    uint32_t* pVideoFormatPropertyCount,
    VkVideoFormatPropertiesKHR* pVideoFormatProperties);
```

- **physicalDevice** is the physical device being queried.
- **pVideoFormatInfo** is a pointer to a `VkPhysicalDeviceVideoFormatInfoKHR` structure specifying the codec and video profile for which information is returned.
- **pVideoFormatPropertyCount** is a pointer to an integer related to the number of video format properties available or queried, as described below.
- **pVideoFormatProperties** is a pointer to an array of `VkVideoFormatPropertiesKHR` structures in which supported formats and image parameters are returned.

If `pVideoFormatProperties` is `NULL`, then the number of video format properties supported for the given `physicalDevice` is returned in `pVideoFormatPropertyCount`. Otherwise, `pVideoFormatPropertyCount` must point to a variable set by the user to the number of elements in the `pVideoFormatProperties` array, and on return the variable is overwritten with the number of values actually written to `pVideoFormatProperties`. If the value of `pVideoFormatPropertyCount` is less than the number of video format properties supported, at most `pVideoFormatPropertyCount` values will be written to `pVideoFormatProperties`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available values were returned.

If an implementation reports `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR` is supported but `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR` is not supported in `VkVideoDecodeCapabilitiesKHR::flags`, then to query for video format properties for decode DPB or output, `VkPhysicalDeviceVideoFormatInfoKHR::imageUsage` must have both `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR` and `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR` set. Otherwise, the call will fail with `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR`.

If an implementation reports `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR` is supported but `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR` is not supported in `VkVideoDecodeCapabilitiesKHR::flags`, then to query for video format properties for decode DPB, `VkPhysicalDeviceVideoFormatInfoKHR::imageUsage` must have `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR` set and `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR` not set. Otherwise, the call will fail with `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR`. Similarly, to query for video format properties for decode output, `VkPhysicalDeviceVideoFormatInfoKHR::imageUsage` must have `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR` set and `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR` not set. Otherwise, the call will fail with `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR`. 
The `imageUsage` member of the `VkPhysicalDeviceVideoFormatInfoKHR` structure specifies the expected video usage flags that the returned video formats must support. Correspondingly, the `imageUsageFlags` member of each `VkVideoFormatPropertiesKHR` structure returned will contain at least the same set of image usage flags.

If the implementation supports using video input, output, or DPB images of a particular format in operations other than video decode/encode then the `imageUsageFlags` member of the corresponding `VkVideoFormatPropertiesKHR` structure returned will include additional image usage flags indicating that.

*Note:*
For most use cases, only decode or encode related usage flags are going to be specified. For a use case such as transcode, if the image were to be shared between decode and encode session(s), then both decode and encode related usage flags can be set.

Video format properties are always queried with respect to a specific set of video profiles, as defined by the `VkVideoProfileInfoKHR` structure. These are specified by chaining the `VkVideoProfileListInfoKHR` structure to `pVideoFormatInfo`.

For most use cases, the images are used by a single video session and a single video profile is provided. For a use case such as transcode, where a decode session output image can be used as encode input in one or more encode sessions, multiple video profiles corresponding to the video sessions that will share the image must be provided.

If any of the profiles specified via `VkVideoProfileListInfoKHR::pProfiles` are not supported, then `vkGetPhysicalDeviceVideoFormatPropertiesKHR` returns one of the video-profile-specific error codes. Furthermore, if `VkPhysicalDeviceVideoFormatInfoKHR::imageUsage` includes any image usage flags not supported by the specified video profiles then `vkGetPhysicalDeviceVideoFormatPropertiesKHR` returns `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR`.

Multiple `VkVideoFormatPropertiesKHR` entries may be returned with the same `format` member with different `componentMapping`, `imageType`, or `imageTiling` values, as described later.

In addition, a different set of `VkVideoFormatPropertiesKHR` entries may be returned depending on the `imageUsage` member of the `VkPhysicalDeviceVideoFormatInfoKHR` structure, even for the same set of video profiles, for example, based on whether encode input, encode DPB, decode output, and/or decode DPB usage is requested.

The application can select the parameters returned in the `VkVideoFormatPropertiesKHR` entries and use compatible parameters when creating the input, output, and DPB images. The implementation will report all image creation and usage flags that are valid for images used with the requested video profiles but applications should create images only with those that are necessary for the particular use case.

Before creating an image, the application can obtain the complete set of supported image format features by calling `vkGetPhysicalDeviceImageFormatProperties2` using parameters derived from the members of one of the reported `VkVideoFormatPropertiesKHR` entries and adding the same `VkVideoProfileListInfoKHR` structure to the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2`. 
The `componentMapping` member of `VkVideoFormatPropertiesKHR` defines the ordering of the Y’CbCr color channels from the perspective of the video codec operations specified in `VkVideoProfileListInfoKHR`. For example, if the implementation produces video decode output with the format `VK_FORMAT_G8_B8R8_2PLANE_420_UNORM` where the blue and red chrominance channels are swapped then the `componentMapping` member of the corresponding `VkVideoFormatPropertiesKHR` structure will have the following member values:

```c
components.r = VK_COMPONENT_SWIZZLE_B;  // Cr component
components.g = VK_COMPONENT_SWIZZLE_IDENTITY;  // Y component
components.b = VK_COMPONENT_SWIZZLE_R;  // Cb component
components.a = VK_COMPONENT_SWIZZLE_IDENTITY;  // unused, defaults to 1.0
```

**Valid Usage**

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pNext-06812
  The `pNext` chain of `pVideoFormatInfo` must include a valid `VkVideoProfileListInfoKHR` structure with `profileCount` greater than 0

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatInfo-parameter
  `pVideoFormatInfo` must be a valid pointer to a valid `VkPhysicalDeviceVideoFormatInfoKHR` structure

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatPropertyCount-parameter
  `pVideoFormatPropertyCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatProperties-parameter
  If the value referenced by `pVideoFormatPropertyCount` is not 0, and `pVideoFormatProperties` is not NULL, `pVideoFormatProperties` must be a valid pointer to an array of `VkVideoFormatPropertiesKHR` structures

**Return Codes**

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
The **VkPhysicalDeviceVideoFormatInfoKHR** input structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkPhysicalDeviceVideoFormatInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkImageUsageFlags imageUsage;
} VkPhysicalDeviceVideoFormatInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **imageUsage** is a bitmask of **VkImageUsageFlagBits** specifying the intended usage of the video images.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVideoFormatInfoKHR-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_FORMAT_INFO_KHR**

- VUID-VkPhysicalDeviceVideoFormatInfoKHR-pNext-pNext
  **pNext** must be **NULL** or a pointer to a valid instance of **VkVideoProfileListInfoKHR**

- VUID-VkPhysicalDeviceVideoFormatInfoKHR-sType-unique
  The **sType** value of each struct in the **pNext** chain must be unique

- VUID-VkPhysicalDeviceVideoFormatInfoKHR-imageUsage-parameter
  **imageUsage** must be a valid combination of **VkImageUsageFlagBits** values

- VUID-VkPhysicalDeviceVideoFormatInfoKHR-imageUsage-requiredbitmask
  **imageUsage** must not be 0

The **VkVideoProfileListInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoProfileListInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t profileCount;
    const VkVideoProfileInfoKHR* pProfiles;
} VkVideoProfileListInfoKHR;
```
• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `profileCount` is an integer which holds the number of video profiles included in `pProfiles`.
• `pProfiles` is a pointer to an array of `VkVideoProfileInfoKHR` structures. Each `VkVideoProfileInfoKHR` structure must chain the corresponding codec-operation specific extension video profile structure.

Video transcoding is an example of a use case that necessitates numerous profiles. When the application provides one or more video decode and encode profiles in the list of profiles, the implementation ensures that the video formats and parameters reported produce video resources suitable for the transcoding use cases without the need for manual transformation.

Valid Usage

• `VUID-VkVideoProfileListInfoKHR-pProfiles-06813`
  If the `pProfiles` list contains more than one `VkVideoProfileInfoKHR` entry, then it must not contain more than one entry whose `videoCodecOperation` member specifies a decode operation.

Valid Usage (Implicit)

• `VUID-VkVideoProfileListInfoKHR-sType-sType`
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_PROFILE_LIST_INFO_KHR`.

• `VUID-VkVideoProfileListInfoKHR-pProfiles-parameter`
  If `profileCount` is not 0, `pProfiles` must be a valid pointer to an array of `profileCount` valid `VkVideoProfileInfoKHR` structures.

The `VkVideoFormatPropertiesKHR` output structure for `vkGetPhysicalDeviceVideoFormatPropertiesKHR` is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoFormatPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkFormat format;
    VkComponentMapping componentMapping;
    VkImageCreateFlags imageCreateFlags;
    VkImageType imageType;
    VkImageTiling imageTiling;
    VkImageUsageFlags imageUsageFlags;
} VkVideoFormatPropertiesKHR;
```
• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **format** is a **VkFormat** that specifies the format that **can** be used with the specified video profiles and image usages.

• **componentMapping** defines the color channel order used for the format. **format** along with **componentMapping** describe how the color channels are ordered when producing video decoder output or are expected to be ordered in video encoder input, when applicable. If the **format** reported does not require component swizzling then all members of **componentMapping** will be set to **VK_COMPONENT_SWIZZLE_IDENTITY**.

• **imageCreateFlags** is a bitmask of **VkImageCreateFlagBits** specifying the supported image creation flags for the format.

• **imageType** is a **VkImageType** that specifies the image type the format **can** be used with.

• **imageTiling** is a **VkImageTiling** that specifies the image tiling the format **can** be used with.

• **imageUsageFlags** is a bitmask of **VkImageUsageFlagBits** specifying the supported image usage flags for the format.

### Valid Usage (Implicit)

- **VUID-VkVideoFormatPropertiesKHR-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_VIDEO_FORMAT_PROPERTIES_KHR**

- **VUID-VkVideoFormatPropertiesKHR-pNext-pNext**
  - **pNext** must be **NULL**

### 40.4. Video Session Objects

#### 40.4.1. Video Session

Video session objects are abstracted and represented by **VkVideoSessionKHR** handles:

```c
// Provided by VK_KHR_video_queue
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkVideoSessionKHR)
```

### Creating a Video Session

To create a video session object, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkCreateVideoSessionKHR(
    VkDevice          device,            // Provided by the calling application
    const VkVideoSessionCreateInfoKHR* pCreateInfo,  // Provided by the calling application
    const VkAllocationCallbacks* pAllocator,        // Provided by the calling application
    VkVideoSessionKHR* pVideoSession               // Returned by the implementation
);
```

- **device** is the logical device that creates the decode or encode session object.
- **pCreateInfo** is a pointer to a `VkVideoSessionCreateInfoKHR` structure containing parameters specifying the creation of the decode or encode session.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pVideoSession** is a pointer to a `VkVideoSessionKHR` structure specifying the decode or encode video session object which will be created by this function when it returns `VK_SUCCESS`.

Video session objects are created in *uninitialized* state. In order to transition the video session into *initial* state, the application must issue a `vkCmdControlVideoCodingKHR` command with the `flags` member of `VkVideoCodingControlInfoKHR` including `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR`.

### Valid Usage (Implicit)

- VUID-vkCreateVideoSessionKHR-device-parameter
  - **device** must be a valid `VkDevice` handle
- VUID-vkCreateVideoSessionKHR-pCreateInfo-parameter
  - **pCreateInfo** must be a valid pointer to a valid `VkVideoSessionCreateInfoKHR` structure
- VUID-vkCreateVideoSessionKHR-pAllocator-parameter
  - If **pAllocator** is not `NULL`, **pAllocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateVideoSessionKHR-pVideoSession-parameter
  - **pVideoSession** must be a valid pointer to a `VkVideoSessionKHR` handle

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_INITIALIZATION_FAILED**
- **VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR**

The `VkVideoSessionCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t queueFamilyIndex;
    VkVideoSessionCreateFlagsKHR flags;
    const VkVideoProfileInfoKHR* pVideoProfile;
} VkVideoSessionCreateInfoKHR;
```
VkVideoSessionCreateInfoKHR

VkFormat pictureFormat;
VkExtent2D maxCodedExtent;
VkFormat referencePictureFormat;
uint32_t maxDpbSlots;
uint32_t maxActiveReferencePictures;
const VkExtensionProperties* pStdHeaderVersion;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **queueFamilyIndex** is the queue family of the created video session.
- **flags** is a bitmask of VkVideoSessionCreateFlagBitsKHR specifying creation flags.
- **pVideoProfile** is a pointer to a VkVideoProfileInfoKHR structure.
- **pictureFormat** is the format of the image views representing decoded Output or encoded Input pictures.
- **maxCodedExtent** is the maximum width and height of the coded pictures that this instance will be able to support.
- **referencePicturesFormat** is the format of the DPB image views representing the Reference Pictures.
- **maxDpbSlots** is the maximum number of DPB Slots that can be activated with associated Video Picture Resources for the created video session.
- **maxActiveReferencePictures** is the maximum number of active DPB Slots that can be used as Dpb or Reconstructed Reference Pictures within a single decode or encode operation for the created video session.
- **pStdHeaderVersion** is a pointer to a VkExtensionProperties structure requesting the Video Std header version to use for codecOperation in pVideoProfile.

**Valid Usage**

- VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-04845
  pVideoProfile must be a pointer to a valid VkVideoProfileInfoKHR structure whose pNext chain must include a valid codec-specific profile structure

- VUID-VkVideoSessionCreateInfoKHR-maxDpbSlots-04846
  If Reference Pictures are required for use with the created video session, the maxDpbSlots must be set to a value bigger than 0

- VUID-VkVideoSessionCreateInfoKHR-maxDpbSlots-04847
  maxDpbSlots cannot exceed the implementation reported VkVideoCapabilitiesKHR ::maxDpbSlots

- VUID-VkVideoSessionCreateInfoKHR-maxActiveReferencePictures-04848
  If Reference Pictures are required for use with the created video session, the maxActiveReferencePictures must be set to a value bigger than 0

- VUID-VkVideoSessionCreateInfoKHR-maxActiveReferencePictures-04849
maxActiveReferencePictures cannot exceed the implementation reported
VkVideoCapabilitiesKHR::maxActiveReferencePictures

- VUID-VkVideoSessionCreateInfoKHR-maxActiveReferencePictures-04850
  maxActiveReferencePictures cannot exceed the maxDpbSlots

- VUID-VkVideoSessionCreateInfoKHR-maxCodedExtent-04851
  maxCodedExtent cannot be smaller than VkVideoCapabilitiesKHR::minExtent and bigger
  than VkVideoCapabilitiesKHR::maxExtent

- VUID-VkVideoSessionCreateInfoKHR-referencePicturesFormat-04852
  If the videoCodecOperation member of pVideoProfile specifies a decode operation then
  referencePicturesFormat must be one of the supported decode DPB formats as reported by
  vkGetPhysicalDeviceVideoFormatPropertiesKHR in the format member of
  VkVideoFormatPropertiesKHR when called with the imageUsage member of its
  pVideoFormatInfo parameter containing VK_IMAGE_USAGE_VIDEO_DECODER_DPB_BIT_KHR, and
  with a VkVideoProfileListInfoKHR structure chained to its pVideoFormatInfo parameter
  whose pProfiles member contains an entry matching pVideoProfile

- VUID-VkVideoSessionCreateInfoKHR-videoCodecOperation-06814
  If the videoCodecOperation member of pVideoProfile specifies an encode operation then
  referencePicturesFormat must be one of the supported encode DPB formats as reported by
  vkGetPhysicalDeviceVideoFormatPropertiesKHR in the format member of
  VkVideoFormatPropertiesKHR when called with the imageUsage member of its
  pVideoFormatInfo parameter containing VK_IMAGE_USAGE_VIDEO_ENCODER_DPB_BIT_KHR, and
  with a VkVideoProfileListInfoKHR structure chained to its pVideoFormatInfo parameter
  whose pProfiles member contains an entry matching pVideoProfile

- VUID-VkVideoSessionCreateInfoKHR-pictureFormat-04853
  If the videoCodecOperation member of pVideoProfile specifies a decode operation then
  pictureFormat must be one of the supported decode output formats as reported by
  vkGetPhysicalDeviceVideoFormatPropertiesKHR in the format member of
  VkVideoFormatPropertiesKHR when called with the imageUsage member of its
  pVideoFormatInfo parameter containing VK_IMAGE_USAGE_VIDEO_DECODER_DST_BIT_KHR, and
  with a VkVideoProfileListInfoKHR structure chained to its pVideoFormatInfo parameter
  whose pProfiles member contains an entry matching pVideoProfile

- VUID-VkVideoSessionCreateInfoKHR-pictureFormat-04854
  If the videoCodecOperation member of pVideoProfile specifies an encode operation then
  pictureFormat must be one of the supported encode input formats as reported by
  vkGetPhysicalDeviceVideoFormatPropertiesKHR in the format member of
  VkVideoFormatPropertiesKHR when called with the imageUsage member of its
  pVideoFormatInfo parameter containing VK_IMAGE_USAGE_VIDEO_ENCODER_SRC_BIT_KHR, and
  with a VkVideoProfileListInfoKHR structure chained to its pVideoFormatInfo parameter
  whose pProfiles member contains an entry matching pVideoProfile

Valid Usage (Implicit)

- VUID-VkVideoSessionCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_SESSION_CREATE_INFO_KHR
• VUID-VkVideoSessionCreateInfoKHR-pNext-pNext
  pNext must be NULL

• VUID-VkVideoSessionCreateInfoKHR-flags-parameter
  flags must be a valid combination of VkVideoSessionCreateFlagBitsKHR values

• VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-parameter
  pVideoProfile must be a valid pointer to a valid VkVideoProfileInfoKHR structure

• VUID-VkVideoSessionCreateInfoKHR-pictureFormat-parameter
  pictureFormat must be a valid VkFormat value

• VUID-VkVideoSessionCreateInfoKHR-referencePictureFormat-parameter
  referencePictureFormat must be a valid VkFormat value

• VUID-VkVideoSessionCreateInfoKHR-pStdHeaderVersion-parameter
  pStdHeaderVersion must be a valid pointer to a valid VkExtensionProperties structure

The decode or encode session creation flags defined with the following enums:

```c
// Provided by VK_KHR_video_queue
typedef enum VkVideoSessionCreateFlagBitsKHR {
    VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR = 0x00000001,
} VkVideoSessionCreateFlagBitsKHR;
```

- **VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR** - create the video session for use with protected video content

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoSessionCreateFlagsKHR;
```

VkVideoSessionCreateFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoSessionCreateFlagBitsKHR.

### 40.4.2. Destroying a Video Session

To destroy a decode session object, call:

```c
// Provided by VK_KHR_video_queue
void vkDestroyVideoSessionKHR(
    VkDevice device,
    VkVideoSessionKHR videoSession,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the device that was used for the creation of the video session.
- **videoSession** is the decode or encode video session to be destroyed.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage (Implicit)

- VUID-vkDestroyVideoSessionKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyVideoSessionKHR-videoSession-parameter
  If videoSession is not VK_NULL_HANDLE, videoSession must be a valid VkVideoSessionKHR handle

- VUID-vkDestroyVideoSessionKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyVideoSessionKHR-videoSession-parent
  If videoSession is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to videoSession must be externally synchronized

40.4.3. Video Session Memory Resource Management

Obtaining the Video Session Object Device Memory Requirements

To get memory requirements for a video session, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkGetVideoSessionMemoryRequirementsKHR(
    VkDevice device,
    VkVideoSessionKHR videoSession,
    uint32_t* pMemoryRequirementsCount,
    VkVideoSessionMemoryRequirementsKHR* pMemoryRequirements);
```

- device is the logical device that owns the video session.
- videoSession is the video session to query.
- pMemoryRequirementsCount is a pointer to an integer related to the number of memory binding requirements available or queried, as described below.
- pMemoryRequirements is NULL or a pointer to an array of VkVideoSessionMemoryRequirementsKHR structures in which the memory binding requirements of the video session are returned.

If pMemoryRequirements is NULL, then the number of memory bindings required for the video session is returned in pMemoryRequirementsCount. Otherwise, pMemoryRequirementsCount must point to a variable set by the user with the number of elements in the pMemoryRequirements array, and on return the variable is overwritten with the number of memory binding requirements actually
written to \texttt{pMemoryRequirements}. If \texttt{pMemoryRequirementsCount} is less than the number of memory bindings required for the video session, then at most \texttt{pMemoryRequirementsCount} elements will be written to \texttt{pMemoryRequirements}, and \texttt{VK_INCOMPLETE} will be returned, instead of \texttt{VK_SUCCESS}, to indicate that not all required memory binding requirements were returned.

### Valid Usage (Implicit)

- VUID-vkGetVideoSessionMemoryRequirementsKHR-device-parameter
  \texttt{device} \textbf{must} be a valid \texttt{VkDevice} handle
- VUID-vkGetVideoSessionMemoryRequirementsKHR-videoSession-parameter
  \texttt{videoSession} \textbf{must} be a valid \texttt{VkVideoSessionKHR} handle
- VUID-vkGetVideoSessionMemoryRequirementsKHR-pMemoryRequirementsCount-parameter
  \texttt{pMemoryRequirementsCount} \textbf{must} be a valid pointer to a \texttt{uint32_t} value
- VUID-vkGetVideoSessionMemoryRequirementsKHR-pMemoryRequirements-parameter
  If the value referenced by \texttt{pMemoryRequirementsCount} is not 0, and \texttt{pMemoryRequirements} is not \texttt{NULL}, \texttt{pMemoryRequirements} \textbf{must} be a valid pointer to an array of \texttt{pMemoryRequirementsCount} \texttt{VkVideoSessionMemoryRequirementsKHR} structures
- VUID-vkGetVideoSessionMemoryRequirementsKHR-videoSession-parent
  \texttt{videoSession} \textbf{must} have been created, allocated, or retrieved from \texttt{device}

### Return Codes

**Success**
- \texttt{VK_SUCCESS}
- \texttt{VK_INCOMPLETE}

**Failure**
- \texttt{VK_ERROR_INITIALIZATION_FAILED}

The \texttt{VkVideoSessionMemoryRequirementsKHR} structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionMemoryRequirementsKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryBindIndex;
    VkMemoryRequirements memoryRequirements;
} VkVideoSessionMemoryRequirementsKHR;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{memoryBindIndex} is the index of the memory binding.
**Valid Usage (Implicit)**

- VUID-VkVideoSessionMemoryRequirementsKHR-sType-sType
  
sType must be VK_STRUCTURE_TYPE_VIDEO_SESSION_MEMORY_REQUIREMENTS_KHR

- VUID-VkVideoSessionMemoryRequirementsKHR-pNext-pNext
  
pNext must be NULL

**Binding the Session Object Device Memory**

To attach memory to a video session object, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkBindVideoSessionMemoryKHR(
    VkDevice device,          
    VkVideoSessionKHR videoSession,  
    uint32_t bindSessionMemoryInfoCount,  
    const VkBindVideoSessionMemoryInfoKHR* pBindSessionMemoryInfos);
```

- device is the logical device that owns the video session.
- videoSession is the video session to be bound with device memory.
- bindSessionMemoryInfoCount is the number of elements in pBindSessionMemoryInfos.
- pBindSessionMemoryInfos is a pointer to an array of bindSessionMemoryInfoCount
  VkBindVideoSessionMemoryInfoKHR structures specifying memory regions to be bound to
  specific memory bindings of the video session.

**Valid Usage (Implicit)**

- VUID-vkBindVideoSessionMemoryKHR-device-parameter
  
device must be a valid VkDevice handle

- VUID-vkBindVideoSessionMemoryKHR-videoSession-parameter
  
videoSession must be a valid VkVideoSessionKHR handle

- VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-parameter
  
pBindSessionMemoryInfos must be a valid pointer to an array of bindSessionMemoryInfoCount
  valid VkBindVideoSessionMemoryInfoKHR structures

- VUID-vkBindVideoSessionMemoryKHR-bindSessionMemoryInfoCount-arraylength
  
bindSessionMemoryInfoCount must be greater than 0

- VUID-vkBindVideoSessionMemoryKHR-videoSession-parent
  
videoSession must have been created, allocated, or retrieved from device
Host Synchronization

* Host access to `videoSession` must be externally synchronized

Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_INITIALIZATION_FAILED**

The `VkBindVideoSessionMemoryInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkBindVideoSessionMemoryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t memoryBindIndex;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    VkDeviceSize memorySize;
} VkBindVideoSessionMemoryInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **memoryBindIndex** is the index of the memory binding returned in `VkVideoSessionMemoryRequirementsKHR::memoryBindIndex` from `vkGetVideoSessionMemoryRequirementsKHR`.
- **memory** is the allocated device memory to be bound to the video session's memory binding with index `memoryBindIndex`.
- **memoryOffset** is the start offset of the region of `memory` which is to be bound.
- **memorySize** is the size in bytes of the region of `memory`, starting from `memoryOffset` bytes, to be bound.

Valid Usage (Implicit)

- **VUID-VkBindVideoSessionMemoryInfoKHR-sType-sType**
  * `sType` must be `VK_STRUCTURE_TYPE_BIND_VIDEO_SESSION_MEMORY_INFO_KHR`

- **VUID-VkBindVideoSessionMemoryInfoKHR-pNext-pNext**
pNext must be NULL

- VUID-VkBindVideoSessionMemoryInfoKHR-memory-parameter
  memory must be a valid VkDeviceMemory handle

### 40.4.4. Video Session Parameters

This specification supports several classes of preprocessed parameters stored in Video Session Parameters objects. The Video Session Parameters objects reduces the number of parameters being dispatched and then processed by the implementation while recording video command buffers.

### 40.4.5. Creating Video Session Parameters

Video session parameter objects are represented by VkVideoSessionParametersKHR handles:

```cpp
// Provided by VK_KHR_video_queue
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkVideoSessionParametersKHR)
```

To create a video session parameters object, call:

```cpp
// Provided by VK_KHR_video_queue
VkResult vkCreateVideoSessionParametersKHR(
    VkDevice device,
    const VkVideoSessionParametersCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkVideoSessionParametersKHR* pVideoSessionParameters);
```

- `device` is the logical device that was used for the creation of the video session object.
- `pCreateInfo` is a pointer to VkVideoSessionParametersCreateInfoKHR structure specifying the video session parameters.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pVideoSessionParameters` is a pointer to a VkVideoSessionParametersKHR handle in which the video session parameters object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateVideoSessionParametersKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCreateVideoSessionParametersKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkVideoSessionParametersCreateInfoKHR structure

- VUID-vkCreateVideoSessionParametersKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_TOO_MANY_OBJECTS

The VkVideoSessionParametersCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionParametersCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoSessionParametersCreateFlagsKHR flags;
    VkVideoSessionParametersKHR videoSessionParametersTemplate;
    VkVideoSessionKHR videoSession;
} VkVideoSessionParametersCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **videoSessionParametersTemplate** is VK_NULL_HANDLE or a valid handle to a VkVideoSessionParametersKHR object. If this parameter represents a valid handle, then the underlying Video Session Parameters object will be used as a template for constructing the new video session parameters object. All of the template object's current parameters will be inherited by the new object in such a case. Optionally, some of the template's parameters can be updated or new parameters added to the newly constructed object via the extension-specific parameters.
- **videoSession** is the video session object against which the video session parameters object is going to be created.

Valid Usage

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-04855
  If videoSessionParametersTemplate represents a valid handle, it **must** have been created
Valid Usage (Implicit)

- **VUID-VkVideoSessionParametersCreateInfoKHR-sType-sType**
  - `sType must be VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_CREATE_INFO_KHR`

- **VUID-VkVideoSessionParametersCreateInfoKHR-pNext-pNext**
  - Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkVideoDecodeH264SessionParametersCreateInfoEXT`, `VkVideoDecodeH265SessionParametersCreateInfoEXT`, `VkVideoEncodeH264SessionParametersCreateInfoEXT`, or `VkVideoEncodeH265SessionParametersCreateInfoEXT`

- **VUID-VkVideoSessionParametersCreateInfoKHR-sType-unique**
  - The `sType` value of each struct in the `pNext` chain **must** be unique

- **VUID-VkVideoSessionParametersCreateInfoKHR-flags-zerobitmask**
  - `flags must be 0`

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-parameter**
  - If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, `videoSessionParametersTemplate must be a valid VkVideoSessionParametersKHR handle`

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-parameter**
  - `videoSession must be a valid VkVideoSessionKHR handle`

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-parent**
  - If `videoSessionParametersTemplate` is a valid handle, it **must** have been created, allocated, or retrieved from `videoSession`

- **VUID-VkVideoSessionParametersCreateInfoKHR-commonparent**
  - Both of `videoSession`, and `videoSessionParametersTemplate` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoSessionParametersCreateFlagsKHR;
```

`VkVideoSessionParametersCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 40.4.6. Updating the parameters of the Video Session Parameters object

To update, add, or remove video session parameters state, call:

```c
// Provided by VK_KHR_video_queue
```
VkResult vkUpdateVideoSessionParametersKHR(
    VkDevice device, 
    VkVideoSessionParametersKHR videoSessionParameters, 
    const VkVideoSessionParametersUpdateInfoKHR* pUpdateInfo);

- **device** is the logical device that was used for the creation of the video session object.
- **videoSessionParameters** is the video session parameters object that is going to be updated.
- **pUpdateInfo** is a pointer to a `VkVideoSessionParametersUpdateInfoKHR` structure containing the session parameters update information.

### Valid Usage (Implicit)

- VUID-vkUpdateVideoSessionParametersKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-parameter
  - `videoSessionParameters` must be a valid `VkVideoSessionParametersKHR` handle
- VUID-vkUpdateVideoSessionParametersKHR-pUpdateInfo-parameter
  - `pUpdateInfo` must be a valid pointer to a valid `VkVideoSessionParametersUpdateInfoKHR` structure

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_INITIALIZATION FAILED`
- `VK_ERROR_TOO_MANY_OBJECTS`

The `VkVideoSessionParametersUpdateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionParametersUpdateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t updateSequenceCount;
} VkVideoSessionParametersUpdateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **updateSequenceCount** is the sequence number of the object update with parameters, starting from 1 and incrementing the value by one with each subsequent update.
Valid Usage (Implicit)

- VUID-VkVideoSessionParametersUpdateInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_UPDATE_INFO_KHR`

- VUID-VkVideoSessionParametersUpdateInfoKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of
  VkVideoDecodeH264SessionParametersAddInfoEXT, VkVideoDecodeH265SessionParametersAddInfoEXT,
  VkVideoEncodeH264SessionParametersAddInfoEXT, or VkVideoEncodeH265SessionParametersAddInfoEXT

- VUID-VkVideoSessionParametersUpdateInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

40.4.7. Destroying Video Session Parameters

To destroy a video session parameters object, call:

```c
// Provided by VK_KHR_video_queue
void vkDestroyVideoSessionParametersKHR(
  VkDevice device,  // Provided by VK_KHR_video_queue
  VkVideoSessionParametersKHR videoSessionParameters,  // Provided by VK_KHR_video_queue
  const VkAllocationCallbacks* pAllocator);  // Provided by VK_KHR_video_queue
```

- `device` is the device the video session parameters object was created with.
- `videoSessionParameters` is the video session parameters object to be destroyed.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage (Implicit)

- VUID-vkDestroyVideoSessionParametersKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-parameter
  If `videoSessionParameters` is not `VK_NULL_HANDLE`, `videoSessionParameters` must be a valid `VkVideoSessionParametersKHR` handle

- VUID-vkDestroyVideoSessionParametersKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

Host Synchronization

- Host access to `videoSessionParameters` must be externally synchronized
40.4.8. Begin Video Coding Scope

To begin a video coding scope, call:

```c
// Provided by VK_KHR_video_queue
void vkCmdBeginVideoCodingKHR(
    VkCommandBuffer commandBuffer,
    const VkVideoBeginCodingInfoKHR* pBeginInfo);
```

- `commandBuffer` is the command buffer to be used when recording commands for the video decode or encode operations.
- `pBeginInfo` is a pointer to a `VkVideoBeginCodingInfoKHR` structure.

After beginning a video coding scope, the session object specified by the `videoSession` member of `VkVideoBeginCodingInfoKHR` is bound to the command buffer, and the command buffer is ready to record video coding operations.

### Valid Usage (Implicit)

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-parameter**
  `commandBuffer must` be a valid `VkCommandBuffer` handle
- **VUID-vkCmdBeginVideoCodingKHR-pBeginInfo-parameter**
  `pBeginInfo must` be a valid pointer to a valid `VkVideoBeginCodingInfoKHR` structure
- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-recording**
  `commandBuffer must` be in the `recording` state
- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from `must` support decode, or encode operations
- **VUID-vkCmdBeginVideoCodingKHR-renderpass**
  This command `must` only be called outside of a render pass instance
- **VUID-vkCmdBeginVideoCodingKHR-videocoding**
  This command `must` only be called outside of a video coding scope
- **VUID-vkCmdBeginVideoCodingKHR-bufferlevel**
  `commandBuffer must` be a primary `VkCommandBuffer`

### Host Synchronization

- Host access to `commandBuffer must` be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from `must` be externally synchronized
The `VkVideoBeginCodingInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoBeginCodingInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoBeginCodingFlagsKHR flags;
    VkVideoSessionKHR videoSession;
    VkVideoSessionParametersKHR videoSessionParameters;
    uint32_t referenceSlotCount;
    const VkVideoReferenceSlotInfoKHR* pReferenceSlots;
} VkVideoBeginCodingInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `videoSession` is the video session object to be bound for the processing of the video commands.
- `videoSessionParameters` is `VK_NULL_HANDLE` or a handle of a `VkVideoSessionParametersKHR` object to be used for the processing of the video commands. If `VK_NULL_HANDLE`, then no video session parameters apply to this command buffer context.
- `referenceSlotCount` is the number of reference slot entries provided in `pReferenceSlots`.
- `pReferenceSlots` is a pointer to an array of `VkVideoReferenceSlotInfoKHR` structures specifying reference slots, used within the video command context between this `vkCmdBeginVideoCodingKHR` command and the `vkCmdEndVideoCodingKHR` command that follows. Each reference slot provides a slot index and the `VkVideoPictureResourceInfoKHR` specifying the reference picture resource bound to this slot index. A slot index must not appear more than once in `pReferenceSlots` in a given command.

### Valid Usage

- VUID-VkVideoBeginCodingInfoKHR-referenceSlotCount-04856
  `VkVideoBeginCodingInfoKHR::referenceSlotCount` must not exceed the value specified in `VkVideoSessionCreateInfoKHR::maxDpbSlots` when creating the video session object that is being provided in `videoSession`.
- VUID-VkVideoBeginCodingInfoKHR-videoSessionParameters-04857
If `videoSessionParameters` is not `VK_NULL_HANDLE`, it must have been created using `videoSession` as a parent object.

### Valid Usage (Implicit)

- **VUID-VkVideoBeginCodingInfoKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_BEGIN_CODING_INFO_KHR`
- **VUID-VkVideoBeginCodingInfoKHR-pNext-pNext**
  - `pNext` must be `NULL`
- **VUID-VkVideoBeginCodingInfoKHR-flags-zerobitmask**
  - `flags` must be `0`
- **VUID-VkVideoBeginCodingInfoKHR-videoSession-parameter**
  - `videoSession` must be a valid `VkVideoSessionKHR` handle
- **VUID-VkVideoBeginCodingInfoKHR-videoSessionParameters-parameter**
  - If `videoSessionParameters` is not `VK_NULL_HANDLE`, `videoSessionParameters` must be a valid `VkVideoSessionParametersKHR` handle
- **VUID-VkVideoBeginCodingInfoKHR-pReferenceSlots-parameter**
  - If `referenceSlotCount` is not `0`, `pReferenceSlots` must be a valid pointer to an array of `referenceSlotCount` valid `VkVideoReferenceSlotInfoKHR` structures
- **VUID-VkVideoBeginCodingInfoKHR-videoSessionParameters-parent**
  - If `videoSessionParameters` is a valid handle, it must have been created, allocated, or retrieved from `videoSession`
- **VUID-VkVideoBeginCodingInfoKHR-commonparent**
  - Both of `videoSession`, and `videoSessionParameters` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoBeginCodingFlagsKHR;

VkVideoBeginCodingFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkVideoReferenceSlotInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoReferenceSlotInfoKHR {
    VkStructureType sType;
    const void* pNext;
    int32_t slotIndex;
    const VkVideoPictureResourceInfoKHR* pPictureResource;
} VkVideoReferenceSlotInfoKHR;
```
• `sType` is the type of this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `slotIndex` is the unique reference slot index used for the encode or decode operation.

• `pPictureResource` is a pointer to a `VkVideoPictureResourceInfoKHR` structure describing the picture resource bound to this slot index.

### Valid Usage (Implicit)

- **VUID-VkVideoReferenceSlotInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_REFERENCE_SLOT_INFO_KHR`

- **VUID-VkVideoReferenceSlotInfoKHR-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoDecodeH264DpbSlotInfoEXT` or `VkVideoDecodeH265DpbSlotInfoEXT`.

- **VUID-VkVideoReferenceSlotInfoKHR-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkVideoReferenceSlotInfoKHR-pPictureResource-parameter**
  
  If `pPictureResource` is not `NULL`, `pPictureResource` must be a valid pointer to a valid `VkVideoPictureResourceInfoKHR` structure.

The `VkVideoPictureResourceInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoPictureResourceInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkOffset2D codedOffset;
    VkExtent2D codedExtent;
    uint32_t baseArrayLayer;
    VkImageView imageViewBinding;
} VkVideoPictureResourceInfoKHR;
```

• `sType` is the type of this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `codedOffset` is the offset to be used for the picture resource.

• `codedExtent` is the extent to be used for the picture resource.

• `baseArrayLayer` is the first array layer to be accessed for the Decode or Encode Operations.

• `imageViewBinding` is a `VkImageView` image view representing this picture resource.

### Valid Usage (Implicit)

- **VUID-VkVideoPictureResourceInfoKHR-sType-sType**
sType must be VK_STRUCTURE_TYPE_VIDEO_PICTURERESOURCE_INFO_KHR

- VUID-VkVideoPictureResourceInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkVideoPictureResourceInfoKHR-imageViewBinding-parameter
  imageViewBinding must be a valid VkImageView handle

### 40.4.9. End Video Coding Scope

To end a video coding scope, call:

```c
// Provided by VK_KHR_video_queue
void vkCmdEndVideoCodingKHR(
    VkCommandBuffer commandBuffer,
    const VkVideoEndCodingInfoKHR* pEndCodingInfo);
```

- `commandBuffer` is the command buffer to be filled by this function.
- `pEndCodingInfo` is a pointer to a VkVideoEndCodingInfoKHR structure.

After ending a video coding scope, the session object previously bound by the corresponding `vkCmdBeginVideoCodingKHR` command is unbound.

#### Valid Usage (Implicit)

- VUID-vkCmdEndVideoCodingKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdEndVideoCodingKHR-pEndCodingInfo-parameter
  pEndCodingInfo must be a valid pointer to a valid VkVideoEndCodingInfoKHR structure

- VUID-vkCmdEndVideoCodingKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdEndVideoCodingKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support decode, or encode operations

- VUID-vkCmdEndVideoCodingKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdEndVideoCodingKHR-videocoding
  This command must only be called inside of a video coding scope

- VUID-vkCmdEndVideoCodingKHR-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

#### Host Synchronization

- Host access to commandBuffer must be externally synchronized
Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>

</table>

The `VkVideoEndCodingInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoEndCodingInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEndCodingFlagsKHR flags;
} VkVideoEndCodingInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

### Valid Usage (Implicit)

- VUID-VkVideoEndCodingInfoKHR-sType-sType
  - `sType must be VK_STRUCTURE_TYPE_VIDEO_END_CODING_INFO_KHR`

- VUID-VkVideoEndCodingInfoKHR-pNext-pNext
  - `pNext must be NULL`

- VUID-VkVideoEndCodingInfoKHR-flags-zerobitmask
  - `flags must be 0`

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoEndCodingFlagsKHR;
```

`VkVideoEndCodingFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 40.4.10. Video Session Control

To apply dynamic controls to the currently bound video session object, call:
void vkCmdControlVideoCodingKHR(
    VkCommandBuffer commandBuffer,
    const VkVideoCodingControlInfoKHR* pCodingControlInfo);

- `commandBuffer` is the command buffer to be filled by this function.
- `pCodingControlInfo` is a pointer to a `VkVideoCodingControlInfoKHR` structure.

Valid Usage (Implicit)

- VUID-vkCmdControlVideoCodingKHR-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdControlVideoCodingKHR-pCodingControlInfo-parameter
  `pCodingControlInfo` must be a valid pointer to a valid `VkVideoCodingControlInfoKHR` structure
- VUID-vkCmdControlVideoCodingKHR-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdControlVideoCodingKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support decode, or encode operations
- VUID-vkCmdControlVideoCodingKHR-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdControlVideoCodingKHR-videocoding
  This command must only be called inside of a video coding scope
- VUID-vkCmdControlVideoCodingKHR-bufferlevel
  `commandBuffer` must be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Inside</td>
<td>Decode, Encode</td>
<td>Action</td>
</tr>
</tbody>
</table>
The control parameters provided in this call are applied to the video session at the time the command executes on the device and are in effect until a subsequent `vkCmdControlVideoCodingKHR` command changes the corresponding control parameters.

The `VkVideoCodingControlInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoCodingControlInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoCodingControlFlagsKHR flags;
} VkVideoCodingControlInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkVideoCodingControlFlagsKHR` specifying control flags.

A newly created video session must be reset before use for video decode or encode operations by including `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR` in `flags`. The reset operation returns all session DPB slots to the unused state (see DPB Slot States).

For encode sessions, the reset operation returns rate control configuration to implementation default settings.

After decode or encode operations are performed on a session, the reset operation may be used to return the video session object to the same initial state as after the reset of a newly created video session. This may be used when different video sequences are processed with the same video session object.

---

**Valid Usage**

- VUID-VkVideoCodingControlInfoKHR-flags-07016
  flags must include at least one bit

- VUID-VkVideoCodingControlInfoKHR-flags-07017
  If the bound video session object is in uninitialized state, then flags must include `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR`

- VUID-VkVideoCodingControlInfoKHR-flags-07018
  If flags includes `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR`, then the pNext chain must include a valid `VkVideoEncodeRateControlInfoKHR` structure

- VUID-VkVideoCodingControlInfoKHR-flags-07019
  If flags includes `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_LAYER_BIT_KHR`, then the pNext chain must include a valid `VkVideoEncodeRateControlLayerInfoKHR` structure

- VUID-VkVideoCodingControlInfoKHR-flags-07020
  If flags includes `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR`, then it must not also include `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_LAYER_BIT_KHR`
• VUID-VkVideoCodingControlInfoKHR-flags-07021
  If flags includes VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR, the rateControlMode member of VkVideoEncodeRateControlInfoKHR included in the pNext chain is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR, and the bound video session was created with VkVideoProfileInfoKHR::videoCodecOperation set to VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT, then the pNext chain must include a VkVideoEncodeH264RateControlInfoEXT structure

• VUID-VkVideoCodingControlInfoKHR-pNext-07022
  If the pNext chain includes a VkVideoEncodeRateControlInfoKHR, and VkVideoEncodeRateControlInfoKHR::layerCount is greater than 1, then VkVideoEncodeH264RateControlInfoEXT::temporalLayerCount must be equal to layerCount

• VUID-VkVideoCodingControlInfoKHR-flags-07023
  If flags includes VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_LAYER_BIT_KHR and the bound video session was created with VkVideoProfileInfoKHR::videoCodecOperation set to VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT, then the pNext chain must include a VkVideoEncodeH264RateControlLayerInfoEXT structure

• VUID-VkVideoCodingControlInfoKHR-flags-07024
  If flags includes VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR, the rateControlMode member of VkVideoEncodeRateControlInfoKHR included in the pNext chain is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR, and the bound video session was created with VkVideoProfileInfoKHR::videoCodecOperation set to VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT, then the pNext chain must include a VkVideoEncodeH265RateControlInfoEXT structure

• VUID-VkVideoCodingControlInfoKHR-pNext-07025
  If the pNext chain includes a VkVideoEncodeRateControlInfoKHR, and VkVideoEncodeRateControlInfoKHR::layerCount is greater than 1, than VkVideoEncodeH265RateControlInfoEXT::subLayerCount must be equal to layerCount

• VUID-VkVideoCodingControlInfoKHR-flags-07026
  If flags includes VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_LAYER_BIT_KHR and the bound video session was created with VkVideoProfileInfoKHR::videoCodecOperation set to VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT, then the pNext chain must include a VkVideoEncodeH265RateControlLayerInfoEXT structure

---

**Valid Usage (Implicit)**

• VUID-VkVideoCodingControlInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_CODING_CONTROL_INFO_KHR

• VUID-VkVideoCodingControlInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkVideoEncodeH264RateControlInfoEXT, VkVideoEncodeH264RateControlLayerInfoEXT, VkVideoEncodeH265RateControlInfoEXT, VkVideoEncodeH265RateControlLayerInfoEXT, or VkVideoEncodeRateControlLayerInfoKHR

• VUID-VkVideoCodingControlInfoKHR-sType-unique
The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkVideoCodingControlInfoKHR-flags-parameter
  flags must be a valid combination of `VkVideoCodingControlFlagBitsKHR` values
- VUID-VkVideoCodingControlInfoKHR-flags-requiredbitmask
  flags must not be 0

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCodingControlFlagsKHR;
```

`VkVideoCodingControlFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoCodingControlFlagBitsKHR`.

Bits which can be set in `VkVideoCodingControlInfoKHR::flags`, specifying the video coding control parameters to be modified, are:

```c
// Provided by VK_KHR_video_queue
typedef enum VkVideoCodingControlFlagBitsKHR {
    VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR = 0x00000001,
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_encode_queue
    VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR = 0x00000002,
#endif
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_encode_queue
    VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_LAYER_BIT_KHR = 0x00000004,
#endif
} VkVideoCodingControlFlagBitsKHR;
```

- `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR` indicates a request for the bound video session to be reset before other coding control parameters are applied.
- `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR` indicates that the coding control parameters include video encode rate control parameters (see `VkVideoEncodeRateControlInfoKHR`).
- `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_LAYER_BIT_KHR` indicates that the coding control parameters include video encode rate control layer parameters (see `VkVideoEncodeRateControlLayerInfoKHR`).

### 40.5. Video Decode Operations

Before the application can start recording Vulkan command buffers for the Video Decode Operations, it must do the following, beforehand:

1. Ensure that the implementation can decode the Video Content by querying the supported codec operations and profiles using `vkGetPhysicalDeviceQueueFamilyProperties2`. 
2. By using `vkGetPhysicalDeviceVideoFormatPropertiesKHR` and providing one or more video profiles, choose the Vulkan formats supported by the implementation. The formats for output and reference pictures must be queried and chosen separately. Refer to the section on enumeration of supported video formats.

3. Before creating an image to be used as a video picture resource, obtain the supported image creation parameters by querying with `vkGetPhysicalDeviceFormatProperties2` and `vkGetPhysicalDeviceImageFormatProperties2` using one of the reported formats and adding `VkVideoProfileListInfoKHR` to the `pNext` chain of `VkFormatProperties2`. When querying the parameters with `vkGetPhysicalDeviceImageFormatProperties2` for images targeting decoded output and reference (DPB) pictures, the `VkPhysicalDeviceImageFormatInfo2::usage` field should contain `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR` and `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`, respectively.

4. Create none, some, or all of the required images for the decoded output and reference pictures. More Video Picture Resources can be created at some later point if needed while processing the decoded content. Also, if the decoded picture size is expected to change, the images can be created based on the maximum decoded content size required.

5. Create the video session to be used for video decode operations. Before creating the Decode Video Session, the decode capabilities should be queried with `vkGetPhysicalDeviceVideoCapabilitiesKHR` to obtain the limits of the parameters allowed by the implementation for a particular codec profile.

6. Bind memory resources with the decode video session by calling `vkBindVideoSessionMemoryKHR`. The video session cannot be used until memory resources are allocated and bound to it. In order to determine the required memory sizes and heap types of the device memory allocations, `vkGetVideoSessionMemoryRequirementsKHR` should be called.

7. Create one or more Session Parameter objects for use across command buffer recording operations, if required by the codec extension in use. These objects must be created against a video session with the parameters required by the codec. Each Session Parameter object created is a child object of the associated Session object and cannot be bound in the command buffer with any other Session Object.

The recording of Video Decode Commands against a Vulkan command buffer consists of the following sequence:

1. `vkCmdBeginVideoCodingKHR` starts the recording of one or more Video Decode operations in the command buffer. For each Video Decode Command operation, a Video Session must be bound to the command buffer within this command. This command establishes a Vulkan Video Decode Context that consists of the bound Video Session Object, Session Parameters Object, and the required Video Picture Resources. The established Video Decode Context is in effect until the `vkCmdEndVideoCodingKHR` command is recorded. If more Video Decode operations are to be required after the `vkCmdEndVideoCodingKHR` command, another Video Decode Context can be started with the `vkCmdBeginVideoCodingKHR` command.

2. `vkCmdDecodeVideoKHR` specifies one or more compressed data buffers to be decoded. The `VkVideoDecodeInfoKHR` parameters, and the codec extension structures chained to this, specify the details of the decode operation.
3. `vkCmdControlVideoCodingKHR` records operations against the decoded data, decoding device, or the Video Session state.

4. `vkCmdEndVideoCodingKHR` signals the end of the recording of the Vulkan Video Decode Context, as established by `vkCmdBeginVideoCodingKHR`.

In addition to the above, the following commands **can** be recorded between `vkCmdBeginVideoCodingKHR` and `vkCmdEndVideoCodingKHR`:

- Query operations
- Global Memory Barriers
- Buffer Memory Barriers
- Image Memory Barriers (these **must** be used to transition the Video Picture Resources to the proper `VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR` and `VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR` layouts).
- Pipeline Barriers
- Events
- Timestamps
- Device Groups (device mask)

The following Video Decode related commands **must** be recorded **outside** the Vulkan Video Decode Context established with the `vkCmdBeginVideoCodingKHR` and `vkCmdEndVideoCodingKHR` commands:

- Sparse Memory Binding
- Copy Commands
- Clear Commands

### 40.5.1. Video Picture Decode Modes

There are a few ways that the `vkCmdDecodeVideoKHR` can be configured for the Video Picture Decode Operations, based on:

- If the **output resource** would need to be used as **Reference Picture** for subsequent decode operations and;
- If **DPB Slots** are required for use as **Reference Pictures** indexes.

The most basic Video Picture Decode operation with the `vkCmdDecodeVideoKHR` command is to output the decoded pixel data without using any DPB **Reference Pictures** and without updating any **DPB Slot's** indexes.

In this case, the following `VkVideoDecodeInfoKHR` parameters **must** be set:

- `VkVideoDecodeInfoKHR::pSetupReferenceSlot->pPictureResource->imageViewBinding` **must** be a valid `VkImageView`. This `VkImageView` represents the **output resource** where the decoded pixels will be populated after a successful decode operation.
• **VkVideoDecodeInfoKHR::pSetupReferenceSlot->slotIndex** must be an invalid DPB Slot index (-1) since the decoded picture is not intended to be used as a reference picture with subsequent video decode operations.

• The value of the **VkVideoDecodeInfoKHR::referenceSlotCount** can be 0 and **VkVideoDecodeInfoKHR::pReferenceSlots** can be NULL.

• If **VkVideoDecodeInfoKHR::pReferenceSlots** is not NULL, it can still have entries representing DPB Slot indexes with a Valid Picture Reference. The codec extension selects the actual use of the Reference Pictures by referring to a DPB Slot index with a Valid Picture Reference.

Video Picture Decode operations with the **vkCmdDecodeVideoKHR** command, requiring one or more Reference Pictures for the predictions of the values of samples for the decoded output picture would require DPB Slots with Valid Picture Reference.

In this case, the following **VkVideoDecodeInfoKHR** parameters must be set:

• **VkVideoDecodeInfoKHR::pSetupReferenceSlot->pPictureResource->imageViewBinding** must be a valid **VkImageView**. This **VkImageView** represents the output resource where the decoded pixels will be populated after a successful decode operation.

• **VkVideoDecodeInfoKHR::pSetupReferenceSlot->slotIndex** must be an invalid DPB Slot index (-1) since the decoded picture is not intended to be used as a reference picture with subsequent video decode operations.

• The value of the **VkVideoDecodeInfoKHR::referenceSlotCount** must not be 0 and **VkVideoDecodeInfoKHR::pReferenceSlots** should represent at least the number of the reference slots required for the decode operation. The codec extension selects the actual use of the Reference Pictures by referring to a DPB Slot index with a Valid Picture Reference. If the implementation does not use an opaque DPB, each DPB slot representing a reference picture must refer to a valid image view. The image views must represent the same image resources that were used to create the reference picture for the corresponding DPB Slot index.

• **VkVideoDecodeInfoKHR::pReferenceSlots** can still have entries representing DPB Slot indexes with a Valid Picture Reference.

After the **vkCmdDecodeVideoKHR** operation is completed successfully, the **VkVideoDecodeInfoKHR::pSetupReferenceSlot->pPictureResource->imageViewBinding** pixel data will be updated with the decoded content. The operation will not update any DPB Slot with Reference Pictures data. However, any DPB Slot activation, invalidation, or deactivation operations requested via **VkVideoDecodeInfoKHR::pReferenceSlots** are still going to be performed.
Video Picture Decode with a Reference Picture slot update and using optional Reference Pictures

When it is known that the picture to be decoded will be used as a reference picture for subsequent decode operations, one of the available DPB Slots needs to be selected for activation and update operations as part of the `vkCmdDecodeVideoKHR` command.

Based on whether a decode operation with reference pictures or without reference pictures is required, the `vkCmdDecodeVideoKHR` should be configured with parameters as described in the previous sections. In addition, one of the available DPB Slots must be selected by the application, activated with resources and then set-up for an update with the decode operation.

In this case, the following `VkVideoDecodeInfoKHR` parameters must be set:

- `VkVideoDecodeInfoKHR::pSetupReferenceSlot->pPictureResource->imageViewBinding` must be a valid `VkImageView`. This `VkImageView` represents the output resource where the decoded pixels will be populated after a successful decode operation. If the implementation does not use an opaque DPB, both the output and reference picture resource coincide.
- `VkVideoDecodeInfoKHR::pSetupReferenceSlot->slotIndex` must be a valid DPB Slot index selected by the application, based on the currently available slots.
- `VkVideoDecodeInfoKHR::pReferenceSlots` can still have entries representing DPB Slot indexes with a Valid Picture Reference.

After the `vkCmdDecodeVideoKHR` operation has completed successfully, the decoded content will be available in the resource provided for `VkVideoDecodeInfoKHR::pSetupReferenceSlot->pPictureResource->imageViewBinding`. In addition, this operation will update the selected DPB Slot with Reference Pictures data. Any other DPB Slot activation, invalidation, or deactivation operation requested via the `VkVideoDecodeInfoKHR::pReferenceSlots` are going to be performed as well.
Figure 33. Decoding a Frame to VkImageView with an update to a Reference Pictures DPB Slot

40.5.2. Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` with `pVideoProfile->videoCodecOperation` specified as one of the decode operation bits, the `VkVideoDecodeCapabilitiesKHR` structure must be included in the `pNext` chain of the `VkVideoCapabilitiesKHR` structure to retrieve capabilities specific to video decoding.

The `VkVideoDecodeCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoDecodeCapabilityFlagsKHR flags;
} VkVideoDecodeCapabilitiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkVideoDecodeCapabilityFlagBitsKHR` describing supported decoding features.

Valid Usage (Implicit)

- VUID-VkVideoDecodeCapabilitiesKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_CAPABILITIES_KHR`
VkVideoDecodeCapabilityFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoDecodeCapabilityFlagBitsKHR.

Bits which may be set in VkVideoDecodeCapabilitiesKHR::flags, indicating the decoding features supported, are:

- **VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR** - reports the implementation supports using the same Video Picture Resource for decode DPB and decode output.
- **VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR** - reports the implementation supports using distinct Video Picture Resources for decode DPB and decode output.

An implementation must report at least one of VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR or VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR as supported.

Note:
If both VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR and VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR are supported, an application may choose to create separate images for decode DPB and decode output in the case where linear tiling is required for output but optimal tiling must still be used for DPB. This avoids scheduling layout transitions at the expense of extra overhead during decoding to write both images and the additional memory requirements.

40.5.3. Video Decode Command Buffer Commands

To decode a frame, call:

- **commandBuffer** is the command buffer to be filled with this function for decode frame command.
- **pDecodeInfo** is a pointer to a VkVideoDecodeInfoKHR structure.
Valid Usage

• VUID-vkCmdDecodeVideoKHR-None-07011
  The bound video session object must not be in uninitializated state

Valid Usage (Implicit)

• VUID-vkCmdDecodeVideoKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-parameter
  pDecodeInfo must be a valid pointer to a valid VkVideoDecodeInfoKHR structure

• VUID-vkCmdDecodeVideoKHR-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdDecodeVideoKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support decode operations

• VUID-vkCmdDecodeVideoKHR-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdDecodeVideoKHR-videocoding
  This command must only be called inside of a video coding scope

• VUID-vkCmdDecodeVideoKHR-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Inside</td>
<td>Decode</td>
<td>Action</td>
</tr>
</tbody>
</table>

The VkVideoDecodeInfoKHR structure is defined as:

// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeInfoKHR {
  VkStructureType sType;
  const void* pNext;
}
• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure. All the codec specific structures related to each frame(picture parameters, quantization matrix, etc.) must be chained here and pass to decode session with the function call `vkCmdDecodeVideoKHR`.

• **flags** is reserved for future use.

• **srcBuffer** is the source buffer that holds the encoded bitstream.

• **srcBufferOffset** is the buffer offset where the valid encoded bitstream starts in `srcBuffer`. It must meet the alignment requirement `minBitstreamBufferOffsetAlignment` within `VkVideoCapabilitiesKHR` queried with the `vkGetPhysicalDeviceVideoCapabilitiesKHR` function.

• **srcBufferRange** is the size of the `srcBuffer` with valid encoded bitstream, starting from `srcBufferOffset`. It must meet the alignment requirement `minBitstreamBufferSizeAlignment` within `VkVideoCapabilitiesKHR` queried with the `vkGetPhysicalDeviceVideoCapabilitiesKHR` function.

• **dstPictureResource** is the destination Decoded Output Picture Resource.

• **pSetupReferenceSlot** is NULL or a pointer to a `VkVideoReferenceSlotInfoKHR` structure used for generating a DPB reference slot and Picture Resource. `pSetupReferenceSlot->slotIndex` specifies the slot index number to use as a target for producing the DPB data. `slotIndex` must reference a valid entry as specified in `VkVideoBeginCodingInfoKHR` via the `pReferenceSlots` within the `vkCmdBeginVideoCodingKHR` command that established the Vulkan Video Decode Context for this command.

• **referenceSlotCount** is the number of the DPB Reference Pictures that will be used when this decoding operation is executing.

• **pReferenceSlots** is a pointer to an array of `VkVideoReferenceSlotInfoKHR` structures specifying the DPB Reference pictures that will be used when this decoding operation is executing.

The coded size of the decode operation is specified in `codedExtent` of `dstPictureResource`.

The coded offset of the decode operation is specified in `codedOffset` of `dstPictureResource`. The purpose of this field is interpreted based on the codec extension. When decoding content in H.264 field mode, `codedOffset` specifies the line or picture field’s offset within the image.

### Valid Usage (Implicit)

- VUID-VkVideoDecodeInfoKHR-sType-sType 2518
**sType** must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_INFO_KHR`

- **VUID-VkVideoDecodeInfoKHR-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkVideoDecodeH264PictureInfoEXT` or `VkVideoDecodeH265PictureInfoEXT`.

- **VUID-VkVideoDecodeInfoKHR-sType-unique**
  The `sType` value of each struct in the `pNext` chain **must** be unique.

- **VUID-VkVideoDecodeInfoKHR-flags-zerobitmask**
  Flags **must** be `0`.

- **VUID-VkVideoDecodeInfoKHR-srcBuffer-parameter**
  `srcBuffer` **must** be a valid `VkBuffer` handle.

- **VUID-VkVideoDecodeInfoKHR-dstPictureResource-parameter**
  `dstPictureResource` **must** be a valid `VkVideoPictureResourceInfoKHR` structure.

- **VUID-VkVideoDecodeInfoKHR-pSetupReferenceSlot-parameter**
  If `pSetupReferenceSlot` is not `NULL`, `pSetupReferenceSlot` **must** be a valid pointer to a valid `VkVideoReferenceSlotInfoKHR` structure.

- **VUID-VkVideoDecodeInfoKHR-pReferenceSlots-parameter**
  If `referenceSlotCount` is not `0`, `pReferenceSlots` **must** be a valid pointer to an array of `referenceSlotCount` valid `VkVideoReferenceSlotInfoKHR` structures.

```c
// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeFlagsKHR;
```

`VkVideoDecodeFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 40.6. Video Decode of AVC (ITU-T H.264)

The `VK_EXT_video_decode_h264` extension adds H.264 codec specific structures needed for decode session to execute decode jobs which include H.264 sequence header, picture parameter header and quantization matrix etc. Unless otherwise noted, all references to the H.264 specification are to the 2010 edition published by the ITU-T, dated March 2010. This specification is available at [https://www.itu.int/rec/T-REC-H.264](https://www.itu.int/rec/T-REC-H.264).

**Note**
Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

#### 40.6.1. H.264 decode profile

A H.264 decode profile is specified using `VkVideoDecodeH264ProfileInfoEXT` chained to `VkVideoProfileInfoKHR` when the codec-operation in `VkVideoProfileInfoKHR` is...
The `VkVideoDecodeH264ProfileInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_decode_h264
typedef struct VkVideoDecodeH264ProfileInfoEXT {
    VkStructureType sType;
    const void* pNext;
    StdVideoH264ProfileIdc stdProfileIdc;
    VkVideoDecodeH264PictureLayoutFlagBitsEXT pictureLayout;
} VkVideoDecodeH264ProfileInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdProfileIdc` is a `StdVideoH264ProfileIdc` value specifying the H.264 codec profile IDC
- `pictureLayout` is a `VkVideoDecodeH264PictureLayoutFlagBitsEXT` value specifying the layout of the decoded picture's contents depending on the nature (progressive vs. interlaced) of the input content.

**Note**

When passing `VkVideoDecodeH264ProfileInfoEXT` to `vkCreateVideoSessionKHR` in the `pNext` chain of `VkVideoSessionCreateInfoKHR`, requests for a `pictureLayout` not supported by the implementation will result in failure of the command.

**Valid Usage**

- **VUID-VkVideoDecodeH264ProfileInfoEXT-pNext-06259**
  If the `VkVideoDecodeH264ProfileInfoEXT` structure is included in the `pNext` chain of the `VkVideoCapabilitiesKHR` structure passed to `vkGetPhysicalDeviceVideoCapabilitiesKHR`, the value in `pictureLayout` is treated as a bitmask of requested picture layouts. It is always valid to use the value `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_EXT` as the implementation is guaranteed to support decoding of progressive content.

- **VUID-VkVideoDecodeH264ProfileInfoEXT-pNext-06260**
  If the `VkVideoDecodeH264ProfileInfoEXT` structure is included in the `pNext` chain of the `VkVideoSessionCreateInfoKHR` structure passed to `vkCreateVideoSessionKHR`, the value in `pictureLayout` must be exactly one of `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_EXT`, `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_EXT` or `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_EXT`.

**Valid Usage (Implicit)**

- **VUID-VkVideoDecodeH264ProfileInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PROFILE_INFO_EXT`
If `pictureLayout` is not 0, `pictureLayout` must be a valid `VkVideoDecodeH264PictureLayoutFlagBitsEXT` value.

```c
// Provided by VK_EXT_video_decode_h264
typedef VkFlags VkVideoDecodeH264PictureLayoutFlagsEXT;
```

`VkVideoDecodeH264PictureLayoutFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoDecodeH264PictureLayoutFlagBitsEXT`.

The H.264 video decode picture layout flags are defined with the following enum:

```c
// Provided by VK_EXT_video_decode_h264
typedef enum VkVideoDecodeH264PictureLayoutFlagBitsEXT {
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_EXT = 0,
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_EXT = 0x00000001,
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_EXT = 0x00000002,
} VkVideoDecodeH264PictureLayoutFlagBitsEXT;
```

- `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_EXT` specifies support for progressive content. This flag has the value 0.
- `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_EXT` specifies support for or use of a picture layout for interlaced content where all lines belonging to the first field are decoded to the even-numbered lines within the picture resource, and all lines belonging to the second field are decoded to the odd-numbered lines within the picture resource.
- `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_EXT` specifies support for or use of a picture layout for interlaced content where all lines belonging to the first field are grouped together in a single plane, followed by another plane containing all lines belonging to the second field.

### 40.6.2. Selecting a H.264 decode profile

When using `vkGetPhysicalDeviceVideoCapabilitiesKHR` to query the capabilities for the input `pVideoProfile` with `videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_EXT`, a `VkVideoDecodeH264ProfileInfoEXT` structure must be chained to `VkVideoProfileInfoKHR` to select a H.264 decode profile. If supported, the implementation returns the capabilities associated with the specified H.264 decode profile. The requirement is similar when querying supported image formats using `vkGetPhysicalDeviceVideoFormatPropertiesKHR`.

A supported H.264 decode profile must be selected when creating a video session by chaining `VkVideoDecodeH264ProfileInfoEXT` to the `VkVideoProfileInfoKHR` field of `VkVideoSessionCreateInfoKHR`. 
40.6.3. Capabilities

The `VkVideoDecodeH264CapabilitiesEXT` structure is defined as:

```c
// Provided by VK_EXT_video_decode_h264
typedef struct VkVideoDecodeH264CapabilitiesEXT {
    VkStructureType sType;
    void* pNext;
    StdVideoH264LevelIdc maxLevelIdc;
    VkOffset2D fieldOffsetGranularity;
} VkVideoDecodeH264CapabilitiesEXT;
```

When using `vkGetPhysicalDeviceVideoCapabilitiesKHR` to query the capabilities for the input `pVideoProfile` with `videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_EXT`, a `VkVideoDecodeH264CapabilitiesEXT` structure must be chained to `VkVideoCapabilitiesKHR` to get this H.264 decode profile specific capabilities.

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxLevel` is the maximum H.264 level supported by the device.
- `fieldOffsetGranularity` - if Interlaced Video Content is supported, the maximum field offset granularity supported for the picture resource.

**Valid Usage (Implicit)**

- VUID-VkVideoDecodeH264CapabilitiesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_CAPABILITIES_EXT`

40.6.4. Decoder Parameter Sets

To reduce parameter traffic during decoding, the decoder parameter set object supports storing H.264 SPS/PPS parameter sets that may be later referenced during decoding.

The `VkVideoDecodeH264SessionParametersCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_decode_h264
typedef struct VkVideoDecodeH264SessionParametersCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxStdSPSCount;
    uint32_t maxStdPPSCount;
    const VkVideoDecodeH264SessionParametersAddInfoEXT* pParametersAddInfo;
} VkVideoDecodeH264SessionParametersCreateInfoEXT;
```

A `VkVideoDecodeH264SessionParametersCreateInfoEXT` structure holding one H.264 SPS and at
least one H.264 PPS parameter set must be chained to VkVideoSessionParametersCreateInfoKHR when calling vkCreateVideoSessionParametersKHR to store these parameter set(s) with the decoder parameter set object for later reference. The provided H.264 SPS/PPS parameters must be within the limits specified during decoder creation for the decoder specified in VkVideoSessionParametersCreateInfoKHR.

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **maxStdSPSCount** is the maximum number of SPS parameters that the VkVideoSessionParametersKHR can contain.
- **maxStdPPSCount** is the maximum number of PPS parameters that the VkVideoSessionParametersKHR can contain.
- **pParametersAddInfo** is NULL or a pointer to a VkVideoDecodeH264SessionParametersAddInfoEXT structure specifying H.264 parameters to add upon object creation.

### Valid Usage (Implicit)

- VUID-VkVideoDecodeH264SessionParametersCreateInfoEXT-sType-sType  
  **sType** must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_CREATE_INFO_EXT
- VUID-VkVideoDecodeH264SessionParametersCreateInfoEXT-pParametersAddInfo-parameter  
  If **pParametersAddInfo** is not NULL, **pParametersAddInfo** must be a valid pointer to a valid VkVideoDecodeH264SessionParametersAddInfoEXT structure

The VkVideoDecodeH264SessionParametersAddInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_decode_h264
typedef struct VkVideoDecodeH264SessionParametersAddInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t stdSPSCount;
    const StdVideoH264SequenceParameterSet* pStdSPSs;
    uint32_t stdPPSCount;
    const StdVideoH264PictureParameterSet* pStdPPSs;
} VkVideoDecodeH264SessionParametersAddInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **stdSPSCount** is the number of SPS elements in **pStdSPSs**. Its value must be less than or equal to the value of **maxStdSPSCount**.
- **pStdSPSs** is a pointer to an array of StdVideoH264SequenceParameterSet structures representing H.264 sequence parameter sets. Each element of the array must have a unique H.264 SPS ID.
- **stdPPSCount** is the number of PPS provided in **pStdPPSs**. Its value must be less than or equal to...
the value of maxStdPPSCount.

- `pStdPPSs` is a pointer to an array of `StdVideoH264PictureParameterSet` structures representing H.264 picture parameter sets. Each element of the array must have a unique H.264 SPS-PPS ID pair.

### Valid Usage

- **VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-stdSPSCount-04822**
  The values of `stdSPSCount` and `stdPPSCount` must be less than or equal to the values of `maxStdSPSCount` and `maxStdPPSCount`, respectively.

- **VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-maxStdSPSCount-04823**
  When the `maxStdSPSCount` number of parameters of type `StdVideoH264SequenceParameterSet` in the Video Session Parameters object is reached, no additional parameters of that type can be added to this object. `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add additional data to this object at this point.

- **VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-maxStdPPSCount-04824**
  When the `maxStdPPSCount` number of parameters of type `StdVideoH264PictureParameterSet` in the Video Session Parameters object is reached, no additional parameters of that type can be added to this object. `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add additional data to this object at this point.

- **VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-None-04825**
  Each entry to be added must have a unique, to the rest of the parameter array entries and the existing parameters in the Video Session Parameters Object that is being updated, SPS-PPS IDs.

- **VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-None-04826**
  Parameter entries that already exist in Video Session Parameters object with a particular SPS-PPS IDs cannot be replaced nor updated.

- **VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-None-04827**
  When creating a new object using a Video Session Parameters as a template, the array’s parameters with the same SPS-PPS IDs as the ones from the template take precedence.

- **VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-None-04828**
  SPS/PPS parameters must comply with the limits specified in `VkVideoSessionCreateInfoKHR` during Video Session creation.

### Valid Usage (Implicit)

- **VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_ADD_INFO_EXT`.

- **VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-pStdSPSs-parameter**
  If `stdSPSCount` is not 0, `pStdSPSs` must be a valid pointer to an array of `stdSPSCount` `StdVideoH264SequenceParameterSet` values.

- **VUID-VkVideoDecodeH264SessionParametersAddInfoEXT-pStdPPSs-parameter**
If stdPPSCount is not 0, pStdPPSs must be a valid pointer to an array of stdPPSCount StdVideoH264PictureParameterSet values.

### 40.6.5. Picture Decoding

To decode a picture, the structure VkVideoDecodeH264PictureInfoEXT may be chained to VkVideoDecodeInfoKHR when calling vkCmdDecodeVideoKHR.

The VkVideoDecodeH264PictureInfoEXT structure represents a picture decode operation and is defined as:

```c
// Provided by VK_EXT_video_decode_h264
typedef struct VkVideoDecodeH264PictureInfoEXT {
    VkStructureType sType;
    const void*pNext;
    const StdVideoDecodeH264PictureInfo*pStdPictureInfo;
    uint32_t sliceCount;
    const uint32_t*pSliceOffsets;
} VkVideoDecodeH264PictureInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pStdPictureInfo** is a pointer to a StdVideoDecodeH264PictureInfo structure specifying the codec standard specific picture information from the H.264 specification.
- **sliceCount** is the number of slices in this picture.
- **pSliceOffsets** is a pointer to an array of sliceCount offsets indicating the start offset of each slice within the bitstream buffer.

#### Valid Usage (Implicit)

- VUID-VkVideoDecodeH264PictureInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PICTURE_INFO_EXT

- VUID-VkVideoDecodeH264PictureInfoEXT-pStdPictureInfo-parameter
  pStdPictureInfo must be a valid pointer to a valid StdVideoDecodeH264PictureInfo value

- VUID-VkVideoDecodeH264PictureInfoEXT-pSliceOffsets-parameter
  pSliceOffsets must be a valid pointer to an array of sliceCount uint32_t values

- VUID-VkVideoDecodeH264PictureInfoEXT-sliceCount-arraylength
  sliceCount must be greater than 0

The VkVideoDecodeH264DpbSlotInfoEXT structure correlates a DPB Slot index with codec-specific information and is defined as:

```c
// Provided by VK_EXT_video_decode_h264
```
typedef struct VkVideoDecodeH264DpbSlotInfoEXT {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH264ReferenceInfo* pStdReferenceInfo;
} VkVideoDecodeH264DpbSlotInfoEXT;

• sType is the type of this structure.

• pStdReferenceInfo is a pointer to a StdVideoDecodeH264ReferenceInfo structure specifying the codec standard specific picture reference information from the H.264 specification.

Valid Usage (Implicit)

• VUID-VkVideoDecodeH264DpbSlotInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_DPB_SLOT_INFO_EXT

• VUID-VkVideoDecodeH264DpbSlotInfoEXT-pStdReferenceInfo-parameter
  pStdReferenceInfo must be a valid pointer to a valid StdVideoDecodeH264ReferenceInfo value

40.7. Video Decode of HEVC (ITU-T H.265)

The VK_EXT_video_decode_h265 extension adds H.265 codec specific structures needed for decode session to execute decode jobs which include H.265 sequence header, picture parameter header and quantization matrix etc. Unless otherwise noted, all references to the H.265 specification are to the 2013 edition published by the ITU-T, dated April 2013. This specification is available at https://www.itu.int/rec/T-REC-H.265.

Note
Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

40.7.1. H.265 decode profile

A H.265 decode profile is specified using VkVideoDecodeH265ProfileInfoEXT chained to VkVideoProfileInfoKHR when the codec-operation in VkVideoProfileInfoKHR is VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_EXT.

The VkVideoDecodeH265ProfileInfoEXT structure is defined as:

// Provided by VK_EXT_video_decode_h265
typedef struct VkVideoDecodeH265ProfileInfoEXT {
    VkStructureType sType;
    const void* pNext;
    StdVideoH265ProfileIdc stdProfileIdc;
} VkVideoDecodeH265ProfileInfoEXT;
VkVideoDecodeH265ProfileInfoEXT;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **stdProfileIdc** is a `StdVideoH265ProfileIdc` value specifying the H.265 codec profile IDC.

**Valid Usage (Implicit)**

- VUID-VkVideoDecodeH265ProfileInfoEXT-sType-sType
  - **sType** must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PROFILE_INFO_EXT`

### 40.7.2. Selecting an H.265 Profile

When using `vkGetPhysicalDeviceVideoCapabilitiesKHR` to query the capabilities for the input `pVideoProfile` with `videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_EXT`, a `VkVideoDecodeH265ProfileInfoEXT` structure **must** be chained to `VkVideoProfileInfoKHR` to select a H.265 decode profile. If supported, the implementation returns the capabilities associated with the specified H.265 decode profile. The requirement is similar when querying supported image formats using `vkGetPhysicalDeviceVideoFormatPropertiesKHR`.

A supported H.265 decode profile **must** be selected when creating a video session by chaining `VkVideoDecodeH265ProfileInfoEXT` to the `VkVideoProfileInfoKHR` field of `VkVideoSessionCreateInfoKHR`.

### 40.7.3. Capabilities

The `VkVideoDecodeH265CapabilitiesEXT` structure is defined as:

```c
// Provided by VK_EXT_video_decode_h265
typedef struct VkVideoDecodeH265CapabilitiesEXT {
    VkStructureType sType;
    void* pNext;
    StdVideoH265LevelIdc maxLevelIdc;
} VkVideoDecodeH265CapabilitiesEXT;
```

When using `vkGetPhysicalDeviceVideoCapabilitiesKHR` to query the capabilities for the parameter `videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_EXT`, a `VkVideoDecodeH265CapabilitiesEXT` structure **can** be chained to `VkVideoCapabilitiesKHR` to return this H.265 extension specific capabilities.

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **maxLevel** is the maximum H.265 level supported by the device.
### Valid Usage (Implicit)

- **VUID-VkVideoDecodeH265CapabilitiesEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_CAPABILITIES_EXT`

#### 40.7.4. Decoder Parameter Sets

To reduce parameter traffic during decoding, the decoder parameter set object supports storing H.265 VPS/SPS/PPS parameter sets that may be later referenced during decoding.

The `VkVideoDecodeH265SessionParametersCreateInfoEXT` structure is defined as:

```c
typedef struct VkVideoDecodeH265SessionParametersCreateInfoEXT {
    VkStructureType sType;  // Provided by VK_EXT_video_decode_h265
    const void* pNext;      // NULL or a pointer to a structure extending this structure.
    uint32_t maxStdVPSCount; // the maximum number of entries of type StdVideoH265VideoParameterSet within VkVideoSessionParametersKHR.
    uint32_t maxStdSPSCount; // the maximum number of SPS parameters that the VkVideoSessionParametersKHR can contain.
    uint32_t maxStdPPSCount; // the maximum number of PPS parameters that the VkVideoSessionParametersKHR can contain.
    const VkVideoDecodeH265SessionParametersAddInfoEXT* pParametersAddInfo; // NULL or a pointer to a VkVideoDecodeH265SessionParametersAddInfoEXT structure specifying H.265 parameters to add upon object creation.
} VkVideoDecodeH265SessionParametersCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxStdVPSCount` is the maximum number of entries of type `StdVideoH265VideoParameterSet` within `VkVideoSessionParametersKHR`.
- `maxStdSPSCount` is the maximum number of SPS parameters that the `VkVideoSessionParametersKHR` can contain.
- `maxStdPPSCount` is the maximum number of PPS parameters that the `VkVideoSessionParametersKHR` can contain.
- `pParametersAddInfo` is `NULL` or a pointer to a `VkVideoDecodeH265SessionParametersAddInfoEXT` structure specifying H.265 parameters to add upon object creation.

When a `VkVideoSessionParametersKHR` object contains `maxStdVPSCount` `StdVideoH265VideoParameterSet` entries, no additional `StdVideoH265VideoParameterSet` entries can be added to it, and `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add these entries. When a `VkVideoSessionParametersKHR` object contains `maxStdSPSCount` `StdVideoH265SequenceParameterSet` entries, no additional `StdVideoH265SequenceParameterSet` entries can be added to it, and `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add these entries. When a `VkVideoSessionParametersKHR` object contains `maxStdPPSCount` `StdVideoH265PictureParameterSet` entries, no additional `StdVideoH265PictureParameterSet` entries can be added to it, and `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add these entries.

The provided H.265 VPS/SPS/PPS parameters **must** be within the limits specified during decoder
creation for the decoder specified in VkVideoSessionParametersCreateInfoKHR.

**Valid Usage (Implicit)**

- VUID-VkVideoDecodeH265SessionParametersCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_PARAMETERS_CREATE_INFO_EXT
- VUID-VkVideoDecodeH265SessionParametersCreateInfoEXT-pParametersAddInfo-
  parameter
  If pParametersAddInfo is not NULL, pParametersAddInfo must be a valid pointer to a valid
  VkVideoDecodeH265SessionParametersAddInfoEXT structure.

The VkVideoDecodeH265SessionParametersAddInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_decode_h265
typedef struct VkVideoDecodeH265SessionParametersAddInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t stdVPSCount;
    const StdVideoH265VideoParameterSet* pStdVPSs;
    uint32_t stdSPSCount;
    const StdVideoH265SequenceParameterSet* pStdSPSs;
    uint32_t stdPPSCount;
    const StdVideoH265PictureParameterSet* pStdPPSs;
} VkVideoDecodeH265SessionParametersAddInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- stdVPSCount is the number of VPS elements in pStdVPSs.
- pStdVPSs is a pointer to an array of stdVPSCount StdVideoH265VideoParameterSet structures representing H.265 video parameter sets.
- stdSPSCount is the number of SPS elements in the pStdSPSs. Its value must be less than or equal to the value of maxStdSPSCount.
- pStdSPSs is a pointer to an array of StdVideoH265SequenceParameterSet structures representing H.265 sequence parameter sets. Each element of the array must have a unique H.265 VPS-SPS ID pair.
- stdPPSCount is the number of PPS provided in pStdPPSs. Its value must be less than or equal to the value of maxStdPPSCount.
- pStdPPSs is a pointer to an array of StdVideoH265PictureParameterSet structures representing H.265 picture parameter sets. Each element of the array entry must have a unique H.265 VPS-SPS-PPS ID tuple.
Valid Usage

- **VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-stdVPSCount-04829**
  The values of `stdVPSCount`, `stdSPSCount` and `stdPPSCount` **must** be less than or equal to the values of `maxStdVPSCount`, `maxStdSPSCount` and `maxStdPPSCount`, respectively.

- **VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-maxStdVPSCount-04830**
  When the `maxStdVPSCount` number of parameters of type `StdVideoH265VideoParameterSet` in the Video Session Parameters object is reached, no additional parameters of that type can be added to the object. `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add additional data to this object at this point.

- **VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-maxStdSPSCount-04831**
  When the `maxStdSPSCount` number of parameters of type `StdVideoH265SequenceParameterSet` in the Video Session Parameters object is reached, no additional parameters of that type can be added to the object. `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add additional data to this object at this point.

- **VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-maxStdPPSCount-04832**
  When the `maxStdPPSCount` number of parameters of type `StdVideoH265PictureParameterSet` in the Video Session Parameters object is reached, no additional parameters of that type can be added to the object. `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add additional data to this object at this point.

- **VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-None-04833**
  Each entry to be added **must** have a unique, to the rest of the parameter array entries and the existing parameters in the Video Session Parameters Object that is being updated, VPS-SPS-PPS IDs.

- **VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-None-04834**
  Parameter entries that already exist in Video Session Parameters object with a particular VPS-SPS-PPS IDs **cannot** be replaced nor updated.

- **VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-None-04835**
  When creating a new object using a Video Session Parameters as a template, the array’s parameters with the same VPS-SPS-PPS IDs as the ones from the template take precedence.

- **VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-None-04836**
  VPS/SPS/PPS parameters **must** comply with the limits specified in ` VkVideoSessionCreateInfoKHR` during Video Session creation.

Valid Usage (Implicit)

- **VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_PARAMETERS_ADD_INFO_EXT`.

- **VUID-VkVideoDecodeH265SessionParametersAddInfoEXT-pStdVPSs-parameter**
  If `stdVPSCount` is not 0, `pStdVPSs` **must** be a valid pointer to an array of `stdVPSCount` `StdVideoH265VideoParameterSet` values.
40.7.5. Picture Parameters

The VkVideoDecodeH265PictureInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_decode_h265
typedef struct VkVideoDecodeH265PictureInfoEXT {
    VkStructureType sType;
    const void* pNext;
    StdVideoDecodeH265PictureInfo* pStdPictureInfo;
    uint32_t sliceCount;
    const uint32_t* pSliceOffsets;
} VkVideoDecodeH265PictureInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pStdPictureInfo** is a pointer to a StdVideoDecodeH265PictureInfo structure specifying codec standard specific picture information from the H.265 specification.
- **sliceCount** is the number of slices in this picture.
- **pSliceOffsets** is a pointer to an array of sliceCount offsets indicating the start offset of each slice within the bitstream buffer.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265PictureInfoEXT-sType-sType
  **sType must** be VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PICTURE_INFO_EXT

- VUID-VkVideoDecodeH265PictureInfoEXT-pStdPictureInfo-parameter
  **pStdPictureInfo must** be a valid pointer to a StdVideoDecodeH265PictureInfo value

- VUID-VkVideoDecodeH265PictureInfoEXT-pSliceOffsets-parameter
  **pSliceOffsets must** be a valid pointer to an array of sliceCount uint32_t values

- VUID-VkVideoDecodeH265PictureInfoEXT-sliceCount-arraylength
  **sliceCount must** be greater than 0

The VkVideoDecodeH265DpbSlotInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_decode_h265
```
typedef struct VkVideoDecodeH265DpbSlotInfoEXT {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH265ReferenceInfo* pStdReferenceInfo;
} VkVideoDecodeH265DpbSlotInfoEXT;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdReferenceInfo` is a pointer to a `StdVideoDecodeH265ReferenceInfo` structure specifying the codec standard specific picture reference information from the H.264 specification.

**Valid Usage (Implicit)**

- VUID-VkVideoDecodeH265DpbSlotInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_DPB_SLOT_INFO_EXT`

- VUID-VkVideoDecodeH265DpbSlotInfoEXT-pStdReferenceInfo-parameter
  `pStdReferenceInfo` must be a valid pointer to a valid `StdVideoDecodeH265ReferenceInfo` value

### 40.8. Video Encode Operations

Before the application can start recording Vulkan command buffers for the Video Encode Operations, it must do the following, beforehand:

1. Ensure that the implementation can encode the Video Content by querying the supported codec operations and profiles using `vkGetPhysicalDeviceQueueFamilyProperties2`.

2. By using `vkGetPhysicalDeviceVideoFormatPropertiesKHR` and providing one or more video profiles, choose the Vulkan formats supported by the implementation. The formats for input and reference pictures must be queried and chosen separately. Refer to the section on enumeration of supported video formats.

3. Before creating an image to be used as a video picture resource, obtain the supported image creation parameters by querying with `vkGetPhysicalDeviceFormatProperties2` and `vkGetPhysicalDeviceImageFormatProperties2` using one of the reported formats and adding `VkVideoProfileListInfoKHR` to the `pNext` chain of `VkFormatProperties2`. When querying the parameters with `vkGetPhysicalDeviceImageFormatProperties2` for images targeting input and reference (DPB) pictures, the `VkPhysicalDeviceImageFormatInfo2::usage` field should contain `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR` and `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`, respectively.

4. Create none, some, or all of the required images for the input and reference pictures. More Video Picture Resources can be created at some later point if needed while processing the content to be encoded. Also, if the size of the picture to be encoded is expected to change, the images can be created based on the maximum expected content size.

5. Create the video session to be used for video encode operations. Before creating the Encode Video Session, the encode capabilities should be queried with
vkGetPhysicalDeviceVideoCapabilitiesKHR to obtain the limits of the parameters allowed by the implementation for a particular codec profile.

6. Bind memory resources with the encode video session by calling vkBindVideoSessionMemoryKHR. The video session cannot be used until memory resources are allocated and bound to it. In order to determine the required memory sizes and heap types of the device memory allocations, vkGetVideoSessionMemoryRequirementsKHR should be called.

7. Create one or more Session Parameter objects for use across command buffer recording operations, if required by the codec extension in use. These objects must be created against a video session with the parameters required by the codec. Each Session Parameter object created is a child object of the associated Session object and cannot be bound in the command buffer with any other Session Object.

The recording of Video Encode Commands against a Vulkan Command Buffer consists of the following sequence:

1. vkCmdBeginVideoCodingKHR starts the recording of one or more Video Encode operations in the command buffer. For each Video Encode Command operation, a Video Session must be bound to the command buffer within this command. This command establishes a Vulkan Video Encode Context that consists of the bound Video Session Object, Session Parameters Object, and the required Video Picture Resources. The established Video Encode Context is in effect until the vkCmdEndVideoCodingKHR command is recorded. If more Video Encode operations are to be required after the vkCmdEndVideoCodingKHR command, another Video Encode Context can be started with the vkCmdBeginVideoCodingKHR command.

2. vkCmdEncodeVideoKHR specifies one or more frames to be encoded. The VkVideoEncodeInfoKHR parameters, and the codec extension structures chained to this, specify the details of the encode operation.

3. vkCmdControlVideoCodingKHR records operations against the encoded data, encoding device, or the Video Session state.

4. vkCmdEndVideoCodingKHR signals the end of the recording of the Vulkan Video Encode Context, as established by vkCmdBeginVideoCodingKHR.

In addition to the above, the following commands can be recorded between vkCmdBeginVideoCodingKHR and vkCmdEndVideoCodingKHR:

- Query operations
- Global Memory Barriers
- Buffer Memory Barriers
- Image Memory Barriers (these must be used to transition the Video Picture Resources to the proper VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR and VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR layouts).
- Pipeline Barriers
- Events
- Timestamps
• Device Groups (device mask)

The following Video Encode related commands must be recorded outside the Vulkan Video Encode Context established with the `vkCmdBeginVideoCodingKHR` and `vkCmdEndVideoCodingKHR` commands:

• Sparse Memory Binding
• Copy Commands
• Clear Commands

### 40.8.1. Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` with `pVideoProfile->videoCodecOperation` specified as one of the encode operation bits, the `VkVideoEncodeCapabilitiesKHR` structure must be included in the `pNext` chain of the `VkVideoCapabilitiesKHR` structure to retrieve capabilities specific to video encoding.

The ` VkVideoEncodeCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeCapabilityFlagsKHR flags;
    VkVideoEncodeRateControlModeFlagsKHR rateControlModes;
    uint8_t rateControlLayerCount;
    uint8_t qualityLevelCount;
    VkExtent2D inputImageDataFillAlignment;
} VkVideoEncodeCapabilitiesKHR;
```

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is a bitmask of `VkVideoEncodeCapabilityFlagBitsKHR` describing supported encoding features.
• `rateControlModes` is a bitmask of `VkVideoEncodeRateControlModeFlagBitsKHR` describing supported rate control modes. All implementations must support `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR`.
• `rateControlLayerCount` reports the maximum number of rate control layers supported. Implementations must report at least 1.
• `qualityLevelCount` is the number of discrete quality levels supported. Implementations must report at least 1.
• `inputImageDataFillAlignment` reports alignment of data that should be filled in the input image horizontally and vertically in pixels before encode operations are performed on the input image.
The input content and encode resolution (specified in `VkVideoEncodeInfoKHR::codedExtent`) may not be aligned with the codec-specific coding block size. For example, the input content may be 1920x1080 and the coding block size may be 16x16 pixel blocks. In this example, the content is horizontally aligned with the coding block size, but not vertically aligned with the coding block size. Encoding of the last row of blocks may be impacted by contents of the input image in pixel rows 1081 to 1088 (the next vertical alignment with the coding block size). In general, to ensure efficient encoding for the last row/column of blocks, and/or to ensure consistent encoding results between repeated encoding of the same input content, these extra pixel rows/columns should be filled to known values up to the coding block size alignment before encoding operations are performed. Some implementations support performing auto-fill of unaligned pixels beyond a specific alignment, which is reported in `inputImageDataFillAlignment`. For example, if an implementation reports 1x1 in `inputImageDataFillAlignment`, then the implementation will perform auto-fill for any unaligned pixels beyond the encode resolution up to the next coding block size. For a coding block size of 16x16, if the implementation reports 16x16 in `inputImageDataFillAlignment`, then it is the application’s responsibility to fill any unaligned pixels, if desired. If not, it may impact the encoding efficiency, but it will not affect the validity of the generated bitstream. If the implementation reports 8x8 in `inputImageDataFillAlignment`, then for the 1920x1080 example, since the content is aligned to 8 pixels vertically, the implementation will auto-fill pixel rows 1081 to 1088 (up to the 16x16 coding block size in the example). The auto-fill value(s) are implementation-specific. The auto-fill value(s) are not written to the input image memory, but are used as part of the encoding operation on the input image.

### Valid Usage (Implicit)

- **VUID-VkVideoEncodeCapabilitiesKHR-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_CAPABILITIES_KHR`

```c
#include <vk VkVideoEncodeCapabilityFlagsKHR.h>

typedef VkFlags VkVideoEncodeCapabilityFlagsKHR;
```

`VkVideoEncodeCapabilityFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoEncodeCapabilityFlagBitsKHR`.

Bits which **may** be set in `VkVideoEncodeCapabilitiesKHR::flags`, indicating the encoding tools supported, are:

```c
#include <vk VkVideoEncodeCapabilityFlagBitsKHR.h>

typedef enum VkVideoEncodeCapabilityFlagBitsKHR {
    VK_VIDEO_ENCODE_CAPABILITY_PRECEDING_EXTERNALLY_ENCODED_BYTES_BIT_KHR =
    0x00000001,
} VkVideoEncodeCapabilityFlagBitsKHR;
```

- **VK_VIDEO_ENCODE_CAPABILITY_PRECEDING_EXTERNALLY_ENCODED_BYTES_BIT_KHR** reports that the implementation supports use of `VkVideoEncodeInfoKHR::precedingExternallyEncodedBytes`. 

---

2535
40.8.2. Video Encode Vulkan Command Buffer Commands

To launch an encode operation that results in bitstream generation, call:

```c
// Provided by VK_KHR_video_encode_queue
void vkCmdEncodeVideoKHR(
    VkCommandBuffer commandBuffer,
    const VkVideoEncodeInfoKHR* pEncodeInfo);
```

- `commandBuffer` is the command buffer to be filled with this function for encoding to generate a bitstream.
- `pEncodeInfo` is a pointer to a `VkVideoEncodeInfoKHR` structure.

**Valid Usage (Implicit)**

- VUID-vkCmdEncodeVideoKHR-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-parameter `pEncodeInfo` must be a valid pointer to a valid `VkVideoEncodeInfoKHR` structure
- VUID-vkCmdEncodeVideoKHR-commandBuffer-recording `commandBuffer` must be in the recording state
- VUID-vkCmdEncodeVideoKHR-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from must support encode operations
- VUID-vkCmdEncodeVideoKHR-renderpass This command must only be called outside of a render pass instance
- VUID-vkCmdEncodeVideoKHR-videocoding This command must only be called inside of a video coding scope
- VUID-vkCmdEncodeVideoKHR-bufferlevel `commandBuffer` must be a primary `VkCommandBuffer`

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Inside</td>
<td>Encode</td>
<td>Action</td>
</tr>
</tbody>
</table>
The VkVideoEncodeInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeFlagsKHR flags;
    uint32_t qualityLevel;
    VkBuffer dstBitstreamBuffer;
    VkDeviceSize dstBitstreamBufferOffset;
    VkDeviceSize dstBitstreamBufferMaxRange;
    VkVideoPictureResourceInfoKHR srcPictureResource;
    const VkVideoReferenceSlotInfoKHR* pSetupReferenceSlot;
    uint32_t referenceSlotCount;
    const VkVideoReferenceSlotInfoKHR* pReferenceSlots;
    uint32_t precedingExternallyEncodedBytes;
} VkVideoEncodeInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is a pointer to a structure extending this structure. A codec-specific extension structure **must** be chained to specify what bitstream unit to generate with this encode operation.
- **flags** is reserved for future use.
- **qualityLevel** is the coding quality level of the encoding. It is defined by the codec-specific extensions.
- **dstBitstreamBuffer** is the buffer where the encoded bitstream output will be produced.
- **dstBitstreamBufferOffset** is the offset in the **dstBitstreamBuffer** where the encoded bitstream output will start. **dstBitstreamBufferOffset**'s value must be aligned to **VkVideoCapabilitiesKHR::minBitstreamBufferOffsetAlignment**, as reported by the implementation.
- **dstBitstreamBufferMaxRange** is the maximum size of the **dstBitstreamBuffer** that can be used while the encoded bitstream output is produced. **dstBitstreamBufferMaxRange**'s value must be aligned to **VkVideoCapabilitiesKHR::minBitstreamBufferSizeAlignment**, as reported by the implementation.
- **srcPictureResource** is the Picture Resource of the Input Picture to be encoded by the operation.
- **pSetupReferenceSlot** is a pointer to a VkVideoReferenceSlotInfoKHR structure used for generating a reconstructed reference slot and Picture Resource. **pSetupReferenceSlot->slotIndex** specifies the slot index number to use as a target for producing the Reconstructed (DPB) data. **pSetupReferenceSlot** must be one of the entries provided in VkVideoBeginCodingInfoKHR via the **pReferenceSlots** within the vkCmdBeginVideoCodingKHR command that established the Vulkan Video Encode Context for this command.
- **referenceSlotCount** is the number of Reconstructed Reference Pictures that will be used when this encoding operation is executing.
- **pReferenceSlots** is NULL or a pointer to an array of VkVideoReferenceSlotInfoKHR structures that will be used when this encoding operation is executing. Each entry in **pReferenceSlots** must be one of the entries provided in VkVideoBeginCodingInfoKHR via the **pReferenceSlots** within the
vkCmdBeginVideoCodingKHR command that established the Vulkan Video Encode Context for this command.

- precedingExternallyEncodedBytes is the number of bytes externally encoded for insertion in the active video encode session overall bitstream prior to the bitstream that will be generated by the implementation for this instance of VkVideoEncodeInfoKHR. Valid when VkVideoEncodeRateControlInfoKHR::rateControlMode is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR. The value provided is used to update the implementation's rate control algorithm for the rate control layer this instance of VkVideoEncodeInfoKHR belongs to, by accounting for the bitrate budget consumed by these externally encoded bytes. See VkVideoEncodeRateControlInfoKHR for additional information about encode rate control.

The coded size of the encode operation is specified in codedExtent of srcPictureResource.

Multiple vkCmdEncodeVideoKHR commands may be recorded within a Vulkan Video Encode Context. The execution of each vkCmdEncodeVideoKHR command will result in generating codec-specific bitstream units. These bitstream units are generated consecutively into the bitstream buffer specified in dstBitstreamBuffer of a VkVideoEncodeInfoKHR structure within the vkCmdBeginVideoCodingKHR command. The produced bitstream is the sum of all these bitstream units, including any padding between the bitstream units. Any bitstream padding must be filled with data compliant to the codec standard so as not to cause any syntax errors during decoding of the bitstream units with the padding included. The range of the bitstream buffer written can be queried via video encode bitstream buffer range queries.

Valid Usage

- VUID-VkVideoEncodeInfoKHR-None-07012
  The bound video session object must not be in uninitialized state

Valid Usage (Implicit)

- VUID-VkVideoEncodeInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_INFO_KHR

- VUID-VkVideoEncodeInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkVideoEncodeH264EmitPictureParametersInfoEXT, VkVideoEncodeH264VclFrameInfoEXT, VkVideoEncodeH265EmitPictureParametersInfoEXT, or VkVideoEncodeH265VclFrameInfoEXT

- VUID-VkVideoEncodeInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkVideoEncodeInfoKHR-flags-zerobitmask
  flags must be 0

- VUID-VkVideoEncodeInfoKHR-dstBitstreamBuffer-parameter
`dstBitstreamBuffer` **must** be a valid `VkBuffer` handle

- VUID-VkVideoEncodeInfoKHR-srcPictureResource-parameter
  `srcPictureResource` **must** be a valid `VkVideoPictureResourceInfoKHR` structure

- VUID-VkVideoEncodeInfoKHR-pSetupReferenceSlot-parameter
  If `pSetupReferenceSlot` is not `NULL`, `pSetupReferenceSlot` **must** be a valid pointer to a valid `VkVideoReferenceSlotInfoKHR` structure

- VUID-VkVideoEncodeInfoKHR-pReferenceSlots-parameter
  If `referenceSlotCount` is not `0`, `pReferenceSlots` **must** be a valid pointer to an array of `referenceSlotCount` valid `VkVideoReferenceSlotInfoKHR` structures

```c
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeFlagsKHR;
```

`VkVideoEncodeFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkVideoEncodeRateControlInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeRateControlInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeRateControlFlagsKHR flags;
    VkVideoEncodeRateControlModeFlagBitsKHR rateControlMode;
    uint8_t layerCount;
    const VkVideoEncodeRateControlLayerInfoKHR* pLayerConfigs;
} VkVideoEncodeRateControlInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `rateControlMode` is a `VkVideoEncodeRateControlModeFlagBitsKHR` value specifying the encode stream rate control mode.
- `layerCount` specifies the number of rate control layers in the video encode stream.
- `pLayerConfigs` is a pointer to an array of `VkVideoEncodeRateControlLayerInfoKHR` structures specifying the rate control configurations of `layerCount` rate control layers.

Including this structure in the `pNext` chain of `VkVideoCodingControlInfoKHR` and including `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR` in `VkVideoCodingControlInfoKHR::flags` will define stream rate control settings for video encoding.

Additional structures providing codec-specific rate control parameters **may** need to be included in the `pNext` chain of `VkVideoCodingControlInfoKHR` depending on the codec profile the bound video
session was created with and the parameters specified in `VkVideoEncodeRateControlInfoKHR` (see Video Session Control).

To ensure that the video session is properly initialized with stream-level rate control settings, the application **must** call `vkCmdControlVideoCodingKHR` with stream-level rate control settings at least once in execution order before the first `vkCmdEncodeVideoKHR` command that is executed after video session reset. If not provided, default implementation-specific stream rate control settings will be used.

Stream rate control settings **can** also be re-initialized during an active video encoding session. The re-initialization takes effect whenever the `VkVideoEncodeRateControlInfoKHR` structure is included in the `pNext` chain of the `VkVideoCodingControlInfoKHR` structure in the call to `vkCmdControlVideoCodingKHR`, and only impacts `vkCmdEncodeVideoKHR` operations that follow in execution order.

### Valid Usage (Implicit)

- **VUID-VkVideoEncodeRateControlInfoKHR-sType-sType**  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_INFO_KHR`

- **VUID-VkVideoEncodeRateControlInfoKHR-flags-zerobitmask**  
  `flags` must be `0`

- **VUID-VkVideoEncodeRateControlInfoKHR-rateControlMode-parameter**  
  `rateControlMode` must be a valid `VkVideoEncodeRateControlModeFlagBitsKHR` value

- **VUID-VkVideoEncodeRateControlInfoKHR-pLayerConfigs-parameter**  
  `pLayerConfigs` must be a valid pointer to an array of `layerCount` valid `VkVideoEncodeRateControlLayerInfoKHR` structures

- **VUID-VkVideoEncodeRateControlInfoKHR-layerCount-arraylength**  
  `layerCount` must be greater than `0`

```c
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeRateControlFlagsKHR;
```

`VkVideoEncodeRateControlFlagsKHR` is a bitmask type for setting a mask, but currently reserved for future use.

The rate control modes are defined with the following enums:

```c
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeRateControlModeFlagBitsKHR {
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR = 0,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR = 1,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR = 2,
} VkVideoEncodeRateControlModeFlagBitsKHR;
```
• VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR for disabling rate control.
• VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR for constant bitrate rate control mode.
• VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR for variable bitrate rate control mode.

typedef VkFlags VkVideoEncodeRateControlModeFlagsKHR;

VkVideoEncodeRateControlModeFlagsKHR is a bitmask type for setting a mask of zero or more
VkVideoEncodeRateControlModeFlagBitsKHR.

The VkVideoEncodeRateControlLayerInfoKHR structure is defined as:

typedef struct VkVideoEncodeRateControlLayerInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t averageBitrate;
    uint32_t maxBitrate;
    uint32_t frameRateNumerator;
    uint32_t frameRateDenominator;
    uint32_t virtualBufferSizeInMs;
    uint32_t initialVirtualBufferSizeInMs;
} VkVideoEncodeRateControlLayerInfoKHR;

• sType is the type of this structure.
• pNext is a pointer to a structure extending this structure.
• averageBitrate is the average bitrate in bits/second. Valid when rate control mode is not
  VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR.
• maxBitrate is the peak bitrate in bits/second. Valid when rate control mode is
  VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR.
• frameRateNumerator is the numerator of the frame rate. Valid when rate control mode is not
  VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR.
• frameRateDenominator is the denominator of the frame rate. Valid when rate control mode is not
  VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR.
• virtualBufferSizeInMs is the leaky bucket model virtual buffer size in milliseconds, with respect
to peak bitrate. Valid when rate control mode is not
  VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR. For example, virtual buffer size is
  (virtualBufferSizeInMs × maxBitrate / 1000).
• initialVirtualBufferSizeInMs is the initial occupancy in milliseconds of the virtual buffer in the
  leaky bucket model. Valid when the rate control mode is not
  VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR.

A codec-specific structure specifying additional per-layer rate control settings must be chained to
VkVideoEncodeRateControlLayerInfoKHR. If multiple rate control layers are enabled
(VkVideoEncodeRateControlInfoKHR::layerCount is greater than 1), then the chained codec-specific extension structure also identifies the specific video coding layer its parent VkVideoEncodeRateControlLayerInfoKHR applies to. If multiple rate control layers are enabled, the number of rate control layers **must** match the number of video coding layers. The specification for an encode codec-specific extension would describe how multiple video coding layers are enabled for the corresponding codec.

Per-layer rate control settings for all enabled rate control layers **must** be initialized or re-initialized whenever stream rate control settings are provided via VkVideoEncodeRateControlInfoKHR. This is done by specifying settings for all enabled rate control layers in VkVideoEncodeRateControlInfoKHR::pLayerConfigs.

Including this structure in the `pNext` chain of VkVideoCodingControlInfoKHR and including `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_LAYER_BIT_KHR` in VkVideoCodingControlInfoKHR::flags will define stream rate control settings for individual layers during video encoding. This adjustment only impacts the specified layer without impacting the rate control settings or implementation rate control algorithm behavior for any other enabled rate control layers. The adjustment takes effect whenever the corresponding `vkCmdControlVideoCodingKHR` is executed, and only impacts `vkCmdEncodeVideoKHR` operations pertaining to the corresponding video coding layer that follow in execution order.

It is possible for an application to enable multiple video coding layers (via codec-specific extensions to encoding operations) while only enabling a single layer of rate control for the entire video stream. To achieve this, layerCount in VkVideoEncodeRateControlInfoKHR **must** be set to 1, and the single VkVideoEncodeRateControlLayerInfoKHR provided in pLayerConfigs would apply to all encoded segments of the video stream, regardless of which codec-defined video coding layer they belong to. In this case, the implementation decides bitrate distribution across video coding layers (if applicable to the specified stream rate control mode).

### Valid Usage (Implicit)

- VUID-VkVideoEncodeRateControlLayerInfoKHR-sType-sType
  
  sType **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_LAYER_INFO_KHR`.

---

### 40.9. Encode H.264

The `VK_EXT_video_encode_h264` extension adds H.264 codec specific structures/types needed to support H.264 encoding. Unless otherwise noted, all references to the H.264 specification are to the 2010 edition published by the ITU-T, dated March 2010. This specification is available at https://www.itu.int/rec/T-REC-H.264.

**Note**

Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.
40.9.1. H.264 encode profile

The VkVideoEncodeH264ProfileInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264ProfileInfoEXT {
    VkStructureType sType;
    const void* pNext;
    StdVideoH264ProfileIdc stdProfileIdc;
} VkVideoEncodeH264ProfileInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdProfileIdc` is a `StdVideoH264ProfileIdc` value specifying the H.264 codec profile IDC.

An H.264 encode profile is specified by including a `VkVideoEncodeH264ProfileInfoEXT` structure in the `pNext` chain of the `VkVideoProfileInfoKHR` structure when `VkVideoProfileInfoKHR::videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264ProfileInfoEXT-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_PROFILE_INFO_EXT`

40.9.2. Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` with `pVideoProfile->videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`, the `VkVideoEncodeH264CapabilitiesEXT` structure must be included in the `pNext` chain of the `VkVideoCapabilitiesKHR` structure to retrieve more capabilities specific to H.264 video encoding.

The `VkVideoEncodeH264CapabilitiesEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264CapabilitiesEXT {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeH264CapabilityFlagsEXT flags;
    VkVideoEncodeH264InputModeFlagsEXT inputModeFlags;
    VkVideoEncodeH264OutputModeFlagsEXT outputModeFlags;
    uint8_t maxPPictureL0ReferenceCount;
    uint8_t maxBPictureL0ReferenceCount;
    uint8_t maxL1ReferenceCount;
    VkBool32 motionVectorsOverPicBoundariesFlag;
    uint32_t maxBytesPerPicDenom;
    uint32_t maxBitsPerMbDenom;
    uint32_t log2MaxMvLengthHorizontal;
    ...
};
```
- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkVideoEncodeH264CapabilityFlagBitsEXT` describing supported encoding tools.
- **inputModeFlags** is a bitmask of `VkVideoEncodeH264InputModeFlagBitsEXT` describing supported command buffer input granularities/modes.
- **outputModeFlags** is a bitmask of `VkVideoEncodeH264OutputModeFlagBitsEXT` describing supported output (bitstream size reporting) granularities/modes.
- **maxPPictureL0ReferenceCount** reports the maximum number of reference pictures the implementation supports in the reference list L0 for P pictures.
- **maxBPictureL0ReferenceCount** reports the maximum number of reference pictures the implementation supports in the reference list L0 for B pictures. The reported value is 0 if encoding of B pictures is not supported.
- **maxL1ReferenceCount** reports the maximum number of reference pictures the implementation supports in the reference list L1 if encoding of B pictures is supported. The reported value is 0 if encoding of B pictures is not supported.
- **motionVectorsOverPicBoundariesFlag** if VK_TRUE, indicates motion_vectors_over_pic_boundaries_flag will be enabled if bitstream_restriction_flag is enabled in StdVideoH264SpsVuiFlags.
- **maxBytesPerPicDenom** reports the value that will be used for max_bytes_per_pic_denom if bitstream_restriction_flag is enabled in StdVideoH264SpsVuiFlags.
- **maxBitsPerMbDenom** reports the value that will be used for max_bits_per_mb_denom if bitstream_restriction_flag is enabled in StdVideoH264SpsVuiFlags.
- **log2MaxMvLengthHorizontal** reports the value that will be used for log2_max_mv_length_horizontal if bitstream_restriction_flag is enabled in StdVideoH264SpsVuiFlags.
- **log2MaxMvLengthVertical** reports the value that will be used for log2_max_mv_length_vertical if bitstream_restriction_flag is enabled in StdVideoH264SpsVuiFlags.

When `vkGetPhysicalDeviceVideoCapabilitiesKHR` is called to query the capabilities with parameter `videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`, a `VkVideoEncodeH264CapabilitiesEXT` structure can be chained to `VkVideoCapabilitiesKHR` to retrieve H.264 extension specific capabilities.

### Valid Usage (Implicit)

- **VUID-VkVideoEncodeH264CapabilitiesEXT-sType-sType**
  - **sType** must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_CAPABILITIES_EXT`
VkVideoEncodeH264CapabilityFlagsEXT is a bitmask type for setting a mask of zero or more "VkVideoEncodeH264CapabilityFlagBitsEXT". Bits which may be set in VkVideoEncodeH264CapabilitiesEXT::flags, indicating the encoding tools supported, are:

- **VK_VIDEO_ENCODE_H264_CAPABILITY_DIRECT_8X8_INFERENCE_ENABLED_BIT_EXT** reports if enabling direct_8x8_inference_flag in StdVideoH264SpsFlags is supported.
- **VK_VIDEO_ENCODE_H264_CAPABILITY_DIRECT_8X8_INFERENCE_DISABLED_BIT_EXT** reports if disabling direct_8x8_inference_flag in StdVideoH264SpsFlags is supported.
- **VK_VIDEO_ENCODE_H264_CAPABILITY_SEPARATE_COLOUR_PLANE_BIT_EXT** reports if enabling separate_colour_plane_flag in StdVideoH264SpsFlags is supported.
• **VK_VIDEO_ENCODE_H264_CAPABILITY_QPPRIME_Y_ZERO_TRANSFORM_BYPASS_BIT_EXT** reports if enabling qpprime_y_zero_transform_bypass_flag in StdVideoH264SpsFlags is supported.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_SCALING_LISTS_BIT_EXT** reports if enabling seq_scaling_matrix_present_flag in StdVideoH264SpsFlags or pic_scaling_matrix_present_flag in StdVideoH264PpsFlags are supported.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_HRD_COMPLIANCE_BIT_EXT** reports if the implementation guarantees generating a HRD compliant bitstream if nal_hrd_parameters_present_flag or vcl_hrd_parameters_present_flag are enabled in StdVideoH264SpsVuiFlags.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_CHROMA_QP_OFFSET_BIT_EXT** reports if setting non-zero chroma_qp_index_offset in StdVideoH264PictureParameterSet is supported.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_SECOND_CHROMA_QP_OFFSET_BIT_EXT** reports if setting non-zero second_chroma_qp_index_offset in StdVideoH264PictureParameterSet is supported.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_PIC_INIT_QP_MINUS26_BIT_EXT** reports if setting non-zero pic_init_qp_minus26 in StdVideoH264PictureParameterSet is supported.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_WEIGHTED_PRED_BIT_EXT** reports if enabling weighted_pred_flag in StdVideoH264PpsFlags is supported.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_WEIGHTED_BIPRED_EXPLICIT_BIT_EXT** reports if using STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_EXPLICIT from StdVideoH264WeightedBipredIdc is supported.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_WEIGHTED_BIPRED_IMPLICIT_BIT_EXT** reports if using STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_IMPLICIT from StdVideoH264WeightedBipredIdc is supported.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_WEIGHTED_PRED_NO_TABLE_BIT_EXT** reports that when weighted_pred_flag is enabled or STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_EXPLICIT from StdVideoH264WeightedBipredIdc is used, the implementation is able to internally decide syntax for pred_weight_table.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_TRANSFORM_8X8_BIT_EXT** reports if enabling transform_8x8_mode_flag in StdVideoH264PpsFlags is supported.

• **VK_VIDEO.Encode_H264.Capability.CABAC_BIT_EXT** reports if CABAC entropy coding is supported.

• **VK_VIDEO.Encode_H264.Capability.CAVLC_BIT_EXT** reports if CAVLC entropy coding is supported. An implementation **must** support at least one entropy coding mode.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_DEBLOCKING_FILTER_DISABLED_BIT_EXT** reports if using STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_DISABLED from StdVideoH264DisableDeblockingFilterIdc is supported.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_DEBLOCKING_FILTER_ENABLED_BIT_EXT** reports if using STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_ENABLED from StdVideoH264DisableDeblockingFilterIdc is supported.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_DEBLOCKING_FILTER_PARTIAL_BIT_EXT** reports if using STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_PARTIAL from StdVideoH264DisableDeblockingFilterIdc is supported. An implementation **must** support at least one deblocking filter mode.

An implementation **must** support at least one entropy coding mode.
• **VK_VIDEO_ENCODE_H264_CAPABILITY_DISABLE_DIRECT_SPATIAL_MV_PRED_BIT_EXT** reports if disabling `StdVideoEncodeH264SliceHeaderFlags::direct_spatial_mv_pred_flag` is supported when it is present in the slice header.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_MULTIPLE_SLICE_PER_FRAME_BIT_EXT** reports if encoding multiple slices per frame is supported. If not set, the implementation is only able to encode a single slice for the entire frame.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_SLICE_MB_COUNT_BIT_EXT** reports support for configuring `VkVideoEncodeH264NaluSliceInfoEXT::mbCount` and `first_mb_in_slice` in `StdVideoEncodeH264SliceHeader` for each slice in a frame with multiple slices. If not supported, the implementation decides the number of macroblocks in each slice based on `VkVideoEncodeH264VclFrameInfoEXT::naluSliceEntryCount`.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_ROW_UNALIGNED_SLICE_BIT_EXT** reports that each slice in a frame with multiple slices may begin or finish at any offset in a macroblock row. If not supported, all slices in the frame must begin at the start of a macroblock row (and hence each slice must finish at the end of a macroblock row).

• **VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_EXT** reports that when **VK_VIDEO_ENCODE_H264_CAPABILITY_MULTIPLE_SLICE_PER_FRAME_BIT_EXT** is supported and a frame is encoded with multiple slices, the implementation allows encoding each slice with a different `StdVideoEncodeH264SliceHeader::slice_type`. If not supported, all slices of the frame must be encoded with the same `slice_type` which corresponds to the picture type of the frame. For example, all slices of a P-frame would be encoded as P-slices.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_EXT** reports support for using a B frame as L1 reference.

```cpp
// Provided by VK_EXT_video_encode_h264
typedef VkFlags VkVideoEncodeH264InputModeFlagsEXT;
```

`VkVideoEncodeH264InputModeFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH264InputModeFlagBitsEXT`.

The `inputModeFlags` field reports the various command buffer input granularities supported by the implementation as follows:

```cpp
// Provided by VK_EXT_video_encode_h264
typedef enum VkVideoEncodeH264InputModeFlagBitsEXT {
    VK_VIDEO_ENCODE_H264_INPUT_MODE_FRAME_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H264_INPUT_MODE_SLICE_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H264_INPUT_MODE_NON_VCL_BIT_EXT = 0x00000004,
} VkVideoEncodeH264InputModeFlagBitsEXT;
```

• **VK_VIDEO_ENCODE_H264_INPUT_MODE_FRAME_BIT_EXT** indicates that a single command buffer must at least encode an entire frame. Any non-VCL NALUs must be encoded using the same command buffer as the frame if **VK_VIDEO_ENCODE_H264_INPUT_MODE_NON_VCL_BIT_EXT** is not supported.

• **VK_VIDEO_ENCODE_H264_INPUT_MODE_SLICE_BIT_EXT** indicates that a single command buffer must at
least encode a single slice. Any non-VCL NALUs must be encoded using the same command buffer as the first slice of the frame if VK_VIDEO_ENCODE_H264_INPUT_MODE_NON_VCL_BIT_EXT is not supported.

- VK_VIDEO_ENCODE_H264_INPUT_MODE_NON_VCL_BIT_EXT indicates that a single command buffer may encode a non-VCL NALU by itself.

An implementation must support at least one of VK_VIDEO_ENCODE_H264_INPUT_MODE_FRAME_BIT_EXT or VK_VIDEO_ENCODE_H264_INPUT_MODE_SLICE_BIT_EXT.

If VK_VIDEO_ENCODE_H264_INPUT_MODE_SLICE_BIT_EXT is not supported, the following two additional restrictions apply for frames encoded with multiple slices. First, all frame slices must have the same pRefList0ModOperations and the same pRefList1ModOperations. Second, the order in which slices appear in VkVideoEncodeH264VclFrameInfoEXT::pNaluSliceEntries or in the command buffer must match the placement order of the slices in the frame.

```cpp
// Provided by VK_EXT_video_encode_h264
typedef VkFlags VkVideoEncodeH264OutputModeFlagsEXT;
```

VkVideoEncodeH264OutputModeFlagsEXT is a bitmask type for setting a mask of zero or more VkVideoEncodeH264InputModeFlagBitsEXT.

Bits which may be set in VkVideoEncodeH264CapabilitiesEXT::outputModeFlags, indicating the minimum bitstream generation commands that must be included between each vkCmdBeginVideoCodingKHR and vkCmdEndVideoCodingKHR pair (henceforth simply begin/end pair), are:

```cpp
// Provided by VK_EXT_video_encode_h264
typedef enum VkVideoEncodeH264OutputModeFlagBitsEXT {
    VK_VIDEO_ENCODE_H264_OUTPUT_MODE_FRAME_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H264_OUTPUT_MODE_SLICE_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H264_OUTPUT_MODE_NON_VCL_BIT_EXT = 0x00000004,
} VkVideoEncodeH264OutputModeFlagBitsEXT;
```

- VK_VIDEO_ENCODE_H264_OUTPUT_MODE_FRAME_BIT_EXT indicates that calls to generate all NALUs of a frame must be included within a single begin/end pair. Any non-VCL NALUs must be encoded within the same begin/end pair if VK_VIDEO_ENCODE_H264_OUTPUT_MODE_NON_VCL_BIT_EXT is not supported.

- VK_VIDEO.Encode_H264_OUTPUT_MODE_SLICE_BIT_EXT indicates that each begin/end pair must encode at least one slice. Any non-VCL NALUs must be encoded within the same begin/end pair as the first slice of the frame if VK_VIDEO_ENCODE_H264_OUTPUT_MODE_NON_VCL_BIT_EXT is not supported.

- VK_VIDEO_ENCODE_H264_OUTPUT_MODE_NON_VCL_BIT_EXT indicates that each begin/end pair may encode only a non-VCL NALU by itself. An implementation must support at least one of VK_VIDEO_ENCODE_H264_OUTPUT_MODE_FRAME_BIT_EXT or VK_VIDEO_ENCODE_H264_OUTPUT_MODE_SLICE_BIT_EXT.
A single begin/end pair must not encode more than a single frame.

The bitstreams of NALUs generated within a single begin/end pair are written continuously into the same bitstream buffer (any padding between the NALUs must be compliant to the H.264 standard).

The supported input modes must be coarser or equal to the supported output modes. For example, it is illegal to report slice input is supported but only frame output is supported.

An implementation must report one of the following combinations of input/output modes:

- Input: Frame, Output: Frame
- Input: Frame, Output: Frame and Non-VCL
- Input: Frame, Output: Slice
- Input: Frame, Output: Slice and Non-VCL
- Input: Slice, Output: Slice
- Input: Slice, Output: Slice and Non-VCL
- Input: Frame and Non-VCL, Output: Frame and Non-VCL
- Input: Frame and Non-VCL, Output: Slice and Non-VCL
- Input: Slice and Non-VCL, Output: Slice and Non-VCL

40.9.3. Encoder Parameter Sets

To reduce parameter traffic during encoding, the encoder parameter set object supports storing H.264 SPS/PPS parameter sets that may be later referenced during encoding.

The VkVideoEncodeH264SessionParametersCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxStdSPSCount;
    uint32_t maxStdPPSCount;
    const VkVideoEncodeH264SessionParametersAddInfoEXT* pParametersAddInfo;
} VkVideoEncodeH264SessionParametersCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **maxStdSPSCount** is the maximum number of SPS parameters that the VkVideoSessionParametersKHR can contain.
- **maxStdPPSCount** is the maximum number of PPS parameters that the VkVideoSessionParametersKHR can contain.
- **pParametersAddInfo** is NULL or a pointer to a VkVideoEncodeH264SessionParametersAddInfoEXT structure specifying H.264 parameters to add upon object creation.
A `VkVideoEncodeH264SessionParametersCreateInfoEXT` structure holding one H.264 SPS and at least one H.264 PPS parameter set must be chained to `VkVideoSessionParametersCreateInfoKHR` when calling `vkCreateVideoSessionParametersKHR` to store these parameter set(s) with the encoder parameter set object for later reference. The provided H.264 SPS/PPS parameters must be within the limits specified during encoder creation for the encoder specified in `VkVideoSessionParametersCreateInfoKHR`.

### Valid Usage (Implicit)

- **VUID-VkVideoEncodeH264SessionParametersCreateInfoEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_CREATE_INFO_EXT`

- **VUID-VkVideoEncodeH264SessionParametersCreateInfoEXT-pParametersAddInfo-parameter**
  
  If `pParametersAddInfo` is not NULL, `pParametersAddInfo` must be a valid pointer to a valid `VkVideoEncodeH264SessionParametersAddInfoEXT` structure.

The `VkVideoEncodeH264SessionParametersAddInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersAddInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t stdSPSCount;
    const StdVideoH264SequenceParameterSet* pStdSPSs;
    uint32_t stdPPSCount;
    const StdVideoH264PictureParameterSet* pStdPPSs;
} VkVideoEncodeH264SessionParametersAddInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `stdSPSCount` is the number of SPS elements in the `pStdSPSs`. Its value must be less than or equal to the value of `maxStdSPSCount`.
- `pStdSPSs` is a pointer to an array of `StdVideoH264SequenceParameterSet` structures representing H.264 sequence parameter sets. Each element of the array must have a unique H.264 SPS ID.
- `stdPPSCount` is the number of PPS provided in `pStdPPSs`. Its value must be less than or equal to the value of `maxStdPPSCount`.
- `pStdPPSs` is a pointer to an array of `StdVideoH264PictureParameterSet` structures representing H.264 picture parameter sets. Each element of the array must have a unique H.264 SPS-PPS ID pair.

### Valid Usage

- **VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-stdSPSCount-04837**
  
  The values of `stdSPSCount` and `stdPPSCount` must be less than or equal to the values of.
maxStdSPSCount and maxStdPPSCount, respectively

- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-maxStdSPSCount-04838
  When the maxStdSPSCount number of parameters of type StdVideoH264SequenceParameterSet in the Video Session Parameters object is reached, no additional parameters of that type can be added to the object. VK_ERROR_TOO_MANY_OBJECTS will be returned if an attempt is made to add additional data to this object at this point.

- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-maxStdPPSCount-04839
  When the maxStdPPSCount number of parameters of type StdVideoH264PictureParameterSet in the Video Session Parameters object is reached, no additional parameters of that type can be added to the object. VK_ERROR_TOO_MANY_OBJECTS will be returned if an attempt is made to add additional data to this object at this point.

- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-None-04840
  Each entry to be added must have a unique, to the rest of the parameter array entries and the existing parameters in the Video Session Parameters Object that is being updated, SPS-PPS IDs.

- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-None-04841
  Parameter entries that already exist in Video Session Parameters object with a particular SPS-PPS IDs cannot be replaced nor updated.

- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-None-04842
  When creating a new object using a Video Session Parameters as a template, the array's parameters with the same SPS-PPS IDs as the ones from the template take precedence.

- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-None-04843
  SPS/PPS parameters must comply with the limits specified in VkVideoSessionCreateInfoKHR during Video Session creation.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_ADD_INFO_EXT.

- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-pStdSPSs-parameter
  If pStdSPSs is not NULL, pStdSPSs must be a valid pointer to an array of stdSPSCount StdVideoH264SequenceParameterSet values.

- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-pStdPPSs-parameter
  If pStdPPSs is not NULL, pStdPPSs must be a valid pointer to an array of stdPPSCount StdVideoH264PictureParameterSet values.

- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-stdSPSCount-arraylength
  stdSPSCount must be greater than 0.

- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-stdPPSCount-arraylength
  stdPPSCount must be greater than 0.
### 40.9.4. Frame Encoding

In order to encode a frame, add a `VkVideoEncodeH264VclFrameInfoEXT` structure to the `pNext` chain of the `VkVideoEncodeInfoKHR` structure passed to the `vkCmdEncodeVideoKHR` command.

The `VkVideoEncodeH264VclFrameInfoEXT` structure representing a frame encode operation is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264VclFrameInfoEXT {
    VkStructureType sType;
    const void* pNext;
    const VkVideoEncodeH264ReferenceListsInfoEXT* pReferenceFinalLists;
    uint32_t naluSliceEntryCount;
    const VkVideoEncodeH264NaluSliceInfoEXT* pNaluSliceEntries;
    const StdVideoEncodeH264PictureInfo* pCurrentPictureInfo;
} VkVideoEncodeH264VclFrameInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pReferenceFinalLists` is `NULL` or a pointer to a `VkVideoEncodeH264ReferenceListsInfoEXT` structure specifying the reference lists to be used for the current picture.
- `naluSliceEntryCount` is the number of slice NALUs in the frame.
- `pNaluSliceEntries` is a pointer to an array of `naluSliceEntryCount` `VkVideoEncodeH264NaluSliceInfoEXT` structures specifying the division of the current picture into slices and the properties of these slices. This is an ordered sequence; the NALUs are generated consecutively in `VkVideoEncodeInfoKHR::dstBitstreamBuffer` in the same order as in this array.
- `pCurrentPictureInfo` is a pointer to a `StdVideoEncodeH264PictureInfo` structure specifying the syntax and other codec-specific information from the H.264 specification associated with this picture. The information provided must reflect the decoded picture marking operations that are applicable to this frame.

### Valid Usage (Implicit)

- **VUID-VkVideoEncodeH264VclFrameInfoEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_VCL_FRAME_INFO_EXT`

- **VUID-VkVideoEncodeH264VclFrameInfoEXT-pReferenceFinalLists-parameter**
  - If `pReferenceFinalLists` is not `NULL`, `pReferenceFinalLists` must be a valid pointer to a valid `VkVideoEncodeH264ReferenceListsInfoEXT` structure.

- **VUID-VkVideoEncodeH264VclFrameInfoEXT-pNaluSliceEntries-parameter**
  - `pNaluSliceEntries` must be a valid pointer to an array of `naluSliceEntryCount` valid `VkVideoEncodeH264NaluSliceInfoEXT` structures.

- **VUID-VkVideoEncodeH264VclFrameInfoEXT-pCurrentPictureInfo-parameter**
  - `pCurrentPictureInfo` must be a valid pointer to a `StdVideoEncodeH264PictureInfo` structure.
pCurrentPictureInfo must be a valid pointer to a valid StdVideoEncodeH264PictureInfo value

- VUID-VkVideoEncodeH264VclFrameInfoEXT-naluSliceEntryCount-arraylength
  naluSliceEntryCount must be greater than 0

The VkVideoEncodeH264NaluSliceInfoEXT structure representing a slice is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264NaluSliceInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t mbCount;
    const VkVideoEncodeH264ReferenceListsInfoEXT* pReferenceFinalLists;
    const StdVideoEncodeH264SliceHeader* pSliceHeaderStd;
} VkVideoEncodeH264NaluSliceInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `mbCount` is the number of macroblocks in this slice.
- `pReferenceFinalLists` is NULL or a pointer to a VkVideoEncodeH264ReferenceListsInfoEXT structure specifying the reference lists to be used for the current slice. If `pReferenceFinalLists` is not NULL, these reference lists override the reference lists provided in VkVideoEncodeH264VclFrameInfoEXT::pReferenceFinalLists.
- `pSliceHeaderStd` is a pointer to a StdVideoEncodeH264SliceHeader structure specifying the slice header for the current slice.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH264NaluSliceInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_NALU_SLICE_INFO_EXT
- VUID-VkVideoEncodeH264NaluSliceInfoEXT-pNext-pNext
  pNext must be NULL
- VUID-VkVideoEncodeH264NaluSliceInfoEXT-pReferenceFinalLists-parameter
  If `pReferenceFinalLists` is not NULL, `pReferenceFinalLists` must be a valid pointer to a valid VkVideoEncodeH264ReferenceListsInfoEXT structure
- VUID-VkVideoEncodeH264NaluSliceInfoEXT-pSliceHeaderStd-parameter
  pSliceHeaderStd must be a valid pointer to a valid StdVideoEncodeH264SliceHeader value

The VkVideoEncodeH264DpbSlotInfoEXT structure, representing a reconstructed picture that is being used as a reference picture, is defined as:

```c
// Provided by VK_EXT_video_encode_h264
```
typedef struct VkVideoEncodeH264DpbSlotInfoEXT {
    VkStructureType sType;
    const void* pNext;
    int8_t slotIndex;
    const StdVideoEncodeH264ReferenceInfo* pStdReferenceInfo;
} VkVideoEncodeH264DpbSlotInfoEXT;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **slotIndex** is the DPB Slot index for this picture. **slotIndex must** match the **slotIndex** in pSetupReferenceSlot of VkVideoEncodeInfoKHR in the command used to encode the corresponding picture.
- **pStdReferenceInfo** is a pointer to a StdVideoEncodeH264ReferenceInfo structure specifying the syntax and other codec-specific information from the H.264 specification associated with this reference picture.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeH264DpbSlotInfoEXT-sType-sType **sType** must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_DPB_SLOT_INFO_EXT
- VUID-VkVideoEncodeH264DpbSlotInfoEXT-pNext-pNext **pNext** must be NULL
- VUID-VkVideoEncodeH264DpbSlotInfoEXT-pStdReferenceInfo-parameter **pStdReferenceInfo** must be a valid pointer to a valid StdVideoEncodeH264ReferenceInfo value

The VkVideoEncodeH264ReferenceListsInfoEXT structure representing reference lists is defined as:

```c
typedef struct VkVideoEncodeH264ReferenceListsInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint8_t referenceList0EntryCount;
    const VkVideoEncodeH264DpbSlotInfoEXT* pReferenceList0Entries;
    uint8_t referenceList1EntryCount;
    const VkVideoEncodeH264DpbSlotInfoEXT* pReferenceList1Entries;
    const StdVideoEncodeH264RefMemMgmtCtrlOperations* pMemMgmtCtrlOperations;
} VkVideoEncodeH264ReferenceListsInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **referenceList0EntryCount** is the number of reference pictures in reference list L0 and is identical to StdVideoEncodeH264SliceHeader::num_ref_idx_l0_active_minus1 + 1.
• \texttt{pReferenceList0Entries} is a pointer to an array of \texttt{referenceList0EntryCount VkVideoEncodeH264DpbSlotInfoEXT} structures specifying the reference list L0 entries for the current picture. The entries provided \textbf{must} be ordered after all reference list L0 modification operations are applied (i.e. final list order). The entries provided \textbf{must} not reflect decoded picture marking operations in this frame that are applicable to references; the impact of such operations \textbf{must} be reflected in future frame encode commands. The slot index in each entry \textbf{must} match one of the slot indexes provided in the \texttt{pReferenceSlots} of the parent \texttt{VkVideoEncodeInfoKHR} structure.

• \texttt{referenceList1EntryCount} is the number of reference pictures in reference list L1 and is identical to \texttt{StdVideoEncodeH264SliceHeader::num_ref_idx_l1_active_minus1 + 1}.

• \texttt{pReferenceList1Entries} is a pointer to an array of \texttt{referenceList1EntryCount VkVideoEncodeH264DpbSlotInfoEXT} structures specifying the reference list L1 entries for the current picture. The entries provided \textbf{must} be ordered after all reference list L1 modification operations are applied (i.e. final list order). The entries provided \textbf{must} not reflect decoded picture marking operations in this frame that are applicable to references; the impact of such operations \textbf{must} be reflected in future frame encode commands. The slot index in each entry \textbf{must} match one of the slot indexes provided in the \texttt{pReferenceSlots} of the parent \texttt{VkVideoEncodeInfoKHR} structure.

• \texttt{pMemMgmtCtrlOperations} is a pointer to a \texttt{StdVideoEncodeH264RefMemMgmtCtrlOperations} structure specifying reference lists modifications and decoded picture marking operations.

### Valid Usage (Implicit)

- \textbf{VUID-VkVideoEncodeH264ReferenceListsInfoEXT-sType-sType} \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_REFERENCE_LISTS_INFO_EXT}

- \textbf{VUID-VkVideoEncodeH264ReferenceListsInfoEXT-pNext-pNext} \texttt{pNext} \textbf{must} be \texttt{NULL}

- \textbf{VUID-VkVideoEncodeH264ReferenceListsInfoEXT-pReferenceList0Entries-parameter} If \texttt{referenceList0EntryCount} is not 0, \texttt{pReferenceList0Entries} \textbf{must} be a valid pointer to an array of \texttt{referenceList0EntryCount} valid \texttt{VkVideoEncodeH264DpbSlotInfoEXT} structures

- \textbf{VUID-VkVideoEncodeH264ReferenceListsInfoEXT-pReferenceList1Entries-parameter} If \texttt{referenceList1EntryCount} is not 0, \texttt{pReferenceList1Entries} \textbf{must} be a valid pointer to an array of \texttt{referenceList1EntryCount} valid \texttt{VkVideoEncodeH264DpbSlotInfoEXT} structures

- \textbf{VUID-VkVideoEncodeH264ReferenceListsInfoEXT-pMemMgmtCtrlOperations-parameter} \texttt{pMemMgmtCtrlOperations} \textbf{must} be a valid pointer to a valid \texttt{StdVideoEncodeH264RefMemMgmtCtrlOperations} value

The \texttt{VkVideoEncodeH264EmitPictureParametersInfoEXT} structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264EmitPictureParametersInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint8_t spsId;
} ...
```
typedef struct VkVideoEncodeH264EmitPictureParametersInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t ppsIdEntryCount;
    const uint8_t* ppsIdEntries;
} VkVideoEncodeH264EmitPictureParametersInfoEXT;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **spsId** is the H.264 SPS ID for the H.264 SPS to insert in the bitstream. The SPS ID must match the SPS provided in *spsStd* of *VkVideoEncodeH264SessionParametersCreateInfoEXT*. This is retrieved from the *VkVideoSessionParametersKHR* object provided in *VkVideoBeginCodingInfoKHR*.
- **emitSpsEnable** enables the emitting of the SPS structure with id of *spsId*.
- **ppsIdEntryCount** is the number of entries in the *ppsIdEntries*. If this parameter is 0 then no pps entries are going to be emitted in the bitstream.
- **ppsIdEntries** is a pointer to an array of H.264 PPS IDs for the H.264 PPS to insert in the bitstream. The PPS IDs must match one of the IDs of the PPS(s) provided in *pStdPPSs* of *VkVideoEncodeH264SessionParametersCreateInfoEXT* to identify the PPS parameter set to insert in the bitstream. This is retrieved from the *VkVideoSessionParametersKHR* object provided in *VkVideoBeginCodingInfoKHR*.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH264EmitPictureParametersInfoEXT-sType-sType
  *sType* must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_EMIT_PICTURE_PARAMETERS_INFO_EXT

- VUID-VkVideoEncodeH264EmitPictureParametersInfoEXT-ppsIdEntries-parameter
  *ppsIdEntries* must be a valid pointer to an array of *ppsIdEntryCount* uint8_t values

- VUID-VkVideoEncodeH264EmitPictureParametersInfoEXT-ppsIdEntryCount-arraylength
  *ppsIdEntryCount* must be greater than 0

### 40.9.5. Rate control

The *VkVideoEncodeH264RateControlInfoEXT* structure is defined as:

```c
typedef struct VkVideoEncodeH264RateControlInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t gopFrameCount;
    uint32_t idrPeriod;
    uint32_t consecutiveBFrameCount;
    VkVideoEncodeH264RateControlStructureEXT rateControlStructure;
    uint8_t temporalLayerCount;
} VkVideoEncodeH264RateControlInfoEXT;
```
• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **gopFrameCount** is the number of frames contained within the group of pictures (GOP), starting from an intra frame and until the next intra frame. If it is set to 0, the implementation chooses a suitable value. If it is set to **UINT32_MAX**, the GOP length is treated as infinite.

• **idrPeriod** is the interval, in terms of number of frames, between two IDR frames. If it is set to 0, the implementation chooses a suitable value. If it is set to **UINT32_MAX**, the IDR period is treated as infinite.

• **consecutiveBFrameCount** is the number of consecutive B-frames between I- and/or P-frames within the GOP.

• **rateControlStructure** is a **VkVideoEncodeH264RateControlStructureEXT** value specifying the expected encode stream reference structure, to aid in rate control calculations.

• **temporalLayerCount** specifies the number of temporal layers enabled in the stream.

In order to provide H.264-specific stream rate control parameters, add a **VkVideoEncodeH264RateControlInfoEXT** structure to the **pNext** chain of the **VkVideoEncodeRateControlInfoKHR** structure in the **pNext** chain of the **VkVideoCodingControlInfoKHR** structure passed to the **vkCmdControlVideoCodingKHR** command.

The parameters from this structure act as a guidance for implementations to apply various rate control heuristics.

It is possible to infer the picture type to be used when encoding a frame, on the basis of the values provided for **consecutiveBFrameCount**, **idrPeriod**, and **gopFrameCount**, but this inferred picture type will not be used by implementations to override the picture type provided in **vkCmdEncodeVideoKHR**. Additionally, it is not required for the video session to be reset if the inferred picture type does not match the actual picture type.

### Valid Usage (Implicit)

- **VUID-VkVideoEncodeH264RateControlInfoEXT-sType-sType**
  
  - **sType** must be **VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_RATE_CONTROL_INFO_EXT**

- **VUID-VkVideoEncodeH264RateControlInfoEXT-rateControlStructure-parameter**
  
  - **rateControlStructure** must be a valid **VkVideoEncodeH264RateControlStructureEXT** value

The **rateControlStructure** in **VkVideoEncodeH264RateControlInfoEXT** specifies one of the following video stream reference structures as a hint for the rate control implementation:

```c
// Provided by VK_EXT_video_encode_h264
typedef enum VkVideoEncodeH264RateControlStructureEXT {
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_STRUCTURE_UNKNOWN_EXT = 0,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_STRUCTURE_FLAT_EXT = 1,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_STRUCTURE_DYADIC_EXT = 2,
} VkVideoEncodeH264RateControlStructureEXT;
```
• **VK_VIDEO_ENCODE_H264_RATE_CONTROL_STRUCTURE_UNKNOWN_EXT** specifies a reference structure unknown at the time of stream rate control configuration.

• **VK_VIDEO_ENCODE_H264_RATE_CONTROL_STRUCTURE_FLAT_EXT** specifies a flat reference structure.

• **VK_VIDEO_ENCODE_H264_RATE_CONTROL_STRUCTURE_DYADIC_EXT** specifies a dyadic reference structure.

The `VkVideoEncodeH264RateControlLayerInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264RateControlLayerInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    uint8_t                  temporalLayerId;
    VkBool32                 useInitialRcQp;
    VkVideoEncodeH264QpEXT   initialRcQp;
    VkBool32                 useMinQp;
    VkVideoEncodeH264QpEXT   minQp;
    VkBool32                 useMaxQp;
    VkVideoEncodeH264QpEXT   maxQp;
    VkBool32                 useMaxFrameSize;
    VkVideoEncodeH264FrameSizeEXT maxFrameSize;
} VkVideoEncodeH264RateControlLayerInfoEXT;
```

• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **temporalLayerId** specifies the H.264 temporal layer ID of the video coding layer that settings provided in this structure and its parent `VkVideoEncodeRateControlLayerInfoKHR` structure apply to.

• **useInitialRcQp** indicates whether the values within `initialRcQp` should be used by the implementation.

• **initialRcQp** provides the QP values for each picture type, to be used in rate control calculations at the start of video encode operations on a newly-created video session, or immediately after a session reset. These values are ignored when `VkVideoEncodeRateControlInfoKHR::rateControlMode` is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_KHR`.

• **useMinQp** indicates whether the values within `minQp` should be used by the implementation. When it is set to `VK_FALSE`, the implementation ignores the values in `minQp` and chooses suitable values.

• **minQp** provides the lower bound on the QP values for each picture type, to be used in rate control calculations.

• **useMaxQp** indicates whether the values within `maxQp` should be used by the implementation. When it is set to `VK_FALSE`, the implementation ignores the values in `maxQp` and chooses suitable values.

• **maxQp** provides the upper bound on the QP values for each picture type, to be used in rate control calculations.

• **useMaxFrameSize** indicates whether the values within `maxFrameSize` should be used by the
maxFrameSize provides the upper bound on the encoded frame size for each picture type. The implementation does not guarantee the encoded frame sizes will be within the specified limits, however these limits may be used as a guide in rate control calculations. If enabled and not set properly, the maxQp limit may prevent the implementation from respecting the maxFrameSize limit.

H.264-specific per-layer rate control parameters must be specified by adding a VkVideoEncodeH264RateControlLayerInfoEXT structure to the pNext chain of each VkVideoEncodeRateControlLayerInfoKHR structure in a call to vkCmdControlVideoCodingKHR command, when the command buffer context has an active video encode H.264 session.

Valid Usage

- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-rateControlMode-06474
  When VkVideoEncodeRateControlInfoKHR::rateControlMode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR, both useMinQp and useMaxQp must be set to VK_TRUE.

- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-rateControlMode-06475
  When VkVideoEncodeRateControlInfoKHR::rateControlMode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE_BIT_KHR, the values provided in minQp must be identical to those provided in maxQp.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_RATE_CONTROL_LAYER_INFO_EXT

- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-initialRcQp-parameter
  initialRcQp must be a valid VkVideoEncodeH264QpEXT structure

- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-minQp-parameter
  minQp must be a valid VkVideoEncodeH264QpEXT structure

- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-maxQp-parameter
  maxQp must be a valid VkVideoEncodeH264QpEXT structure

- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-maxFrameSize-parameter
  maxFrameSize must be a valid VkVideoEncodeH264FrameSizeEXT structure

The VkVideoEncodeH264QpEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264QpEXT {
    int32_t qpI;
    int32_t qpP;
    int32_t qpB;
};
```
• \( qpI \) is the QP to be used for I-frames.
• \( qpP \) is the QP to be used for P-frames.
• \( qpB \) is the QP to be used for B-frames.

The \texttt{VkVideoEncodeH264FrameSizeEXT} structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264FrameSizeEXT {
    uint32_t frameISize;
    uint32_t framePSize;
    uint32_t frameBSize;
} VkVideoEncodeH264FrameSizeEXT;
```

• \texttt{frameISize} is the size in bytes to be used for I-frames.
• \texttt{framePSize} is the size in bytes to be used for P-frames.
• \texttt{frameBSize} is the size in bytes to be used for B-frames.

40.10. Encode H.265

The \texttt{VK_EXT_video_encode_h265} extension adds H.265 codec-specific structures/types needed to support H.265 video encoding. Unless otherwise noted, all references to the H.265 specification are to the 2013 edition published by the ITU-T, dated April 2013. This specification is available at https://www.itu.int/rec/T-REC-H.265.

\textbf{Note}

Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

40.10.1. H.265 encode profile

An H.265 encode profile is specified by including the \texttt{VkVideoEncodeH265ProfileInfoEXT} structure in the \texttt{pNext} chain of the \texttt{VkVideoProfileInfoKHR} structure when \texttt{VkVideoProfileInfoKHR::videoCodecOperation} is \texttt{VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT}.

The \texttt{VkVideoEncodeH265ProfileInfoEXT} structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265ProfileInfoEXT {
    VkStructureType sType;
    const void* pNext;
    StdVideoH265ProfileIdc stdProfileIdc;
} VkVideoEncodeH265ProfileInfoEXT;
```
- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **stdProfileIdc** is a `StdVideoH265ProfileIdc` value specifying the H.265 codec profile IDC.

### Valid Usage (Implicit)

- `VUID-VkVideoEncodeH265ProfileInfoEXT-sType-sType`
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_PROFILE_INFO_EXT`

### 40.10.2. Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` with `pVideoProfile->videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT`, the `VkVideoEncodeH265CapabilitiesEXT` structure must be included in the `pNext` chain of the `VkVideoCapabilitiesKHR` structure to retrieve more capabilities specific to H.265 video encoding.

The `VkVideoEncodeH265CapabilitiesEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265CapabilitiesEXT {
    VkStructureType sType;                        
    void*         pNext;                          
    VkVideoEncodeH265CapabilityFlagsEXT flags;    
    VkVideoEncodeH265InputModeFlagsEXT inputModeFlags; 
    VkVideoEncodeH265OutputModeFlagsEXT outputModeFlags; 
    VkVideoEncodeH265CtbSizeFlagsEXT ctbSizes;   
    VkVideoEncodeH265TransformBlockSizeFlagsEXT transformBlockSizes; 
    uint8_t   maxPPictureL0ReferenceCount;        
    uint8_t   maxBPictureL0ReferenceCount;        
    uint8_t   maxL1ReferenceCount;                
    uint8_t   maxSubLayersCount;                  
    uint8_t   minLog2MinLumaCodingBlockSizeMinus3; 
    uint8_t  maxLog2MinLumaCodingBlockSizeMinus3; 
    uint8_t   minLog2MinLumaTransformBlockSizeMinus2; 
    uint8_t  maxLog2MinLumaTransformBlockSizeMinus2; 
    uint8_t   minMaxTransformHierarchyDepthInter; 
    uint8_t   maxMaxTransformHierarchyDepthInter; 
    uint8_t   minMaxTransformHierarchyDepthIntra; 
    uint8_t   maxMaxTransformHierarchyDepthIntra; 
    uint8_t   maxDiffCuQpDeltaDepth;              
    uint8_t   minMaxNumMergeCand;                 
} VkVideoEncodeH265CapabilitiesEXT;
```
- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkVideoEncodeH265CapabilityFlagBitsEXT describing supported encoding tools.
- **inputModeFlags** is a bitmask of VkVideoEncodeH265InputModeFlagBitsEXT describing the command buffer input granularities/modes supported by the implementation.
- **outputModeFlags** is a bitmask of VkVideoEncodeH265OutputModeFlagBitsEXT describing the output (bitstream size reporting) granularities/modes supported by the implementation.
- **ctbSizes** is a bitmask of VkVideoEncodeH265CtbSizeFlagBitsEXT describing the supported CTB sizes.
- **transformBlockSizes** is a bitmask of VkVideoEncodeH265TransformBlockSizeFlagBitsEXT describing the supported transform block sizes.
- **maxPPictureL0ReferenceCount** reports the maximum number of reference pictures the implementation supports in the reference list L0 for P pictures.
- **maxBPictureL0ReferenceCount** reports the maximum number of reference pictures the implementation supports in the reference list L0 for B pictures. The reported value is 0 if encoding of B pictures is not supported.
- **maxL1ReferenceCount** reports the maximum number of reference pictures the implementation supports in the reference list L1 if encoding of B pictures is supported. The reported value is 0 if encoding of B pictures is not supported.
- **maxSubLayersCount** reports the maximum number of sublayers.
- **minLog2MinLumaCodingBlockSizeMinus3** reports the minimum value that may be set for log2_min_luma_coding_block_size_minus3 in StdVideoH265SequenceParameterSet.
- **maxLog2MinLumaCodingBlockSizeMinus3** reports the maximum value that may be set for log2_min_luma_coding_block_size_minus3 in StdVideoH265SequenceParameterSet.
- **minLog2MinLumaTransformBlockSizeMinus2** reports the minimum value that may be set for log2_min_luma_transform_block_size_minus2 in StdVideoH265SequenceParameterSet.
- **maxLog2MinLumaTransformBlockSizeMinus2** reports the maximum value that may be set for log2_min_luma_transform_block_size_minus2 in StdVideoH265SequenceParameterSet.
- **minMaxTransformHierarchyDepthInter** reports the minimum value that may be set for max_transform_hierarchy_depth_inter in StdVideoH265SequenceParameterSet.
- **maxMaxTransformHierarchyDepthInter** reports the maximum value that may be set for max_transform_hierarchy_depth_inter in StdVideoH265SequenceParameterSet.
- **minMaxTransformHierarchyDepthIntra** reports the minimum value that may be set for max_transform_hierarchy_depth_intra in StdVideoH265SequenceParameterSet.
- **maxMaxTransformHierarchyDepthIntra** reports the maximum value that may be set for max_transform_hierarchy_depth_intra in StdVideoH265SequenceParameterSet.
- `maxDiffCuQpDeltaDepth` reports the maximum value that may be set for `diff_cu_qp_delta_depth` in `StdVideoH265PictureParameterSet`.

- `minMaxNumMergeCand` reports the minimum value that may be set for `MaxNumMergeCand` in `StdVideoEncodeH265SliceHeader`.

- `maxMaxNumMergeCand` reports the maximum value that may be set for `MaxNumMergeCand` in `StdVideoEncodeH265SliceHeader`.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeH265CapabilitiesEXT-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_CAPABILITIES_EXT`

```c
// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265CapabilityFlagsEXT;
```

`VkVideoEncodeH265CapabilityFlagsEXT` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH265CapabilityFlagBitsEXT`.

Bits which **may** be set in `VkVideoEncodeH265CapabilitiesEXT::flags`, indicating the encoding tools supported, are:

```c
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265CapabilityFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_CAPABILITY_SEPARATE_COLOUR_PLANE_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_CAPABILITY_SCALING_LISTS_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_CAPABILITY_SAMPLE_ADAPTIVE_OFFSET_ENABLED_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H265_CAPABILITY_PCM_ENABLE_BIT_EXT = 0x00000008,
    VK_VIDEO_ENCODE_H265_CAPABILITY_SPS_TEMPORAL_MVP_ENABLED_BIT_EXT = 0x00000010,
    VK_VIDEO_ENCODE_H265_CAPABILITY_HRD_COMPLIANCE_BIT_EXT = 0x00000020,
    VK_VIDEO_ENCODE_H265_CAPABILITY_INIT_QP_MINUS26_BIT_EXT = 0x00000040,
    VK_VIDEO_ENCODE_H265_CAPABILITY_LOG2_PARALLEL_MERGE_LEVEL_MINUS2_BIT_EXT = 0x00000080,
    VK_VIDEO_ENCODE_H265_CAPABILITY_SIGN_DATA_HIDING_ENABLED_BIT_EXT = 0x00000100,
    VK_VIDEO_ENCODE_H265_CAPABILITY_TRANSFORM_SKIP_ENABLED_BIT_EXT = 0x00000200,
    VK_VIDEO_ENCODE_H265_CAPABILITY_TRANSFORM_SKIP_DISABLED_BIT_EXT = 0x00000400,
    VK_VIDEO_ENCODE_H265_CAPABILITY_TRANSQUANT_BYPASS_ENABLED_BIT_EXT = 0x00000800,
    VK_VIDEO_ENCODE_H265_CAPABILITY_ENTROPY_CODING_SYNC_ENABLED_BIT_EXT = 0x00010000,
    VK_VIDEO_ENCODE_H265_CAPABILITY_DEBLOCKING_FILTER_OVERRIDE_ENABLED_BIT_EXT = 0x00020000,
    VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILE_PER_FRAME_BIT_EXT = 0x00040000,
} VkVideoEncodeH265CapabilityFlagBitsEXT;
```
VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_SLICE_PER_TILE_BIT_EXT = 0x00080000,
VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILE_PER_SLICE_BIT_EXT = 0x00100000,
VK_VIDEO_ENCODE_H265_CAPABILITY_SLICE_SEGMENT_CTB_COUNT_BIT_EXT = 0x00200000,
VK_VIDEO_ENCODE_H265_CAPABILITY_ROW_UNALIGNED_SLICE_SEGMENT_BIT_EXT = 0x00400000,
VK_VIDEO_ENCODE_H265_CAPABILITY_DEPENDENT_SLICE_SEGMENT_BIT_EXT = 0x00800000,
VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_EXT = 0x01000000,
VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_EXT = 0x02000000,
VK_VIDEO_ENCODE_H265_CAPABILITY_SEPARATE_COLOUR_PLANE_BIT_EXT reports if enabling separate_colour_plane_flag in StdVideoH265SpsFlags is supported.
VK_VIDEO_ENCODE_H265_CAPABILITY_SCALING_lists_BIT_EXT reports if enabling scaling_list_enabled_flag and sps_scaling_list_data_present_flag in StdVideoH265SpsFlags, or enabling pps_scaling_list_data_present_flag in StdVideoH265PpsFlags are supported.
VK_VIDEO_ENCODE_H265_CAPABILITY_SAMPLE_ADAPTIVE_OFFSET_ENABLED_BIT_EXT reports if enabling sample_adaptive_offset_enabled_flag in StdVideoH265SpsFlags is supported.
VK_VIDEO_ENCODE_H265_CAPABILITY_PCM_ENABLE_BIT_EXT reports if enabling pcm_enable_flag in StdVideoH265SpsFlags is supported.
VK_VIDEO_ENCODE_H265_CAPABILITY_SPS_TEMPORAL_MVP_ENABLED_BIT_EXT reports if enabling sps_temporal_mvp_enabled_flag in StdVideoH265SpsFlags is supported.
VK_VIDEO_ENCODE_H265_CAPABILITY_HRD_COMPLIANCE_BIT_EXT reports if the implementation guarantees generating a HRD compliant bitstream if nal_hrd_parameters_present_flag, vcl_hrd_parameters_present_flag, or sub_pic_hrd_params_present_flag are enabled in StdVideoH265HrdFlags, or vui_hrd_parameters_present_flag is enabled in StdVideoH265SpsVuiFlags.
VK_VIDEO_ENCODE_H265_CAPABILITY_INIT_QP_MINUS26_BIT_EXT reports if setting non-zero init_qp_minus26 in StdVideoH265PictureParameterSet is supported.
VK_VIDEO_ENCODE_H265_CAPABILITY_LOG2_PARALLEL_MERGE_LEVEL_MINUS2_BIT_EXT reports if setting non-zero value for log2_parallel_merge_level_minus2 in StdVideoH265PictureParameterSet is supported.
VK_VIDEO_ENCODE_H265_CAPABILITY_SIGN_DATA_HIDING_ENABLED_BIT_EXT reports if enabling sign_data_hiding_enabled_flag in StdVideoH265PpsFlags is supported.
VK_VIDEO_ENCODE_H265_CAPABILITY_TRANSFORM_SKIP_ENABLED_BIT_EXT reports if enabling transform_skip_enabled_flag in StdVideoH265PpsFlags is supported.
VK_VIDEO_ENCODE_H265_CAPABILITY_TRANSFORM_SKIP_DISABLED_BIT_EXT reports if disabling transform_skip_enabled_flag in StdVideoH265PpsFlags is supported. Implementations must report at least one of VK_VIDEO_ENCODE_H265_CAPABILITY_TRANSFORM_SKIP_ENABLED_BIT_EXT and VK_VIDEO_ENCODE_H265_CAPABILITY_TRANSFORM_SKIP_DISABLED_BIT_EXT as supported.
VK_VIDEO_ENCODE_H265_CAPABILITY_PPS_SLICE_CHROMA_QP_OFFSETS_PRESENT_BIT_EXT reports if enabling pps_slice_chroma_qp_offsets_present_flag in StdVideoH265PpsFlags is supported.
VK_VIDEO_ENCODE_H265_CAPABILITY_WEIGHTED_PRED_BIT_EXT reports if enabling weighted_pred_flag in StdVideoH265PpsFlags is supported.
VK_VIDEO_ENCODE_H265_CAPABILITY_WEIGHTED_BIPRED_BIT_EXT reports if enabling weighted_bipred_flag in StdVideoH265PpsFlags is supported.
} VkVideoEncodeH265CapabilityFlagBitsEXT;
• **VK_VIDEO_ENCODE_H265_CAPABILITY_WEIGHTED_PRED_NO_TABLE_BIT_EXT** reports that when
  weighted_pred_flag or weighted_bipred_flag in StdVideoH265PpsFlags are enabled, the
  implementation is able to internally decide syntax for pred_weight_table.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_TRANSQUANT_BYPASS_ENABLED_BIT_EXT** reports if enabling
  transquant_bypass_enabled_flag in StdVideoH265PpsFlags is supported.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_ENTROPY_CODING_SYNC_ENABLED_BIT_EXT** reports if enabling
  entropy_coding_sync_enabled_flag in StdVideoH265PpsFlags is supported.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_DEBLOCKING_FILTER OVERRIDE_ENABLED_BIT_EXT** reports if
  enabling deblocking_filter_override_enabled_flag in StdVideoH265PpsFlags is supported.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE TILE PER FRAME BIT_EXT** reports if encoding multiple
  tiles per frame is supported. If not set, the implementation is only able to encode a single tile for
  each frame.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE SLICE PER TILE BIT_EXT** reports if encoding multiple
  slices per tile is supported. If not set, the implementation is only able to encode a single slice for
  each tile.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE TILE PER SLICE BIT_EXT** reports if encoding multiple
  tiles per slice is supported. If not set, the implementation is only able to encode a single tile for
  each slice.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_SLICE SEGMENT CTB COUNT BIT_EXT** reports support for
  configuring VkVideoEncodeH265NaluSliceSegmentInfoEXT::ctbCount and slice_segment_address
  in StdVideoEncodeH265SliceSegmentHeader for each slice segment in a frame with multiple
  slice segments. If not supported, the implementation decides the number of CTBs in each slice
  segment based on VkVideoEncodeH265VclFrameInfoEXT::naluSliceSegmentEntryCount.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_ROW UNALIGNED SLICE SEGMENT BIT_EXT** reports that each slice
  segment in a frame with a single or multiple tiles per slice may begin or finish at any offset in a
  CTB row. If not supported, all slice segments in such a frame must begin at the start of a CTB
  row (and hence each slice segment must finish at the end of a CTB row). Also reports that each
  slice segment in a frame with multiple slices per tile may begin or finish at any offset within the
  enclosing tile’s CTB row. If not supported, slice segments in such a frame must begin at the start
  of the enclosing tile’s CTB row (and hence each slice segment must finish at the end of the
  enclosing tile’s CTB row).

• **VK_VIDEO_ENCODE_H265_CAPABILITY_DEPENDENT SLICE SEGMENT BIT_EXT** reports if enabling
  dependent_slice_segment_flag in StdVideoEncodeH265SliceHeaderFlags is supported.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT SLICE TYPE BIT_EXT** reports that when
  VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE SLICE PER TILE BIT_EXT is supported and a frame is
  encoded with multiple slices, the implementation allows encoding each slice segment with a
  different StdVideoEncodeH265SliceSegmentHeader::slice_type. If not supported, all slice segments
  of the frame must be encoded with the same slice_type which corresponds to the picture type
  of the frame. For example, all slice segments of a P-frame would be encoded as P-slices.

• **VK_VIDEO_ENCODE_H265_CAPABILITY_B FRAME IN L1 LIST BIT_EXT** reports support for using a B
  frame as L1 reference.
typedef VkFlags VkVideoEncodeH265InputModeFlagsEXT;

VkVideoEncodeH265InputModeFlagsEXT is a bitmask type for setting a mask of zero or more 
VkVideoEncodeH265InputModeFlagBitsEXT.

Bits which may be set in VkVideoEncodeH265CapabilitiesEXT::inputModeFlags, indicating the 
command buffer input granularities supported by the implementation, are:

typedef enum VkVideoEncodeH265InputModeFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_INPUT_MODE_FRAME_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_INPUT_MODE_SLICE_SEGMENT_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_INPUT_MODE_NON_VCL_BIT_EXT = 0x00000004,
} VkVideoEncodeH265InputModeFlagBitsEXT;

• VK_VIDEO_ENCODE_H265_INPUT_MODE_FRAME_BIT_EXT indicates that a single command buffer must at 
least encode an entire frame. Any non-VCL NALUs must be encoded using the same command 
buffer as the frame if VK_VIDEO_ENCODE_H265_INPUT_MODE_NON_VCL_BIT_EXT is not supported.

• VK_VIDEO_ENCODE_H265_INPUT_MODE_SLICE_SEGMENT_BIT_EXT indicates that a single command buffer 
must at least encode a single slice segment. Any non-VCL NALUs must be encoded using the 
same command buffer as the first slice segment of the frame if 
VK_VIDEO_ENCODE_H265_INPUT_MODE_NON_VCL_BIT_EXT is not supported.

• VK_VIDEO_ENCODE_H265_INPUT_MODE_NON_VCL_BIT_EXT indicates that a single command buffer may 
encode a non-VCL NALU by itself.

An implementation must support at least one of VK_VIDEO_ENCODE_H265_INPUT_MODE_FRAME_BIT_EXT or
VK_VIDEO_ENCODE_H265_INPUT_MODE_SLICE_SEGMENT_BIT_EXT.

If VK_VIDEO_ENCODE_H265_INPUT_MODE_SLICE_SEGMENT_BIT_EXT is not supported, the following two 
additional restrictions apply for frames encoded with multiple slice segments. First, all frame slice 
segments must have the same pReferenceFinalLists. Second, the order in which slice segments 
appear in VkVideoEncodeH265VclFrameInfoEXT::pNaluSliceSegmentEntries or in the command 
buffer must match the placement order of the slice segments in the frame.

typedef VkFlags VkVideoEncodeH265OutputModeFlagsEXT;

VkVideoEncodeH265OutputModeFlagsEXT is a bitmask type for setting a mask of zero or more 
VkVideoEncodeH265OutputModeFlagBitsEXT.

Bits which may be set in VkVideoEncodeH265CapabilitiesEXT::outputModeFlags, indicating the 
minimum bitstream generation commands that must be included between each 
vkCmdBeginVideoCodingKHR and vkCmdEndVideoCodingKHR pair (henceforth simply begin/end pair), are:
// Provided by VK_EXT_video_encode_h265

typedef enum VkVideoEncodeH265OutputModeFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_OUTPUT_MODE_FRAME_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_OUTPUT_MODE_SLICE_SEGMENT_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_OUTPUT_MODE_NON_VCL_BIT_EXT = 0x00000004,
} VkVideoEncodeH265OutputModeFlagBitsEXT;

• **VK_VIDEO_ENCODE_H265_OUTPUT_MODE_FRAME_BIT_EXT** indicates that calls to generate all NALUs of a frame **must** be included within a single begin/end pair. Any non-VCL NALUs **must** be encoded within the same begin/end pair if **VK_VIDEO_ENCODE_H265_OUTPUT_MODE_NON_VCL_BIT_EXT** is not supported.

• **VK_VIDEO_ENCODE_H265_OUTPUT_MODE_SLICE_SEGMENT_BIT_EXT** indicates that each begin/end pair **must** encode at least one slice segment. Any non-VCL NALUs **must** be encoded within the same begin/end pair as the first slice segment of the frame if **VK_VIDEO_ENCODE_H265_OUTPUT_MODE_NON_VCL_BIT_EXT** is not supported.

• **VK_VIDEO_ENCODE_H265_OUTPUT_MODE_NON_VCL_BIT_EXT** indicates that each begin/end pair **may** encode only a non-VCL NALU by itself. An implementation **must** support at least one of **VK_VIDEO_ENCODE_H265_OUTPUT_MODE_FRAME_BIT_EXT** or **VK_VIDEO_ENCODE_H265_OUTPUT_MODE_SLICE_SEGMENT_BIT_EXT**.

A single begin/end pair **must** not encode more than a single frame.

The bitstreams of NALUs generated within a single begin/end pair are written continuously into the same bitstream buffer (any padding between the NALUs **must** be compliant to the H.265 standard).

The supported input modes **must** be coarser or equal to the supported output modes. For example, it is illegal to report slice segment input is supported but only frame output is supported.

An implementation **must** report one of the following combinations of input/output modes:

• Input: Frame, Output: Frame
• Input: Frame, Output: Frame and Non-VCL
• Input: Frame, Output: Slice Segment
• Input: Frame, Output: Slice Segment and Non-VCL
• Input: Slice Segment, Output: Slice Segment
• Input: Slice Segment, Output: Slice Segment and Non-VCL
• Input: Frame and Non-VCL, Output: Frame and Non-VCL
• Input: Frame and Non-VCL, Output: Slice Segment and Non-VCL
• Input: Slice Segment and Non-VCL, Output: Slice Segment and Non-VCL

// Provided by VK_EXT_video_encode_h265

typedef VkFlags VkVideoEncodeH265CtbSizeFlagsEXT;
VkVideoEncodeH265CtbSizeFlagsEXT is a bitmask type for setting a mask of zero or more VkVideoEncodeH265CtbSizeFlagBitsEXT. Implementations must set at least one of VkVideoEncodeH265CtbSizeFlagBitsEXT.

Bits which may be set in VkVideoEncodeH265CapabilitiesEXT::ctbSizes, indicating the CTB sizes supported by the implementation, are:

```c
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265CtbSizeFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_CTB_SIZE_16_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_CTB_SIZE_32_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_CTB_SIZE_64_BIT_EXT = 0x00000004,
} VkVideoEncodeH265CtbSizeFlagBitsEXT;
```

- VK_VIDEO_ENCODE_H265_CTB_SIZE_16_BIT_EXT specifies that a CTB size of 16x16 is supported.
- VK_VIDEO_ENCODE_H265_CTB_SIZE_32_BIT_EXT specifies that a CTB size of 32x32 is supported.
- VK_VIDEO_ENCODE_H265_CTB_SIZE_64_BIT_EXT specifies that a CTB size of 64x64 is supported.

VkVideoEncodeH265TransformBlockSizeFlagsEXT is a bitmask type for setting a mask of zero or more VkVideoEncodeH265TransformBlockSizeFlagBitsEXT. Implementations must set at least one of VkVideoEncodeH265TransformBlockSizeFlagBitsEXT.

Bits which may be set in VkVideoEncodeH265CapabilitiesEXT::transformBlockSizes, indicating the transform block sizes supported by the implementation, are:

```c
// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265TransformBlockSizeFlagsEXT;
```

VkVideoEncodeH265TransformBlockSizeFlagsEXT is a bitmask type for setting a mask of zero or more VkVideoEncodeH265TransformBlockSizeFlagBitsEXT. Implementations must set at least one of VkVideoEncodeH265TransformBlockSizeFlagBitsEXT.

Bits which may be set in VkVideoEncodeH265CapabilitiesEXT::transformBlockSizes, indicating the transform block sizes supported by the implementation, are:

```c
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265TransformBlockSizeFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_4_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_8_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_16_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_32_BIT_EXT = 0x00000008,
} VkVideoEncodeH265TransformBlockSizeFlagBitsEXT;
```

- VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_4_BIT_EXT specifies that a transform block size of 4x4 is supported.
- VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_8_BIT_EXT specifies that a transform block size of 8x8 is supported.
- VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_16_BIT_EXT specifies that a transform block size of 16x16 is supported.
- VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_32_BIT_EXT specifies that a transform block size of 32x32 is supported.
40.10.3. Encoder H.265 Video Session Parameters Object

When creating a Video Session Parameters object, add a VkVideoEncodeH265SessionParametersCreateInfoEXT structure to the pNext chain of the VkVideoSessionParametersCreateInfoKHR structure passed to vkCreateVideoSessionParametersKHR in order to specify the H.265-specific video encoder session parameters.

The VkVideoEncodeH265SessionParametersCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxStdVPSCount;
    uint32_t maxStdSPSCount;
    uint32_t maxStdPPSCount;
    const VkVideoEncodeH265SessionParametersAddInfoEXT* pParametersAddInfo;
} VkVideoEncodeH265SessionParametersCreateInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxStdVPSCount is the maximum number of entries of type StdVideoH265VideoParameterSet within VkVideoSessionParametersKHR.
- maxStdSPSCount is the maximum number of entries of type StdVideoH265SequenceParameterSet within VkVideoSessionParametersKHR.
- maxStdPPSCount is the maximum number of entries of type StdVideoH265PictureParameterSet within VkVideoSessionParametersKHR.
- pParametersAddInfo is NULL or a pointer to a VkVideoEncodeH265SessionParametersAddInfoEXT structure specifying the video session parameters to add upon creation of this object.

When a VkVideoSessionParametersKHR object contains maxStdVPSCount StdVideoH265VideoParameterSet entries, no additional StdVideoH265VideoParameterSet entries can be added to it, and VK_ERROR_TOO_MANY_OBJECTS will be returned if an attempt is made to add these entries. When a VkVideoSessionParametersKHR object contains maxStdSPSCount StdVideoH265SequenceParameterSet entries, no additional StdVideoH265SequenceParameterSet entries can be added to it, and VK_ERROR_TOO_MANY_OBJECTS will be returned if an attempt is made to add these entries. When a VkVideoSessionParametersKHR object contains maxStdPPSCount StdVideoH265PictureParameterSet entries, no additional StdVideoH265PictureParameterSet entries can be added to it, and VK_ERROR_TOO_MANY_OBJECTS will be returned if an attempt is made to add these entries.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265SessionParametersCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_CREATE_INFO_EXT
• **VUID-VkVideoEncodeH265SessionParametersCreateInfoEXT-pParametersAddInfo-parameter**  
  If `pParametersAddInfo` is not NULL, `pParametersAddInfo` must be a valid pointer to a valid `VkVideoEncodeH265SessionParametersAddInfoEXT` structure.

The `VkVideoEncodeH265SessionParametersAddInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265  
typedef struct VkVideoEncodeH265SessionParametersAddInfoEXT
{
    VkStructureType sType;  
    const void* pNext;  
    uint32_t stdVPSCount;  
    const StdVideoH265VideoParameterSet* pStdVPSs;  
    uint32_t stdSPSCount;  
    const StdVideoH265SequenceParameterSet* pStdSPSs;  
    uint32_t stdPPSCount;  
    const StdVideoH265PictureParameterSet* pStdPPSs;  
} VkVideoEncodeH265SessionParametersAddInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdVPSCount` is the number of VPS elements in `pStdVPSs`.
- `pStdVPSs` is a pointer to an array of `stdVPSCount` `StdVideoH265VideoParameterSet` structures representing H.265 video parameter sets.
- `stdSPSCount` is the number of SPS elements in `pStdSPSs`.
- `pStdSPSs` is a pointer to an array of `stdSPSCount` `StdVideoH265SequenceParameterSet` structures representing H.265 sequence parameter sets.
- `stdPPSCount` is the number of PPS elements in `pStdPPSs`.
- `pStdPPSs` is a pointer to an array of `stdPPSCount` `StdVideoH265PictureParameterSet` structures representing H.265 picture parameter sets.

**Valid Usage (Implicit)**

- **VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-sType-sType**  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_ADD_INFO_EXT`.

- **VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdVPSs-parameter**  
  If `pStdVPSs` is not NULL, `pStdVPSs` must be a valid pointer to an array of `stdVPSCount` `StdVideoH265VideoParameterSet` values.

- **VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdSPSs-parameter**  
  If `pStdSPSs` is not NULL, `pStdSPSs` must be a valid pointer to an array of `stdSPSCount` `StdVideoH265SequenceParameterSet` values.

- **VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdPPSs-parameter**  
  If `pStdPPSs` is not NULL, `pStdPPSs` must be a valid pointer to an array of `stdPPSCount` values.
StdVideoH265PictureParameterSet values

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-stdVPSCount-arraylength
  stdVPSCount must be greater than 0
- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-stdSPSCount-arraylength
  stdSPSCount must be greater than 0
- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-stdPPSCount-arraylength
  stdPPSCount must be greater than 0

Valid Usage

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-stdVPSCount-06438
  The values of stdVPSCount, stdSPSCount and stdPPSCount must be less than or equal to the values of 
  VkVideoEncodeH265SessionParametersCreateInfoEXT::maxStdVPSCount, 
  VkVideoEncodeH265SessionParametersCreateInfoEXT::maxStdSPSCount, and 
  VkVideoEncodeH265SessionParametersCreateInfoEXT::maxStdPPSCount, respectively

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdVPSs-06439
  Each StdVideoH265VideoParameterSet entry in pStdVPSs must have a unique H.265 VPS ID

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdSPSs-06440
  Each StdVideoH265SequenceParameterSet entry in pStdSPSs must have a unique H.265 VPS-SPS ID pair

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdPPSs-06441
  Each StdVideoH265PictureParameterSet entry in pStdPPSs must have a unique H.265 VPS-SPS-PPS ID tuple

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06442
  Each entry to be added must have a unique, to the rest of the parameter array entries and the
  existing parameters in the Video Session Parameters Object that is being updated,
  VPS-SPS-PPS IDs

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06443
  Parameter entries that already exist in Video Session Parameters object with a particular
  VPS-SPS-PPS IDs must not be replaced nor updated

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06444
  When creating a new object using a Video Session Parameters as a template, the array's
  parameters with the same VPS-SPS-PPS IDs as the ones from the template take precedence

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06445
  VPS/SPS/PPS parameters must comply with the limits specified in
  VkVideoSessionCreateInfoKHR during Video Session creation

40.10.4. Frame Encoding

In order to encode a frame, add a VkVideoEncodeH265VclFrameInfoEXT structure to the pNext
chain of the VkVideoEncodeInfoKHR structure passed to the vkCmdEncodeVideoKHR command.
The **VkVideoEncodeH265VclFrameInfoEXT** structure representing a frame encode operation is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265VclFrameInfoEXT {
    VkStructureType sType;
    const void* pNext;
    const VkVideoEncodeH265ReferenceListsInfoEXT* pReferenceFinalLists;
    uint32_t naluSliceSegmentEntryCount;
    const VkVideoEncodeH265NaluSliceSegmentInfoEXT* pNaluSliceSegmentEntries;
    const StdVideoEncodeH265PictureInfo* pCurrentPictureInfo;
} VkVideoEncodeH265VclFrameInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **pReferenceFinalLists** is **NULL** or a pointer to a `VkVideoEncodeH265ReferenceListsInfoEXT` structure specifying the reference lists to be used for the current picture.
- **naluSliceSegmentEntryCount** is the number of slice segment NALUs in the frame.
- **pNaluSliceSegmentEntries** is a pointer to an array of `VkVideoEncodeH265NaluSliceSegmentInfoEXT` structures specifying the division of the current picture into slice segments and the properties of these slice segments.
- **pCurrentPictureInfo** is a pointer to a `StdVideoEncodeH265PictureInfo` structure specifying the syntax and other codec-specific information from the H.265 specification, associated with this picture.

**Valid Usage (Implicit)**

- **VUID-VkVideoEncodeH265VclFrameInfoEXT-sType-sType**
  
  **sType** must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_VCL_FRAME_INFO_EXT`

- **VUID-VkVideoEncodeH265VclFrameInfoEXT-pReferenceFinalLists-parameter**
  
  If **pReferenceFinalLists** is not **NULL**, **pReferenceFinalLists** must be a valid pointer to a valid `VkVideoEncodeH265ReferenceListsInfoEXT` structure

- **VUID-VkVideoEncodeH265VclFrameInfoEXT-pNaluSliceSegmentEntries-parameter**
  
  **pNaluSliceSegmentEntries** must be a valid pointer to an array of **naluSliceSegmentEntryCount** valid `VkVideoEncodeH265NaluSliceSegmentInfoEXT` structures

- **VUID-VkVideoEncodeH265VclFrameInfoEXT-pCurrentPictureInfo-parameter**
  
  **pCurrentPictureInfo** must be a valid pointer to a valid `StdVideoEncodeH265PictureInfo` value

- **VUID-VkVideoEncodeH265VclFrameInfoEXT-naluSliceSegmentEntryCount-arraylength**
  
  **naluSliceSegmentEntryCount** must be greater than 0

The **VkVideoEncodeH265NaluSliceSegmentInfoEXT** structure representing a slice segment is
defined as:

```c
typedef struct VkVideoEncodeH265NaluSliceSegmentInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t ctbCount;
    const VkVideoEncodeH265ReferenceListsInfoEXT* pReferenceFinalLists;
    const StdVideoEncodeH265SliceSegmentHeader* pSliceSegmentHeaderStd;
} VkVideoEncodeH265NaluSliceSegmentInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `ctbCount` is the number of CTBs in this slice segment.
- `pReferenceFinalLists` is `NULL` or a pointer to a `VkVideoEncodeH265ReferenceListsInfoEXT` structure specifying the reference lists to be used for the current slice segment. If `pReferenceFinalLists` is not `NULL`, these reference lists override the reference lists provided in `VkVideoEncodeH265VclFrameInfoEXT::pReferenceFinalLists`.
- `pSliceSegmentHeaderStd` is a pointer to a `StdVideoEncodeH265SliceSegmentHeader` structure specifying the slice segment header for the current slice segment.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH265NaluSliceSegmentInfoEXT-sType-sType
  sType must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_NALU_SLICE_SEGMENT_INFO_EXT`
- VUID-VkVideoEncodeH265NaluSliceSegmentInfoEXT-pNext-pNext
  pNext must be `NULL`
- VUID-VkVideoEncodeH265NaluSliceSegmentInfoEXT-pReferenceFinalLists-parameter
  If `pReferenceFinalLists` is not `NULL`, `pReferenceFinalLists` must be a valid pointer to a valid `VkVideoEncodeH265ReferenceListsInfoEXT` structure
- VUID-VkVideoEncodeH265NaluSliceSegmentInfoEXT-pSliceSegmentHeaderStd-parameter
  `pSliceSegmentHeaderStd` must be a valid pointer to a valid `StdVideoEncodeH265SliceSegmentHeader` value

The `VkVideoEncodeH265DpbSlotInfoEXT` structure, representing a reconstructed picture that is being used as a reference picture, is defined as:

```c
typedef struct VkVideoEncodeH265DpbSlotInfoEXT {
    VkStructureType sType;
    const void* pNext;
    int8_t slotIndex;
    const StdVideoEncodeH265ReferenceInfo* pStdReferenceInfo;
} VkVideoEncodeH265DpbSlotInfoEXT;
```
VkVideoEncodeH265DpbSlotInfoEXT;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **slotIndex** is the **DPB Slot** index for this picture.
- **pStdReferenceInfo** is a pointer to a StdVideoEncodeH265ReferenceInfo structure specifying the syntax and other codec-specific information from the H.265 specification, associated with this reference picture.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeH265DpbSlotInfoEXT-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_DPB_SLOT_INFO_EXT**

- VUID-VkVideoEncodeH265DpbSlotInfoEXT-pNext-pNext

  **pNext** must be NULL

- VUID-VkVideoEncodeH265DpbSlotInfoEXT-pStdReferenceInfo-parameter

  **pStdReferenceInfo** must be a valid pointer to a valid StdVideoEncodeH265ReferenceInfo value

The **VkVideoEncodeH265ReferenceListsInfoEXT** structure representing reference lists is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265ReferenceListsInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint8_t referenceList0EntryCount;
    const VkVideoEncodeH265DpbSlotInfoEXT* pReferenceList0Entries;
    uint8_t referenceList1EntryCount;
    const VkVideoEncodeH265DpbSlotInfoEXT* pReferenceList1Entries;
    const StdVideoEncodeH265ReferenceModifications* pReferenceModifications;
} VkVideoEncodeH265ReferenceListsInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **referenceList0EntryCount** is the number of reference pictures in reference list L0 and is identical to `StdVideoEncodeH265SliceSegmentHeader::num_ref_idx_l0_active_minus1 + 1`.
- **pReferenceList0Entries** is a pointer to an array of **referenceList0EntryCount** `VkVideoEncodeH265DpbSlotInfoEXT` structures specifying the reference list L0 entries for the current picture.
- **referenceList1EntryCount** is the number of reference pictures in reference list L1 and is identical to `StdVideoEncodeH265SliceSegmentHeader::num_ref_idx_l1_active_minus1 + 1`.
- **pReferenceList1Entries** is a pointer to an array of **referenceList1EntryCount** `.std::`
structures specifying the reference list L1 entries for the current picture.

- **pReferenceModifications** is a pointer to a *StdVideoEncodeH265ReferenceModifications* structure specifying reference list modifications.

### Valid Usage (Implicit)

- **VUID-VkVideoEncodeH265ReferenceListsInfoEXT-sType-sType**
  - *sType* **must** be *VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_REFERENCE_LISTS_INFO_EXT*

- **VUID-VkVideoEncodeH265ReferenceListsInfoEXT-pNext-pNext**
  - *pNext* **must** be **NULL**

- **VUID-VkVideoEncodeH265ReferenceListsInfoEXT-pReferenceList0Entries-parameter**
  - If *referenceList0EntryCount* is not 0, *pReferenceList0Entries** must** be a valid pointer to an array of *referenceList0EntryCount* valid *VkVideoEncodeH265DpbSlotInfoEXT* structures

- **VUID-VkVideoEncodeH265ReferenceListsInfoEXT-pReferenceList1Entries-parameter**
  - If *referenceList1EntryCount* is not 0, *pReferenceList1Entries** must** be a valid pointer to an array of *referenceList1EntryCount* valid *VkVideoEncodeH265DpbSlotInfoEXT* structures

- **VUID-VkVideoEncodeH265ReferenceListsInfoEXT-pReferenceModifications-parameter**
  - *pReferenceModifications** must** be a valid pointer to a valid *StdVideoEncodeH265ReferenceModifications* value

The *VkVideoEncodeH265EmitPictureParametersInfoEXT* structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265EmitPictureParametersInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint8_t vpsId;
    uint8_t spsId;
    VkBool32 emitVpsEnable;
    VkBool32 emitSpsEnable;
    uint32_t ppsIdEntryCount;
    const uint8_t* ppsIdEntries;
} VkVideoEncodeH265EmitPictureParametersInfoEXT;
```

- **sType** is the type of this structure.

- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **vpsId** is the H.265 VPS ID for the H.265 VPS to insert in the bitstream. The VPS ID **must** match the VPS provided in *vpsStd* of *VkVideoEncodeH265SessionParametersCreateInfoEXT*. This is retrieved from the *VkVideoSessionParametersKHR* object provided in *VkVideoBeginCodingInfoKHR*.

- **spsId** is the H.265 SPS ID for the H.265 SPS to insert in the bitstream. The SPS ID **must** match one of the IDs of the SPS(s) provided in *pStdSPSs* of
to identify the SPS parameter set to insert in the bitstream. This is retrieved from the VkVideoSessionParametersKHR object provided in VkVideoBeginCodingInfoKHR.

- **emitVpsEnable** enables the emitting of the VPS structure with id of `vpsId`.
- **emitSpsEnable** enables the emitting of the SPS structure with id of `spsId`.

- **ppsIdEntryCount** is the number of entries in the `ppsIdEntries`. If this parameter is 0 then no pps entries are going to be emitted in the bitstream.

- **ppsIdEntries** is the H.265 PPS IDs for the H.265 PPS to insert in the bitstream. The PPS IDs **must** match one of the IDs of the PPS(s) provided in `pStdPPSs` of VkVideoEncodeH265SessionParametersCreateInfoEXT to identify the PPS parameter set to insert in the bitstream. This is retrieved from the VkVideoSessionParametersKHR object provided in VkVideoBeginCodingInfoKHR.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH265EmitPictureParametersInfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_EMIT_PICTURE_PARAMETERS_INFO_EXT`.

- VUID-VkVideoEncodeH265EmitPictureParametersInfoEXT-ppsIdEntries-parameter
  
  If `ppsIdEntryCount` is not 0, `ppsIdEntries` must be a valid pointer to an array of `ppsIdEntryCount uint8_t` values.

### 40.10.5. Rate control

The VkVideoEncodeH265RateControlInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265RateControlInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t gopFrameCount;
    uint32_t idrPeriod;
    uint32_t consecutiveBFrameCount;
    VkVideoEncodeH265RateControlStructureEXT rateControlStructure;
    uint8_t subLayerCount;
} VkVideoEncodeH265RateControlInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **gopFrameCount** is the number of frames contained within the group of pictures (GOP), starting from an intra frame and until the next intra frame. If it is set to 0, the implementation chooses a suitable value. If it is set to `UINT32_MAX`, the GOP length is treated as infinite.
- **idrPeriod** is the interval, in terms of number of frames, between two IDR frames. If it is set to 0, the implementation chooses a suitable value. If it is set to `UINT32_MAX`, the IDR period is treated
as infinite.

- **consecutiveBFrameCount** is the number of consecutive B-frames between I- and/or P-frames within the GOP.

- **rateControlStructure** is a `VkVideoEncodeH265RateControlStructureEXT` value specifying the expected encode stream reference structure, to aid in rate control calculations.

- **subLayerCount** specifies the number of sub layers enabled in the stream.

In order to provide H.265-specific stream rate control parameters, add a `VkVideoEncodeH265RateControlInfoEXT` structure to the `pNext` chain of the `VkVideoEncodeRateControlInfoKHR` structure in the `pNext` chain of the `VkVideoCodingControlInfoKHR` structure passed to the `vkCmdControlVideoCodingKHR` command.

The parameters from this structure act as a guidance for implementations to apply various rate control heuristics.

It is possible to infer the picture type to be used when encoding a frame, on the basis of the values provided for `consecutiveBFrameCount`, `idrPeriod`, and `gopFrameCount`, but this inferred picture type will not be used by implementations to override the picture type provided in `vkCmdEncodeVideoKHR`. Additionally, it is not required for the video session to be reset if the inferred picture type does not match the actual picture type.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeH265RateControlInfoEXT-sType-sType
  
  sType must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_RATE_CONTROL_INFO_EXT`

- VUID-VkVideoEncodeH265RateControlInfoEXT-rateControlStructure-parameter

  rateControlStructure must be a valid `VkVideoEncodeH265RateControlStructureEXT` value

Possible values of `VkVideoEncodeH265RateControlInfoEXT::rateControlStructure`, specifying a video stream reference structure as a hint for the rate control implementation, are:

```c
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265RateControlStructureEXT {
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_STRUCTURE_UNKNOWN_EXT = 0,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_STRUCTURE_FLAT_EXT = 1,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_STRUCTURE_DYADIC_EXT = 2,
} VkVideoEncodeH265RateControlStructureEXT;
```

- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_STRUCTURE_UNKNOWN_EXT` specifies a reference structure unknown at the time of stream rate control configuration.

- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_STRUCTURE_FLAT_EXT` specifies a flat reference structure.

- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_STRUCTURE_DYADIC_EXT` specifies a dyadic reference structure.

The `VkVideoEncodeH265RateControlLayerInfoEXT` structure is defined as:
typedef struct VkVideoEncodeH265RateControlLayerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint8_t temporalId;
    VkBool32 useInitialRcQp;
    VkVideoEncodeH265QpEXT initialRcQp;
    VkBool32 useMinQp;
    VkVideoEncodeH265QpEXT minQp;
    VkBool32 useMaxQp;
    VkVideoEncodeH265QpEXT maxQp;
    VkBool32 useMaxFrameSize;
    VkVideoEncodeH265FrameSizeEXT maxFrameSize;
} VkVideoEncodeH265RateControlLayerInfoEXT;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **temporalId** specifies the H.265 temporal ID of the video coding layer that settings provided in this structure and its parent VkVideoEncodeRateControlLayerInfoKHR structure apply to.
- **useInitialRcQp** indicates whether the values within initialRcQp should be used by the implementation.
- **initialRcQp** provides the QP values for each picture type, to be used in rate control calculations at the start of video encode operations on a newly-created video session, or immediately after a session reset. These values are ignored when VkVideoEncodeRateControlInfoKHR::rateControlMode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_NONE.Bit_KHR.
- **useMinQp** indicates whether the values within minQp should be used by the implementation. When it is set to VK_FALSE, the implementation ignores the values in minQp and chooses suitable values.
- **minQp** provides the lower bound on the QP values for each picture type, to be used in rate control calculations.
- **useMaxQp** indicates whether the values within maxQp should be used by the implementation. When it is set to VK_FALSE, the implementation ignores the values in maxQp and chooses suitable values.
- **maxQp** provides the upper bound on the QP values for each picture type, to be used in rate control calculations.
- **useMaxFrameSize** indicates whether the values within maxFrameSize should be used by the implementation.
- **maxFrameSize** provides the upper bound on the encoded frame size for each picture type. The implementation does not guarantee the encoded frame sizes will be within the specified limits, however these limits may be used as a guide in rate control calculations. If enabled and not set properly, the maxQp limit may prevent the implementation from respecting the maxFrameSize limit.

H.265-specific per-layer rate control parameters must be specified by adding a
The `VkVideoEncodeH265RateControlLayerInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265RateControlLayerInfoEXT {
    int32_t qpI;
    int32_t qpP;
    int32_t qpB;
} VkVideoEncodeH265RateControlLayerInfoEXT;
```

- `qpI` is the QP to be used for I-frames.
- `qpP` is the QP to be used for P-frames.
- `qpB` is the QP to be used for B-frames.

The `VkVideoEncodeH265FrameSizeEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef VkVideoEncodeH265FrameSizeEXT {
    //...
} VkVideoEncodeH265FrameSizeEXT;
```
typedef struct VkVideoEncodeH265FrameSizeEXT {
    uint32_t frameISize;
    uint32_t framePSize;
    uint32_t frameBSize;
} VkVideoEncodeH265FrameSizeEXT;

• **frameISize** is the size in bytes to be used for I-frames.
• **framePSize** is the size in bytes to be used for P-frames.
• **frameBSize** is the size in bytes to be used for B-frames.
Chapter 41. Optical Flow

41.1. Optical Flow Queues

VK_NV_optical_flow adds a optical flow queue type bit VK_QUEUE_OPTICAL_FLOW_BIT_NV to VkQueueFlagBits. Optical flow operations are supported by queues with an advertised queue capability of VK_QUEUE_OPTICAL_FLOW_BIT_NV. As in the case of other queue types, an application must use vkGetPhysicalDeviceQueueFamilyProperties to query whether the physical device has support for the Optical Flow Queue. When the implementation reports the VK_QUEUE_OPTICAL_FLOW_BIT_NV bit for a queue family, it advertises general support for Vulkan queue operations described in Devices and Queues.

41.2. Optical Flow Image Formats

To enumerate the supported image formats for a specific optical flow usage, call:

```c
// Provided by VK_NV_optical_flow
VkResult vkGetPhysicalDeviceOpticalFlowImageFormatsNV(
    VkPhysicalDevice physicalDevice,
    const VkOpticalFlowImageFormatInfoNV* pOpticalFlowImageFormatInfo,
    uint32_t* pFormatCount,
    VkOpticalFlowImageFormatPropertiesNV* pImageFormatProperties);
```

- **physicalDevice** is the physical device being queried.
- **pOpticalFlowImageFormatInfo** is a pointer to a VkOpticalFlowImageFormatInfoNV structure specifying the optical flow usage for which information is returned.
- **pFormatCount** is a pointer to an integer related to the number of optical flow properties available or queried, as described below.
- **pImageFormatProperties** is a pointer to an array of VkOpticalFlowImageFormatPropertiesNV structures in which supported formats and image parameters are returned.

If **pImageFormatProperties** is NULL, then the number of optical flow properties supported for the given **physicalDevice** is returned in **pFormatCount**. Otherwise, **pFormatCount** must point to a variable set by the user to the number of elements in the **pImageFormatProperties** array, and on return the variable is overwritten with the number of values actually written to **pImageFormatProperties**. If the value of **pFormatCount** is less than the number of optical flow properties supported, at most **pFormatCount** values will be written to **pImageFormatProperties**, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available values were returned. Before creating an image to be used as a optical flow frame, obtain the supported image creation parameters by querying with **vkGetPhysicalDeviceFormatProperties2** and **vkGetPhysicalDeviceImageFormatProperties2** using one of the reported formats and adding **VkOpticalFlowImageFormatInfoNV** to the **pNext** chain of **VkPhysicalDeviceImageFormatInfo2**.

When querying the parameters with **vkGetPhysicalDeviceImageFormatProperties2** for images used for optical flow operations, the **VkOpticalFlowImageFormatInfoNV::usage** field should contain one or more of the bits defined in **VkOpticalFlowUsageFlagBitsNV**.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceOpticalFlowImageFormatsNV-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

  pOpticalFlowImageFormatInfo must be a valid pointer to a valid VkOpticalFlowImageFormatInfoNV structure

  pFormatCount must be a valid pointer to a uint32_t value

  If the value referenced by pFormatCount is not 0, and pImageFormatProperties is not NULL, pImageFormatProperties must be a valid pointer to an array of pFormatCount VkOpticalFlowImageFormatPropertiesNV structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_EXTENSION_NOT_PRESENT
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_FORMAT_NOT_SUPPORTED

Note

VK_FORMAT_B8G8R8A8_UNORM, VK_FORMAT_R8_UNORM and VK_FORMAT_G8_B8R8_2PLANE_420_UNORM are initially supported for images with optical usage VK_OPTICAL_FLOW_USAGE_INPUT_BIT_NV.

VK_FORMAT_R16G16_S10_5_NV is initially supported for images with optical usage VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV, VK_OPTICAL_FLOW_USAGE_HINT_BIT_NV and VK_OPTICAL_FLOW_USAGE_GLOBAL_FLOW_BIT_NV.

VK_FORMAT_R8_UINT and VK_FORMAT_R32_UINT are initially supported for images with optical usage VK_OPTICAL_FLOW_USAGE_COST_BIT_NV. It is recommended to use VK_FORMAT_R8_UINT because of the lower bandwidth.

The VkOpticalFlowImageFormatInfoNV structure is defined as:

```c
// Provided by VK_NV_optical_flow
```
typedef struct VkOpticalFlowImageFormatInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkOpticalFlowUsageFlagsNV usage;
} VkOpticalFlowImageFormatInfoNV;

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **usage** is a bitmask of **VkOpticalFlowUsageFlagBitsNV** describing the intended optical flow usage of the image.

### Valid Usage (Implicit)

- VUID-VkOpticalFlowImageFormatInfoNV-sType-sType
  *sType* must be *VK_STRUCTURE_TYPE_OPTICAL_FLOW_IMAGE_FORMAT_INFO_NV*

- VUID-VkOpticalFlowImageFormatInfoNV-usage-parameter
  *usage* must be a valid combination of **VkOpticalFlowUsageFlagBitsNV** values

- VUID-VkOpticalFlowImageFormatInfoNV-usage-required bitmask
  *usage* must not be 0

Bits which **can** be set in **VkOpticalFlowImageFormatInfoNV::usage**, controlling optical flow usage, are:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowUsageFlagBitsNV {
    VK_OPTICAL_FLOW_USAGE_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_USAGE_INPUT_BIT_NV = 0x00000001,
    VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV = 0x00000002,
    VK_OPTICAL_FLOW_USAGE_HINT_BIT_NV = 0x00000004,
    VK_OPTICAL_FLOW_USAGE_COST_BIT_NV = 0x00000008,
    VK_OPTICAL_FLOW_USAGE_GLOBAL_FLOW_BIT_NV = 0x00000010,
} VkOpticalFlowUsageFlagBitsNV;
```

- **VK_OPTICAL_FLOW_USAGE_INPUT_BIT_NV** specifies that the image **can** be used as input or reference frame for an optical flow operation.
- **VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV** specifies that the image **can** be used as output flow vector map for an optical flow operation.
- **VK_OPTICAL_FLOW_USAGE_HINT_BIT_NV** specifies that the image **can** be used as hint flow vector map for an optical flow operation.
- **VK_OPTICAL_FLOW_USAGE_COST_BIT_NV** specifies that the image **can** be used as output cost map for an optical flow operation.
- **VK_OPTICAL_FLOW_USAGE_GLOBAL_FLOW_BIT_NV** specifies that the image **can** be used as global flow vector for an optical flow operation.
typedef VkFlags VkOpticalFlowUsageFlagsNV;

VkOpticalFlowUsageFlagsNV is a bitmask type for setting a mask of zero or more VkOpticalFlowUsageFlagBitsNV.

The VkOpticalFlowImageFormatPropertiesNV structure is defined as:

```c
typedef struct VkOpticalFlowImageFormatPropertiesNV {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
} VkOpticalFlowImageFormatPropertiesNV;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **format** is a VkFormat that specifies the format that can be used with the specified optical flow image usages.

**Valid Usage (Implicit)**

- VUID-VkOpticalFlowImageFormatPropertiesNV-sType-sType
  
  **sType** must be VK_STRUCTURE_TYPE_OPTICAL_FLOW_IMAGE_FORMAT_PROPERTIES_NV

- VUID-VkOpticalFlowImageFormatPropertiesNV-pNext-pNext
  
  **pNext** must be **NULL**

### 41.3. Optical Flow Session

#### 41.3.1. Optical Flow Session Object

Optical flow session objects are abstracted and represented by VkOpticalFlowSessionNV handles:

```c
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkOpticalFlowSessionNV)
```

**Creating an Optical Flow Session**

To create an optical flow session object, call:

```c
VkResult vkCreateOpticalFlowSessionNV(
    VkDevice device,
    ...)
```
const VkOpticalFlowSessionCreateInfoNV* pCreateInfo,
const VkAllocationCallbacks* pAllocator,
VkOpticalFlowSessionNV* pSession);

- device is the logical device that creates the optical flow session object.
- pCreateInfo is a pointer to a VkOpticalFlowSessionCreateInfoNV structure containing parameters specifying the creation of the optical flow session.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pSession is a pointer to a VkOpticalFlowSessionNV handle specifying the optical flow session object which will be created by this function when it returns VK_SUCCESS

Valid Usage (Implicit)

- VUID-vkCreateOpticalFlowSessionNV-device-parameter
  device must be a valid VkDevice handle
- VUID-vkCreateOpticalFlowSessionNV-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkOpticalFlowSessionCreateInfoNV structure
- VUID-vkCreateOpticalFlowSessionNV-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateOpticalFlowSessionNV-pSession-parameter
  pSession must be a valid pointer to a VkOpticalFlowSessionNV handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INITIALIZATION_FAILED

The VkOpticalFlowSessionCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_optical_flow
typedef struct VkOpticalFlowSessionCreateInfoNV {
    VkStructureType sType;
    void* pNext;
    uint32_t width;
    uint32_t height;
    VkFormat imageFormat;
    VkFormat flowVectorFormat;
} VkOpticalFlowSessionCreateInfoNV;
```
VkFormat costFormat;
VkOpticalFlowGridSizeFlagsNV outputGridSize;
VkOpticalFlowGridSizeFlagsNV hintGridSize;
VkOpticalFlowPerformanceLevelNV performanceLevel;
VkOpticalFlowSessionCreateFlagsNV flags;
}

VkOpticalFlowSessionCreateInfoNV

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• width is the width in pixels of the input or reference frame to be bound to this optical flow session.
• height is the height in pixels of the input or reference frame to be bound to this optical flow session.
• imageFormat is the VkFormat of the input and reference frame to be bound to this optical flow session.
• flowVectorFormat is the VkFormat of the flow vector maps (output or hint) to be bound to this optical flow session.
• costFormat is the VkFormat of the cost maps to be bound to this optical flow session.
• outputGridSize is exactly one bit of VkOpticalFlowGridSizeFlagsNV specifying the grid size of the output flow and cost maps to be bound to this optical flow session. The size of the output flow and cost maps is determined by VkOpticalFlowSessionCreateInfoNV::width and VkOpticalFlowSessionCreateInfoNV::height divided by VkOpticalFlowSessionCreateInfoNV::outputGridSize.
• hintGridSize is one exactly bit of VkOpticalFlowGridSizeFlagsNV specifying the grid size of of the hint flow vector maps to be bound to this optical flow session. The size of the hint maps is determined by VkOpticalFlowSessionCreateInfoNV::width and VkOpticalFlowSessionCreateInfoNV::height divided by VkOpticalFlowSessionCreateInfoNV::hintGridSize.
• performanceLevel is the VkOpticalFlowPerformanceLevelNV used for this optical flow session.
• flags are the VkOpticalFlowSessionCreateFlagsNV used for this optical flow session.

Valid Usage

• VUID-VkOpticalFlowSessionCreateInfoNV-width-07581
  width must be greater than or equal to VkPhysicalDeviceOpticalFlowPropertiesNV::minWidth and less than or equal to VkPhysicalDeviceOpticalFlowPropertiesNV::maxWidth.

• VUID-VkOpticalFlowSessionCreateInfoNV-height-07582
  height must be greater than or equal to VkPhysicalDeviceOpticalFlowPropertiesNV::minHeight and less than or equal to VkPhysicalDeviceOpticalFlowPropertiesNV::maxHeight.

• VUID-VkOpticalFlowSessionCreateInfoNV-imageFormat-07583
  imageFormat must be one of the formats returned by vkGetPhysicalDeviceOpticalFlowImageFormatsNV for VK_OPTICAL_FLOW_USAGE_INPUT_BIT_NV.
• VUID-VkOpticalFlowSessionCreateInfoNV-flowVectorFormat-07584
  flowVectorFormat must be one of the formats returned by
  vkGetPhysicalDeviceOpticalFlowImageFormatsNV for
  VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV.

• VUID-VkOpticalFlowSessionCreateInfoNV-costFormat-07585
  costFormat must be one of the formats returned by
  vkGetPhysicalDeviceOpticalFlowImageFormatsNV for
  VK_OPTICAL_FLOW_USAGE_COST_BIT_NV if
  VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV is set in flags.

• VUID-VkOpticalFlowSessionCreateInfoNV-outputGridSize-07586
  outputGridSize must be exactly one of the bits reported in
  VkPhysicalDeviceOpticalFlowPropertiesNV::supportedOutputGridSizes.

• VUID-VkOpticalFlowSessionCreateInfoNV-hintGridSize-07587
  hintGridSize must be exactly one of the bits reported in
  VkPhysicalDeviceOpticalFlowPropertiesNV::supportedHintGridSizes
  if
  VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT_BIT_NV is set in flags.

• VUID-VkOpticalFlowSessionCreateInfoNV-flags-07588
  VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT_BIT_NV must not be set in
  flags if
  VkPhysicalDeviceOpticalFlowPropertiesNV::hintSupported is VK_FALSE.

• VUID-VkOpticalFlowSessionCreateInfoNV-flags-07589
  VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV must not be set in
  flags if
  VkPhysicalDeviceOpticalFlowPropertiesNV::costSupported is VK_FALSE.

• VUID-VkOpticalFlowSessionCreateInfoNV-flags-07590
  VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_GLOBAL_FLOW_BIT_NV must not be set in
  flags if
  VkPhysicalDeviceOpticalFlowPropertiesNV::globalFlowSupported is VK_FALSE.

• VUID-VkOpticalFlowSessionCreateInfoNV-flags-07591
  VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV must not be set in
  flags if
  VkPhysicalDeviceOpticalFlowPropertiesNV::maxNumRegionsOfInterest is 0.

• VUID-VkOpticalFlowSessionCreateInfoNV-flags-07592
  VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV must not be set in
  flags if
  VkPhysicalDeviceOpticalFlowPropertiesNV::bidirectionalFlowSupported is VK_FALSE.

Valid Usage (Implicit)

• VUID-VkOpticalFlowSessionCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_OPTICAL_FLOW_SESSION_CREATE_INFO_NV

• VUID-VkOpticalFlowSessionCreateInfoNV-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of
  VkOpticalFlowSessionCreatePrivateDataCreateInfoNV

• VUID-VkOpticalFlowSessionCreateInfoNV-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkOpticalFlowSessionCreateInfoNV-imageFormat-parameter
  imageFormat must be a valid VkFormat value
• VUID-VkOpticalFlowSessionCreateInfoNV-flowVectorFormat-parameter
  flowVectorFormat must be a valid VkFormat value

• VUID-VkOpticalFlowSessionCreateInfoNV-costFormat-parameter
  If costFormat is not 0, costFormat must be a valid VkFormat value

• VUID-VkOpticalFlowSessionCreateInfoNV-outputGridSize-parameter
  outputGridSize must be a valid combination of VkOpticalFlowGridSizeFlagBitsNV values

• VUID-VkOpticalFlowSessionCreateInfoNV-outputGridSize-requiredbitmap
  outputGridSize must not be 0

• VUID-VkOpticalFlowSessionCreateInfoNV-hintGridSize-parameter
  hintGridSize must be a valid combination of VkOpticalFlowGridSizeFlagBitsNV values

• VUID-VkOpticalFlowSessionCreateInfoNV-performanceLevel-parameter
  If performanceLevel is not 0, performanceLevel must be a valid VkOpticalFlowPerformanceLevelNV value

• VUID-VkOpticalFlowSessionCreateInfoNV-flags-parameter
  flags must be a valid combination of VkOpticalFlowSessionCreateFlagBitsNV values

The VkOpticalFlowSessionCreateInfoNV structure is for NV internal use only and is defined as:

```c
// Provided by VK_NV_optical_flow
typedef struct VkOpticalFlowSessionCreateInfoNV {
    VkStructureType   sType;
    void*              pNext;
    uint32_t           id;
    uint32_t           size;
    const void*        pPrivateData;
} VkOpticalFlowSessionCreateInfoNV;
```

• sType is the type of this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• id is an identifier for data which is passed at a memory location specified in VkOpticalFlowSessionCreateInfoNV::pPrivateData.

• size is the size of data in bytes which is passed at a memory location specified in VkOpticalFlowSessionCreateInfoNV::pPrivateData.

• pPrivateData is a pointer to NV internal data.

Valid Usage (Implicit)

• VUID-VkOpticalFlowSessionCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_OPTICAL_FLOW_SESSION_CREATE_PRIVATE_DATA_INFO_NV

• VUID-VkOpticalFlowSessionCreateInfoNV-pPrivateData-parameter
  pPrivateData must be a pointer value
Optical flow vectors are generated block-wise, one vector for each block of \(N\times N\) pixels (referred to as grid).

Bits which can be set in \texttt{VkOpticalFlowSessionCreateInfoNV::outputGridSize} and \texttt{VkOpticalFlowSessionCreateInfoNV::hintGridSize}, or which are returned in \texttt{VkPhysicalDeviceOpticalFlowPropertiesNV::supportedOutputGridSizes} and \texttt{VkPhysicalDeviceOpticalFlowPropertiesNV::supportedHintGridSizes} controlling optical flow grid sizes, are:

// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowGridSizeFlagBitsNV {
    VK_OPTICAL_FLOW_GRID_SIZE_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_GRID_SIZE_1X1_BIT_NV = 0x00000001,
    VK_OPTICAL_FLOW_GRID_SIZE_2X2_BIT_NV = 0x00000002,
    VK_OPTICAL_FLOW_GRID_SIZE_4X4_BIT_NV = 0x00000004,
    VK_OPTICAL_FLOW_GRID_SIZE_8X8_BIT_NV = 0x00000008,
} VkOpticalFlowGridSizeFlagBitsNV;

- \texttt{VK_OPTICAL_FLOW_GRID_SIZE_1X1_BIT_NV} specifies that grid is 1x1 pixel.
- \texttt{VK_OPTICAL_FLOW_GRID_SIZE_2X2_BIT_NV} specifies that grid is 2x2 pixel.
- \texttt{VK_OPTICAL_FLOW_GRID_SIZE_4X4_BIT_NV} specifies that grid is 4x4 pixel.
- \texttt{VK_OPTICAL_FLOW_GRID_SIZE_8X8_BIT_NV} specifies that grid is 8x8 pixel.

// Provided by VK_NV_optical_flow
typedef VkFlags VkOpticalFlowGridSizeFlagsNV;

\texttt{VkOpticalFlowGridSizeFlagsNV} is a bitmask type for setting a mask of zero or more \texttt{VkOpticalFlowGridSizeFlagBitsNV}.

Optical flow exposes performance levels which the user can choose based on the desired performance and quality requirement.

The optical flow performance level types are defined with the following:

// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowPerformanceLevelNV {
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_SLOW_NV = 1,
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_MEDIUM_NV = 2,
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_FAST_NV = 3,
} VkOpticalFlowPerformanceLevelNV;

- \texttt{VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_SLOW_NV} is a level with slower performance but higher quality.
- \texttt{VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_MEDIUM_NV} is a level with medium performance and medium quality.
quality.

- **VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_FAST_NV** is a preset with higher performance but lower quality.

Bits which **can** be set in VkOpticalFlowSessionCreateInfoNV::flags, controlling optical flow session operations, are:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowSessionCreateFlagBitsNV {
    VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT_BIT_NV = 0x00000001,
    VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV = 0x00000002,
    VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_GLOBAL_FLOW_BIT_NV = 0x00000004,
    VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV = 0x00000008,
    VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV = 0x00000010,
} VkOpticalFlowSessionCreateFlagBitsNV;
```

- **VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT_BIT_NV** specifies that a VkImageView with external flow vectors will be used as hints in performing the motion search and **must** be bound to VK_OPTICAL_FLOW_SESSION_BINDING_POINT_HINT_NV.

- **VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV** specifies that the cost for the forward flow is generated in a VkImageView which **must** be bound to VK_OPTICAL_FLOW_SESSION_BINDING_POINT_COST_NV. Additionally, if VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV is also set, the cost for backward flow is generated in a VkImageView which **must** be bound to VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_COST_NV. The cost is the confidence level of the flow vector for each grid in the frame. The Cost implies how (in)accurate the flow vector is. Higher cost value implies the flow vector to be less accurate and vice-versa.

- **VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_GLOBAL_FLOW_BIT_NV** specifies that a global flow vector is estimated from forward flow in a single pixel VkImageView which **must** be bound to VK_OPTICAL_FLOW_SESSION_BINDING_POINT_GLOBAL_FLOW_NV.

- **VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV** specifies that regions of interest **can** be specified in VkOpticalFlowExecuteInfoNV.

- **VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV** specifies that backward flow is generated in addition to forward flow which is always generated.

VkOpticalFlowSessionCreateFlagsNV is a bitmask type for setting a mask of zero or more VkOpticalFlowSessionCreateFlagBitsNV.

```c
// Provided by VK_NV_optical_flow
typedef VkFlags VkOpticalFlowSessionCreateFlagsNV;
```

**Destroying an Optical Flow Session**

To destroy a optical flow session object, call:
void vkDestroyOpticalFlowSessionNV(
    VkDevice device,
    VkOpticalFlowSessionNV session,
    const VkAllocationCallbacks* pAllocator);

- **device** is the device that was used for the creation of the optical flow session.
- **session** is the optical flow session to be destroyed.
- **pAllocator** controls host memory allocation as described in the *Memory Allocation* chapter.

### Valid Usage (Implicit)

- **VUID-vkDestroyOpticalFlowSessionNV-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkDestroyOpticalFlowSessionNV-session-parameter**
  - `session` must be a valid `VkOpticalFlowSessionNV` handle

- **VUID-vkDestroyOpticalFlowSessionNV-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyOpticalFlowSessionNV-session-parent**
  - `session` must have been created, allocated, or retrieved from `device`

## 41.3.2. Binding vulkan image views to an optical flow session

To bind a vulkan image to an optical flow session object, call:

```c
// Provided by VK_NV_optical_flow
VkResult vkBindOpticalFlowSessionImageNV(
    VkDevice device,
    VkOpticalFlowSessionNV session,
    VkOpticalFlowSessionBindingPointNV bindingPoint,
    VkImageView view,
    VkImageLayout layout);
```

- **device** is the device which owns the optical flow session object `session`.
- **session** is the optical flow session object to which the image view is to be bound.
- **bindingPoint** specifies the binding point `VkOpticalFlowSessionBindingPointNV` to which the image view is bound.
- **view** is a `VkImageView` to be bound.
- **layout** must specify the layout that the image subresources accessible from `view` will be in at the time the optical flow vectors are calculated with `vkCmdOpticalFlowExecuteNV` on a `VkDevice`. 
Valid Usage (Implicit)

- **VUID-vkBindOpticalFlowSessionImageNV-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkBindOpticalFlowSessionImageNV-session-parameter**
  
  `session` must be a valid `VkOpticalFlowSessionNV` handle

- **VUID-vkBindOpticalFlowSessionImageNV-bindingPoint-parameter**
  
  `bindingPoint` must be a valid `VkOpticalFlowSessionBindingPointNV` value

- **VUID-vkBindOpticalFlowSessionImageNV-view-parameter**
  
  If `view` is not `VK_NULL_HANDLE`, `view` must be a valid `VkImageView` handle

- **VUID-vkBindOpticalFlowSessionImageNV-layout-parameter**
  
  `layout` must be a valid `VkImageLayout` value

- **VUID-vkBindOpticalFlowSessionImageNV-session-parent**
  
  `session` must have been created, allocated, or retrieved from `device`

- **VUID-vkBindOpticalFlowSessionImageNV-view-parent**
  
  If `view` is a valid handle, it must have been created, allocated, or retrieved from `device`

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`

- `VK_ERROR_INITIALIZATION_FAILED`

The optical flow session binding points are defined with the following:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowSessionBindingPointNV {
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_INPUT_NV = 1,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_REFERENCE_NV = 2,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_HINT_NV = 3,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_FLOW_VECTOR_NV = 4,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_FLOW_VECTOR_NV = 5,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_COST_NV = 6,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_COST_NV = 7,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_GLOBAL_FLOW_NV = 8,
} VkOpticalFlowSessionBindingPointNV;
```

- `VK_OPTICAL_FLOW_SESSION_BINDING_POINT_INPUT_NV` specifies the binding point for the input frame.
• **VK_OPTICAL_FLOW_SESSION_BINDING_POINT_REFERENCE_NV** specifies the binding point for the input reference frame.

• **VK_OPTICAL_FLOW_SESSION_BINDING_POINT_HINT_NV** specifies the binding point for the optional external hint flow vectors.

• **VK_OPTICAL_FLOW_SESSION_BINDING_POINT_FLOW_VECTOR_NV** specifies the binding point for output flow vectors of default forward flow calcution.

• **VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_FLOW_VECTOR_NV** specifies the binding point for the optional output flow vector map of optional backward flow calcution.

• **VK_OPTICAL_FLOW_SESSION_BINDING_POINT_COST_NV** specifies the binding point for the optional output cost map of default forward flow calcution.

• **VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_COST_NV** specifies the binding point for the optional output cost map of optional backward flow calcution.

• **VK_OPTICAL_FLOW_SESSION_BINDING_POINT_GLOBAL_FLOW_NV** specifies the binding point for the optional global flow value of default forward flow calcution.

### 41.3.3. Optical Flow Execution

Default direction of flow estimation is forward which calculates the optical flow from input frame to reference frame. Optionally backward flow estimation can be additionally calculated. An output flow vector (Vx, Vy) means that current pixel (x, y) of input frame can be found at location (x+Vx, y+Vy) in reference frame. A backward flow vector (Vx, Vy) means that current pixel (x, y) of reference frame can be found at location (x+Vx, y+Vy) in input frame.

To calculate optical flow vectors from two input frames, call:

```c
// Provided by VK_NV_optical_flow
void vkCmdOpticalFlowExecuteNV(
    VkCommandBuffer commandBuffer,
    VkOpticalFlowSessionNV session,
    const VkOpticalFlowExecuteInfoNV* pExecuteInfo);
```

• **commandBuffer** is the command buffer into which the command will be recorded.

• **session** is the optical flow session object on which this command is operating.

• **pExecuteInfo** Info is a pointer to a **VkOpticalFlowExecuteInfoNV**.

### Valid Usage (Implicit)

- **VUID-vkCmdOpticalFlowExecuteNV-commandBuffer-parameter**
  - **commandBuffer** must be a valid **VkCommandBuffer** handle

- **VUID-vkCmdOpticalFlowExecuteNV-session-parameter**
  - **session** must be a valid **VkOpticalFlowSessionNV** handle

- **VUID-vkCmdOpticalFlowExecuteNV-pExecuteInfo-parameter**
  - **pExecuteInfo** must be a valid pointer to a valid **VkOpticalFlowExecuteInfoNV** structure
Host Synchronization

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Opticalflow</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td>Outside</td>
<td>Outside</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkOpticalFlowExecuteInfoNV structure is defined as:

```c
// Provided by VK_NV_optical_flow
typedef struct VkOpticalFlowExecuteInfoNV {
    VkStructureType sType;
    void* pNext;
    VkOpticalFlowExecuteFlagsNV flags;
    uint32_t regionCount;
    const VkRect2D* pRegions;
} VkOpticalFlowExecuteInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` are the VkOpticalFlowExecuteFlagsNV used for this command.
- `regionCount` is the number of regions of interest specified in `pRegions`.
- `pRegions` is a pointer to `regionCount VkRect2D` regions of interest.
Valid Usage

- VUID-VkOpticalFlowExecuteInfoNV-regionCount-07593
  
  regionCount must be 0 if VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV was not set for VkOpticalFlowSessionNV on which this command is operating.

Valid Usage (Implicit)

- VUID-VkOpticalFlowExecuteInfoNV-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_OPTICAL_FLOW_EXECUTE_INFO_NV

- VUID-VkOpticalFlowExecuteInfoNV-pNext-pNext
  
  pNext must be NULL

- VUID-VkOpticalFlowExecuteInfoNV-flags-parameter
  
  flags must be a valid combination of VkOpticalFlowExecuteFlagBitsNV values

- VUID-VkOpticalFlowExecuteInfoNV-pRegions-parameter
  
  If regionCount is not 0, pRegions must be a valid pointer to an array of regionCount VkRect2D structures

Bits which can be set in VkOpticalFlowExecuteInfoNV::flags, controlling optical flow execution, are:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowExecuteFlagBitsNV {
    VK_OPTICAL_FLOW_EXECUTE_DISABLE_TEMPORAL_HINTS_BIT_NV = 0x00000001,
} VkOpticalFlowExecuteFlagBitsNV;
```

- VK_OPTICAL_FLOW_EXECUTE_DISABLE_TEMPORAL_HINTS_BIT_NV specifies that temporal hints from previously generated flow vectors are not used. If temporal hints are enabled, optical flow vectors from previous vkCmdOpticalFlowExecuteNV call are automatically used as hints for the current vkCmdOpticalFlowExecuteNV call, to take advantage of temporal correlation in a video sequence. Temporal hints should be disabled if there is a-priori knowledge of no temporal correlation (e.g. a scene change, independent successive frame pairs).

VkOpticalFlowExecuteFlagsNV is a bitmask type for setting a mask of zero or more VkOpticalFlowExecuteFlagBitsNV.

```c
// Provided by VK_NV_optical_flow
typedef VkFlags VkOpticalFlowExecuteFlagsNV;
```
Chapter 42. Extending Vulkan

New functionality may be added to Vulkan via either new extensions or new versions of the core, or new versions of an extension in some cases.

This chapter describes how Vulkan is versioned, how compatibility is affected between different versions, and compatibility rules that are followed by the Vulkan Working Group.

42.1. Instance and Device Functionality

Commands that enumerate instance properties, or that accept a VkInstance object as a parameter, are considered instance-level functionality. Commands that enumerate physical device properties, or that accept a VkDevice object or any of a device's child objects as a parameter, are considered device-level functionality.

Note
Applications usually interface to Vulkan using a loader that implements only instance-level functionality, passing device-level functionality to implementations of the full Vulkan API on the system. In some circumstances, as these may be implemented independently, it is possible that the loader and device implementations on a given installation will support different versions. To allow for this and call out when it happens, the Vulkan specification enumerates device and instance level functionality separately - they have independent version queries.

Note
Vulkan 1.0 initially specified new physical device enumeration functionality as instance-level, requiring it to be included in an instance extension. As the capabilities of device-level functionality require discovery via physical device enumeration, this led to the situation where many device extensions required an instance extension as well. To alleviate this extra work, VK_KHR_get_physical_device_properties2 (and subsequently Vulkan 1.1) redefined device-level functionality to include physical device enumeration.

42.2. Core Versions

The Vulkan Specification is regularly updated with bug fixes and clarifications. Occasionally new functionality is added to the core and at some point it is expected that there will be a desire to perform a large, breaking change to the API. In order to indicate to developers how and when these changes are made to the specification, and to provide a way to identify each set of changes, the Vulkan API maintains a version number.

42.2.1. Version Numbers

The Vulkan version number comprises four parts indicating the variant, major, minor and patch version of the Vulkan API Specification.
The variant indicates the variant of the Vulkan API supported by the implementation. This is always 0 for the Vulkan API.

Note
A non-zero variant indicates the API is a variant of the Vulkan API and applications will typically need to be modified to run against it. The variant field was a later addition to the version number, added in version 1.2.175 of the Specification. As Vulkan uses variant 0, this change is fully backwards compatible with the previous version number format for Vulkan implementations. New version number macros have been added for this change and the old macros deprecated. For existing applications using the older format and macros, an implementation with non-zero variant will decode as a very high Vulkan version. The high version number should be detectable by applications performing suitable version checking.

The major version indicates a significant change in the API, which will encompass a wholly new version of the specification.

The minor version indicates the incorporation of new functionality into the core specification.

The patch version indicates bug fixes, clarifications, and language improvements have been incorporated into the specification.

Compatibility guarantees made about versions of the API sharing any of the same version numbers are documented in Core Versions

The version number is used in several places in the API. In each such use, the version numbers are packed into a 32-bit integer as follows:

- The variant is a 3-bit integer packed into bits 31-29.
- The major version is a 7-bit integer packed into bits 28-22.
- The minor version number is a 10-bit integer packed into bits 21-12.
- The patch version number is a 12-bit integer packed into bits 11-0.

**VK_API_VERSION_VARIANT** extracts the API variant number from a packed version number:

```c
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_VARIANT(version) ((uint32_t)(version) >> 29)
```

**VK_API_VERSION_MAJOR** extracts the API major version number from a packed version number:

```c
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_MAJOR(version) (((uint32_t)(version) >> 22) & 0x7FU)
```

**VK_VERSION_MAJOR** extracts the API major version number from a packed version number:
VK_API_VERSION_MINOR extracts the API minor version number from a packed version number:

```c
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_MINOR(version) (((uint32_t)(version) >> 12) & 0x3FFU)
```

VK_VERSION_MINOR extracts the API minor version number from a packed version number:

```c
// Provided by VK_VERSION_1_0
#define VK_VERSION_MINOR(version) (((uint32_t)(version) >> 12) & 0x3FFU)
```

VK_API_VERSION_PATCH extracts the API patch version number from a packed version number:

```c
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_PATCH(version) ((uint32_t)(version) & 0xFFFU)
```

VK_VERSION_PATCH extracts the API patch version number from a packed version number:

```c
// Provided by VK_VERSION_1_0
#define VK_VERSION_PATCH(version) ((uint32_t)(version) & 0xFFFU)
```

VK_MAKE_API_VERSION constructs an API version number:

```c
// Provided by VK_VERSION_1_0
#define VK_MAKE_API_VERSION(variant, major, minor, patch) \
    (((uint32_t)(variant)) << 29) | (((uint32_t)(major)) << 22) | \
    (((uint32_t)(minor)) << 12) | ((uint32_t)(patch))
```

- **variant** is the variant number.
- **major** is the major version number.
- **minor** is the minor version number.
- **patch** is the patch version number.

VK_MAKE_VERSION constructs an API version number:

```c
// Provided by VK_VERSION_1_0
// DEPRECATED: This define is deprecated. VK_MAKE_API_VERSION should be used instead.
```
#define VK_MAKE_VERSION(major, minor, patch) 
  (((uint32_t)(major)) << 22) | (((uint32_t)(minor)) << 12) | ((uint32_t)(patch))

- **major** is the major version number.
- **minor** is the minor version number.
- **patch** is the patch version number.

**VK_API_VERSION_1_0** returns the API version number for Vulkan 1.0.0.

```c
// Provided by VK_VERSION_1_0  
// Vulkan 1.0 version number 
#define VK_API_VERSION_1_0 VK_MAKE_API_VERSION(0, 1, 0, 0)// Patch version should always be set to 0
```

**VK_API_VERSION_1_1** returns the API version number for Vulkan 1.1.0.

```c
// Provided by VK_VERSION_1_1  
// Vulkan 1.1 version number 
#define VK_API_VERSION_1_1 VK_MAKE_API_VERSION(0, 1, 1, 0)// Patch version should always be set to 0
```

**VK_API_VERSION_1_2** returns the API version number for Vulkan 1.2.0.

```c
// Provided by VK_VERSION_1_2  
// Vulkan 1.2 version number 
#define VK_API_VERSION_1_2 VK_MAKE_API_VERSION(0, 1, 2, 0)// Patch version should always be set to 0
```

**VK_API_VERSION_1_3** returns the API version number for Vulkan 1.3.0.

```c
// Provided by VK_VERSION_1_3  
// Vulkan 1.3 version number 
#define VK_API_VERSION_1_3 VK_MAKE_API_VERSION(0, 1, 3, 0)// Patch version should always be set to 0
```

### 42.2.2. Querying Version Support

The version of instance-level functionality can be queried by calling `vkEnumerateInstanceVersion`.

The version of device-level functionality can be queried by calling `vkGetPhysicalDeviceProperties` or `vkGetPhysicalDeviceProperties2`, and is returned in `VkPhysicalDeviceProperties::apiVersion`, encoded as described in **Version Numbers**.
42.3. Layers

When a layer is enabled, it inserts itself into the call chain for Vulkan commands the layer is interested in. Layers can be used for a variety of tasks that extend the base behavior of Vulkan beyond what is required by the specification - such as call logging, tracing, validation, or providing additional extensions.

**Note**

For example, an implementation is not expected to check that the value of enums used by the application fall within allowed ranges. Instead, a validation layer would do those checks and flag issues. This avoids a performance penalty during production use of the application because those layers would not be enabled in production.

**Note**

Vulkan layers may wrap object handles (i.e. return a different handle value to the application than that generated by the implementation). This is generally discouraged, as it increases the probability of incompatibilities with new extensions. The validation layers wrap handles in order to track the proper use and destruction of each object. See the “Architecture of the Vulkan Loader Interfaces” document for additional information.

To query the available layers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumerateInstanceLayerProperties(
    uint32_t* pPropertyCount,
    VkLayerProperties* pProperties);
```

- `pPropertyCount` is a pointer to an integer related to the number of layer properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkLayerProperties` structures.

If `pProperties` is `NULL`, then the number of layer properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of layer properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

The list of available layers may change at any time due to actions outside of the Vulkan implementation, so two calls to `vkEnumerateInstanceLayerProperties` with the same parameters may return different results, or retrieve different `pPropertyCount` values or `pProperties` contents. Once an instance has been created, the layers enabled for that instance will continue to be enabled and valid for the lifetime of that instance, even if some of them become unavailable for future instances.
Valid Usage (Implicit)

- VUID-vkEnumerateInstanceLayerProperties-pPropertyCount-parameter
  pPropertyCount **must** be a valid pointer to a `uint32_t` value

- VUID-vkEnumerateInstanceLayerProperties-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties **must** be a valid pointer to an array of pPropertyCount VkLayerProperties structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkLayerProperties structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkLayerProperties {
    char    layerName[VK_MAX_EXTENSION_NAME_SIZE];
    uint32_t specVersion;
    uint32_t implementationVersion;
    char    description[VK_MAX_DESCRIPTION_SIZE];
} VkLayerProperties;
```

- **layerName** is an array of `VK_MAX_EXTENSION_NAME_SIZE` char containing a null-terminated UTF-8 string which is the name of the layer. Use this name in the ppEnabledLayerNames array passed in the VkInstanceCreateInfo structure to enable this layer for an instance.

- **specVersion** is the Vulkan version the layer was written to, encoded as described in Version Numbers.

- **implementationVersion** is the version of this layer. It is an integer, increasing with backward compatible changes.

- **description** is an array of `VK_MAX_DESCRIPTION_SIZE` char containing a null-terminated UTF-8 string which provides additional details that can be used by the application to identify the layer.

**VK_MAX_EXTENSION_NAME_SIZE** is the length in char values of an array containing a layer or extension name string, as returned in VkLayerProperties::layerName, VkExtensionProperties::extensionName, and other queries.
#define VK_MAX_EXTENSION_NAME_SIZE 256U

VK_MAX_DESCRIPTION_SIZE is the length in char values of an array containing a string with additional descriptive information about a query, as returned in VkLayerProperties::description and other queries.

#define VK_MAX_DESCRIPTION_SIZE 256U

To enable a layer, the name of the layer should be added to the ppEnabledLayerNames member of VkInstanceCreateInfo when creating a VkInstance.

Loader implementations may provide mechanisms outside the Vulkan API for enabling specific layers. Layers enabled through such a mechanism are implicitly enabled, while layers enabled by including the layer name in the ppEnabledLayerNames member of VkInstanceCreateInfo are explicitly enabled. Implicitly enabled layers are loaded before explicitly enabled layers, such that implicitly enabled layers are closer to the application, and explicitly enabled layers are closer to the driver. Except where otherwise specified, implicitly enabled and explicitly enabled layers differ only in the way they are enabled, and the order in which they are loaded. Explicitly enabling a layer that is implicitly enabled results in this layer being loaded as an implicitly enabled layer; it has no additional effect.

## 42.3.1. Device Layer Deprecation

Previous versions of this specification distinguished between instance and device layers. Instance layers were only able to intercept commands that operate on VkInstance and VkPhysicalDevice, except they were not able to intercept vkCreateDevice. Device layers were enabled for individual devices when they were created, and could only intercept commands operating on that device or its child objects.

Device-only layers are now deprecated, and this specification no longer distinguishes between instance and device layers. Layers are enabled during instance creation, and are able to intercept all commands operating on that instance or any of its child objects. At the time of deprecation there were no known device-only layers and no compelling reason to create one.

In order to maintain compatibility with implementations released prior to device-layer deprecation, applications should still enumerate and enable device layers. The behavior of vkEnumerateDeviceLayerProperties and valid usage of the ppEnabledLayerNames member of VkDeviceCreateInfo maximizes compatibility with applications written to work with the previous requirements.

To enumerate device layers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumerateDeviceLayerProperties(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
```
 VkLayerProperties* pProperties);

- **physicalDevice** is the physical device that will be queried.
- **pPropertyCount** is a pointer to an integer related to the number of layer properties available or queried.
- **pProperties** is either NULL or a pointer to an array of VkLayerProperties structures.

If pProperties is NULL, then the number of layer properties available is returned in pPropertyCount. Otherwise, pPropertyCount must point to a variable set by the user to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If pPropertyCount is less than the number of layer properties available, at most pPropertyCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available properties were returned.

The list of layers enumerated by vkEnumerateDeviceLayerProperties must be exactly the sequence of layers enabled for the instance. The members of VkLayerProperties for each enumerated layer must be the same as the properties when the layer was enumerated by vkEnumerateInstanceLayerProperties.

**Note**

Due to platform details on Android, vkEnumerateDeviceLayerProperties may be called with physicalDevice equal to NULL during layer discovery. This behaviour will only be observed by layer implementations, and not the underlying Vulkan driver.

**Valid Usage (Implicit)**

- VUID-vkEnumerateDeviceLayerProperties-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkEnumerateDeviceLayerProperties-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value
- VUID-vkEnumerateDeviceLayerProperties-pProperties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkLayerProperties structures

**Return Codes**

**Success**

- VK_SUCCESS
- VK_INCOMPLETE

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
The `ppEnabledLayerNames` and `enabledLayerCount` members of `VkDeviceCreateInfo` are deprecated and their values must be ignored by implementations. However, for compatibility, only an empty list of layers or a list that exactly matches the sequence enabled at instance creation time are valid, and validation layers should issue diagnostics for other cases.

Regardless of the enabled layer list provided in `VkDeviceCreateInfo`, the sequence of layers active for a device will be exactly the sequence of layers enabled when the parent instance was created.

### 42.4. Extensions

Extensions may define new Vulkan commands, structures, and enumerants. For compilation purposes, the interfaces defined by registered extensions, including new structures and enumerants as well as function pointer types for new commands, are defined in the Khronos-supplied `vulkan_core.h` together with the core API. However, commands defined by extensions may not be available for static linking - in which case function pointers to these commands should be queried at runtime as described in Command Function Pointers. Extensions may be provided by layers as well as by a Vulkan implementation.

Because extensions may extend or change the behavior of the Vulkan API, extension authors should add support for their extensions to the Khronos validation layers. This is especially important for new commands whose parameters have been wrapped by the validation layers. See the “Architecture of the Vulkan Loader Interfaces” document for additional information.

**Note**

To enable an instance extension, the name of the extension can be added to the `ppEnabledExtensionNames` member of `VkInstanceCreateInfo` when creating a `VkInstance`.

To enable a device extension, the name of the extension can be added to the `ppEnabledExtensionNames` member of `VkDeviceCreateInfo` when creating a `VkDevice`.

Physical-Device-Level functionality does not have any enabling mechanism and can be used as long as the `VkPhysicalDevice` supports the device extension as determined by `vkEnumerateDeviceExtensionProperties`.

Enabling an extension (with no further use of that extension) does not change the behavior of functionality exposed by the core Vulkan API or any other extension, other than making valid the use of the commands, enums and structures defined by that extension.

Valid Usage sections for individual commands and structures do not currently contain which extensions have to be enabled in order to make their use valid, although they might do so in the future. It is defined only in the Valid Usage for Extensions section.

### 42.4.1. Instance Extensions

Instance extensions add new instance-level functionality to the API, outside of the core
specification.

To query the available instance extensions, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumerateInstanceExtensionProperties(
    const char* pLayerName,
    uint32_t* pPropertyCount,
    VkExtensionProperties* pProperties);
```

- `pLayerName` is either `NULL` or a pointer to a null-terminated UTF-8 string naming the layer to retrieve extensions from.
- `pPropertyCount` is a pointer to an integer related to the number of extension properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkExtensionProperties` structures.

When `pLayerName` parameter is `NULL`, only extensions provided by the Vulkan implementation or by implicitly enabled layers are returned. When `pLayerName` is the name of a layer, the instance extensions provided by that layer are returned.

If `pProperties` is `NULL`, then the number of extensions properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of extension properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

Because the list of available layers may change externally between calls to `vkEnumerateInstanceExtensionProperties`, two calls may retrieve different results if a `pLayerName` is available in one call but not in another. The extensions supported by a layer may also change between two calls, e.g. if the layer implementation is replaced by a different version between those calls.

Implementations must not advertise any pair of extensions that cannot be enabled together due to behavioral differences, or any extension that cannot be enabled against the advertised version.

### Valid Usage (Implicit)

- VUID-vkEnumerateInstanceExtensionProperties-pLayerName-parameter
  If `pLayerName` is not `NULL`, `pLayerName` must be a null-terminated UTF-8 string

- VUID-vkEnumerateInstanceExtensionProperties-pPropertyCount-parameter
  `pPropertyCount` must be a valid pointer to a `uint32_t` value

- VUID-vkEnumerateInstanceExtensionProperties-pProperties-parameter
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkExtensionProperties` structures
Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_LAYER_NOT_PRESENT

42.4.2. Device Extensions

Device extensions add new device-level functionality to the API, outside of the core specification.

To query the extensions available to a given physical device, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumerateDeviceExtensionProperties(
    VkPhysicalDevice physicalDevice,
    const char* pLayerName,
    uint32_t* pPropertyCount,
    VkExtensionProperties* pProperties);
```

• `physicalDevice` is the physical device that will be queried.
• `pLayerName` is either NULL or a pointer to a null-terminated UTF-8 string naming the layer to retrieve extensions from.
• `pPropertyCount` is a pointer to an integer related to the number of extension properties available or queried, and is treated in the same fashion as the `vkEnumerateInstanceExtensionProperties` ::`pPropertyCount` parameter.
• `pProperties` is either NULL or a pointer to an array of `VkExtensionProperties` structures.

When `pLayerName` parameter is NULL, only extensions provided by the Vulkan implementation or by implicitly enabled layers are returned. When `pLayerName` is the name of a layer, the device extensions provided by that layer are returned.

Implementations must not advertise any pair of extensions that cannot be enabled together due to behavioral differences, or any extension that cannot be enabled against the advertised version.

Implementations claiming support for the Roadmap 2022 profile must advertise the VK_KHR_global_priority extension in `pProperties`.

---

Note

Due to platform details on Android, `vkEnumerateDeviceExtensionProperties` may be called with `physicalDevice` equal to NULL during layer discovery. This behaviour...
will only be observed by layer implementations, and not the underlying Vulkan driver.

**Valid Usage (Implicit)**

- **VUID-vkEnumerateDeviceExtensionProperties-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkEnumerateDeviceExtensionProperties-pLayerName-parameter**
  - If `pLayerName` is not NULL, `pLayerName` must be a null-terminated UTF-8 string

- **VUID-vkEnumerateDeviceExtensionProperties-pPropertyCount-parameter**
  - `pPropertyCount` must be a valid pointer to a `uint32_t` value

- **VUID-vkEnumerateDeviceExtensionProperties-pProperties-parameter**
  - If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkExtensionProperties` structures

**Return Codes**

**Success**

- VK_SUCCESS
- VK_INCOMPLETE

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_LAYER_NOT_PRESENT

The `VkExtensionProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtensionProperties {
    char extensionName[VK_MAX_EXTENSION_NAME_SIZE];
    uint32_t specVersion;
} VkExtensionProperties;
```

- `extensionName` is an array of `VK_MAX_EXTENSION_NAME_SIZE` char containing a null-terminated UTF-8 string which is the name of the extension.
- `specVersion` is the version of this extension. It is an integer, incremented with backward compatible changes.

**42.5. Extension Dependencies**

Some extensions are dependent on other extensions, or on specific core API versions, to function.
To enable extensions with dependencies, any 
required extensions **must** also be enabled through the 
same API mechanisms when creating an instance with **vkCreateInstance** or a device with 
**vkCreateDevice**. Each extension which has such dependencies documents them in the **appendix** 
summarizing that extension.

If an extension is supported (as queried by **vkEnumerateInstanceExtensionProperties** or 
**vkEnumerateDeviceExtensionProperties**), then **required extensions** of that extension **must** also be 
supported for the same instance or physical device.

Any device extension that has an instance extension dependency that is not enabled by 
**vkCreateInstance** is considered to be unsupported, hence it **must** not be returned by 
**vkEnumerateDeviceExtensionProperties** for any **VkPhysicalDevice** child of the instance. Instance 
extensions do not have dependencies on device extensions.

If a required extension has been **promoted** to another extension or to a core API version, then as a 
general rule, the dependency is also satisfied by the promoted extension or core version. This will 
be true so long as any features required by the original extension are also required or enabled by 
the promoted extension or core version. However, in some cases an extension is promoted while 
making some of its features optional in the promoted extension or core version. In this case, the 
dependency **may** not be satisfied. The only way to be certain is to look at the descriptions of the 
original dependency and the promoted version in the **Layers & Extensions** and **Core Revisions** 
appendices.

**Note**

There is metadata in **vk.xml** describing some aspects of promotion, especially 
requires, promotedto and deprecatedby attributes of **<extension>** tags. However, the 
metadata does not yet fully describe this scenario. In the future, we may extend 
the XML schema to describe the full set of extensions and versions satisfying a 
dependency.

### 42.6. Compatibility Guarantees (Informative)

This section is marked as informal as there is no binding responsibility on implementations of the 
Vulkan API - these guarantees are however a contract between the Vulkan Working Group and 
developers using this Specification.

#### 42.6.1. Core Versions

Each of the major, minor, and patch versions of the Vulkan specification provide different 
compatibility guarantees.

**Patch Versions**

A difference in the patch version indicates that a set of bug fixes or clarifications have been made 
to the Specification. Informative enums returned by Vulkan commands that will not affect the 
runtime behavior of a valid application may be added in a patch version (e.g. **VkVendorId**).

The specification’s patch version is strictly increasing for a given major version of the specification;
any change to a specification as described above will result in the patch version being increased by 1. Patch versions are applied to all minor versions, even if a given minor version is not affected by the provoking change.

Specifications with different patch versions but the same major and minor version are fully compatible with each other - such that a valid application written against one will work with an implementation of another.

Note

If a patch version includes a bug fix or clarification that could have a significant impact on developer expectations, these will be highlighted in the change log. Generally the Vulkan Working Group tries to avoid these kinds of changes, instead fixing them in either an extension or core version.

Minor Versions

Changes in the minor version of the specification indicate that new functionality has been added to the core specification. This will usually include new interfaces in the header, and may also include behavior changes and bug fixes. Core functionality may be deprecated in a minor version, but will not be obsoleted or removed.

The specification's minor version is strictly increasing for a given major version of the specification; any change to a specification as described above will result in the minor version being increased by 1. Changes that can be accommodated in a patch version will not increase the minor version.

Specifications with a lower minor version are backwards compatible with an implementation of a specification with a higher minor version for core functionality and extensions issued with the KHR vendor tag. Vendor and multi-vendor extensions are not guaranteed to remain functional across minor versions, though in general they are with few exceptions - see Obsoletion for more information.

Major Versions

A difference in the major version of specifications indicates a large set of changes which will likely include interface changes, behavioral changes, removal of deprecated functionality, and the modification, addition, or replacement of other functionality.

The specification's major version is monotonically increasing; any change to the specification as described above will result in the major version being increased. Changes that can be accommodated in a patch or minor version will not increase the major version.

The Vulkan Working Group intends to only issue a new major version of the Specification in order to realise significant improvements to the Vulkan API that will necessarily require breaking compatibility.

A new major version will likely include a wholly new version of the specification to be issued - which could include an overhaul of the versioning semantics for the minor and patch versions. The patch and minor versions of a specification are therefore not meaningful across major versions. If a
major version of the specification includes similar versioning semantics, it is expected that the patch and the minor version will be reset to 0 for that major version.

42.6.2. Extensions

A KHR extension must be able to be enabled alongside any other KHR extension, and for any minor or patch version of the core Specification beyond the minimum version it requires. A multi-vendor extension should be able to be enabled alongside any KHR extension or other multi-vendor extension, and for any minor or patch version of the core Specification beyond the minimum version it requires. A vendor extension should be able to be enabled alongside any KHR extension, multi-vendor extension, or other vendor extension from the same vendor, and for any minor or patch version of the core Specification beyond the minimum version it requires. A vendor extension may be able to be enabled alongside vendor extensions from another vendor.

The one other exception to this is if a vendor or multi-vendor extension is made obsolete by either a core version or another extension, which will be highlighted in the extension appendix.

Promotion

Extensions, or features of an extension, may be promoted to a new core version of the API, or a newer extension which an equal or greater number of implementors are in favour of.

When extension functionality is promoted, minor changes may be introduced, limited to the following:

- Naming
- Non-intrusive parameters changes
- Feature advertisement/enablement
- Combining structure parameters into larger structures
- Author ID suffixes changed or removed

Note

If extension functionality is promoted, there is no guarantee of direct compatibility, however it should require little effort to port code from the original feature to the promoted one.

The Vulkan Working Group endeavours to ensure that larger changes are marked as either deprecated or obsoleted as appropriate, and can do so retroactively if necessary.

Extensions that are promoted are listed as being promoted in their extension appendices, with reference to where they were promoted to.

When an extension is promoted, any backwards compatibility aliases which exist in the extension will not be promoted.

Note
As a hypothetical example, if the VK_KHR_surface extension were promoted to part of a future core version, the VK_COLOR_SPACE_SRGB_NONLINEAR_KHR token defined by that extension would be promoted to VK_COLOR_SPACE_SRGB_NONLINEAR. However, the VK_COLORSPACE_SRGB_NONLINEAR_KHR token aliases VK_COLOR_SPACE_SRGB_NONLINEAR_KHR. The VK_COLORSPACE_SRGB_NONLINEAR_KHR would not be promoted, because it is a backwards compatibility alias that exists only due to a naming mistake when the extension was initially published.

**Deprecation**

Extensions may be marked as deprecated when the intended use cases either become irrelevant or can be solved in other ways. Generally, a new feature will become available to solve the use case in another extension or core version of the API, but it is not guaranteed.

*Note*

Features that are intended to replace deprecated functionality have no guarantees of compatibility, and applications may require drastic modification in order to make use of the new features.

Extensions that are deprecated are listed as being deprecated in their extension appendices, with an explanation of the deprecation and any features that are relevant.

**Obsoletion**

Occasionally, an extension will be marked as obsolete if a new version of the core API or a new extension is fundamentally incompatible with it. An obsoleted extension must not be used with the extension or core version that obsoleted it.

Extensions that are obsoleted are listed as being obsoleted in their extension appendices, with reference to what they were obsoleted by.

**Aliases**

When an extension is promoted or deprecated by a newer feature, some or all of its functionality may be replicated into the newer feature. Rather than duplication of all the documentation and definitions, the specification instead identifies the identical commands and types as aliases of one another. Each alias is mentioned together with the definition it aliases, with the older aliases marked as “equivalents”. Each alias of the same command has identical behavior, and each alias of the same type has identical meaning - they can be used interchangeably in an application with no compatibility issues.

*Note*

For promoted types, the aliased extension type is semantically identical to the new core type. The C99 headers simply typedef the older aliases to the promoted types.

For promoted command aliases, however, there are two separate entry point definitions, due to the fact that the C99 ABI has no way to alias command definitions without resorting to macros. Calling via either entry point definition
will produce identical behavior within the bounds of the specification, and should still invoke the same entry point in the implementation. Debug tools may use separate entry points with different debug behavior; to write the appropriate command name to an output log, for instance.

**Special Use Extensions**

Some extensions exist only to support a specific purpose or specific class of application. These are referred to as “special use extensions”. Use of these extensions in applications not meeting the special use criteria is not recommended.

Special use cases are restricted, and only those defined below are used to describe extensions:

*Table 50. Extension Special Use Cases*

<table>
<thead>
<tr>
<th>Special Use</th>
<th>XML Tag</th>
<th>Full Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAD support</td>
<td>cadsupport</td>
<td>Extension is intended to support specialized functionality used by CAD/CAM applications.</td>
</tr>
<tr>
<td>D3D support</td>
<td>d3demulation</td>
<td>Extension is intended to support D3D emulation layers, and applications ported from D3D, by adding functionality specific to D3D.</td>
</tr>
<tr>
<td>Developer tools</td>
<td>devtools</td>
<td>Extension is intended to support developer tools such as capture-replay libraries.</td>
</tr>
<tr>
<td>Debugging tools</td>
<td>debugging</td>
<td>Extension is intended for use by applications when debugging.</td>
</tr>
<tr>
<td>OpenGL / ES support</td>
<td>glemulation</td>
<td>Extension is intended to support OpenGL and/or OpenGL ES emulation layers, and applications ported from those APIs, by adding functionality specific to those APIs.</td>
</tr>
</tbody>
</table>

Special use extensions are identified in the metadata for each such extension in the Layers & Extensions appendix, using the name in the “Special Use” column above.

Special use extensions are also identified in *vk.xml* with the short name in “XML Tag” column above, as described in the “API Extensions (extension tag)” section of the registry schema documentation.
Chapter 43. Features

Features describe functionality which is not supported on all implementations. Features are properties of the physical device. Features are **optional**, and **must** be explicitly enabled before use. Support for features is reported and enabled on a per-feature basis.

---

**Note**

Features are reported via the basic `VkPhysicalDeviceFeatures` structure, as well as the extensible structure `VkPhysicalDeviceFeatures2`, which was added in the `VK_KHR_get_physical_device_properties2` extension and included in Vulkan 1.1. When new features are added in future Vulkan versions or extensions, each extension **should** introduce one new feature structure, if needed. This structure **can** be added to the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure.

For convenience, new core versions of Vulkan **may** introduce new unified feature structures for features promoted from extensions. At the same time, the extension's original feature structure (if any) is also promoted to the core API, and is an alias of the extension's structure. This results in multiple names for the same feature: in the original extension's feature structure and the promoted structure alias, in the unified feature structure. When a feature was implicitly supported and enabled in the extension, but an explicit name was added during promotion, then the extension itself acts as an alias for the feature as listed in the table below.

All aliases of the same feature in the core API **must** be reported consistently: either all **must** be reported as supported, or none of them. When a promoted extension is available, any corresponding feature aliases **must** be supported.

**Table 51. Extension Feature Aliases**

<table>
<thead>
<tr>
<th>Extension</th>
<th>Feature(s)</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>VK_EXT_shader_viewport_index_layer</td>
<td>shaderOutputViewportIndex, shaderOutputLayer</td>
</tr>
</tbody>
</table>

To query supported features, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceFeatures(VkPhysicalDevice physicalDevice, VkPhysicalDeviceFeatures* pFeatures);
```

- **physicalDevice** is the physical device from which to query the supported features.
- **pFeatures** is a pointer to a `VkPhysicalDeviceFeatures` structure in which the physical device
features are returned. For each feature, a value of `VK_TRUE` specifies that the feature is supported on this physical device, and `VK_FALSE` specifies that the feature is not supported.

### Valid Usage (Implicit)

- `VUID-vkGetPhysicalDeviceFeatures-physicalDevice-parameter`  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- `VUID-vkGetPhysicalDeviceFeatures-pFeatures-parameter`  
  `pFeatures` must be a valid pointer to a `VkPhysicalDeviceFeatures` structure

Fine-grained features used by a logical device must be enabled at `VkDevice` creation time. If a feature is enabled that the physical device does not support, `VkDevice` creation will fail and return `VK_ERROR_FEATURE_NOT_PRESENT`.

The fine-grained features are enabled by passing a pointer to the `VkPhysicalDeviceFeatures` structure via the `pEnabledFeatures` member of the `VkDeviceCreateInfo` structure that is passed into the `vkCreateDevice` call. If a member of `pEnabledFeatures` is set to `VK_TRUE` or `VK_FALSE`, then the device will be created with the indicated feature enabled or disabled, respectively. Features can also be enabled by using the `VkPhysicalDeviceFeatures2` structure.

If an application wishes to enable all features supported by a device, it can simply pass in the `VkPhysicalDeviceFeatures` structure that was previously returned by `vkGetPhysicalDeviceFeatures`. To disable an individual feature, the application can set the desired member to `VK_FALSE` in the same structure. Setting `pEnabledFeatures` to `NULL` and not including a `VkPhysicalDeviceFeatures2` in the `pNext` chain of `VkDeviceCreateInfo` is equivalent to setting all members of the structure to `VK_FALSE`.

**Note**

Some features, such as `robustBufferAccess`, may incur a runtime performance cost. Application writers should carefully consider the implications of enabling all supported features.

To query supported features defined by the core or extensions, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceFeatures2(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceFeatures2* pFeatures);
```

or the equivalent command

```c
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceFeatures2KHR(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceFeatures2* pFeatures);
```
• `physicalDevice` is the physical device from which to query the supported features.

• `pFeatures` is a pointer to a `VkPhysicalDeviceFeatures2` structure in which the physical device features are returned.

Each structure in `pFeatures` and its `pNext` chain contains members corresponding to fine-grained features. `vkGetPhysicalDeviceFeatures2` writes each member to a boolean value indicating whether that feature is supported.

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceFeatures2-physicalDevice-parameter

  `physicalDevice` must be a valid `VkPhysicalDevice` handle

• VUID-vkGetPhysicalDeviceFeatures2-pFeatures-parameter

  `pFeatures` must be a valid pointer to a `VkPhysicalDeviceFeatures2` structure

The `VkPhysicalDeviceFeatures2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceFeatures2 {
  VkStructureType sType;
  void* pNext;
  VkPhysicalDeviceFeatures features;
} VkPhysicalDeviceFeatures2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceFeatures2 VkPhysicalDeviceFeatures2KHR;
```

• `sType` is the type of this structure.

• `pNext` is NULL or a pointer to a structure extending this structure.

• `features` is a `VkPhysicalDeviceFeatures` structure describing the fine-grained features of the Vulkan 1.0 API.

The `pNext` chain of this structure is used to extend the structure with features defined by extensions. This structure can be used in `vkGetPhysicalDeviceFeatures2` or can be included in the `pNext` chain of a `VkDeviceCreateInfo` structure, in which case it controls which features are enabled in the device in lieu of `pEnabledFeatures`.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceFeatures2-sType-sType

  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FEATURES_2`
The `VkPhysicalDeviceFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceFeatures {
    VkBool32 robustBufferAccess;
    VkBool32 fullDrawIndexUint32;
    VkBool32 imageCubeArray;
    VkBool32 independentBlend;
    VkBool32 geometryShader;
    VkBool32 tessellationShader;
    VkBool32 sampleRateShading;
    VkBool32 dualSrcBlend;
    VkBool32 logicOp;
    VkBool32 multiDrawIndirect;
    VkBool32 drawIndirectFirstInstance;
    VkBool32 depthClamp;
    VkBool32 depthBiasClamp;
    VkBool32 fillModeNonSolid;
    VkBool32 depthBounds;
    VkBool32 wideLines;
    VkBool32 largePoints;
    VkBool32 alphaToOne;
    VkBool32 multiViewport;
    VkBool32 samplerAnisotropy;
    VkBool32 textureCompressionETC2;
    VkBool32 textureCompressionASTC_LDR;
    VkBool32 textureCompressionBC;
    VkBool32 occlusionQueryPrecise;
    VkBool32 pipelineStatisticsQuery;
    VkBool32 vertexPipelineStoresAndAtomics;
    VkBool32 fragmentStoresAndAtomics;
    VkBool32 shaderTessellationAndGeometryPointSize;
    VkBool32 shaderImageGatherExtended;
    VkBool32 shaderStorageImageExtendedFormats;
    VkBool32 shaderStorageImageMultisample;
    VkBool32 shaderStorageImageReadWithoutFormat;
    VkBool32 shaderStorageImageWriteWithoutFormat;
    VkBool32 shaderUniformBufferArrayDynamicIndexing;
    VkBool32 shaderSampledImageArrayDynamicIndexing;
    VkBool32 shaderStorageBufferArrayDynamicIndexing;
    VkBool32 shaderStorageImageArrayDynamicIndexing;
    VkBool32 shaderClipDistance;
    VkBool32 shaderCullDistance;
    VkBool32 shaderFloat64;
    VkBool32 shaderInt64;
    VkBool32 shaderInt16;
    VkBool32 shaderResourceResidency;
    VkBool32 shaderResourceMinLod;
    VkBool32 sparseBinding;
    VkBool32 sparseResidencyBuffer;
}
```
This structure describes the following features:

- **robustBufferAccess** specifies that accesses to buffers are bounds-checked against the range of the buffer descriptor (as determined by `VkDescriptorBufferInfo::range`, `VkBufferViewCreateInfo::range`, or the size of the buffer). Out of bounds accesses must not cause application termination, and the effects of shader loads, stores, and atomics must conform to an implementation-dependent behavior as described below.
  - A buffer access is considered to be out of bounds if any of the following are true:
    - The pointer was formed by `OpImageTexelPointer` and the coordinate is less than zero or greater than or equal to the number of whole elements in the bound range.
    - The pointer was not formed by `OpImageTexelPointer` and the object pointed to is not wholly contained within the bound range. This includes accesses performed via variable pointers where the buffer descriptor being accessed cannot be statically determined. Uninitialized pointers and pointers equal to `OpConstantNull` are treated as pointing to a zero-sized object, so all accesses through such pointers are considered to be out of bounds. Buffer accesses through buffer device addresses are not bounds-checked. If the cooperativeMatrixRobustBufferAccess feature is not enabled, then accesses using `OpCooperativeMatrixLoadNV` and `OpCooperativeMatrixStoreNV` may not be bounds-checked.

  - If a SPIR-V `OpLoad` instruction loads a structure and the tail end of the structure is out of bounds, then all members of the structure are considered out of bounds even if the members at the end are not statically used.

  - If `robustBufferAccess2` is not enabled and any buffer access is determined to be out of bounds, then any other access of the same type (load, store, or atomic) to the same buffer that accesses an address less than 16 bytes away from the out of bounds address may also be considered out of bounds.

  - If the access is a load that reads from the same memory locations as a prior store in the same shader invocation, with no other intervening accesses to the same memory locations in that shader invocation, then the result of the load may be the value stored by the store instruction, even if the access is out of bounds. If the load is `Volatile`, then an out of bounds load must return the appropriate out of bounds value.

  - Accesses to descriptors written with a `VK_NULL_HANDLE` resource or view are not
considered to be out of bounds. Instead, each type of descriptor access defines a specific behavior for accesses to a null descriptor.

- Out-of-bounds buffer loads will return any of the following values:
  - If the access is to a uniform buffer and \textit{robustBufferAccess2} is enabled, loads of offsets between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of \textit{robustUniformBufferAccessSizeAlignment} bytes \textbf{must} return either zero values or the contents of the memory at the offset being loaded. Loads of offsets past the descriptor range rounded up to a multiple of \textit{robustUniformBufferAccessSizeAlignment} bytes \textbf{must} return zero values.
  - If the access is to a storage buffer and \textit{robustBufferAccess2} is enabled, loads of offsets between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of \textit{robustStorageBufferAccessSizeAlignment} bytes \textbf{must} return either zero values or the contents of the memory at the offset being loaded. Loads of offsets past the descriptor range rounded up to a multiple of \textit{robustStorageBufferAccessSizeAlignment} bytes \textbf{must} return zero values. Similarly, stores to addresses between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of \textit{robustStorageBufferAccessSizeAlignment} bytes \textbf{may} be discarded.
  - Non-atomic accesses to storage buffers that are a multiple of 32 bits \textbf{may} be decomposed into 32-bit accesses that are individually bounds-checked.
  - If the access is to an index buffer and \textit{robustBufferAccess2} is enabled, zero values \textbf{must} be returned.
  - If the access is to a uniform texel buffer or storage texel buffer and \textit{robustBufferAccess2} is enabled, zero values \textbf{must} be returned, and then \textbf{Conversion to RGBA} is applied based on the buffer view's format.
  - Values from anywhere within the memory range(s) bound to the buffer (possibly including bytes of memory past the end of the buffer, up to the end of the bound range).
  - Zero values, or \((0,0,0,x)\) vectors for vector reads where \(x\) is a valid value represented in the type of the vector components and \textbf{may} be any of:
    - 0, 1, or the maximum representable positive integer value, for signed or unsigned integer components
    - 0.0 or 1.0, for floating-point components

- Out-of-bounds writes \textbf{may} modify values within the memory range(s) bound to the buffer, but \textbf{must} not modify any other memory.
  - If \textit{robustBufferAccess2} is enabled, out of bounds writes \textbf{must} not modify any memory.

- Out-of-bounds atomics \textbf{may} modify values within the memory range(s) bound to the buffer, but \textbf{must} not modify any other memory, and return an undefined value.
  - If \textit{robustBufferAccess2} is enabled, out of bounds atomics \textbf{must} not modify any memory, and return an undefined value.

- If \textit{robustBufferAccess2} is disabled, vertex input attributes are considered out of bounds if the offset of the attribute in the bound vertex buffer range plus the size of the attribute is greater than either:
• vertexBufferRangeSize, if bindingStride == 0; or
• (vertexBufferRangeSize - (vertexBufferRangeSize % bindingStride))

where vertexBufferRangeSize is the byte size of the memory range bound to the vertex buffer binding and bindingStride is the byte stride of the corresponding vertex input binding. Further, if any vertex input attribute using a specific vertex input binding is out of bounds, then all vertex input attributes using that vertex input binding for that vertex shader invocation are considered out of bounds.

• If a vertex input attribute is out of bounds, it will be assigned one of the following values:
  • Values from anywhere within the memory range(s) bound to the buffer, converted according to the format of the attribute.
  • Zero values, format converted according to the format of the attribute.
  • Zero values, or (0,0,0,x) vectors, as described above.
  ◦ If robustBufferAccess2 is enabled, vertex input attributes are considered out of bounds if the offset of the attribute in the bound vertex buffer range plus the size of the attribute is greater than the byte size of the memory range bound to the vertex buffer binding.
  • If a vertex input attribute is out of bounds, the raw data extracted are zero values, and missing G, B, or A components are filled with (0,0,1).
  ◦ If robustBufferAccess is not enabled, applications must not perform out of bounds accesses except under the conditions enabled by the pipelineRobustness feature.

• fullDrawIndexUint32 specifies the full 32-bit range of indices is supported for indexed draw calls when using a VkIndexType of VK_INDEX_TYPE_UINT32. maxDrawIndexedIndexValue is the maximum index value that may be used (aside from the primitive restart index, which is always 232-1 when the VkIndexType is VK_INDEX_TYPE_UINT32). If this feature is supported, maxDrawIndexedIndexValue must be 223-1; otherwise it must be no smaller than 224-1. See maxDrawIndexedIndexValue.

• imageCubeArray specifies whether image views with a VkImageViewType of VK_IMAGE_VIEW_TYPE_CUBE_ARRAY can be created, and that the corresponding SampledCubeArray and ImageCubeArray SPIR-V capabilities can be used in shader code.

• independentBlend specifies whether the VkPipelineColorBlendAttachmentState settings are controlled independently per-attachment. If this feature is not enabled, the VkPipelineColorBlendAttachmentState settings for all color attachments must be identical. Otherwise, a different VkPipelineColorBlendAttachmentState can be provided for each bound color attachment.

• geometryShader specifies whether geometry shaders are supported. If this feature is not enabled, the VK_SHADER_STAGE_GEOMETRY_BIT and VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT enum values must not be used. This also specifies whether shader modules can declare the Geometry capability.

• tessellationShader specifies whether tessellation control and evaluation shaders are supported. If this feature is not enabled, the VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT, and VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT,
VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO enum values must not be used. This also specifies whether shader modules can declare the Tessellation capability.

- sampleRateShading specifies whether Sample Shading and multisample interpolation are supported. If this feature is not enabled, the sampleShadingEnable member of the VkPipelineMultisampleStateCreateInfo structure must be set to VK_FALSE and the minSampleShading member is ignored. This also specifies whether shader modules can declare the SampleRateShading capability.

- dualSrcBlend specifies whether blend operations which take two sources are supported. If this feature is not enabled, the VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, and VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA enum values must not be used as source or destination blending factors. See Dual-Source Blending.

- logicOp specifies whether logic operations are supported. If this feature is not enabled, the logicOpEnable member of the VkPipelineColorBlendStateCreateInfo structure must be set to VK_FALSE, and the logicOp member is ignored.

- multiDrawIndirect specifies whether multiple draw indirect is supported. If this feature is not enabled, the drawCount parameter to the vkCmdDrawIndirect and vkCmdDrawIndexedIndirect commands must be 0 or 1. The maxDrawIndirectCount member of the VkPhysicalDeviceLimits structure must also be 1 if this feature is not supported. See maxDrawIndirectCount.

- drawIndirectFirstInstance specifies whether indirect drawing calls support the firstInstance parameter. If this feature is not enabled, the firstInstance member of all VkDrawIndirectCommand and VkDrawIndexedIndirectCommand structures that are provided to the vkCmdDrawIndirect and vkCmdDrawIndexedIndirect commands must be 0.

- depthClamp specifies whether depth clamping is supported. If this feature is not enabled, the depthClampEnable member of the VkPipelineRasterizationStateCreateInfo structure must be set to VK_FALSE. Otherwise, setting depthClampEnable to VK_TRUE will enable depth clamping.

- depthBiasClamp specifies whether depth bias clamping is supported. If this feature is not enabled, the depthBiasClamp member of the VkPipelineRasterizationStateCreateInfo structure must be set to 0.0 unless the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state is enabled, and the depthBiasClamp parameter to vkCmdSetDepthBias must be set to 0.0.

- fillModeNonSolid specifies whether point and wireframe fill modes are supported. If this feature is not enabled, the VK_POLYGON_MODE_POINT and VK_POLYGON_MODE_LINE enum values must not be used.

- depthBounds specifies whether depth bounds tests are supported. If this feature is not enabled, the depthBoundsTestEnable member of the VkPipelineDepthStencilStateCreateInfo structure must be set to VK_FALSE. When depthBoundsTestEnable is set to VK_FALSE, the minDepthBounds and maxDepthBounds members of the VkPipelineDepthStencilStateCreateInfo structure are ignored.

- wideLines specifies whether lines with width other than 1.0 are supported. If this feature is not enabled, the lineWidth member of the VkPipelineRasterizationStateCreateInfo structure must be set to 1.0 unless the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state is enabled, and the lineWidth parameter to vkCmdSetLineWidth must be set to 1.0. When this feature is supported, the range and granularity of supported line widths are indicated by the lineWidthRange and lineWidthGranularity members of the VkPhysicalDeviceLimits structure, respectively.

- largePoints specifies whether points with size greater than 1.0 are supported. If this feature is
not enabled, only a point size of 1.0 written by a shader is supported. The range and granularity of supported point sizes are indicated by the `pointSizeRange` and `pointSizeGranularity` members of the `VkPhysicalDeviceLimits` structure, respectively.

- **alphaToOne** specifies whether the implementation is able to replace the alpha value of the fragment shader color output in the Multisample Coverage fragment operation. If this feature is not enabled, then the `alphaToOneEnable` member of the `VkPipelineMultisampleStateCreateInfo` structure must be set to `VK_FALSE`. Otherwise setting `alphaToOneEnable` to `VK_TRUE` will enable alpha-to-one behavior.

- **multiViewport** specifies whether more than one viewport is supported. If this feature is not enabled:
  - The `viewportCount` and `scissorCount` members of the `VkPipelineViewportStateCreateInfo` structure must be set to 1.
  - The `firstViewport` and `viewportCount` parameters to the `vkCmdSetViewport` command must be set to 0 and 1, respectively.
  - The `firstScissor` and `scissorCount` parameters to the `vkCmdSetScissor` command must be set to 0 and 1, respectively.
  - The `exclusiveScissorCount` member of the `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure must be set to 0 or 1.
  - The `firstExclusiveScissor` and `exclusiveScissorCount` parameters to the `vkCmdSetExclusiveScissorNV` command must be set to 0 and 1, respectively.

- **samplerAnisotropy** specifies whether anisotropic filtering is supported. If this feature is not enabled, the `anisotropyEnable` member of the `VkSamplerCreateInfo` structure must be `VK_FALSE`.

- **textureCompressionETC2** specifies whether all of the ETC2 and EAC compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features must be supported in `optimalTilingFeatures` for the following formats:
  - `VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK`
  - `VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK`
  - `VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK`
  - `VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK`
  - `VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK`
  - `VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK`
  - `VK_FORMAT_EAC_R11_UNORM_BLOCK`
  - `VK_FORMAT_EAC_R11_SNORM_BLOCK`
  - `VK_FORMAT_EAC_R11G11_UNORM_BLOCK`
  - `VK_FORMAT_EAC_R11G11_SNORM_BLOCK`
  - `VK_FORMAT_EAC_R11G11A1_UNORM_BLOCK`
  - `VK_FORMAT_EAC_R11G11A1_SRGB_BLOCK`
  - `VK_FORMAT_EAC_R11G11A8_UNORM_BLOCK`
  - `VK_FORMAT_EAC_R11G11A8_SRGB_BLOCK`
  - `VK_FORMAT_EAC_R11G11A16_UNORM_BLOCK`
  - `VK_FORMAT_EAC_R11G11A16_SRGB_BLOCK`
  - `VK_FORMAT_EAC_R11G11A16_SIGNED_BLOCK`

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.
• `textureCompressionASTC_LDR` specifies whether all of the ASTC LDR compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features must be supported in `optimalTilingFeatures` for the following formats:

- `VK_FORMAT_ASTC_4x4_UNORM_BLOCK`
- `VK_FORMAT_ASTC_4x4_SRGB_BLOCK`
- `VK_FORMAT_ASTC_5x4_UNORM_BLOCK`
- `VK_FORMAT_ASTC_5x4_SRGB_BLOCK`
- `VK_FORMAT_ASTC_5x5_UNORM_BLOCK`
- `VK_FORMAT_ASTC_5x5_SRGB_BLOCK`
- `VK_FORMAT_ASTC_6x5_UNORM_BLOCK`
- `VK_FORMAT_ASTC_6x5_SRGB_BLOCK`
- `VK_FORMAT_ASTC_6x6_UNORM_BLOCK`
- `VK_FORMAT_ASTC_6x6_SRGB_BLOCK`
- `VK_FORMAT_ASTC_8x5_UNORM_BLOCK`
- `VK_FORMAT_ASTC_8x5_SRGB_BLOCK`
- `VK_FORMAT_ASTC_8x6_UNORM_BLOCK`
- `VK_FORMAT_ASTC_8x6_SRGB_BLOCK`
- `VK_FORMAT_ASTC_8x8_UNORM_BLOCK`
- `VK_FORMAT_ASTC_8x8_SRGB_BLOCK`
- `VK_FORMAT_ASTC_10x5_UNORM_BLOCK`
- `VK_FORMAT_ASTC_10x5_SRGB_BLOCK`
- `VK_FORMAT_ASTC_10x6_UNORM_BLOCK`
- `VK_FORMAT_ASTC_10x6_SRGB_BLOCK`
- `VK_FORMAT_ASTC_10x8_UNORM_BLOCK`
- `VK_FORMAT_ASTC_10x8_SRGB_BLOCK`
- `VK_FORMAT_ASTC_10x10_UNORM_BLOCK`
- `VK_FORMAT_ASTC_10x10_SRGB_BLOCK`
- `VK_FORMAT_ASTC_12x10_UNORM_BLOCK`
- `VK_FORMAT_ASTC_12x10_SRGB_BLOCK`
- `VK_FORMAT_ASTC_12x12_UNORM_BLOCK`
- `VK_FORMAT_ASTC_12x12_SRGB_BLOCK`

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.
• **textureCompressionBC** specifies whether all of the BC compressed texture formats are supported. If this feature is enabled, then the **VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT, VK_FORMAT_FEATURE_BLIT_SRC_BIT** and **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT** features must be supported in **optimalTilingFeatures** for the following formats:

  - **VK_FORMAT_BC1_RGB_UNORM_BLOCK**
  - **VK_FORMAT_BC1_RGB_SRGB_BLOCK**
  - **VK_FORMAT_BC1_RGBA_UNORM_BLOCK**
  - **VK_FORMAT_BC1_RGBA_SRGB_BLOCK**
  - **VK_FORMAT_BC2_UNORM_BLOCK**
  - **VK_FORMAT_BC2_SRGB_BLOCK**
  - **VK_FORMAT_BC3_UNORM_BLOCK**
  - **VK_FORMAT_BC3_SRGB_BLOCK**
  - **VK_FORMAT_BC4_UNORM_BLOCK**
  - **VK_FORMAT_BC4_SNORM_BLOCK**
  - **VK_FORMAT_BC5_UNORM_BLOCK**
  - **VK_FORMAT_BC5_SNORM_BLOCK**
  - **VK_FORMAT_BC6H_UFLOAT_BLOCK**
  - **VK_FORMAT_BC6H_SFLOAT_BLOCK**
  - **VK_FORMAT_BC7_UNORM_BLOCK**
  - **VK_FORMAT_BC7_SRGB_BLOCK**

To query for additional properties, or if the feature is not enabled, **vkGetPhysicalDeviceFormatProperties** and **vkGetPhysicalDeviceImageFormatProperties** can be used to check for supported properties of individual formats as normal.

• **occlusionQueryPrecise** specifies whether occlusion queries returning actual sample counts are supported. Occlusion queries are created in a **VkQueryPool** by specifying the **queryType** of **VK_QUERY_TYPE_OCCLUSION** in the **VkQueryPoolCreateInfo** structure which is passed to **vkCreateQueryPool**. If this feature is enabled, queries of this type can enable **VK_QUERY_CONTROL_PRECISE_BIT** in the **flags** parameter to **vkCmdBeginQuery**. If this feature is not supported, the implementation supports only boolean occlusion queries. When any samples are passed, boolean queries will return a non-zero result value, otherwise a result value of zero is returned. When this feature is enabled and **VK_QUERY_CONTROL_PRECISE_BIT** is set, occlusion queries will report the actual number of samples passed.

• **pipelineStatisticsQuery** specifies whether the pipeline statistics queries are supported. If this feature is not enabled, queries of type **VK_QUERY_TYPE_PIPELINE_STATISTICS** cannot be created, and none of the **VkQueryPipelineStatisticFlagBits** bits can be set in the **pipelineStatistics** member of the **VkQueryPoolCreateInfo** structure.

• **vertexPipelineStoresAndAtomics** specifies whether storage buffers and images support stores and atomic operations in the vertex, tessellation, and geometry shader stages. If this feature is not enabled, all storage image, storage texel buffer, and storage buffer variables used by these
stages in shader modules **must** be decorated with the `NonWritable` decoration (or the `readonly` memory qualifier in GLSL).

- **fragmentStoresAndAtomics** specifies whether storage buffers and images support stores and atomic operations in the fragment shader stage. If this feature is not enabled, all storage image, storage texel buffer, and storage buffer variables used by the fragment stage in shader modules **must** be decorated with the `NonWritable` decoration (or the `readonly` memory qualifier in GLSL).

- **shaderTessellationAndGeometryPointSize** specifies whether the `PointSize` built-in decoration is available in the tessellation control, tessellation evaluation, and geometry shader stages. If this feature is not enabled, members decorated with the `PointSize` built-in decoration **must** not be read from or written to and all points written from a tessellation or geometry shader will have a size of 1.0. This also specifies whether shader modules can declare the `TessellationPointSize` capability for tessellation control and evaluation shaders, or if the shader modules can declare the `GeometryPointSize` capability for geometry shaders. An implementation supporting this feature **must** also support one or both of the `tessellationShader` or `geometryShader` features.

- **shaderImageGatherExtended** specifies whether the extended set of image gather instructions are available in shader code. If this feature is not enabled, the `OpImage*Gather` instructions do not support the `Offset` and `ConstOffsets` operands. This also specifies whether shader modules can declare the `ImageGatherExtended` capability.

- **shaderStorageImageExtendedFormats** specifies whether all the “storage image extended formats” below are supported; if this feature is supported, then the `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT` **must** be supported in `optimalTilingFeatures` for the following formats:

  - `VK_FORMAT_R16G16_SFLOAT`
  - `VK_FORMAT_B10G11R11_UFLOAT_PACK32`
  - `VK_FORMAT_R16_SFLOAT`
  - `VK_FORMAT_R16G16B16A16_UNORM`
  - `VK_FORMAT_A2B10G10R10_UNORM_PACK32`
  - `VK_FORMAT_R16G16_UNORM`
  - `VK_FORMAT_R8G8_UNORM`
  - `VK_FORMAT_R16_UNORM`
  - `VK_FORMAT_R8_UNORM`
  - `VK_FORMAT_R16G16B16A16_SNORM`
  - `VK_FORMAT_R16G16_SNORM`
  - `VK_FORMAT_R8G8_SNORM`
  - `VK_FORMAT_R16_SNORM`
  - `VK_FORMAT_R8_SNORM`
  - `VK_FORMAT_R16G16_SINT`
  - `VK_FORMAT_R8G8_SINT`
  - `VK_FORMAT_R16_SINT`
  - `VK_FORMAT_R8_SINT`
Note

The `shaderStorageImageExtendedFormats` feature only adds a guarantee of format support, which is specified for the whole physical device. Therefore enabling or disabling the feature via `vkCreateDevice` has no practical effect.

To query for additional properties, or if the feature is not supported, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats, as usual rules allow.

`VK_FORMAT_R32G32_UINT`, `VK_FORMAT_R32G32_SINT`, and `VK_FORMAT_R32G32_SFLOAT` from `StorageImageExtendedFormats` SPIR-V capability, are already covered by core Vulkan mandatory format support.

- `shaderStorageImageMultisample` specifies whether multisampled storage images are supported. If this feature is not enabled, images that are created with a usage that includes `VK_IMAGE_USAGE_STORAGE_BIT` must be created with `samples` equal to `VK_SAMPLE_COUNT_1_BIT`. This also specifies whether shader modules can declare the `StorageImageMultisample` and `ImageMSArray` capabilities.

- `shaderStorageImageReadWithoutFormat` specifies whether storage images require a format qualifier to be specified when reading. `shaderStorageImageReadWithoutFormat` applies only to formats listed in the `storage without format` list.

- `shaderStorageImageWriteWithoutFormat` specifies whether storage images require a format qualifier to be specified when writing. `shaderStorageImageWriteWithoutFormat` applies only to formats listed in the `storage without format` list.

- `shaderUniformBufferArrayDynamicIndexing` specifies whether arrays of uniform buffers can be indexed by `dynamically uniform` integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the `UniformBufferArrayDynamicIndexing` capability.

- `shaderSampledImageArrayDynamicIndexing` specifies whether arrays of samplers or sampled images can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the `SampledImageArrayDynamicIndexing` capability.

- `shaderStorageBufferArrayDynamicIndexing` specifies whether arrays of storage buffers can be
indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the `StorageBufferArrayDynamicIndexing` capability.

- **shaderStorageImageArrayDynamicIndexing** specifies whether arrays of storage images can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the `StorageImageArrayDynamicIndexing` capability.

- **shaderClipDistance** specifies whether clip distances are supported in shader code. If this feature is not enabled, any members decorated with the `ClipDistance` built-in decoration must not be read from or written to in shader modules. This also specifies whether shader modules can declare the `ClipDistance` capability.

- **shaderCullDistance** specifies whether cull distances are supported in shader code. If this feature is not enabled, any members decorated with the `CullDistance` built-in decoration must not be read from or written to in shader modules. This also specifies whether shader modules can declare the `CullDistance` capability.

- **shaderFloat64** specifies whether 64-bit floats (doubles) are supported in shader code. If this feature is not enabled, 64-bit floating-point types must not be used in shader code. This also specifies whether shader modules can declare the `Float64` capability. Declaring and using 64-bit floats is enabled for all storage classes that SPIR-V allows with the `Float64` capability.

- **shaderInt64** specifies whether 64-bit integers (signed and unsigned) are supported in shader code. If this feature is not enabled, 64-bit integer types must not be used in shader code. This also specifies whether shader modules can declare the `Int64` capability. Declaring and using 64-bit integers is enabled for all storage classes that SPIR-V allows with the `Int64` capability.

- **shaderInt16** specifies whether 16-bit integers (signed and unsigned) are supported in shader code. If this feature is not enabled, 16-bit integer types must not be used in shader code. This also specifies whether shader modules can declare the `Int16` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Int16` SPIR-V capability: Declaring and using 16-bit integers in the `Private`, `Workgroup` (for non-Block variables), and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.

- **shaderResourceResidency** specifies whether image operations that return resource residency information are supported in shader code. If this feature is not enabled, the `OpImageSparse*` instructions must not be used in shader code. This also specifies whether shader modules can declare the `SparseResidency` capability. The feature requires at least one of the `sparseResidency*` features to be supported.

- **shaderResourceMinLod** specifies whether image operations specifying the minimum resource LOD are supported in shader code. If this feature is not enabled, the `MinLod` image operand must not be used in shader code. This also specifies whether shader modules can declare the `MinLod` capability.

- **sparseBinding** specifies whether resource memory can be managed at opaque sparse block level instead of at the object level. If this feature is not enabled, resource memory must be bound
only on a per-object basis using the `vkBindBufferMemory` and `vkBindImageMemory` commands. In this case, buffers and images must not be created with `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` and `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` set in the flags member of the `VkBufferCreateInfo` and `VkImageCreateInfo` structures, respectively. Otherwise resource memory can be managed as described in Sparse Resource Features.

- `sparseResidencyBuffer` specifies whether the device can access partially resident buffers. If this feature is not enabled, buffers must not be created with `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` set in the flags member of the `VkBufferCreateInfo` structure.

- `sparseResidencyImage2D` specifies whether the device can access partially resident 2D images with 1 sample per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_1_BIT` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the flags member of the `VkImageCreateInfo` structure.

- `sparseResidencyImage3D` specifies whether the device can access partially resident 3D images. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_3D` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the flags member of the `VkImageCreateInfo` structure.

- `sparseResidency2Samples` specifies whether the physical device can access partially resident 2D images with 2 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_2_BIT` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the flags member of the `VkImageCreateInfo` structure.

- `sparseResidency4Samples` specifies whether the physical device can access partially resident 2D images with 4 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_4_BIT` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the flags member of the `VkImageCreateInfo` structure.

- `sparseResidency8Samples` specifies whether the physical device can access partially resident 2D images with 8 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_8_BIT` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the flags member of the `VkImageCreateInfo` structure.

- `sparseResidency16Samples` specifies whether the physical device can access partially resident 2D images with 16 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_16_BIT` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the flags member of the `VkImageCreateInfo` structure.

- `sparseResidencyAliased` specifies whether the physical device can correctly access data aliased into multiple locations. If this feature is not enabled, the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` enum values must not be used in flags members of the `VkBufferCreateInfo` and `VkImageCreateInfo` structures, respectively.

- `variableMultisampleRate` specifies whether all pipelines that will be bound to a command buffer during a subpass which uses no attachments must have the same value for `VkPipelineMultisampleStateCreateInfo::rasterizationSamples`. If set to `VK_TRUE`, the
implementation supports variable multisample rates in a subpass which uses no attachments. If set to `VK_FALSE`, then all pipelines bound in such a subpass **must** have the same multisample rate. This has no effect in situations where a subpass uses any attachments.

- **inheritedQueries** specifies whether a secondary command buffer **may** be executed while a query is active.

The `VkPhysicalDeviceVulkan11Features` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan11Features {
    VkStructureType     sType;
    void*                pNext;
    VkBool32             storageBuffer16BitAccess;
    VkBool32             uniformAndStorageBuffer16BitAccess;
    VkBool32             storagePushConstant16;
    VkBool32             storageInputOutput16;
    VkBool32             multiview;
    VkBool32             multiviewGeometryShader;
    VkBool32             multiviewTessellationShader;
    VkBool32             variablePointersStorageBuffer;
    VkBool32             variablePointers;
    VkBool32             protectedMemory;
    VkBool32             samplerYcbcrConversion;
    VkBool32             shaderDrawParameters;
} VkPhysicalDeviceVulkan11Features;
```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **storageBuffer16BitAccess** specifies whether objects in the `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer` storage class with the `Block` decoration **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `StorageBuffer16BitAccess` capability.
- **uniformAndStorageBuffer16BitAccess** specifies whether objects in the `Uniform` storage class with the `Block` decoration **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `UniformAndStorageBuffer16BitAccess` capability.
- **storagePushConstant16** specifies whether objects in the `PushConstant` storage class **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or floating-point members **must** not be used in such objects. This also specifies whether shader modules **can** declare the `StoragePushConstant16` capability.
- **storageInputOutput16** specifies whether objects in the `Input` and `Output` storage classes **can** have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or
16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the StorageInputOutput16 capability.

- **multiview** specifies whether the implementation supports multiview rendering within a render pass. If this feature is not enabled, the view mask of each subpass must always be zero.

- **multiviewGeometryShader** specifies whether the implementation supports multiview rendering within a render pass, with geometry shaders. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask must not include a geometry shader.

- **multiviewTessellationShader** specifies whether the implementation supports multiview rendering within a render pass, with tessellation shaders. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask must not include any tessellation shaders.

- **variablePointersStorageBuffer** specifies whether the implementation supports the SPIR-V VariablePointersStorageBuffer capability. When this feature is not enabled, shader modules must not declare the SPV_KHR_variable_pointers extension or the VariablePointersStorageBuffer capability.

- **variablePointers** specifies whether the implementation supports the SPIR-V VariablePointers capability. When this feature is not enabled, shader modules must not declare the VariablePointers capability.

- **protectedMemory** specifies whether protected memory is supported.

- **samplerYcbcrConversion** specifies whether the implementation supports sampler Y’C_aC_R conversion. If samplerYcbcrConversion is VK_FALSE, sampler Y’C_aC_R conversion is not supported, and samplers using sampler Y’C_aC_R conversion must not be used.

- **shaderDrawParameters** specifies whether the implementation supports the SPIR-V DrawParameters capability. When this feature is not enabled, shader modules must not declare the SPV_KHR_shader_draw_parameters extension or the DrawParameters capability.

If the VkPhysicalDeviceVulkan11Features structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceVulkan11Features can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkan11Features-sType-sType

  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_1_FEATURES

The VkPhysicalDeviceVulkan12Features structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan12Features {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           samplerMirrorClampToEdge;
    VkBool32           drawIndirectCount;
} VkPhysicalDeviceVulkan12Features;
```
This structure describes the following features:

- **sType** is the type of this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `samplerMirrorClampToEdge` indicates whether the implementation supports the `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` sampler address mode. If this feature is not enabled, the `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` sampler address mode must not be used.

• `drawIndirectCount` indicates whether the implementation supports the `vkCmdDrawIndirectCount` and `vkCmdDrawIndexedIndirectCount` functions. If this feature is not enabled, these functions must not be used.

• `storageBuffer8BitAccess` indicates whether objects in the `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer` storage class with the `Block` decoration can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the `StorageBuffer8BitAccess` capability.

• `uniformAndStorageBuffer8BitAccess` indicates whether objects in the `Uniform` storage class with the `Block` decoration can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the `UniformAndStorageBuffer8BitAccess` capability.

• `storagePushConstant8` indicates whether objects in the `PushConstant` storage class can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the `StoragePushConstant8` capability.

• `shaderBufferInt64Atomics` indicates whether shaders can perform 64-bit unsigned and signed integer atomic operations on buffers.

• `shaderSharedInt64Atomics` indicates whether shaders can perform 64-bit unsigned and signed integer atomic operations on shared and payload memory.

• `shaderFloat16` indicates whether 16-bit floats (halfs) are supported in shader code. This also indicates whether shader modules can declare the `Float16` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Float16` SPIR-V capability: Declaring and using 16-bit floats in the `Private`, `Workgroup` (for non-Block variables), and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.

• `shaderInt8` indicates whether 8-bit integers (signed and unsigned) are supported in shader code. This also indicates whether shader modules can declare the `Int8` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Int8` SPIR-V capability: Declaring and using 8-bit integers in the `Private`, `Workgroup` (for non-Block variables), and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.

• `descriptorIndexing` indicates whether the implementation supports the minimum set of descriptor indexing features as described in the `Feature Requirements` section. Enabling the `descriptorIndexing` member when `vkCreateDevice` is called does not imply the other minimum descriptor indexing features are also enabled. Those other descriptor indexing features must be enabled individually as needed by the application.

• `shaderInputAttachmentArrayDynamicIndexing` indicates whether arrays of input attachments can be indexed by dynamically uniform integer expressions in shader code. If this feature is not
enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `InputAttachmentArrayDynamicIndexing` capability.

- shaderUniformTexelBufferArrayDynamicIndexing indicates whether arrays of uniform texel buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `UniformTexelBufferArrayDynamicIndexing` capability.

- shaderStorageTexelBufferArrayDynamicIndexing indicates whether arrays of storage texel buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageTexelBufferArrayDynamicIndexing` capability.

- shaderUniformBufferArrayNonUniformIndexing indicates whether arrays of uniform buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `UniformBufferArrayNonUniformIndexing` capability.

- shaderSampledImageArrayNonUniformIndexing indicates whether arrays of samplers or sampled images can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `SampledImageArrayNonUniformIndexing` capability.

- shaderStorageBufferArrayNonUniformIndexing indicates whether arrays of storage buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageBufferArrayNonUniformIndexing` capability.

- shaderStorageImageArrayNonUniformIndexing indicates whether arrays of storage images can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageImageArrayNonUniformIndexing` capability.

- shaderInputAttachmentArrayNonUniformIndexing indicates whether arrays of input attachments can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This
also indicates whether shader modules can declare the `InputAttachmentArrayNonUniformIndexing` capability.

- `shaderUniformTexelBufferArrayNonUniformIndexing` indicates whether arrays of uniform texel buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `UniformTexelBufferArrayNonUniformIndexing` capability.

- `shaderStorageTexelBufferArrayNonUniformIndexing` indicates whether arrays of storage texel buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageTexelBufferArrayNonUniformIndexing` capability.

- `descriptorBindingUniformBufferUpdateAfterBind` indicates whether the implementation supports updating uniform buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`.

- `descriptorBindingSampledImageUpdateAfterBind` indicates whether the implementation supports updating sampled image descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`.

- `descriptorBindingStorageImageUpdateAfterBind` indicates whether the implementation supports updating storage image descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`.

- `descriptorBindingStorageBufferUpdateAfterBind` indicates whether the implementation supports updating storage buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`.

- `descriptorBindingUniformTexelBufferUpdateAfterBind` indicates whether the implementation supports updating uniform texel buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`.

- `descriptorBindingStorageTexelBufferUpdateAfterBind` indicates whether the implementation supports updating storage texel buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`.

- `descriptorBindingUpdateUnusedWhilePending` indicates whether the implementation supports updating descriptors while the set is in use. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT` must not be used.

- `descriptorBindingPartiallyBound` indicates whether the implementation supports statically using a descriptor set binding in which some descriptors are not valid. If this feature is not
enabled, `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` must not be used.

- `descriptorBindingVariableDescriptorCount` indicates whether the implementation supports descriptor sets with a variable-sized last binding. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT` must not be used.

- `runtimeDescriptorArray` indicates whether the implementation supports the SPIR-V RuntimeDescriptorArray capability. If this feature is not enabled, descriptors must not be declared in runtime arrays.

- `samplerFilterMinmax` indicates whether the implementation supports a minimum set of required formats supporting min/max filtering as defined by the `filterMinmaxSingleComponentFormats` property minimum requirements. If this feature is not enabled, then `VkSamplerReductionModeCreateInfo` must only use `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`.

- `scalarBlockLayout` indicates that the implementation supports the layout of resource blocks in shaders using scalar alignment.

- `imagelessFramebuffer` indicates that the implementation supports specifying the image view for attachments at render pass begin time via `VkRenderPassAttachmentBeginInfo`.

- `uniformBufferStandardLayout` indicates that the implementation supports the same layouts for uniform buffers as for storage and other kinds of buffers. See Standard Buffer Layout.

- `shaderSubgroupExtendedTypes` is a boolean specifying whether subgroup operations can use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types in group operations with subgroup scope, if the implementation supports the types.

- `separateDepthStencilLayouts` indicates whether the implementation supports a `VkImageMemoryBarrier` for a depth/stencil image with only one of `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` set, and whether `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` can be used.

- `hostQueryReset` indicates that the implementation supports resetting queries from the host with `vkResetQueryPool`.

- `timelineSemaphore` indicates whether semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` are supported.

- `bufferDeviceAddress` indicates that the implementation supports accessing buffer memory in shaders as storage buffers via an address queried from `vkGetBufferDeviceAddress`.

- `bufferDeviceAddressCaptureReplay` indicates that the implementation supports saving and reusing buffer and device addresses, e.g. for trace capture and replay.

- `bufferDeviceAddressMultiDevice` indicates that the implementation supports the `bufferDeviceAddress`, `rayTracingPipeline` and `rayQuery` features for logical devices created with multiple physical devices. If this feature is not supported, buffer and acceleration structure addresses must not be queried on a logical device created with more than one physical device.

- `vulkanMemoryModel` indicates whether the Vulkan Memory Model is supported, as defined in Vulkan Memory Model. This also indicates whether shader modules can declare the VulkanMemoryModel capability.

- `vulkanMemoryModelDeviceScope` indicates whether the Vulkan Memory Model can use Device
scope synchronization. This also indicates whether shader modules can declare the VulkanMemoryModelDeviceScope capability.

- `vulkanMemoryModelAvailabilityVisibilityChains` indicates whether the Vulkan Memory Model can use availability and visibility chains with more than one element.

- `shaderOutputViewportIndex` indicates whether the implementation supports the ShaderViewportIndex SPIR-V capability enabling variables decorated with the ViewportIndex built-in to be exported from mesh, vertex or tessellation evaluation shaders. If this feature is not enabled, the ViewportIndex built-in decoration must not be used on outputs in mesh, vertex or tessellation evaluation shaders.

- `shaderOutputLayer` indicates whether the implementation supports the ShaderLayer SPIR-V capability enabling variables decorated with the Layer built-in to be exported from mesh, vertex or tessellation evaluation shaders. If this feature is not enabled, the Layer built-in decoration must not be used on outputs in mesh, vertex or tessellation evaluation shaders.

- If `subgroupBroadcastDynamicId` is VK_TRUE, the “Id” operand of OpGroupNonUniformBroadcast can be dynamically uniform within a subgroup, and the “Index” operand of OpGroupNonUniformQuadBroadcast can be dynamically uniform within the derivative group. If it is VK_FALSE, these operands must be constants.

If the VkPhysicalDeviceVulkan12Features structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceVulkan12Features can also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkan12Features-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_2_FEATURES

The VkPhysicalDeviceVulkan13Features structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceVulkan13Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 robustImageAccess;
    VkBool32 inlineUniformBlock;
    VkBool32 descriptorBindingInlineUniformBlockUpdateAfterBind;
    VkBool32 pipelineCreationCacheControl;
    VkBool32 privateData;
    VkBool32 shaderDemoteToHelperInvocation;
    VkBool32 shaderTerminateInvocation;
    VkBool32 subgroupSizeControl;
    VkBool32 computeFullSubgroups;
    VkBool32 synchronization2;
    VkBool32 textureCompressionASTC_HDR;
    VkBool32 shaderZeroInitializeWorkgroupMemory;
} VkPhysicalDeviceVulkan13Features;
```
This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **robustImageAccess** indicates whether image accesses are tightly bounds-checked against the dimensions of the image view. **Invalid texels** resulting from out of bounds image loads will be replaced as described in *Texel Replacement*, with either (0,0,1) or (0,0,0) values inserted for missing G, B, or A components based on the format.

- **inlineUniformBlock** indicates whether the implementation supports inline uniform block descriptors. If this feature is not enabled, **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** must not be used.

- **descriptorBindingInlineUniformBlockUpdateAfterBind** indicates whether the implementation supports updating inline uniform block descriptors after a set is bound. If this feature is not enabled, **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** must not be used with **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK**.

- **pipelineCreationCacheControl** indicates that the implementation supports:
  - The following **can** be used in *Vk*PipelineCreateInfo::flags:
    - **VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT**
    - **VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT**
  - The following **can** be used in *VkPipelineCacheCreateInfo::flags**:
    - **VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT**

- **privateData** indicates whether the implementation supports private data. See Private Data.

- **shaderDemoteToHelperInvocation** indicates whether the implementation supports the SPIR-V DemoteToHelperInvocationEXT capability.

- **shaderTerminateInvocation** specifies whether the implementation supports SPIR-V modules that use the SPV_KHR_terminate_invocation extension.

- **subgroupSizeControl** indicates whether the implementation supports controlling shader subgroup sizes via the **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT** flag and the *VkPipelineShaderStageRequiredSubgroupSizeCreateInfo* structure.

- **computeFullSubgroups** indicates whether the implementation supports requiring full subgroups in compute, mesh, or task shaders via the **VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT** flag.

- **synchronization2** indicates whether the implementation supports the new set of synchronization commands introduced in **VK_KHR_synchronization2**.

- **textureCompressionASTC_HDR** indicates whether all of the ASTC HDR compressed texture formats are supported. If this feature is enabled, then the **VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT**,
VK_FORMAT_FEATURE_BLIT_SRC_BIT and VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT features must be supported in optimalTilingFeatures for the following formats:

- VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK
- VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK
- VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK
- VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK
- VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK
- VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK
- VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK
- VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK
- VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK
- VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK
- VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK
- VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK
- VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK
- VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK

To query for additional properties, or if the feature is not enabled, vkGetPhysicalDeviceFormatProperties and vkGetPhysicalDeviceImageFormatProperties can be used to check for supported properties of individual formats as normal.

- shaderZeroInitializeWorkgroupMemory specifies whether the implementation supports initializing a variable in Workgroup storage class.
- dynamicRendering specifies that the implementation supports dynamic render pass instances using the vkCmdBeginRendering command.
- shaderIntegerDotProduct specifies whether shader modules can declare the DotProductInputAllKHR, DotProductInput4x8BitKHR, DotProductInput4x8BitPackedKHR and DotProductKHR capabilities.
- maintenance4 indicates that the implementation supports the following:
  - The application may destroy a VkPipelineLayout object immediately after using it to create another object.
  - LocalSizeId can be used as an alternative to LocalSize to specify the local workgroup size with specialization constants.
  - Images created with identical creation parameters will always have the same alignment requirements.
  - The size memory requirement of a buffer or image is never greater than that of another buffer or image created with a greater or equal size.
  - Push constants do not have to be initialized before they are dynamically accessed.
  - The interface matching rules allow a larger output vector to match with a smaller input
vector, with additional values being discarded.

If the `VkPhysicalDeviceVulkan13Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVulkan13Features` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceVulkan13Features-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_3_FEATURES

The `VkPhysicalDeviceVariablePointersFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceVariablePointersFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 variablePointersStorageBuffer;
    VkBool32 variablePointers;
} VkPhysicalDeviceVariablePointersFeatures;
```

or the equivalent

```c
// Provided by VK_VERSION_1_1
typedef VkPhysicalDeviceVariablePointersFeatures
VkPhysicalDeviceVariablePointerFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_variable_pointers
typedef VkPhysicalDeviceVariablePointersFeatures
VkPhysicalDeviceVariablePointersFeaturesKHR;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is **NULL** or a pointer to a structure extending this structure.
- `variablePointersStorageBuffer` specifies whether the implementation supports the SPIR-V `VariablePointersStorageBuffer` capability. When this feature is not enabled, shader modules must not declare the `SPV_KHR_variable_pointers` extension or the `VariablePointersStorageBuffer`
capability.

- `variablePointers` specifies whether the implementation supports the SPIR-V `VariablePointers` capability. When this feature is not enabled, shader modules **must** not declare the `VariablePointers` capability.

If the `VkPhysicalDeviceVariablePointersFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVariablePointersFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage

- **VUID-VkPhysicalDeviceVariablePointersFeatures-variablePointers-01431**

  If `variablePointers` is enabled then `variablePointersStorageBuffer` **must** also be enabled

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceVariablePointersFeatures-sType-sType**

  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VARIABLE_POINTERS_FEATURES`

The `VkPhysicalDeviceMultiviewFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMultiviewFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 multiview;
    VkBool32 multiviewGeometryShader;
    VkBool32 multiviewTessellationShader;
} VkPhysicalDeviceMultiviewFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_multiview
typedef VkPhysicalDeviceMultiviewFeatures VkPhysicalDeviceMultiviewFeaturesKHR;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `multiview` specifies whether the implementation supports multiview rendering within a render pass. If this feature is not enabled, the view mask of each subpass **must** always be zero.
• multiviewGeometryShader specifies whether the implementation supports multiview rendering within a render pass, with geometry shaders. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask must not include a geometry shader.

• multiviewTessellationShader specifies whether the implementation supports multiview rendering within a render pass, with tessellation shaders. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask must not include any tessellation shaders.

If the VkPhysicalDeviceMultiviewFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceMultiviewFeatures can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage

• VUID-VkPhysicalDeviceMultiviewFeatures-multiviewGeometryShader-00580
  If multiviewGeometryShader is enabled then multiview must also be enabled

• VUID-VkPhysicalDeviceMultiviewFeatures-multiviewTessellationShader-00581
  If multiviewTessellationShader is enabled then multiview must also be enabled

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceMultiviewFeatures-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_FEATURES

The VkPhysicalDeviceShaderAtomicFloatFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_shader_atomic_float
typedef struct VkPhysicalDeviceShaderAtomicFloatFeaturesEXT {
    VkStructureType     sType;
    void*               pNext;
    VkBool32            shaderBufferFloat32Atomics;
    VkBool32            shaderBufferFloat32AtomicAdd;
    VkBool32            shaderBufferFloat64Atomics;
    VkBool32            shaderBufferFloat64AtomicAdd;
    VkBool32            shaderSharedFloat32Atomics;
    VkBool32            shaderSharedFloat32AtomicAdd;
    VkBool32            shaderSharedFloat64Atomics;
    VkBool32            shaderSharedFloat64AtomicAdd;
    VkBool32            shaderImageFloat32Atomics;
    VkBool32            shaderImageFloat32AtomicAdd;
    VkBool32            sparseImageFloat32Atomics;
    VkBool32            sparseImageFloat32AtomicAdd;
} VkPhysicalDeviceShaderAtomicFloatFeaturesEXT;
```
This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderBufferFloat32Atomics** indicates whether shaders can perform 32-bit floating-point load, store and exchange atomic operations on storage buffers.
- **shaderBufferFloat32AtomicAdd** indicates whether shaders can perform 32-bit floating-point add atomic operations on storage buffers.
- **shaderBufferFloat64Atomics** indicates whether shaders can perform 64-bit floating-point load, store and exchange atomic operations on storage buffers.
- **shaderBufferFloat64AtomicAdd** indicates whether shaders can perform 64-bit floating-point add atomic operations on storage buffers.
- **shaderSharedFloat32Atomics** indicates whether shaders can perform 32-bit floating-point load, store and exchange atomic operations on shared and payload memory.
- **shaderSharedFloat32AtomicAdd** indicates whether shaders can perform 32-bit floating-point add atomic operations on shared and payload memory.
- **shaderSharedFloat64Atomics** indicates whether shaders can perform 64-bit floating-point load, store and exchange atomic operations on shared and payload memory.
- **shaderSharedFloat64AtomicAdd** indicates whether shaders can perform 64-bit floating-point add atomic operations on shared and payload memory.
- **shaderImageFloat32Atomics** indicates whether shaders can perform 32-bit floating-point load, store and exchange atomic image operations.
- **shaderImageFloat32AtomicAdd** indicates whether shaders can perform 32-bit floating-point add atomic image operations.
- **sparseImageFloat32Atomics** indicates whether 32-bit floating-point load, store and exchange atomic operations can be used on sparse images.
- **sparseImageFloat32AtomicAdd** indicates whether 32-bit floating-point add atomic operations can be used on sparse images.

If the `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceShaderAtomicFloatFeaturesEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_FLOAT_FEATURES_EXT`
This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderBufferFloat16Atomics` indicates whether shaders can perform 16-bit floating-point load, store, and exchange atomic operations on storage buffers.
- `shaderBufferFloat16AtomicAdd` indicates whether shaders can perform 16-bit floating-point add atomic operations on storage buffers.
- `shaderBufferFloat16AtomicMinMax` indicates whether shaders can perform 16-bit floating-point min and max atomic operations on storage buffers.
- `shaderBufferFloat32AtomicMinMax` indicates whether shaders can perform 32-bit floating-point min and max atomic operations on storage buffers.
- `shaderBufferFloat64AtomicMinMax` indicates whether shaders can perform 64-bit floating-point min and max atomic operations on storage buffers.
- `shaderSharedFloat16Atomics` indicates whether shaders can perform 16-bit floating-point load, store and exchange atomic operations on shared and payload memory.
- `shaderSharedFloat16AtomicAdd` indicates whether shaders can perform 16-bit floating-point add atomic operations on shared and payload memory.
- `shaderSharedFloat16AtomicMinMax` indicates whether shaders can perform 16-bit floating-point min and max atomic operations on shared and payload memory.
- `shaderSharedFloat32AtomicMinMax` indicates whether shaders can perform 32-bit floating-point min and max atomic operations on shared and payload memory.
- `shaderSharedFloat64AtomicMinMax` indicates whether shaders can perform 64-bit floating-point min and max atomic operations on shared and payload memory.
- `shaderImageFloat32AtomicMinMax` indicates whether shaders can perform 32-bit floating-point min and max atomic operations on shared and payload memory.
min and max atomic image operations.

- `sparseImageFloat32AtomicMinMax` indicates whether 32-bit floating-point min and max atomic operations can be used on sparse images.

If the `VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT-sType-sType
  
  The `VkPhysicalDeviceShaderAtomicInt64Features` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceShaderAtomicInt64Features {
  VkStructureType sType;
  void* pNext;
  VkBool32 shaderBufferInt64Atomics;
  VkBool32 shaderSharedInt64Atomics;
} VkPhysicalDeviceShaderAtomicInt64Features;
```

or the equivalent

```c
// Provided by VK_KHR_shader_atomic_int64
typedef VkPhysicalDeviceShaderAtomicInt64Features
  VkPhysicalDeviceShaderAtomicInt64FeaturesKHR;
```

This structure describes the following features:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderBufferInt64Atomics` indicates whether shaders can perform 64-bit unsigned and signed integer atomic operations on buffers.
- `shaderSharedInt64Atomics` indicates whether shaders can perform 64-bit unsigned and signed integer atomic operations on shared and payload memory.

If the `VkPhysicalDeviceShaderAtomicInt64Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderAtomicInt64Features` can also be used in the `pNext` chain of
VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderAtomicInt64Features-sType-sType
  
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_INT64_FEATURES

The VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_shader_image_atomic_int64
typedef struct VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderImageInt64Atomics;
    VkBool32 sparseImageInt64Atomics;
} VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT;
```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderImageInt64Atomics** indicates whether shaders can support 64-bit unsigned and signed integer atomic operations on images.
- **sparseImageInt64Atomics** indicates whether 64-bit integer atomics can be used on sparse images.

If the VkPhysicalDeviceShaderAtomicInt64FeaturesEXT structure is included in the *pNext* chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT can also be used in the *pNext* chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT-sType-sType
  
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_IMAGE_ATOMIC_INT64_FEATURES_EXT

The VkPhysicalDevice8BitStorageFeatures structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDevice8BitStorageFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 storageBuffer8BitAccess;
    VkBool32 uniformAndStorageBuffer8BitAccess;
} VkPhysicalDevice8BitStorageFeatures;
```
or the equivalent

```c
// Provided by VK_KHR_8bit_storage
typedef VkPhysicalDevice8BitStorageFeatures VkPhysicalDevice8BitStorageFeaturesKHR;
```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **storageBuffer8BitAccess** indicates whether objects in the `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer` storage class with the `Block` decoration can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the `StorageBuffer8BitAccess` capability.
- **uniformAndStorageBuffer8BitAccess** indicates whether objects in the `Uniform` storage class with the `Block` decoration can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the `UniformAndStorageBuffer8BitAccess` capability.
- **storagePushConstant8** indicates whether objects in the `PushConstant` storage class can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the `StoragePushConstant8` capability.

If the `VkPhysicalDevice8BitStorageFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevice8BitStorageFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDevice8BitStorageFeatures-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_8BIT_STORAGE_FEATURES

The `VkPhysicalDevice16BitStorageFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDevice16BitStorageFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 storageBuffer16BitAccess;
    VkBool32 uniformAndStorageBuffer16BitAccess;
    VkBool32 storagePushConstant16;
} VkPhysicalDevice16BitStorageFeatures;
```
This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **storageBuffer16BitAccess** specifies whether objects in the StorageBuffer, ShaderRecordBufferKHR, or PhysicalStorageBuffer storage class with the Block decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the StorageBuffer16BitAccess capability.
- **uniformAndStorageBuffer16BitAccess** specifies whether objects in the Uniform storage class with the Block decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the UniformAndStorageBuffer16BitAccess capability.
- **storagePushConstant16** specifies whether objects in the PushConstant storage class can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or floating-point members must not be used in such objects. This also specifies whether shader modules can declare the StoragePushConstant16 capability.
- **storageInputOutput16** specifies whether objects in the Input and Output storage classes can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the StorageInputOutput16 capability.

If the VkPhysicalDevice16BitStorageFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDevice16BitStorageFeatures can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDevice16BitStorageFeatures-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_16BIT_STORAGE_FEATURES

The VkPhysicalDeviceShaderFloat16Int8Features structure is defined as:
This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **shaderFloat16** indicates whether 16-bit floats (halves) are supported in shader code. This also indicates whether shader modules can declare the Float16 capability. However, this only enables a subset of the storage classes that SPIR-V allows for the Float16 SPIR-V capability: Declaring and using 16-bit floats in the Private, Workgroup (for non-Block variables), and Function storage classes is enabled, while declaring them in the interface storage classes (e.g., UniformConstant, Uniform, StorageBuffer, Input, Output, and PushConstant) is not enabled.

- **shaderInt8** indicates whether 8-bit integers (signed and unsigned) are supported in shader code. This also indicates whether shader modules can declare the Int8 capability. However, this only enables a subset of the storage classes that SPIR-V allows for the Int8 SPIR-V capability: Declaring and using 8-bit integers in the Private, Workgroup (for non-Block variables), and Function storage classes is enabled, while declaring them in the interface storage classes (e.g., UniformConstant, Uniform, StorageBuffer, Input, Output, and PushConstant) is not enabled.

If the VkPhysicalDeviceShaderFloat16Int8Features structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceShaderFloat16Int8Features can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

**Valid Usage ( Implicit)**

- VUID-VkPhysicalDeviceShaderFloat16Int8Features-sType-sType
The **VkPhysicalDeviceShaderClockFeaturesKHR** structure is defined as:

```c
// Provided by VK_KHR_shader_clock
typedef struct VkPhysicalDeviceShaderClockFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderSubgroupClock;
    VkBool32 shaderDeviceClock;
} VkPhysicalDeviceShaderClockFeaturesKHR;
```

This structure describes the following features:

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **shaderSubgroupClock** indicates whether shaders **can** perform **Subgroup** scoped clock reads.
- **shaderDeviceClock** indicates whether shaders **can** perform **Device** scoped clock reads.

If the **VkPhysicalDeviceShaderClockFeaturesKHR** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceShaderClockFeaturesKHR** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderClockFeaturesKHR-sType-sType

  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CLOCK_FEATURES_KHR**

The **VkPhysicalDeviceSamplerYcbcrConversionFeatures** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceSamplerYcbcrConversionFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 samplerYcbcrConversion;
} VkPhysicalDeviceSamplerYcbcrConversionFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkPhysicalDeviceSamplerYcbcrConversionFeatures
    VkPhysicalDeviceSamplerYcbcrConversionFeaturesKHR;
```
This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.

- **samplerYcbcrConversion** specifies whether the implementation supports sampler Y′CbCr conversion. If **samplerYcbcrConversion** is **VK_FALSE**, sampler Y′CbCr conversion is not supported, and samplers using sampler Y′CbCr conversion must not be used.

If the **VkPhysicalDeviceSamplerYcbcrConversionFeatures** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceSamplerYcbcrConversionFeatures** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceSamplerYcbcrConversionFeatures-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLER_YCBCR_CONVERSION_FEATURES**

The **VkPhysicalDeviceProtectedMemoryFeatures** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProtectedMemoryFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 protectedMemory;
} VkPhysicalDeviceProtectedMemoryFeatures;
```

This structure describes the following feature:

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.

- **protectedMemory** specifies whether protected memory is supported.

If the **VkPhysicalDeviceProtectedMemoryFeatures** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceProtectedMemoryFeatures** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceProtectedMemoryFeatures-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROTECTED_MEMORY_FEATURES**

2649
The \texttt{VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT} structure is defined as:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 advancedBlendCoherentOperations;
} VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT;
```

This structure describes the following feature:

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{advancedBlendCoherentOperations} specifies whether blending using \texttt{advanced blend operations} is guaranteed to execute atomically and in \texttt{primitive order}. If this is \texttt{VK_TRUE}, \texttt{VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT} is treated the same as \texttt{VK_ACCESS_COLOR_ATTACHMENT_READ_BIT}, and advanced blending needs no additional synchronization over basic blending. If this is \texttt{VK_FALSE}, then memory dependencies are required to guarantee order between two advanced blending operations that occur on the same sample.

If the \texttt{VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT} structure is included in the \texttt{pNext} chain of the \texttt{VkPhysicalDeviceFeatures2} structure passed to \texttt{vkGetPhysicalDeviceFeatures2}, it is filled in to indicate whether each corresponding feature is supported. \texttt{VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT} can also be used in the \texttt{pNext} chain of \texttt{VkDeviceCreateInfo} to selectively enable these features.

### Valid Usage (Implicit)

- \texttt{VUID-VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT-sType-sType}
  - \texttt{sType} \texttt{must be} \texttt{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BLEND_OPERATION_ADVANCED_FEATURES_EXT}

The \texttt{VkPhysicalDeviceConditionalRenderingFeaturesEXT} structure is defined as:

```c
