Chapter 1. Preamble

Copyright 2014-2023 The Khronos Group Inc.

This Specification is protected by copyright laws and contains material proprietary to Khronos. Except as described by these terms, it or any components may not be reproduced, republished, distributed, transmitted, displayed, broadcast or otherwise exploited in any manner without the express prior written permission of Khronos.

Khronos grants a conditional copyright license to use and reproduce the unmodified Specification for any purpose, without fee or royalty, EXCEPT no licenses to any patent, trademark or other intellectual property rights are granted under these terms.

Khronos makes no, and expressly disclaims any, representations or warranties, express or implied, regarding this Specification, including, without limitation: merchantability, fitness for a particular purpose, non-infringement of any intellectual property, correctness, accuracy, completeness, timeliness, and reliability. Under no circumstances will Khronos, or any of its Promoters, Contributors or Members, or their respective partners, officers, directors, employees, agents or representatives be liable for any damages, whether direct, indirect, special or consequential damages for lost revenues, lost profits, or otherwise, arising from or in connection with these materials.

This document contains extensions which are not ratified by Khronos, and as such is not a ratified Specification, though it contains text from (and is a superset of) the ratified Vulkan Specification. The ratified versions of the Vulkan Specification can be found at https://registry.khronos.org/vulkan/specs/1.3/html/vkspec.html (core only) and https://registry.khronos.org/vulkan/specs/1.3-khr-extensions/html/vkspec.html (core with all ratified extensions).

This Specification contains substantially unmodified functionality from, and is a successor to, Khronos specifications including OpenGL, OpenGL ES and OpenCL.

The Khronos Intellectual Property Rights Policy defines the terms 'Scope', 'Compliant Portion', and 'Necessary Patent Claims'.

Some parts of this Specification are purely informative and so are EXCLUDED the Scope of this Specification. The Document Conventions section of the Introduction defines how these parts of the Specification are identified.

Where this Specification uses technical terminology, defined in the Glossary or otherwise, that refer to enabling technologies that are not expressly set forth in this Specification, those enabling technologies are EXCLUDED from the Scope of this Specification. For clarity, enabling technologies not disclosed with particularity in this Specification (e.g. semiconductor manufacturing technology, hardware architecture, processor architecture or microarchitecture, memory architecture, compiler technology, object oriented technology, basic operating system technology, compression technology, algorithms, and so on) are NOT to be considered expressly set forth; only those application program interfaces and data structures disclosed with particularity are included in the Scope of this Specification.

For purposes of the Khronos Intellectual Property Rights Policy as it relates to the definition of
Necessary Patent Claims, all recommended or optional features, behaviors and functionality set forth in this Specification, if implemented, are considered to be included as Compliant Portions.

Where this Specification identifies specific sections of external references, only those specifically identified sections define normative functionality. The Khronos Intellectual Property Rights Policy excludes external references to materials and associated enabling technology not created by Khronos from the Scope of this Specification, and any licenses that may be required to implement such referenced materials and associated technologies must be obtained separately and may involve royalty payments.

Khronos and Vulkan are registered trademarks, and SPIR-V is a trademark of The Khronos Group Inc. OpenCL is a trademark of Apple Inc., used under license by Khronos. OpenGL is a registered trademark and the OpenGL ES logo is a trademark of Hewlett Packard Enterprise, used under license by Khronos. ASTC is a trademark of ARM Holdings PLC. All other product names, trademarks, and/or company names are used solely for identification and belong to their respective owners.
Chapter 2. Introduction

This document, referred to as the “Vulkan Specification” or just the “Specification” hereafter, describes the Vulkan Application Programming Interface (API). Vulkan is a C99 API designed for explicit control of low-level graphics and compute functionality.

The canonical version of the Specification is available in the official Vulkan Registry (https://registry.khronos.org/vulkan/). The source files used to generate the Vulkan specification are stored in the Vulkan Documentation Repository (https://github.com/KhronosGroup/Vulkan-Docs).

The source repository additionally has a public issue tracker and allows the submission of pull requests that improve the specification.

2.1. Document Conventions

The Vulkan specification is intended for use by both implementors of the API and application developers seeking to make use of the API, forming a contract between these parties. Specification text may address either party; typically the intended audience can be inferred from context, though some sections are defined to address only one of these parties. (For example, Valid Usage sections only address application developers). Any requirements, prohibitions, recommendations or options defined by normative terminology are imposed only on the audience of that text.

Note
Structure and enumerated types defined in extensions that were promoted to core in a later version of Vulkan are now defined in terms of the equivalent Vulkan core interfaces. This affects the Vulkan Specification, the Vulkan header files, and the corresponding XML Registry.

2.1.1. Informative Language

Some language in the specification is purely informative, intended to give background or suggestions to implementors or developers.

If an entire chapter or section contains only informative language, its title will be suffixed with “(Informative)”.

All NOTEs are implicitly informative.

2.1.2. Normative Terminology

Within this specification, the key words must, required, should, recommended, may, and optional are to be interpreted as described in RFC 2119 - Key words for use in RFCs to Indicate Requirement Levels (https://www.ietf.org/rfc/rfc2119.txt). The additional key word optionally is an alternate form of optional, for use where grammatically appropriate.

These key words are highlighted in the specification for clarity. In text addressing application developers, their use expresses requirements that apply to application behavior. In text addressing implementors, their use expresses requirements that apply to implementations.
In text addressing application developers, the additional key words **can** and **cannot** are to be interpreted as describing the capabilities of an application, as follows:

**can**

This word means that the application is able to perform the action described.

**cannot**

This word means that the API and/or the execution environment provide no mechanism through which the application can express or accomplish the action described.

These key words are never used in text addressing implementors.

---

**Note**

There is an important distinction between **cannot** and **must not**, as used in this Specification. **Cannot** means something the application literally is unable to express or accomplish through the API, while **must not** means something that the application is capable of expressing through the API, but that the consequences of doing so are undefined and potentially unrecoverable for the implementation (see Valid Usage).

---

Unless otherwise noted in the section heading, all sections and appendices in this document are normative.

### 2.1.3. Technical Terminology

The Vulkan Specification makes use of common engineering and graphics terms such as **Pipeline**, **Shader**, and **Host** to identify and describe Vulkan API constructs and their attributes, states, and behaviors. The **Glossary** defines the basic meanings of these terms in the context of the Specification. The Specification text provides fuller definitions of the terms and may elaborate, extend, or clarify the **Glossary** definitions. When a term defined in the **Glossary** is used in normative language within the Specification, the definitions within the Specification govern and supersede any meanings the terms may have in other technical contexts (i.e. outside the Specification).

### 2.1.4. Normative References

References to external documents are considered normative references if the Specification uses any of the normative terms defined in **Normative Terminology** to refer to them or their requirements, either as a whole or in part.

The following documents are referenced by normative sections of the specification:

Chapter 3. Fundamentals

This chapter introduces fundamental concepts including the Vulkan architecture and execution model, API syntax, queues, pipeline configurations, numeric representation, state and state queries, and the different types of objects and shaders. It provides a framework for interpreting more specific descriptions of commands and behavior in the remainder of the Specification.

3.1. Host and Device Environment

The Vulkan Specification assumes and requires: the following properties of the host environment with respect to Vulkan implementations:

- The host must have runtime support for 8, 16, 32 and 64-bit signed and unsigned two-complement integers, all addressable at the granularity of their size in bytes.
- The host must have runtime support for 32- and 64-bit floating-point types satisfying the range and precision constraints in the Floating Point Computation section.
- The representation and endianness of these types on the host must match the representation and endianness of the same types on every physical device supported.

Note
Since a variety of data types and structures in Vulkan may be accessible by both host and physical device operations, the implementation should be able to access such data efficiently in both paths in order to facilitate writing portable and performant applications.

3.2. Execution Model

This section outlines the execution model of a Vulkan system.

Vulkan exposes one or more devices, each of which exposes one or more queues which may process work asynchronously to one another. The set of queues supported by a device is partitioned into families. Each family supports one or more types of functionality and may contain multiple queues with similar characteristics. Queues within a single family are considered compatible with one another, and work produced for a family of queues can be executed on any queue within that family. This specification defines the following types of functionality that queues may support: graphics, compute, video decode, video encode, protected memory management, sparse memory management, and transfer.

Note
A single device may report multiple similar queue families rather than, or as well as, reporting multiple members of one or more of those families. This indicates that while members of those families have similar capabilities, they are not directly compatible with one another.

Device memory is explicitly managed by the application. Each device may advertise one or more
heaps, representing different areas of memory. Memory heaps are either device-local or host-local, but are always visible to the device. Further detail about memory heaps is exposed via memory types available on that heap. Examples of memory areas that may be available on an implementation include:

- **device-local** is memory that is physically connected to the device.
- **device-local, host visible** is device-local memory that is visible to the host.
- **host-local, host visible** is memory that is local to the host and visible to the device and host.

On other architectures, there may only be a single heap that can be used for any purpose.

### 3.2.1. Queue Operation

Vulkan queues provide an interface to the execution engines of a device. Commands for these execution engines are recorded into command buffers ahead of execution time, and then submitted to a queue for execution. Once submitted to a queue, command buffers will begin and complete execution without further application intervention, though the order of this execution is dependent on a number of implicit and explicit ordering constraints.

Work is submitted to queues using *queue submission commands* that typically take the form `vkQueue*` (e.g. `vkQueueSubmit`, `vkQueueBindSparse`), and can take a list of semaphores upon which to wait before work begins and a list of semaphores to signal once work has completed. The work itself, as well as signaling and waiting on the semaphores are all *queue operations*. Queue submission commands return control to the application once queue operations have been submitted - they do not wait for completion.

There are no implicit ordering constraints between queue operations on different queues, or between queues and the host, so these may operate in any order with respect to each other. Explicit ordering constraints between different queues or with the host can be expressed with *semaphores* and *fences*.

Command buffer submissions to a single queue respect *submission order* and other implicit ordering guarantees, but otherwise may overlap or execute out of order. Other types of batches and queue submissions against a single queue (e.g. sparse memory binding) have no implicit ordering constraints with any other queue submission or batch. Additional explicit ordering constraints between queue submissions and individual batches can be expressed with *semaphores* and *fences*.

Before a fence or semaphore is signaled, it is guaranteed that any previously submitted queue operations have completed execution, and that memory writes from those queue operations are available to future queue operations. Waiting on a signaled semaphore or fence guarantees that previous writes that are available are also visible to subsequent commands.

Command buffer boundaries, both between primary command buffers of the same or different batches or submissions as well as between primary and secondary command buffers, do not introduce any additional ordering constraints. In other words, submitting the set of command buffers (which can include executing secondary command buffers) between any semaphore or fence operations execute the recorded commands as if they had all been recorded into a single primary command buffer, except that the current state is reset on each boundary. Explicit ordering constraints can be expressed with *explicit synchronization primitives*. 
There are a few **implicit ordering guarantees** between commands within a command buffer, but only covering a subset of execution. Additional explicit ordering constraints can be expressed with the various **explicit synchronization primitives**.

**Note**

Implementations have significant freedom to overlap execution of work submitted to a queue, and this is common due to deep pipelining and parallelism in Vulkan devices.

Commands recorded in command buffers can perform actions, set state that persists across commands, synchronize other commands, or indirectly launch other commands, with some commands fulfilling several of these roles. The “Command Properties” section for each such command lists which of these roles the command takes. State setting commands update the **current state** of the command buffer. Some commands that perform actions (e.g. draw/dispatch) do so based on the current state set cumulatively since the start of the command buffer. The work involved in performing action commands is often allowed to overlap or to be reordered, but doing so **must** not alter the state to be used by each action command. In general, action commands are those commands that alter framebuffer attachments, read/write buffer or image memory, or write to query pools.

Synchronization commands introduce explicit execution and memory dependencies between two sets of action commands, where the second set of commands depends on the first set of commands. These dependencies enforce both that the execution of certain pipeline stages in the later set occurs after the execution of certain stages in the source set, and that the effects of memory accesses performed by certain pipeline stages occur in order and are visible to each other. When not enforced by an explicit dependency or **implicit ordering guarantees**, action commands **may** overlap execution or execute out of order, and **may** not see the side effects of each other's memory accesses.

### 3.3. Object Model

The devices, queues, and other entities in Vulkan are represented by Vulkan objects. At the API level, all objects are referred to by handles. There are two classes of handles, dispatchable and non-dispatchable. **Dispatchable** handle types are a pointer to an opaque type. This pointer **may** be used by layers as part of intercepting API commands, and thus each API command takes a dispatchable type as its first parameter. Each object of a dispatchable type **must** have a unique handle value during its lifetime.

**Non-dispatchable** handle types are a 64-bit integer type whose meaning is implementation-dependent. If the privateData feature is enabled for a **VkDevice**, each object of a non-dispatchable type created on that device **must** have a handle value that is unique among objects created on that device, for the duration of the object's lifetime. Otherwise, non-dispatchable handles **may** encode object information directly in the handle rather than acting as a reference to an underlying object, and thus **may** not have unique handle values. If handle values are not unique, then destroying one such handle **must** not cause identical handles of other types to become invalid, and **must** not cause identical handles of the same type to become invalid if that handle value has been created more times than it has been destroyed.
All objects created or allocated from a VkDevice (i.e. with a VkDevice as the first parameter) are private to that device, and must not be used on other devices.

### 3.3.1. Object Lifetime

Objects are created or allocated by vkCreate* and vkAllocate* commands, respectively. Once an object is created or allocated, its “structure” is considered to be immutable, though the contents of certain object types is still free to change. Objects are destroyed or freed by vkDestroy* and vkFree* commands, respectively.

Objects that are allocated (rather than created) take resources from an existing pool object or memory heap, and when freed return resources to that pool or heap. While object creation and destruction are generally expected to be low-frequency occurrences during runtime, allocating and freeing objects can occur at high frequency. Pool objects help accommodate improved performance of the allocations and frees.

It is an application’s responsibility to track the lifetime of Vulkan objects, and not to destroy them while they are still in use.

The ownership of application-owned memory is immediately acquired by any Vulkan command it is passed into. Ownership of such memory must be released back to the application at the end of the duration of the command, unless that command was deferred, so that the application can alter or free this memory as soon as all the commands that acquired it have returned. If the command was deferred, ownership of such memory is released back to the application when the deferred operation is complete.

The following object types are consumed when they are passed into a Vulkan command and not further accessed by the objects they are used to create. They must not be destroyed in the duration of any API command they are passed into:

- VkShaderModule
- VkPipelineCache
- VkValidationCacheEXT

A VkRenderPass or VkPipelineLayout object passed as a parameter to create another object is not further accessed by that object after the duration of the command it is passed into. A VkRenderPass used in a command buffer follows the rules described below.

VkDescriptorSetLayout objects may be accessed by commands that operate on descriptor sets allocated using that layout, and those descriptor sets must not be updated with vkUpdateDescriptorSets after the descriptor set layout has been destroyed. Otherwise, a VkDescriptorSetLayout object passed as a parameter to create another object is not further accessed by that object after the duration of the command it is passed into.

The application must not destroy any other type of Vulkan object until all uses of that object by the device (such as via command buffer execution) have completed.

The following Vulkan objects must not be destroyed while any command buffers using the object are in the pending state:
• VkEvent
• VkQueryPool
• VkBuffer
• VkBufferView
• VkImage
• VkImageView
• VkPipeline
• VkSampler
• VkSamplerYcbcrConversion
• VkDescriptorPool
• VkFramebuffer
• VkRenderPass
• VkCommandBuffer
• VkCommandPool
• VkDeviceMemory
• VkDescriptorSet
• VkIndirectCommandsLayoutNV
• VkAccelerationStructureNV
• VkAccelerationStructureKHR
• VkVideoSessionKHR
• VkVideoSessionParametersKHR

Destroying these objects will move any command buffers that are in the **recording or executable state**, and are using those objects, to the **invalid state**.

The following Vulkan objects **must** not be destroyed while any queue is executing commands that use the object:

• VkFence
• VkSemaphore
• VkCommandBuffer
• VkCommandPool

In general, objects **can** be destroyed or freed in any order, even if the object being freed is involved in the use of another object (e.g. use of a resource in a view, use of a view in a descriptor set, use of a pipeline library in another pipeline, use of a referenced pipeline for additional graphics shader groups in another pipeline, use of a bottom level acceleration structure in an instance referenced by a top level acceleration structure, use of an object in a command buffer, binding of a memory allocation to a resource), as long as any object that uses the freed object is not further used in any way except to be destroyed or to be reset in such a way that it no longer uses the other object (such
as resetting a command buffer). If the object has been reset, then it **can** be used as if it never used the freed object. An exception to this is when there is a parent/child relationship between objects. In this case, the application **must** not destroy a parent object before its children, except when the parent is explicitly defined to free its children when it is destroyed (e.g. for pool objects, as defined below).

**VkCommandPool** objects are parents of **VkCommandBuffer** objects. **VkDescriptorPool** objects are parents of **VkDescriptorSet** objects. **VkDevice** objects are parents of many object types (all that take a **VkDevice** as a parameter to their creation).

The following Vulkan objects have specific restrictions for when they **can** be destroyed:

- **VkQueue** objects **cannot** be explicitly destroyed. Instead, they are implicitly destroyed when the **VkDevice** object they are retrieved from is destroyed.
- Destroying a pool object implicitly frees all objects allocated from that pool. Specifically, destroying **VkCommandPool** frees all **VkCommandBuffer** objects that were allocated from it, and destroying **VkDescriptorPool** frees all **VkDescriptorSet** objects that were allocated from it.
- **VkDevice** objects **can** be destroyed when all **VkQueue** objects retrieved from them are idle, and all objects created from them have been destroyed.
  - This includes the following objects:
    - **VkFence**
    - **VkSemaphore**
    - **VkEvent**
    - **VkQueryPool**
    - **VkBuffer**
    - **VkBufferView**
    - **VkImage**
    - **VkImageView**
    - **VkShaderModule**
    - **VkPipelineCache**
    - **VkPipeline**
    - **VkPipelineLayout**
    - **VkSampler**
    - **VkSamplerYcbcrConversion**
    - **VkDescriptorSetLayout**
    - **VkDescriptorPool**
    - **VkFramebuffer**
    - **VkRenderPass**
    - **VkCommandPool**
The scope of external handles and their associated resources may vary according to their type, but they can generally be shared across process and API boundaries.

3.4. Application Binary Interface

The mechanism by which Vulkan is made available to applications is platform- or implementation-defined. On many platforms, the C interface described in this Specification is provided by a shared library. Since shared libraries can be changed independently of the applications that use them, they present particular compatibility challenges, and this Specification places some requirements on them.

Shared library implementations must use the default Application Binary Interface (ABI) of the standard C compiler for the platform, or provide customized API headers that cause application code to use the implementation’s non-default ABI. An ABI in this context means the size, alignment, and layout of C data types; the procedure calling convention; and the naming convention for shared library symbols corresponding to C functions. Customizing the calling convention for a platform is usually accomplished by defining calling convention macros appropriately in vk_platform.h.

On platforms where Vulkan is provided as a shared library, library symbols beginning with “vk” and followed by a digit or uppercase letter are reserved for use by the implementation. Applications which use Vulkan must not provide definitions of these symbols. This allows the Vulkan shared library to be updated with additional symbols for new API versions or extensions without causing symbol conflicts with existing applications.
Shared library implementations should provide library symbols for commands in the highest version of this Specification they support, and for Window System Integration extensions relevant to the platform. They may also provide library symbols for commands defined by additional extensions.

Note
These requirements and recommendations are intended to allow implementors to take advantage of platform-specific conventions for SDKs, ABIs, library versioning mechanisms, etc. while still minimizing the code changes necessary to port applications or libraries between platforms. Platform vendors, or providers of the de facto standard Vulkan shared library for a platform, are encouraged to document what symbols the shared library provides and how it will be versioned when new symbols are added.

Applications should only rely on shared library symbols for commands in the minimum core version required by the application. vkGetInstanceProcAddr and vkGetDeviceProcAddr should be used to obtain function pointers for commands in core versions beyond the application's minimum required version.

3.5. Command Syntax and Duration

The Specification describes Vulkan commands as functions or procedures using C99 syntax. Language bindings for other languages such as C++ and JavaScript may allow for stricter parameter passing, or object-oriented interfaces.

Vulkan uses the standard C types for the base type of scalar parameters (e.g. types from <stdint.h>), with exceptions described below, or elsewhere in the text when appropriate:

VkBool32 represents boolean True and False values, since C does not have a sufficiently portable built-in boolean type:

```c
// Provided by VK_VERSION_1_0
typedef uint32_t VkBool32;
```

VK_TRUE represents a boolean True (unsigned integer 1) value, and VK_FALSE a boolean False (unsigned integer 0) value.

All values returned from a Vulkan implementation in a VkBool32 will be either VK_TRUE or VK_FALSE.

Applications must not pass any other values than VK_TRUE or VK_FALSE into a Vulkan implementation where a VkBool32 is expected.

VK_TRUE is a constant representing a VkBool32 True value.

```c
#define VK_TRUE 1U
```

VK_FALSE is a constant representing a VkBool32 False value.

VkDeviceSize represents device memory size and offset values:

```c
// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceSize;
```

VkDeviceAddress represents device buffer address values:

```c
// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceAddress;
```

Commands that create Vulkan objects are of the form `vkCreate*` and take `Vk*CreateInfo` structures with the parameters needed to create the object. These Vulkan objects are destroyed with commands of the form `vkDestroy*`.

The last in-parameter to each command that creates or destroys a Vulkan object is `pAllocator`. The `pAllocator` parameter can be set to a non-`NULL` value such that allocations for the given object are delegated to an application provided callback; refer to the Memory Allocation chapter for further details.

Commands that allocate Vulkan objects owned by pool objects are of the form `vkAllocate*`, and take `Vk*AllocateInfo` structures. These Vulkan objects are freed with commands of the form `vkFree*`. These objects do not take allocators; if host memory is needed, they will use the allocator that was specified when their parent pool was created.

Commands are recorded into a command buffer by calling API commands of the form `vkCmd*`. Each such command may have different restrictions on where it can be used: in a primary and/or secondary command buffer, inside and/or outside a render pass, and in one or more of the supported queue types. These restrictions are documented together with the definition of each such command.

The duration of a Vulkan command refers to the interval between calling the command and its return to the caller.

### 3.5.1. Lifetime of Retrieved Results

Information is retrieved from the implementation with commands of the form `vkGet*` and `vkEnumerate*`.

Unless otherwise specified for an individual command, the results are invariant; that is, they will remain unchanged when retrieved again by calling the same command with the same parameters, so long as those parameters themselves all remain valid.
3.6. Threading Behavior

Vulkan is intended to provide scalable performance when used on multiple host threads. All commands support being called concurrently from multiple threads, but certain parameters, or components of parameters are defined to be externally synchronized. This means that the caller **must** guarantee that no more than one thread is using such a parameter at a given time.

More precisely, Vulkan commands use simple stores to update the state of Vulkan objects. A parameter declared as externally synchronized **may** have its contents updated at any time during the host execution of the command. If two commands operate on the same object and at least one of the commands declares the object to be externally synchronized, then the caller **must** guarantee not only that the commands do not execute simultaneously, but also that the two commands are separated by an appropriate memory barrier (if needed).

**Note**

Memory barriers are particularly relevant for hosts based on the ARM CPU architecture, which is more weakly ordered than many developers are accustomed to from x86/x64 programming. Fortunately, most higher-level synchronization primitives (like the pthread library) perform memory barriers as a part of mutual exclusion, so muting Vulkan objects via these primitives will have the desired effect.

Similarly the application **must** avoid any potential data hazard of application-owned memory that has its ownership temporarily acquired by a Vulkan command. While the ownership of application-owned memory remains acquired by a command the implementation **may** read the memory at any point, and it **may** write non-**const** qualified memory at any point. Parameters referring to non-**const** qualified application-owned memory are not marked explicitly as externally synchronized in the Specification.

If an application is using deferred host operations in a command, and that operation is successfully deferred, object parameters and application-owned memory passed to that command **may** be accessed at any time until the deferred operation is complete.

Many object types are immutable, meaning the objects cannot change once they have been created. These types of objects never need external synchronization, except that they **must** not be destroyed while they are in use on another thread. In certain special cases mutable object parameters are internally synchronized, making external synchronization unnecessary. Any command parameters that are not labeled as externally synchronized are either not mutated by the command or are internally synchronized. Additionally, certain objects related to a command’s parameters (e.g. command pools and descriptor pools) **may** be affected by a command, and **must** also be externally synchronized. These implicit parameters are documented as described below.

Parameters of commands that are externally synchronized are listed below.

**Externally Synchronized Parameters**

- The instance parameter in `vkDestroyInstance`
• The `device` parameter in `vkDestroyDevice`
• The `queue` parameter in `vkQueueSubmit`
• The `fence` parameter in `vkQueueSubmit`
• The `queue` parameter in `vkQueueWaitIdle`
• The `memory` parameter in `vkFreeMemory`
• The `memory` parameter in `vkMapMemory`
• The `memory` parameter in `vkUnmapMemory`
• The `buffer` parameter in `vkBindBufferMemory`
• The `image` parameter in `vkBindImageMemory`
• The `queue` parameter in `vkQueueBindSparse`
• The `fence` parameter in `vkQueueBindSparse`
• The `fence` parameter in `vkDestroyFence`
• The `semaphore` parameter in `vkDestroySemaphore`
• The `event` parameter in `vkDestroyEvent`
• The `event` parameter in `vkSetEvent`
• The `event` parameter in `vkResetEvent`
• The `queryPool` parameter in `vkDestroyQueryPool`
• The `buffer` parameter in `vkDestroyBuffer`
• The `bufferView` parameter in `vkDestroyBufferView`
• The `image` parameter in `vkDestroyImage`
• The `imageView` parameter in `vkDestroyImageView`
• The `shaderModule` parameter in `vkDestroyShaderModule`
• The `pipelineCache` parameter in `vkDestroyPipelineCache`
• The `dstCache` parameter in `vkMergePipelineCaches`
• The `pipeline` parameter in `vkDestroyPipeline`
• The `pipelineLayout` parameter in `vkDestroyPipelineLayout`
• The `sampler` parameter in `vkDestroySampler`
• The `descriptorSetLayout` parameter in `vkDestroyDescriptorSetLayout`
• The `descriptorPool` parameter in `vkDestroyDescriptorPool`
• The `descriptorPool` parameter in `vkResetDescriptorPool`
• The `descriptorPool` member of the `pAllocateInfo` parameter in `vkAllocateDescriptorSets`
• The `descriptorPool` parameter in `vkFreeDescriptorSets`
• The `framebuffer` parameter in `vkDestroyFramebuffer`
• The `renderPass` parameter in `vkDestroyRenderPass`
• The `commandPool` parameter in `vkDestroyCommandPool`
- The `commandPool` parameter in `vkResetCommandPool`
- The `commandPool` member of the `pAllocateInfo` parameter in `vkAllocateCommandBuffers`
- The `commandPool` parameter in `vkFreeCommandBuffers`
- The `commandBuffer` parameter in `vkBeginCommandBuffer`
- The `commandBuffer` parameter in `vkEndCommandBuffer`
- The `commandBuffer` parameter in `vkResetCommandBuffer`
- The `commandBuffer` parameter in `vkCmdBindPipeline`
- The `commandBuffer` parameter in `vkCmdSetViewport`
- The `commandBuffer` parameter in `vkCmdSetScissor`
- The `commandBuffer` parameter in `vkCmdSetLineWidth`
- The `commandBuffer` parameter in `vkCmdSetDepthBias`
- The `commandBuffer` parameter in `vkCmdSetBlendConstants`
- The `commandBuffer` parameter in `vkCmdSetDepthBounds`
- The `commandBuffer` parameter in `vkCmdSetStencilCompareMask`
- The `commandBuffer` parameter in `vkCmdSetStencilWriteMask`
- The `commandBuffer` parameter in `vkCmdSetStencilReference`
- The `commandBuffer` parameter in `vkCmdBindDescriptorSets`
- The `commandBuffer` parameter in `vkCmdBindIndexBuffer`
- The `commandBuffer` parameter in `vkCmdBindVertexBuffers`
- The `commandBuffer` parameter in `vkCmdDraw`
- The `commandBuffer` parameter in `vkCmdDrawIndexed`
- The `commandBuffer` parameter in `vkCmdDrawIndirect`
- The `commandBuffer` parameter in `vkCmdDrawIndexedIndirect`
- The `commandBuffer` parameter in `vkCmdDispatch`
- The `commandBuffer` parameter in `vkCmdDispatchIndirect`
- The `commandBuffer` parameter in `vkCmdCopyBuffer`
- The `commandBuffer` parameter in `vkCmdCopyImage`
- The `commandBuffer` parameter in `vkCmdBlitImage`
- The `commandBuffer` parameter in `vkCmdCopyBufferToImage`
- The `commandBuffer` parameter in `vkCmdCopyImageToBuffer`
- The `commandBuffer` parameter in `vkCmdUpdateBuffer`
- The `commandBuffer` parameter in `vkCmdFillBuffer`
- The `commandBuffer` parameter in `vkCmdClearColorImage`
- The `commandBuffer` parameter in `vkCmdClearDepthStencilImage`
- The `commandBuffer` parameter in `vkCmdClearAttachments`
• The `commandBuffer` parameter in `vkCmdResolveImage`
• The `commandBuffer` parameter in `vkCmdSetEvent`
• The `commandBuffer` parameter in `vkCmdResetEvent`
• The `commandBuffer` parameter in `vkCmdWaitEvents`
• The `commandBuffer` parameter in `vkCmdPipelineBarrier`
• The `commandBuffer` parameter in `vkCmdBeginQuery`
• The `commandBuffer` parameter in `vkCmdEndQuery`
• The `commandBuffer` parameter in `vkCmdResetQueryPool`
• The `commandBuffer` parameter in `vkCmdWriteTimestamp`
• The `commandBuffer` parameter in `vkCmdCopyQueryPoolResults`
• The `commandBuffer` parameter in `vkCmdPushConstants`
• The `commandBuffer` parameter in `vkCmdBeginRenderPass`
• The `commandBuffer` parameter in `vkCmdNextSubpass`
• The `commandBuffer` parameter in `vkCmdEndRenderPass`
• The `commandBuffer` parameter in `vkCmdExecuteCommands`
• The `commandBuffer` parameter in `vkCmdSetDeviceMask`
• The `commandBuffer` parameter in `vkCmdDispatchBase`
• The `commandPool` parameter in `vkTrimCommandPool`
• The `ycbcrConversion` parameter in `vkDestroySamplerYcbcrConversion`
• The `descriptorUpdateTemplate` parameter in `vkDestroyDescriptorUpdateTemplate`
• The `commandBuffer` parameter in `vkCmdDrawIndirectCount`
• The `commandBuffer` parameter in `vkCmdDrawIndexedIndirectCount`
• The `commandBuffer` parameter in `vkCmdBeginRenderPass2`
• The `commandBuffer` parameter in `vkCmdNextSubpass2`
• The `commandBuffer` parameter in `vkCmdEndRenderPass2`
• The `privateDataSlot` parameter in `vkDestroyPrivateDataSlot`
• The `commandBuffer` parameter in `vkCmdSetEvent2`
• The `commandBuffer` parameter in `vkCmdResetEvent2`
• The `commandBuffer` parameter in `vkCmdWaitEvents2`
• The `commandBuffer` parameter in `vkCmdPipelineBarrier2`
• The `commandBuffer` parameter in `vkCmdWriteTimestamp2`
• The `queue` parameter in `vkQueueSubmit2`
• The `fence` parameter in `vkQueueSubmit2`
• The `commandBuffer` parameter in `vkCmdCopyBuffer2`
• The `commandBuffer` parameter in `vkCmdCopyImage2`
- The `commandBuffer` parameter in `vkCmdCopyBufferToImage2`
- The `commandBuffer` parameter in `vkCmdCopyImageToBuffer2`
- The `commandBuffer` parameter in `vkCmdBlitImage2`
- The `commandBuffer` parameter in `vkCmdResolveImage2`
- The `commandBuffer` parameter in `vkCmdBeginRendering`
- The `commandBuffer` parameter in `vkCmdEndRendering`
- The `commandBuffer` parameter in `vkCmdSetCullMode`
- The `commandBuffer` parameter in `vkCmdSetFrontFace`
- The `commandBuffer` parameter in `vkCmdSetPrimitiveTopology`
- The `commandBuffer` parameter in `vkCmdSetViewportWithCount`
- The `commandBuffer` parameter in `vkCmdSetScissorWithCount`
- The `commandBuffer` parameter in `vkCmdBindVertexBuffers2`
- The `commandBuffer` parameter in `vkCmdSetDepthTestEnable`
- The `commandBuffer` parameter in `vkCmdSetDepthWriteEnable`
- The `commandBuffer` parameter in `vkCmdSetDepthCompareOp`
- The `commandBuffer` parameter in `vkCmdSetDepthBoundsTestEnable`
- The `commandBuffer` parameter in `vkCmdSetStencilTestEnable`
- The `commandBuffer` parameter in `vkCmdSetStencilOp`
- The `commandBuffer` parameter in `vkCmdSetRasterizerDiscardEnable`
- The `commandBuffer` parameter in `vkCmdSetDepthBiasEnable`
- The `commandBuffer` parameter in `vkCmdSetPrimitiveRestartEnable`
- The `surface` parameter in `vkDestroySurfaceKHR`
- The `surface` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`
- The `oldSwapchain` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`
- The `swapchain` parameter in `vkDestroySwapchainKHR`
- The `swapchain` parameter in `vkAcquireNextImageKHR`
- The `semaphore` parameter in `vkAcquireNextImageKHR`
- The `fence` parameter in `vkQueuePresentKHR`
- The `surface` parameter in `vkGetDeviceGroupSurfacePresentModesKHR`
- The `surface` parameter in `vkGetPhysicalDevicePresentRectanglesKHR`
- The `display` parameter in `vkCreateDisplayModeKHR`
- The `mode` parameter in `vkGetDisplayPlaneCapabilitiesKHR`
- The `videoSession` parameter in `vkDestroyVideoSessionKHR`
- The `videoSession` parameter in `vkBindVideoSessionMemoryKHR`
- The `videoSessionParameters` parameter in `vkDestroyVideoSessionParametersKHR`
- The `commandBuffer` parameter in `vkCmdBeginVideoCodingKHR`
- The `commandBuffer` parameter in `vkCmdEndVideoCodingKHR`
- The `commandBuffer` parameter in `vkCmdControlVideoCodingKHR`

• The commandBuffer parameter in vkCmdDrawMeshTasksIndirectCountEXT

For VkPipelineCache objects created with flags containing VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, the above table is extended with the pipelineCache parameter to vkCreate*Pipelines being externally synchronized.

There are also a few instances where a command can take in a user allocated list whose contents are externally synchronized parameters. In these cases, the caller must guarantee that at most one thread is using a given element within the list at a given time. These parameters are listed below.

**Externally Synchronized Parameter Lists**

• Each element of the pFences parameter in vkResetFences
• Each element of the pDescriptorSets parameter in vkFreeDescriptorSets
• Each element of the pCommandBuffers parameter in vkFreeCommandBuffers
• Each element of the pWaitSemaphores member of the pPresentInfo parameter in vkQueuePresentKHR
• Each element of the pSwapchains member of the pPresentInfo parameter in vkQueuePresentKHR
• The surface member of each element of the pCreateInfos parameter in vkCreateSharedSwapchainsKHR
• The oldSwapchain member of each element of the pCreateInfos parameter in vkCreateSharedSwapchainsKHR

In addition, there are some implicit parameters that need to be externally synchronized. For example, when a commandBuffer parameter needs to be externally synchronized, it implies that the commandPool from which that command buffer was allocated also needs to be externally synchronized. The implicit parameters and their associated object are listed below.

**Implicit Externally Synchronized Parameters**

• All VkPhysicalDevice objects enumerated from instance in vkDestroyInstance
• All VkQueue objects created from device in vkDestroyDevice
• All VkQueue objects created from device in vkDeviceWaitIdle
• Any VkDescriptorSet objects allocated from descriptorPool in vkResetDescriptorPool
• The VkCommandPool that commandBuffer was allocated from in vkBeginCommandBuffer
• The VkCommandPool that commandBuffer was allocated from in vkEndCommandBuffer
• The VkCommandPool that commandBuffer was allocated from in vkResetCommandBuffer

3.7. Valid Usage

Valid usage defines a set of conditions which **must** be met in order to achieve well-defined runtime behavior in an application. These conditions depend only on Vulkan state, and the parameters or objects whose usage is constrained by the condition.

The core layer assumes applications are using the API correctly. Except as documented elsewhere in the Specification, the behavior of the core layer to an application using the API incorrectly is undefined, and **may** include program termination. However, implementations **must** ensure that incorrect usage by an application does not affect the integrity of the operating system, the Vulkan implementation, or other Vulkan client applications in the system. In particular, any guarantees made by an operating system about whether memory from one process **can** be visible to another process or not **must** not be violated by a Vulkan implementation for **any memory allocation**.
Vulkan implementations are not required to make additional security or integrity guarantees beyond those provided by the OS unless explicitly directed by the application's use of a particular feature or extension.

Note

For instance, if an operating system guarantees that data in all its memory allocations are set to zero when newly allocated, the Vulkan implementation must make the same guarantees for any allocations it controls (e.g. VkDeviceMemory).

Similarly, if an operating system guarantees that use-after-free of host allocations will not result in values written by another process becoming visible, the same guarantees must be made by the Vulkan implementation for device memory.

If the protectedMemory feature is supported, the implementation provides additional guarantees when invalid usage occurs to prevent values in protected memory from being accessed or inferred outside of protected operations, as described in Protected Memory Access Rules.

Some valid usage conditions have dependencies on runtime limits or feature availability. It is possible to validate these conditions against Vulkan's minimum supported values for these limits and features, or some subset of other known values.

Valid usage conditions do not cover conditions where well-defined behavior (including returning an error code) exists.

Valid usage conditions should apply to the command or structure where complete information about the condition would be known during execution of an application. This is such that a validation layer or linter can be written directly against these statements at the point they are specified.

Note

This does lead to some non-obvious places for valid usage statements. For instance, the valid values for a structure might depend on a separate value in the calling command. In this case, the structure itself will not reference this valid usage as it is impossible to determine validity from the structure that it is invalid - instead this valid usage would be attached to the calling command.

Another example is draw state - the state setters are independent, and can cause a legitimately invalid state configuration between draw calls; so the valid usage statements are attached to the place where all state needs to be valid - at the drawing command.

Valid usage conditions are described in a block labelled “Valid Usage” following each command or structure they apply to.

3.7.1. Usage Validation

Vulkan is a layered API. The lowest layer is the core Vulkan layer, as defined by this Specification. The application can use additional layers above the core for debugging, validation, and other
One of the core principles of Vulkan is that building and submitting command buffers should be highly efficient. Thus error checking and validation of state in the core layer is minimal, although more rigorous validation can be enabled through the use of layers.

Validation of correct API usage is left to validation layers. Applications should be developed with validation layers enabled, to help catch and eliminate errors. Once validated, released applications should not enable validation layers by default.

3.7.2. Implicit Valid Usage

Some valid usage conditions apply to all commands and structures in the API, unless explicitly denoted otherwise for a specific command or structure. These conditions are considered implicit, and are described in a block labelled “Valid Usage (Implicit)” following each command or structure they apply to. Implicit valid usage conditions are described in detail below.

Valid Usage for Object Handles

Any input parameter to a command that is an object handle must be a valid object handle, unless otherwise specified. An object handle is valid if:

- It has been created or allocated by a previous, successful call to the API. Such calls are noted in the Specification.
- It has not been deleted or freed by a previous call to the API. Such calls are noted in the Specification.
- Any objects used by that object, either as part of creation or execution, must also be valid.

The reserved values VK_NULL_HANDLE and NULL can be used in place of valid non-dispatchable handles and dispatchable handles, respectively, when explicitly called out in the Specification. Any command that creates an object successfully must not return these values. It is valid to pass these values to vkDestroy* or vkFree* commands, which will silently ignore these values.

Valid Usage for Pointers

Any parameter that is a pointer must be a valid pointer only if it is explicitly called out by a Valid Usage statement.

A pointer is “valid” if it points at memory containing values of the number and type(s) expected by the command, and all fundamental types accessed through the pointer (e.g. as elements of an array or as members of a structure) satisfy the alignment requirements of the host processor.

Valid Usage for Strings

Any parameter that is a pointer to char must be a finite sequence of values terminated by a null character, or if explicitly called out in the Specification, can be NULL.
Valid Usage for Enumerated Types

Any parameter of an enumerated type must be a valid enumerant for that type. Use of an enumerant is valid if the following conditions are true:

- The enumerant is defined as part of the enumerated type.
- The enumerant is not a value suffixed with _MAX_ENUM.
  - This value exists only to ensure that C enum types are 32 bits in size and must not be used by applications.
- If the enumerant is used in a function that has a VkInstance as its first parameter and either:
  - it was added by a core version that is supported (as reported by vkEnumerateInstanceVersion) and the value of VkApplicationInfo::apiVersion is greater than or equal to the version that added it; or
  - it was added by an instance extension that was enabled for the instance.
- If the enumerant is used in a function that has a VkPhysicalDevice object as its first parameter and either:
  - it was added by a core version that is supported by that device (as reported by VkPhysicalDeviceProperties::apiVersion); or
  - it was added by an instance extension that was enabled for the instance; or
  - it was added by a device extension that is supported by that device.
- If the enumerant is used in a function that has any other dispatchable object as its first parameter and either:
  - it was added by a core version that is supported for the device (as reported by VkPhysicalDeviceProperties::apiVersion); or
  - it was added by a device extension that was enabled for the device.

Additionally, if maintenance5 is supported, any integer value representable in the range valid for the defined type is valid when used in a function that has a VkPhysicalDevice object as its first parameter. Physical device queries will either return results indicating lack of support, or ignore unsupported values when used as a bit flag in a Vk*Flags* parameter.

Any enumerated type returned from a query command or otherwise output from Vulkan to the application must not have a reserved value. Reserved values are values not defined by any extension for that enumerated type.

Note

In some special cases, an enumerant is only meaningful if a feature defined by an extension is also enabled, as well as the extension itself. The global “valid enumerant” rule described here does not address such cases.

Note

This language is intended to accommodate cases such as “hidden” extensions known only to driver internals, or layers enabling extensions without knowledge
of the application, without allowing return of values not defined by any extension.

**Note**

Application developers are encouraged to be careful when using `switch` statements with Vulkan API enums. This is because new extensions can add new values to existing enums. Using a `default:` statement within a `switch` may avoid future compilation issues.

This is particularly true for enums such as `VkDriverId`, which may have values added that do not belong to a corresponding new extension.

### Valid Usage for Flags

A collection of flags is represented by a bitmask using the type `VkFlags`:

```c
// Provided by VK_VERSION_1_0
typedef uint32_t VkFlags;
```

Bitmasks are passed to many commands and structures to compactly represent options, but `VkFlags` is not used directly in the API. Instead, a `Vk*Flags` type which is an alias of `VkFlags`, and whose name matches the corresponding `Vk*FlagBits` that are valid for that type, is used.

Any `Vk*Flags` member or parameter used in the API as an input **must** be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.

An individual bit flag is valid for a `Vk*Flags` type if it would be a valid enumerant when used with the equivalent `Vk*FlagBits` type, where the bits type is obtained by taking the flag type and replacing the trailing `Flags` with `FlagBits`. For example, a flag value of type `VkColorComponentFlags` **must** contain only bit flags defined by `VkColorComponentFlagBits`.

Any `Vk*Flags` member or parameter returned from a query command or otherwise output from Vulkan to the application **may** contain bit flags undefined in its corresponding `Vk*FlagBits` type. An application **cannot** rely on the state of these unspecified bits.

Only the low-order 31 bits (bit positions zero through 30) are available for use as flag bits.

**Note**

This restriction is due to poorly defined behavior by C compilers given a C enumerant value of `0x80000000`. In some cases adding this enumerant value may increase the size of the underlying `Vk*FlagBits` type, breaking the ABI.

A collection of 64-bit flags is represented by a bitmask using the type `VkFlags64`:

```c
// Provided by VK_VERSION_1_3, VK_KHR_synchronization2
typedef uint64_t VkFlags64;
```

When the 31 bits available in `VkFlags` are insufficient, the `VkFlags64` type can be passed to
commands and structures to represent up to 64 options. VkFlags64 is not used directly in the API. Instead, a Vk*Flags2 type which is an alias of VkFlags64, and whose name matches the corresponding VkFlagBits2 that are valid for that type, is used.

Any Vk*Flags2 member or parameter used in the API as an input must be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.

An individual bit flag is valid for a Vk*Flags2 type if it would be a valid enumerant when used with the equivalent Vk*FlagBits2 type, where the bits type is obtained by taking the flag type and replacing the trailing Flags2 with FlagBits2. For example, a flag value of type VkAccessFlags2KHR must contain only bit flags defined by VkAccessFlagBits2KHR.

Any Vk*Flags2 member or parameter returned from a query command or otherwise output from Vulkan to the application may contain bit flags undefined in its corresponding Vk*FlagBits2 type. An application cannot rely on the state of these unspecified bits.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Both the Vk<em>FlagBits2 type, and the individual bits defined for that type, are defined as uint64_t integers in the C API. This is in contrast to the 32-bit types, where the Vk</em>FlagBits type is defined as a C enum and the individual bits as enumerants belonging to that enum. As a result, there is less compile time type checking possible for the 64-bit types. This is unavoidable since there is no sufficiently portable way to define a 64-bit enum type in C99.</td>
</tr>
</tbody>
</table>

**Valid Usage for Structure Types**

Any parameter that is a structure containing a sType member must have a value of sType which is a valid VkStructureType value matching the type of the structure.

**Valid Usage for Structure Pointer Chains**

Any parameter that is a structure containing a void* pNext member must have a value of pNext that is either NULL, or is a pointer to a valid extending structure, containing sType and pNext members as described in the Vulkan Documentation and Extensions document in the section “Extending Structures”. The set of structures connected by pNext pointers is referred to as a pNext chain.

Each structure included in the pNext chain must be defined at runtime by either:

- a core version which is supported
- an extension which is enabled
- a supported device extension in the case of physical-device-level functionality added by the device extension

Each type of extending structure must not appear more than once in a pNext chain, including any aliases. This general rule may be explicitly overridden for specific structures.

Any component of the implementation (the loader, any enabled layers, and drivers) must skip over, without processing (other than reading the sType and pNext members) any extending structures in the chain not defined by core versions or extensions supported by that component.
As a convenience to implementations and layers needing to iterate through a structure pointer chain, the Vulkan API provides two base structures. These structures allow for some type safety, and can be used by Vulkan API functions that operate on generic inputs and outputs.

The \texttt{VkBaseInStructure} structure is defined as:

\begin{verbatim}
// Provided by VK_VERSION_1_0
typedef struct VkBaseInStructure {
    VkStructureType sType;
    const struct VkBaseInStructure* pNext;
} VkBaseInStructure;
\end{verbatim}

- \texttt{sType} is the structure type of the structure being iterated through.
- \texttt{pNext} is NULL or a pointer to the next structure in a structure chain.

\texttt{VkBaseInStructure} can be used to facilitate iterating through a read-only structure pointer chain.

The \texttt{VkBaseOutStructure} structure is defined as:

\begin{verbatim}
// Provided by VK_VERSION_1_0
typedef struct VkBaseOutStructure {
    VkStructureType sType;
    struct VkBaseOutStructure* pNext;
} VkBaseOutStructure;
\end{verbatim}

- \texttt{sType} is the structure type of the structure being iterated through.
- \texttt{pNext} is NULL or a pointer to the next structure in a structure chain.

\texttt{VkBaseOutStructure} can be used to facilitate iterating through a structure pointer chain that returns data back to the application.

**Valid Usage for Nested Structures**

The above conditions also apply recursively to members of structures provided as input to a command, either as a direct argument to the command, or themselves a member of another structure.

Specifics on valid usage of each command are covered in their individual sections.

**Valid Usage for Extensions**

Instance-level functionality or behavior added by an instance extension to the API must not be used unless that extension is supported by the instance as determined by \texttt{vkEnumerateInstanceExtensionProperties}, and that extension is enabled in \texttt{VkInstanceCreateInfo}.

Physical-device-level functionality or behavior added by an instance extension to the API must not be used unless that extension is supported by the instance as determined by \texttt{vkEnumerateInstanceExtensionProperties}, and that extension is enabled in \texttt{VkInstanceCreateInfo}.
Physical-device-level functionality or behavior added by a device extension to the API must not be used unless the conditions described in Extending Physical Device Core Functionality are met.

Device-level functionality added by a device extension that is dispatched from a VkDevice, or from a child object of a VkDevice must not be used unless that extension is supported by the device as determined by vkEnumerateDeviceExtensionProperties, and that extension is enabled in VkDeviceCreateInfo.

Valid Usage for Newer Core Versions

Instance-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the instance as determined by vkEnumerateInstanceVersion and the specified version of VkApplicationInfo::apiVersion.

Physical-device-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the physical device as determined by VkPhysicalDeviceProperties::apiVersion and the specified version of VkApplicationInfo::apiVersion.

Device-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the device as determined by VkPhysicalDeviceProperties::apiVersion and the specified version of VkApplicationInfo::apiVersion.

3.8. VkResult Return Codes

While the core Vulkan API is not designed to capture incorrect usage, some circumstances still require return codes. Commands in Vulkan return their status via return codes that are in one of two categories:

- Successful completion codes are returned when a command needs to communicate success or status information. All successful completion codes are non-negative values.
- Run time error codes are returned when a command needs to communicate a failure that could only be detected at runtime. All runtime error codes are negative values.

All return codes in Vulkan are reported via VkResult return values. The possible codes are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkResult {
    VK_SUCCESS = 0,
    VK_NOT_READY = 1,
    VK_TIMEOUT = 2,
    VK_EVENT_SET = 3,
    VK_EVENT_RESET = 4,
    VK_INCOMPLETE = 5,
    VK_ERROR_OUT_OF_HOST_MEMORY = -1,
    VK_ERROR_OUT_OFDEVICE_MEMORY = -2,
    VK_ERROR_INITIALIZATION_FAILED = -3,
    VK_ERROR_DEVICE_LOST = -4,
    VK_ERROR_MEMORY_MAP_FAILED = -5,
    VK_ERROR_LAYER_NOT_PRESENT = -6,
} VkResult;
```
VK_ERROR_EXTENSION_NOT_PRESENT = -7,
VK_ERROR_FEATURE_NOT_PRESENT = -8,
VK_ERROR_INCOMPATIBLE_DRIVER = -9,
VK_ERROR_TOO_MANY_OBJECTS = -10,
VK_ERROR_FORMAT_NOT_SUPPORTED = -11,
VK_ERROR_FRAGMENTED_POOL = -12,
VK_ERROR_UNKNOWN = -13,
  // Provided by VK_VERSION_1_1
VK_ERROR_OUT_OF_POOL_MEMORY = -1000069000,
  // Provided by VK_VERSION_1_1
VK_ERROR_INVALID_EXTERNAL_HANDLE = -1000072003,
  // Provided by VK_VERSION_1_2
VK_ERROR_FRAGMENTATION = -1000161000,
  // Provided by VK_VERSION_1_2
VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS = -1000257000,
  // Provided by VK_VERSION_1_3
VK_PIPELINE_COMPILE_REQUIRED = 1000297000,
  // Provided by VK_KHR_surface
VK_ERROR_SURFACE_LOST_KHR = -1000000000,
  // Provided by VK_KHR_surface
VK_ERROR_NATIVE_WINDOW_IN_USE_KHR = -1000000001,
  // Provided by VK_KHR_swapchain
VK_SUBOPTIMAL_KHR = 1000001003,
  // Provided by VK_KHR_swapchain
VK_ERROR_OUT_OF_DATE_KHR = -1000001004,
  // Provided by VK_KHR_display_swapchain
VK_ERROR_INCOMPATIBLE_DISPLAY_KHR = -1000003001,
  // Provided by VK_EXT_debug_report
VK_ERROR_VALIDATION_FAILED_EXT = -1000011001,
  // Provided by VK_NV_glsl_shader
VK_ERROR_INVALID_SHADER_NV = -1000012000,
  // Provided by VK_KHR_video_queue
VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR = -1000023000,
  // Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR = -1000023001,
  // Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR = -1000023002,
  // Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR = -1000023003,
  // Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR = -1000023004,
  // Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR = -1000023005,
  // Provided by VK_EXT_image_drm_format_modifier
VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT = -1000158000,
  // Provided by VK_KHR_global_priority
VK_ERROR_NOT_PERMITTED_KHR = -1000174001,
  // Provided by VK_EXT_full_screen_exclusive
VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT = -1000255000,
  // Provided by VK_KHR_deferred_host_operations
VK_THREAD_IDLE_KHR = 1000268000,
// Provided by VK_KHR_deferred_host_operations
VK_THREAD_DONE_KHR = 1000268001,
// Provided by VK_KHR_deferred_host_operations
VK_OPERATION_DEFERRED_KHR = 1000268002,
// Provided by VK_KHR_deferred_host_operations
VK_OPERATION_NOT_DEFERRED_KHR = 1000268003,
#endif
// Provided by VK_KHR_video_encode_queue
VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR = -1000299000,
// Provided by VK_KHR_image_compression_control
VK_ERROR_COMPRESSION_EXHAUSTED_EXT = -1000338000,
// Provided by VK_KHR_shader_object
VK_ERROR_INCOMPATIBLE_SHADER_BINARY_EXT = 1000482000,
// Provided by VK_KHR_maintenance1
VK_ERROR_OUT_OF_POOL_MEMORY_KHR = VK_ERROR_OUT_OF_POOL_MEMORY,
// Provided by VK_KHR_external_memory
VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR = VK_ERROR_INVALID_EXTERNAL_HANDLE,
// Provided by VK_EXT_descriptor_indexing
VK_ERROR_FRAGMENTATION_EXT = VK_ERROR_FRAGMENTATION,
// Provided by VK_KHR_global_priority
VK_ERROR_NOT_PERMITTED_EXT = VK_ERROR_NOT_PERMITTED_KHR,
// Provided by VK_KHR_buffer_device_address
VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR = VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS,
// Provided by VK_KHR_buffer_device_address
VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR = VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS,
// Provided by VK_KHR_pipeline_creation_cache_control
VK_PIPELINE_COMPILE_REQUIRED_EXT = VK_PIPELINE_COMPILE_REQUIRED,
// Provided by VK_KHR_buffer_device_address
VK_ERROR_PIPELINE_COMPILE_REQUIRED_EXT = VK_PIPELINE_COMPILE_REQUIRED,
} VkResult;

Success Codes

- **VK_SUCCESS** Command successfully completed
- **VK_NOT_READY** A fence or query has not yet completed
- **VK_TIMEOUT** A wait operation has not completed in the specified time
- **VK_EVENT_SET** An event is signaled
- **VK_EVENT_RESET** An event is unsignaled
- **VK_INCOMPLETE** A return array was too small for the result
- **VK_SUBOPTIMAL_KHR** A swapchain no longer matches the surface properties exactly, but can still be used to present to the surface successfully.
- **VK_THREAD_IDLE_KHR** A deferred operation is not complete but there is currently no work for this thread to do at the time of this call.
- **VK_THREAD_DONE_KHR** A deferred operation is not complete but there is no work remaining to assign to additional threads.
• **VK_OPERATION_DEFERRED_KHR** A deferred operation was requested and at least some of the work was deferred.

• **VK_OPERATION_NOT_DEFERRED_KHR** A deferred operation was requested and no operations were deferred.

• **VK_PIPELINE_COMPILE_REQUIRED** A requested pipeline creation would have required compilation, but the application requested compilation to not be performed.

**Error codes**

• **VK_ERROR_OUT_OF_HOST_MEMORY** A host memory allocation has failed.

• **VK_ERROR_OUT_OF_DEVICE_MEMORY** A device memory allocation has failed.

• **VK_ERROR_INITIALIZATION_FAILED** Initialization of an object could not be completed for implementation-specific reasons.

• **VK_ERROR_DEVICE_LOST** The logical or physical device has been lost. See Lost Device

• **VK_ERROR_MEMORY_MAP_FAILED** Mapping of a memory object has failed.

• **VK_ERROR_LAYER_NOT_PRESENT** A requested layer is not present or could not be loaded.

• **VK_ERROR_EXTENSION_NOT_PRESENT** A requested extension is not supported.

• **VK_ERROR_FEATURE_NOT_PRESENT** A requested feature is not supported.

• **VK_ERROR_INCOMPATIBLE_DRIVER** The requested version of Vulkan is not supported by the driver or is otherwise incompatible for implementation-specific reasons.

• **VK_ERROR_TOO_MANY_OBJECTS** Too many objects of the type have already been created.

• **VK_ERROR_FORMAT_NOT_SUPPORTED** A requested format is not supported on this device.

• **VK_ERROR_FRAGMENTED_POOL** A pool allocation has failed due to fragmentation of the pool’s memory. This **must** only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. This **should** be returned in preference to **VK_ERROR_OUT_OF_POOL_MEMORY**, but only if the implementation is certain that the pool allocation failure was due to fragmentation.

• **VK_ERROR_SURFACE_LOST_KHR** A surface is no longer available.

• **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** The requested window is already in use by Vulkan or another API in a manner which prevents it from being used again.

• **VK_ERROR_OUT_OF_DATE_KHR** A surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications **must** query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.

• **VK_ERROR_INCOMPATIBLE_DISPLAY_KHR** The display used by a swapchain does not use the same presentable image layout, or is incompatible in a way that prevents sharing an image.

• **VK_ERROR_INVALID_SHADER_NV** One or more shaders failed to compile or link. More details are reported back to the application via **VK_EXT_DEBUG_REPORT** if enabled.

• **VK_ERROR_OUT_OF_POOL_MEMORY** A pool memory allocation has failed. This **must** only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. If the failure was definitely due to fragmentation of the pool, **VK_ERROR_FRAGMENTED_POOL** **should** be
• VK_ERROR_INVALID_EXTERNAL_HANDLE An external handle is not a valid handle of the specified type.
• VK_ERROR_FRAGMENTATION A descriptor pool creation has failed due to fragmentation.
• VK_ERROR_INVALID_DEVICE_ADDRESS_EXT A buffer creation failed because the requested address is not available.
• VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS A buffer creation or memory allocation failed because the requested address is not available. A shader group handle assignment failed because the requested shader group handle information is no longer valid.
• VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT An operation on a swapchain created with VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT failed as it did not have exclusive full-screen access. This may occur due to implementation-dependent reasons, outside of the application’s control.
• VK_ERROR_VALIDATION_FAILED_EXT A command failed because invalid usage was detected by the implementation or a validation-layer.
• VK_ERROR_COMPRESSION_EXHAUSTED_EXT An image creation failed because internal resources required for compression are exhausted. This must only be returned when fixed-rate compression is requested.
• VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR The requested VkImageUsageFlags are not supported.
• VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR The requested video picture layout is not supported.
• VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR A video profile operation specified via VkVideoProfileInfoKHR::videoCodecOperation is not supported.
• VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR Format parameters in a requested VkVideoProfileInfoKHR chain are not supported.
• VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR Codec-specific parameters in a requested VkVideoProfileInfoKHR chain are not supported.
• VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR The specified video Std header version is not supported.
• VK_ERROR_VIDEO_STD_PARAMETERS_KHR The specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.
• VK_ERROR_INCOMPATIBLE_SHADER_BINARY_EXT The provided binary shader code is not compatible with this device.
• VK_ERROR_UNKNOWN An unknown error has occurred; either the application has provided invalid input, or an implementation failure has occurred.

If a command returns a runtime error, unless otherwise specified any output parameters will have undefined contents, except that if the output parameter is a structure with sType and pNext fields, those fields will be unmodified. Any structures chained from pNext will also have undefined contents, except that sType and pNext will be unmodified.
**Note**

As a general rule, Free, Release, and Reset commands do not return VK_ERROR_OUT_OF_HOST_MEMORY, while any other command with a return code may return it. Any exceptions from this rule are described for those commands.

**Note**

VK_ERROR_UNKNOWN is not expected to ever be returned if the application behavior is valid, and if the implementation is bug-free. If VK_ERROR_UNKNOWN is received, the application should be checked against the latest validation layers to verify correct behavior as much as possible. If no issues are identified it could be an implementation issue, and the implementor should be contacted for support.

Any command returning a VkResult may return VK_ERROR_VALIDATION_FAILED_EXT if a violation of valid usage is detected, even though commands do not explicitly list this as a possible return code.

Performance-critical commands generally do not have return codes. If a runtime error occurs in such commands, the implementation will defer reporting the error until a specified point. For commands that record into command buffers (vkCmd*) runtime errors are reported by vkEndCommandBuffer.

### 3.9. Numeric Representation and Computation

Implementations normally perform computations in floating-point, and must meet the range and precision requirements defined under “Floating-Point Computation” below.

These requirements only apply to computations performed in Vulkan operations outside of shader execution, such as texture image specification and sampling, and per-fragment operations. Range and precision requirements during shader execution differ and are specified by the Precision and Operation of SPIR-V Instructions section.

In some cases, the representation and/or precision of operations is implicitly limited by the specified format of vertex or texel data consumed by Vulkan. Specific floating-point formats are described later in this section.

#### 3.9.1. Floating-Point Computation

Most floating-point computation is performed in SPIR-V shader modules. The properties of computation within shaders are constrained as defined by the Precision and Operation of SPIR-V Instructions section.

Some floating-point computation is performed outside of shaders, such as viewport and depth...
range calculations. For these computations, we do not specify how floating-point numbers are to be represented, or the details of how operations on them are performed, but only place minimal requirements on representation and precision as described in the remainder of this section.

We require simply that numbers’ floating-point parts contain enough bits and that their exponent fields are large enough so that individual results of floating-point operations are accurate to about 1 part in $10^5$. The maximum representable magnitude for all floating-point values must be at least $2^{32}$.

$$x \times 0 = 0 \times x = 0$$
for any non-infinite and non-NaN $x$.

$$1 \times x = x \times 1 = x.$$  

$$x + 0 = 0 + x = x.$$  

$$0^0 = 1.$$  

Occasionally, further requirements will be specified. Most single-precision floating-point formats meet these requirements.

The special values Inf and -Inf encode values with magnitudes too large to be represented; the special value NaN encodes “Not A Number” values resulting from undefined arithmetic operations such as $0 / 0$. Implementations may support Inf and NaN in their floating-point computations. Any computation which does not support either Inf or NaN, for which that value is an input or output will yield an undefined value.

### 3.9.2. Floating-Point Format Conversions

When a value is converted to a defined floating-point representation, finite values falling between two representable finite values are rounded to one or the other. The rounding mode is not defined. Finite values whose magnitude is larger than that of any representable finite value may be rounded either to the closest representable finite value or to the appropriately signed infinity. For unsigned destination formats any negative values are converted to zero. Positive infinity is converted to positive infinity; negative infinity is converted to negative infinity in signed formats and to zero in unsigned formats; and any NaN is converted to a NaN.

### 3.9.3. 16-Bit Floating-Point Numbers

16-bit floating point numbers are defined in the “16-bit floating point numbers” section of the Khronos Data Format Specification.

### 3.9.4. Unsigned 11-Bit Floating-Point Numbers

Unsigned 11-bit floating point numbers are defined in the “Unsigned 11-bit floating point numbers” section of the Khronos Data Format Specification.
3.9.5. Unsigned 10-Bit Floating-Point Numbers

Unsigned 10-bit floating point numbers are defined in the “Unsigned 10-bit floating point numbers” section of the Khronos Data Format Specification.

3.9.6. General Requirements

Any representable floating-point value in the appropriate format is legal as input to a Vulkan command that requires floating-point data. The result of providing a value that is not a floating-point number to such a command is unspecified, but must not lead to Vulkan interruption or termination. For example, providing a negative zero (where applicable) or a denormalized number to a Vulkan command must yield deterministic results, while providing a NaN or Inf yields unspecified results.

Some calculations require division. In such cases (including implied divisions performed by vector normalization), division by zero produces an unspecified result but must not lead to Vulkan interruption or termination.

3.10. Fixed-Point Data Conversions

When generic vertex attributes and pixel color or depth components are represented as integers, they are often (but not always) considered to be normalized. Normalized integer values are treated specially when being converted to and from floating-point values, and are usually referred to as normalized fixed-point.

In the remainder of this section, b denotes the bit width of the fixed-point integer representation. When the integer is one of the types defined by the API, b is the bit width of that type. When the integer comes from an image containing color or depth component texels, b is the number of bits allocated to that component in its specified image format.

The signed and unsigned fixed-point representations are assumed to be b-bit binary two’s-complement integers and binary unsigned integers, respectively.

3.10.1. Conversion from Normalized Fixed-Point to Floating-Point

Unsigned normalized fixed-point integers represent numbers in the range [0,1). The conversion from an unsigned normalized fixed-point value c to the corresponding floating-point value f is defined as

\[ f = \frac{c}{2^b - 1} \]

Signed normalized fixed-point integers represent numbers in the range [-1,1]. The conversion from a signed normalized fixed-point value c to the corresponding floating-point value f is performed using

\[ f = \max\left(\frac{c}{2^b - 1} - 1.0, -1.0\right) \]

Only the range \([-2^{b-1} + 1, 2^{b-1} - 1]\) is used to represent signed fixed-point values in the range [-1,1]. For
example, if \( b = 8 \), then the integer value -127 corresponds to -1.0 and the value 127 corresponds to 1.0. This equation is used everywhere that signed normalized fixed-point values are converted to floating-point.

Note that while zero is exactly expressible in this representation, one value (-128 in the example) is outside the representable range, and implementations must clamp it to -1.0. Where the value is subject to further processing by the implementation, e.g., during texture filtering, values less than -1.0 may be used but the result must be clamped before the value is returned to shaders.

### 3.10.2. Conversion from Floating-Point to Normalized Fixed-Point

The conversion from a floating-point value \( f \) to the corresponding unsigned normalized fixed-point value \( c \) is defined by first clamping \( f \) to the range \([0,1]\), then computing

\[
c = \text{convertFloatToUint}(f \times (2^b - 1), b)
\]

where \text{convertFloatToUint}(r,b) returns one of the two unsigned binary integer values with exactly \( b \) bits which are closest to the floating-point value \( r \). Implementations should round to nearest. If \( r \) is equal to an integer, then that integer value must be returned. In particular, if \( f \) is equal to 0.0 or 1.0, then \( c \) must be assigned 0 or \( 2^b - 1 \), respectively.

The conversion from a floating-point value \( f \) to the corresponding signed normalized fixed-point value \( c \) is performed by clamping \( f \) to the range \([-1,1]\), then computing

\[
c = \text{convertFloatToInt}(f \times (2^{b-1} - 1), b)
\]

where \text{convertFloatToInt}(r,b) returns one of the two signed two's-complement binary integer values with exactly \( b \) bits which are closest to the floating-point value \( r \). Implementations should round to nearest. If \( r \) is equal to an integer, then that integer value must be returned. In particular, if \( f \) is equal to -1.0, 0.0, or 1.0, then \( c \) must be assigned \(-(2^{b-1} - 1)\), 0, or \( 2^{b-1} - 1 \), respectively.

This equation is used everywhere that floating-point values are converted to signed normalized fixed-point.

### 3.11. Common Object Types

Some types of Vulkan objects are used in many different structures and command parameters, and are described here. These types include offsets, extents, and rectangles.

#### 3.11.1. Offsets

Offsets are used to describe a pixel location within an image or framebuffer, as an \((x,y)\) location for two-dimensional images, or an \((x,y,z)\) location for three-dimensional images.

A two-dimensional offset is defined by the structure:

```c
// Provided by VK_VERSION_1_0
```
typedef struct VkOffset2D {
    int32_t x;
    int32_t y;
} VkOffset2D;

• x is the x offset.
• y is the y offset.

A three-dimensional offset is defined by the structure:

// Provided by VK_VERSION_1_0
typedef struct VkOffset3D {
    int32_t x;
    int32_t y;
    int32_t z;
} VkOffset3D;

• x is the x offset.
• y is the y offset.
• z is the z offset.

3.11.2. Extents

Extents are used to describe the size of a rectangular region of pixels within an image or framebuffer, as (width,height) for two-dimensional images, or as (width,height,depth) for three-dimensional images.

A two-dimensional extent is defined by the structure:

// Provided by VK_VERSION_1_0
typedef struct VkExtent2D {
    uint32_t width;
    uint32_t height;
} VkExtent2D;

• width is the width of the extent.
• height is the height of the extent.

A three-dimensional extent is defined by the structure:

// Provided by VK_VERSION_1_0
typedef struct VkExtent3D {
    uint32_t width;
    uint32_t height;
    uint32_t depth;
} VkExtent3D;
• width is the width of the extent.
• height is the height of the extent.
• depth is the depth of the extent.

3.11.3. Rectangles

Rectangles are used to describe a specified rectangular region of pixels within an image or framebuffer. Rectangles include both an offset and an extent of the same dimensionality, as described above. Two-dimensional rectangles are defined by the structure

```c
// Provided by VK_VERSION_1_0
typedef struct VkRect2D {
    VkOffset2D offset;
    VkExtent2D extent;
} VkRect2D;
```

• offset is a VkOffset2D specifying the rectangle offset.
• extent is a VkExtent2D specifying the rectangle extent.

3.11.4. Structure Types

Each value corresponds to a particular structure with a sType member with a matching name. As a general rule, the name of each VkStructureType value is obtained by taking the name of the structure, stripping the leading Vk, prefixing each capital letter with _, converting the entire resulting string to upper case, and prefixing it with VK_STRUCTURE_TYPE_. For example, structures of type VkImageCreateInfo correspond to a VkStructureType value of VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO, and thus a structure of this type must have its sType member set to this value before it is passed to the API.

The values VK_STRUCTURE_TYPE_LOADER_INSTANCE_CREATE_INFO and VK_STRUCTURE_TYPE_LOADER_DEVICE_CREATE_INFO are reserved for internal use by the loader, and do not have corresponding Vulkan structures in this Specification.

Structure types supported by the Vulkan API include:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStructureType {
    VK_STRUCTURE_TYPE_APPLICATION_INFO = 0,
    VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO = 1,
    VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO = 2,
    VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO = 3,
    VK_STRUCTURE_TYPE_SUBMIT_INFO = 4,
    VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO = 5,
    VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE = 6,
};
```

3.12. API Name Aliases

A small number of APIs did not follow the naming conventions when initially defined. For consistency, when we discover an API name that violates the naming conventions, we rename it in the Specification, XML, and header files. For backwards compatibility, the original (incorrect) name is retained as a “typo alias”. The alias is deprecated and should not be used, but will be retained indefinitely.

Note

VK_STENCIL_FRONT_AND_BACK is an example of a typo alias. It was initially defined as part of VkStencilFaceFlagBits. Once the naming inconsistency was noticed, it was renamed to VK_STENCIL_FACE_FRONT_AND_BACK, and the old name was aliased to the correct name.
Chapter 4. Initialization

Before using Vulkan, an application must initialize it by loading the Vulkan commands, and creating a VkInstance object.

4.1. Command Function Pointers

Vulkan commands are not necessarily exposed by static linking on a platform. Commands to query function pointers for Vulkan commands are described below.

Note

When extensions are promoted or otherwise incorporated into another extension or Vulkan core version, command aliases may be included. Whilst the behavior of each command alias is identical, the behavior of retrieving each alias's function pointer is not. A function pointer for a given alias can only be retrieved if the extension or version that introduced that alias is supported and enabled, irrespective of whether any other alias is available.

Function pointers for all Vulkan commands can be obtained with the command:

```c
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetInstanceProcAddr(
    VkInstance instance,
    const char* pName);
```

- `instance` is the instance that the function pointer will be compatible with, or NULL for commands not dependent on any instance.
- `pName` is the name of the command to obtain.

`vkGetInstanceProcAddr` itself is obtained in a platform- and loader- specific manner. Typically, the loader library will export this command as a function symbol, so applications can link against the loader library, or load it dynamically and look up the symbol using platform-specific APIs.

The table below defines the various use cases for `vkGetInstanceProcAddr` and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) must not be NULL.

The returned function pointer is of type `PFN_vkVoidFunction`, and must be cast to the type of the command being queried before use.

<table>
<thead>
<tr>
<th><code>instance</code></th>
<th><code>pName</code></th>
<th><code>return value</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>*¹</td>
<td>NULL</td>
<td>undefined</td>
</tr>
<tr>
<td>invalid non-NULL instance</td>
<td>*¹</td>
<td>undefined</td>
</tr>
<tr>
<td>NULL</td>
<td><code>global command</code>²</td>
<td>fp</td>
</tr>
</tbody>
</table>
### Table 1. Function Pointer Return Values

<table>
<thead>
<tr>
<th>instance</th>
<th>pName</th>
<th>return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>vkGetInstanceProcAddr</td>
<td>fp&lt;sup&gt;5&lt;/sup&gt;</td>
</tr>
<tr>
<td>instance</td>
<td>vkGetInstanceProcAddr</td>
<td>fp</td>
</tr>
<tr>
<td>instance</td>
<td>core dispatchable command</td>
<td>fp&lt;sup&gt;3&lt;/sup&gt;</td>
</tr>
<tr>
<td>instance</td>
<td>enabled instance extension dispatchable command for instance</td>
<td>fp&lt;sup&gt;3&lt;/sup&gt;</td>
</tr>
<tr>
<td>instance</td>
<td>available device extension&lt;sup&gt;4&lt;/sup&gt; dispatchable command for instance</td>
<td>fp&lt;sup&gt;3&lt;/sup&gt;</td>
</tr>
<tr>
<td>any other case, not covered above</td>
<td>NULL</td>
<td>NULL</td>
</tr>
</tbody>
</table>

1

"*" means any representable value for the parameter (including valid values, invalid values, and NULL).

2

The global commands are: vkEnumerateInstanceVersion, vkEnumerateInstanceExtensionProperties, vkEnumerateInstanceLayerProperties, and vkCreateInstance. Dispatchable commands are all other commands which are not global.

3

The returned function pointer **must** only be called with a dispatchable object (the first parameter) that is instance or a child of instance, e.g. VkInstance, VkPhysicalDevice, VkDevice, VkQueue, or VkCommandBuffer.

4

An “available device extension” is a device extension supported by any physical device enumerated by instance.

5

Starting with Vulkan 1.2, vkGetInstanceProcAddr can resolve itself with a NULL instance pointer.

#### Valid Usage (Implicit)

- VUID-vkGetInstanceProcAddr-instance-parameter
  
  If instance is not NULL, instance **must** be a valid VkInstance handle

- VUID-vkGetInstanceProcAddr-pName-parameter
  
  pName **must** be a null-terminated UTF-8 string

In order to support systems with multiple Vulkan implementations, the function pointers returned by vkGetInstanceProcAddr **may** point to dispatch code that calls a different real implementation for different VkDevice objects or their child objects. The overhead of the internal dispatch for VkDevice
objects can be avoided by obtaining device-specific function pointers for any commands that use a device or device-child object as their dispatchable object. Such function pointers can be obtained with the command:

```c
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetDeviceProcAddr(
    VkDevice device,
    const char* pName);
```

The table below defines the various use cases for `vkGetDeviceProcAddr` and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) must not be `NULL`.

The returned function pointer is of type `PFN_vkVoidFunction`, and must be cast to the type of the command being queried before use. The function pointer must only be called with a dispatchable object (the first parameter) that is `device` or a child of `device`.

### Table 2. `vkGetDeviceProcAddr` behavior

<table>
<thead>
<tr>
<th>device</th>
<th>pName</th>
<th>return value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>NULL</code></td>
<td>*¹</td>
<td>undefined</td>
</tr>
<tr>
<td>invalid device</td>
<td>*¹</td>
<td>undefined</td>
</tr>
<tr>
<td>device</td>
<td><code>NULL</code></td>
<td>undefined</td>
</tr>
<tr>
<td>device</td>
<td>requested core version²</td>
<td><code>fp</code>³</td>
</tr>
<tr>
<td></td>
<td>device-level dispatchable</td>
<td></td>
</tr>
<tr>
<td></td>
<td>command³</td>
<td></td>
</tr>
<tr>
<td>device</td>
<td>enabled extension</td>
<td><code>fp</code>⁴</td>
</tr>
<tr>
<td></td>
<td>device-level dispatchable</td>
<td></td>
</tr>
<tr>
<td></td>
<td>command³</td>
<td></td>
</tr>
<tr>
<td>any other case, not covered above</td>
<td></td>
<td><code>NULL</code></td>
</tr>
</tbody>
</table>

1  
“*” means any representable value for the parameter (including valid values, invalid values, and `NULL`).

2  
Device-level commands which are part of the core version specified by `VkApplicationInfo::apiVersion` when creating the instance will always return a valid function pointer. If the `maintenance5` feature is enabled, core commands beyond that version which are supported by the implementation will return `NULL`, otherwise the implementation may either return `NULL` or a function pointer. If a function pointer is returned, it must not be called.

3  
In this function, device-level excludes all physical-device-level commands.

4  
The returned function pointer must only be called with a dispatchable object (the first
parameter) that is device or a child of device e.g. VkDevice, VkQueue, or VkCommandBuffer.

<table>
<thead>
<tr>
<th>Valid Usage (Implicit)</th>
</tr>
</thead>
<tbody>
<tr>
<td>• VUID-vkGetDeviceProcAddr-device-parameter</td>
</tr>
<tr>
<td>device must be a valid VkDevice handle</td>
</tr>
<tr>
<td>• VUID-vkGetDeviceProcAddr-pName-parameter</td>
</tr>
<tr>
<td>pName must be a null-terminated UTF-8 string</td>
</tr>
</tbody>
</table>

The definition ofPFN_vkVoidFunctionis:

```c
// Provided by VK_VERSION_1_0
typedef void (VKAPI_PTR *PFN_vkVoidFunction)(void);
```

This type is returned from command function pointer queries, and must be cast to an actual command function pointer before use.

### 4.1.1. Extending Physical Device Core Functionality

New core physical-device-level functionality can be used when the physical-device version is greater than or equal to the version of Vulkan that added the new functionality. The Vulkan version supported by a physical device can be obtained by calling vkGetPhysicalDeviceProperties.

### 4.1.2. Extending Physical Device From Device Extensions

When the VK_KHR_get_physical_device_properties2 extension is enabled, or when both the instance and the physical-device versions are at least 1.1, physical-device-level functionality of a device extension can be used with a physical device if the corresponding extension is enumerated by vkEnumerateDeviceExtensionProperties for that physical device, even before a logical device has been created.

To obtain a function pointer for a physical-device-level command from a device extension, an application can use vkGetInstanceProcAddr. This function pointer may point to dispatch code, which calls a different real implementation for different VkPhysicalDevice objects. Applications must not use a VkPhysicalDevice in any command added by an extension or core version that is not supported by that physical device.

Device extensions may define structures that can be added to the pNext chain of physical-device-level commands.

### 4.2. Instances

There is no global state in Vulkan and all per-application state is stored in a VkInstance object. Creating a VkInstance object initializes the Vulkan library and allows the application to pass information about itself to the implementation.
Instances are represented by VkInstance handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkInstance)
```

To query the version of instance-level functionality supported by the implementation, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkEnumerateInstanceVersion(
    uint32_t* pApiVersion);
```

- `pApiVersion` is a pointer to a `uint32_t`, which is the version of Vulkan supported by instance-level functionality, encoded as described in Version Numbers.

**Note**
The intended behaviour of `vkEnumerateInstanceVersion` is that an implementation **should** not need to perform memory allocations and **should** unconditionally return `VK_SUCCESS`. The loader, and any enabled layers, **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` in the case of a failed memory allocation.

### Valid Usage (Implicit)
- VUID-vkEnumerateInstanceVersion-pApiVersion-parameter `pApiVersion` must be a valid pointer to a `uint32_t` value

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`

To create an instance object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateInstance(
    const VkInstanceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkInstance* pInstance);
```

- `pCreateInfo` is a pointer to a `VkInstanceCreateInfo` structure controlling creation of the instance.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
• `pInstance` points a `VkInstance` handle in which the resulting instance is returned.

`vkCreateInstance` verifies that the requested layers exist. If not, `vkCreateInstance` will return `VK_ERROR_LAYER_NOT_PRESENT`. Next, `vkCreateInstance` verifies that the requested extensions are supported (e.g., in the implementation or in any enabled instance layer) and if any requested extension is not supported, `vkCreateInstance` must return `VK_ERROR_EXTENSION_NOT_PRESENT`. After verifying and enabling the instance layers and extensions, the `VkInstance` object is created and returned to the application. If a requested extension is only supported by a layer, both the layer and the extension need to be specified at `vkCreateInstance` time for the creation to succeed.

### Valid Usage

- VUID-vkCreateInstance-ppEnabledExtensionNames-01388
  All required extensions for each extension in the `VkInstanceCreateInfo::ppEnabledExtensionNames` list must also be present in that list

### Valid Usage (Implicit)

- VUID-vkCreateInstance-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkInstanceCreateInfo` structure
- VUID-vkCreateInstance-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateInstance-pInstance-parameter
  `pInstance` must be a valid pointer to a `VkInstance` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_LAYER_NOT_PRESENT`
- `VK_ERROR_EXTENSION_NOT_PRESENT`
- `VK_ERROR_INCOMPATIBLE_DRIVER`

The `VkInstanceCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
```
typedef struct VkInstanceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkInstanceCreateFlags flags;
    const VkApplicationInfo* pApplicationInfo;
    uint32_t enabledLayerCount;
    const char* const* ppEnabledLayerNames;
    uint32_t enabledExtensionCount;
    const char* const* ppEnabledExtensionNames;
} VkInstanceCreateInfo;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkInstanceCreateFlagBits` indicating the behavior of the instance.
- `pApplicationInfo` is `NULL` or a pointer to a `VkApplicationInfo` structure. If not `NULL`, this information helps implementations recognize behavior inherent to classes of applications. `VkApplicationInfo` is defined in detail below.
- `enabledLayerCount` is the number of global layers to enable.
- `ppEnabledLayerNames` is a pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings containing the names of layers to enable for the created instance. The layers are loaded in the order they are listed in this array, with the first array element being the closest to the application, and the last array element being the closest to the driver. See the Layers section for further details.
- `enabledExtensionCount` is the number of global extensions to enable.
- `ppEnabledExtensionNames` is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable.

To capture events that occur while creating or destroying an instance, an application can link a `VkDebugReportCallbackCreateInfoEXT` structure or a `VkDebugUtilsMessengerCreateInfoEXT` structure to the `pNext` element of the `VkInstanceCreateInfo` structure given to `vkCreateInstance`. This callback is only valid for the duration of the `vkCreateInstance` and the `vkDestroyInstance` call. Use `vkCreateDebugReportCallbackEXT` or `vkCreateDebugUtilsMessengerEXT` to create persistent callback objects.

An application can add additional drivers by including the `VkDirectDriverLoadingListLUNARG` struct to the `pNext` element of the `VkInstanceCreateInfo` structure given to `vkCreateInstance`.

**Note**

`VkDirectDriverLoadingListLUNARG` allows applications to ship drivers with themselves. Only drivers that are designed to work with it should be used, such as drivers that implement Vulkan in software or that implement Vulkan by translating it to a different API. Any driver that requires installation should not be used, such as hardware drivers.
Valid Usage

- VUID-VkInstanceCreateInfo-pNext-04925
  If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkDebugReportCallbackCreateInfoEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` must contain `VK_EXT_debug_report`

- VUID-VkInstanceCreateInfo-pNext-04926
  If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkDebugUtilsMessengerCreateInfoEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` must contain `VK_EXT_debug_utils`

- VUID-VkInstanceCreateInfo-pNext-06779
  If the `pNext` chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its `exportObjectType` member must be either `VK_EXPORT_METAL_OBJECT_TYPE_METAL_DEVICE_BIT_EXT` or `VK.Export.Metal.Object.Type.Metal.Command.Queue.Bit_EXT`

- VUID-VkInstanceCreateInfo-flags-06559
  If `flags` has the `VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR` bit set, the list of enabled extensions in `ppEnabledExtensionNames` must contain `VK_KHR_portability_enumeration`

- VUID-VkInstanceCreateInfo-pNext
  If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkDirectDriverLoadingListLUNARG` structure, the list of enabled extensions in `ppEnabledExtensionNames` must contain `VK_LUNARG_direct_driver_loading`

Valid Usage (Implicit)

- VUID-VkInstanceCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO`

- VUID-VkInstanceCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDebugReportCallbackCreateInfoEXT`, `VkDebugUtilsMessengerCreateInfoEXT`, `VkDirectDriverLoadingListLUNARG`, `VkExportMetalObjectCreateInfoEXT`, `VkValidationFeaturesEXT`, or `VkValidationFlagsEXT`

- VUID-VkInstanceCreateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkDebugUtilsMessengerCreateInfoEXT` or `VkExportMetalObjectCreateInfoEXT`

- VUID-VkInstanceCreateInfo-flags-parameter
  `flags` must be a valid combination of `VkInstanceCreateFlagBits` values

- VUID-VkInstanceCreateInfo-pApplicationInfo-parameter
  If `pApplicationInfo` is not `NULL`, `pApplicationInfo` must be a valid pointer to a valid `VkApplicationInfo` structure
• **VUID-VkInstanceCreateInfo-ppEnabledLayerNames-parameter**
  If `enabledLayerCount` is not 0, `ppEnabledLayerNames` must be a valid pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings.

• **VUID-VkInstanceCreateInfo-ppEnabledExtensionNames-parameter**
  If `enabledExtensionCount` is not 0, `ppEnabledExtensionNames` must be a valid pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings.

```c
// Provided by VK_VERSION_1_0
typedef enum VkInstanceCreateFlagBits {
    // Provided by VK_KHR_portability_enumeration
    VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR = 0x00000001,
} VkInstanceCreateFlagBits;
```

• **VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR** specifies that the instance will enumerate available Vulkan Portability-compliant physical devices and groups in addition to the Vulkan physical devices and groups that are enumerated by default.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkInstanceCreateFlags;
```

*VkInstanceCreateFlags* is a bitmask type for setting a mask of zero or more *VkInstanceCreateFlagBits*.

When creating a Vulkan instance for which you wish to disable validation checks, add a *VkValidationFlagsEXT* structure to the `pNext` chain of the *VkInstanceCreateInfo* structure, specifying the checks to be disabled.

```c
// Provided by VK_EXT_validation_flags
typedef struct VkValidationFlagsEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t disabledValidationCheckCount;
    const VkValidationCheckEXT* pDisabledValidationChecks;
} VkValidationFlagsEXT;
```

• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **disabledValidationCheckCount** is the number of checks to disable.

• **pDisabledValidationChecks** is a pointer to an array of *VkValidationCheckEXT* values specifying the validation checks to be disabled.
Valid Usage (Implicit)

• VUID-VkValidationFlagsEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VALIDATION_FLAGS_EXT

• VUID-VkValidationFlagsEXT-pDisabledValidationChecks-parameter
  pDisabledValidationChecks must be a valid pointer to an array of
disabledValidationCheckCount valid VkValidationCheckEXT values

• VUID-VkValidationFlagsEXT-disabledValidationCheckCount-arraylength
  disabledValidationCheckCount must be greater than 0

Possible values of elements of the VkValidationFlagsEXT::pDisabledValidationChecks array, specifying validation checks to be disabled, are:

```c
// Provided by VK_EXT_validation_flags
typedef enum VkValidationCheckEXT {
    VK_VALIDATION_CHECK_ALL_EXT = 0,
    VK_VALIDATION_CHECK_SHADERS_EXT = 1,
} VkValidationCheckEXT;
```

• VK_VALIDATION_CHECK_ALL_EXT specifies that all validation checks are disabled.
• VK_VALIDATION_CHECK_SHADERS_EXT specifies that shader validation is disabled.

When creating a Vulkan instance for which you wish to enable or disable specific validation features, add a VkValidationFeaturesEXT structure to the pNext chain of the VkInstanceCreateInfo structure, specifying the features to be enabled or disabled.

```c
// Provided by VK_EXT_validation_features
typedef struct VkValidationFeaturesEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t enabledValidationFeatureCount;
    const VkValidationFeatureEnableEXT* pEnabledValidationFeatures;
    uint32_t disabledValidationFeatureCount;
    const VkValidationFeatureDisableEXT* pDisabledValidationFeatures;
} VkValidationFeaturesEXT;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• enabledValidationFeatureCount is the number of features to enable.
• pEnabledValidationFeatures is a pointer to an array of VkValidationFeatureEnableEXT values specifying the validation features to be enabled.
• disabledValidationFeatureCount is the number of features to disable.
• pDisabledValidationFeatures is a pointer to an array of VkValidationFeatureDisableEXT values
specifying the validation features to be disabled.

Valid Usage

- VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-02967
  If the `pEnabledValidationFeatures` array contains `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT`, then it must also contain `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT`

- VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-02968
  If the `pEnabledValidationFeatures` array contains `VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT`, then it must not contain `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT`

Valid Usage (Implicit)

- VUID-VkValidationFeaturesEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VALIDATION_FEATURES_EXT`

- VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-parameter
  If `enabledValidationFeatureCount` is not 0, `pEnabledValidationFeatures` must be a valid pointer to an array of `enabledValidationFeatureCount` valid `VkValidationFeatureEnableEXT` values

- VUID-VkValidationFeaturesEXT-pDisabledValidationFeatures-parameter
  If `disabledValidationFeatureCount` is not 0, `pDisabledValidationFeatures` must be a valid pointer to an array of `disabledValidationFeatureCount` valid `VkValidationFeatureDisableEXT` values

Possible values of elements of the `VkValidationFeaturesEXT::pEnabledValidationFeatures` array, specifying validation features to be enabled, are:

```c
// Provided by VK_EXT_validation_features
typedef enum VkValidationFeatureEnableEXT {
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT = 0,
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT = 1,
    VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT = 2,
    VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT = 3,
    VK_VALIDATION_FEATURE_ENABLE_SYNCHRONIZATION_VALIDATION_EXT = 4,
} VkValidationFeatureEnableEXT;
```

- `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT` specifies that GPU-assisted validation is enabled. Activating this feature instruments shader programs to generate additional diagnostic data. This feature is disabled by default.

- `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT` specifies that the validation layers reserve a descriptor set binding slot for their own use. The layer reports a value for `VkPhysicalDeviceLimits::maxBoundDescriptorSets` that is one less than the value
reported by the device. If the device supports the binding of only one descriptor set, the validation layer does not perform GPU-assisted validation. This feature is disabled by default.

• **VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT** specifies that Vulkan best-practices validation is enabled. Activating this feature enables the output of warnings related to common misuse of the API, but which are not explicitly prohibited by the specification. This feature is disabled by default.

• **VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT** specifies that the layers will process `debugPrintfEXT` operations in shaders and send the resulting output to the debug callback. This feature is disabled by default.

• **VK_VALIDATION_FEATURE_ENABLE_SYNCHRONIZATION_VALIDATION_EXT** specifies that Vulkan synchronization validation is enabled. This feature reports resource access conflicts due to missing or incorrect synchronization operations between actions (Draw, Copy, Dispatch, Blit) reading or writing the same regions of memory. This feature is disabled by default.

Possible values of elements of the `VkValidationFeaturesEXT::pDisabledValidationFeatures` array, specifying validation features to be disabled, are:

```c
// Provided by VK_EXT_validation_features
typedef enum VkValidationFeatureDisableEXT {
    VK_VALIDATION_FEATURE_DISABLE_ALL_EXT = 0,
    VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT = 1,
    VK_VALIDATION_FEATURE_DISABLE_THREAD_SAFETY_EXT = 2,
    VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT = 3,
    VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT = 4,
    VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT = 5,
    VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT = 6,
    VK_VALIDATION_FEATURE_DISABLE_SHADER_VALIDATION_CACHE_EXT = 7,
} VkValidationFeatureDisableEXT;
```

• **VK_VALIDATION_FEATURE_DISABLE_ALL_EXT** specifies that all validation checks are disabled.

• **VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT** specifies that shader validation is disabled. This feature is enabled by default.

• **VK_VALIDATION_FEATURE_DISABLE_THREAD_SAFETY_EXT** specifies that thread safety validation is disabled. This feature is enabled by default.

• **VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT** specifies that stateless parameter validation is disabled. This feature is enabled by default.

• **VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT** specifies that object lifetime validation is disabled. This feature is enabled by default.

• **VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT** specifies that core validation checks are disabled. This feature is enabled by default. If this feature is disabled, the shader validation and GPU-assisted validation features are also disabled.

• **VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT** specifies that protection against duplicate non-dispatchable object handles is disabled. This feature is enabled by default.

• **VK_VALIDATION_FEATURE_DISABLE_SHADER_VALIDATION_CACHE_EXT** specifies that there will be no
The caching of shader validation results and every shader will be validated on every application execution. Shader validation caching is enabled by default.

**Note**
Disabling checks such as parameter validation and object lifetime validation prevents the reporting of error conditions that can cause other validation checks to behave incorrectly or crash. Some validation checks assume that their inputs are already valid and do not always revalidate them.

**Note**
The [VK_EXT_validation_features] extension subsumes all the functionality provided in the [VK_EXT_validation_flags] extension.

The `VkDirectDriverLoadingListLUNARG` structure is defined as:

```c
// Provided by VK_LUNARG_direct_driver_loading
typedef struct VkDirectDriverLoadingListLUNARG {
    VkStructureType sType;
    void* pNext;
    VkDirectDriverLoadingModeLUNARG mode;
    uint32_t driverCount;
    const VkDirectDriverLoadingInfoLUNARG* pDrivers;
} VkDirectDriverLoadingListLUNARG;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **mode** controls the mode in which to load the provided drivers.
- **driverCount** is the number of driver manifest paths.
- **pDrivers** is a pointer to an array of `driverCount` `VkDirectDriverLoadingInfoLUNARG` structures.

When creating a Vulkan instance for which additional drivers are to be included, add a `VkDirectDriverLoadingListLUNARG` structure to the pNext chain of the `VkInstanceCreateInfo` structure, and include in it the list of `VkDirectDriverLoadingInfoLUNARG` structures which contain the information necessary to load additional drivers.

### Valid Usage (Implicit)

- **VUID-VkDirectDriverLoadingListLUNARG-sType-sType**
  sType must be `VK_STRUCTURE_TYPE_DIRECT_DRIVER_LOADING_LIST_LUNARG`

- **VUID-VkDirectDriverLoadingListLUNARG-mode-parameter**
  mode must be a valid `VkDirectDriverLoadingModeLUNARG` value

- **VUID-VkDirectDriverLoadingListLUNARG-pDrivers-parameter**
  pDrivers must be a valid pointer to an array of `driverCount` valid `VkDirectDriverLoadingInfoLUNARG` structures
The `VkDirectDriverLoadingInfoLUNARG` structure is defined as:

```
// Provided by VK_LUNARG_direct_driver_loading
typedef struct VkDirectDriverLoadingInfoLUNARG {
    VkStructureType sType;
    void* pNext;
    VkDirectDriverLoadingFlagsLUNARG flags;
    PFN_vkGetInstanceProcAddrLUNARG pfnGetInstanceProcAddr;
} VkDirectDriverLoadingInfoLUNARG;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **pfnGetInstanceProcAddr** is a `PFN_vkGetInstanceProcAddrLUNARG` pointer to the driver `vkGetInstanceProcAddr` function.

### Valid Usage (Implicit)

- VUID-VkDirectDriverLoadingInfoLUNARG-sType-sType must be `VK_STRUCTURE_TYPE_DIRECT_DRIVER_LOADING_INFO_LUNARG`
- VUID-VkDirectDriverLoadingInfoLUNARG-flags-zerobitmask flags must be 0

Possible values of `VkDirectDriverLoadingListLUNARG::mode`, specifying the mode in which drivers are used, are:

```
// Provided by VK_LUNARG_direct_driver_loading
typedef enum VkDirectDriverLoadingModeLUNARG {
    VK_DIRECT_DRIVER_LOADING_MODE_EXCLUSIVE_LUNARG = 0,
    VK_DIRECT_DRIVER>Loading_MODE_INCLUSIVE_LUNARG = 1,
} VkDirectDriverLoadingModeLUNARG;
```

- **VK_DIRECT_DRIVER_LOADING_MODE_EXCLUSIVE_LUNARG** specifies that the provided drivers are used instead of the system-loaded drivers.
- **VK_DIRECT_DRIVER_LOADING_MODE_INCLUSIVE_LUNARG** specifies that the provided drivers are used in addition to the system-loaded drivers.

```
// Provided by VK_LUNARG_direct_driver_loading
typedef VkFlags VkDirectDriverLoadingFlagsLUNARG;
```
VkDirectDriverLoadingFlagsLUNARG is a bitmask type for setting a mask, but is currently reserved for future use.

The type of PFN_vkGetInstanceProcAddrLUNARG is:

```c
// Provided by VK_LUNARG_direct_driver_loading
typedef PFN_vkVoidFunction (VKAPI_PTR *PFN_vkGetInstanceProcAddrLUNARG)(
    VkInstance instance, const char* pName);
```

- `instance` is a VkInstance handle.
- `pName` is the name of a Vulkan command.

This type is compatible with the type of a pointer to the `vkGetInstanceProcAddr` command, but is used only to specify device driver addresses in VkDirectDriverLoadingInfoLUNARG::pfnGetInstanceProcAddr.

Note

This type exists only because of limitations in the XML schema and processing scripts, and its name may change in the future. Ideally we would use the PFN_vkGetInstanceProcAddr type generated in the vulkan_core.h header.

The VkApplicationInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkApplicationInfo {
    VkStructureType  sType;
    const void*      pNext;
    const char*      pApplicationName;
    uint32_t         applicationVersion;
    const char*      pEngineName;
    uint32_t         engineVersion;
    uint32_t         apiVersion;
} VkApplicationInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pApplicationName` is NULL or is a pointer to a null-terminated UTF-8 string containing the name of the application.
- `applicationVersion` is an unsigned integer variable containing the developer-supplied version number of the application.
- `pEngineName` is NULL or is a pointer to a null-terminated UTF-8 string containing the name of the engine (if any) used to create the application.
- `engineVersion` is an unsigned integer variable containing the developer-supplied version number of the engine used to create the application.
• **apiVersion** must be the highest version of Vulkan that the application is designed to use, encoded as described in Version Numbers. The patch version number specified in **apiVersion** is ignored when creating an instance object. The variant version of the instance must match that requested in **apiVersion**.

Vulkan 1.0 implementations were required to return **VK_ERROR_INCOMPATIBLE_DRIVER** if **apiVersion** was larger than 1.0. Implementations that support Vulkan 1.1 or later must not return **VK_ERROR_INCOMPATIBLE_DRIVER** for any value of **apiVersion**.

**Note**
Because Vulkan 1.0 implementations may fail with **VK_ERROR_INCOMPATIBLE_DRIVER**, applications should determine the version of Vulkan available before calling **vkCreateInstance**. If the **vkGetInstanceProcAddr** returns **NULL** for **vkEnumerateInstanceVersion**, it is a Vulkan 1.0 implementation. Otherwise, the application can call **vkEnumerateInstanceVersion** to determine the version of Vulkan.

As long as the instance supports at least Vulkan 1.1, an application can use different versions of Vulkan with an instance than it does with a device or physical device.

**Note**
The Khronos validation layers will treat **apiVersion** as the highest API version the application targets, and will validate API usage against the minimum of that version and the implementation version (instance or device, depending on context). If an application tries to use functionality from a greater version than this, a validation error will be triggered.

For example, if the instance supports Vulkan 1.1 and three physical devices support Vulkan 1.0, Vulkan 1.1, and Vulkan 1.2, respectively, and if the application sets **apiVersion** to 1.2, the application can use the following versions of Vulkan:

- **Vulkan 1.0** can be used with the instance and with all physical devices.
- **Vulkan 1.1** can be used with the instance and with the physical devices that support Vulkan 1.1 and Vulkan 1.2.
- **Vulkan 1.2** can be used with the physical device that supports Vulkan 1.2.

If we modify the above example so that the application sets **apiVersion** to 1.1, then the application must not use Vulkan 1.2 functionality on the physical device that supports Vulkan 1.2.

**Note**
Providing a **NULL** **VkInstanceCreateInfo::pApplicationInfo** or providing an **apiVersion** of 0 is equivalent to providing an **apiVersion** of **VK_MAKE_API_VERSION(0,1,0,0)**.
Valid Usage

- VUID-VkApplicationInfo-apiVersion-04010
  If `apiVersion` is not 0, then it **must** be greater than or equal to `VK_API_VERSION_1_0`

Valid Usage (Implicit)

- VUID-VkApplicationInfo-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_APPLICATION_INFO`

- VUID-VkApplicationInfo-pNext-pNext
  `pNext` **must** be `NULL`

- VUID-VkApplicationInfo-pApplicationName-parameter
  If `pApplicationName` is not `NULL`, `pApplicationName` **must** be a null-terminated UTF-8 string

- VUID-VkApplicationInfo-pEngineName-parameter
  If `pEngineName` is not `NULL`, `pEngineName` **must** be a null-terminated UTF-8 string

To destroy an instance, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyInstance(
    VkInstance instance,
    const VkAllocationCallbacks* pAllocator);
```

- `instance` is the handle of the instance to destroy.

- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyInstance-instance-00629
  All child objects created using `instance` **must** have been destroyed prior to destroying `instance`

- VUID-vkDestroyInstance-instance-00630
  If `VkAllocationCallbacks` were provided when `instance` was created, a compatible set of callbacks **must** be provided here

- VUID-vkDestroyInstance-instance-00631
  If no `VkAllocationCallbacks` were provided when `instance` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyInstance-instance-parameter
If `instance` is not `NULL`, `instance` must be a valid `VkInstance` handle

- VUID-vkDestroyInstance-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

### Host Synchronization

- Host access to `instance` must be externally synchronized
- Host access to all `VkPhysicalDevice` objects enumerated from `instance` must be externally synchronized
Chapter 5. Devices and Queues

Once Vulkan is initialized, devices and queues are the primary objects used to interact with a Vulkan implementation.

Vulkan separates the concept of physical and logical devices. A physical device usually represents a single complete implementation of Vulkan (excluding instance-level functionality) available to the host, of which there are a finite number. A logical device represents an instance of that implementation with its own state and resources independent of other logical devices.

Physical devices are represented by VkPhysicalDevice handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkPhysicalDevice)
```

### 5.1. Physical Devices

To retrieve a list of physical device objects representing the physical devices installed in the system, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumeratePhysicalDevices(
    VkInstance instance,
    uint32_t* pPhysicalDeviceCount,
    VkPhysicalDevice* pPhysicalDevices);
```

- `instance` is a handle to a Vulkan instance previously created with `vkCreateInstance`.
- `pPhysicalDeviceCount` is a pointer to an integer related to the number of physical devices available or queried, as described below.
- `pPhysicalDevices` is either `NULL` or a pointer to an array of `VkPhysicalDevice` handles.

If `pPhysicalDevices` is `NULL`, then the number of physical devices available is returned in `pPhysicalDeviceCount`. Otherwise, `pPhysicalDeviceCount` must point to a variable set by the user to the number of elements in the `pPhysicalDevices` array, and on return the variable is overwritten with the number of handles actually written to `pPhysicalDevices`. If `pPhysicalDeviceCount` is less than the number of physical devices available, at most `pPhysicalDeviceCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available physical devices were returned.

**Valid Usage (Implicit)**

- VUID-vkEnumeratePhysicalDevices-instance-parameter
  `instance` must be a valid `VkInstance` handle
- VUID-vkEnumeratePhysicalDevices-pPhysicalDeviceCount-parameter
**pPhysicalDeviceCount must** be a valid pointer to a `uint32_t` value

- **VUID-vkEnumeratePhysicalDevices-pPhysicalDevices-parameter**
  If the value referenced by `pPhysicalDeviceCount` is not `0`, and `pPhysicalDevices` is not `NULL`, `pPhysicalDevices` must be a valid pointer to an array of `pPhysicalDeviceCount` `VkPhysicalDevice` handles.

---

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

To query general properties of physical devices once enumerated, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceProperties(VkPhysicalDevice physicalDevice, VkPhysicalDeviceProperties* pProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pProperties` is a pointer to a `VkPhysicalDeviceProperties` structure in which properties are returned.

---

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceProperties-physicalDevice-parameter**
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceProperties-pProperties-parameter**
  `pProperties` must be a valid pointer to a `VkPhysicalDeviceProperties` structure

The `VkPhysicalDeviceProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceProperties {
  uint32_t apiVersion;
  uint32_t driverVersion;
  uint32_t vendorID;
} VkPhysicalDeviceProperties;
```
struct VkPhysicalDeviceProperties {
    uint32_t deviceID;
    VkPhysicalDeviceType deviceType;
    char deviceName[VK_MAX_PHYSICAL_DEVICE_NAME_SIZE];
    uint8_t pipelineCacheUUID[VK_UUID_SIZE];
    VkPhysicalDeviceLimits limits;
    VkPhysicalDeviceSparseProperties sparseProperties;
} VkPhysicalDeviceProperties;

• **apiVersion** is the version of Vulkan supported by the device, encoded as described in Version Numbers.

• **driverVersion** is the vendor-specified version of the driver.

• **vendorID** is a unique identifier for the vendor (see below) of the physical device.

• **deviceID** is a unique identifier for the physical device among devices available from the vendor.

• **deviceType** is a VkPhysicalDeviceType specifying the type of device.

• **deviceName** is an array of VK_MAX_PHYSICAL_DEVICE_NAME_SIZE char containing a null-terminated UTF-8 string which is the name of the device.

• **pipelineCacheUUID** is an array of VK_UUID_SIZE uint8_t values representing a universally unique identifier for the device.

• **limits** is the VkPhysicalDeviceLimits structure specifying device-specific limits of the physical device. See Limits for details.

• **sparseProperties** is the VkPhysicalDeviceSparseProperties structure specifying various sparse related properties of the physical device. See Sparse Properties for details.

Note

The value of apiVersion may be different than the version returned by vkEnumerateInstanceVersion; either higher or lower. In such cases, the application must not use functionality that exceeds the version of Vulkan associated with a given object. The pApiVersion parameter returned by vkEnumerateInstanceVersion is the version associated with a VkInstance and its children, except for a VkPhysicalDevice and its children. VkPhysicalDeviceProperties::apiVersion is the version associated with a VkPhysicalDevice and its children.

Note

The encoding of driverVersion is implementation-defined. It may not use the same encoding as apiVersion. Applications should follow information from the vendor on how to extract the version information from driverVersion.

On implementations that claim support for the Roadmap 2022 profile, the major and minor version expressed by apiVersion must be at least Vulkan 1.3.

The vendorID and deviceID fields are provided to allow applications to adapt to device characteristics that are not adequately exposed by other Vulkan queries.
Note
These may include performance profiles, hardware errata, or other characteristics.

The vendor identified by vendorID is the entity responsible for the most salient characteristics of the underlying implementation of the VkPhysicalDevice being queried.

Note
For example, in the case of a discrete GPU implementation, this should be the GPU chipset vendor. In the case of a hardware accelerator integrated into a system-on-chip (SoC), this should be the supplier of the silicon IP used to create the accelerator.

If the vendor has a PCI vendor ID, the low 16 bits of vendorID must contain that PCI vendor ID, and the remaining bits must be set to zero. Otherwise, the value returned must be a valid Khronos vendor ID, obtained as described in the Vulkan Documentation and Extensions: Procedures and Conventions document in the section “Registering a Vendor ID with Khronos”. Khronos vendor IDs are allocated starting at 0x10000, to distinguish them from the PCI vendor ID namespace. Khronos vendor IDs are symbolically defined in the VkVendorId type.

The vendor is also responsible for the value returned in deviceID. If the implementation is driven primarily by a PCI device with a PCI device ID, the low 16 bits of deviceID must contain that PCI device ID, and the remaining bits must be set to zero. Otherwise, the choice of what values to return may be dictated by operating system or platform policies - but should uniquely identify both the device version and any major configuration options (for example, core count in the case of multicore devices).

Note
The same device ID should be used for all physical implementations of that device version and configuration. For example, all uses of a specific silicon IP GPU version and configuration should use the same device ID, even if those uses occur in different SoCs.

Khronos vendor IDs which may be returned in VkPhysicalDeviceProperties::vendorID are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkVendorId {
    VK_VENDOR_ID_VIV = 0x10001,
    VK_VENDOR_ID_VSI = 0x10002,
    VK_VENDOR_ID_KAZAN = 0x10003,
    VK_VENDOR_ID_CODEPLAY = 0x10004,
    VK_VENDOR_ID_MESA = 0x10005,
    VK_VENDOR_ID_POCL = 0x10006,
    VK_VENDOR_ID_MOBILEYE = 0x10007,
} VkVendorId;
```
Khronos vendor IDs may be allocated by vendors at any time. Only the latest canonical versions of this Specification, of the corresponding `vk.xml` API Registry, and of the corresponding `vulkan_core.h` header file must contain all reserved Khronos vendor IDs.

Only Khronos vendor IDs are given symbolic names at present. PCI vendor IDs returned by the implementation can be looked up in the PCI-SIG database.

`VK_MAX_PHYSICAL_DEVICE_NAME_SIZE` is the length in `char` values of an array containing a physical device name string, as returned in `VkPhysicalDeviceProperties::deviceName`.

```c
#define VK_MAX_PHYSICAL_DEVICE_NAME_SIZE  256U
```

The physical device types which may be returned in `VkPhysicalDeviceProperties::deviceType` are:

```c
typedef enum VkPhysicalDeviceType {
    VK_PHYSICAL_DEVICE_TYPE_OTHER         = 0,
    VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU = 1,
    VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU  = 2,
    VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU   = 3,
    VK_PHYSICAL_DEVICE_TYPE_CPU           = 4,
} VkPhysicalDeviceType;
```

- **VK_PHYSICAL_DEVICE_TYPE_OTHER** - the device does not match any other available types.
- **VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU** - the device is typically one embedded in or tightly coupled with the host.
- **VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU** - the device is typically a separate processor connected to the host via an interlink.
- **VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU** - the device is typically a virtual node in a virtualization environment.
- **VK_PHYSICAL_DEVICE_TYPE_CPU** - the device is typically running on the same processors as the host.

The physical device type is advertised for informational purposes only, and does not directly affect the operation of the system. However, the device type may correlate with other advertised properties or capabilities of the system, such as how many memory heaps there are.

To query general properties of physical devices once enumerated, call:

```c
void vkGetPhysicalDeviceProperties2(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);
```
or the equivalent command

```c
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pProperties` is a pointer to a `VkPhysicalDeviceProperties2` structure in which properties are returned.

Each structure in `pProperties` and its `pNext` chain contains members corresponding to implementation-dependent properties, behaviors, or limits. `vkGetPhysicalDeviceProperties2` fills in each member to specify the corresponding value for the implementation.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceProperties2-physicalDevice-parameter
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceProperties2-pProperties-parameter
  - `pProperties` must be a valid pointer to a `VkPhysicalDeviceProperties2` structure

The `VkPhysicalDeviceProperties2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProperties2 {
    VkStructureType sType;
    void* pNext;
    VkPhysicalDeviceProperties properties;
} VkPhysicalDeviceProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceProperties2 VkPhysicalDeviceProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `properties` is a `VkPhysicalDeviceProperties` structure describing properties of the physical device. This structure is written with the same values as if it were written by `vkGetPhysicalDeviceProperties`.

The `pNext` chain of this structure is used to extend the structure with properties defined by extensions.
Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceProperties2-sType-sType**
  
  *sType* must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROPERTIES_2**

- **VUID-VkPhysicalDeviceProperties2-pNext-pNext**
  
  Each *pNext* member of any structure (including this one) in the *pNext* chain must be either **NULL** or a pointer to a valid instance of:
  
  - VkPhysicalDeviceAccelerationStructurePropertiesKHR,
  - VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT,
  - VkPhysicalDeviceClusterCullingShaderPropertiesHUAWEI,
  - VkPhysicalDeviceConservativeRasterizationPropertiesEXT,
  - VkPhysicalDeviceCooperativeMatrixPropertiesKHR,
  - VkPhysicalDeviceCooperativeMatrixPropertiesNV,
  - VkPhysicalDeviceCopyMemoryIndirectPropertiesNV,
  - VkPhysicalDeviceCustomBorderColorPropertiesEXT,
  - VkPhysicalDeviceDepthStencilResolveProperties,
  - VkPhysicalDeviceDescriptorBufferDensityMapPropertiesEXT,
  - VkPhysicalDeviceDescriptorBufferPropertiesEXT,
  - VkPhysicalDeviceDiscardRectanglePropertiesEXT,
  - VkPhysicalDeviceDisplacementMicromapPropertiesNV,
  - VkPhysicalDeviceDriverProperties,
  - VkPhysicalDeviceDrmPropertiesEXT,
  - VkPhysicalDeviceExtendedDynamicState3PropertiesEXT,
  - VkPhysicalDeviceExternalMemoryHostPropertiesEXT,
  - VkPhysicalDeviceFloatControlsProperties,
  - VkPhysicalDeviceFragmentDensityMap2PropertiesEXT,
  - VkPhysicalDeviceFragmentDensityMapOffsetPropertiesQCOM,
  - VkPhysicalDeviceFragmentDensityMapPropertiesEXT,
  - VkPhysicalDeviceFragmentShaderBarycentricPropertiesKHR,
  - VkPhysicalDeviceFragmentShadingRate EnumsPropertiesNV,
  - VkPhysicalDeviceFragmentShadingRatePropertiesKHR,
  - VkPhysicalDeviceGraphicsPipelineLibraryPropertiesEXT,
  - VkPhysicalDeviceHostImageCopyPropertiesEXT,
  - VkPhysicalDeviceIDProperties,
  - VkPhysicalDeviceImageProcessing2PropertiesQCOM,
  - VkPhysicalDeviceImageProcessingPropertiesQCOM,
  - VkPhysicalDeviceInlineUniformBlockProperties,
  - VkPhysicalDeviceLayeredDriverPropertiesMSFT,
  - VkPhysicalDeviceLineRasterizationPropertiesEXT,
  - VkPhysicalDeviceMaintenance3Properties,
  - VkPhysicalDeviceMaintenance4Properties,
  - VkPhysicalDeviceMaintenance5PropertiesKHR,
  - VkPhysicalDeviceMemoryDecompressionPropertiesNV,
  - VkPhysicalDeviceMeshShaderPropertiesEXT,
  - VkPhysicalDeviceMeshShaderPropertiesNV,
  - VkPhysicalDeviceMultiDrawPropertiesEXT,
  - VkPhysicalDeviceMultiviewPerViewAttributesPropertiesNVX,
  - VkPhysicalDeviceMultiviewProperties,
  - VkPhysicalDeviceOpacityMicromapPropertiesEXT,
  - VkPhysicalDeviceOpticalFlowPropertiesNV,
  - VkPhysicalDevicePCIBusInfoPropertiesEXT,
The `VkPhysicalDeviceVulkan11Properties` structure is defined as:

```c
typedef struct VkPhysicalDeviceVulkan11Properties {
    VkStructureType sType;
    void* pNext;
    uint8_t deviceUUID[VK_UUID_SIZE];
    uint8_t driverUUID[VK_UUID_SIZE];
    uint8_t deviceLUID[VK_LUID_SIZE];
    uint32_t deviceNodeMask;
    VkBool32 deviceLUIDValid;
    uint32_t subgroupSize;
    VkShaderStageFlags subgroupSupportedStages;
} VkPhysicalDeviceVulkan11Properties;
```
VkSubgroupFeatureFlags subgroupSupportedOperations;
VkBool32 subgroupQuadOperationsInAllStages;
VkPointClippingBehavior pointClippingBehavior;
uint32_t maxMultiviewViewCount;
uint32_t maxMultiviewInstanceIndex;
VkBool32 protectedNoFault;
uint32_t maxPerSetDescriptors;
VkDeviceSize maxMemoryAllocationSize;
}

• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **deviceUUID** is an array of *VK_UUID_SIZE* uint8_t values representing a universally unique identifier for the device.

• **driverUUID** is an array of *VK_UUID_SIZE* uint8_t values representing a universally unique identifier for the driver build in use by the device.

• **deviceLUID** is an array of *VK_LUID_SIZE* uint8_t values representing a locally unique identifier for the device.

• **deviceNodeMask** is a uint32_t bitfield identifying the node within a linked device adapter corresponding to the device.

• **deviceLUIDValid** is a boolean value that will be VK_TRUE if deviceLUID contains a valid LUID and deviceNodeMask contains a valid node mask, and VK_FALSE if they do not.

• **subgroupSize** is the default number of invocations in each subgroup. subgroupSize is at least 1 if any of the physical device's queues support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT. subgroupSize is a power-of-two.

• **subgroupSupportedStages** is a bitfield of *VkShaderStageFlagBits* describing the shader stages that group operations with subgroup scope are supported in. subgroupSupportedStages will have the VK_SHADER_STAGE_COMPUTE_BIT bit set if any of the physical device's queues support VK_QUEUE_COMPUTE_BIT.

• **subgroupSupportedOperations** is a bitmask of *VkSubgroupFeatureFlagBits* specifying the sets of group operations with subgroup scope supported on this device. subgroupSupportedOperations will have the VK_SUBGROUP_FEATURE_BASIC_BIT bit set if any of the physical device's queues support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT.

• **subgroupQuadOperationsInAllStages** is a boolean specifying whether quad group operations are available in all stages, or are restricted to fragment and compute stages.

• **pointClippingBehavior** is a *VkPointClippingBehavior* value specifying the point clipping behavior supported by the implementation.

• **maxMultiviewViewCount** is one greater than the maximum view index that can be used in a subpass.

• **maxMultiviewInstanceIndex** is the maximum valid value of instance index allowed to be generated by a drawing command recorded within a subpass of a multiview render pass instance.
• **protectedNoFault** specifies how an implementation behaves when an application attempts to write to unprotected memory in a protected queue operation, read from protected memory in an unprotected queue operation, or perform a query in a protected queue operation. If this limit is **VK_TRUE**, such writes will be discarded or have undefined values written, reads and queries will return undefined values. If this limit is **VK_FALSE**, applications must not perform these operations. See Protected Memory Access Rules for more information.

• **maxPerSetDescriptors** is a maximum number of descriptors (summed over all descriptor types) in a single descriptor set that is guaranteed to satisfy any implementation-dependent constraints on the size of a descriptor set itself. Applications can query whether a descriptor set that goes beyond this limit is supported using `vkGetDescriptorSetLayoutSupport`.

• **maxMemoryAllocationSize** is the maximum size of a memory allocation that can be created, even if there is more space available in the heap.

If the `VkPhysicalDeviceVulkan11Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.1 functionality.

The members of `VkPhysicalDeviceVulkan11Properties` have the same values as the corresponding members of `VkPhysicalDeviceIDProperties`, `VkPhysicalDeviceSubgroupProperties`, `VkPhysicalDevicePointClippingProperties`, `VkPhysicalDeviceMultiviewProperties`, `VkPhysicalDeviceProtectedMemoryProperties`, and `VkPhysicalDeviceMaintenance3Properties`.

VkPhysicalDeviceVulkan12Properties

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• driverID is a unique identifier for the driver of the physical device.
• driverName is an array of VK_MAX_DRIVER_NAME_SIZE char containing a null-terminated UTF-8 string which is the name of the driver.
• driverInfo is an array of VK_MAX_DRIVER_INFO_SIZE char containing a null-terminated UTF-8 string with additional information about the driver.
• conformanceVersion is the version of the Vulkan conformance test this driver is conformant against (see VkConformanceVersion).
• denormBehaviorIndependence is a VkShaderFloatControlsIndependence value indicating whether, and how, denorm behavior can be set independently for different bit widths.
• roundingModeIndependence is a VkShaderFloatControlsIndependence value indicating whether, and how, rounding modes can be set independently for different bit widths.
• shaderSignedZeroInfNanPreserveFloat16 is a boolean value indicating whether sign of a zero, Nans and ±∞ can be preserved in 16-bit floating-point computations. It also indicates whether the SignedZeroInfNanPreserve execution mode can be used for 16-bit floating-point types.
• shaderSignedZeroInfNanPreserveFloat32 is a boolean value indicating whether sign of a zero, Nans and ±∞ can be preserved in 32-bit floating-point computations. It also indicates whether the SignedZeroInfNanPreserve execution mode can be used for 32-bit floating-point types.
• shaderSignedZeroInfNanPreserveFloat64 is a boolean value indicating whether sign of a zero, Nans and ±∞ can be preserved in 64-bit floating-point computations. It also indicates whether the SignedZeroInfNanPreserve execution mode can be used for 64-bit floating-point types.
• shaderDenormPreserveFloat16 is a boolean value indicating whether denormals can be preserved in 16-bit floating-point computations. It also indicates whether the DenormPreserve execution mode can be used for 16-bit floating-point types.
• shaderDenormPreserveFloat32 is a boolean value indicating whether denormals can be preserved in 32-bit floating-point computations. It also indicates whether the DenormPreserve execution mode can be used for 32-bit floating-point types.
• shaderDenormPreserveFloat64 is a boolean value indicating whether denormals can be preserved in 64-bit floating-point computations. It also indicates whether the DenormPreserve execution mode can be used for 64-bit floating-point types.
• shaderDenormFlushToZeroFloat16 is a boolean value indicating whether denormals can be flushed to zero in 16-bit floating-point computations. It also indicates whether the DenormFlushToZero execution mode can be used for 16-bit floating-point types.
• shaderDenormFlushToZeroFloat32 is a boolean value indicating whether denormals can be flushed
to zero in 32-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode can be used for 32-bit floating-point types.

- `shaderDenormFlushToZeroFloat64` is a boolean value indicating whether denormals can be flushed to zero in 64-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode can be used for 64-bit floating-point types.

- `shaderRoundingModeRTEFloat16` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode can be used for 16-bit floating-point types.

- `shaderRoundingModeRTEFloat32` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode can be used for 32-bit floating-point types.

- `shaderRoundingModeRTEFloat64` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode can be used for 64-bit floating-point types.

- `shaderRoundingModeRTZFloat16` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode can be used for 16-bit floating-point types.

- `shaderRoundingModeRTZFloat32` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode can be used for 32-bit floating-point types.

- `shaderRoundingModeRTZFloat64` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode can be used for 64-bit floating-point types.

- `maxUpdateAfterBindDescriptorsInAllPools` is the maximum number of descriptors (summed over all descriptor types) that can be created across all pools that are created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set. Pool creation may fail when this limit is exceeded, or when the space this limit represents is unable to satisfy a pool creation due to fragmentation.

- `shaderUniformBufferArrayNonUniformIndexingNative` is a boolean value indicating whether uniform buffer descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of uniform buffers may execute multiple times in order to access all the descriptors.

- `shaderSampledImageArrayNonUniformIndexingNative` is a boolean value indicating whether sampler and image descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of samplers or images may execute multiple times in order to access all the descriptors.

- `shaderStorageBufferArrayNonUniformIndexingNative` is a boolean value indicating whether
storage buffer descriptors natively support nonuniform indexing. If this is \texttt{VK_FALSE}, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage buffers may execute multiple times in order to access all the descriptors.

- \texttt{shaderStorageImageArrayNonUniformIndexingNative} is a boolean value indicating whether storage image descriptors natively support nonuniform indexing. If this is \texttt{VK_FALSE}, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage images may execute multiple times in order to access all the descriptors.

- \texttt{shaderInputAttachmentArrayNonUniformIndexingNative} is a boolean value indicating whether input attachment descriptors natively support nonuniform indexing. If this is \texttt{VK_FALSE}, then a single dynamic instance of an instruction that nonuniformly indexes an array of input attachments may execute multiple times in order to access all the descriptors.

- \texttt{robustBufferAccessUpdateAfterBind} is a boolean value indicating whether \texttt{robustBufferAccess} can be enabled on a device simultaneously with \texttt{descriptorBindingUniformBufferUpdateAfterBind}, \texttt{descriptorBindingStorageBufferUpdateAfterBind}, \texttt{descriptorBindingUniformTexelBufferUpdateAfterBind}, and/or \texttt{descriptorBindingStorageTexelBufferUpdateAfterBind}. If this is \texttt{VK_FALSE}, then either \texttt{robustBufferAccess} must be disabled or all of these update-after-bind features must be disabled.

- \texttt{quadDivergentImplicitLod} is a boolean value indicating whether implicit LOD calculations for image operations have well-defined results when the image and/or sampler objects used for the instruction are not uniform within a quad. See Derivative Image Operations.

- \texttt{maxPerStageDescriptorUpdateAfterBindSamplers} is similar to \texttt{maxPerStageDescriptorSamplers} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxPerStageDescriptorUpdateAfterBindUniformBuffers} is similar to \texttt{maxPerStageDescriptorUniformBuffers} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxPerStageDescriptorUpdateAfterBindStorageBuffers} is similar to \texttt{maxPerStageDescriptorStorageBuffers} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxPerStageDescriptorUpdateAfterBindSamplerImages} is similar to \texttt{maxPerStageDescriptorSamplerImages} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxPerStageDescriptorUpdateAfterBindStorageImages} is similar to \texttt{maxPerStageDescriptorStorageImages} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxPerStageDescriptorUpdateAfterBindInputAttachments} is similar to \texttt{maxPerStageDescriptorInputAttachments} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxPerStageUpdateAfterBindResources} is similar to \texttt{maxPerStageResources} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxDescriptorSetUpdateAfterBindSamplers} is similar to \texttt{maxDescriptorSetSamplers} but counts descriptors from descriptor sets created with or without the
**VkDescriptorSetLayoutCreateUpdateAfterBindPoolBit** bit set.

- **maxDescriptorSetUpdateAfterBindUniformBuffers** is similar to **maxDescriptorSetUniformBuffers** but counts descriptors from descriptor sets created with or without the **VkDescriptorSetLayoutCreateUpdateAfterBindPoolBit** bit set.

- **maxDescriptorSetUpdateAfterBindUniformBuffersDynamic** is similar to **maxDescriptorSetUniformBuffersDynamic** but counts descriptors from descriptor sets created with or without the **VkDescriptorSetLayoutCreateUpdateAfterBindPoolBit** bit set. While an application can allocate dynamic uniform buffer descriptors from a pool created with the **VkDescriptorSetLayoutCreateUpdateAfterBindPoolBit**, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with **VkDescriptorBindingUpdateAfterBindBit**.

- **maxDescriptorSetUpdateAfterBindStorageBuffers** is similar to **maxDescriptorSetStorageBuffers** but counts descriptors from descriptor sets created with or without the **VkDescriptorSetLayoutCreateUpdateAfterBindPoolBit** bit set.

- **maxDescriptorSetUpdateAfterBindStorageBuffersDynamic** is similar to **maxDescriptorSetStorageBuffersDynamic** but counts descriptors from descriptor sets created with or without the **VkDescriptorSetLayoutCreateUpdateAfterBindPoolBit** bit set. While an application can allocate dynamic storage buffer descriptors from a pool created with the **VkDescriptorSetLayoutCreateUpdateAfterBindPoolBit**, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with **VkDescriptorBindingUpdateAfterBindBit**.

- **maxDescriptorSetUpdateAfterBindSampledImages** is similar to **maxDescriptorSetSampledImages** but counts descriptors from descriptor sets created with or without the **VkDescriptorSetLayoutCreateUpdateAfterBindPoolBit** bit set.

- **maxDescriptorSetUpdateAfterBindStorageImages** is similar to **maxDescriptorSetStorageImages** but counts descriptors from descriptor sets created with or without the **VkDescriptorSetLayoutCreateUpdateAfterBindPoolBit** bit set.

- **maxDescriptorSetUpdateAfterBindInputAttachments** is similar to **maxDescriptorSetInputAttachments** but counts descriptors from descriptor sets created with or without the **VkDescriptorSetLayoutCreateUpdateAfterBindPoolBit** bit set.

- **supportedDepthResolveModes** is a bitmask of **VkResolveModeFlagBits** indicating the set of supported depth resolve modes. **VkResolveModeSampleZeroBit** must be included in the set but implementations may support additional modes.

- **supportedStencilResolveModes** is a bitmask of **VkResolveModeFlagBits** indicating the set of supported stencil resolve modes. **VkResolveModeSampleZeroBit** must be included in the set but implementations may support additional modes. **VkResolveModeAverageBit** must not be included in the set.

- **independentResolveNone** is **VkTrue** if the implementation supports setting the depth and stencil resolve modes to different values when one of those modes is **VkResolveModeNone**. Otherwise the implementation only supports setting both modes to the same value.

- **independentResolve** is **VkTrue** if the implementation supports all combinations of the supported depth and stencil resolve modes, including setting either depth or stencil resolve mode to **VkResolveModeNone**. An implementation that supports **independentResolve** must also support
• `filterMinmaxSingleComponentFormats` is a boolean value indicating whether a minimum set of required formats support min/max filtering.

• `filterMinmaxImageComponentMapping` is a boolean value indicating whether the implementation supports non-identity component mapping of the image when doing min/max filtering.

• `maxTimelineSemaphoreValueDifference` indicates the maximum difference allowed by the implementation between the current value of a timeline semaphore and any pending signal or wait operations.

• `framebufferIntegerColorSampleCounts` is a bitmask of `VkSampleCountFlagBits` indicating the color sample counts that are supported for all framebuffer color attachments with integer formats.

If the `VkPhysicalDeviceVulkan12Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.2 functionality.

The members of `VkPhysicalDeviceVulkan12Properties` must have the same values as the corresponding members of `VkPhysicalDeviceDriverProperties`, `VkPhysicalDeviceFloatControlsProperties`, `VkPhysicalDeviceDescriptorIndexingProperties`, `VkPhysicalDeviceDepthStencilResolveProperties`, `VkPhysicalDeviceSamplerFilterMinmaxProperties`, `VkPhysicalDeviceTimelineSemaphoreProperties`, and `VkPhysicalDeviceVulkan13Properties`.

### Valid Usage (Implicit)

• **VUID-VkPhysicalDeviceVulkan12Properties-sType-sType**  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_2_PROPERTIES`

The `VkPhysicalDeviceVulkan13Properties` structure is defined as:

```c
// Provided by VK_VERSION_1_3

VkBool32 storageTexelBufferOffsetSingleTexelAlignment;
VkDeviceSize uniformTexelBufferOffsetAlignmentBytes;
VkBool32 uniformTexelBufferOffsetSingleTexelAlignment;
VkDeviceSize maxBufferSize;
} VkPhysicalDeviceVulkan13Properties;
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **minSubgroupSize** is the minimum subgroup size supported by this device. `minSubgroupSize` is at least one if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `minSubgroupSize` is a power-of-two. `minSubgroupSize` is less than or equal to `maxSubgroupSize`. `minSubgroupSize` is less than or equal to `subgroupSize`.

• **maxSubgroupSize** is the maximum subgroup size supported by this device. `maxSubgroupSize` is at least one if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `maxSubgroupSize` is a power-of-two. `maxSubgroupSize` is greater than or equal to `minSubgroupSize`. `maxSubgroupSize` is greater than or equal to `subgroupSize`.

• **maxComputeWorkgroupSubgroups** is the maximum number of subgroups supported by the implementation within a workgroup.

• **requiredSubgroupSizeStages** is a bitfield of what shader stages support having a required subgroup size specified.

• **maxInlineUniformBlockSize** is the maximum size in bytes of an inline uniform block binding.

• **maxPerStageDescriptorInlineUniformBlocks** is the maximum number of inline uniform block bindings that can be accessible to a single shader stage in a pipeline layout. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` count against this limit. Only descriptor bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.

• **maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks** is similar to `maxPerStageDescriptorInlineUniformBlocks` but counts descriptor bindings from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• **maxDescriptorSetInlineUniformBlocks** is the maximum number of inline uniform block bindings that can be included in descriptor bindings in a pipeline layout across all pipeline shader stages and descriptor set numbers. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` count against this limit. Only descriptor bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.

• **maxDescriptorSetUpdateAfterBindInlineUniformBlocks** is similar to `maxDescriptorSetInlineUniformBlocks` but counts descriptor bindings from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

• **maxInlineUniformTotalSize** is the maximum total size in bytes of all inline uniform block bindings, across all pipeline shader stages and descriptor set numbers, that can be included in a pipeline layout. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` count against this limit.

• **integerDotProduct8BitUnsignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProduct8BitSignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.
• integerDotProduct8BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 8-bit mixed signedness dot product operations using the OpSU DotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct4x8BitPackedUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit unsigned dot product operations from operands packed into 32-bit integers using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct4x8BitPackedSignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit signed dot product operations from operands packed into 32-bit integers using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct4x8BitPackedMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 8-bit mixed signedness dot product operations from operands packed into 32-bit integers using the OpSU DotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct16BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 16-bit unsigned dot product operations using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct16BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 16-bit signed dot product operations using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct16BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 16-bit mixed signedness dot product operations using the OpSU DotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct32BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 32-bit unsigned dot product operations using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct32BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 32-bit signed dot product operations using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct32BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 32-bit mixed signedness dot product operations using the OpSU DotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct64BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 64-bit unsigned dot product operations using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct64BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 64-bit signed dot product operations using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct64BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 64-bit mixed signedness dot product operations using the OpSU DotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating8BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit unsigned accumulating saturating dot product operations using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.
• \texttt{integerDotProductAccumulatingSaturating8BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit signed accumulating saturating dot product operations using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated \textcolor{red}{as defined below}.

• \texttt{integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit mixed signedness accumulating saturating dot product operations using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated \textcolor{red}{as defined below}.

• \texttt{integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated \textcolor{red}{as defined below}.

• \texttt{integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated \textcolor{red}{as defined below}.

• \texttt{integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated \textcolor{red}{as defined below}.

• \texttt{integerDotProductAccumulatingSaturating16BitUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 16-bit unsigned accumulating saturating dot product operations using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated \textcolor{red}{as defined below}.

• \texttt{integerDotProductAccumulatingSaturating16BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 16-bit signed accumulating saturating dot product operations using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated \textcolor{red}{as defined below}.

• \texttt{integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 16-bit mixed signedness accumulating saturating dot product operations using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated \textcolor{red}{as defined below}.

• \texttt{integerDotProductAccumulatingSaturating32BitUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 32-bit unsigned accumulating saturating dot product operations using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated \textcolor{red}{as defined below}.

• \texttt{integerDotProductAccumulatingSaturating32BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 32-bit signed accumulating saturating dot product operations using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated \textcolor{red}{as defined below}.

• \texttt{integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 32-bit mixed signedness accumulating saturating dot product operations using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated \textcolor{red}{as defined below}.

• \texttt{integerDotProductAccumulatingSaturating64BitUnsignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit unsigned accumulating saturating dot product operations using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated \textcolor{red}{as defined below}.

• \texttt{integerDotProductAccumulatingSaturating64BitSignedAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit signed accumulating saturating dot product operations using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated \textcolor{red}{as defined below}.

• \texttt{integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated} is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit mixed signedness accumulating saturating dot product operations using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated \textcolor{red}{as defined below}.
be `VK_TRUE` if the support for 64-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- `storageTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a storage texel buffer of any format. The value must be a power of two.
- `storageTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a storage texel buffer of any format.
- `uniformTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a uniform texel buffer of any format. The value must be a power of two.
- `uniformTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a uniform texel buffer of any format.
- `maxBufferSize` is the maximum size `VkBuffer` that can be created.

If the `VkPhysicalDeviceVulkan13Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.3 functionality.

The members of `VkPhysicalDeviceVulkan13Properties` must have the same values as the corresponding members of `VkPhysicalDeviceInlineUniformBlockProperties` and `VkPhysicalDeviceSubgroupSizeControlProperties`.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkan13Properties-sType-sType
  
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_3_PROPERTIES`

The `VkPhysicalDeviceIDProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceIDProperties {
    VkStructureType sType;
    void* pNext;
    uint8_t deviceUUID[VK_UUID_SIZE];
    uint8_t driverUUID[VK_UUID_SIZE];
    uint8_t deviceLUID[VK_LUID_SIZE];
    uint32_t deviceNodeMask;
    VkBool32 deviceLUIDValid;
} VkPhysicalDeviceIDProperties;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence_capabilities,
// VK_KHR_external_memory_capabilities, VK_KHR_external_semaphore_capabilities
```
typedef VkPhysicalDeviceIDProperties VkPhysicalDeviceIDPropertiesKHR;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **deviceUUID** is an array of `VK_UUID_SIZE uint8_t` values representing a universally unique identifier for the device.
• **driverUUID** is an array of `VK_UUID_SIZE uint8_t` values representing a universally unique identifier for the driver build in use by the device.
• **deviceLUID** is an array of `VK_LUID_SIZE uint8_t` values representing a locally unique identifier for the device.
• **deviceNodeMask** is a `uint32_t` bitfield identifying the node within a linked device adapter corresponding to the device.

• **deviceLUIDValid** is a boolean value that will be `VK_TRUE` if `deviceLUID` contains a valid LUID and `deviceNodeMask` contains a valid node mask, and `VK_FALSE` if they do not.

If the `VkPhysicalDeviceIDProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

**deviceUUID** must be immutable for a given device across instances, processes, driver APIs, driver versions, and system reboots.

Applications can compare the **driverUUID** value across instance and process boundaries, and can make similar queries in external APIs to determine whether they are capable of sharing memory objects and resources using them with the device.

**deviceUUID** and/or **driverUUID** must be used to determine whether a particular external object can be shared between driver components, where such a restriction exists as defined in the compatibility table for the particular object type:

• External memory handle types compatibility
• External semaphore handle types compatibility
• External fence handle types compatibility

If **deviceLUIDValid** is `VK_FALSE`, the values of **deviceLUID** and **deviceNodeMask** are undefined. If **deviceLUIDValid** is `VK_TRUE` and Vulkan is running on the Windows operating system, the contents of **deviceLUID** can be cast to an `LUID` object and must be equal to the locally unique identifier of a `IDXGIAdapter1` object that corresponds to `physicalDevice`. If **deviceLUIDValid** is `VK_TRUE`, **deviceNodeMask** must contain exactly one bit. If Vulkan is running on an operating system that supports the Direct3D 12 API and `physicalDevice` corresponds to an individual device in a linked device adapter, **deviceNodeMask** identifies the Direct3D 12 node corresponding to `physicalDevice`. Otherwise, **deviceNodeMask** must be 1.

**Note**
Although they have identical descriptions, `VkPhysicalDeviceIDProperties`
deviceUUID may differ from VkPhysicalDeviceProperties2::pipelineCacheUUID. The former is intended to identify and correlate devices across API and driver boundaries, while the latter is used to identify a compatible device and driver combination to use when serializing and de-serializing pipeline state.

Implementations should return deviceUUID values which are likely to be unique even in the presence of multiple Vulkan implementations (such as a GPU driver and a software renderer; two drivers for different GPUs; or the same Vulkan driver running on two logically different devices).

Khronos' conformance testing is unable to guarantee that deviceUUID values are actually unique, so implementors should make their own best efforts to ensure this. In particular, hard-coded deviceUUID values, especially all-0 bits, should never be used.

A combination of values unique to the vendor, the driver, and the hardware environment can be used to provide a deviceUUID which is unique to a high degree of certainty. Some possible inputs to such a computation are:

- Information reported by vkGetPhysicalDeviceProperties
- PCI device ID (if defined)
- PCI bus ID, or similar system configuration information.
- Driver binary checksums.

**Note**
While VkPhysicalDeviceIDProperties::deviceUUID is specified to remain consistent across driver versions and system reboots, it is not intended to be usable as a serializable persistent identifier for a device. It may change when a device is physically added to, removed from, or moved to a different connector in a system while that system is powered down. Further, there is no reasonable way to verify with conformance testing that a given device retains the same UUID in a given system across all driver versions supported in that system. While implementations should make every effort to report consistent device UUIDs across driver versions, applications should avoid relying on the persistence of this value for uses other than identifying compatible devices for external object sharing purposes.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceIDProperties-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ID_PROPERTIES

VK_UUID_SIZE is the length in uint8_t values of an array containing a universally unique device or driver build identifier, as returned in VkPhysicalDeviceIDProperties::deviceUUID and VkPhysicalDeviceIDProperties::driverUUID.
VK_UUID_SIZE is the length in `uint8_t` values of an array containing a locally unique device identifier, as returned in `VkPhysicalDeviceIDProperties::deviceLUID`.

```
#define VK_LUID_SIZE                      16U
```

or the equivalent

```
#define VK_LUID_SIZE                      8U
```

or the equivalent

```
#define VK_LUID_SIZE_KHR                  VK_LUID_SIZE
```

The `VkPhysicalDeviceDriverProperties` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDriverProperties {
    VkStructureType sType;
    void* pNext;
    VkDriverId driverID;
    char driverName[VK_MAX_DRIVER_NAME_SIZE];
    char driverInfo[VK_MAX_DRIVER_INFO_SIZE];
    VkConformanceVersion conformanceVersion;
} VkPhysicalDeviceDriverProperties;
```

or the equivalent

```
// Provided by VK_KHR_driver_properties
typedef VkPhysicalDeviceDriverProperties VkPhysicalDeviceDriverPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `driverID` is a unique identifier for the driver of the physical device.
- `driverName` is an array of `VK_MAX_DRIVER_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the driver.
- `driverInfo` is an array of `VK_MAX_DRIVER_INFO_SIZE` `char` containing a null-terminated UTF-8 string with additional information about the driver.
- `conformanceVersion` is the version of the Vulkan conformance test this driver is conformant against (see `VkConformanceVersion`).

If the `VkPhysicalDeviceDriverProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.
These are properties of the driver corresponding to a physical device.

driverID must be immutable for a given driver across instances, processes, driver versions, and system reboots.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDriverProperties-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DRIVER_PROPERTIES

Khronos driver IDs which may be returned in VkPhysicalDeviceDriverProperties::driverID are:

```c
typedef enum VkDriverId {
    VK_DRIVER_ID_AMD_PROPRIETARY = 1,
    VK_DRIVER_ID_AMD_OPEN_SOURCE = 2,
    VK_DRIVER_ID_MESA_RADV = 3,
    VK_DRIVER_ID_NVIDIA_PROPRIETARY = 4,
    VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS = 5,
    VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA = 6,
    VK_DRIVER_ID_IMAGINATION_PROPRIETARY = 7,
    VK_DRIVER_ID_QUALCOMM_PROPRIETARY = 8,
    VK_DRIVER_ID_ARM_PROPRIETARY = 9,
    VK_DRIVER_ID_GOOGLE_SWIFTSHADER = 10,
    VK_DRIVER_ID_GGP_PROPRIETARY = 11,
    VK_DRIVER_ID_BROADCOM_PROPRIETARY = 12,
    VK_DRIVER_ID_MESA_LLVMPIPE = 13,
    VK_DRIVER_ID_MOLTENVK = 14,
    VK_DRIVER_ID_COREAVI_PROPRIETARY = 15,
    VK_DRIVER_ID_JUICE_PROPRIETARY = 16,
    VK_DRIVER_ID_VERISILICON_PROPRIETARY = 17,
    VK_DRIVER_ID_MESA_TURNIP = 18,
    VK_DRIVER_ID_MESA_V3DV = 19,
    VK_DRIVER_ID_MESA_PANVK = 20,
    VK_DRIVER_ID_SAMSUNG_PROPRIETARY = 21,
    VK_DRIVER_ID_MESA_VENUS = 22,
    VK_DRIVER_ID_MESA_DOZEN = 23,
    VK_DRIVER_ID_MESA_NVK = 24,
    VK_DRIVER_ID_IMAGINATION_OPEN_SOURCE_MESA = 25,
} VkDriverId;
```

142
VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS,
   // Provided by VK_KHR_driver_properties
   VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA_KHR = VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA,
   // Provided by VK_KHR_driver_properties
   VK_DRIVER_ID_IMAGINATION_PROPRIETARY_KHR = VK_DRIVER_ID_IMAGINATION_PROPRIETARY,
   // Provided by VK_KHR_driver_properties
   VK_DRIVER_ID_QUALCOMM_PROPRIETARY_KHR = VK_DRIVER_ID_QUALCOMM_PROPRIETARY,
   // Provided by VK_KHR_driver_properties
   VK_DRIVER_ID_ARM_PROPRIETARY_KHR = VK_DRIVER_ID_ARM_PROPRIETARY,
   // Provided by VK_KHR_driver_properties
   VK_DRIVER_ID_GOOGLE_SWIFTSHADER_KHR = VK_DRIVER_ID_GOOGLE_SWIFTSHADER,
   // Provided by VK_KHR_driver_properties
   VK_DRIVER_ID_GGP_PROPRIETARY_KHR = VK_DRIVER_ID_GGP_PROPRIETARY,
   // Provided by VK_KHR_driver_properties
   VK_DRIVER_ID_BROADCOM_PROPRIETARY_KHR = VK_DRIVER_ID_BROADCOM_PROPRIETARY,
} VkDriverId;

or the equivalent

// Provided by VK_KHR_driver_properties
typedef VkDriverId VkDriverIdKHR;

Note
Khronos driver IDs may be allocated by vendors at any time. There may be multiple driver IDs for the same vendor, representing different drivers (for e.g. different platforms, proprietary or open source, etc.). Only the latest canonical versions of this Specification, of the corresponding \textit{vk.xml} API Registry, and of the corresponding \textit{vulkan_core.h} header file \textbf{must} contain all reserved Khronos driver IDs.

Only driver IDs registered with Khronos are given symbolic names. There \textbf{may be} unregistered driver IDs returned.

\textbf{VK\_MAX\_DRIVER\_NAME\_SIZE} is the length in \texttt{char} values of an array containing a driver name string, as returned in \texttt{VkPhysicalDeviceDriverProperties::driverName}.

\begin{verbatim}
#define VK_MAX_DRIVER_NAME_SIZE 256U
\end{verbatim}

or the equivalent

\begin{verbatim}
#define VK_MAX_DRIVER_NAME_SIZE_KHR VK_MAX_DRIVER_NAME_SIZE
\end{verbatim}

\textbf{VK\_MAX\_DRIVER\_INFO\_SIZE} is the length in \texttt{char} values of an array containing a driver information string, as returned in \texttt{VkPhysicalDeviceDriverProperties::driverInfo}.
```c
#define VK_MAX_DRIVER_INFO_SIZE           256U

or the equivalent

#define VK_MAX_DRIVER_INFO_SIZE_KHR       VK_MAX_DRIVER_INFO_SIZE

The conformance test suite version an implementation is compliant with is described with the `VkConformanceVersion` structure:

```c
// Provided by VK_VERSION_1_2
typedef struct VkConformanceVersion {
    uint8_t major;
    uint8_t minor;
    uint8_t subminor;
    uint8_t patch;
} VkConformanceVersion;
```

or the equivalent

```c
// Provided by VK_KHR_driver_properties
typedef VkConformanceVersion VkConformanceVersionKHR;
```

- **major** is the major version number of the conformance test suite.
- **minor** is the minor version number of the conformance test suite.
- **subminor** is the subminor version number of the conformance test suite.
- **patch** is the patch version number of the conformance test suite.

The `VkPhysicalDevicePCIBusInfoPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_pci_bus_info
typedef struct VkPhysicalDevicePCIBusInfoPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t pciDomain;
    uint32_t pciBus;
    uint32_t pciDevice;
    uint32_t pciFunction;
} VkPhysicalDevicePCIBusInfoPropertiesEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **pciDomain** is the PCI bus domain.
• `pciBus` is the PCI bus identifier.
• `pciDevice` is the PCI device identifier.
• `pciFunction` is the PCI device function identifier.

If the `VkPhysicalDevicePCIBusInfoPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the PCI bus information of a physical device.

**Valid Usage (Implicit)**

• VUID-VkPhysicalDevicePCIBusInfoPropertiesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PCI_BUS_INFO_PROPERTIES_EXT`

The `VkPhysicalDeviceDrmPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_physical_device_drm
typedef struct VkPhysicalDeviceDrmPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 hasPrimary;
    VkBool32 hasRender;
    int64_t primaryMajor;
    int64_t primaryMinor;
    int64_t renderMajor;
    int64_t renderMinor;
} VkPhysicalDeviceDrmPropertiesEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `hasPrimary` is a boolean indicating whether the physical device has a DRM primary node.
• `hasRender` is a boolean indicating whether the physical device has a DRM render node.
• `primaryMajor` is the DRM primary node major number, if any.
• `primaryMinor` is the DRM primary node minor number, if any.
• `renderMajor` is the DRM render node major number, if any.
• `renderMinor` is the DRM render node minor number, if any.

If the `VkPhysicalDeviceDrmPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the DRM information of a physical device.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDrmPropertiesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DRM_PROPERTIES_EXT

The `VkPhysicalDeviceShaderIntegerDotProductProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceShaderIntegerDotProductProperties {
    VkStructureType sType;
    void* pNext;
    VkBool32 integerDotProduct8BitUnsignedAccelerated;
    VkBool32 integerDotProduct8BitSignedAccelerated;
    VkBool32 integerDotProduct8BitMixedSignednessAccelerated;
    VkBool32 integerDotProduct4x8BitPackedUnsignedAccelerated;
    VkBool32 integerDotProduct4x8BitPackedSignedAccelerated;
    VkBool32 integerDotProduct4x8BitPackedMixedSignednessAccelerated;
    VkBool32 integerDotProduct16BitUnsignedAccelerated;
    VkBool32 integerDotProduct16BitSignedAccelerated;
    VkBool32 integerDotProduct16BitMixedSignednessAccelerated;
    VkBool32 integerDotProduct32BitUnsignedAccelerated;
    VkBool32 integerDotProduct32BitSignedAccelerated;
    VkBool32 integerDotProduct32BitMixedSignednessAccelerated;
    VkBool32 integerDotProduct64BitUnsignedAccelerated;
    VkBool32 integerDotProduct64BitSignedAccelerated;
    VkBool32 integerDotProduct64BitMixedSignednessAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating8BitUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating8BitSignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating16BitUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating16BitSignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating32BitUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating32BitSignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating64BitUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating64BitSignedAccelerated;
} VkPhysicalDeviceShaderIntegerDotProductProperties;
```
VkBool32 integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated;
} VkPhysicalDeviceShaderIntegerDotProductProperties;

or the equivalent

// Provided by VK_KHR_shader_integer_dot_product
typedef VkPhysicalDeviceShaderIntegerDotProductProperties
VkPhysicalDeviceShaderIntegerDotProductPropertiesKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.

• integerDotProduct8BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit unsigned dot product operations using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct8BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit signed dot product operations using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct8BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 8-bit mixed signedness dot product operations using the OpSUDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct4x8BitPackedUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit unsigned dot product operations from operands packed into 32-bit integers using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct4x8BitPackedSignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit signed dot product operations from operands packed into 32-bit integers using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

• **integerDotProduct64BitMixedSignednessAccelerated** is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating8BitUnsignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating8BitSignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating16BitUnsignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 16-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating16BitSignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 16-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated** is a boolean that will be `VK_TRUE` if the support for 16-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.
be **VK_TRUE** if the support for 16-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- **integerDotProductAccumulatingSaturating32BitUnsignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 32-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- **integerDotProductAccumulatingSaturating32BitSignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 32-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- **integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated** is a boolean that will be **VK_TRUE** if the support for 32-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- **integerDotProductAccumulatingSaturating64BitUnsignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 64-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- **integerDotProductAccumulatingSaturating64BitSignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 64-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- **integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated** is a boolean that will be **VK_TRUE** if the support for 64-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

If the `VkPhysicalDeviceShaderIntegerDotProductProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the integer dot product acceleration information of a physical device.

**Note**

A dot product operation is deemed accelerated if its implementation provides a performance advantage over application-provided code composed from elementary instructions and/or other dot product instructions, either because the implementation uses optimized machine code sequences whose generation from application-provided code cannot be guaranteed or because it uses hardware features that cannot otherwise be targeted from application-provided code.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceShaderIntegerDotProductProperties-sType-sType**  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_DOT_PRODUCT_PROPERTIES**

The `VkPhysicalDeviceImageProcessingPropertiesQCOM` structure is defined as:

```c
// Provided by VK_QCOM_image_processing
typedef struct VkPhysicalDeviceImageProcessingPropertiesQCOM {
```

```c
```
VkStructureType sType;  
void* pNext;  
uint32_t maxWeightFilterPhases;  
VkExtent2D maxWeightFilterDimension;  
VkExtent2D maxBlockMatchRegion;  
VkExtent2D maxBoxFilterBlockSize;
} VkPhysicalDeviceImageProcessingPropertiesQCOM;

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **maxWeightFilterPhases** is the maximum value that **can** be specified for *VkImageViewSampleWeightCreateInfoQCOM::numPhases* in weight image sampling operations.
- **maxWeightFilterDimension** is a *VkExtent2D* describing the largest dimensions (width and height) that **can** be specified for *VkImageViewSampleWeightCreateInfoQCOM::filterSize*.
- **maxBlockMatchRegion** is a *VkExtent2D* describing the largest dimensions (width and height) that **can** be specified for *blockSize* in block matching operations.
- **maxBoxFilterBlockSize** is a *VkExtent2D* describing the maximum dimensions (width and height) that **can** be specified for *blocksize* in box filter sampling operations.

If the *VkPhysicalDeviceImageProcessingPropertiesQCOM* structure is included in the **pNext** chain of the *VkPhysicalDeviceProperties2* structure passed to *vkGetPhysicalDeviceProperties2*, it is filled in with each corresponding implementation-dependent property.

These are properties of the image processing information of a physical device.

Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceImageProcessingPropertiesQCOM-sType-sType**
  
  **sType must be** [VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_PROCESSING_PROPERTIES_QCOM](#)

The *VkPhysicalDeviceShaderTileImagePropertiesEXT* structure is defined as:

```c
// Provided by VK_EXT_shader_tile_image
typedef struct VkPhysicalDeviceShaderTileImagePropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderTileImageCoherentReadAccelerated;
    VkBool32 shaderTileImageReadSampleFromPixelRateInvocation;
    VkBool32 shaderTileImageReadFromHelperInvocation;
} VkPhysicalDeviceShaderTileImagePropertiesEXT;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderTileImageCoherentReadAccelerated** is a boolean that will be **VK_TRUE** if coherent reads of tile
image data is accelerated.

- `shaderTileImageReadSampleFromPixelRateInvocation` is a boolean that will be `VK_TRUE` if reading from samples from a pixel rate fragment invocation is supported when `VkPipelineMultisampleStateCreateInfo::rasterizationSamples > 1`.

- `shaderTileImageReadFromHelperInvocation` is a boolean that will be `VK_TRUE` if reads of tile image data from helper fragment invocations result in valid values.

If the `VkPhysicalDeviceShaderTileImagePropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the tile image information of a physical device.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderTileImagePropertiesEXT-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TILE_IMAGE_PROPERTIES_EXT`

The `VkPhysicalDeviceImageProcessing2PropertiesQCOM` structure is defined as:

```c
// Provided by VK_QCOM_image_processing2
typedef struct VkPhysicalDeviceImageProcessing2PropertiesQCOM {
    VkStructureType sType;
    void* pNext;
    VkExtent2D maxBlockMatchWindow;
} VkPhysicalDeviceImageProcessing2PropertiesQCOM;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **maxBlockMatchWindow** is a `VkExtent2D` describing the largest dimensions (width and height) that can be specified for the block match window.

If the `VkPhysicalDeviceImageProcessing2PropertiesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the image processing2 information of a physical device.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageProcessing2PropertiesQCOM-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_PROCESSING_2_PROPERTIES_QCOM`

The `VkPhysicalDeviceLayeredDriverPropertiesMSFT` structure is defined as:
typedef struct VkPhysicalDeviceLayeredDriverPropertiesMSFT {
    VkStructureType sType;
    void* pNext;
    VkLayeredDriverUnderlyingApiMSFT underlyingAPI;
} VkPhysicalDeviceLayeredDriverPropertiesMSFT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• underlyingAPI is a VkLayeredDriverUnderlyingApiMSFT value indicating which underlying API is used to implement the layered driver, or VK_LAYERED_DRIVER_UNDERLYING_API_NONE_MSFT if the driver is not layered.

These are properties of the driver layering information of a physical device.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceLayeredDriverPropertiesMSFT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LAYERED_DRIVER_PROPERTIES_MSFT

Underlying APIs which may be returned in VkPhysicalDeviceLayeredDriverPropertiesMSFT::underlyingAPI are:

typedef enum VkLayeredDriverUnderlyingApiMSFT {
    VK_LAYERED_DRIVER_UNDERLYING_API_NONE_MSFT = 0,
    VK_LAYERED_DRIVER_UNDERLYING_API_D3D12_MSFT = 1,
} VkLayeredDriverUnderlyingApiMSFT;

To query properties of queues available on a physical device, call:

void vkGetPhysicalDeviceQueueFamilyProperties(
    VkPhysicalDevice physicalDevice,
    uint32_t* pQueueFamilyPropertyCount,
    VkQueueFamilyProperties* pQueueFamilyProperties);

• physicalDevice is the handle to the physical device whose properties will be queried.
• pQueueFamilyPropertyCount is a pointer to an integer related to the number of queue families available or queried, as described below.
• pQueueFamilyProperties is either NULL or a pointer to an array of VkQueueFamilyProperties structures.

If pQueueFamilyProperties is NULL, then the number of queue families available is returned in
pQueueFamilyPropertyCount. Implementations must support at least one queue family. Otherwise, pQueueFamilyPropertyCount must point to a variable set by the user to the number of elements in the pQueueFamilyProperties array, and on return the variable is overwritten with the number of structures actually written to pQueueFamilyProperties. If pQueueFamilyPropertyCount is less than the number of queue families available, at most pQueueFamilyPropertyCount structures will be written.

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceQueueFamilyProperties-physicalDevice-parameter
physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyPropertyCount-parameter
pQueueFamilyPropertyCount must be a valid pointer to a uint32_t value

• VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyProperties-parameter
If the value referenced by pQueueFamilyPropertyCount is not 0, and pQueueFamilyProperties is not NULL, pQueueFamilyProperties must be a valid pointer to an array of pQueueFamilyPropertyCount VkQueueFamilyProperties structures

The VkQueueFamilyProperties structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkQueueFamilyProperties {
    VkQueueFlags queueFlags;
    uint32_t queueCount;
    uint32_t timestampValidBits;
    VkExtent3D minImageTransferGranularity;
} VkQueueFamilyProperties;
```

• queueFlags is a bitmask of VkQueueFlagBits indicating capabilities of the queues in this queue family.

• queueCount is the unsigned integer count of queues in this queue family. Each queue family must support at least one queue.

• timestampValidBits is the unsigned integer count of meaningful bits in the timestamps written via vkCmdWriteTimestamp2 or vkCmdWriteTimestamp. The valid range for the count is 36 to 64 bits, or a value of 0, indicating no support for timestamps. Bits outside the valid range are guaranteed to be zeros.

• minImageTransferGranularity is the minimum granularity supported for image transfer operations on the queues in this queue family.

The value returned in minImageTransferGranularity has a unit of compressed texel blocks for images having a block-compressed format, and a unit of texels otherwise.

Possible values of minImageTransferGranularity are:

• (0,0,0) specifies that only whole mip levels must be transferred using the image transfer
operations on the corresponding queues. In this case, the following restrictions apply to all offset and extent parameters of image transfer operations:

- The $x$, $y$, and $z$ members of a VkOffset3D parameter must always be zero.
- The width, height, and depth members of a VkExtent3D parameter must always match the width, height, and depth of the image subresource corresponding to the parameter, respectively.

- $(A_x, A_y, A_z)$ where $A_x$, $A_y$, and $A_z$ are all integer powers of two. In this case the following restrictions apply to all image transfer operations:
  - $x$, $y$, and $z$ of a VkOffset3D parameter must be integer multiples of $A_x$, $A_y$, and $A_z$, respectively.
  - width of a VkExtent3D parameter must be an integer multiple of $A_x$, or else $x + \text{width}$ must equal the width of the image subresource corresponding to the parameter.
  - height of a VkExtent3D parameter must be an integer multiple of $A_y$, or else $y + \text{height}$ must equal the height of the image subresource corresponding to the parameter.
  - depth of a VkExtent3D parameter must be an integer multiple of $A_z$, or else $z + \text{depth}$ must equal the depth of the image subresource corresponding to the parameter.
  - If the format of the image corresponding to the parameters is one of the block-compressed formats then for the purposes of the above calculations the granularity must be scaled up by the compressed texel block dimensions.

Queues supporting graphics and/or compute operations must report $(1,1,1)$ in minImageTransferGranularity, meaning that there are no additional restrictions on the granularity of image transfer operations for these queues. Other queues supporting image transfer operations are only required to support whole mip level transfers, thus minImageTransferGranularity for queues belonging to such queue families may be $(0,0,0)$.

The Device Memory section describes memory properties queried from the physical device.

For physical device feature queries see the Features chapter.

Bits which may be set in VkQueueFamilyProperties::queueFlags, indicating capabilities of queues in a queue family are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueueFlagBits {
    VK_QUEUE_GRAPHICS_BIT = 0x00000001,
    VK_QUEUE_COMPUTE_BIT = 0x00000002,
    VK_QUEUE_TRANSFER_BIT = 0x00000004,
    VK_QUEUE_SPARSE_BINDING_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_QUEUE_PROTECTED_BIT = 0x00000010,
    // Provided by VK_KHR_video_decode_queue
    VK_QUEUE_VIDEO_DECODE_BIT_KHR = 0x00000020,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_encode_queue
    VK_QUEUE_VIDEO_ENCODE_BIT_KHR = 0x00000040,
    #endif
};
```
• **VK_QUEUE_GRAPHICS_BIT** specifies that queues in this queue family support graphics operations.

• **VK_QUEUE.Compute_BIT** specifies that queues in this queue family support compute operations.

• **VK_QUEUE_TRANSFER_BIT** specifies that queues in this queue family support transfer operations.

• **VK_QUEUE_SPARSE_BINDING_BIT** specifies that queues in this queue family support sparse memory management operations (see Sparse Resources). If any of the sparse resource features are enabled, then at least one queue family must support this bit.

• **VK_QUEUE_VIDEO DECODE_BIT_KHR** specifies that queues in this queue family support video decode operations.

• **VK_QUEUE_VIDEO_ENCODE_BIT_KHR** specifies that queues in this queue family support video encode operations.

• **VK_QUEUE_OPTICAL_FLOW_BIT_NV** specifies that queues in this queue family support optical flow operations.

• **VK_QUEUE_PROTECTED_BIT** specifies that queues in this queue family support the `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT` bit. (see Protected Memory). If the physical device supports the protectedMemory feature, at least one of its queue families must support this bit.

If an implementation exposes any queue family that supports graphics operations, at least one queue family of at least one physical device exposed by the implementation must support both graphics and compute operations.

Furthermore, if the protectedMemory physical device feature is supported, then at least one queue family of at least one physical device exposed by the implementation must support graphics operations, compute operations, and protected memory operations.

---

**Note**

All commands that are allowed on a queue that supports transfer operations are also allowed on a queue that supports either graphics or compute operations. Thus, if the capabilities of a queue family include **VK_QUEUE_GRAPHICS_BIT** or **VK_QUEUE_COMPUTE_BIT**, then reporting the **VK_QUEUE_TRANSFER_BIT** capability separately for that queue family is optional.

For further details see Queues.
void vkGetPhysicalDeviceQueueFamilyProperties2(
    VkPhysicalDevice physicalDevice,
    uint32_t* pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2* pQueueFamilyProperties);

or the equivalent command

void vkGetPhysicalDeviceQueueFamilyProperties2KHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2* pQueueFamilyProperties);

- physicalDevice is the handle to the physical device whose properties will be queried.
- pQueueFamilyPropertyCount is a pointer to an integer related to the number of queue families available or queried, as described in vkGetPhysicalDeviceQueueFamilyProperties.
- pQueueFamilyProperties is either NULL or a pointer to an array of VkQueueFamilyProperties2 structures.

vkGetPhysicalDeviceQueueFamilyProperties2 behaves similarly to vkGetPhysicalDeviceQueueFamilyProperties, with the ability to return extended information in a pNext chain of output structures.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyPropertyCount-parameter pQueueFamilyPropertyCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyProperties-parameter If the value referenced by pQueueFamilyPropertyCount is not 0, and pQueueFamilyProperties is not NULL, pQueueFamilyProperties must be a valid pointer to an array of pQueueFamilyPropertyCount VkQueueFamilyProperties2 structures

The VkQueueFamilyProperties2 structure is defined as:

typedef struct VkQueueFamilyProperties2 {
    VkStructureType sType;
    void* pNext;
    VkQueueFamilyProperties queueFamilyProperties;
};
} VkQueueFamilyProperties2;

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkQueueFamilyProperties2 VkQueueFamilyProperties2KHR;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **queueFamilyProperties** is a *VkQueueFamilyProperties* structure which is populated with the same values as in *vkGetPhysicalDeviceQueueFamilyProperties*.

### Valid Usage (Implicit)

- **VUID-VkQueueFamilyProperties2-sType-sType**
  
  *sType* must be **VK_STRUCTURE_TYPE_QUEUE_FAMILY_PROPERTIES_2**

- **VUID-VkQueueFamilyProperties2-pNext-pNext**
  
  Each **pNext** member of any structure (including this one) in the **pNext** chain must be either **NULL** or a pointer to a valid instance of *VkQueueFamilyCheckpointProperties2NV*, *VkQueueFamilyCheckpointPropertiesNV*, *VkQueueFamilyGlobalPriorityPropertiesKHR*, *VkQueueFamilyQueryResultStatusPropertiesKHR*, or *VkQueueFamilyVideoPropertiesKHR*.

- **VUID-VkQueueFamilyProperties2-sType-unique**
  
  The **sType** value of each struct in the **pNext** chain must be unique.

The definition of *VkQueueFamilyGlobalPriorityPropertiesKHR* is:

```c
// Provided by VK_KHR_global_priority
typedef struct VkQueueFamilyGlobalPriorityPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t priorityCount;
    VkQueueGlobalPriorityKHR priorities[VK_MAX_GLOBAL_PRIORITY_SIZE_KHR];
} VkQueueFamilyGlobalPriorityPropertiesKHR;
```

or the equivalent

```c
// Provided by VK_EXT_global_priority_query
typedef VkQueueFamilyGlobalPriorityPropertiesKHR
VkQueueFamilyGlobalPriorityPropertiesEXT;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
• priorityCount is the number of supported global queue priorities in this queue family, and it **must** be greater than 0.

• priorities is an array of `VK_MAX_GLOBAL_PRIORITY_SIZE_EXT` VkQueueGlobalPriorityEXT enums representing all supported global queue priorities in this queue family. The first priorityCount elements of the array will be valid.

If the `VkQueueFamilyGlobalPriorityPropertiesKHR` structure is included in the pNext chain of the `VkQueueFamilyProperties2` structure passed to `vkGetPhysicalDeviceQueueFamilyProperties2`, it is filled in with the list of supported global queue priorities for the indicated family.

The valid elements of priorities **must** not contain any duplicate values.

The valid elements of priorities **must** be a continuous sequence of VkQueueGlobalPriorityKHR enums in the ascending order.

**Note**

For example, returning priorityCount as 3 with supported priorities as VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR, VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR and VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR is not allowed.

**Valid Usage (Implicit)**

- VUID-VkQueueFamilyGlobalPriorityPropertiesKHR-sType-sType
  sType **must be** VK_STRUCTURE_TYPE_QUEUE_FAMILY_GLOBAL_PRIORITY_PROPERTIES_KHR

- VUID-VkQueueFamilyGlobalPriorityPropertiesKHR-priorities-parameter
  Each element of priorities **must be** a valid VkQueueGlobalPriorityKHR value

`VK_MAX_GLOBAL_PRIORITY_SIZE_KHR` is the length of an array of VkQueueGlobalPriorityKHR enumerants representing supported queue priorities, as returned in `VkQueueFamilyGlobalPriorityPropertiesKHR::priorities`.

```c
#define VK_MAX_GLOBAL_PRIORITY_SIZE_KHR   16U
```

or the equivalent

```c
#define VK_MAX_GLOBAL_PRIORITY_SIZE_EXT   VK_MAX_GLOBAL_PRIORITY_SIZE_KHR
```

The `VkQueueFamilyCheckpointProperties2NV` structure is defined as:

```c
// Provided by VK_KHR_synchronization2 with VK_NV_device_diagnostic_checkpoints
typedef struct VkQueueFamilyCheckpointProperties2NV {
    VkStructureType sType;
    void* pNext;
    VkPipelineStageFlags2 checkpointExecutionStageMask;
} VkQueueFamilyCheckpointProperties2NV;
```
• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **checkpointExecutionStageMask** is a mask indicating which pipeline stages the implementation can execute checkpoint markers in.

Additional queue family information can be queried by setting `VkQueueFamilyProperties2::pNext` to point to a `VkQueueFamilyCheckpointProperties2NV` structure.

**Valid Usage (Implicit)**

• VUID-VkQueueFamilyCheckpointProperties2NV-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_QUEUE_FAMILY_CHECKPOINT_PROPERTIES_2_NV**

The **VkQueueFamilyCheckpointPropertiesNV** structure is defined as:

```c
// Provided by VK_NV_device_diagnostic_checkpoints
typedef struct VkQueueFamilyCheckpointPropertiesNV {
    VkStructureType sType;
    void* pNext;
    VkPipelineStageFlags checkpointExecutionStageMask;
} VkQueueFamilyCheckpointPropertiesNV;
```

• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **checkpointExecutionStageMask** is a mask indicating which pipeline stages the implementation can execute checkpoint markers in.

Additional queue family information can be queried by setting `VkQueueFamilyProperties2::pNext` to point to a `VkQueueFamilyCheckpointPropertiesNV` structure.

**Valid Usage (Implicit)**

• VUID-VkQueueFamilyCheckpointPropertiesNV-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_QUEUE_FAMILY_CHECKPOINT_PROPERTIES_NV**

The **VkQueueFamilyVideoPropertiesKHR** structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkQueueFamilyVideoPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoCodecOperationFlagsKHR videoCodecOperations;
} VkQueueFamilyVideoPropertiesKHR;
```
• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• videoCodecOperations is a bitmask of VkVideoCodecOperationFlagBitsKHR that indicates the set of video codec operations supported by the queue family.

If this structure is included in the pNext chain of the VkQueueFamilyProperties2 structure passed to vkGetPhysicalDeviceQueueFamilyProperties2, then it is filled with the set of video codec operations supported by the specified queue family.

Valid Usage (Implicit)

• VUID-VkQueueFamilyVideoPropertiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUEUE_FAMILY_VIDEO_PROPERTIES_KHR

The VkQueueFamilyQueryResultStatusPropertiesKHR structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkQueueFamilyQueryResultStatusPropertiesKHR {
  VkStructureType sType;
  void* pNext;
  VkBool32 queryResultStatusSupport;
} VkQueueFamilyQueryResultStatusPropertiesKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• queryResultStatusSupport reports VK_TRUE if query type VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR and use of VK_QUERY_RESULT_WITH_STATUS_BIT_KHR are supported.

If this structure is included in the pNext chain of the VkQueueFamilyProperties2 structure passed to vkGetPhysicalDeviceQueueFamilyProperties2, then it is filled with information about whether result status queries are supported by the specified queue family.

Valid Usage (Implicit)

• VUID-VkQueueFamilyQueryResultStatusPropertiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUEUE_FAMILY_QUERY_RESULT_STATUS_PROPERTIES_KHR

To enumerate the performance query counters available on a queue family of a physical device, call:

```c
// Provided by VK_KHR_performance_query
VkResult vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
```
**VkPhysicalDevice**

```c
uint32_t
VkPerformanceCounterKHR*
VkPerformanceCounterDescriptionKHR*` physicalDevice,
queueFamilyIndex,
pCounterCount,
pCounters,
pCounterDescriptions);
```

- **physicalDevice** is the handle to the physical device whose queue family performance query counter properties will be queried.
- **queueFamilyIndex** is the index into the queue family of the physical device we want to get properties for.
- **pCounterCount** is a pointer to an integer related to the number of counters available or queried, as described below.
- **pCounters** is either `NULL` or a pointer to an array of `VkPerformanceCounterKHR` structures.
- **pCounterDescriptions** is either `NULL` or a pointer to an array of `VkPerformanceCounterDescriptionKHR` structures.

If **pCounters** is `NULL` and **pCounterDescriptions** is `NULL`, then the number of counters available is returned in **pCounterCount**. Otherwise, **pCounterCount** must point to a variable set by the user to the number of elements in the **pCounters**, **pCounterDescriptions**, or both arrays and on return the variable is overwritten with the number of structures actually written out. If **pCounterCount** is less than the number of counters available, at most **pCounterCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available counters were returned.

### Valid Usage (Implicit)

- **VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-physicalDevice-parameter**
  - **physicalDevice** must be a valid `VkPhysicalDevice` handle

- **VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterCount-parameter**
  - **pCounterCount** must be a valid pointer to a `uint32_t` value

- **VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounters-parameter**
  - If the value referenced by **pCounterCount** is not `0`, and **pCounters** is not `NULL`, **pCounters** must be a valid pointer to an array of **pCounterCount** `VkPerformanceCounterKHR` structures

- **VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterDescriptions-parameter**
  - If the value referenced by **pCounterCount** is not `0`, and **pCounterDescriptions** is not `NULL`, **pCounterDescriptions** must be a valid pointer to an array of **pCounterCount** `VkPerformanceCounterDescriptionKHR` structures
Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INITIALIZATION_FAILED

The VkPerformanceCounterKHR structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterKHR {
    VkStructureType sType;
    void* pNext;
    VkPerformanceCounterUnitKHR unit;
    VkPerformanceCounterScopeKHR scope;
    VkPerformanceCounterStorageKHR storage;
    uint8_t uuid[VK_UUID_SIZE];
} VkPerformanceCounterKHR;
```

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **unit** is a VkPerformanceCounterUnitKHR specifying the unit that the counter data will record.
• **scope** is a VkPerformanceCounterScopeKHR specifying the scope that the counter belongs to.
• **storage** is a VkPerformanceCounterStorageKHR specifying the storage type that the counter’s data uses.
• **uuid** is an array of size VK_UUID_SIZE, containing 8-bit values that represent a universally unique identifier for the counter of the physical device.

Valid Usage (Implicit)

• VUID-VkPerformanceCounterKHR-sType-sType
  **sType** must be VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_KHR
• VUID-VkPerformanceCounterKHR-pNext-pNext
  **pNext** must be NULL

Performance counters have an associated unit. This unit describes how to interpret the performance counter result.
The performance counter unit types which **may** be returned in `VkPerformanceCounterKHR::unit` are:

```c
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterUnitKHR {
    VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR = 0,
    VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR = 1,
    VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR = 2,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR = 3,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR = 4,
    VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR = 5,
    VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR = 6,
    VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR = 7,
    VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR = 8,
    VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR = 9,
    VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR = 10,
} VkPerformanceCounterUnitKHR;
```

- **VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR** - the performance counter unit is a generic data point.
- **VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR** - the performance counter unit is a percentage (%).
- **VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR** - the performance counter unit is a value of nanoseconds (ns).
- **VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR** - the performance counter unit is a value of bytes.
- **VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR** - the performance counter unit is a value of bytes/s.
- **VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR** - the performance counter unit is a temperature reported in Kelvin.
- **VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR** - the performance counter unit is a value of watts (W).
- **VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR** - the performance counter unit is a value of volts (V).
- **VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR** - the performance counter unit is a value of amps (A).
- **VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR** - the performance counter unit is a value of hertz (Hz).
- **VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR** - the performance counter unit is a value of cycles.

Performance counters have an associated scope. This scope describes the granularity of a performance counter.

The performance counter scope types which **may** be returned in `VkPerformanceCounterKHR::scope` are:

```c
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterScopeKHR {
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR = 0,
    VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR = 1,
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR = 2,
    VkPerformanceCounterScopeKHR;
```

Performance counter unit types which may be returned in `VkPerformanceCounterKHR::unit` are:

- **VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR** - the performance counter unit is a generic data point.
- **VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR** - the performance counter unit is a percentage (%).
- **VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR** - the performance counter unit is a value of nanoseconds (ns).
- **VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR** - the performance counter unit is a value of bytes.
- **VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR** - the performance counter unit is a value of bytes/s.
- **VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR** - the performance counter unit is a temperature reported in Kelvin.
- **VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR** - the performance counter unit is a value of watts (W).
- **VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR** - the performance counter unit is a value of volts (V).
- **VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR** - the performance counter unit is a value of amps (A).
- **VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR** - the performance counter unit is a value of hertz (Hz).
- **VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR** - the performance counter unit is a value of cycles.

Performance counters have an associated scope. This scope describes the granularity of a performance counter.

The performance counter scope types which may be returned in `VkPerformanceCounterKHR::scope` are:
vk_query_scope_command_buffer_khr =
vk_performance_counter_scope_command_buffer_khr,
vk_query_scope_render_pass_khr = vk_performance_counter_scope_render_pass_khr,
vk_query_scope_command_khr = vk_performance_counter_scope_command_khr,
} VkPerformanceCounterScopeKHR;

- **VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR** - the performance counter scope is a single complete command buffer.

- **VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR** - the performance counter scope is zero or more complete render passes. The performance query containing the performance counter must begin and end outside a render pass instance.

- **VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR** - the performance counter scope is zero or more commands.

Performance counters have an associated storage. This storage describes the payload of a counter result.

The performance counter storage types which may be returned in `VkPerformanceCounterKHR::storage` are:

```c
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterStorageKHR {
   VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR = 0,
   VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR = 1,
   VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR = 2,
   VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR = 3,
   VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR = 4,
   VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR = 5,
} VkPerformanceCounterStorageKHR;
```

- **VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR** - the performance counter storage is a 32-bit signed integer.

- **VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR** - the performance counter storage is a 64-bit signed integer.

- **VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR** - the performance counter storage is a 32-bit unsigned integer.

- **VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR** - the performance counter storage is a 64-bit unsigned integer.

- **VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR** - the performance counter storage is a 32-bit floating-point.

- **VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR** - the performance counter storage is a 64-bit floating-point.

The `VkPerformanceCounterDescriptionKHR` structure is defined as:
```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterDescriptionKHR {
    VkStructureType sType;
    void* pNext;
    VkPerformanceCounterDescriptionFlagsKHR flags;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char category[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
} VkPerformanceCounterDescriptionKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkPerformanceCounterDescriptionFlagBitsKHR` indicating the usage behavior for the counter.
- **name** is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the name of the counter.
- **category** is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the category of the counter.
- **description** is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the description of the counter.

**Valid Usage (Implicit)**

- **VUID-VkPerformanceCounterDescriptionKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR`
- **VUID-VkPerformanceCounterDescriptionKHR-pNext-pNext**
  - `pNext` must be `NULL`

Bits which can be set in `VkPerformanceCounterDescriptionKHR::flags`, specifying usage behavior of a performance counter, are:

```c
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterDescriptionFlagBitsKHR {
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR = 0x00000001,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR = 0x00000002,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_KHR =
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_KHR =
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR,
} VkPerformanceCounterDescriptionFlagBitsKHR;
```

- **VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR** specifies that recording the counter may have a noticeable performance impact.
- `VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR` specifies that concurrently recording the counter while other submitted command buffers are running may impact the accuracy of the recording.

```cpp
// Provided by VK_KHR_performance_query
typedef VkFlags VkPerformanceCounterDescriptionFlagsKHR;
```

`VkPerformanceCounterDescriptionFlagsKHR` is a bitmask type for setting a mask of zero or more `VkPerformanceCounterDescriptionFlagBitsKHR`.

### 5.2. Devices

Device objects represent logical connections to physical devices. Each device exposes a number of queue families each having one or more queues. All queues in a queue family support the same operations.

As described in Physical Devices, a Vulkan application will first query for all physical devices in a system. Each physical device can then be queried for its capabilities, including its queue and queue family properties. Once an acceptable physical device is identified, an application will create a corresponding logical device. The created logical device is then the primary interface to the physical device.

How to enumerate the physical devices in a system and query those physical devices for their queue family properties is described in the Physical Device Enumeration section above.

A single logical device can be created from multiple physical devices, if those physical devices belong to the same device group. A device group is a set of physical devices that support accessing each other’s memory and recording a single command buffer that can be executed on all the physical devices. Device groups are enumerated by calling `vkEnumeratePhysicalDeviceGroups`, and a logical device is created from a subset of the physical devices in a device group by passing the physical devices through `VkDeviceGroupDeviceCreateInfo`. For two physical devices to be in the same device group, they must support identical extensions, features, and properties.

**Note**

Physical devices in the same device group must be so similar because there are no rules for how different features/properties would interact. They must return the same values for nearly every invariant `vkGetPhysicalDevice*` feature, property, capability, etc., but could potentially differ for certain queries based on things like having a different display connected, or a different compositor. The specification does not attempt to enumerate which state is in each category, because such a list would quickly become out of date.

To retrieve a list of the device groups present in the system, call:

```cpp
// Provided by VK_VERSION_1_1
VkResult vkEnumeratePhysicalDeviceGroups(
    VkInstance instance,
```
or the equivalent command

```c
// Provided by VK_KHR_device_group_creation
VkResult vkEnumeratePhysicalDeviceGroupsKHR(
    VkInstance instance,
    uint32_t* pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

- `instance` is a handle to a Vulkan instance previously created with `vkCreateInstance`.
- `pPhysicalDeviceGroupCount` is a pointer to an integer related to the number of device groups available or queried, as described below.
- `pPhysicalDeviceGroupProperties` is either `NULL` or a pointer to an array of `VkPhysicalDeviceGroupProperties` structures.

If `pPhysicalDeviceGroupProperties` is `NULL`, then the number of device groups available is returned in `pPhysicalDeviceGroupCount`. Otherwise, `pPhysicalDeviceGroupCount` must point to a variable set by the user to the number of elements in the `pPhysicalDeviceGroupProperties` array, and on return the variable is overwritten with the number of structures actually written to `pPhysicalDeviceGroupProperties`. If `pPhysicalDeviceGroupCount` is less than the number of device groups available, at most `pPhysicalDeviceGroupCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available device groups were returned.

Every physical device must be in exactly one device group.

### Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDeviceGroups-instance-parameter
  
  `instance` must be a valid `VkInstance` handle

- VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupCount-parameter
  
  `pPhysicalDeviceGroupCount` must be a valid pointer to a `uint32_t` value

- VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupProperties-parameter
  
  If the value referenced by `pPhysicalDeviceGroupCount` is not 0, and `pPhysicalDeviceGroupProperties` is not `NULL`, `pPhysicalDeviceGroupProperties` must be a valid pointer to an array of `pPhysicalDeviceGroupCount` `VkPhysicalDeviceGroupProperties` structures

### Return Codes

**Success**

- `VK_SUCCESS`
The `VkPhysicalDeviceGroupProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceGroupProperties {
    VkStructureType sType;
    void*pNext;
    uint32_t physicalDeviceCount;
    VkPhysicalDevice physicalDevices[VK_MAX_DEVICE_GROUP_SIZE];
    VkBool32 subsetAllocation;
} VkPhysicalDeviceGroupProperties;
```

or the equivalent

```c
// Provided by VK_KHR_device_group_creation
typedef VkPhysicalDeviceGroupProperties VkPhysicalDeviceGroupPropertiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **physicalDeviceCount** is the number of physical devices in the group.
- **physicalDevices** is an array of `VK_MAX_DEVICE_GROUP_SIZE` `VkPhysicalDevice` handles representing all physical devices in the group. The first `physicalDeviceCount` elements of the array will be valid.
- **subsetAllocation** specifies whether logical devices created from the group support allocating device memory on a subset of devices, via the `deviceMask` member of the `VkMemoryAllocateFlagsInfo`. If this is `VK_FALSE`, then all device memory allocations are made across all physical devices in the group. If `physicalDeviceCount` is 1, then `subsetAllocation` must be `VK_FALSE`.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceGroupProperties-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES`

- VUID-VkPhysicalDeviceGroupProperties-pNext-pNext
  
  **pNext** must be `NULL`

`VK_MAX_DEVICE_GROUP_SIZE` is the length of an array containing `VkPhysicalDevice` handle values.
representing all physical devices in a group, as returned in `VkPhysicalDeviceGroupProperties::physicalDevices`.

```c
#define VK_MAX_DEVICE_GROUP_SIZE          32U
```
or the equivalent

```c
#define VK_MAX_DEVICE_GROUP_SIZE_KHR      VK_MAX_DEVICE_GROUP_SIZE
```

### 5.2.1. Device Creation

Logical devices are represented by `VkDevice` handles:

// Provided by VK_VERSION_1_0

```c
VK_DEFINE_HANDLE(VkDevice)
```

A logical device is created as a *connection* to a physical device. To create a logical device, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateDevice(                  
    VkPhysicalDevice physicalDevice,     
    const VkDeviceCreateInfo* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkDevice* pDevice);                   
```

- `physicalDevice` *must* be one of the device handles returned from a call to `vkEnumeratePhysicalDevices` (see Physical Device Enumeration).
- `pCreateInfo` is a pointer to a `VkDeviceCreateInfo` structure containing information about how to create the device.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pDevice` is a pointer to a handle in which the created `VkDevice` is returned.

`vkCreateDevice` verifies that extensions and features requested in the `ppEnabledExtensionNames` and `pEnabledFeatures` members of `pCreateInfo`, respectively, are supported by the implementation. If any requested extension is not supported, `vkCreateDevice` *must* return `VK_ERROR_EXTENSION_NOT_PRESENT`. If any requested feature is not supported, `vkCreateDevice` *must* return `VK_ERROR_FEATURE_NOT_PRESENT`. Support for extensions *can* be checked before creating a device by querying `vkEnumerateDeviceExtensionProperties`. Support for features *can* similarly be checked by querying `vkGetPhysicalDeviceFeatures`.

After verifying and enabling the extensions the `VkDevice` object is created and returned to the application.

Multiple logical devices *can* be created from the same physical device. Logical device creation *may*
fail due to lack of device-specific resources (in addition to other errors). If that occurs, `vkCreateDevice` will return `VK_ERROR_TOO_MANY_OBJECTS`.

### Valid Usage

- VUID-vkCreateDevice-ppEnabledExtensionNames-01387
  All required device extensions for each extension in the `VkDeviceCreateInfo ::ppEnabledExtensionNames` list must also be present in that list

### Valid Usage (Implicit)

- VUID-vkCreateDevice-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkCreateDevice-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkDeviceCreateInfo` structure
- VUID-vkCreateDevice-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateDevice-pDevice-parameter
  `pDevice` must be a valid pointer to a `VkDevice` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_EXTENSION_NOT_PRESENT`
- `VK_ERROR_FEATURE_NOT_PRESENT`
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_DEVICE_LOST`

The `VkDeviceCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDeviceCreateInfo {
    VkStructureType sType;
    const void*pNext;
} VkDeviceCreateInfo;
```
VkDeviceCreateInfo

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- queueCreateInfoCount is the unsigned integer size of the pQueueCreateInfos array. Refer to the Queue Creation section below for further details.
- pQueueCreateInfos is a pointer to an array of VkDeviceQueueCreateInfo structures describing the queues that are requested to be created along with the logical device. Refer to the Queue Creation section below for further details.
- enabledLayerCount is deprecated and ignored.
- ppEnabledLayerNames is deprecated and ignored. See Device Layer Deprecation.
- enabledExtensionCount is the number of device extensions to enable.
- ppEnabledExtensionNames is a pointer to an array of enabledExtensionCount null-terminated UTF-8 strings containing the names of extensions to enable for the created device. See the Extensions section for further details.
- pEnabledFeatures is NULL or a pointer to a VkPhysicalDeviceFeatures structure containing boolean indicators of all the features to be enabled. Refer to the Features section for further details.

Valid Usage

- VUID-VkDeviceCreateInfo-queueFamilyIndex-02802
  The queueFamilyIndex member of each element of pQueueCreateInfos must be unique within pQueueCreateInfos, except that two members can share the same queueFamilyIndex if one describes protected-capable queues and one describes queues that are not protected-capable.

- VUID-VkDeviceCreateInfo-pQueueCreateInfos-06755
  If multiple elements of pQueueCreateInfos share the same queueFamilyIndex, the sum of their queueCount members must be less than or equal to the queueCount member of the VkQueueFamilyProperties structure, as returned by vkGetPhysicalDeviceQueueFamilyProperties in the pQueueFamilyProperties[queueFamilyIndex].

- VUID-VkDeviceCreateInfo-pQueueCreateInfos-06654
  If multiple elements of pQueueCreateInfos share the same queueFamilyIndex, then all of
such elements must have the same global priority level, which can be specified explicitly by the including a VkDeviceQueueGlobalPriorityCreateInfoKHR structure in the pNext chain, or by the implicit default value

- VUID-VkDeviceCreateInfo-pNext-00373
  If the pNext chain includes a VkPhysicalDeviceFeatures2 structure, then pEnabledFeatures must be NULL

- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-01840
  If VkPhysicalDeviceProperties::apiVersion advertises Vulkan 1.1 or later, ppEnabledExtensionNames must not contain VK_AMD_negative_viewport_height

- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-00374
  ppEnabledExtensionNames must not contain both VK_KHR_maintenance1 and VK_AMD_negative_viewport_height

- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-03328
  ppEnabledExtensionNames must not contain both VK_KHR_buffer_device_address and VK_EXT_buffer_device_address

- VUID-VkDeviceCreateInfo-pNext-04748
  If the pNext chain includes a VkPhysicalDeviceVulkan12Features structure and VkPhysicalDeviceVulkan12Features::bufferDeviceAddress is VK_TRUE, ppEnabledExtensionNames must not contain VK_EXT_buffer_device_address

- VUID-VkDeviceCreateInfo-pNext-02829
  If the pNext chain includes a VkPhysicalDeviceVulkan11Features structure, then it must not include a VkPhysicalDevice16BitStorageFeatures, VkPhysicalDeviceMultiviewFeatures, VkPhysicalDeviceProtectedMemoryFeatures, VkPhysicalDeviceSamplerYcbcrConversionFeatures, or VkPhysicalDeviceShaderDrawParametersFeatures structure

- VUID-VkDeviceCreateInfo-pNext-02830
  If the pNext chain includes a VkPhysicalDeviceVulkan12Features structure, then it must not include a VkPhysicalDevice8BitStorageFeatures, VkPhysicalDeviceShader AtomicInt64Features, VkPhysicalDeviceShaderFloat16Int8Features, VkPhysicalDeviceDescriptorIndexingFeatures, VkPhysicalDeviceScalarBlockLayoutFeatures, VkPhysicalDeviceImagelessFramebufferFeatures, VkPhysicalDeviceUniformBufferStandardLayoutFeatures, VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures, VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures, VkPhysicalDeviceHostQueryResetFeatures, VkPhysicalDeviceTimelineSemaphoreFeatures, VkPhysicalDeviceBufferDeviceAddressFeatures, or VkPhysicalDeviceVulkanMemoryModelFeatures structure

- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-04476
  If ppEnabledExtensionNames contains "VK_KHR_shader_draw_parameters" and the pNext chain includes a VkPhysicalDeviceVulkan11Features structure, then VkPhysicalDeviceVulkan11Features::shaderDrawParameters must be VK_TRUE
If `ppEnabledExtensionNames` contains "VK_KHR_draw_indirect_count" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::drawIndirectCount` must be `VK_TRUE`.

If `ppEnabledExtensionNames` contains "VK_KHR_sampler_mirror_clamp_to_edge" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::samplerMirrorClampToEdge` must be `VK_TRUE`.

If `ppEnabledExtensionNames` contains "VK_EXT_descriptor_indexing" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::descriptorIndexing` must be `VK_TRUE`.

If `ppEnabledExtensionNames` contains "VK_EXT_sampler_filter_minmax" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::samplerFilterMinmax` must be `VK_TRUE`.

If `ppEnabledExtensionNames` contains "VK_EXT_shader_viewport_index_layer" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::shaderOutputViewportIndex` and `VkPhysicalDeviceVulkan12Features::shaderOutputLayer` must both be `VK_TRUE`.

If the `pNext` chain includes a `VkPhysicalDeviceVulkan13Features` structure, then it must not include a `VkPhysicalDeviceDynamicRenderingFeatures`, `VkPhysicalDeviceImageRobustnessFeatures`, `VkPhysicalDeviceInlineUniformBlockFeatures`, `VkPhysicalDeviceMaintenance4Features`, `VkPhysicalDevicePipelineCreationCacheControlFeatures`, `VkPhysicalDevicePrivateDataFeatures`, `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures`, `VkPhysicalDeviceShaderIntegerDotProductFeatures`, `VkPhysicalDeviceShaderTerminateInvocationFeatures`, `VkPhysicalDeviceSubgroupSizeControlFeatures`, `VkPhysicalDeviceSynchronization2Features`, `VkPhysicalDeviceTextureCompressionASTCHDRFeatures`, or `VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures` structure.

If the `VK_KHR_portability_subset` extension is included in `pProperties` of `vkEnumerateDeviceExtensionProperties`, `ppEnabledExtensionNames` must include "VK_KHR_portability_subset".

If the `shadingRateImage` feature is enabled, the `pipelineFragmentShadingRate` feature must not be enabled.

If the `shadingRateImage` feature is enabled, the `primitiveFragmentShadingRate` feature must not be enabled.
• VUID-VkDeviceCreateInfo-shadingRateImage-04480
  If the shadingRateImage feature is enabled, the attachmentFragmentShadingRate feature must not be enabled

• VUID-VkDeviceCreateInfo-fragmentDensityMap-04481
  If the fragmentDensityMap feature is enabled, the pipelineFragmentShadingRate feature must not be enabled

• VUID-VkDeviceCreateInfo-fragmentDensityMap-04482
  If the fragmentDensityMap feature is enabled, the primitiveFragmentShadingRate feature must not be enabled

• VUID-VkDeviceCreateInfo-fragmentDensityMap-04483
  If the fragmentDensityMap feature is enabled, the attachmentFragmentShadingRate feature must not be enabled

• VUID-VkDeviceCreateInfo-None-04896
  If sparseImageInt64Atomics is enabled, shaderImageInt64Atomics must be enabled

• VUID-VkDeviceCreateInfo-None-04897
  If sparseImageFloat32Atomics is enabled, shaderImageFloat32Atomics must be enabled

• VUID-VkDeviceCreateInfo-None-04898
  If sparseImageFloat32AtomicAdd is enabled, shaderImageFloat32AtomicAdd must be enabled

• VUID-VkDeviceCreateInfo-sparseImageFloat32AtomicMinMax-04975
  If sparseImageFloat32AtomicMinMax is enabled, shaderImageFloat32AtomicMinMax must be enabled

• VUID-VkDeviceCreateInfo-None-08095
  If descriptorBuffer is enabled, ppEnabledExtensionNames must not contain VK_AMD_shader_fragment_mask

Valid Usage (Implicit)

• VUID-VkDeviceCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO

• VUID-VkDeviceCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceDeviceMemoryReportCreateInfoEXT,
  VkDeviceDiagnosticsConfigCreateInfoNV, VkDeviceGroupDeviceCreateInfo,
  VkDeviceMemoryOverallocationCreateInfoAMD, VkDevicePrivateDataCreateInfo,
  VkPhysicalDevice16BitStorageFeatures, VkPhysicalDevice4444FormatsFeaturesEXT,

 VkPhysicalDeviceYcbcrDegammaFeaturesQCOM,  
 VkPhysicalDeviceYcbcrImageArraysFeaturesEXT,  
 or  
 VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures  

• VUID-VkDeviceCreateInfo-sType-unique  
The sType value of each struct in the pNext chain must be unique, with the exception of structures of type VkDeviceDeviceMemoryReportCreateInfoEXT or VkDevicePrivateDataCreateInfo  

• VUID-VkDeviceCreateInfo-flags-zerobitmask  
flags must be 0  

• VUID-VkDeviceCreateInfo-pQueueCreateInfos-parameter  
pQueueCreateInfos must be a valid pointer to an array of queueCreateInfoCount valid VkDeviceQueueCreateInfo structures  

• VUID-VkDeviceCreateInfo-ppEnabledLayerNames-parameter  
If enabledLayerCount is not 0, ppEnabledLayerNames must be a valid pointer to an array of enabledLayerCount null-terminated UTF-8 strings  

• VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-parameter  
If enabledExtensionCount is not 0, ppEnabledExtensionNames must be a valid pointer to an array of enabledExtensionCount null-terminated UTF-8 strings  

• VUID-VkDeviceCreateInfo-pEnabledFeatures-parameter  
If pEnabledFeatures is not NULL, pEnabledFeatures must be a valid pointer to a valid VkPhysicalDeviceFeatures structure  

• VUID-VkDeviceCreateInfo-queueCreateInfoCount-arraylength  
queueCreateInfoCount must be greater than 0  

// Provided by VK_VERSION_1_0  
typedef VkFlags VkDeviceCreateFlags;  

VkDeviceCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.  

A logical device can be created that connects to one or more physical devices by adding a VkDeviceGroupDeviceCreateInfo structure to the pNext chain of VkDeviceCreateInfo. The VkDeviceGroupDeviceCreateInfo structure is defined as:  

// Provided by VK_VERSION_1_1  
typedef struct VkDeviceGroupDeviceCreateInfo {  
    VkStructureType sType;  
    const void* pNext;  
    uint32_t physicalDeviceCount;  
    const VkPhysicalDevice* pPhysicalDevices;  
} VkDeviceGroupDeviceCreateInfo;
or the equivalent

```c
// Provided by VK_KHR_device_group_creation
typedef VkDeviceGroupDeviceCreateInfo VkDeviceGroupDeviceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `physicalDeviceCount` is the number of elements in the `pPhysicalDevices` array.
- `pPhysicalDevices` is a pointer to an array of physical device handles belonging to the same device group.

The elements of the `pPhysicalDevices` array are an ordered list of the physical devices that the logical device represents. These must be a subset of a single device group, and need not be in the same order as they were enumerated. The order of the physical devices in the `pPhysicalDevices` array determines the device index of each physical device, with element `i` being assigned a device index of `i`. Certain commands and structures refer to one or more physical devices by using device indices or device masks formed using device indices.

A logical device created without using `VkDeviceGroupDeviceCreateInfo`, or with `physicalDeviceCount` equal to zero, is equivalent to a `physicalDeviceCount` of one and `pPhysicalDevices` pointing to the `physicalDevice` parameter to `vkCreateDevice`. In particular, the device index of that physical device is zero.

### Valid Usage

- **VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00375**
  Each element of `pPhysicalDevices` must be unique

- **VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00376**
  All elements of `pPhysicalDevices` must be in the same device group as enumerated by `vkEnumeratePhysicalDeviceGroups`

- **VUID-VkDeviceGroupDeviceCreateInfo-physicalDeviceCount-00377**
  If `physicalDeviceCount` is not `0`, the `physicalDevice` parameter of `vkCreateDevice` must be an element of `pPhysicalDevices`

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupDeviceCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO`

- **VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-parameter**
  If `physicalDeviceCount` is not `0`, `pPhysicalDevices` must be a valid pointer to an array of `physicalDeviceCount` valid `VkPhysicalDevice` handles

To specify whether device memory allocation is allowed beyond the size reported by
VkPhysicalDeviceMemoryProperties, add a VkDeviceMemoryOverallocationCreateInfoAMD structure to the pNext chain of the VkDeviceCreateInfo structure. If this structure is not specified, it is as if the VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD value is used.

// Provided by VK_AMD_memory_overallocation_behavior
typedef struct VkDeviceMemoryOverallocationCreateInfoAMD {
    VkStructureType sType;
    const void* pNext;
    VkMemoryOverallocationBehaviorAMD overallocationBehavior;
} VkDeviceMemoryOverallocationCreateInfoAMD;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• overallocationBehavior is the desired overallocation behavior.

Valid Usage (Implicit)

• VUID-VkDeviceMemoryOverallocationCreateInfoAMD-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_MEMORY_OVERALLOCATION_CREATE_INFO_AMD

• VUID-VkDeviceMemoryOverallocationCreateInfoAMD-overallocationBehavior-parameter
  overallocationBehavior must be a valid VkMemoryOverallocationBehaviorAMD value

Possible values for VkDeviceMemoryOverallocationCreateInfoAMD::overallocationBehavior include:

// Provided by VK_AMD_memory_overallocation_behavior
typedef enum VkMemoryOverallocationBehaviorAMD {
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD = 0,
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_ALLOWED_AMD = 1,
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_DISALLOWED_AMD = 2,
} VkMemoryOverallocationBehaviorAMD;

• VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD lets the implementation decide if overallocation is allowed.
• VK_MEMORY_OVERALLOCATION_BEHAVIOR_ALLOWED_AMD specifies overallocation is allowed if platform permits.
• VK_MEMORY_OVERALLOCATION_BEHAVIOR_DISALLOWED_AMD specifies the application is not allowed to allocate device memory beyond the heap sizes reported by VkPhysicalDeviceMemoryProperties. Allocations that are not explicitly made by the application within the scope of the Vulkan instance are not accounted for.

When using the Nsight™ Aftermath SDK, to configure how device crash dumps are created, add a VkDeviceDiagnosticsConfigCreateInfoNV structure to the pNext chain of the VkDeviceCreateInfo structure.
typedef struct VkDeviceDiagnosticsConfigCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkDeviceDiagnosticsConfigFlagsNV flags;
} VkDeviceDiagnosticsConfigCreateInfoNV;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkDeviceDiagnosticsConfigFlagBitsNV` specifying additional parameters for configuring diagnostic tools.

### Valid Usage (Implicit)

- VUID-VkDeviceDiagnosticsConfigCreateInfoNV-sType-sType
  sType must be `VK_STRUCTURE_TYPE_DEVICE_DIAGNOSTICS_CONFIG_CREATE_INFO_NV`
- VUID-VkDeviceDiagnosticsConfigCreateInfoNV-flags-parameter
  flags must be a valid combination of `VkDeviceDiagnosticsConfigFlagBitsNV` values

Bits which can be set in `VkDeviceDiagnosticsConfigCreateInfoNV::flags` include:

typedef enum VkDeviceDiagnosticsConfigFlagBitsNV {
    VKDEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_DEBUG_INFO_BIT_NV = 0x00000001,
    VKDEVICE_DIAGNOSTICS_CONFIG_ENABLE_RESOURCE_TRACKING_BIT_NV = 0x00000002,
    VKDEVICE_DIAGNOSTICS_CONFIG_ENABLE_AUTOMATIC_CHECKPOINTS_BIT_NV = 0x00000004,
    VKDEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_ERROR_REPORTING_BIT_NV = 0x00000008,
} VkDeviceDiagnosticsConfigFlagBitsNV;

- **VKDEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_DEBUG_INFO_BIT_NV** enables the generation of debug information for shaders.
- **VKDEVICE_DIAGNOSTICS_CONFIG_ENABLE_RESOURCE_TRACKING_BIT_NV** enables driver side tracking of resources (images, buffers, etc.) used to augment the device fault information.
- **VKDEVICE_DIAGNOSTICS_CONFIG_ENABLE_AUTOMATIC_CHECKPOINTS_BIT_NV** enables automatic insertion of diagnostic checkpoints for draw calls, dispatches, trace rays, and copies. The CPU call stack at the time of the command will be associated as the marker data for the automatically inserted checkpoints.
- **VKDEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_ERROR_REPORTING_BIT_NV** enables shader error reporting.
\textbf{VkDeviceDiagnosticsConfigFlagsNV} is a bitmask type for setting a mask of zero or more \textbf{VkDeviceDiagnosticsConfigFlagBitsNV}.

To register callbacks for underlying device memory events of type \textbf{VkDeviceMemoryReportEventTypeEXT}, add one or multiple \textbf{VkDeviceDeviceMemoryReportCreateInfoEXT} structures to the \textit{pNext} chain of the \textbf{VkDeviceCreateInfo} structure.

```c
// Provided by VK_EXT_device_memory_report
typedef struct VkDeviceDeviceMemoryReportCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemoryReportFlagsEXT flags;
    PFN_vkDeviceMemoryReportCallbackEXT pfnUserCallback;
    void* pUserData;
} VkDeviceDeviceMemoryReportCreateInfoEXT;
```

- \textit{sType} is a \textbf{VkStructureType} value identifying this structure.
- \textit{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \textit{flags} is \texttt{0} and reserved for future use.
- \textit{pfnUserCallback} is the application callback function to call.
- \textit{pUserData} is user data to be passed to the callback.

The callback \textbf{may} be called from multiple threads simultaneously.

The callback \textbf{must} be called only once by the implementation when a \textbf{VkDeviceMemoryReportEventTypeEXT} event occurs.

\textbf{Valid Usage (Implicit)}

- VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-sType-sType \textit{sType} must be \texttt{VK_STRUCTURE_TYPE_DEVICE_DEVICE_MEMORY_REPORT_CREATE_INFO_EXT}
- VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-flags-zerobitmask \textit{flags} must be \texttt{0}
- VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-pfnUserCallback-parameter \textit{pfnUserCallback} must be a valid \texttt{PFN_vkDeviceMemoryReportCallbackEXT} value
- VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-pUserData-parameter \textit{pUserData} must be a pointer value

The prototype for the \textbf{VkDeviceDeviceMemoryReportCreateInfoEXT::pfnUserCallback} function
implemented by the application is:

```c
// Provided by VK_EXT_device_memory_report
typedef void (VKAPI_PTR *PFN_vkDeviceMemoryReportCallbackEXT)(
    const VkDeviceMemoryReportCallbackDataEXT* pCallbackData,
    void* pUserData);
```

- `pCallbackData` contains all the callback related data in the `VkDeviceMemoryReportCallbackDataEXT` structure.
- `pUserData` is the user data provided when the `VkDeviceDeviceMemoryReportCreateInfoEXT` was created.

The callback must not make calls to any Vulkan commands.

The definition of `VkDeviceMemoryReportCallbackDataEXT` is:

```c
// Provided by VK_EXT_device_memory_report
typedef struct VkDeviceMemoryReportCallbackDataEXT {
    VkStructureType sType;
    void* pNext;
    VkDeviceMemoryReportFlagsEXT flags;
    VkDeviceMemoryReportEventTypeEXT type;
    uint64_t memoryObjectId;
    VkDeviceSize size;
    VkObjectType objectType;
    uint64_t objectHandle;
    uint32_t heapIndex;
} VkDeviceMemoryReportCallbackDataEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is 0 and reserved for future use.
- `type` is a `VkDeviceMemoryReportEventTypeEXT` type specifying the type of event reported in this `VkDeviceMemoryReportCallbackDataEXT` structure.
- `memoryObjectId` is the unique id for the underlying memory object as described below.
- `size` is the size of the memory object in bytes. If `type` is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT` or `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT`, `size` is a valid `VkDeviceSize` value. Otherwise, `size` is undefined.
- `objectType` is a `VkObjectType` value specifying the type of the object associated with this device memory report event. If `type` is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT` or `VKDEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT`, `objectType` is a valid `VkObjectType`
enum. Otherwise, objectType is undefined.

- objectHandle is the object this device memory report event is attributed to. If type is
  
  - VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT, VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT,
  - VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT
  or
  - VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT, objectHandle is a valid Vulkan handle of the
    type associated with objectType as defined in the VkObjectType and Vulkan Handle Relationship
    table. Otherwise, objectHandle is undefined.

- heapIndex describes which memory heap this device memory allocation is made from. If type is
  
  - VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT
  - VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT
  heapIndex corresponds to one of the valid heaps from the VkPhysicalDeviceMemoryProperties structure. Otherwise, heapIndex is
  undefined.

memoryObjectId is used to avoid double-counting on the same memory object.

If an internally-allocated device memory object or a VkDeviceMemory cannot be exported, memoryObjectId must be unique in the VkDevice.

If an internally-allocated device memory object or a VkDeviceMemory supports being exported, memoryObjectId must be unique system wide.

If an internal device memory object or a VkDeviceMemory is backed by an imported external memory object, memoryObjectId must be unique system wide.

---

**Implementor’s Note**

If the heap backing an internally-allocated device memory cannot be used to back VkDeviceMemory, implementations can advertise that heap with no types.

---

**Note**

This structure should only be considered valid during the lifetime of the triggered callback.

For

- VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT
- VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT

events, objectHandle usually will not yet exist when the application or tool receives the callback. objectHandle will only exist when the create or allocate call that triggered the event returns, and if the allocation or import ends up failing objectHandle will not ever exist.

---

**Valid Usage (Implicit)**

- VUID-VkDeviceMemoryReportCallbackDataEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_MEMORY_REPORT_CALLBACK_DATA_EXT
- VUID-VkDeviceMemoryReportCallbackDataEXT-pNext-pNext
  pNext must be NULL
typedef VkFlags VkDeviceMemoryReportFlagsEXT;

VkDeviceMemoryReportFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkDeviceMemoryReportCallbackDataEXT::type, specifying event types which cause the device driver to call the callback, are:

- VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT specifies this event corresponds to the allocation of an internal device memory object or a VkDeviceMemory.
- VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT specifies this event corresponds to the deallocation of an internally-allocated device memory object or a VkDeviceMemory.
- VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT specifies this event corresponds to the import of an external memory object.
- VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT specifies this event is the release of an imported external memory object.
- VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT specifies this event corresponds to the failed allocation of an internal device memory object or a VkDeviceMemory.

To reserve private data storage slots, add a VkDevicePrivateDataCreateInfo structure to the pNext chain of the VkDeviceCreateInfo structure. Reserving slots in this manner is not strictly necessary, but doing so may improve performance.

or the equivalent

typedef VkDevicePrivateDataCreateInfoEXT VkDevicePrivateDataCreateInfo;

or the equivalent

typedef VkDevicePrivateDataCreateInfo VkDevicePrivateDataCreateInfoEXT;
• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• privateDataSlotRequestCount is the amount of slots to reserve.

Valid Usage (Implicit)

- VUID-VkDevicePrivateDataCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_PRIVATE_DATA_CREATE_INFO

5.2.2. Device Use

The following is a high-level list of VkDevice uses along with references on where to find more information:

• Creation of queues. See the Queues section below for further details.
• Creation and tracking of various synchronization constructs. See Synchronization and Cache Control for further details.
• Allocating, freeing, and managing memory. See Memory Allocation and Resource Creation for further details.
• Creation and destruction of command buffers and command buffer pools. See Command Buffers for further details.
• Creation, destruction, and management of graphics state. See Pipelines and Resource Descriptors, among others, for further details.

5.2.3. Lost Device

A logical device may become lost for a number of implementation-specific reasons, indicating that pending and future command execution may fail and cause resources and backing memory to become undefined.

Note

Typical reasons for device loss will include things like execution timing out (to prevent denial of service), power management events, platform resource management, implementation errors.

Applications not adhering to valid usage may also result in device loss being reported, however this is not guaranteed. Even if device loss is reported, the system may be in an unrecoverable state, and further usage of the API is still considered invalid.

When this happens, certain commands will return VK_ERROR_DEVICE_LOST. After any such event, the logical device is considered lost. It is not possible to reset the logical device to a non-lost state, however the lost state is specific to a logical device (VkDevice), and the corresponding physical device (VkPhysicalDevice) may be otherwise unaffected.
In some cases, the physical device may also be lost, and attempting to create a new logical device will fail, returning `VK_ERROR_DEVICE_LOST`. This is usually indicative of a problem with the underlying implementation, or its connection to the host. If the physical device has not been lost, and a new logical device is successfully created from that physical device, it must be in the non-lost state.

**Note**

Whilst logical device loss may be recoverable, in the case of physical device loss, it is unlikely that an application will be able to recover unless additional, unaffected physical devices exist on the system. The error is largely informational and intended only to inform the user that a platform issue has occurred, and should be investigated further. For example, underlying hardware may have developed a fault or become physically disconnected from the rest of the system. In many cases, physical device loss may cause other more serious issues such as the operating system crashing; in which case it may not be reported via the Vulkan API.

When a device is lost, its child objects are not implicitly destroyed and their handles are still valid. Those objects must still be destroyed before their parents or the device can be destroyed (see the Object Lifetime section). The host address space corresponding to device memory mapped using `vkMapMemory` is still valid, and host memory accesses to these mapped regions are still valid, but the contents are undefined. It is still legal to call any API command on the device and child objects.

Once a device is lost, command execution may fail, and certain commands that return a `VkResult` may return `VK_ERROR_DEVICE_LOST`. These commands can be identified by the inclusion of `VK_ERROR_DEVICE_LOST` in the Return Codes section for each command. Commands that do not allow runtime errors must still operate correctly for valid usage and, if applicable, return valid data.

Commands that wait indefinitely for device execution (namely `vkDeviceWaitIdle`, `vkQueueWaitIdle`, `vkWaitForFences` or `vkAcquireNextImageKHR` with a maximum timeout, and `vkGetQueryPoolResults` with the `VK_QUERY_RESULT_WAIT_BIT` bit set in `flags`) must return in finite time even in the case of a lost device, and return either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`. For any command that may return `VK_ERRORDEVICE_LOST`, for the purpose of determining whether a command buffer is in the pending state, or whether resources are considered in-use by the device, a return value of `VK_ERRORDEVICE_LOST` is equivalent to `VK_SUCCESS`.

If a device was created with the maintenance5 feature enabled, and any device command returns `VK_ERRORDEVICE_LOST`, then all device commands for which `VK_ERRORDEVICE_LOST` is a valid return value and which happen-after it on the same host thread must return `VK_ERRORDEVICE_LOST`.

Device commands executing on other threads must begin returning `VK_ERRORDEVICE_LOST` within finite time.

The content of any external memory objects that have been exported from or imported to a lost device become undefined. Objects on other logical devices or in other APIs which are associated with the same underlying memory resource as the external memory objects on the lost device are unaffected other than their content becoming undefined. The layout of subresources of images on other logical devices that are bound to `VkDeviceMemory` objects associated with the same underlying memory resources as external memory objects on the lost device becomes `VK_IMAGE_LAYOUT_UNDEFINED`. 

- 187
The state of VkSemaphore objects on other logical devices created by importing a semaphore payload with temporary permanence which was exported from the lost device is undefined. The state of VkSemaphore objects on other logical devices that permanently share a semaphore payload with a VkSemaphore object on the lost device is undefined, and remains undefined following any subsequent signal operations. Implementations must ensure pending and subsequently submitted wait operations on such semaphores behave as defined in Semaphore State Requirements For Wait Operations for external semaphores not in a valid state for a wait operation.

5.2.4. Device Destruction

To destroy a device, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyDevice(
    VkDevice device,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

To ensure that no work is active on the device, `vkDeviceWaitIdle` can be used to gate the destruction of the device. Prior to destroying a device, an application is responsible for destroying/freeing any Vulkan objects that were created using that device as the first parameter of the corresponding `vkCreate*` or `vkAllocate*` command.

**Note**
The lifetime of each of these objects is bound by the lifetime of the `VkDevice` object. Therefore, to avoid resource leaks, it is critical that an application explicitly free all of these resources prior to calling `vkDestroyDevice`.

**Valid Usage**

- VUID-vkDestroyDevice-device-00378
  All child objects created on `device` must have been destroyed prior to destroying `device`

- VUID-vkDestroyDevice-device-00379
  If `VkAllocationCallbacks` were provided when `device` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyDevice-device-00380
  If no `VkAllocationCallbacks` were provided when `device` was created, `pAllocator` must be NULL

**Valid Usage (Implicit)**

- VUID-vkDestroyDevice-device-parameter
If `device` is not `NULL`, `device` must be a valid `VkDevice` handle

- VUID-vkDestroyDevice-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

### Host Synchronization

- Host access to `device` must be externally synchronized
- Host access to all `VkQueue` objects created from `device` must be externally synchronized

## 5.3. Queues

### 5.3.1. Queue Family Properties

As discussed in the Physical Device Enumeration section above, the `vkGetPhysicalDeviceQueueFamilyProperties` command is used to retrieve details about the queue families and queues supported by a device.

Each index in the `pQueueFamilyProperties` array returned by `vkGetPhysicalDeviceQueueFamilyProperties` describes a unique queue family on that physical device. These indices are used when creating queues, and they correspond directly with the `queueFamilyIndex` that is passed to the `vkCreateDevice` command via the `VkDeviceQueueCreateInfo` structure as described in the Queue Creation section below.

Grouping of queue families within a physical device is implementation-dependent.

**Note**

The general expectation is that a physical device groups all queues of matching capabilities into a single family. However, while implementations should do this, it is possible that a physical device may return two separate queue families with the same capabilities.

Once an application has identified a physical device with the queue(s) that it desires to use, it will create those queues in conjunction with a logical device. This is described in the following section.

### 5.3.2. Queue Creation

Creating a logical device also creates the queues associated with that device. The queues to create are described by a set of `VkDeviceQueueCreateInfo` structures that are passed to `vkCreateDevice` in `pQueueCreateInfos`.

Queues are represented by `VkQueue` handles:

```c
// Provided by VK_VERSION_1_0
```
The **VkDeviceQueueCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDeviceQueueCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t queueFamilyIndex;
    uint32_t queueCount;
    const float* pQueuePriorities;
} VkDeviceQueueCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask indicating behavior of the queues.
- **queueFamilyIndex** is an unsigned integer indicating the index of the queue family in which to create the queues on this device. This index corresponds to the index of an element of the **pQueueFamilyProperties** array that was returned by **vkGetPhysicalDeviceQueueFamilyProperties**.
- **queueCount** is an unsigned integer specifying the number of queues to create in the queue family indicated by **queueFamilyIndex**, and with the behavior specified by **flags**.
- **pQueuePriorities** is a pointer to an array of **queueCount** normalized floating point values, specifying priorities of work that will be submitted to each created queue. See **Queue Priority** for more information.

### Valid Usage

- **VUID-VkDeviceQueueCreateInfo-queueFamilyIndex-00381**
  queueFamilyIndex must be less than **pQueueFamilyPropertyCount** returned by **vkGetPhysicalDeviceQueueFamilyProperties**

- **VUID-VkDeviceQueueCreateInfo-queueCount-00382**
  queueCount must be less than or equal to the **queueCount** member of the **VkQueueFamilyProperties** structure, as returned by **vkGetPhysicalDeviceQueueFamilyProperties** in the **pQueueFamilyProperties[queueFamilyIndex]**

- **VUID-VkDeviceQueueCreateInfo-pQueuePriorities-00383**
  Each element of **pQueuePriorities** must be between 0.0 and 1.0 inclusive

- **VUID-VkDeviceQueueCreateInfo-flags-02861**
  If the protectedMemory feature is not enabled, the **VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT** bit of **flags** must not be set

- **VUID-VkDeviceQueueCreateInfo-flags-06449**
  If **flags** includes **VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT**, **queueFamilyIndex** must be the
Valid Usage (Implicit)

- **VUID-VkDeviceQueueCreateInfo-sType-sType**
  
  
  *sType* must be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO`

- **VUID-VkDeviceQueueCreateInfo-pNext-pNext**
  
  *pNext* must be `NULL` or a pointer to a valid instance of `VkDeviceQueueGlobalPriorityCreateInfoKHR`

- **VUID-VkDeviceQueueCreateInfo-sType-unique**
  
  The *sType* value of each struct in the *pNext* chain must be unique

- **VUID-VkDeviceQueueCreateInfo-flags-parameter**
  
  *flags* must be a valid combination of `VkDeviceQueueCreateFlagBits` values

- **VUID-VkDeviceQueueCreateInfo-pQueuePriorities-parameter**
  
  *pQueuePriorities* must be a valid pointer to an array of `queueCount float` values

- **VUID-VkDeviceQueueCreateInfo-queueCount-arraylength**
  
  *queueCount* must be greater than 0

Bits which can be set in `VkDeviceQueueCreateInfo::flags`, specifying usage behavior of a queue, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkDeviceQueueCreateFlagBits {
    // Provided by VK_VERSION_1_1
    VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT = 0x00000001,
} VkDeviceQueueCreateFlagBits;
```

- **VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT** specifies that the device queue is a protected-capable queue.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceQueueCreateFlags;
```

`VkDeviceQueueCreateFlags` is a bitmask type for setting a mask of zero or more `VkDeviceQueueCreateFlagBits`.

Queues can be created with a system-wide priority by adding a `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure to the *pNext* chain of `VkDeviceQueueCreateInfo`.

The `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_global_priority
```
typedef struct VkDeviceQueueGlobalPriorityCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkQueueGlobalPriorityKHR globalPriority;
} VkDeviceQueueGlobalPriorityCreateInfoKHR;

or the equivalent

// Provided by VK_EXT_global_priority
typedef VkDeviceQueueGlobalPriorityCreateInfoKHR VkDeviceQueueGlobalPriorityCreateInfoEXT;

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `globalPriority` is the system-wide priority associated to these queues as specified by `VkQueueGlobalPriorityEXT`

Queues created without specifying `VkDeviceQueueGlobalPriorityCreateInfoKHR` will default to `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR`.

Valid Usage (Implicit)

• `VUID-VkDeviceQueueGlobalPriorityCreateInfoKHR-sType-sType` `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_GLOBAL_PRIORITY_CREATE_INFO_KHR`
• `VUID-VkDeviceQueueGlobalPriorityCreateInfoKHR-globalPriority-parameter` `globalPriority` **must** be a valid `VkQueueGlobalPriorityKHR` value

Possible values of `VkDeviceQueueGlobalPriorityCreateInfoKHR::globalPriority`, specifying a system-wide priority level are:

// Provided by VK_KHR_global_priority
typedef enum VkQueueGlobalPriorityKHR {
    VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR = 128,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR = 256,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR = 512,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR = 1024,
    VK_QUEUE_GLOBAL_PRIORITY_LOW_EXT = VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT = VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_EXT = VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_EXT = VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR,
} VkQueueGlobalPriorityKHR;

or the equivalent
Priority values are sorted in ascending order. A comparison operation on the enum values can be used to determine the priority order.

- `VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR` is below the system default. Useful for non-interactive tasks.
- `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR` is the system default priority.
- `VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR` is above the system default.
- `VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR` is the highest priority. Useful for critical tasks.

Queues with higher system priority may be allotted more processing time than queues with lower priority. An implementation may allow a higher-priority queue to starve a lower-priority queue until the higher-priority queue has no further commands to execute.

Priorities imply no ordering or scheduling constraints.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

The global priority level of a queue takes precedence over the per-process queue priority (`VkDeviceQueueCreateInfo::pQueuePriorities`).

Abuse of this feature may result in starving the rest of the system of implementation resources. Therefore, the driver implementation may deny requests to acquire a priority above the default priority (VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR) if the caller does not have sufficient privileges. In this scenario VK_ERROR_NOT_PERMITTED_KHR is returned.

The driver implementation may fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this scenario VK_ERROR_INITIALIZATION_FAILED is returned.

If the `globalPriorityQuery` feature is enabled and the requested global priority is not reported via `VkQueueFamilyGlobalPriorityPropertiesKHR`, the driver implementation must fail the queue creation. In this scenario, VK_ERROR_INITIALIZATION_FAILED is returned.

To retrieve a handle to a `VkQueue` object, call:

```c
void vkGetDeviceQueue(
    VkDevice device,
    uint32_t queueFamilyIndex,
    uint32_t queueIndex,
    VkQueue* pQueue);
```

- `device` is the logical device that owns the queue.
- `queueFamilyIndex` is the index of the queue family to which the queue belongs.
• **queueIndex** is the index within this queue family of the queue to retrieve.

• **pQueue** is a pointer to a **VkQueue** object that will be filled with the handle for the requested queue.

**vkGetDeviceQueue** must only be used to get queues that were created with the **flags** parameter of **VkDeviceQueueCreateInfo** set to zero. To get queues that were created with a non-zero **flags** parameter use **vkGetDeviceQueue2**.

---

### Valid Usage

- **VUID-vkGetDeviceQueue-queueFamilyIndex-00384**  
  queueFamilyIndex **must** be one of the queue family indices specified when **device** was created, via the **VkDeviceQueueCreateInfo** structure

- **VUID-vkGetDeviceQueue-queueIndex-00385**  
  queueIndex **must** be less than the value of **VkDeviceQueueCreateInfo::queueCount** for the queue family indicated by queueFamilyIndex when **device** was created

- **VUID-vkGetDeviceQueue-flags-01841**  
  **VkDeviceQueueCreateInfo::flags** **must** have been set to zero when **device** was created

---

### Valid Usage (Implicit)

- **VUID-vkGetDeviceQueue-device-parameter**  
  **device** **must** be a valid **VkDevice** handle

- **VUID-vkGetDeviceQueue-pQueue-parameter**  
  **pQueue** **must** be a valid pointer to a **VkQueue** handle

To retrieve a handle to a **VkQueue** object with specific **VkDeviceQueueCreateFlags** creation flags, call:

```c
// Provided by VK_VERSION_1_1
void vkGetDeviceQueue2(
    VkDevice device,
    const VkDeviceQueueInfo2* pQueueInfo,
    VkQueue* pQueue);
```

• **device** is the logical device that owns the queue.

• **pQueueInfo** is a pointer to a **VkDeviceQueueInfo2** structure, describing parameters of the device queue to be retrieved.

• **pQueue** is a pointer to a **VkQueue** object that will be filled with the handle for the requested queue.
Valid Usage (Implicit)

- **VUID-vkGetDeviceQueue2-device-parameter**
  *device* must be a valid *VkDevice* handle

- **VUID-vkGetDeviceQueue2-pQueueInfo-parameter**
  *pQueueInfo* must be a valid pointer to a valid *VkDeviceQueueInfo2* structure

- **VUID-vkGetDeviceQueue2-pQueue-parameter**
  *pQueue* must be a valid pointer to a *VkQueue* handle

The *VkDeviceQueueInfo2* structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceQueueInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t queueFamilyIndex;
    uint32_t queueIndex;
} VkDeviceQueueInfo2;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure. The **pNext** chain of *VkDeviceQueueInfo2* can be used to provide additional device queue parameters to *vkGetDeviceQueue2*.
- **flags** is a *VkDeviceQueueCreateFlags* value indicating the flags used to create the device queue.
- **queueFamilyIndex** is the index of the queue family to which the queue belongs.
- **queueIndex** is the index of the queue to retrieve from within the set of queues that share both the queue family and flags specified.

The queue returned by *vkGetDeviceQueue2* must have the same *flags* value from this structure as that used at device creation time in a *VkDeviceQueueCreateInfo* structure.

**Note**

Normally, if you create both protected-capable and non-protected-capable queues with the same family, they are treated as separate lists of queues and *queueIndex* is relative to the start of the list of queues specified by both *queueFamilyIndex* and *flags*. However, for historical reasons, some implementations may exhibit different behavior. These divergent implementations instead concatenate the lists of queues and treat *queueIndex* as relative to the start of the first list of queues with the given *queueFamilyIndex*. This only matters in cases where an application has created both protected-capable and non-protected-capable queues from the same queue family.

For such divergent implementations, the maximum value of *queueIndex* is equal to
the sum of `VkDeviceQueueCreateInfo::queueCount` minus one, for all `VkDeviceQueueCreateInfo` structures that share a common `queueFamilyIndex`.

Such implementations will return `NULL` for either the protected or unprotected queues when calling `vkGetDeviceQueue2` with `queueIndex` in the range zero to `VkDeviceQueueCreateInfo::queueCount` minus one. In cases where these implementations returned `NULL`, the corresponding queues are instead located in the extended range described in the preceding two paragraphs.

This behaviour will not be observed on any driver that has passed Vulkan conformance test suite version 1.3.3.0, or any subsequent version. This information can be found by querying `VkPhysicalDeviceDriverProperties::conformanceVersion`.

Valid Usage

- VUID-VkDeviceQueueInfo2-queueFamilyIndex-01842
  `queueFamilyIndex` must be one of the queue family indices specified when `device` was created, via the `VkDeviceQueueCreateInfo` structure

- VUID-VkDeviceQueueInfo2-flags-06225
  `flags` must be equal to `VkDeviceQueueCreateInfo::flags` for a `VkDeviceQueueCreateInfo` structure for the queue family indicated by `queueFamilyIndex` when `device` was created

- VUID-VkDeviceQueueInfo2-queueIndex-01843
  `queueIndex` must be less than `VkDeviceQueueCreateInfo::queueCount` for the corresponding queue family and flags indicated by `queueFamilyIndex` and `flags` when `device` was created

Valid Usage (Implicit)

- VUID-VkDeviceQueueInfo2-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_INFO_2`

- VUID-VkDeviceQueueInfo2-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkDeviceQueueInfo2-flags-parameter
  `flags` must be a valid combination of `VkDeviceQueueCreateFlagBits` values

5.3.3. Queue Family Index

The queue family index is used in multiple places in Vulkan in order to tie operations to a specific family of queues.

When retrieving a handle to the queue via `vkGetDeviceQueue`, the queue family index is used to select which queue family to retrieve the `VkQueue` handle from as described in the previous section.

When creating a `VkCommandPool` object (see Command Pools), a queue family index is specified in the `VkCommandPoolCreateInfo` structure. Command buffers from this pool can only be submitted on
queues corresponding to this queue family.

When creating VkImage (see Images) and VkBuffer (see Buffers) resources, a set of queue families is included in the VkImageCreateInfo and VkBufferCreateInfo structures to specify the queue families that can access the resource.

When inserting a VkBufferMemoryBarrier or VkImageMemoryBarrier (see Pipeline Barriers), a source and destination queue family index is specified to allow the ownership of a buffer or image to be transferred from one queue family to another. See the Resource Sharing section for details.

5.3.4. Queue Priority

Each queue is assigned a priority, as set in the VkDeviceQueueCreateInfo structures when creating the device. The priority of each queue is a normalized floating point value between 0.0 and 1.0, which is then translated to a discrete priority level by the implementation. Higher values indicate a higher priority, with 0.0 being the lowest priority and 1.0 being the highest.

Within the same device, queues with higher priority may be allotted more processing time than queues with lower priority. The implementation makes no guarantees with regards to ordering or scheduling among queues with the same priority, other than the constraints defined by any explicit synchronization primitives. The implementation makes no guarantees with regards to queues across different devices.

An implementation may allow a higher-priority queue to starve a lower-priority queue on the same VkDevice until the higher-priority queue has no further commands to execute. The relationship of queue priorities must not cause queues on one VkDevice to starve queues on another VkDevice.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

5.3.5. Queue Submission

Work is submitted to a queue via queue submission commands such as vkQueueSubmit2 or vkQueueSubmit. Queue submission commands define a set of queue operations to be executed by the underlying physical device, including synchronization with semaphores and fences.

Submission commands take as parameters a target queue, zero or more batches of work, and an optional fence to signal upon completion. Each batch consists of three distinct parts:

1. Zero or more semaphores to wait on before execution of the rest of the batch.
   - If present, these describe a semaphore wait operation.
2. Zero or more work items to execute.
   - If present, these describe a queue operation matching the work described.
3. Zero or more semaphores to signal upon completion of the work items.
   - If present, these describe a semaphore signal operation.

If a fence is present in a queue submission, it describes a fence signal operation.
All work described by a queue submission command **must** be submitted to the queue before the command returns.

**Sparse Memory Binding**

In Vulkan it is possible to sparsely bind memory to buffers and images as described in the *Sparse Resource* chapter. Sparse memory binding is a queue operation. A queue whose flags include the *VK_QUEUE_SPARSE_BINDING_BIT* **must** be able to support the mapping of a virtual address to a physical address on the device. This causes an update to the page table mappings on the device. This update **must** be synchronized on a queue to avoid corrupting page table mappings during execution of graphics commands. By binding the sparse memory resources on queues, all commands that are dependent on the updated bindings are synchronized to only execute after the binding is updated. See the *Synchronization and Cache Control* chapter for how this synchronization is accomplished.

**5.3.6. Queue Destruction**

Queues are created along with a logical device during **vkCreateDevice**. All queues associated with a logical device are destroyed when **vkDestroyDevice** is called on that device.
Chapter 6. Command Buffers

Command buffers are objects used to record commands which can be subsequently submitted to a device queue for execution. There are two levels of command buffers - primary command buffers, which can execute secondary command buffers, and which are submitted to queues, and secondary command buffers, which can be executed by primary command buffers, and which are not directly submitted to queues.

Command buffers are represented by VkCommandBuffer handles:

```c
// Provided by VK_VERSION_1_0
Vk_DEFINE_HANDLE(VkCommandBuffer)
```

Recorded commands include commands to bind pipelines and descriptor sets to the command buffer, commands to modify dynamic state, commands to draw (for graphics rendering), commands to dispatch (for compute), commands to execute secondary command buffers (for primary command buffers only), commands to copy buffers and images, and other commands.

Each command buffer manages state independently of other command buffers. There is no inheritance of state across primary and secondary command buffers, or between secondary command buffers. When a command buffer begins recording, all state in that command buffer is undefined. When secondary command buffer(s) are recorded to execute on a primary command buffer, the secondary command buffer inherits no state from the primary command buffer, and all state of the primary command buffer is undefined after an execute secondary command buffer command is recorded. There is one exception to this rule - if the primary command buffer is inside a render pass instance, then the render pass and subpass state is not disturbed by executing secondary command buffers. For state dependent commands (such as draws and dispatches), any state consumed by those commands must not be undefined.

VkCommandBufferInheritanceViewportScissorInfoNV defines an exception allowing limited inheritance of dynamic viewport and scissor state.

Unless otherwise specified, and without explicit synchronization, the various commands submitted to a queue via command buffers may execute in arbitrary order relative to each other, and/or concurrently. Also, the memory side effects of those commands may not be directly visible to other commands without explicit memory dependencies. This is true within a command buffer, and across command buffers submitted to a given queue. See the synchronization chapter for information on implicit and explicit synchronization between commands.

6.1. Command Buffer Lifecycle

Each command buffer is always in one of the following states:

**Initial**

When a command buffer is allocated, it is in the initial state. Some commands are able to reset a command buffer (or a set of command buffers) back to this state from any of the executable, recording or invalid state. Command buffers in the initial state can only be moved to the
recording state, or freed.

**Recording**

`vkBeginCommandBuffer` changes the state of a command buffer from the initial state to the *recording state*. Once a command buffer is in the recording state, `vkCmd*` commands can be used to record to the command buffer.

**Executable**

`vkEndCommandBuffer` ends the recording of a command buffer, and moves it from the recording state to the *executable state*. Executable command buffers can be submitted, reset, or recorded to another command buffer.

**Pending**

*Queue submission* of a command buffer changes the state of a command buffer from the executable state to the *pending state*. Whilst in the pending state, applications must not attempt to modify the command buffer in any way - as the device may be processing the commands recorded to it. Once execution of a command buffer completes, the command buffer either reverts back to the *executable state*, or if it was recorded with `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT`, it moves to the *invalid state*. A synchronization command should be used to detect when this occurs.

**Invalid**

Some operations, such as modifying or deleting a resource that was used in a command recorded to a command buffer, will transition the state of that command buffer into the *invalid state*. Command buffers in the invalid state can only be reset or freed.

![Figure 1. Lifecycle of a command buffer](image)

Any given command that operates on a command buffer has its own requirements on what state a command buffer must be in, which are detailed in the valid usage constraints for that command.

Resetting a command buffer is an operation that discards any previously recorded commands and puts a command buffer in the *initial state*. Resetting occurs as a result of `vkResetCommandBuffer` or `vkResetCommandPool`, or as part of `vkBeginCommandBuffer` (which additionally puts the command buffer in the *recording state*).
Secondary command buffers can be recorded to a primary command buffer via vkCmdExecuteCommands. This partially ties the lifecycle of the two command buffers together - if the primary is submitted to a queue, both the primary and any secondaries recorded to it move to the pending state. Once execution of the primary completes, so it does for any secondary recorded within it. After all executions of each command buffer complete, they each move to their appropriate completion state (either to the executable state or the invalid state, as specified above).

If a secondary moves to the invalid state or the initial state, then all primary buffers it is recorded in move to the invalid state. A primary moving to any other state does not affect the state of a secondary recorded in it.

Note
Resetting or freeing a primary command buffer removes the lifecycle linkage to all secondary command buffers that were recorded into it.

6.2. Command Pools

Command pools are opaque objects that command buffer memory is allocated from, and which allow the implementation to amortize the cost of resource creation across multiple command buffers. Command pools are externally synchronized, meaning that a command pool must not be used concurrently in multiple threads. That includes use via recording commands on any command buffers allocated from the pool, as well as operations that allocate, free, and reset command buffers or the pool itself.

Command pools are represented by VkCommandPool handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCommandPool)
```

To create a command pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateCommandPool(
    VkDevice device,
    const VkCommandPoolCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkCommandPool* pCommandPool);
```

- `device` is the logical device that creates the command pool.
- `pCreateInfo` is a pointer to a VkCommandPoolCreateInfo structure specifying the state of the command pool object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pCommandPool` is a pointer to a VkCommandPool handle in which the created pool is returned.
Valid Usage

• VUID-vkCreateCommandPool-queueFamilyIndex-01937
  `pCreateInfo->queueFamilyIndex` must be the index of a queue family available in the logical device `device`

Valid Usage (Implicit)

• VUID-vkCreateCommandPool-device-parameter
  `device` must be a valid `VkDevice` handle

• VUID-vkCreateCommandPool-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkCommandPoolCreateInfo` structure

• VUID-vkCreateCommandPool-pAllocator-parameter
  If `pAllocator` is not `NULL`, `Allocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

• VUID-vkCreateCommandPool-pCommandPool-parameter
  `pCommandPool` must be a valid pointer to a `VkCommandPool` handle

Return Codes

Success

• `VK_SUCCESS`

Failure

• `VK_ERROR_OUT_OF_HOST_MEMORY`

• `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCommandPoolCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandPoolCreateFlags flags;
    uint32_t queueFamilyIndex;
} VkCommandPoolCreateInfo;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `flags` is a bitmask of `VkCommandPoolCreateFlagBits` indicating usage behavior for the pool and command buffers allocated from it.
• **queueFamilyIndex** designates a queue family as described in section Queue Family Properties. All command buffers allocated from this command pool **must** be submitted on queues from the same queue family.

### Valid Usage

- **VUID-VkCommandPoolCreateInfo-flags-02860**
  If the protectedMemory feature is not enabled, the **VK_COMMAND_POOL_CREATE_PROTECTED_BIT** bit of **flags** **must** not be set.

### Valid Usage (Implicit)

- **VUID-VkCommandPoolCreateInfo-sType-sType**
  **sType** **must** be **VK_STRUCTURE_TYPE_COMMAND_POOL_CREATE_INFO**

- **VUID-VkCommandPoolCreateInfo-pNext-pNext**
  **pNext** **must** be **NULL**

- **VUID-VkCommandPoolCreateInfo-flags-parameter**
  **flags** **must** be a valid combination of **VkCommandPoolCreateFlagBits** values

Bits which **can** be set in **VkCommandPoolCreateInfo::flags**, specifying usage behavior for a command pool, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolCreateFlagBits {
  VK_COMMAND_POOL_CREATE_TRANSIENT_BIT = 0x00000001,
  VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT = 0x00000002,
// Provided by VK_VERSION_1_1
  VK_COMMAND_POOL_CREATE_PROTECTED_BIT = 0x00000004,
} VkCommandPoolCreateFlagBits;
```

- **VK_COMMAND_POOL_CREATE_TRANSIENT_BIT** specifies that command buffers allocated from the pool will be short-lived, meaning that they will be reset or freed in a relatively short timeframe. This flag **may** be used by the implementation to control memory allocation behavior within the pool.

- **VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT** allows any command buffer allocated from a pool to be individually reset to the **initial state**; either by calling **vkResetCommandBuffer**, or via the implicit reset when calling **vkBeginCommandBuffer**. If this flag is not set on a pool, then **vkResetCommandBuffer** **must** not be called for any command buffer allocated from that pool.

- **VK_COMMAND_POOL_CREATE_PROTECTED_BIT** specifies that command buffers allocated from the pool are protected command buffers.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolCreateFlags;
```
 VkCommandPoolCreateFlags is a bitmask type for setting a mask of zero or more VkCommandPoolCreateFlagBits.

To trim a command pool, call:

```c
// Provided by VK_VERSION_1_1
void vkTrimCommandPool(
    VkDevice device,
    VkCommandPool commandPool,
    VkCommandPoolTrimFlags flags);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance1
void vkTrimCommandPoolKHR(
    VkDevice device,
    VkCommandPool commandPool,
    VkCommandPoolTrimFlags flags);
```

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool to trim.
- `flags` is reserved for future use.

Trimming a command pool recycles unused memory from the command pool back to the system. Command buffers allocated from the pool are not affected by the command.

**Note**

This command provides applications with some control over the internal memory allocations used by command pools.

Unused memory normally arises from command buffers that have been recorded and later reset, such that they are no longer using the memory. On reset, a command buffer can return memory to its command pool, but the only way to release memory from a command pool to the system requires calling `vkResetCommandPool`, which cannot be executed while any command buffers from that pool are still in use. Subsequent recording operations into command buffers will reuse this memory but since total memory requirements fluctuate over time, unused memory can accumulate.

In this situation, trimming a command pool may be useful to return unused memory back to the system, returning the total outstanding memory allocated by the pool back to a more “average” value.

Implementations utilize many internal allocation strategies that make it impossible to guarantee that all unused memory is released back to the system. For instance, an implementation of a command pool may involve allocating memory in bulk from the system and sub-allocating from that memory. In such an
implementation any live command buffer that holds a reference to a bulk allocation would prevent that allocation from being freed, even if only a small proportion of the bulk allocation is in use.

In most cases trimming will result in a reduction in allocated but unused memory, but it does not guarantee the “ideal” behavior.

Trimming may be an expensive operation, and should not be called frequently. Trimming should be treated as a way to relieve memory pressure after application-known points when there exists enough unused memory that the cost of trimming is “worth” it.

---

Valid Usage (Implicit)

- VUID-vkTrimCommandPool-device-parameter
device must be a valid VkDevice handle
- VUID-vkTrimCommandPool-commandPool-parameter
commandPool must be a valid VkCommandPool handle
- VUID-vkTrimCommandPool-flags-zerobitmask
flags must be 0
- VUID-vkTrimCommandPool-commandPool-parent
commandPool must have been created, allocated, or retrieved from device

---

Host Synchronization

- Host access to commandPool must be externally synchronized

---

// Provided by VK_VERSION_1_1
typedef VkFlags VkCommandPoolTrimFlags;

or the equivalent

// Provided by VK_KHR_maintenance1
typedef VkCommandPoolTrimFlags VkCommandPoolTrimFlagsKHR;

VkCommandPoolTrimFlags is a bitmask type for setting a mask, but is currently reserved for future use.

To reset a command pool, call:

---

// Provided by VK_VERSION_1_0
VkResult vkResetCommandPool(
    VkDevice device,
    VkCommandPool commandPool,
    ...);

---
VkCommandPoolResetFlags flags);

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool to reset.
- `flags` is a bitmask of `VkCommandPoolResetFlagBits` controlling the reset operation.

Resetting a command pool recycles all of the resources from all of the command buffers allocated from the command pool back to the command pool. All command buffers that have been allocated from the command pool are put in the initial state.

Any primary command buffer allocated from another `VkCommandPool` that is in the recording or executable state and has a secondary command buffer allocated from `commandPool` recorded into it, becomes invalid.

**Valid Usage**

- VUID-vkResetCommandPool-commandPool-00040
  All `VkCommandBuffer` objects allocated from `commandPool` must not be in the pending state

**Valid Usage (Implicit)**

- VUID-vkResetCommandPool-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkResetCommandPool-commandPool-parameter
  `commandPool` must be a valid `VkCommandPool` handle
- VUID-vkResetCommandPool-flags-parameter
  `flags` must be a valid combination of `VkCommandPoolResetFlagBits` values
- VUID-vkResetCommandPool-commandPool-parent
  `commandPool` must have been created, allocated, or retrieved from `device`

**Host Synchronization**

- Host access to `commandPool` must be externally synchronized

**Return Codes**

- **Success**
  - `VK_SUCCESS`
- **Failure**
  - `VK_ERROR_OUT_OF_DEVICE_MEMORY`
Bits which **can** be set in `vkResetCommandPool::flags`, controlling the reset operation, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolResetFlagBits {
    VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandPoolResetFlagBits;
```

- **VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT** specifies that resetting a command pool recycles all of the resources from the command pool back to the system.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolResetFlags;
```

`VkCommandPoolResetFlags` is a bitmask type for setting a mask of zero or more `VkCommandPoolResetFlagBits`.

To destroy a command pool, call:

```cpp
// Provided by VK_VERSION_1_0
void vkDestroyCommandPool(
    VkDevice device,  // device is the logical device that destroys the command pool.
    VkCommandPool commandPool,  // commandPool is the handle of the command pool to destroy.
    const VkAllocationCallbacks* pAllocator);  // pAllocator controls host memory allocation as described in the Memory Allocation chapter.
```

When a pool is destroyed, all command buffers allocated from the pool are **freed**.

Any primary command buffer allocated from another `VkCommandPool` that is in the recording or executable state and has a secondary command buffer allocated from `commandPool` recorded into it, becomes **invalid**.

---

**Valid Usage**

- **VUID-vkDestroyCommandPool-commandPool-00041**
  All `VkCommandBuffer` objects allocated from `commandPool` **must** not be in the **pending state**

- **VUID-vkDestroyCommandPool-commandPool-00042**
  If `VkAllocationCallbacks` were provided when `commandPool` was created, a compatible set of callbacks **must** be provided here

- **VUID-vkDestroyCommandPool-commandPool-00043**
  If no `VkAllocationCallbacks` were provided when `commandPool` was created, `pAllocator` **must** be `NULL`
Valid Usage (Implicit)

- VUID-vkDestroyCommandPool-device-parameter
  - device must be a valid VkDevice handle

- VUID-vkDestroyCommandPool-commandPool-parameter
  - If commandPool is not VK_NULL_HANDLE, commandPool must be a valid VkCommandPool handle

- VUID-vkDestroyCommandPool-pAllocator-parameter
  - If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyCommandPool-commandPool-parent
  - If commandPool is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to commandPool must be externally synchronized

6.3. Command Buffer Allocation and Management

To allocate command buffers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateCommandBuffers(
    VkDevice device,
    const VkCommandBufferAllocateInfo* pAllocateInfo,
    VkCommandBuffer* pCommandBuffers);
```

- device is the logical device that owns the command pool.
- pAllocateInfo is a pointer to a VkCommandBufferAllocateInfo structure describing parameters of the allocation.
- pCommandBuffers is a pointer to an array of VkCommandBuffer handles in which the resulting command buffer objects are returned. The array must be at least the length specified by the commandBufferCount member of pAllocateInfo. Each allocated command buffer begins in the initial state.

vkAllocateCommandBuffers can be used to allocate multiple command buffers. If the allocation of any of those command buffers fails, the implementation must free all successfully allocated command buffer objects from this command, set all entries of the pCommandBuffers array to NULL and return the error.

Note
Filling `pCommandBuffers` with NULL values on failure is an exception to the default error behavior that output parameters will have undefined contents.

When command buffers are first allocated, they are in the initial state.

Valid Usage (Implicit)

- **VUID-vkAllocateCommandBuffers-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkAllocateCommandBuffers-pAllocateInfo-parameter**
  
  `pAllocateInfo` must be a valid pointer to a valid `VkCommandBufferAllocateInfo` structure

- **VUID-vkAllocateCommandBuffers-pCommandBuffers-parameter**
  
  `pCommandBuffers` must be a valid pointer to an array of `pAllocateInfo->commandBufferCount` `VkCommandBuffer` handles

- **VUID-vkAllocateCommandBuffers-pAllocateInfo::commandBufferCount-arraylength**
  
  `pAllocateInfo->commandBufferCount` must be greater than 0

Host Synchronization

- Host access to `pAllocateInfo->commandPool` must be externally synchronized

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCommandBufferAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandPool commandPool;
    VkCommandBufferLevel level;
    uint32_t commandBufferCount;
} VkCommandBufferAllocateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `commandPool` is the command pool from which the command buffers are allocated.
• `level` is a `VkCommandBufferLevel` value specifying the command buffer level.
• `commandBufferCount` is the number of command buffers to allocate from the pool.

### Valid Usage (Implicit)

- VUID-VkCommandBufferAllocateInfo-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_ALLOCATE_INFO`

- VUID-VkCommandBufferAllocateInfo-pNext-pNext
  
  `pNext` **must** be `NULL`

- VUID-VkCommandBufferAllocateInfo-commandPool-parameter
  
  `commandPool` **must** be a valid `VkCommandPool` handle

- VUID-VkCommandBufferAllocateInfo-level-parameter
  
  `level` **must** be a valid `VkCommandBufferLevel` value

Possible values of `VkCommandBufferAllocateInfo::level`, specifying the command buffer level, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferLevel {
    VK_COMMAND_BUFFER_LEVEL_PRIMARY = 0,
    VK_COMMAND_BUFFER_LEVEL_SECONDARY = 1,
} VkCommandBufferLevel;
```

- `VK_COMMAND_BUFFER_LEVEL_PRIMARY` specifies a primary command buffer.
- `VK_COMMAND_BUFFER_LEVEL_SECONDARY` specifies a secondary command buffer.

To reset a command buffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetCommandBuffer(  
    VkCommandBuffer commandBuffer,  
    VkCommandBufferResetFlags flags);
```

- `commandBuffer` is the command buffer to reset. The command buffer **can** be in any state other than `pending`, and is moved into the initial state.
- `flags` is a bitmask of `VkCommandBufferResetFlagBits` controlling the reset operation.

Any primary command buffer that is in the recording or executable state and has `commandBuffer` recorded into it, becomes invalid.
Valid Usage

- VUID-vkResetCommandBuffer-commandBuffer-00045
  `commandBuffer` must not be in the **pending state**

- VUID-vkResetCommandBuffer-commandBuffer-00046
  `commandBuffer` must have been allocated from a pool that was created with the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT`

Valid Usage (Implicit)

- VUID-vkResetCommandBuffer-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkResetCommandBuffer-flags-parameter
  `flags` must be a valid combination of `VkCommandBufferResetFlagBits` values

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Bits which **can** be set in `vkResetCommandBuffer::flags`, controlling the reset operation, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferResetFlagBits {
    VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandBufferResetFlagBits;
```

- `VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT` specifies that most or all memory resources currently owned by the command buffer **should** be returned to the parent command pool. If this flag is not set, then the command buffer **may** hold onto memory resources and reuse them when recording commands. `commandBuffer` is moved to the **initial state**.
typedef VkFlags VkCommandBufferResetFlags;

VkCommandBufferResetFlags is a bitmask type for setting a mask of zero or more VkCommandBufferResetFlagBits.

To free command buffers, call:

```c
void vkFreeCommandBuffers(
    VkDevice device,
    VkCommandPool commandPool,
    uint32_t commandBufferCount,
    const VkCommandBuffer* pCommandBuffers);
```

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool from which the command buffers were allocated.
- `commandBufferCount` is the length of the `pCommandBuffers` array.
- `pCommandBuffers` is a pointer to an array of handles of command buffers to free.

Any primary command buffer that is in the recording or executable state and has any element of `pCommandBuffers` recorded into it, becomes invalid.

### Valid Usage

- VUID-vkFreeCommandBuffers-pCommandBuffers-00047
  All elements of `pCommandBuffers` must not be in the pending state

- VUID-vkFreeCommandBuffers-pCommandBuffers-00048
  `pCommandBuffers` must be a valid pointer to an array of `commandBufferCount` VkCommandBuffer handles, each element of which must either be a valid handle or NULL

### Valid Usage (Implicit)

- VUID-vkFreeCommandBuffers-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkFreeCommandBuffers-commandPool-parameter
  `commandPool` must be a valid `VkCommandPool` handle

- VUID-vkFreeCommandBuffers-commandBufferCount-arraylength
  `commandBufferCount` must be greater than 0

- VUID-vkFreeCommandBuffers-commandPool-parent
  `commandPool` must have been created, allocated, or retrieved from `device`

- VUID-vkFreeCommandBuffers-pCommandBuffers-parent
Each element of \texttt{pCommandBuffers} that is a valid handle \textbf{must} have been created, allocated, or retrieved from \texttt{commandPool}

### Host Synchronization

- Host access to \texttt{commandPool} \textbf{must} be externally synchronized
- Host access to each member of \texttt{pCommandBuffers} \textbf{must} be externally synchronized

### 6.4. Command Buffer Recording

To begin recording a command buffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBeginCommandBuffer(
    VkCommandBuffer commandBuffer,
    const VkCommandBufferBeginInfo* pBeginInfo);
```

- \texttt{commandBuffer} is the handle of the command buffer which is to be put in the recording state.
- \texttt{pBeginInfo} is a pointer to a \texttt{VkCommandBufferBeginInfo} structure defining additional information about how the command buffer begins recording.

### Valid Usage

- VUID-vkBeginCommandBuffer-commandBuffer-00049
  \texttt{commandBuffer} \textbf{must} not be in the \texttt{recording or pending state}

- VUID-vkBeginCommandBuffer-commandBuffer-00050
  If \texttt{commandBuffer} was allocated from a \texttt{VkCommandPool} which did not have the \texttt{VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT} flag set, \texttt{commandBuffer} \textbf{must} be in the \texttt{initial state}

- VUID-vkBeginCommandBuffer-commandBuffer-00051
  If \texttt{commandBuffer} is a secondary command buffer, the \texttt{pInheritanceInfo} member of \texttt{pBeginInfo} \textbf{must} be a valid \texttt{VkCommandBufferInheritanceInfo} structure

- VUID-vkBeginCommandBuffer-commandBuffer-00052
  If \texttt{commandBuffer} is a secondary command buffer and either the \texttt{occlusionQueryEnable} member of the \texttt{pInheritanceInfo} member of \texttt{pBeginInfo} is \texttt{VK_FALSE}, or the \texttt{occlusionQueryPrecise} feature is not enabled, then \texttt{pBeginInfo->pInheritanceInfo->queryFlags} \textbf{must} not contain \texttt{VK_QUERY_CONTROL_PRECISE_BIT}

- VUID-vkBeginCommandBuffer-commandBuffer-02840
  If \texttt{commandBuffer} is a primary command buffer, then \texttt{pBeginInfo->flags} \textbf{must} not set both the \texttt{VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT} and the \texttt{VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT} flags
Valid Usage (Implicit)

- VUID-vkBeginCommandBuffer-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkBeginCommandBuffer-pBeginInfo-parameter
  pBeginInfo must be a valid pointer to a valid VkCommandBufferBeginInfo structure

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkCommandBufferBeginInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandBufferUsageFlags flags;
    const VkCommandBufferInheritanceInfo* pInheritanceInfo;
} VkCommandBufferBeginInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkCommandBufferUsageFlagBits specifying usage behavior for the command buffer.
- `pInheritanceInfo` is a pointer to a VkCommandBufferInheritanceInfo structure, used if commandBuffer is a secondary command buffer. If this is a primary command buffer, then this value is ignored.
Valid Usage

- VUID-VkCommandBufferBeginInfo-flags-09123
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT, the VkCommandPool that commandBuffer was allocated from must support graphics operations.

- VUID-VkCommandBufferBeginInfo-flags-00055
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT, the framebuffer member of pInheritanceInfo must be either VK_NULL_HANDLE, or a valid VkFramebuffer that is compatible with the renderPass member of pInheritanceInfo.

- VUID-VkCommandBufferBeginInfo-flags-09240
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT and the dynamicRendering feature is not enabled, the renderPass member of pInheritanceInfo must not be VK_NULL_HANDLE.

- VUID-VkCommandBufferBeginInfo-flags-06002
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT and the renderPass member of pInheritanceInfo is VK_NULL_HANDLE, the pNext chain of pInheritanceInfo must include a VkCommandBufferInheritanceRenderingInfo structure.

- VUID-VkCommandBufferBeginInfo-flags-06003
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT, the renderPass member of pInheritanceInfo is VK_NULL_HANDLE, and the pNext chain of pInheritanceInfo includes a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, the colorAttachmentCount member of that structure must be equal to the value of VkCommandBufferInheritanceRenderingInfo::colorAttachmentCount.

- VUID-VkCommandBufferBeginInfo-flags-06000
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT and the renderPass member of pInheritanceInfo is not VK_NULL_HANDLE, the renderPass member of pInheritanceInfo must be a valid VkRenderPass.

- VUID-VkCommandBufferBeginInfo-flags-06001
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT and the renderPass member of pInheritanceInfo is not VK_NULL_HANDLE, the subpass member of pInheritanceInfo must be a valid subpass index within the renderPass member of pInheritanceInfo.

Valid Usage (Implicit)

- VUID-VkCommandBufferBeginInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO.

- VUID-VkCommandBufferBeginInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkDeviceGroupCommandBufferBeginInfo.

- VUID-VkCommandBufferBeginInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique.
Bits which **can** be set in `VkCommandBufferBeginInfo::flags`, specifying usage behavior for a command buffer, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferUsageFlagBits {
    VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT = 0x00000001,
    VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT = 0x00000002,
    VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT = 0x00000004,
} VkCommandBufferUsageFlagBits;
```

- **VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT** specifies that each recording of the command buffer will only be submitted once, and the command buffer will be reset and recorded again between each submission.

- **VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT** specifies that a secondary command buffer is considered to be entirely inside a render pass. If this is a primary command buffer, then this bit is ignored.

- **VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT** specifies that a command buffer **can** be resubmitted to a queue while it is in the *pending state*, and recorded into multiple primary command buffers.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandBufferUsageFlags;
```

`VkCommandBufferUsageFlags` is a bitmask type for setting a mask of zero or more `VkCommandBufferUsageFlagBits`.

If the command buffer is a secondary command buffer, then the `VkCommandBufferInheritanceInfo` structure defines any state that will be inherited from the primary command buffer:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferInheritanceInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderPass renderPass;
    uint32_t subpass;
    VkFramebuffer framebuffer;
    VkBool32 occlusionQueryEnable;
    VkQueryControlFlags queryFlags;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkCommandBufferInheritanceInfo;
```

- **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **renderPass** is a **VkRenderPass** object defining which render passes the **VkCommandBuffer** will be compatible with and **can** be executed within.

• **subpass** is the index of the subpass within the render pass instance that the **VkCommandBuffer** will be executed within.

• **framebuffer** **can** refer to the **VkFramebuffer** object that the **VkCommandBuffer** will be rendering to if it is executed within a render pass instance. It **can** be **VK_NULL_HANDLE** if the framebuffer is not known.

Note

Specifying the exact framebuffer that the secondary command buffer will be executed with **may** result in better performance at command buffer execution time.

• **occlusionQueryEnable** specifies whether the command buffer **can** be executed while an occlusion query is active in the primary command buffer. If this is **VK_TRUE**, then this command buffer **can** be executed whether the primary command buffer has an occlusion query active or not. If this is **VK_FALSE**, then the primary command buffer **must** not have an occlusion query active.

• **queryFlags** specifies the query flags that **can** be used by an active occlusion query in the primary command buffer when this secondary command buffer is executed. If this value includes the **VK_QUERY_CONTROL_PRECISE_BIT** bit, then the active query **can** return boolean results or actual sample counts. If this bit is not set, then the active query **must** not use the **VK_QUERY_CONTROL_PRECISE_BIT** bit.

• **pipelineStatistics** is a bitmask of **VkQueryPipelineStatisticFlagBits** specifying the set of pipeline statistics that **can** be counted by an active query in the primary command buffer when this secondary command buffer is executed. If this value includes a given bit, then this command buffer **can** be executed whether the primary command buffer has a pipeline statistics query active that includes this bit or not. If this value excludes a given bit, then the active pipeline statistics query **must** not be from a query pool that counts that statistic.

If the **VkCommandBuffer** will not be executed within a render pass instance, or if the render pass instance was begun with **vkCmdBeginRendering**, **renderPass**, **subpass**, and **framebuffer** are ignored.

Valid Usage

• **VUID-VkCommandBufferInheritanceInfo-occlusionQueryEnable-00056**
  If the **inheritedQueries** feature is not enabled, **occlusionQueryEnable** **must** be **VK_FALSE**

• **VUID-VkCommandBufferInheritanceInfo-queryFlags-00057**
  If the **inheritedQueries** feature is enabled, **queryFlags** **must** be a valid combination of **VkQueryControlFlagBits** values

• **VUID-VkCommandBufferInheritanceInfo-queryFlags-02788**
  If the **inheritedQueries** feature is not enabled, **queryFlags** **must** be **0**

• **VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-02789**
If the `pipelineStatisticsQuery` feature is enabled, `pipelineStatistics` must be a valid combination of `VkQueryPipelineStatisticFlagBits` values.

- VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-00058

If the `pipelineStatisticsQuery` feature is not enabled, `pipelineStatistics` must be 0.

### Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceInfo-sType-sType
  
  The `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_INFO`.

- VUID-VkCommandBufferInheritanceInfo-pNext-pNext
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkAttachmentSampleCountInfoAMD`, `VkCommandBufferInheritanceConditionalRenderingInfoEXT`, `VkCommandBufferInheritanceRenderPassTransformInfoQCOM`, `VkCommandBufferInheritanceRenderingInfo`, `VkCommandBufferInheritanceViewportScissorInfoNV`, or `VkMultiviewPerViewAttributesInfoNVX`.

- VUID-VkCommandBufferInheritanceInfo-sType-unique
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- VUID-VkCommandBufferInheritanceInfo-commonparent
  
  Both of `framebuffer`, and `renderPass` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

---

<i>Note</i>

On some implementations, not using the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` bit enables command buffers to be patched in-place if needed, rather than creating a copy of the command buffer.

If a command buffer is in the invalid, or executable state, and the command buffer was allocated from a command pool with the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, then `vkBeginCommandBuffer` implicitly resets the command buffer, behaving as if `vkResetCommandBuffer` had been called with `VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT` not set. After the implicit reset, `commandBuffer` is moved to the recording state.

If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceConditionalRenderingInfoEXT` structure, then that structure controls whether a command buffer can be executed while conditional rendering is active in the primary command buffer.

The `VkCommandBufferInheritanceConditionalRenderingInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_conditional_rendering
typedef struct VkCommandBufferInheritanceConditionalRenderingInfoEXT {
    VkStructureType    sType;
}...
```
const void* pNext;
VkBool32 conditionalRenderingEnable;
} VkCommandBufferInheritanceConditionalRenderingInfoEXT;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **conditionalRenderingEnable** specifies whether the command buffer can be executed while conditional rendering is active in the primary command buffer. If this is VK_TRUE, then this command buffer can be executed whether the primary command buffer has active conditional rendering or not. If this is VK_FALSE, then the primary command buffer must not have conditional rendering active.

If this structure is not present, the behavior is as if `conditionalRenderingEnable` is VK_FALSE.

### Valid Usage

- **VUID-VkCommandBufferInheritanceConditionalRenderingInfoEXT-conditionalRenderingEnable-01977**
  
  If the inheritedConditionalRendering feature is not enabled, `conditionalRenderingEnable` must be VK_FALSE

### Valid Usage (Implicit)

- **VUID-VkCommandBufferInheritanceConditionalRenderingInfoEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_CONDITIONAL_RENDERING_INFO_EXT`

To begin recording a secondary command buffer compatible with execution inside a render pass using render pass transform, add the `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` to the `pNext` chain of `VkCommandBufferInheritanceInfo` structure passed to the `vkBeginCommandBuffer` command specifying the parameters for transformed rasterization.

The `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` structure is defined as:

```c
// Provided by VK_QCOM_render_pass_transform
typedef struct VkCommandBufferInheritanceRenderPassTransformInfoQCOM {
    VkStructureType sType;
    void* pNext;
    VkSurfaceTransformFlagBitsKHR transform;
    VkRect2D renderArea;
} VkCommandBufferInheritanceRenderPassTransformInfoQCOM;
```

- **sType** is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `transform` is a `VkSurfaceTransformFlagBitsKHR` value describing the transform to be applied to the render pass.

• `renderArea` is the render area that is affected by the command buffer.

When the secondary is recorded to execute within a render pass instance using `vkCmdExecuteCommands`, the render pass transform parameters of the secondary command buffer must be consistent with the render pass transform parameters specified for the render pass instance. In particular, the `transform` and `renderArea` for command buffer must be identical to the `transform` and `renderArea` of the render pass instance.

### Valid Usage

- VUID-VkCommandBufferInheritanceRenderPassTransformInfoQCOM-transform-02864

  `transform` must be `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR`, `VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR`, or `VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR`.

### Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceRenderPassTransformInfoQCOM-sType-sType

  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDER_PASS_TRANSFORM_INFO_QCOM`.

The `VkCommandBufferInheritanceViewportScissorInfoNV` structure is defined as:

```c
// Provided by VK_NV_inherited_viewport_scissor
typedef struct VkCommandBufferInheritanceViewportScissorInfoNV {
  VkStructureType   sType;
  const void*       pNext;
  VkBool32          viewportScissor2D;
  uint32_t          viewportDepthCount;
  const VkViewport* pViewportDepths;
} VkCommandBufferInheritanceViewportScissorInfoNV;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is NULL or a pointer to a structure extending this structure.

• `viewportScissor2D` specifies whether the listed dynamic state is inherited.

• `viewportDepthCount` specifies the maximum number of viewports to inherit. When `viewportScissor2D` is `VK_FALSE`, the behavior is as if this value is zero.

• `pViewportDepths` is a pointer to a `VkViewport` structure specifying the expected depth range for each inherited viewport.
If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceViewportScissorInfoNV` structure, then that structure controls whether a command buffer can inherit the following state from other command buffers:

- `VK_DYNAMIC_STATE_SCISSOR`
- `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`
- `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT`
- `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT`
- `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT`

as well as the following state, with restrictions on inherited depth values and viewport count:

- `VK_DYNAMIC_STATE_VIEWPORT`
- `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`

If `viewportScissor2D` is `VK_FALSE`, then the command buffer does not inherit the listed dynamic state, and should set this state itself. If this structure is not present, the behavior is as if `viewportScissor2D` is `VK_FALSE`.

If `viewportScissor2D` is `VK_TRUE`, then the listed dynamic state is inherited, and the command buffer must not set this state, except that the viewport and scissor count may be set by binding a graphics pipeline that does not specify this state as dynamic.

**Note**
Due to this restriction, applications should ensure either all or none of the graphics pipelines bound in this secondary command buffer use dynamic viewport/scissor counts.

When the command buffer is executed as part of a the execution of a `vkCmdExecuteCommands` command, the inherited state (if enabled) is determined by the following procedure, performed separately for each dynamic state, and separately for each value for dynamic state that consists of multiple values (e.g. multiple viewports).

- With `i` being the index of the executed command buffer in the `pCommandBuffers` array of `vkCmdExecuteCommands`, if `i > 0` and any secondary command buffer from index 0 to `i-1` modifies the state, the inherited state is provisionally set to the final value set by the last such secondary command buffer. Binding a graphics pipeline defining the state statically is equivalent to setting the state to an undefined value.

- Otherwise, the tentatative inherited state is that of the primary command buffer at the point the `vkCmdExecuteCommands` command was recorded; if the state is undefined, then so is the provisional inherited state.

- If the provisional inherited state is an undefined value, then the state is not inherited.

- If the provisional inherited state is a viewport, with `n` being its viewport index, then if `n ≥ viewportDepthCount`, or if either `VkViewport::minDepth` or `VkViewport::maxDepth` are not equal to the respective values of the `n`th element of `pViewportDepths`, then the state is not inherited.
• If the provisional inherited state passes both checks, then it becomes the actual inherited state.

Note
There is no support for inheriting dynamic state from a secondary command buffer executed as part of a different `vkCmdExecuteCommands` command.

Valid Usage

• VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04782
  If the `inheritedViewportScissor2D` feature is not enabled, `viewportScissor2D` must be `VK_FALSE`

• VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04783
  If the `multiViewport` feature is not enabled and `viewportScissor2D` is `VK_TRUE`, then `viewportDepthCount` must be 1

• VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04784
  If `viewportScissor2D` is `VK_TRUE`, then `viewportDepthCount` must be greater than 0

• VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04785
  If `viewportScissor2D` is `VK_TRUE`, then `pViewportDepths` must be a valid pointer to an array of `viewportDepthCount` valid `VkViewport` structures, except any requirements on `x`, `y`, `width`, and `height` do not apply

• VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04786
  If `viewportScissor2D` is `VK_TRUE`, then the command buffer must be recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`

Valid Usage ( Implicit )

• VUID-VkCommandBufferInheritanceViewportScissorInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_VIEWPORT_SCISSOR_INFO_NV`

The `VkCommandBufferInheritanceRenderingInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferInheritanceRenderingInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderingFlags flags;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkFormat* pColorAttachmentFormats;
    VkFormat depthAttachmentFormat;
    VkFormat stencilAttachmentFormat;
    VkSampleCountFlagBits rasterizationSamples;
} VkCommandBufferInheritanceRenderingInfo;
```
or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkCommandBufferInheritanceRenderingInfo
    VkCommandBufferInheritanceRenderingInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkRenderingFlagBits` used by the render pass instance.
- `viewMask` is the view mask used for rendering.
- `colorAttachmentCount` is the number of color attachments specified in the render pass instance.
- `pColorAttachmentFormats` is a pointer to an array of `VkFormat` values defining the format of color attachments.
- `depthAttachmentFormat` is a `VkFormat` value defining the format of the depth attachment.
- `stencilAttachmentFormat` is a `VkFormat` value defining the format of the stencil attachment.
- `rasterizationSamples` is a `VkSampleCountFlagBits` specifying the number of samples used in rasterization.

If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceRenderingInfo` structure, then that structure controls parameters of dynamic render pass instances that the `VkCommandBuffer` can be executed within. If `VkCommandBufferInheritanceInfo::renderPass` is not `VK_NULL_HANDLE`, or `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` is not specified in `VkCommandBufferBeginInfo::flags`, parameters of this structure are ignored.

If `colorAttachmentCount` is `0` and the `variableMultisampleRate` feature is enabled, `rasterizationSamples` is ignored.

If `depthAttachmentFormat`, `stencilAttachmentFormat`, or any element of `pColorAttachmentFormats` is `VK_FORMAT_UNDEFINED`, it indicates that the corresponding attachment is unused within the render pass and writes to those attachments are discarded.

### Valid Usage

- **VUID-VkCommandBufferInheritanceRenderingInfo-colorAttachmentCount-06004**
  
  If `colorAttachmentCount` is not `0`, `rasterizationSamples` must be a valid `VkSampleCountFlagBits` value.

- **VUID-VkCommandBufferInheritanceRenderingInfo-variableMultisampleRate-06005**
  
  If the `variableMultisampleRate` feature is not enabled, `rasterizationSamples` must be a valid `VkSampleCountFlagBits` value.

- **VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06540**
  
  If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format that includes a depth component.
• VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06007
  If depthAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format with potential format features that include VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT.

• VUID-VkCommandBufferInheritanceRenderingInfo-pColorAttachmentFormats-06492
  If any element of pColorAttachmentFormats is not VK_FORMAT_UNDEFINED, it must be a format with potential format features that include VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT, or VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV if the linearColorAttachment feature is enabled.

• VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-06541
  If stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format that includes a stencil aspect.

• VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-06199
  If stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format with potential format features that include VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT.

• VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06200
  If depthAttachmentFormat is not VK_FORMAT_UNDEFINED and stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, depthAttachmentFormat must equal stencilAttachmentFormat.

• VUID-VkCommandBufferInheritanceRenderingInfo-multiview-06008
  If the multiview feature is not enabled, viewMask must be 0.

• VUID-VkCommandBufferInheritanceRenderingInfo-viewMask-06009
  The index of the most significant bit in viewMask must be less than maxMultiviewViewCount.

Valid Usage (Implicit)

• VUID-VkCommandBufferInheritanceRenderingInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDERING_INFO.

• VUID-VkCommandBufferInheritanceRenderingInfo-flags-parameter
  flags must be a valid combination of VkRenderingFlagBits values.

• VUID-VkCommandBufferInheritanceRenderingInfo-pColorAttachmentFormats-parameter
  If colorAttachmentCount is not 0, pColorAttachmentFormats must be a valid pointer to an array of colorAttachmentCount valid VkFormat values.

• VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-parameter
  depthAttachmentFormat must be a valid VkFormat value.

• VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-parameter
  stencilAttachmentFormat must be a valid VkFormat value.

• VUID-VkCommandBufferInheritanceRenderingInfo-rasterizationSamples-parameter
  If rasterizationSamples is not 0, rasterizationSamples must be a valid VkSampleCountFlagBits value.

The VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure is defined as:
// Provided by VK_KHR_dynamic_rendering with VK_AMD_mixed_attachment_samples

typedef struct VkAttachmentSampleCountInfoAMD {
    VkStructureType sType;
    const void* pNext;
    uint32_t colorAttachmentCount;
    const VkSampleCountFlagBits* pColorAttachmentSamples;
    VkSampleCountFlagBits depthStencilAttachmentSamples;
} VkAttachmentSampleCountInfoAMD;

or the equivalent

// Provided by VK_KHR_dynamic_rendering with VK_NV_framebuffer_mixed_samples

typedef VkAttachmentSampleCountInfoAMD VkAttachmentSampleCountInfoNV;

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **colorAttachmentCount** is the number of color attachments specified in a render pass instance.
- **pColorAttachmentSamples** is a pointer to an array of *VkSampleCountFlagBits* values defining the sample count of color attachments.
- **depthStencilAttachmentSamples** is a *VkSampleCountFlagBits* value defining the sample count of a depth/stencil attachment.

If *VkCommandBufferInheritanceInfo::renderPass* is VK_NULL_HANDLE, *VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT* is specified in *VkCommandBufferBeginInfo::flags*, and the **pNext** chain of *VkCommandBufferInheritanceInfo* includes *VkAttachmentSampleCountInfoAMD*, then this structure defines the sample counts of each attachment within the render pass instance. If *VkAttachmentSampleCountInfoAMD* is not included, the value of *VkAttachmentSampleCountInfoAMD* is used as the sample count for each attachment. If *VkCommandBufferInheritanceInfo::renderPass* is not VK_NULL_HANDLE, or *VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT* is not specified in *VkCommandBufferBeginInfo::flags*, parameters of this structure are ignored.

*VkAttachmentSampleCountInfoAMD* can also be included in the **pNext** chain of *VkGraphicsPipelineCreateInfo*. When a graphics pipeline is created without a *VkRenderPass*, if this structure is included in the **pNext** chain of *VkGraphicsPipelineCreateInfo*, it specifies the sample count of attachments used for rendering. If this structure is not specified, and the pipeline does not include a *VkRenderPass*, the value of *VkPipelineMultisampleStateCreateInfo::rasterizationSamples* is used as the sample count for each attachment. If a graphics pipeline is created with a valid *VkRenderPass*, parameters of this structure are ignored.

### Valid Usage (Implicit)

- **VUID-VkAttachmentSampleCountInfoAMD-sType-sType**
  
  *sType* must be *VK_STRUCTURE_TYPE_ATTACHMENT_SAMPLE_COUNT_INFO_AMD*
Once recording starts, an application records a sequence of commands (vkCmd*) to set state in the command buffer, draw, dispatch, and other commands.

Several commands can also be recorded indirectly from VkBuffer content, see Device-Generated Commands.

To complete recording of a command buffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEndCommandBuffer(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer to complete recording.

The command buffer must have been in the recording state, and, if successful, is moved to the executable state.

If there was an error during recording, the application will be notified by an unsuccessful return code returned by `vkEndCommandBuffer`, and the command buffer will be moved to the invalid state.

In case the application recorded one or more video encode operations into the command buffer, implementations may return the VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

**Note**

Applications should not rely on the VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.

**Valid Usage**

- VUID-vkEndCommandBuffer-commandBuffer-00059
  commandBuffer must be in the recording state
- VUID-vkEndCommandBuffer-commandBuffer-00060
  If commandBuffer is a primary command buffer, there must not be an active render pass instance
- VUID-vkEndCommandBuffer-commandBuffer-00061
  All queries made active during the recording of commandBuffer must have been made inactive
- VUID-vkEndCommandBuffer-None-01978
  Conditional rendering must not be active
- VUID-vkEndCommandBuffer-None-06991
  There must be no video session object bound
If `commandBuffer` is a secondary command buffer, there **must** not be an outstanding `vkCmdBeginDebugUtilsLabelEXT` command recorded to `commandBuffer` that has not previously been ended by a call to `vkCmdEndDebugUtilsLabelEXT`.

If `commandBuffer` is a secondary command buffer, there **must** not be an outstanding `vkCmdDebugMarkerBeginEXT` command recorded to `commandBuffer` that has not previously been ended by a call to `vkCmdDebugMarkerEndEXT`.

**Valid Usage (Implicit)**

- VUID-vkEndCommandBuffer-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

**Return Codes**

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR

When a command buffer is in the executable state, it **can** be submitted to a queue for execution.

### 6.5. Command Buffer Submission

**Note**

Submission can be a high overhead operation, and applications **should** attempt to batch work together into as few calls to `vkQueueSubmit` or `vkQueueSubmit2` as possible.

To submit command buffers to a queue, call:
// Provided by VK_VERSION_1_3
VkResult vkQueueSubmit2(
    VkQueue queue, uint32_t submitCount, const VkSubmitInfo2* pSubmits,
    VkFence fence);

or the equivalent command

// Provided by VK_KHR_synchronization2
VkResult vkQueueSubmit2KHR(
    VkQueue queue, uint32_t submitCount, const VkSubmitInfo2* pSubmits,
    VkFence fence);

- `queue` is the queue that the command buffers will be submitted to.
- `submitCount` is the number of elements in the `pSubmits` array.
- `pSubmits` is a pointer to an array of `VkSubmitInfo2` structures, each specifying a command buffer submission batch.
- `fence` is an optional handle to a fence to be signaled once all submitted command buffers have completed execution. If `fence` is not `VK_NULL_HANDLE`, it defines a fence signal operation.

`vkQueueSubmit2` is a queue submission command, with each batch defined by an element of `pSubmits`.

Semaphore operations submitted with `vkQueueSubmit2` have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the semaphore section of the synchronization chapter.

If any command buffer submitted to this queue is in the executable state, it is moved to the pending state. Once execution of all submissions of a command buffer complete, it moves from the pending state, back to the executable state. If a command buffer was recorded with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` flag, it instead moves back to the invalid state.

If `vkQueueSubmit2` fails, it may return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by `pSubmits` is unaffected by the call or its failure. If `vkQueueSubmit2` fails in such a way that the implementation is unable to make that guarantee, the implementation must return `VK_ERROR_DEVICE_LOST`. See Lost Device.

**Valid Usage**

- VUID-vkQueueSubmit2-fence-04894
  If `fence` is not `VK_NULL_HANDLE`, `fence` must be unsigned

228
• VUID-vkQueueSubmit2-fence-04895
  If `fence` is not `VK_NULL_HANDLE`, `fence` must not be associated with any other queue command that has not yet completed execution on that queue.

• VUID-vkQueueSubmit2-synchronization2-03866
  The `synchronization2` feature must be enabled.

• VUID-vkQueueSubmit2-commandBuffer-03867
  If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` referenced an `VkEvent`, that event must not be referenced by a command that has been submitted to another queue and is still in the `pending state`.

• VUID-vkQueueSubmit2-semaphore-03868
  The `semaphore` member of any binary semaphore element of the `pSignalSemaphoreInfos` member of any element of `pSubmits` must be unsignaled when the semaphore signal operation it defines is executed on the device.

• VUID-vkQueueSubmit2-stageMask-03869
  The `stageMask` member of any element of the `pSignalSemaphoreInfos` member of any element of `pSubmits` must only include pipeline stages that are supported by the queue family which `queue` belongs to.

• VUID-vkQueueSubmit2-stageMask-03870
  The `stageMask` member of any element of the `pWaitSemaphoreInfos` member of any element of `pSubmits` must only include pipeline stages that are supported by the queue family which `queue` belongs to.

• VUID-vkQueueSubmit2-semaphore-03871
  When a semaphore wait operation for a binary semaphore is executed, as defined by the `semaphore` member of any element of the `pWaitSemaphoreInfos` member of any element of `pSubmits`, there must be no other queues waiting on the same semaphore.

• VUID-vkQueueSubmit2-semaphore-03873
  The `semaphore` member of any element of the `pWaitSemaphoreInfos` member of any element of `pSubmits` that was created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_BINARY_KHR` must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends must have also been submitted for execution.

• VUID-vkQueueSubmit2-commandBuffer-03874
  The `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` must be in the `pending or executable state`.

• VUID-vkQueueSubmit2-commandBuffer-03875
  If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it must not be in the `pending state`.

• VUID-vkQueueSubmit2-commandBuffer-03876
  Any secondary command buffers recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` must be in the `pending or executable state`.
If any secondary command buffers recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits was not recorded with the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT, it must not be in the pending state.

The commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits must have been allocated from a VkCommandPool that was created for the same queue family queue belongs to.

If a command recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits includes a Queue Family Transfer Acquire Operation, there must exist a previously submitted Queue Family Transfer Release Operation on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such acquire operations, and which happens before the acquire operation.

If a command recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits was a vkCmdBeginQuery whose queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the profiling lock must have been held continuously on the VkDevice that queue was retrieved from, throughout recording of those command buffers.

If queue was not created with VKDEVICE_QUEUE_CREATE_PROTECTED_BIT, the flags member of any element of pSubmits must not include VK_SUBMIT_PROTECTED_BIT_KHR.

Valid Usage (Implicit)

- VUID-vkQueueSubmit2-queue-parameter
  queue must be a valid VkQueue handle

- VUID-vkQueueSubmit2-pSubmits-parameter
  If submitCount is not 0, pSubmits must be a valid pointer to an array of submitCount valid VkSubmitInfo2 structures

- VUID-vkQueueSubmit2-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

- VUID-vkQueueSubmit2-commonparent
  Both of fence, and queue that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to queue must be externally synchronized

230
Host access to fence must be externally synchronized

## Command Properties

<table>
<thead>

</tbody>
</table>

## Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The VkSubmitInfo2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkSubmitInfo2 {
    VkStructureType           sType;
    const void*               pNext;
    VkSubmitFlags             flags;
    uint32_t                  waitSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pWaitSemaphoreInfos;
    uint32_t                  commandBufferInfoCount;
    const VkCommandBufferSubmitInfo* pCommandBufferInfos;
    uint32_t                  signalSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pSignalSemaphoreInfos;
} VkSubmitInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkSubmitInfo2 VkSubmitInfo2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkSubmitFlagBits.
- `waitSemaphoreInfoCount` is the number of elements in `pWaitSemaphoreInfos`.
• `pWaitSemaphoreInfos` is a pointer to an array of `VkSemaphoreSubmitInfo` structures defining semaphore wait operations.

• `commandBufferInfoCount` is the number of elements in `pCommandBufferInfos` and the number of command buffers to execute in the batch.

• `pCommandBufferInfos` is a pointer to an array of `VkCommandBufferSubmitInfo` structures describing command buffers to execute in the batch.

• `signalSemaphoreInfoCount` is the number of elements in `pSignalSemaphoreInfos`.

• `pSignalSemaphoreInfos` is a pointer to an array of `VkSemaphoreSubmitInfo` describing semaphore signal operations.

**Valid Usage**

• VUID-VkSubmitInfo2-semaphore-03881
  If the same semaphore is used as the `semaphore` member of both an element of `pSignalSemaphoreInfos` and `pWaitSemaphoreInfos`, and that semaphore is a timeline semaphore, the value member of the `pSignalSemaphoreInfos` element must be greater than the value member of the `pWaitSemaphoreInfos` element

• VUID-VkSubmitInfo2-semaphore-03882
  If the `semaphore` member of any element of `pSignalSemaphoreInfos` is a timeline semaphore, the value member of that element must have a value greater than the current value of the semaphore when the semaphore signal operation is executed

• VUID-VkSubmitInfo2-semaphore-03883
  If the `semaphore` member of any element of `pSignalSemaphoreInfos` is a timeline semaphore, the value member of that element must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`

• VUID-VkSubmitInfo2-semaphore-03884
  If the `semaphore` member of any element of `pWaitSemaphoreInfos` is a timeline semaphore, the value member of that element must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`

• VUID-VkSubmitInfo2-flags-03886
  If `flags` includes `VK_SUBMIT_PROTECTED_BIT`, all elements of `pCommandBuffers` must be protected command buffers

• VUID-VkSubmitInfo2-flags-03887
  If `flags` does not include `VK_SUBMIT_PROTECTED_BIT`, each element of `pCommandBuffers` must not be a protected command buffer

• VUID-VkSubmitInfo2KHR-commandBuffer-06192
  If any `commandBuffer` member of an element of `pCommandBufferInfos` contains any resumed render pass instances, they must be suspended by a render pass instance earlier in submission order within `pCommandBufferInfos`

• VUID-VkSubmitInfo2KHR-commandBuffer-06010
  If any `commandBuffer` member of an element of `pCommandBufferInfos` contains any
suspended render pass instances, they must be resumed by a render pass instance later in submission order within pCommandBufferInfos

- VUID-VkSubmitInfo2KHR-commandBuffer-06011
  If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, there must be no action or synchronization commands between that render pass instance and the render pass instance that resumes it

- VUID-VkSubmitInfo2KHR-commandBuffer-06012
  If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, there must be no render pass instances between that render pass instance and the render pass instance that resumes it

- VUID-VkSubmitInfo2KHR-variableSampleLocations-06013
  If the variableSampleLocations limit is not supported, and any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, must use the same sample locations

Valid Usage (Implicit)

- VUID-VkSubmitInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBMIT_INFO_2

- VUID-VkSubmitInfo2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkFrameBoundaryEXT, VkPerformanceQuerySubmitInfoKHR, VkWin32KeyedMutexAcquireReleaseInfoKHR, or VkWin32KeyedMutexAcquireReleaseInfoNV

- VUID-VkSubmitInfo2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkSubmitInfo2-flags-parameter
  flags must be a valid combination of VkSubmitFlagBits values

- VUID-VkSubmitInfo2-pWaitSemaphoreInfos-parameter
  If waitSemaphoreInfoCount is not 0, pWaitSemaphoreInfos must be a valid pointer to an array of waitSemaphoreInfoCount valid VkSemaphoreSubmitInfo structures

- VUID-VkSubmitInfo2-pCommandBufferInfos-parameter
  If commandBufferInfoCount is not 0, pCommandBufferInfos must be a valid pointer to an array of commandBufferInfoCount valid VkCommandBufferSubmitInfo structures

- VUID-VkSubmitInfo2-pSignalSemaphoreInfos-parameter
  If signalSemaphoreInfoCount is not 0, pSignalSemaphoreInfos must be a valid pointer to an array of signalSemaphoreInfoCount valid VkSemaphoreSubmitInfo structures

Bits which can be set in VkSubmitInfo2::flags, specifying submission behavior, are:
// Provided by VK_VERSION_1_3
typedef enum VkSubmitFlagBits {
    VK_SUBMIT_PROTECTED_BIT = 0x00000001,
    VK_SUBMIT_PROTECTED_BIT_KHR = VK_SUBMIT_PROTECTED_BIT,
} VkSubmitFlagBits;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkSubmitFlagBits VkSubmitFlagBitsKHR;

• **VK_SUBMIT_PROTECTED_BIT** specifies that this batch is a protected submission.

// Provided by VK_VERSION_1_3
typedef VkFlags VkSubmitFlags;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkSubmitFlags VkSubmitFlagsKHR;

VkSubmitFlags is a bitmask type for setting a mask of zero or more VkSubmitFlagBits.

The VkSemaphoreSubmitInfo structure is defined as:

// Provided by VK_VERSION_1_3
typedef struct VkSemaphoreSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    uint64_t value;
    VkPipelineStageFlags2 stageMask;
    uint32_t deviceIndex;
} VkSemaphoreSubmitInfo;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkSemaphoreSubmitInfo VkSemaphoreSubmitInfoKHR;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **semaphore** is aVkSemaphore affected by this operation.
• value is either the value used to signal semaphore or the value waited on by semaphore, if semaphore is a timeline semaphore. Otherwise it is ignored.

• stageMask is a VkPipelineStageFlags2 mask of pipeline stages which limit the first synchronization scope of a semaphore signal operation, or second synchronization scope of a semaphore wait operation as described in the semaphore wait operation and semaphore signal operation sections of the synchronization chapter.

• deviceIndex is the index of the device within a device group that executes the semaphore wait or signal operation.

Whether this structure defines a semaphore wait or signal operation is defined by how it is used.

Valid Usage

• VUID-VkSemaphoreSubmitInfo-stageMask-03929
If the geometryShader feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT

• VUID-VkSemaphoreSubmitInfo-stageMask-03930
If the tessellationShader feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT

• VUID-VkSemaphoreSubmitInfo-stageMask-03931
If the conditionalRendering feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT

• VUID-VkSemaphoreSubmitInfo-stageMask-03932
If the fragmentDensityMap feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT

• VUID-VkSemaphoreSubmitInfo-stageMask-03933
If the transformFeedback feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT

• VUID-VkSemaphoreSubmitInfo-stageMask-03934
If the meshShader feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT

• VUID-VkSemaphoreSubmitInfo-stageMask-03935
If the taskShader feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT

• VUID-VkSemaphoreSubmitInfo-stageMask-07316
If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, stageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-VkSemaphoreSubmitInfo-stageMask-04957
If the subpassShading feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI

• VUID-VkSemaphoreSubmitInfo-stageMask-04995
If the invocationMask feature is not enabled, stageMask must not contain
If neither the \texttt{VK_NV_ray_tracing} extension or \texttt{rayTracingPipeline} feature are enabled, \texttt{stageMask} must not contain \texttt{VK_PIPELINE_STAGE_2RAY_TRACING_SHADER_BIT_KHR}.

If the \texttt{device} that \texttt{semaphore} was created on is not a device group, \texttt{deviceIndex} must be 0.

If the \texttt{device} that \texttt{semaphore} was created on is a device group, \texttt{deviceIndex} must be a valid device index.

### Valid Usage (Implicit)

- \texttt{VUID-VkSemaphoreSubmitInfo-sType-sType} \\
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_SEMAPHORE_SUBMIT_INFO}

- \texttt{VUID-VkSemaphoreSubmitInfo-pNext-pNext} \\
  \texttt{pNext} must be \texttt{NULL}

- \texttt{VUID-VkSemaphoreSubmitInfo-semaphore-parameter} \\
  \texttt{semaphore} must be a valid \texttt{VkSemaphore} handle

- \texttt{VUID-VkSemaphoreSubmitInfo-stageMask-parameter} \\
  \texttt{stageMask} must be a valid combination of \texttt{VkPipelineStageFlagBits2} values

The \texttt{VkCommandBufferSubmitInfo} structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandBuffer commandBuffer;
    uint32_t deviceMask;
} VkCommandBufferSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkCommandBufferSubmitInfo VkCommandBufferSubmitInfoKHR;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{commandBuffer} is a \texttt{VkCommandBuffer} to be submitted for execution.
- \texttt{deviceMask} is a bitmask indicating which devices in a device group execute the command buffer. A \texttt{deviceMask} of 0 is equivalent to setting all bits corresponding to valid devices in the group to 1.
Valid Usage

- VUID-VkCommandBufferSubmitInfo-commandBuffer-03890
  `commandBuffer` must not have been allocated with `VK_COMMAND_BUFFER_LEVEL_SECONDARY`

- VUID-VkCommandBufferSubmitInfo-deviceMask-03891
  If `deviceMask` is not 0, it must be a valid device mask

Valid Usage (Implicit)

- VUID-VkCommandBufferSubmitInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_SUBMIT_INFO`

- VUID-VkCommandBufferSubmitInfo-pNext-pNext
  `pNext` must be NULL

- VUID-VkCommandBufferSubmitInfo-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

To submit command buffers to a queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueSubmit(
    VkQueue queue,
    uint32_t submitCount,
    const VkSubmitInfo* pSubmits,
    VkFence fence);
```

- `queue` is the queue that the command buffers will be submitted to.
- `submitCount` is the number of elements in the `pSubmits` array.
- `pSubmits` is a pointer to an array of `VkSubmitInfo` structures, each specifying a command buffer submission batch.
- `fence` is an optional handle to a fence to be signaled once all submitted command buffers have completed execution. If `fence` is not `VK_NULL_HANDLE`, it defines a fence signal operation.

`vkQueueSubmit` is a queue submission command, with each batch defined by an element of `pSubmits`. Batches begin execution in the order they appear in `pSubmits`, but may complete out of order.

Fence and semaphore operations submitted with `vkQueueSubmit` have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the semaphore and fence sections of the synchronization chapter.

Details on the interaction of `pWaitDstStageMask` with synchronization are described in the semaphore wait operation section of the synchronization chapter.

The order that batches appear in `pSubmits` is used to determine submission order, and thus all the
There are implicit ordering guarantees that respect it. Other than these implicit ordering guarantees and any explicit synchronization primitives, these batches may overlap or otherwise execute out of order.

If any command buffer submitted to this queue is in the executable state, it is moved to the pending state. Once execution of all submissions of a command buffer complete, it moves from the pending state, back to the executable state. If a command buffer was recorded with the VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT flag, it instead moves to the invalid state.

If vkQueueSubmit fails, it may return VK_ERROR_OUT_OF_HOST_MEMORY or VK_ERROR_OUT_OF_DEVICE_MEMORY. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by pSubmits is unaffected by the call or its failure. If vkQueueSubmit fails in such a way that the implementation is unable to make that guarantee, the implementation must return VK_ERROR_DEVICE_LOST. See Lost Device.

Valid Usage

- VUID-vkQueueSubmit-fence-00063
  If fence is not VK_NULL_HANDLE, fence must be unsignaled

- VUID-vkQueueSubmit-fence-00064
  If fence is not VK_NULL_HANDLE, fence must not be associated with any other queue command that has not yet completed execution on that queue

- VUID-vkQueueSubmit-pCommandBuffers-00065
  Any calls to vkCmdSetEvent, vkCmdResetEvent or vkCmdWaitEvents that have been recorded into any of the command buffer elements of the pCommandBuffers member of any element of pSubmits, must not reference any VkEvent that is referenced by any of those commands in a command buffer that has been submitted to another queue and is still in the pending state

- VUID-vkQueueSubmit-pWaitDstStageMask-00066
  Any stage flag included in any element of the pWaitDstStageMask member of any element of pSubmits must be a pipeline stage supported by one of the capabilities of queue, as specified in the table of supported pipeline stages

- VUID-vkQueueSubmit-pSignalSemaphores-00067
  Each binary semaphore element of the pSignalSemaphores member of any element of pSubmits must be unsignaled when the semaphore signal operation it defines is executed on the device

- VUID-vkQueueSubmit-pWaitSemaphores-00068
  When a semaphore wait operation referring to a binary semaphore defined by any element of the pWaitSemaphores member of any element of pSubmits executes on queue, there must be no other queues waiting on the same semaphore

- VUID-vkQueueSubmit-pWaitSemaphores-03238
  All elements of the pWaitSemaphores member of all elements of pSubmits created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends must have also been submitted for execution
Each element of the `pCommandBuffers` member of each element of `pSubmits` must be in the pending or executable state.

If any element of the `pCommandBuffers` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it must not be in the pending state.

Any secondary command buffers recorded into any element of the `pCommandBuffers` member of any element of `pSubmits` must be in the pending or executable state.

If any secondary command buffers recorded into any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it must not be in the pending state.

Each element of the `pCommandBuffers` member of each element of `pSubmits` must have been allocated from a `VkCommandPool` that was created for the same queue family `queue` belongs to.

If any element of `pSubmits->pCommandBuffers` includes a Queue Family Transfer Acquire Operation, there must exist a previously submitted Queue Family Transfer Release Operation on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such acquire operations, and which happens-before the acquire operation.

If a command recorded into any element of `pCommandBuffers` was a `vkCmdBeginQuery` whose `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the profiling lock must have been held continuously on the `VkDevice` that `queue` was retrieved from, throughout recording of those command buffers.

Any resource created with `VK_SHARING_MODE_EXCLUSIVE` that is read by an operation specified by `pSubmits` must not be owned by any queue family other than the one which `queue` belongs to, at the time it is executed.

Any resource created with `VK_SHARING_MODE_CONCURRENT` that is accessed by an operation specified by `pSubmits` must have included the queue family of `queue` at resource creation time.

If `queue` was not created with `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT`, there must be no element of `pSubmits` that includes an `VkProtectedSubmitInfo` structure in its `pNext` chain with `protectedSubmit` equal to `VK_TRUE`. 
Valid Usage (Implicit)

- VUID-vkQueueSubmit-queue-parameter
  queue must be a valid VkQueue handle

- VUID-vkQueueSubmit-pSubmits-parameter
  If submitCount is not 0, pSubmits must be a valid pointer to an array of submitCount valid VkSubmitInfo structures

- VUID-vkQueueSubmit-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

- VUID-vkQueueSubmit-commonparent
  Both of fence, and queue that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to queue must be externally synchronized
- Host access to fence must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The VkSubmitInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubmitInfo {
    VkStructureType sType;
    const void* pNext;
} VkSubmitInfo;
```
uint32_t waitSemaphoreCount;
const VkSemaphore* pWaitSemaphores;
const VkPipelineStageFlags* pWaitDstStageMask;
uint32_t commandBufferCount;
const VkCommandBuffer* pCommandBuffers;
uint32_t signalSemaphoreCount;
const VkSemaphore* pSignalSemaphores;
}
VkSubmitInfo;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• waitSemaphoreCount is the number of semaphores upon which to wait before executing the command buffers for the batch.
• pWaitSemaphores is a pointer to an array of VkSemaphore handles upon which to wait before the command buffers for this batch begin execution. If semaphores to wait on are provided, they define a semaphore wait operation.
• pWaitDstStageMask is a pointer to an array of pipeline stages at which each corresponding semaphore wait will occur.
• commandBufferCount is the number of command buffers to execute in the batch.
• pCommandBuffers is a pointer to an array of VkCommandBuffer handles to execute in the batch.
• signalSemaphoreCount is the number of semaphores to be signaled once the commands specified in pCommandBuffers have completed execution.
• pSignalSemaphores is a pointer to an array of VkSemaphore handles which will be signaled when the command buffers for this batch have completed execution. If semaphores to be signaled are provided, they define a semaphore signal operation.

The order that command buffers appear in pCommandBuffers is used to determine submission order, and thus all the implicit ordering guarantees that respect it. Other than these implicit ordering guarantees and any explicit synchronization primitives, these command buffers may overlap or otherwise execute out of order.

Valid Usage

• VUID-VkSubmitInfo-pWaitDstStageMask-04090
  If the geometryShader feature is not enabled, pWaitDstStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

• VUID-VkSubmitInfo-pWaitDstStageMask-04091
  If the tessellationShader feature is not enabled, pWaitDstStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

• VUID-VkSubmitInfo-pWaitDstStageMask-04092
  If the conditionalRendering feature is not enabled, pWaitDstStageMask must not contain VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT
• VUID-VkSubmitInfo-pWaitDstStageMask-04093
  If the fragmentDensityMap feature is not enabled, pWaitDstStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

• VUID-VkSubmitInfo-pWaitDstStageMask-04094
  If the transformFeedback feature is not enabled, pWaitDstStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

• VUID-VkSubmitInfo-pWaitDstStageMask-04095
  If the meshShader feature is not enabled, pWaitDstStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT

• VUID-VkSubmitInfo-pWaitDstStageMask-04096
  If the taskShader feature is not enabled, pWaitDstStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

• VUID-VkSubmitInfo-pWaitDstStageMask-07318
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, pWaitDstStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-VkSubmitInfo-pWaitDstStageMask-03937
  If the synchronization2 feature is not enabled, pWaitDstStageMask must not be 0

• VUID-VkSubmitInfo-pWaitDstStageMask-07949
  If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled, pWaitDstStageMask must not contain VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

• VUID-VkSubmitInfo-pCommandBuffers-00075
  Each element of pCommandBuffers must not have been allocated with VK_COMMAND_BUFFER_LEVEL_SECONDARY

• VUID-VkSubmitInfo-pWaitDstStageMask-00078
  Each element of pWaitDstStageMask must not include VK_PIPELINE_STAGE_HOST_BIT

• VUID-VkSubmitInfo-pWaitSemaphores-03239
  If any element of pWaitSemaphores or pSignalSemaphores was created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, then the pNext chain must include a VkTimelineSemaphoreSubmitInfo structure

• VUID-VkSubmitInfo-pNext-03240
  If the pNext chain of this structure includes a VkTimelineSemaphoreSubmitInfo structure and any element of pWaitSemaphores was created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, then its waitSemaphoreValueCount member must equal waitSemaphoreCount

• VUID-VkSubmitInfo-pNext-03241
  If the pNext chain of this structure includes a VkTimelineSemaphoreSubmitInfo structure and any element of pSignalSemaphores was created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, then its signalSemaphoreValueCount member must equal signalSemaphoreCount

• VUID-VkSubmitInfo-pSignalSemaphores-03242
  For each element of pSignalSemaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE the corresponding element of
VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues must have a value greater than the current value of the semaphore when the semaphore signal operation is executed

- VUID-VkSubmitInfo-pWaitSemaphores-03243
  For each element of pWaitSemaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE the corresponding element of VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than maxTimelineSemaphoreValueDifference

- VUID-VkSubmitInfo-pSignalSemaphores-03244
  For each element of pSignalSemaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE the corresponding element of VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than maxTimelineSemaphoreValueDifference

- VUID-VkSubmitInfo-pNext-04120
  If the pNext chain of this structure does not include a VkProtectedSubmitInfo structure with protectedSubmit set to VK_TRUE, then each element of the pCommandBuffers array must be an unprotected command buffer

- VUID-VkSubmitInfo-pNext-04148
  If the pNext chain of this structure includes a VkProtectedSubmitInfo structure with protectedSubmit set to VK_TRUE, then each element of the pCommandBuffers array must be a protected command buffer

- VUID-VkSubmitInfo-pCommandBuffers-06193
  If pCommandBuffers contains any resumed render pass instances, they must be suspended by a render pass instance earlier in submission order within pCommandBuffers

- VUID-VkSubmitInfo-pCommandBuffers-06014
  If pCommandBuffers contains any suspended render pass instances, they must be resumed by a render pass instance later in submission order within pCommandBuffers

- VUID-VkSubmitInfo-pCommandBuffers-06015
  If pCommandBuffers contains any suspended render pass instances, there must be no action or synchronization commands executed in a primary or secondary command buffer between that render pass instance and the render pass instance that resumes it

- VUID-VkSubmitInfo-pCommandBuffers-06016
  If pCommandBuffers contains any suspended render pass instances, there must be no render pass instances between that render pass instance and the render pass instance that resumes it

- VUID-VkSubmitInfo-variableSampleLocations-06017
  If the variableSampleLocations limit is not supported, and any element of pCommandBuffers contains any suspended render pass instances, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, must use the same sample
Valid Usage (Implicit)

- **VUID-VkSubmitInfo-sType-sType**
  - The `sType` must be `VK_STRUCTURE_TYPE_SUBMIT_INFO`

- **VUID-VkSubmitInfo-pNext-pNext**
  - Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkAmigoProfilingSubmitInfoSEC`, `VkD3D12FenceSubmitInfoKHR`, `VkDeviceGroupSubmitInfo`, `VkFrameBoundaryEXT`, `VkPerformanceQuerySubmitInfoKHR`, `VkTimelineSemaphoreSubmitInfo`, `VkWin32KeyedMutexAcquireReleaseInfoKHR`, or `VkWin32KeyedMutexAcquireReleaseInfoNV`

- **VUID-VkSubmitInfo-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkSubmitInfo-pWaitSemaphores-parameter**
  - If `waitSemaphoreCount` is not 0, `pWaitSemaphores` must be a valid pointer to an array of `waitSemaphoreCount` valid `VkSemaphore` handles

- **VUID-VkSubmitInfo-pWaitDstStageMask-parameter**
  - If `waitSemaphoreCount` is not 0, `pWaitDstStageMask` must be a valid pointer to an array of `waitSemaphoreCount` valid combinations of `VkPipelineStageFlagBits` values

- **VUID-VkSubmitInfo-pCommandBuffers-parameter**
  - If `commandBufferCount` is not 0, `pCommandBuffers` must be a valid pointer to an array of `commandBufferCount` valid `VkCommandBuffer` handles

- **VUID-VkSubmitInfo-pSignalSemaphores-parameter**
  - If `signalSemaphoreCount` is not 0, `pSignalSemaphores` must be a valid pointer to an array of `signalSemaphoreCount` valid `VkSemaphore` handles

- **VUID-VkSubmitInfo-commonparent**
  - Each of the elements of `pCommandBuffers`, the elements of `pSignalSemaphores`, and the elements of `pWaitSemaphores` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

To specify the values to use when waiting for and signaling semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, add a `VkTimelineSemaphoreSubmitInfo` structure to the `pNext` chain of the `VkSubmitInfo` structure when using `vkQueueSubmit` or the `VkBindSparseInfo` structure when using `vkQueueBindSparse`. The `VkTimelineSemaphoreSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkTimelineSemaphoreSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreValueCount;
} VkTimelineSemaphoreSubmitInfo;
```
const uint64_t* pWaitSemaphoreValues;
uint32_t signalSemaphoreValueCount;
const uint64_t* pSignalSemaphoreValues;
} VkTimelineSemaphoreSubmitInfo;

or the equivalent

// Provided by VK_KHR_timeline_semaphore
typedef VkTimelineSemaphoreSubmitInfo VkTimelineSemaphoreSubmitInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• waitSemaphoreValueCount is the number of semaphore wait values specified in pWaitSemaphoreValues.
• pWaitSemaphoreValues is a pointer to an array of waitSemaphoreValueCount values for the corresponding semaphores in VkSubmitInfo::pWaitSemaphores to wait for.
• signalSemaphoreValueCount is the number of semaphore signal values specified in pSignalSemaphoreValues.
• pSignalSemaphoreValues is a pointer to an array signalSemaphoreValueCount values for the corresponding semaphores in VkSubmitInfo::pSignalSemaphores to set when signaled.

If the semaphore in VkSubmitInfo::pWaitSemaphores or VkSubmitInfo::pSignalSemaphores corresponding to an entry in pWaitSemaphoreValues or pSignalSemaphoreValues respectively was not created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, the implementation must ignore the value in the pWaitSemaphoreValues or pSignalSemaphoreValues entry.

Valid Usage (Implicit)

- VUID-VkTimelineSemaphoreSubmitInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_TIMELINE_SEMAPHORE_SUBMIT_INFO
- VUID-VkTimelineSemaphoreSubmitInfo-pWaitSemaphoreValues-parameter
  If waitSemaphoreValueCount is not 0, and pWaitSemaphoreValues is not NULL, pWaitSemaphoreValues must be a valid pointer to an array of waitSemaphoreValueCount uint64_t values
- VUID-VkTimelineSemaphoreSubmitInfo-pSignalSemaphoreValues-parameter
  If signalSemaphoreValueCount is not 0, and pSignalSemaphoreValues is not NULL, pSignalSemaphoreValues must be a valid pointer to an array of signalSemaphoreValueCount uint64_t values

To specify the values to use when waiting for and signaling semaphores whose current payload refers to a Direct3D 12 fence, add a VkD3D12FenceSubmitInfoKHR structure to the pNext chain of the VkSubmitInfo structure. The VkD3D12FenceSubmitInfoKHR structure is defined as:
typedef struct VkD3D12FenceSubmitInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreValuesCount;
    const uint64_t* pWaitSemaphoreValues;
    uint32_t signalSemaphoreValuesCount;
    const uint64_t* pSignalSemaphoreValues;
} VkD3D12FenceSubmitInfoKHR;

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **waitSemaphoreValuesCount** is the number of semaphore wait values specified in **pWaitSemaphoreValues**.
- **pWaitSemaphoreValues** is a pointer to an array of **waitSemaphoreValuesCount** values for the corresponding semaphores in *VkSubmitInfo::pWaitSemaphores* to wait for.
- **signalSemaphoreValuesCount** is the number of semaphore signal values specified in **pSignalSemaphoreValues**.
- **pSignalSemaphoreValues** is a pointer to an array of **signalSemaphoreValuesCount** values for the corresponding semaphores in *VkSubmitInfo::pSignalSemaphores* to set when signaled.

If the semaphore in *VkSubmitInfo::pWaitSemaphores* or *VkSubmitInfo::pSignalSemaphores* corresponding to an entry in **pWaitSemaphoreValues** or **pSignalSemaphoreValues** respectively does not currently have a payload referring to a Direct3D 12 fence, the implementation must ignore the value in the **pWaitSemaphoreValues** or **pSignalSemaphoreValues** entry.

**Note**

As the introduction of the external semaphore handle type `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a *VkSemaphoreType* of `VK_SEMAPHORE_TYPE_BINARY` is preserved for backwards compatibility. However, applications should prefer importing such handle types into semaphores created with a *VkSemaphoreType* of `VK_SEMAPHORE_TYPE_TIMELINE`, and use the *VkTimelineSemaphoreSubmitInfo* structure instead of the *VkD3D12FenceSubmitInfoKHR* structure to specify the values to use when waiting for and signaling such semaphores.

**Valid Usage**

- `VUID-VkD3D12FenceSubmitInfoKHR-waitSemaphoreValuesCount-00079`
  
  **waitSemaphoreValuesCount** must be the same value as *VkSubmitInfo::waitSemaphoreCount*, where this structure is in the **pNext** chain of a *VkSubmitInfo* structure

- `VUID-VkD3D12FenceSubmitInfoKHR-signalSemaphoreValuesCount-00080`
signalSemaphoreValuesCount must be the same value as VkSubmitInfo::signalSemaphoreCount, where this structure is in the pNext chain of a VkSubmitInfo structure.

**Valid Usage (Implicit)**

- VUID-VkD3D12FenceSubmitInfoKHR-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_D3D12_FENCE_SUBMIT_INFO_KHR

- VUID-VkD3D12FenceSubmitInfoKHR-pWaitSemaphoreValues-parameter
  
  If waitSemaphoreValuesCount is not 0, and pWaitSemaphoreValues is not NULL, pWaitSemaphoreValues must be a valid pointer to an array of waitSemaphoreValuesCount uint64_t values.

- VUID-VkD3D12FenceSubmitInfoKHR-pSignalSemaphoreValues-parameter
  
  If signalSemaphoreValuesCount is not 0, and pSignalSemaphoreValues is not NULL, pSignalSemaphoreValues must be a valid pointer to an array of signalSemaphoreValuesCount uint64_t values.

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism may be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They can only be used if the imported resource was created with the D3D11_RESOURCE_MISC_SHARED_KEYED_MUTEX flag.

To acquire keyed mutexes before submitted work and/or release them after, add a VkWin32KeyedMutexAcquireReleaseInfoKHR structure to the pNext chain of the VkSubmitInfo structure.

The VkWin32KeyedMutexAcquireReleaseInfoKHR structure is defined as:

```c
// Provided by VK_KHR_win32_keyed_mutex
typedef struct VkWin32KeyedMutexAcquireReleaseInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           acquireCount;
    const VkDeviceMemory* pAcquireSyncs;
    const uint64_t*    pAcquireKeys;
    const uint32_t*    pAcquireTimeouts;
    uint32_t           releaseCount;
    const VkDeviceMemory* pReleaseSyncs;
    const uint64_t*    pReleaseKeys;
} VkWin32KeyedMutexAcquireReleaseInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- acquireCount is the number of entries in the pAcquireSyncs, pAcquireKeys, and pAcquireTimeouts arrays.
• **pAcquireSyncs** is a pointer to an array of **VkDeviceMemory** objects which were imported from Direct3D 11 resources.

• **pAcquireKeys** is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in **pAcquireSyncs**.

• **pAcquireTimeouts** is a pointer to an array of timeout values, in millisecond units, for each acquire specified in **pAcquireKeys**.

• **releaseCount** is the number of entries in the **pReleaseSyncs** and **pReleaseKeys** arrays.

• **pReleaseSyncs** is a pointer to an array of **VkDeviceMemory** objects which were imported from Direct3D 11 resources.

• **pReleaseKeys** is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in **pReleaseSyncs**.

---

**Valid Usage**

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-00081
  Each member of **pAcquireSyncs** and **pReleaseSyncs** must be a device memory object imported by setting **VkImportMemoryWin32HandleInfoKHR::handleType** to **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT** or **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT**

---

**Valid Usage (Implicit)**

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_KHR**

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-parameter
  If **acquireCount** is not 0, **pAcquireSyncs** must be a valid pointer to an array of **acquireCount** valid **VkDeviceMemory** handles

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireKeys-parameter
  If **acquireCount** is not 0, **pAcquireKeys** must be a valid pointer to an array of **acquireCount** uint64_t values

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireTimeouts-parameter
  If **acquireCount** is not 0, **pAcquireTimeouts** must be a valid pointer to an array of **acquireCount** uint32_t values

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pReleaseSyncs-parameter
  If **releaseCount** is not 0, **pReleaseSyncs** must be a valid pointer to an array of **releaseCount** valid **VkDeviceMemory** handles

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pReleaseKeys-parameter
  If **releaseCount** is not 0, **pReleaseKeys** must be a valid pointer to an array of **releaseCount** uint64_t values

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-commonparent
Both of the elements of `pAcquireSyncs`, and the elements of `pReleaseSyncs` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`.

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism **may** be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They **can** only be used if the imported resource was created with the `D3D11_RESOURCE_MISC_SHARED_KEYEDMUTEX` flag.

To acquire keyed mutexes before submitted work and/or release them after, add a `VkWin32KeyedMutexAcquireReleaseInfoNV` structure to the `pNext` chain of the `VkSubmitInfo` structure.

The `VkWin32KeyedMutexAcquireReleaseInfoNV` structure is defined as:

```c
// Provided by VK_NV_win32_keyed_mutex
typedef struct VkWin32KeyedMutexAcquireReleaseInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t acquireCount;
    const VkDeviceMemory* pAcquireSyncs;
    const uint64_t* pAcquireKeys;
    const uint32_t* pAcquireTimeoutMilliseconds;
    uint32_t releaseCount;
    const VkDeviceMemory* pReleaseSyncs;
    const uint64_t* pReleaseKeys;
} VkWin32KeyedMutexAcquireReleaseInfoNV;
```

- `acquireCount` is the number of entries in the `pAcquireSyncs`, `pAcquireKeys`, and `pAcquireTimeoutMilliseconds` arrays.
- `pAcquireSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pAcquireKeys` is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in `pAcquireSyncs`.
- `pAcquireTimeoutMilliseconds` is a pointer to an array of timeout values, in millisecond units, for each acquire specified in `pAcquireKeys`.
- `releaseCount` is the number of entries in the `pReleaseSyncs` and `pReleaseKeys` arrays.
- `pReleaseSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pReleaseKeys` is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in `pReleaseSyncs`. 
Valid Usage (Implicit)

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_NV`

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireSyncs-parameter**
  
  If `acquireCount` is not 0, `pAcquireSyncs` must be a valid pointer to an array of `acquireCount` valid `VkDeviceMemory` handles

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireKeys-parameter**
  
  If `acquireCount` is not 0, `pAcquireKeys` must be a valid pointer to an array of `acquireCount` `uint64_t` values

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireTimeoutMilliseconds-parameter**
  
  If `acquireCount` is not 0, `pAcquireTimeoutMilliseconds` must be a valid pointer to an array of `acquireCount` `uint32_t` values

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pReleaseSyncs-parameter**
  
  If `releaseCount` is not 0, `pReleaseSyncs` must be a valid pointer to an array of `releaseCount` valid `VkDeviceMemory` handles

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pReleaseKeys-parameter**
  
  If `releaseCount` is not 0, `pReleaseKeys` must be a valid pointer to an array of `releaseCount` `uint64_t` values

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-commonparent**
  
  Both of the elements of `pAcquireSyncs`, and the elements of `pReleaseSyncs` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

If the `pNext` chain of `VkSubmitInfo` includes a `VkProtectedSubmitInfo` structure, then the structure indicates whether the batch is protected. The `VkProtectedSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkProtectedSubmitInfo {  
  VkStructureType sType;  
  const void* pNext;  
  VkBool32 protectedSubmit; 
} VkProtectedSubmitInfo;
```

- `protectedSubmit` specifies whether the batch is protected. If `protectedSubmit` is `VK_TRUE`, the batch is protected. If `protectedSubmit` is `VK_FALSE`, the batch is unprotected. If the `VkSubmitInfo::pNext` chain does not include this structure, the batch is unprotected.

Valid Usage (Implicit)

- **VUID-VkProtectedSubmitInfo-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_PROTECTED_SUBMIT_INFO`
If the `pNext` chain of `VkSubmitInfo` includes a `VkDeviceGroupSubmitInfo` structure, then that structure includes device indices and masks specifying which physical devices execute semaphore operations and command buffers.

The `VkDeviceGroupSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const uint32_t* pWaitSemaphoreDeviceIndices;
    uint32_t commandBufferCount;
    const uint32_t* pCommandBufferDeviceMasks;
    uint32_t signalSemaphoreCount;
    const uint32_t* pSignalSemaphoreDeviceIndices;
} VkDeviceGroupSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupSubmitInfo VkDeviceGroupSubmitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of elements in the `pWaitSemaphoreDeviceIndices` array.
- `pWaitSemaphoreDeviceIndices` is a pointer to an array of `waitSemaphoreCount` device indices indicating which physical device executes the semaphore wait operation in the corresponding element of `VkSubmitInfo::pWaitSemaphores`.
- `commandBufferCount` is the number of elements in the `pCommandBufferDeviceMasks` array.
- `pCommandBufferDeviceMasks` is a pointer to an array of `commandBufferCount` device masks indicating which physical devices execute the command buffer in the corresponding element of `VkSubmitInfo::pCommandBuffers`. A physical device executes the command buffer if the corresponding bit is set in the mask.
- `signalSemaphoreCount` is the number of elements in the `pSignalSemaphoreDeviceIndices` array.
- `pSignalSemaphoreDeviceIndices` is a pointer to an array of `signalSemaphoreCount` device indices indicating which physical device executes the semaphore signal operation in the corresponding element of `VkSubmitInfo::pSignalSemaphores`.

If this structure is not present, semaphore operations and command buffers execute on device index zero.
Valid Usage

- VUID-VkDeviceGroupSubmitInfo-waitSemaphoreCount-00082
  waitSemaphoreCount must equal VkSubmitInfo::waitSemaphoreCount

- VUID-VkDeviceGroupSubmitInfo-commandBufferCount-00083
  commandBufferCount must equal VkSubmitInfo::commandBufferCount

- VUID-VkDeviceGroupSubmitInfo-signalSemaphoreCount-00084
  signalSemaphoreCount must equal VkSubmitInfo::signalSemaphoreCount

- VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-00085
  All elements of pWaitSemaphoreDeviceIndices and pSignalSemaphoreDeviceIndices must be valid device indices

- VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-00086
  All elements of pCommandBufferDeviceMasks must be valid device masks

Valid Usage (Implicit)

- VUID-VkDeviceGroupSubmitInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_SUBMIT_INFO

- VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-parameter
  If waitSemaphoreCount is not 0, pWaitSemaphoreDeviceIndices must be a valid pointer to an array of waitSemaphoreCount uint32_t values

- VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-parameter
  If commandBufferCount is not 0, pCommandBufferDeviceMasks must be a valid pointer to an array of commandBufferCount uint32_t values

- VUID-VkDeviceGroupSubmitInfo-pSignalSemaphoreDeviceIndices-parameter
  If signalSemaphoreCount is not 0, pSignalSemaphoreDeviceIndices must be a valid pointer to an array of signalSemaphoreCount uint32_t values

If the pNext chain of VkSubmitInfo includes a VkPerformanceQuerySubmitInfoKHR structure, then the structure indicates which counter pass is active for the batch in that submit.

The VkPerformanceQuerySubmitInfoKHR structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceQuerySubmitInfoKHR {
    VkStructureType      sType;
    const void*           pNext;
    uint32_t              counterPassIndex;
} VkPerformanceQuerySubmitInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
• **counterPassIndex** specifies which counter pass index is active.

If the **VkSubmitInfo::pNext** chain does not include this structure, the batch defaults to use counter pass index 0.

**Valid Usage**

- VUID-VkPerformanceQuerySubmitInfoKHR-counterPassIndex-03221
  - **counterPassIndex must** be less than the number of counter passes required by any queries within the batch. The required number of counter passes for a performance query is obtained by calling `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`

**Valid Usage (Implicit)**

- VUID-VkPerformanceQuerySubmitInfoKHR-sType-sType
  - **sType must** be `VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR`

### 6.6. Queue Forward Progress

When using binary semaphores, the application **must** ensure that command buffer submissions will be able to complete without any subsequent operations by the application on any queue. After any call to `vkQueueSubmit` (or other queue operation), for every queued wait on a semaphore created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_BINARY** there **must** be a prior signal of that semaphore that will not be consumed by a different wait on the semaphore.

When using timeline semaphores, wait-before-signal behavior is well-defined and applications **can** submit work via `vkQueueSubmit` defining a timeline semaphore wait operation before submitting a corresponding semaphore signal operation. For each timeline semaphore wait operation defined by a call to `vkQueueSubmit`, the application **must** ensure that a corresponding semaphore signal operation is executed before forward progress can be made.

If a command buffer submission waits for any events to be signaled, the application **must** ensure that command buffer submissions will be able to complete without any subsequent operations by the application. Events signaled by the host **must** be signaled before the command buffer waits on those events.

**Note**

The ability for commands to wait on the host to set an events was originally added to allow low-latency updates to resources between host and device. However, to ensure quality of service, implementations would necessarily detect extended stalls in execution and timeout after a short period. As this period is not defined in the Vulkan specification, it is impossible to correctly validate any application with any wait period. Since the original users of this functionality were highly limited and platform-specific, this functionality is now considered defunct and should not be used.
6.7. Secondary Command Buffer Execution

A secondary command buffer must not be directly submitted to a queue. Instead, secondary command buffers are recorded to execute as part of a primary command buffer with the command:

```c
// Provided by VK_VERSION_1_0
void vkCmdExecuteCommands(
    VkCommandBuffer commandBuffer,
    uint32_t commandBufferCount,
    const VkCommandBuffer* pCommandBuffers);
```

- `commandBuffer` is a handle to a primary command buffer that the secondary command buffers are executed in.
- `commandBufferCount` is the length of the `pCommandBuffers` array.
- `pCommandBuffers` is a pointer to an array of `commandBufferCount` secondary command buffer handles, which are recorded to execute in the primary command buffer in the order they are listed in the array.

If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, and it was recorded into any other primary command buffer which is currently in the executable or recording state, that primary command buffer becomes invalid.

Valid Usage

- VUID-vkCmdExecuteCommands-pCommandBuffers-00088
  Each element of `pCommandBuffers` must have been allocated with a level of `VK_COMMAND_BUFFER_LEVEL_SECONDARY`

- VUID-vkCmdExecuteCommands-pCommandBuffers-00089
  Each element of `pCommandBuffers` must be in the pending or executable state

- VUID-vkCmdExecuteCommands-pCommandBuffers-00091
  If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it must not be in the pending state

- VUID-vkCmdExecuteCommands-pCommandBuffers-00092
  If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it must not have already been recorded to `commandBuffer`

- VUID-vkCmdExecuteCommands-pCommandBuffers-00093
  If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it must not appear more than once in `pCommandBuffers`

- VUID-vkCmdExecuteCommands-pCommandBuffers-00094
  Each element of `pCommandBuffers` must have been allocated from a `VkCommandPool` that was
• VUID-vkCmdExecuteCommands-pCommandBuffers-00096
  If \( \text{vkCmdExecuteCommands} \) is being called within a render pass instance, each element of \( p\text{CommandBuffers} \) must have been recorded with the VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT

• VUID-vkCmdExecuteCommands-pCommandBuffers-00099
  If \( \text{vkCmdExecuteCommands} \) is being called within a render pass instance, and any element of \( p\text{CommandBuffers} \) was recorded with \( \text{VkCommandBufferInheritanceInfo}::\text{framebuffer} \) not equal to VK_NULL_HANDLE, that \( \text{VkFramebuffer} \) must match the \( \text{VkFramebuffer} \) used in the current render pass instance

• VUID-vkCmdExecuteCommands-contents-06018
  If \( \text{vkCmdExecuteCommands} \) is being called within a render pass instance begun with \( \text{vkCmdBeginRenderPass} \), its \textit{contents} parameter must have been set to VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS

• VUID-vkCmdExecuteCommands-pCommandBuffers-06019
  If \( \text{vkCmdExecuteCommands} \) is being called within a render pass instance begun with \( \text{vkCmdBeginRenderPass} \), each element of \( p\text{CommandBuffers} \) must have been recorded with \( \text{VkCommandBufferInheritanceInfo}::\text{subpass} \) set to the index of the subpass which the given command buffer will be executed in

• VUID-vkCmdExecuteCommands-pBeginInfo-06020
  If \( \text{vkCmdExecuteCommands} \) is being called within a render pass instance begun with \( \text{vkCmdBeginRenderPass} \), the render passes specified in the \( p\text{BeginInfo->pInheritanceInfo->renderPass} \) members of the \( \text{vkBeginCommandBuffer} \) commands used to begin recording each element of \( p\text{CommandBuffers} \) must be compatible with the current render pass

• VUID-vkCmdExecuteCommands-pNext-02865
  If \( \text{vkCmdExecuteCommands} \) is being called within a render pass instance that included \( \text{VkRenderPassTransformBeginInfoQCOM} \) in the \( p\text{Next} \) chain of \( \text{VkRenderPassBeginInfo} \), then each element of \( p\text{CommandBuffers} \) must have been recorded with \( \text{VkCommandBufferInheritanceRenderPassTransformInfoQCOM} \) in the \( p\text{Next} \) chain of \( \text{VkCommandBufferBeginInfo} \)

• VUID-vkCmdExecuteCommands-pNext-02866
  If \( \text{vkCmdExecuteCommands} \) is being called within a render pass instance that included \( \text{VkRenderPassTransformBeginInfoQCOM} \) in the \( p\text{Next} \) chain of \( \text{VkRenderPassBeginInfo} \), then each element of \( p\text{CommandBuffers} \) must have been recorded with \( \text{VkCommandBufferInheritanceRenderPassTransformInfoQCOM}::\text{transform} \) identical to \( \text{VkRenderPassTransformBeginInfoQCOM}::\text{transform} \)

• VUID-vkCmdExecuteCommands-pNext-02867
  If \( \text{vkCmdExecuteCommands} \) is being called within a render pass instance that included \( \text{VkRenderPassTransformBeginInfoQCOM} \) in the \( p\text{Next} \) chain of \( \text{VkRenderPassBeginInfo} \), then each element of \( p\text{CommandBuffers} \) must have been recorded with \( \text{VkCommandBufferInheritanceRenderPassTransformInfoQCOM}::\text{renderArea} \) identical to \( \text{VkRenderPassBeginInfo}::\text{renderArea} \)

• VUID-vkCmdExecuteCommands-pCommandBuffers-00100
If `vkCmdExecuteCommands` is not being called within a render pass instance, each element of `pCommandBuffers` must not have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`

- VUID-vkCmdExecuteCommands-commandBuffer-00101
  If the `inheritedQueries` feature is not enabled, `commandBuffer` must not have any queries active

- VUID-vkCmdExecuteCommands-commandBuffer-00102
  If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::occlusionQueryEnable` set to `VK_TRUE`

- VUID-vkCmdExecuteCommands-commandBuffer-00103
  If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::queryFlags` having all bits set that are set for the query

- VUID-vkCmdExecuteCommands-commandBuffer-00104
  If `commandBuffer` has a `VK_QUERY_TYPE_PIPELINE_STATISTICS` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::pipelineStatistics` having all bits set that are set in the `VkQueryPool` the query uses

- VUID-vkCmdExecuteCommands-pCommandBuffers-00105
  Each element of `pCommandBuffers` must not begin any query types that are active in `commandBuffer`

- VUID-vkCmdExecuteCommands-commandBuffer-07594
  `commandBuffer` must not have any queries other than `VK_QUERY_TYPE_OCCLUSION` and `VK_QUERY_TYPE_PIPELINE_STATISTICS` active

- VUID-vkCmdExecuteCommands-commandBuffer-01820
  If `commandBuffer` is a protected command buffer and protectedNoFault is not supported, each element of `pCommandBuffers` must be a protected command buffer

- VUID-vkCmdExecuteCommands-commandBuffer-01821
  If `commandBuffer` is an unprotected command buffer and protectedNoFault is not supported, each element of `pCommandBuffers` must be an unprotected command buffer

- VUID-vkCmdExecuteCommands-None-02286
  This command must not be recorded when transform feedback is active

- VUID-vkCmdExecuteCommands-commandBuffer-06533
  If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in `commandBuffer` in the current subpass will write to an image subresource as an attachment, commands recorded in elements of `pCommandBuffers` must not read from the memory backing that image subresource in any other way

- VUID-vkCmdExecuteCommands-commandBuffer-06534
  If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in `commandBuffer` in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of `pCommandBuffers` must not write to that image subresource as an attachment

- VUID-vkCmdExecuteCommands-pCommandBuffers-06535
If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in a given element of `pCommandBuffers` will write to an image subresource as an attachment, commands recorded in elements of `pCommandBuffers` at a higher index must not read from the memory backing that image subresource in any other way.

- VUID-vkCmdExecuteCommands-pCommandBuffers-06536
  If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in a given element of `pCommandBuffers` will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of `pCommandBuffers` at a higher index must not write to that image subresource as an attachment.

- VUID-vkCmdExecuteCommands-pCommandBuffers-06021
  If `pCommandBuffers` contains any suspended render pass instances, there must be no action or synchronization commands between that render pass instance and any render pass instance that resumes it.

- VUID-vkCmdExecuteCommands-pCommandBuffers-06022
  If `pCommandBuffers` contains any suspended render pass instances, there must be no render pass instances between that render pass instance and any render pass instance that resumes it.

- VUID-vkCmdExecuteCommands-variableSampleLocations-06023
  If the `variableSampleLocations` limit is not supported, and any element of `pCommandBuffers` contains any suspended render pass instances, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, must use the same sample locations.

- VUID-vkCmdExecuteCommands-flags-06024
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, its `VkRenderingInfo::flags` parameter must have included `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`.

- VUID-vkCmdExecuteCommands-pBeginInfo-06025
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the render passes specified in the `pBeginInfo->pInheritanceInfo->renderPass` members of the `vkBeginCommandBuffer` commands used to begin recording each element of `pCommandBuffers` must be `VK_NULL_HANDLE`.

- VUID-vkCmdExecuteCommands-flags-06026
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the `flags` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the `VkRenderingInfo::flags` parameter to `vkCmdBeginRendering`, excluding `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`.

- VUID-vkCmdExecuteCommands-colorAttachmentCount-06027
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the `colorAttachmentCount` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of
**pCommandBuffers must** be equal to the **VkRenderingInfo::colorAttachmentCount** parameter to **vkCmdBeginRendering**

- **VUID-vkCmdExecuteCommands-imageView-06028**  
  If **vkCmdExecuteCommands** is being called within a render pass instance begun with **vkCmdBeginRendering**, if the **imageView** member of an element of the **VkRenderingInfo::pColorAttachments** parameter to **vkCmdBeginRendering** is not **VK_NULL_HANDLE**, the corresponding element of the **pColorAttachmentFormats** member of the **VkCommandBufferInheritanceRenderingInfo** structure included in the **pNext** chain of **VkCommandBufferBeginInfo::pInheritanceInfo** used to begin recording each element of **pCommandBuffers** must be equal to the format used to create that image view.

- **VUID-vkCmdExecuteCommands-imageView-07606**  
  If **vkCmdExecuteCommands** is being called within a render pass instance begun with **vkCmdBeginRendering**, if the **imageView** member of an element of the **VkRenderingInfo::pColorAttachments** parameter to **vkCmdBeginRendering** is **VK_NULL_HANDLE**, the corresponding element of the **pColorAttachmentFormats** member of the **VkCommandBufferInheritanceRenderingInfo** structure included in the **pNext** chain of **VkCommandBufferBeginInfo::pInheritanceInfo** used to begin recording each element of **pCommandBuffers** must be **VK_FORMAT_UNDEFINED**.

- **VUID-vkCmdExecuteCommands-pDepthAttachment-06029**  
  If **vkCmdExecuteCommands** is being called within a render pass instance begun with **vkCmdBeginRendering**, if the **VkRenderingInfo::pDepthAttachment->imageView** parameter to **vkCmdBeginRendering** is not **VK_NULL_HANDLE**, the value of the **depthAttachmentFormat** member of the **VkCommandBufferInheritanceRenderingInfo** structure included in the **pNext** chain of **VkCommandBufferBeginInfo::pInheritanceInfo** used to begin recording each element of **pCommandBuffers** must be equal to the format used to create that image view.

- **VUID-vkCmdExecuteCommands-pStencilAttachment-06030**  
  If **vkCmdExecuteCommands** is being called within a render pass instance begun with **vkCmdBeginRendering**, if the **VkRenderingInfo::pStencilAttachment->imageView** parameter to **vkCmdBeginRendering** is **VK_NULL_HANDLE**, the value of the **stencilAttachmentFormat** member of the **VkCommandBufferInheritanceRenderingInfo** structure included in the **pNext** chain of **VkCommandBufferBeginInfo::pInheritanceInfo** used to begin recording each element of **pCommandBuffers** must be **VK_FORMAT_UNDEFINED**.

- **VUID-vkCmdExecuteCommands-pDepthAttachment-06774**  
  If **vkCmdExecuteCommands** is being called within a render pass instance begun with **vkCmdBeginRendering** and the **VkRenderingInfo::pDepthAttachment->imageView** parameter to **vkCmdBeginRendering** was **VK_NULL_HANDLE**, the value of the **depthAttachmentFormat** member of the **VkCommandBufferInheritanceRenderingInfo** structure included in the **pNext** chain of **VkCommandBufferBeginInfo::pInheritanceInfo** used to begin recording each element of **pCommandBuffers** must be **VK_FORMAT_UNDEFINED**.

- **VUID-vkCmdExecuteCommands-pStencilAttachment-06775**  
  If **vkCmdExecuteCommands** is being called within a render pass instance begun with **vkCmdBeginRendering** and the **VkRenderingInfo::pStencilAttachment->imageView** parameter to **vkCmdBeginRendering** was **VK_NULL_HANDLE**, the value of the
stencilAttachmentFormat member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be VK_FORMAT_UNDEFINED

• VUID-vkCmdExecuteCommands-viewMask-06031
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, the viewMask member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the VkRenderingInfo::viewMask parameter to vkCmdBeginRendering

• VUID-vkCmdExecuteCommands-pNext-06032
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering and the pNext chain of VkCommandBufferInheritanceInfo includes a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, if the imageView member of an element of the VkRenderingInfo::pColorAttachments parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the corresponding element of the pColorAttachmentSamples member of the VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the sample count used to create that image view

• VUID-vkCmdExecuteCommands-pNext-06033
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering and the pNext chain of VkCommandBufferInheritanceInfo includes a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, if the VkRenderingInfo::pDepthAttachment->imageView parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of the depthStencilAttachment Samples member of the VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the sample count used to create that image view

• VUID-vkCmdExecuteCommands-pNext-06034
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering and the pNext chain of VkCommandBufferInheritanceInfo includes a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, if the VkRenderingInfo::pStencilAttachment->imageView parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of the depthStencilAttachment Samples member of the VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the sample count used to create that image view

• VUID-vkCmdExecuteCommands-pNext-06035
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering and the pNext chain of VkCommandBufferInheritanceInfo does not include a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, if the imageView member of an element of the VkRenderingInfo
::pColorAttachments parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of VkCommandBufferInheritanceRenderingInfo::rasterizationSamples must be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-06036
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering and the pNext chain of VkCommandBufferInheritanceInfo does not include a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, if the VkRenderingInfo::pDepthAttachment->imageView parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of VkCommandBufferInheritanceRenderingInfo::rasterizationSamples must be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-06037
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering and the pNext chain of VkCommandBufferInheritanceInfo does not include a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, if the VkRenderingInfo::pStencilAttachment->imageView parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of VkCommandBufferInheritanceRenderingInfo::rasterizationSamples must be equal to the sample count used to create that image view

Valid Usage (Implicit)

- VUID-vkCmdExecuteCommands-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdExecuteCommands-pCommandBuffers-parameter
  pCommandBuffers must be a valid pointer to an array of commandBufferCount valid VkCommandBuffer handles

- VUID-vkCmdExecuteCommands-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdExecuteCommands-commandBuffer-cmdpool
  TheVkCommandPoolthat commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdExecuteCommands-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdExecuteCommands-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

- VUID-vkCmdExecuteCommands-commandBufferCount-arraylength
  commandBufferCount must be greater than 0

- VUID-vkCmdExecuteCommands-commonparent
  Both of commandBuffer, and the elements of pCommandBuffers must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

6.8. Command Buffer Device Mask

Each command buffer has a piece of state storing the current device mask of the command buffer. This mask controls which physical devices within the logical device all subsequent commands will execute on, including state-setting commands, action commands, and synchronization commands.

Scissor, exclusive scissor, and viewport state (excluding the count of each) can be set to different values on each physical device (only when set as dynamic state), and each physical device will render using its local copy of the state. Other state is shared between physical devices, such that all physical devices use the most recently set values for the state. However, when recording an action command that uses a piece of state, the most recent command that set that state must have included all physical devices that execute the action command in its current device mask.

The command buffer's device mask is orthogonal to the `pCommandBufferDeviceMasks` member of `VkDeviceGroupSubmitInfo`. Commands only execute on a physical device if the device index is set in both device masks.

If the `pNext` chain of `VkCommandBufferBeginInfo` includes a `VkDeviceGroupCommandBufferBeginInfo` structure, then that structure includes an initial device mask for the command buffer.

The `VkDeviceGroupCommandBufferBeginInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupCommandBufferBeginInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceMask;
} VkDeviceGroupCommandBufferBeginInfo;
```

or the equivalent
typedef VkDeviceGroupCommandBufferBeginInfo VkDeviceGroupCommandBufferBeginInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **deviceMask** is the initial value of the command buffer’s device mask.

The initial device mask also acts as an upper bound on the set of devices that can ever be in the device mask in the command buffer.

If this structure is not present, the initial value of a command buffer’s device mask is set to include all physical devices in the logical device when the command buffer begins recording.

**Valid Usage**

- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00106
  
  deviceMask must be a valid device mask value

- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00107
  
  deviceMask must not be zero

**Valid Usage (Implicit)**

- VUID-VkDeviceGroupCommandBufferBeginInfo-sType-sType
  
  sType must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_COMMAND_BUFFER_BEGIN_INFO`

To update the current device mask of a command buffer, call:

```c
// Provided by VK_VERSION_1_1
void vkCmdSetDeviceMask(
    VkCommandBuffer commandBuffer,
    uint32_t deviceMask);

or the equivalent command

// Provided by VK_KHR_device_group
void vkCmdSetDeviceMaskKHR(
    VkCommandBuffer commandBuffer,
    uint32_t deviceMask);
```

- **commandBuffer** is command buffer whose current device mask is modified.
- **deviceMask** is the new value of the current device mask.

deviceMask is used to filter out subsequent commands from executing on all physical devices whose
bit indices are not set in the mask, except commands beginning a render pass instance, commands transitioning to the next subpass in the render pass instance, and commands ending a render pass instance, which always execute on the set of physical devices whose bit indices are included in the `deviceMask` member of the `VkDeviceGroupRenderPassBeginInfo` structure passed to the command beginning the corresponding render pass instance.

**Valid Usage**

- VUID-vkCmdSetDeviceMask-deviceMask-00108
  `deviceMask` must be a valid device mask value

- VUID-vkCmdSetDeviceMask-deviceMask-00109
  `deviceMask` must not be zero

- VUID-vkCmdSetDeviceMask-deviceMask-00110
  `deviceMask` must not include any set bits that were not in the `VkDeviceGroupCommandBufferBeginInfo::deviceMask` value when the command buffer began recording

- VUID-vkCmdSetDeviceMask-deviceMask-00111
  If `vkCmdSetDeviceMask` is called inside a render pass instance, `deviceMask` must not include any set bits that were not in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` value when the render pass instance began recording

**Valid Usage (Implicit)**

- VUID-vkCmdSetDeviceMask-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDeviceMask-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetDeviceMask-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, or transfer operations

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Chapter 7. Synchronization and Cache Control

Synchronization of access to resources is primarily the responsibility of the application in Vulkan. The order of execution of commands with respect to the host and other commands on the device has few implicit guarantees, and needs to be explicitly specified. Memory caches and other optimizations are also explicitly managed, requiring that the flow of data through the system is largely under application control.

Whilst some implicit guarantees exist between commands, five explicit synchronization mechanisms are exposed by Vulkan:

**Fences**
Fences can be used to communicate to the host that execution of some task on the device has completed, controlling resource access between host and device.

**Semaphores**
Semaphores can be used to control resource access across multiple queues.

**Events**
Events provide a fine-grained synchronization primitive which can be signaled either within a command buffer or by the host, and can be waited upon within a command buffer or queried on the host. Events can be used to control resource access within a single queue.

**Pipeline Barriers**
Pipeline barriers also provide synchronization control within a command buffer, but at a single point, rather than with separate signal and wait operations. Pipeline barriers can be used to control resource access within a single queue.

**Render Passes**
Render passes provide a useful synchronization framework for most rendering tasks, built upon the concepts in this chapter. Many cases that would otherwise need an application to use other synchronization primitives can be expressed more efficiently as part of a render pass. Render pass objects can be used to control resource access within a single queue.

7.1. Execution and Memory Dependencies

An operation is an arbitrary amount of work to be executed on the host, a device, or an external entity such as a presentation engine. Synchronization commands introduce explicit execution dependencies, and memory dependencies between two sets of operations defined by the command’s two synchronization scopes.

The synchronization scopes define which other operations a synchronization command is able to create execution dependencies with. Any type of operation that is not in a synchronization command’s synchronization scopes will not be included in the resulting dependency. For example, for many synchronization commands, the synchronization scopes can be limited to just operations executing in specific pipeline stages, which allows other pipeline stages to be excluded from a
dependency. Other scoping options are possible, depending on the particular command.

An execution dependency is a guarantee that for two sets of operations, the first set must happen-before the second set. If an operation happens-before another operation, then the first operation must complete before the second operation is initiated. More precisely:

- Let \(\text{Ops}_1\) and \(\text{Ops}_2\) be separate sets of operations.
- Let \(\text{Sync}\) be a synchronization command.
- Let \(\text{Scope}_{\text{1st}}\) and \(\text{Scope}_{\text{2nd}}\) be the synchronization scopes of \(\text{Sync}\).
- Let \(\text{ScopedOps}_1\) be the intersection of sets \(\text{Ops}_1\) and \(\text{Scope}_{\text{1st}}\).
- Let \(\text{ScopedOps}_2\) be the intersection of sets \(\text{Ops}_2\) and \(\text{Scope}_{\text{2nd}}\).
- Submitting \(\text{Ops}_1\), \(\text{Sync}\) and \(\text{Ops}_2\) for execution, in that order, will result in execution dependency \(\text{ExeDep}\) between \(\text{ScopedOps}_1\) and \(\text{ScopedOps}_2\).
- Execution dependency \(\text{ExeDep}\) guarantees that \(\text{ScopedOps}_1\) happen-before \(\text{ScopedOps}_2\).

An execution dependency chain is a sequence of execution dependencies that form a happens-before relation between the first dependency’s \(\text{ScopedOps}_1\) and the final dependency’s \(\text{ScopedOps}_2\). For each consecutive pair of execution dependencies, a chain exists if the intersection of \(\text{Scope}_{\text{2nd}}\) in the first dependency and \(\text{Scope}_{\text{1st}}\) in the second dependency is not an empty set. The formation of a single execution dependency from an execution dependency chain can be described by substituting the following in the description of execution dependencies:

- Let \(\text{Sync}\) be a set of synchronization commands that generate an execution dependency chain.
- Let \(\text{Scope}_{\text{1st}}\) be the first synchronization scope of the first command in \(\text{Sync}\).
- Let \(\text{Scope}_{\text{2nd}}\) be the second synchronization scope of the last command in \(\text{Sync}\).

Execution dependencies alone are not sufficient to guarantee that values resulting from writes in one set of operations can be read from another set of operations.

Three additional types of operations are used to control memory access. Availability operations cause the values generated by specified memory write accesses to become available to a memory domain for future access. Any available value remains available until a subsequent write to the same memory location occurs (whether it is made available or not) or the memory is freed. Memory domain operations cause writes that are available to a source memory domain to become available to a destination memory domain (an example of this is making writes available to the host domain available to the device domain). Visibility operations cause values available to a memory domain to become visible to specified memory accesses.

Availability, visibility, memory domains, and memory domain operations are formally defined in the Availability and Visibility section of the Memory Model chapter. Which API operations perform each of these operations is defined in Availability, Visibility, and Domain Operations.

A memory dependency is an execution dependency which includes availability and visibility operations such that:

- The first set of operations happens-before the availability operation.
• The availability operation happens-before the visibility operation.
• The visibility operation happens-before the second set of operations.

Once written values are made visible to a particular type of memory access, they can be read or written by that type of memory access. Most synchronization commands in Vulkan define a memory dependency.

The specific memory accesses that are made available and visible are defined by the access scopes of a memory dependency. Any type of access that is in a memory dependency’s first access scope and occurs in \texttt{ScopedOps}_1 is made available. Any type of access that is in a memory dependency’s second access scope and occurs in \texttt{ScopedOps}_2 has any available writes made visible to it. Any type of operation that is not in a synchronization command’s access scopes will not be included in the resulting dependency.

A memory dependency enforces availability and visibility of memory accesses and execution order between two sets of operations. Adding to the description of execution dependency chains:

• Let \texttt{MemOps}_1 be the set of memory accesses performed by \texttt{ScopedOps}_1.
• Let \texttt{MemOps}_2 be the set of memory accesses performed by \texttt{ScopedOps}_2.
• Let \texttt{AccessScope}_{1st} be the first access scope of the first command in the \texttt{Sync} chain.
• Let \texttt{AccessScope}_{2nd} be the second access scope of the last command in the \texttt{Sync} chain.
• Let \texttt{ScopedMemOps}_1 be the intersection of sets \texttt{MemOps}_1 and \texttt{AccessScope}_{1st}.
• Let \texttt{ScopedMemOps}_2 be the intersection of sets \texttt{MemOps}_2 and \texttt{AccessScope}_{2nd}.
• Submitting \texttt{Ops}_1, \texttt{Sync}, and \texttt{Ops}_2 for execution, in that order, will result in a memory dependency \texttt{MemDep} between \texttt{ScopedOps}_1 and \texttt{ScopedOps}_2.
• Memory dependency \texttt{MemDep} guarantees that:
  ◦ Memory writes in \texttt{ScopedMemOps}_1 are made available.
  ◦ Available memory writes, including those from \texttt{ScopedMemOps}_1, are made visible to \texttt{ScopedMemOps}_2.

\textbf{Note}

Execution and memory dependencies are used to solve data hazards, i.e. to ensure that read and write operations occur in a well-defined order. Write-after-read hazards can be solved with just an execution dependency, but read-after-write and write-after-write hazards need appropriate memory dependencies to be included between them. If an application does not include dependencies to solve these hazards, the results and execution orders of memory accesses are undefined.

\subsection*{7.1.1. Image Layout Transitions}

Image subresources can be transitioned from one layout to another as part of a memory dependency (e.g. by using an image memory barrier). When a layout transition is specified in a memory dependency, it happens-after the availability operations in the memory dependency, and happens-before the visibility operations. Image layout transitions may perform read and write
accesses on all memory bound to the image subresource range, so applications must ensure that all memory writes have been made available before a layout transition is executed. Available memory is automatically made visible to a layout transition, and writes performed by a layout transition are automatically made available.

Layout transitions always apply to a particular image subresource range, and specify both an old layout and new layout. The old layout must either be VK_IMAGE_LAYOUT_UNDEFINED, or match the current layout of the image subresource range. If the old layout matches the current layout of the image subresource range, the transition preserves the contents of that range. If the old layout is VK_IMAGE_LAYOUT_UNDEFINED, the contents of that range may be discarded.

Note
Image layout transitions with VK_IMAGE_LAYOUT_UNDEFINED allow the implementation to discard the image subresource range, which can provide performance or power benefits. Tile-based architectures may be able to avoid flushing tile data to memory, and immediate style renderers may be able to achieve fast metadata clears to reinitialize frame buffer compression state, or similar.

If the contents of an attachment are not needed after a render pass completes, then applications should use VK_ATTACHMENT_STORE_OP_DONT_CARE.

As image layout transitions may perform read and write accesses on the memory bound to the image, if the image subresource affected by the layout transition is bound to peer memory for any device in the current device mask then the memory heap the bound memory comes from must support the VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT and VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT capabilities as returned by vkGetDeviceGroupPeerMemoryFeatures.

Note
Applications must ensure that layout transitions happen-after all operations accessing the image with the old layout, and happen-before any operations that will access the image with the new layout. Layout transitions are potentially read/write operations, so not defining appropriate memory dependencies to guarantee this will result in a data race.

Image layout transitions interact with memory aliasing.

Layout transitions that are performed via image memory barriers execute in their entirety in submission order, relative to other image layout transitions submitted to the same queue, including those performed by render passes. In effect there is an implicit execution dependency from each such layout transition to all layout transitions previously submitted to the same queue.

The image layout of each image subresource of a depth/stencil image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus when the image member of an image memory barrier is an image created with this flag the application can chain a VkSampleLocationsInfoEXT structure to the pNext chain of VkImageMemoryBarrier2 or VkImageMemoryBarrier to specify the sample locations to use during any image layout transition.
If the VkSampleLocationsInfoEXT structure does not match the sample location state last used to render to the image subresource range specified by subresourceRange, or if no VkSampleLocationsInfoEXT structure is present, then the contents of the given image subresource range becomes undefined as if oldLayout would equal VK_IMAGE_LAYOUT_UNDEFINED.

7.1.2. Pipeline Stages

The work performed by an action command consists of multiple operations, which are performed as a sequence of logically independent steps known as pipeline stages. The exact pipeline stages executed depend on the particular command that is used, and current command buffer state when the command was recorded.

Operations performed by synchronization commands (e.g. availability and visibility operations) are not executed by a defined pipeline stage. However other commands can still synchronize with them by using the synchronization scopes to create a dependency chain.

Execution of operations across pipeline stages must adhere to implicit ordering guarantees, particularly including pipeline stage order. Otherwise, execution across pipeline stages may overlap or execute out of order with regards to other stages, unless otherwise enforced by an execution dependency.

Several of the synchronization commands include pipeline stage parameters, restricting the synchronization scopes for that command to just those stages. This allows fine grained control over the exact execution dependencies and accesses performed by action commands. Implementations should use these pipeline stages to avoid unnecessary stalls or cache flushing.

Bits which can be set in a VkPipelineStageFlags2 mask, specifying stages of execution, are:

```
// Provided by VK_VERSION_1_3
// Flag bits forVkPipelineStageFlagBits2
typedef VkFlags64 VkPipelineStageFlagBits2;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE = 0ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE_KHR = 0ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT = 0x00000001ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT_KHR = 0x00000001ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT = 0x00000002ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT_KHR = 0x00000002ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT = 0x00000004ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT_KHR = 0x00000004ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT = 0x00000008ULL;
```
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT_KHR = 0x00000008ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT_KHR = 0x00000010ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT_KHR = 0x00000020ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT = 0x00000040ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR = 0x00000040ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT = 0x00000080ULL;

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkPipelineStageFlagBits2 VkPipelineStageFlagBits2KHR;
```

- **VK_PIPELINE_STAGE_2_NONE** specifies no stages of execution.
- **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT** specifies the stage of the pipeline where indirect command parameters are consumed. This stage also includes reading commands written by `vkCmdPreprocessGeneratedCommandsNV`.
- **VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT** specifies the task shader stage.
- **VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT** specifies the mesh shader stage.
- **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT** specifies the stage of the pipeline where index buffers are consumed.
- **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT** specifies the stage of the pipeline where vertex buffers are consumed.
- **VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT** is equivalent to the logical OR of:
  - **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT**
  - **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT**
- **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT** specifies the vertex shader stage.
- **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT** specifies the tessellation control shader stage.
- **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT** specifies the tessellation evaluation shader stage.
- **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT** specifies the geometry shader stage.
- **VK_PIPELINE_STAGE_2_PRE_RASTERIZATION_SHADERS_BIT** is equivalent to specifying all supported pre-rasterization shader stages:
  - **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT**
  - **VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT**
  - **VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI**
- **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT** specifies the fragment shader stage.
- **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also
includes render pass load operations for framebuffer attachments with a depth/stencil format.

- VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes render pass store operations for framebuffer attachments with a depth/stencil format.

- VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT specifies the stage of the pipeline where final color values are output from the pipeline. This stage includes blending, logic operations, render pass load and store operations for color attachments, render pass multisample resolve operations, and vkCmdClearAttachments.

- VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT specifies the compute shader stage.

- VK_PIPELINE_STAGE_2_HOST_BIT specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.

- VK_PIPELINE_STAGE_2_COPY_BIT specifies the execution of all copy commands, including vkCmdCopyQueryPoolResults.

- VK_PIPELINE_STAGE_2_BLIT_BIT specifies the execution of vkCmdBlitImage.

- VK_PIPELINE_STAGE_2_RESOLVE_BIT specifies the execution of vkCmdResolveImage.

- VK_PIPELINE_STAGE_2_CLEAR_BIT specifies the execution of clear commands, with the exception of vkCmdClearAttachments.

- VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT is equivalent to specifying all of:
  - VK_PIPELINE_STAGE_2_COPY_BIT
  - VK_PIPELINE_STAGE_2_BLIT_BIT
  - VK_PIPELINE_STAGE_2_RESOLVE_BIT
  - VK_PIPELINE_STAGE_2_CLEAR_BIT
  - VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR

- VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR specifies the execution of the ray tracing shader stages.

- VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR specifies the execution of acceleration structure commands or acceleration structure copy commands.

- VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR specifies the execution of acceleration structure copy commands.

- VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
  - VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT
  - VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT
  - VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT
  - VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT
  - VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT
  - VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT

274
• **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT**
  - Specifies all operations performed by all commands supported on the queue it is used with.

• **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**
  - Specifies the stage of the pipeline where the predicate of conditional rendering is consumed.

• **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT**
  - Specifies the stage of the pipeline where vertex attribute output values are written to the transform feedback buffers.

• **VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT**
  - Specifies the stage of the pipeline where device-side generation of commands via `vkCmdPreprocessGeneratedCommandsNV` is handled.

• **VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**
  - Specifies the stage of the pipeline where the fragment shading rate attachment or shading rate image is read to determine the fragment shading rate for portions of a rasterized primitive.

• **VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT**
  - Specifies the stage of the pipeline where the fragment density map is read to generate the fragment areas.

• **VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI**
  - Specifies the stage of the pipeline where the invocation mask image is read by the implementation to optimize the ray dispatch.

• **VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR**
  - Specifies the execution of video decode operations.

• **VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR**
  - Specifies the execution of video encode operations.

• **VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV**
  - Specifies the stage of the pipeline where optical flow operation are performed.

• **VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI**
  - Specifies the subpass shading shader stage.

• **VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT**
  - Specifies the execution of micromap commands.

• **VK_PIPELINE_STAGE_2_CLUSTER_CULLING_SHADER_BIT_HUAWEI**
  - Specifies the cluster culling shader stage.

• **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT** is equivalent to **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT** with **VkAccessFlags2** set to 0 when specified in the second synchronization scope, but equivalent to
VK_PIPELINE_STAGE_2_NONE in the first scope.

- VK_PIPELINE_STAGE_2_BOTTOM_OF_PIPE_BIT is equivalent to VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT with VkAccessFlags2 set to 0 when specified in the first synchronization scope, but equivalent to VK_PIPELINE_STAGE_2_NONE in the second scope.

Note
The TOP and BOTTOM pipeline stages are deprecated, and applications should prefer VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT and VK_PIPELINE_STAGE_2_NONE.

Note
The VkPipelineStageFlags2 bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how VkPipelineStageFlagBits is defined. The first 31 values are common to both, and are interchangeable.

VkPipelineStageFlags2 is a bitmask type for setting a mask of zero or more VkPipelineStageFlagBits2 flags:

```c
typedef VkFlags64 VkPipelineStageFlags2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkPipelineStageFlags2 VkPipelineStageFlags2KHR;
```

Bits which can be set in a VkPipelineStageFlags mask, specifying stages of execution, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineStageFlagBits {
    VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT = 0x00000001,
    VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT = 0x00000002,
    VK_PIPELINE_STAGE_VERTEX_INPUT_BIT = 0x00000004,
    VK_PIPELINE_STAGE_VERTEX_SHADER_BIT = 0x00000008,
    VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010,
    VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020,
    VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT = 0x00000040,
    VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT = 0x00000080,
    VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT = 0x00000100,
    VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT = 0x00000200,
    VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT = 0x00000400,
    VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT = 0x00000800,
    VK_PIPELINE_STAGE_TRANSFER_BIT = 0x00001000,
    VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT = 0x00002000,
    VK_PIPELINE_STAGE_HOST_BIT = 0x00004000,
    VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT = 0x00008000,
    VK_PIPELINE_STAGE_ALL_COMMANDS_BIT = 0x00010000,
} VkPipelineStageFlagBits;
```
These values all have the same meaning as the equivalently named values for \texttt{VkPipelineStageFlags2}.

- \texttt{VK_PIPELINE_STAGE_NONE} specifies no stages of execution.
- \texttt{VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT} specifies the stage of the pipeline where \texttt{VkDrawIndirect* / VkDispatchIndirect* / VkTraceRaysIndirect*} data structures are consumed. This stage also includes reading commands written by \texttt{vkCmdExecuteGeneratedCommandsNV}.
- \texttt{VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT} specifies the task shader stage.
- \texttt{VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT} specifies the mesh shader stage.
- \texttt{VK_PIPELINE_STAGE_VERTEX_INPUT_BIT} specifies the stage of the pipeline where vertex and index buffers are consumed.
• **VK_PIPELINE_STAGE_VERTEX_SHADER_BIT** specifies the vertex shader stage.

• **VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT** specifies the tessellation control shader stage.

• **VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT** specifies the tessellation evaluation shader stage.

• **VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT** specifies the geometry shader stage.

• **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** specifies the fragment shader stage.

• **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes render pass load operations for framebuffer attachments with a depth/stencil format.

• **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes render pass store operations for framebuffer attachments with a depth/stencil format.

• **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** specifies the stage of the pipeline after blending where the final color values are output from the pipeline. This stage includes blending, logic operations, render pass load and store operations for color attachments, render pass multisample resolve operations, and vkCmdClearAttachments.

• **VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT** specifies the execution of a compute shader.

• **VK_PIPELINE_STAGE_TRANSFER_BIT** specifies the following commands:
  - All copy commands, including vkCmdCopyQueryPoolResults
  - vkCmdBlitImage2 and vkCmdBlitImage
  - vkCmdResolveImage2 and vkCmdResolveImage
  - All clear commands, with the exception of vkCmdClearAttachments

• **VK_PIPELINE_STAGE_HOST_BIT** specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.

• **VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** specifies the execution of vkCmdBuildAccelerationStructureNV, vkCmdWriteAccelerationStructuresPropertiesNV, vkCmdBuildAccelerationStructuresIndirectKHR, vkCmdCopyAccelerationStructureToMemoryKHR, vkCmdCopyMemoryToAccelerationStructureKHR, and vkCmdWriteAccelerationStructuresPropertiesKHR.

• **VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR** specifies the execution of the ray tracing shader stages, via vkCmdTraceRaysNV, vkCmdTraceRaysKHR, or vkCmdTraceRaysIndirectKHR.

• **VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT** specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
  - **VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT**
  - **VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT**
  - **VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT**
VK_PIPELINE_STAGE_VERTEX_INPUT_BIT
VK_PIPELINE_STAGE_VERTEX_SHADER_BIT
VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT
VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT
VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT
VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT
VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT
VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT
VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT
VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT
VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT
VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

VK_PIPELINE_STAGE_ALL_COMMANDS_BIT specifies all operations performed by all commands supported on the queue it is used with.

VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT specifies the stage of the pipeline where the predicate of conditional rendering is consumed.

VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT specifies the stage of the pipeline where vertex attribute output values are written to the transform feedback buffers.

VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV specifies the stage of the pipeline where device-side preprocessing for generated commands via vkCmdPreprocessGeneratedCommandsNV is handled.

VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR specifies the stage of the pipeline where the fragment shading rate attachment or shading rate image is read to determine the fragment shading rate for portions of a rasterized primitive.

VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT specifies the stage of the pipeline where the fragment density map is read to generate the fragment areas.

VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT is equivalent to VK_PIPELINE_STAGE_ALL_COMMANDS_BIT with VkAccessFlags set to 0 when specified in the second synchronization scope, but specifies no stage of execution when specified in the first scope.

VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT is equivalent to VK_PIPELINE_STAGE_ALL_COMMANDS_BIT with VkAccessFlags set to 0 when specified in the first synchronization scope, but specifies no stage of execution when specified in the second scope.

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineStageFlags;

VkPipelineStageFlags is a bitmask type for setting a mask of zero or more VkPipelineStageFlagBits.
If a synchronization command includes a source stage mask, its first synchronization scope only includes execution of the pipeline stages specified in that mask and any logically earlier stages. Its first access scope only includes memory accesses performed by pipeline stages explicitly specified in the source stage mask.

If a synchronization command includes a destination stage mask, its second synchronization scope only includes execution of the pipeline stages specified in that mask and any logically later stages. Its second access scope only includes memory accesses performed by pipeline stages explicitly specified in the destination stage mask.

**Note**

Note that access scopes do not interact with the logically earlier or later stages for either scope - only the stages the app specifies are considered part of each access scope.

Certain pipeline stages are only available on queues that support a particular set of operations. The following table lists, for each pipeline stage flag, which queue capability flag must be supported by the queue. When multiple flags are enumerated in the second column of the table, it means that the pipeline stage is supported on the queue if it supports any of the listed capability flags. For further details on queue capabilities see Physical Device Enumeration and Queues.

**Table 3. Supported pipeline stage flags**

</tbody>
</table>
Pipeline stages that execute as a result of a command logically complete execution in a specific order, such that completion of a logically later pipeline stage must not happen-before completion of a logically earlier stage. This means that including any stage in the source stage mask for a particular synchronization command also implies that any logically earlier stages are included in Scope\textsubscript{1st} for that command.

Similarly, initiation of a logically earlier pipeline stage must not happen-after initiation of a logically later pipeline stage. Including any given stage in the destination stage mask for a particular synchronization command also implies that any logically later stages are included in Scope\textsubscript{2nd} for that command.

**Note**

Implementations may not support synchronization at every pipeline stage for every synchronization operation. If a pipeline stage that an implementation does not support synchronization for appears in a source stage mask, it may substitute any logically later stage in its place for the first synchronization scope. If a pipeline stage that an implementation does not support synchronization for appears in a destination stage mask, it may substitute any logically earlier stage in its place for the second synchronization scope.

For example, if an implementation is unable to signal an event immediately after vertex shader execution is complete, it may instead signal the event after color attachment output has completed.

If an implementation makes such a substitution, it must not affect the semantics of execution or memory dependencies or image and buffer memory barriers.

Graphics pipelines are executable on queues supporting VK\_QUEUE\_GRAPHICS\_BIT. Stages executed by graphics pipelines can only be specified in commands recorded for queues supporting VK\_QUEUE\_GRAPHICS\_BIT.

The graphics primitive pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:

- VK\_PIPELINE\_STAGE\_2\_DRAW\_INDIRECT\_BIT
- VK\_PIPELINE\_STAGE\_2\_INDEX\_INPUT\_BIT
- VK\_PIPELINE\_STAGE\_2\_VERTEX\_ATTRIBUTE\_INPUT\_BIT
- VK\_PIPELINE\_STAGE\_2\_VERTEX\_SHADER\_BIT
- VK\_PIPELINE\_STAGE\_2\_TESSELLATION\_CONTROL\_SHADER\_BIT
- VK\_PIPELINE\_STAGE\_2\_TESSELLATION\_EVALUATION\_SHADER\_BIT
- VK\_PIPELINE\_STAGE\_2\_GEOMETRY\_SHADER\_BIT
- VK\_PIPELINE\_STAGE\_2\_TRANSFORM\_FEEDBACK\_BIT\_EXT
- VK\_PIPELINE\_STAGE\_2\_FRAGMENT\_SHADING\_RATE\_ATTACHMENT\_BIT\_KHR
- VK\_PIPELINE\_STAGE\_2\_EARLY\_FRAGMENT\_TESTS\_BIT
- VK\_PIPELINE\_STAGE\_2\_FRAGMENT\_SHADER\_BIT
• VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT
• VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT

The graphics mesh pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:

• VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT
• VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT
• VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT
• VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
• VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT
• VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT
• VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT
• VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT

For the compute pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT
• VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT

For the subpass shading pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI

For graphics pipeline commands executing in a render pass with a fragment density map attachment, the following pipeline stage where the fragment density map read happens has no particular order relative to the other stages, except that it is logically earlier than VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT:

• VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT
• VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT

The conditional rendering stage is formally part of both the graphics, and the compute pipeline. The pipeline stage where the predicate read happens has unspecified order relative to other stages of these pipelines:

• VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

For the transfer pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_2_TRANSFER_BIT

For host operations, only one pipeline stage occurs, so no order is guaranteed:

• VK_PIPELINE_STAGE_2_HOST_BIT

For the command preprocessing pipeline, the following stages occur in this order:
• VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV

For acceleration structure build operations, only one pipeline stage occurs, so no order is guaranteed:

• VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR

For acceleration structure copy operations, only one pipeline stage occurs, so no order is guaranteed:

• VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR

For opacity micromap build operations, only one pipeline stage occurs, so no order is guaranteed:

• VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT

For the ray tracing pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT
• VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

For the video decode pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR

For the video encode pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR

7.1.3. Access Types

Memory in Vulkan can be accessed from within shader invocations and via some fixed-function stages of the pipeline. The access type is a function of the descriptor type used, or how a fixed-function stage accesses memory.

Some synchronization commands take sets of access types as parameters to define the access scopes of a memory dependency. If a synchronization command includes a source access mask, its first access scope only includes accesses via the access types specified in that mask. Similarly, if a synchronization command includes a destination access mask, its second access scope only includes accesses via the access types specified in that mask.

Bits which can be set in the srcAccessMask and dstAccessMask members of VkMemoryBarrier2KHR, VkImageMemoryBarrier2KHR, and VkBufferMemoryBarrier2KHR, specifying access behavior, are:

```c
// Provided by VK_VERSION_1_3
// Flag bits for VkAccessFlagBits2
typedef VkFlags64 VkAccessFlagBits2;
static const VkAccessFlagBits2 VK_ACCESS_2_NONE = 0ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_NONE_KHR = 0ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT = 0x00000001ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT_KHR =
```
0x00000001ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INDEX_READ_BIT = 0x00000002ULL;

// Provided by VK_KHR_synchronization2 with VK_KHR_synchronization2
or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkAccessFlagBits2 VkAccessFlagBits2KHR;
```

- `VK_ACCESS_2_NONE` specifies no accesses.
- `VK_ACCESS_2_MEMORY_READ_BIT` specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all `READ` access flags that are valid where it is used.
- `VK_ACCESS_2_MEMORY_WRITE_BIT` specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all `WRITE` access flags that are valid where it is used.
- `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT` specifies read access to command data read from indirect buffers as part of an indirect build, trace, drawing or dispatch command. Such access occurs in the `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT` pipeline stage.
- `VK_ACCESS_2_INDEX_READ_BIT` specifies read access to an index buffer as part of an indexed drawing command, bound by `vkCmdBindIndexBuffer2KHR` and `vkCmdBindIndexBuffer`. Such access occurs in the `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT` pipeline stage.
- `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT` specifies read access to a vertex buffer as part of a drawing command, bound by `vkCmdBindVertexBuffers`. Such access occurs in the `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT` pipeline stage.
- `VK_ACCESS_2_UNIFORM_READ_BIT` specifies read access to a uniform buffer in any shader pipeline
• **VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT** specifies read access to an input attachment within a render pass during subpass shading or fragment shading. Such access occurs in the `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI` or `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` pipeline stage.

• **VK_ACCESS_2_SHADER_SAMPLED_READ_BIT** specifies read access to a uniform texel buffer or sampled image in any shader pipeline stage.

• **VK_ACCESS_2_SHADER_STORAGE_READ_BIT** specifies read access to a storage buffer, physical storage buffer, storage texel buffer, or storage image in any shader pipeline stage.

• **VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR** specifies read access to a shader binding table in any shader pipeline stage.

• **VK_ACCESS_2_SHADER_READ_BIT** is equivalent to the logical OR of:
  - **VK_ACCESS_2_SHADER_SAMPLED_READ_BIT**
  - **VK_ACCESS_2_SHADER_STORAGE_READ_BIT**
  - **VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR**

• **VK_ACCESS_2_SHADER_WRITE_BIT** is equivalent to **VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT**.

• **VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT** specifies read access to a color attachment, such as via blending (other than advanced blend operations), logic operations or certain render pass load operations in the `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage or via fragment shader tile image reads in the `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` pipeline stage.

• **VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT** specifies write access to a color attachment during a render pass or via certain render pass load, store, and multisample resolve operations. Such access occurs in the `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.

• **VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT** specifies read access to a depth/stencil attachment, via depth or stencil operations or certain render pass load operations in the `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT` pipeline stages or via fragment shader tile image reads in the `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` pipeline stage.

• **VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT** specifies write access to a depth/stencil attachment, via depth or stencil operations or certain render pass load and store operations. Such access occurs in the `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT` pipeline stages.

• **VK_ACCESS_2_TRANSFER_READ_BIT** specifies read access to an image or buffer in a copy operation. Such access occurs in the `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, or `VK_PIPELINE_STAGE_2_RESOLVE_BIT` pipeline stages.

• **VK_ACCESS_2_TRANSFER_WRITE_BIT** specifies write access to an image or buffer in a clear or copy operation. Such access occurs in the `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, or `VK_PIPELINE_STAGE_2_RESOLVE_BIT` pipeline stages.
VK_ACCESS_2_HOST_READ_BIT specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the VK_PIPELINE_STAGE_2_HOST_BIT pipeline stage.

VK_ACCESS_2_HOST_WRITE_BIT specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the VK_PIPELINE_STAGE_2_HOST_BIT pipeline stage.

VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT specifies read access to a predicate as part of conditional rendering. Such access occurs in the VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT pipeline stage.

VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT specifies write access to a transform feedback buffer made when transform feedback is active. Such access occurs in the VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT pipeline stage.

VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT specifies read access to a transform feedback counter buffer which is read when vkCmdBeginTransformFeedbackEXT executes. Such access occurs in the VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT pipeline stage.

VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT specifies write access to a transform feedback counter buffer which is written when vkCmdEndTransformFeedbackEXT executes. Such access occurs in the VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT pipeline stage.

VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV specifies reads from buffer inputs to vkCmdPreprocessGeneratedCommandsNV. Such access occurs in the VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV pipeline stage.

VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV specifies writes to the target command buffer preprocess outputs. Such access occurs in the VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV pipeline stage.

VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT specifies read access to color attachments, including advanced blend operations. Such access occurs in the VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage.

VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI specifies read access to a invocation mask image in the VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI pipeline stage.

VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR specifies read access to an acceleration structure as part of a trace, build, or copy command, or to an acceleration structure scratch buffer as part of a build command. Such access occurs in the VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR or VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage.

VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR specifies write access to an acceleration structure or acceleration structure scratch buffer as part of a build or copy command. Such access occurs in the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage.

VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT specifies read access to a fragment density map attachment during dynamic fragment density map operations. Such access occurs in the VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT pipeline stage.

VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR pipeline stage.
• **VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV** specifies read access to a shading rate image during rasterization. Such access occurs in the **VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV** pipeline stage. It is equivalent to **VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR**.

• **VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR** specifies read access to an image or buffer resource in a **video decode operation**. Such access occurs in the **VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR** pipeline stage.

• **VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR** specifies write access to an image or buffer resource in a **video decode operation**. Such access occurs in the **VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR** pipeline stage.

• **VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR** specifies read access to an image or buffer resource in a **video encode operation**. Such access occurs in the **VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR** pipeline stage.

• **VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR** specifies write access to an image or buffer resource in a **video encode operation**. Such access occurs in the **VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR** pipeline stage.

• **VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT** specifies read access to a **descriptor buffer** in any shader pipeline stage.

• **VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV** specifies read access to an image or buffer resource as part of a **optical flow operation**. Such access occurs in the **VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV** pipeline stage.

• **VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV** specifies write access to an image or buffer resource as part of a **optical flow operation**. Such access occurs in the **VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV** pipeline stage.

• **VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT** specifies write access to a micromap object. Such access occurs in the **VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT** pipeline stage.

• **VK_ACCESS_2_MICROMAP_READ_BIT_EXT** specifies read access to a micromap object. Such access occurs in the **VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT** and **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** pipeline stages.

---

**Note**
In situations where an application wishes to select all access types for a given set of pipeline stages, **VK_ACCESS_2_MEMORY_READ_BIT** or **VK_ACCESS_2_MEMORY_WRITE_BIT** can be used. This is particularly useful when specifying stages that only have a single access type.

**Note**
The **VkAccessFlags2** bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how **VkAccessFlagBits** is defined. The first 31 values are common to both, and are interchangeable.

**VkAccessFlags2** is a bitmask type for setting a mask of zero or more **VkAccessFlagBits2**:

```cpp
// Provided by VK_VERSION_1_3
```
typedef VkFlags64 VkAccessFlags2;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkAccessFlags2 VkAccessFlags2KHR;

Bits which \textbf{can} be set in the \texttt{srcAccessMask} and \texttt{dstAccessMask} members of \texttt{VkSubpassDependency}, \texttt{VkSubpassDependency2}, \texttt{VkMemoryBarrier}, \texttt{VkBufferMemoryBarrier}, and \texttt{VkImageMemoryBarrier}, specifying access behavior, are:

// Provided by VK_VERSION_1_0
typedef enum VkAccessFlagBits {
    VK_ACCESS_INDIRECT_COMMAND_READ_BIT = 0x00000001,
    VK_ACCESS_INDEX_READ_BIT = 0x00000002,
    VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT = 0x00000004,
    VK_ACCESS_UNIFORM_READ_BIT = 0x00000008,
    VK_ACCESS_INPUT_ATTACHMENT_READ_BIT = 0x00000010,
    VK_ACCESS_SHADER_READ_BIT = 0x00000020,
    VK_ACCESS_SHADER_WRITE_BIT = 0x00000040,
    VK_ACCESS_COLOR_ATTACHMENT_READ_BIT = 0x00000080,
    VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT = 0x00000100,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT = 0x00000200,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT = 0x00000400,
    VK_ACCESS_TRANSFER_READ_BIT = 0x00000800,
    VK_ACCESS_TRANSFER_WRITE_BIT = 0x00001000,
    VK_ACCESS_HOST_READ_BIT = 0x00002000,
    VK_ACCESS_HOST_WRITE_BIT = 0x00004000,
    VK_ACCESS_MEMORY_READ_BIT = 0x00008000,
    VK_ACCESS_MEMORY_WRITE_BIT = 0x00010000,
    // Provided by VK_VERSION_1_3
    VK_ACCESS_NONE = 0,
    // Provided by VK_EXT_transform_feedback
    VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT = 0x02000000,
    // Provided by VK_KHR_acceleration_structure
    VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR = 0x00200000,
    VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR = 0x00400000,
    // Provided by VK_EXT_fragment_density_map
    VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT = 0x01000000,
} VkAccessFlagBits;

// Provided by VK_KHR.acceleration_structure
VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR = 0x00200000,
// Provided by VK_KHR.acceleration_structure
VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR = 0x00400000,
// Provided by VK_EXT.fragment_density_map
VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT = 0x01000000,
These values all have the same meaning as the equivalently named values for `VkAccessFlags2`.

- **VK_ACCESS_NONE** specifies no accesses.
- **VK_ACCESS_MEMORY_READ_BIT** specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all `READ` access flags that are valid where it is used.
- **VK_ACCESS_MEMORY_WRITE_BIT** specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all `WRITE` access flags that are valid where it is used.
- **VK_ACCESS_INDIRECT_COMMAND_READ_BIT** specifies read access to indirect command data read as part of an indirect build, trace, drawing or dispatching command. Such access occurs in the `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT` pipeline stage.
- **VK_ACCESS_INDEX_READ_BIT** specifies read access to an index buffer as part of an indexed drawing command, bound by `vkCmdBindIndexBuffer2KHR` and `vkCmdBindIndexBuffer`. Such access occurs in the `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` pipeline stage.
- **VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT** specifies read access to a vertex buffer as part of a drawing command, bound by `vkCmdBindVertexBuffer`. Such access occurs in the `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` pipeline stage.
- **VK_ACCESS_UNIFORM_READ_BIT** specifies read access to a uniform buffer in any shader pipeline stage.
- **VK_ACCESS_INPUT_ATTACHMENT_READ_BIT** specifies read access to an input attachment within a render pass during subpass shading or fragment shading. Such access occurs in the `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI` or `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` pipeline stage.
- **VK_ACCESS_SHADER_READ_BIT** specifies read access to a uniform texel buffer, sampled image, storage buffer, physical storage buffer, shader binding table, storage texel buffer, or storage image in any shader pipeline stage.
- **VK_ACCESS_SHADER_WRITE_BIT** specifies write access to a storage buffer, physical storage buffer,
storage texel buffer, or storage image in any shader pipeline stage.

- **VK_ACCESS_COLOR_ATTACHMENT_READ_BIT** specifies read access to a color attachment, such as via blending (other than advanced blend operations), logic operations or certain render pass load operations in the **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage or via fragment shader tile image reads in the **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** pipeline stage.

- **VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT** specifies write access to a color, resolve, or depth/stencil resolve attachment during a render pass or via certain render pass load and store operations. Such access occurs in the **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage.

- **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT** specifies read access to a depth/stencil attachment, via depth or stencil operations or certain render pass load operations in the **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT** or **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** pipeline stages or via fragment shader tile image reads in the **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** pipeline stage.

- **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT** specifies write access to a depth/stencil attachment, via depth or stencil operations or certain render pass load and store operations. Such access occurs in the **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT** or **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** pipeline stages.

- **VK_ACCESS_TRANSFER_READ_BIT** specifies read access to an image or buffer in a copy operation. Such access occurs in the **VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT** pipeline stage.

- **VK_ACCESS_TRANSFER_WRITE_BIT** specifies write access to an image or buffer in a clear or copy operation. Such access occurs in the **VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT** pipeline stage.

- **VK_ACCESS_HOST_READ_BIT** specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the **VK_PIPELINE_STAGE_HOST_BIT** pipeline stage.

- **VK_ACCESS_HOST_WRITE_BIT** specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the **VK_PIPELINE_STAGE_HOST_BIT** pipeline stage.

- **VK_ACCESS_CONDITIONAL_RENDERING_READ_BIT_EXT** specifies read access to a predicate as part of conditional rendering. Such access occurs in the **VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT** pipeline stage.

- **VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT** specifies write access to a transform feedback buffer made when transform feedback is active. Such access occurs in the **VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT** pipeline stage.

- **VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT** specifies read access to a transform feedback counter buffer which is read when **vkCmdBeginTransformFeedbackEXT** executes. Such access occurs in the **VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT** pipeline stage.

- **VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT** specifies write access to a transform feedback counter buffer which is written when **vkCmdEndTransformFeedbackEXT** executes. Such access occurs in the **VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT** pipeline stage.

- **VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV** specifies reads from buffer inputs to **vkCmdPreprocessGeneratedCommandsNV**. Such access occurs in the **VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV** pipeline stage.
• **VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV** specifies writes to the target command buffer preprocess outputs in `vkCmdPreprocessGeneratedCommandsNV`. Such access occurs in the `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV` pipeline stage.

• **VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT** specifies read access to color attachments, including advanced blend operations. Such access occurs in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.

• **VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI** specifies read access to a invocation mask image in the `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI` pipeline stage.

• **VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR** specifies read access to an acceleration structure as part of a trace, build, or copy command, or to an acceleration structure scratch buffer as part of a build command. Such access occurs in the `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR` pipeline stage or `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage.

• **VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR** specifies write access to an acceleration structure or acceleration structure scratch buffer as part of a build or copy command. Such access occurs in the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage.

• **VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT** specifies read access to a fragment density map attachment during dynamic fragment density map operations. Such access occurs in the `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT` pipeline stage.

• **VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR** specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` pipeline stage.

• **VK_ACCESS_SHADING_RATE_IMAGE_READ_BIT_NV** specifies read access to a shading rate image during rasterization. Such access occurs in the `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV` pipeline stage. It is equivalent to `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

Certain access types are only performed by a subset of pipeline stages. Any synchronization command that takes both stage masks and access masks uses both to define the access scopes - only the specified access types performed by the specified stages are included in the access scope. An application **must** not specify an access flag in a synchronization command if it does not include a pipeline stage in the corresponding stage mask that is able to perform accesses of that type. The following table lists, for each access flag, which pipeline stages can perform that type of access.

**Table 4. Supported access types**

<table>
<thead>
<tr>
<th>Access flag</th>
<th>Supported pipeline stages</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_ACCESS_2_NONE</td>
<td>Any</td>

// Provided by VK_VERSION_1_0
typedef VkFlags VkAccessFlags;

**VkAccessFlags** is a bitmask type for setting a mask of zero or more **VkAccessFlagBits**.

If a memory object does not have the **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** property, then **vkFlushMappedMemoryRanges** must be called in order to guarantee that writes to the memory object from the host are made available to the host domain, where they can be further made available to the device domain via a domain operation. Similarly, **vkInvalidateMappedMemoryRanges** must be called to guarantee that writes which are available to
the host domain are made visible to host operations.

If the memory object does have the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` property flag, writes to
the memory object from the host are automatically made available to the host domain. Similarly,
writes made available to the host domain are automatically made visible to the host.

```
Note
Queue submission commands automatically perform a domain operation from
host to device for all writes performed before the command executes, so in most
cases an explicit memory barrier is not needed for this case. In the few
circumstances where a submit does not occur between the host write and the
device read access, writes can be made available by using an explicit memory
barrier.
```

### 7.1.4. Framebuffer Region Dependencies

**Pipeline stages** that operate on, or with respect to, the framebuffer are collectively the `framebuffer-space` pipeline stages. These stages are:

- `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT`
- `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`

For these pipeline stages, an execution or memory dependency from the first set of operations to
the second set can either be a single `framebuffer-global` dependency, or split into multiple
`framebuffer-local` dependencies. A dependency with non-framebuffer-space pipeline stages is
neither framebuffer-global nor framebuffer-local.

A **framebuffer region** is a subset of the entire framebuffer, and can either be:

- A **sample region**, which is set of sample (x, y, layer, sample) coordinates that is a subset of the
  entire framebuffer, or
- A **fragment region**, which is a set of fragment (x, y, layer) coordinates that is a subset of the
  entire framebuffer.

Both **synchronization scopes** of a framebuffer-local dependency include only the operations
performed within corresponding framebuffer regions (as defined below). No ordering guarantees
are made between different framebuffer regions for a framebuffer-local dependency.

Both **synchronization scopes** of a framebuffer-global dependency include operations on all
framebuffer-regions.

If the first synchronization scope includes operations on pixels/fragments with N samples and the
second synchronization scope includes operations on pixels/fragments with M samples, where N
does not equal M, then a framebuffer region containing all samples at a given (x, y, layer)
coordinate in the first synchronization scope corresponds to a region containing all samples at the
same coordinate in the second synchronization scope. In other words, the framebuffer region is a
fragment region and it is a pixel granularity dependency. If N equals M, and if the `VkSubpassDescription::flags` does not specify the `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM` flag, then a framebuffer region containing a single (x, y, layer, sample) coordinate in the first synchronization scope corresponds to a region containing the same sample at the same coordinate in the second synchronization scope. In other words, the framebuffer region is a sample region and it is a sample granularity dependency.

If the pipeline performing the operation was created with `VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT`, `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT`, or `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`, the framebuffer region is a fragment region and it is a pixel granularity dependency.

**Note**

Since fragment shader invocations are not specified to run in any particular groupings, the size of a framebuffer region is implementation-dependent, not known to the application, and **must** be assumed to be no larger than specified above.

**Note**

Practically, the pixel vs. sample granularity dependency means that if an input attachment has a different number of samples than the pipeline's `rasterizationSamples`, then a fragment **can** access any sample in the input attachment's pixel even if it only uses framebuffer-local dependencies. If the input attachment has the same number of samples, then the fragment **can** only access the covered samples in its input `SampleMask` (i.e. the fragment operations happen-after a framebuffer-local dependency for each sample the fragment covers). To access samples that are not covered, either the `VkSubpassDescription::flags` `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM` flag is required, or a framebuffer-global dependency is required.

If a synchronization command includes a `dependencyFlags` parameter, and specifies the `VK_DEPENDENCY_BY_REGION_BIT` flag, then it defines framebuffer-local dependencies for the framebuffer-space pipeline stages in that synchronization command, for all framebuffer regions. If no `dependencyFlags` parameter is included, or the `VK_DEPENDENCY_BY_REGION_BIT` flag is not specified, then a framebuffer-global dependency is specified for those stages. The `VK_DEPENDENCY_BY_REGION_BIT` flag does not affect the dependencies between non-framebuffer-space pipeline stages, nor does it affect the dependencies between framebuffer-space and non-framebuffer-space pipeline stages.

**Note**

Framebuffer-local dependencies are more efficient for most architectures; particularly tile-based architectures - which can keep framebuffer-regions entirely in on-chip registers and thus avoid external bandwidth across such a dependency. Including a framebuffer-global dependency in your rendering will usually force all implementations to flush data to memory, or to a higher level cache, breaking any potential locality optimizations.
7.1.5. View-Local Dependencies

In a render pass instance that has multiview enabled, dependencies can be either view-local or view-global.

A view-local dependency only includes operations from a single source view from the source subpass in the first synchronization scope, and only includes operations from a single destination view from the destination subpass in the second synchronization scope. A view-global dependency includes all views in the view mask of the source and destination subpasses in the corresponding synchronization scopes.

If a synchronization command includes a dependencyFlags parameter and specifies the VK_DEPENDENCY_VIEW_LOCAL_BIT flag, then it defines view-local dependencies for that synchronization command, for all views. If no dependencyFlags parameter is included or the VK_DEPENDENCY_VIEW_LOCAL_BIT flag is not specified, then a view-global dependency is specified.

7.1.6. Device-Local Dependencies

Dependencies can be either device-local or non-device-local. A device-local dependency acts as multiple separate dependencies, one for each physical device that executes the synchronization command, where each dependency only includes operations from that physical device in both synchronization scopes. A non-device-local dependency is a single dependency where both synchronization scopes include operations from all physical devices that participate in the synchronization command. For subpass dependencies, all physical devices in the VkDeviceGroupRenderPassBeginInfo::deviceMask participate in the dependency, and for pipeline barriers all physical devices that are set in the command buffer's current device mask participate in the dependency.

If a synchronization command includes a dependencyFlags parameter and specifies the VK_DEPENDENCY_DEVICE_GROUP_BIT flag, then it defines a non-device-local dependency for that synchronization command. If no dependencyFlags parameter is included or the VK_DEPENDENCY_DEVICE_GROUP_BIT flag is not specified, then it defines device-local dependencies for that synchronization command, for all participating physical devices.

Semaphore and event dependencies are device-local and only execute on the one physical device that performs the dependency.

7.2. Implicit Synchronization Guarantees

A small number of implicit ordering guarantees are provided by Vulkan, ensuring that the order in which commands are submitted is meaningful, and avoiding unnecessary complexity in common operations.

Submission order is a fundamental ordering in Vulkan, giving meaning to the order in which action and synchronization commands are recorded and submitted to a single queue. Explicit and implicit ordering guarantees between commands in Vulkan all work on the premise that this ordering is meaningful. This order does not itself define any execution or memory dependencies; synchronization commands and other orderings within the API use this ordering to define their scopes.
Submission order for any given set of commands is based on the order in which they were recorded to command buffers and then submitted. This order is determined as follows:

1. The initial order is determined by the order in which `vkQueueSubmit` and `vkQueueSubmit2` commands are executed on the host, for a single queue, from first to last.

2. The order in which `VkSubmitInfo` structures are specified in the `pSubmits` parameter of `vkQueueSubmit`, or in which `VkSubmitInfo2` structures are specified in the `pSubmits` parameter of `vkQueueSubmit2`, from lowest index to highest.

3. The order in which command buffers are specified in the `pCommandBuffers` member of `VkSubmitInfo` or `VkSubmitInfo2` from lowest index to highest.

4. The order in which commands were recorded to a command buffer on the host, from first to last:
   - For commands recorded outside a render pass, this includes all other commands recorded outside a render pass, including `vkCmdBeginRenderPass` and `vkCmdEndRenderPass` commands; it does not directly include commands inside a render pass.
   - For commands recorded inside a render pass, this includes all other commands recorded inside the same subpass, including the `vkCmdBeginRenderPass` and `vkCmdEndRenderPass` commands that delimit the same render pass instance; it does not include commands recorded to other subpasses. **State commands** do not execute any operations on the device, instead they set the state of the command buffer when they execute on the host, in the order that they are recorded. **Action commands** consume the current state of the command buffer when they are recorded, and will execute state changes on the device as required to match the recorded state.

The order of primitives passing through the graphics pipeline and image layout transitions as part of an image memory barrier provide additional guarantees based on submission order.

Execution of **pipeline stages** within a given command also has a loose ordering, dependent only on a single command.

**Signal operation order** is a fundamental ordering in Vulkan, giving meaning to the order in which semaphore and fence signal operations occur when submitted to a single queue. The signal operation order for queue operations is determined as follows:

1. The initial order is determined by the order in which `vkQueueSubmit` and `vkQueueSubmit2` commands are executed on the host, for a single queue, from first to last.

2. The order in which `VkSubmitInfo` structures are specified in the `pSubmits` parameter of `vkQueueSubmit`, or in which `VkSubmitInfo2` structures are specified in the `pSubmits` parameter of `vkQueueSubmit2`, from lowest index to highest.

3. The fence signal operation defined by the `fence` parameter of a `vkQueueSubmit` or `vkQueueSubmit2` or `vkQueueBindSparse` command is ordered after all semaphore signal operations defined by that command.

Semaphore signal operations defined by a single `VkSubmitInfo` or `VkSubmitInfo2` or `VkBindSparseInfo` structure are unordered with respect to other semaphore signal operations defined within the same structure.
The `vkSignalSemaphore` command does not execute on a queue but instead performs the signal operation from the host. The semaphore signal operation defined by executing a `vkSignalSemaphore` command happens-after the `vkSignalSemaphore` command is invoked and happens-before the command returns.

**Note**

When signaling timeline semaphores, it is the responsibility of the application to ensure that they are ordered such that the semaphore value is strictly increasing. Because the first synchronization scope for a semaphore signal operation contains all semaphore signal operations which occur earlier in submission order, all semaphore signal operations contained in any given batch are guaranteed to happen-after all semaphore signal operations contained in any previous batches. However, no ordering guarantee is provided between the semaphore signal operations defined within a single batch. This, combined with the requirement that timeline semaphore values strictly increase, means that it is invalid to signal the same timeline semaphore twice within a single batch.

If an application wishes to ensure that some semaphore signal operation happens-after some other semaphore signal operation, it can submit a separate batch containing only semaphore signal operations, which will happen-after the semaphore signal operations in any earlier batches.

When signaling a semaphore from the host, the only ordering guarantee is that the signal operation happens-after when `vkSignalSemaphore` is called and happens-before it returns. Therefore, it is invalid to call `vkSignalSemaphore` while there are any outstanding signal operations on that semaphore from any queue submissions unless those queue submissions have some dependency which ensures that they happen-after the host signal operation. One example of this would be if the pending signal operation is, itself, waiting on the same semaphore at a lower value and the call to `vkSignalSemaphore` signals that lower value. Furthermore, if there are two or more processes or threads signaling the same timeline semaphore from the host, the application must ensure that the `vkSignalSemaphore` with the lower semaphore value returns before `vkSignalSemaphore` is called with the higher value.

### 7.3. Fences

Fences are a synchronization primitive that can be used to insert a dependency from a queue to the host. Fences have two states - signaled and unsignaled. A fence can be signaled as part of the execution of a queue submission command. Fences can be unsignaled on the host with `vkResetFences`. Fences can be waited on by the host with the `vkWaitForFences` command, and the current state can be queried with `vkGetFenceStatus`.

The internal data of a fence may include a reference to any resources and pending work associated with signal or unsignal operations performed on that fence object, collectively referred to as the fence’s *payload*. Mechanisms to import and export that internal data to and from fences are provided below. These mechanisms indirectly enable applications to share fence state between two or more fences and other synchronization primitives across process and API boundaries.
Fences are represented by `VkFence` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFence)
```

To create a fence, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateFence(
    VkDevice device,
    const VkFenceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFence* pFence);
```

- `device` is the logical device that creates the fence.
- `pCreateInfo` is a pointer to a `VkFenceCreateInfo` structure containing information about how the fence is to be created.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pFence` is a pointer to a handle in which the resulting fence object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateFence-device-parameter
  device must be a valid `VkDevice` handle
- VUID-vkCreateFence-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkFenceCreateInfo` structure
- VUID-vkCreateFence-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateFence-pFence-parameter
  `pFence` must be a valid pointer to a `VkFence` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkFenceCreateInfo` structure is defined as:
typedef struct VkFenceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFenceCreateFlags flags;
} VkFenceCreateInfo;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is a bitmask of VkFenceCreateFlagBits specifying the initial state and behavior of the fence.

Valid Usage (Implicit)

• VUID-VkFenceCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_FENCE_CREATE_INFO

• VUID-VkFenceCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkExportFenceCreateInfo or VkExportFenceWin32HandleInfoKHR

• VUID-VkFenceCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkFenceCreateInfo-flags-parameter
  flags must be a valid combination of VkFenceCreateFlagBits values

typedef enum VkFenceCreateFlagBits {
    VK_FENCE_CREATE_SIGNALED_BIT = 0x00000001,
} VkFenceCreateFlagBits;

• VK_FENCE_CREATE_SIGNALED_BIT specifies that the fence object is created in the signaled state. Otherwise, it is created in the unsignaled state.

typedef VkFlags VkFenceCreateFlags;

VkFenceCreateFlags is a bitmask type for setting a mask of zero or more VkFenceCreateFlagBits.

To create a fence whose payload can be exported to external handles, add a VkExportFenceCreateInfo structure to the pNext chain of the VkFenceCreateInfo structure. The VkExportFenceCreateInfo structure is defined as:
typedef struct VkExportFenceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalFenceHandleTypeFlags handleTypes;
} VkExportFenceCreateInfo;

or the equivalent

typedef VkExportFenceCreateInfo VkExportFenceCreateInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• handleTypes is a bitmask of VkExternalFenceHandleTypeFlagBits specifying one or more fence handle types the application can export from the resulting fence. The application can request multiple handle types for the same fence.

Valid Usage

• VUID-VkExportFenceCreateInfo-handleTypes-01446
  The bits in handleTypes must be supported and compatible, as reported by VkExternalFenceProperties

Valid Usage (Implicit)

• VUID-VkExportFenceCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_EXPORT_FENCE_CREATE_INFO
• VUID-VkExportFenceCreateInfo-handleTypes-parameter
  handleTypes must be a valid combination of VkExternalFenceHandleTypeFlagBits values

To specify additional attributes of NT handles exported from a fence, add a VkExportFenceWin32HandleInfoKHR structure to the pNext chain of the VkFenceCreateInfo structure. The VkExportFenceWin32HandleInfoKHR structure is defined as:

typedef struct VkExportFenceWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD dwAccess;
    LPCWSTR name;
} VkExportFenceWin32HandleInfoKHR;
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **pAttributes** is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.

• **dwAccess** is a `DWORD` specifying access rights of the handle.

• **name** is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created fence.

If `VkExportFenceCreateInfo` is not included in the same **pNext** chain, this structure is ignored.

If `VkExportFenceCreateInfo` is included in the **pNext** chain of `VkFenceCreateInfo` with a Windows `handleType`, but either `VkExportFenceWin32HandleInfoKHR` is not included in the **pNext** chain, or it is included but **pAttributes** is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights will be

`DXGI_SHARED_RESOURCE_READ | DXGI_SHARED_RESOURCE_WRITE`

for handles of the following types:

`VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT`

1

---

**Valid Usage**

• **VUID-VkExportFenceWin32HandleInfoKHR-handleTypes-01447**

  If `VkExportFenceCreateInfo::handleTypes` does not include `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT`, a `VkExportFenceWin32HandleInfoKHR` structure **must** not be included in the **pNext** chain of `VkFenceCreateInfo`.

---

**Valid Usage (Implicit)**

• **VUID-VkExportFenceWin32HandleInfoKHR-sType-sType**

  **sType** **must** be `VK_STRUCTURE_TYPE_EXPORT_FENCE_WIN32_HANDLE_INFO_KHR`.

• **VUID-VkExportFenceWin32HandleInfoKHR-pAttributes-parameter**

  If **pAttributes** is not `NULL`, **pAttributes** **must** be a valid pointer to a valid `SECURITY_ATTRIBUTES` value.

---

To export a Windows handle representing the state of a fence, call:
// Provided by VK_KHR_external_fence_win32
VkResult vkGetFenceWin32HandleKHR(
    VkDevice device,
    const VkFenceGetWin32HandleInfoKHR* pGetWin32HandleInfo,
    HANDLE* pHandle);

• device is the logical device that created the fence being exported.
• pGetWin32HandleInfo is a pointer to a VkFenceGetWin32HandleInfoKHR structure containing parameters of the export operation.
• pHandle will return the Windows handle representing the fence state.

For handle types defined as NT handles, the handles returned by vkGetFenceWin32HandleKHR are owned by the application. To avoid leaking resources, the application must release ownership of them using the CloseHandle system call when they are no longer needed.

Exporting a Windows handle from a fence may have side effects depending on the transference of the specified handle type, as described in Importing Fence Payloads.

Valid Usage (Implicit)

• VUID-vkGetFenceWin32HandleKHR-device-parameter
device must be a valid VkDevice handle
• VUID-vkGetFenceWin32HandleKHR-pGetWin32HandleInfo-parameter
pGetWin32HandleInfo must be a valid pointer to a valid VkFenceGetWin32HandleInfoKHR structure
• VUID-vkGetFenceWin32HandleKHR-pHandle-parameter
pHandle must be a valid pointer to a HANDLE value

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

The VkFenceGetWin32HandleInfoKHR structure is defined as:

// Provided by VK_KHR_external_fence_win32
typedef struct VkFenceGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
}
VkExternalFenceHandleTypeFlagBits handleType;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fence` is the fence from which state will be exported.
- `handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalFenceHandleTypeFlagBits` for a description of the properties of the defined external fence handle types.

**Valid Usage**

- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01448
  `handleType` must have been included in `VkExportFenceCreateInfo::handleTypes` when the fence's current payload was created.

- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01449
  If `handleType` is defined as an NT handle, `vkGetFenceWin32HandleKHR` must be called no more than once for each valid unique combination of `fence` and `handleType`.

- VUID-VkFenceGetWin32HandleInfoKHR-fence-01450
  `fence` must not currently have its payload replaced by an imported payload as described below in Importing Fence Payloads unless that imported payload's handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for `handleType`.

- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01451
  If `handleType` refers to a handle type with copy payload transference semantics, `fence` must be signaled, or have an associated `fence signal operation` pending execution.

- VUID-VkFenceGetWin32HandleInfoKHR-handleType-01452
  `handleType` must be defined as an NT handle or a global share handle.

**Valid Usage (Implicit)**

- VUID-VkFenceGetWin32HandleInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_FENCE_GET_WIN32_HANDLE_INFO_KHR`.

- VUID-VkFenceGetWin32HandleInfoKHR-pNext-pNext
  `pNext` must be `NULL`.

- VUID-VkFenceGetWin32HandleInfoKHR-fence-parameter
  `fence` must be a valid `VkFence` handle.

- VUID-VkFenceGetWin32HandleInfoKHR-handleType-parameter
  `handleType` must be a valid `VkExternalFenceHandleTypeFlagBits` value.
To export a POSIX file descriptor representing the payload of a fence, call:

```c
// Provided by VK_KHR_external_fence_fd
VkResult vkGetFenceFdKHR(
    VkDevice device,
    const VkFenceGetFdInfoKHR* pGetFdInfo,
    int* pFd);
```

- `device` is the logical device that created the fence being exported.
- `pGetFdInfo` is a pointer to a `VkFenceGetFdInfoKHR` structure containing parameters of the export operation.
- `pFd` will return the file descriptor representing the fence payload.

Each call to `vkGetFenceFdKHR` must create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application must release ownership of the file descriptor when it is no longer needed.

**Note**
Ownership can be released in many ways. For example, the application can call `close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a fence payload.

If `pGetFdInfo->handleType` is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` and the fence is signaled at the time `vkGetFenceFdKHR` is called, `pFd` may return the value `-1` instead of a valid file descriptor.

Where supported by the operating system, the implementation must set the file descriptor to be closed automatically when an `execve` system call is made.

Exporting a file descriptor from a fence may have side effects depending on the transference of the specified handle type, as described in Importing Fence State.

**Valid Usage (Implicit)**

- VUID-vkGetFenceFdKHR-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkGetFenceFdKHR-pGetFdInfo-parameter `pGetFdInfo` must be a valid pointer to a valid `VkFenceGetFdInfoKHR` structure
- VUID-vkGetFenceFdKHR-pFd-parameter `pFd` must be a valid pointer to an `int` value

**Return Codes**

**Success**

- `VK_SUCCESS`
The `VkFenceGetFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_fence_fd
typedef struct VkFenceGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fence` is the fence from which state will be exported.
- `handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of `handleType`. See `VkExternalFenceHandleTypeFlagBits` for a description of the properties of the defined external fence handle types.

**Valid Usage**

- **VUID-VkFenceGetFdInfoKHR-handleType-01453**
  
  `handleType` must have been included in `VkExportFenceCreateInfo::handleTypes` when `fence`'s current payload was created

- **VUID-VkFenceGetFdInfoKHR-handleType-01454**
  
  If `handleType` refers to a handle type with copy payload transference semantics, `fence` must be signaled, or have an associated `fence signal operation` pending execution

- **VUID-VkFenceGetFdInfoKHR-fence-01455**
  
  `fence` must not currently have its payload replaced by an imported payload as described below in Importing Fence Payloads unless that imported payload's handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for `handleType`

- **VUID-VkFenceGetFdInfoKHR-handleType-01456**
  
  `handleType` must be defined as a POSIX file descriptor handle

**Valid Usage (Implicit)**

- **VUID-VkFenceGetFdInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_FENCE_GET_FD_INFO_KHR`
To destroy a fence, call:

```c
// Provided by VK_VERSION_1_0
define vkDestroyFence
    device, fence, pAllocator);
```

- `device` is the logical device that destroys the fence.
- `fence` is the handle of the fence to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyFence-fence-01120**
  All queue submission commands that refer to `fence` must have completed execution.

- **VUID-vkDestroyFence-fence-01121**
  If `VkAllocationCallbacks` were provided when `fence` was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroyFence-fence-01122**
  If no `VkAllocationCallbacks` were provided when `fence` was created, `pAllocator` must be `NULL`.

### Valid Usage (Implicit)

- **VUID-vkDestroyFence-device-parameter**
  `device` must be a valid `VkDevice` handle.

- **VUID-vkDestroyFence-fence-parameter**
  If `fence` is not `VK_NULL_HANDLE`, `fence` must be a valid `VkFence` handle.

- **VUID-vkDestroyFence-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkDestroyFence-fence-parent**
  If `fence` is a valid handle, it must have been created, allocated, or retrieved from `device`. 
Host Synchronization

- Host access to fence must be externally synchronized

To query the status of a fence from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetFenceStatus(
    VkDevice device,
    VkFence fence);
```

- `device` is the logical device that owns the fence.
- `fence` is the handle of the fence to query.

Upon success, `vkGetFenceStatus` returns the status of the fence object, with the following return codes:

### Table 5. Fence Object Status Codes

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SUCCESS</td>
<td>The fence specified by <code>fence</code> is signaled.</td>
</tr>
<tr>
<td>VK_NOT_READY</td>
<td>The fence specified by <code>fence</code> is unsignaled.</td>
</tr>
<tr>
<td>VK_ERROR_DEVICE_LOST</td>
<td>The device has been lost. See Lost Device.</td>
</tr>
</tbody>
</table>

If a queue submission command is pending execution, then the value returned by this command may immediately be out of date.

If the device has been lost (see Lost Device), `vkGetFenceStatus` may return any of the above status codes. If the device has been lost and `vkGetFenceStatus` is called repeatedly, it will eventually return either VK_SUCCESS or VK_ERROR_DEVICE_LOST.

### Valid Usage (Implicit)

- VUID-vkGetFenceStatus-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetFenceStatus-fence-parameter
  - `fence` must be a valid `VkFence` handle
- VUID-vkGetFenceStatus-fence-parent
  - `fence` must have been created, allocated, or retrieved from `device`
Return Codes

**Success**

- VK_SUCCESS
- VK_NOT_READY

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

To set the state of fences to unsignaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetFences(
    VkDevice device,
    uint32_t fenceCount,
    const VkFence* pFences);
```

- `device` is the logical device that owns the fences.
- `fenceCount` is the number of fences to reset.
- `pFences` is a pointer to an array of fence handles to reset.

If any member of `pFences` currently has its payload imported with temporary permanence, that fence’s prior permanent payload is first restored. The remaining operations described therefore operate on the restored payload.

When `vkResetFences` is executed on the host, it defines a fence unsignal operation for each fence, which resets the fence to the unsignaled state.

If any member of `pFences` is already in the unsignaled state when `vkResetFences` is executed, then `vkResetFences` has no effect on that fence.

**Valid Usage**

- VUID-vkResetFences-pFences-01123
  Each element of `pFences` must not be currently associated with any queue command that has not yet completed execution on that queue

**Valid Usage (Implicit)**

- VUID-vkResetFences-device-parameter
  `device` must be a valid `VkDevice` handle
• **VUID-vkResetFences-pFences-parameter**
  *pFences must* be a valid pointer to an array of *fenceCount* valid *VkFence* handles

• **VUID-vkResetFences-fenceCount-arraylength**
  *fenceCount must* be greater than 0

• **VUID-vkResetFences-pFences-parent**
  Each element of *pFences must* have been created, allocated, or retrieved from *device*

---

**Host Synchronization**

• Host access to each member of *pFences must* be externally synchronized

---

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_DEVICE_MEMORY

---

When a fence is submitted to a queue as part of a *queue submission* command, it defines a memory dependency on the batches that were submitted as part of that command, and defines a *fence signal operation* which sets the fence to the signaled state.

The first *synchronization scope* includes every batch submitted in the same *queue submission* command. Fence signal operations that are defined by *vkQueueSubmit* or *vkQueueSubmit2* additionally include in the first synchronization scope all commands that occur earlier in *submission order*. Fence signal operations that are defined by *vkQueueSubmit* or *vkQueueSubmit2* or *vkQueueBindSparse* additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in *signal operation order*.

The second *synchronization scope* only includes the fence signal operation.

The first *access scope* includes all memory access performed by the device.

The second *access scope* is empty.

To wait for one or more fences to enter the signaled state on the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkWaitForFences(
    VkDevice device,
    uint32_t fenceCount,
    const VkFence* pFences,
    VkBool32 waitAll,
    uint64_t timeout);
```
• **device** is the logical device that owns the fences.

• **fenceCount** is the number of fences to wait on.

• **pFences** is a pointer to an array of **fenceCount** fence handles.

• **waitAll** is the condition that **must** be satisfied to successfully unblock the wait. If **waitAll** is **VK_TRUE**, then the condition is that all fences in **pFences** are signaled. Otherwise, the condition is that at least one fence in **pFences** is signaled.

• **timeout** is the timeout period in units of nanoseconds. **timeout** is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

If the condition is satisfied when **vkWaitForFences** is called, then **vkWaitForFences** returns immediately. If the condition is not satisfied at the time **vkWaitForFences** is called, then **vkWaitForFences** will block and wait until the condition is satisfied or the **timeout** has expired, whichever is sooner.

If **timeout** is zero, then **vkWaitForFences** does not wait, but simply returns the current state of the fences. **VK_TIMEOUT** will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the **timeout** has expired, **vkWaitForFences** returns **VK_SUCCESS**. Otherwise, **vkWaitForFences** returns **VK_TIMEOUT** after the **timeout** has expired.

If device loss occurs (see Lost Device) before the timeout has expired, **vkWaitForFences** must return in finite time with either **VK_SUCCESS** or **VK_ERROR_DEVICE_LOST**.

**Note**

While we guarantee that **vkWaitForFences** **must** return in finite time, no guarantees are made that it returns immediately upon device loss. However, the client can reasonably expect that the delay will be on the order of seconds and that calling **vkWaitForFences** will not result in a permanently (or seemingly permanently) dead process.

**Valid Usage (Implicit)**

- **VUID-vkWaitForFences-device-parameter**
  
  **device** **must** be a valid **VkDevice** handle

- **VUID-vkWaitForFences-pFences-parameter**
  
  **pFences** **must** be a valid pointer to an array of **fenceCount** valid **VkFence** handles

- **VUID-vkWaitForFences-fenceCount-arraylength**
  
  **fenceCount** **must** be greater than 0

- **VUID-vkWaitForFences-pFences-parent**
  
  Each element of **pFences** **must** have been created, allocated, or retrieved from **device**
Return Codes

Success
• VK_SUCCESS
• VK_TIMEOUT

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_DEVICE_LOST

An execution dependency is defined by waiting for a fence to become signaled, either via `vkWaitForFences` or by polling on `vkGetFenceStatus`.

The first synchronization scope includes only the fence signal operation.

The second synchronization scope includes the host operations of `vkWaitForFences` or `vkGetFenceStatus` indicating that the fence has become signaled.

Note
Signaling a fence and waiting on the host does not guarantee that the results of memory accesses will be visible to the host, as the access scope of a memory dependency defined by a fence only includes device access. A memory barrier or other memory dependency must be used to guarantee this. See the description of host access types for more information.

7.3.1. Alternate Methods to Signal Fences

Besides submitting a fence to a queue as part of a queue submission command, a fence may also be signaled when a particular event occurs on a device or display.

To create a fence that will be signaled when an event occurs on a device, call:

```c
// Provided by VK_EXT_display_control
VkResult vkRegisterDeviceEventEXT(
    VkDevice device,
    const VkDeviceEventInfoEXT* pDeviceEventInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFence* pFence);
```

- `device` is a logical device on which the event may occur.
- `pDeviceEventInfo` is a pointer to a `VkDeviceEventInfoEXT` structure describing the event of interest to the application.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
• `pFence` is a pointer to a handle in which the resulting fence object is returned.

Valid Usage (Implicit)

• VUID-vkRegisterDeviceEventEXT-device-parameter
  
  `device` must be a valid `VkDevice` handle

• VUID-vkRegisterDeviceEventEXT-pDeviceEventInfo-parameter
  
  `pDeviceEventInfo` must be a valid pointer to a valid `VkDeviceEventInfoEXT` structure

• VUID-vkRegisterDeviceEventEXT-pAllocator-parameter
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

• VUID-vkRegisterDeviceEventEXT-pFence-parameter
  
  `pFence` must be a valid pointer to a `VkFence` handle

Return Codes

Success

• `VK_SUCCESS`

Failure

• `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkDeviceEventInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkDeviceEventInfoEXT {
    VkStructureType sType;
    const void*pNext;
    VkDeviceEventTypeEXT deviceEvent;
} VkDeviceEventInfoEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `device` is a `VkDeviceEventTypeEXT` value specifying when the fence will be signaled.

Valid Usage (Implicit)

• VUID-VkDeviceEventInfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_EVENT_INFO_EXT`

• VUID-VkDeviceEventInfoEXT-pNext-pNext
  
  `pNext` must be `NULL`

• VUID-VkDeviceEventInfoEXT-deviceEvent-parameter
deviceEvent must be a valid VkDeviceEventTypeEXT value

Possible values of VkDeviceEventInfoEXT::device, specifying when a fence will be signaled, are:

```c
// Provided by VK_EXT_display_control
typedef enumVkDeviceEventTypeEXT {
    VKDEVICEEVENTTYPE_DISPLAYHOTPLUG_EXT = 0,
} VkDeviceEventTypeEXT;
```

• VK_DEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT specifies that the fence is signaled when a display is plugged into or unplugged from the specified device. Applications can use this notification to determine when they need to re-enumerate the available displays on a device.

To create a fence that will be signaled when an event occurs on a VkDisplayKHR object, call:

```c
// Provided by VK_EXT_display_control
VkResult vkRegisterDisplayEventEXT(
    VkDevice device,                  // device
    VkDisplayKHR display,             // display
    const VkDisplayEventInfoEXT* pDisplayEventInfo, // pDisplayEventInfo
    const VkAllocationCallbacks* pAllocator, // pAllocator
    VkFence* pFence); // pFence
```

• device is a logical device associated with display
• display is the display on which the event may occur.
• pDisplayEventInfo is a pointer to a VkDisplayEventInfoEXT structure describing the event of interest to the application.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.
• pFence is a pointer to a handle in which the resulting fence object is returned.

Valid Usage (Implicit)

• VUID-vkRegisterDisplayEventEXT-device-parameter
device must be a valid VkDevice handle
• VUID-vkRegisterDisplayEventEXT-display-parameter
display must be a valid VkDisplayKHR handle
• VUID-vkRegisterDisplayEventEXT-pDisplayEventInfo-parameter
pDisplayEventInfo must be a valid pointer to a valid VkDisplayEventInfoEXT structure
• VUID-vkRegisterDisplayEventEXT-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
• VUID-vkRegisterDisplayEventEXT-pFence-parameter
pFence must be a valid pointer to a VkFence handle
Both of device, and display must have been created, allocated, or retrieved from the same VkPhysicalDevice.

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkDisplayEventInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkDisplayEventInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDisplayEventTypeEXT displayEvent;
} VkDisplayEventInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `displayEvent` is a VkDisplayEventTypeEXT specifying when the fence will be signaled.

### Valid Usage (Implicit)

- VUID-VkDisplayEventInfoEXT-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_DISPLAY_EVENT_INFO_EXT

- VUID-VkDisplayEventInfoEXT-pNext-pNext
  `pNext` must be NULL

- VUID-VkDisplayEventInfoEXT-displayEvent-parameter
  `displayEvent` must be a valid VkDisplayEventTypeEXT value

Possible values of `VkDisplayEventInfoEXT::displayEvent`, specifying when a fence will be signaled, are:

```c
// Provided by VK_EXT_display_control
typedef enum VkDisplayEventTypeEXT {
    VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT = 0,
} VkDisplayEventTypeEXT;
```

- `VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT` specifies that the fence is signaled when the first
Applications can import a fence payload into an existing fence using an external fence handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the fence will be restored to its permanent state the next time that fence is passed to `vkResetFences`.

Performing a subsequent temporary import on a fence before resetting it has no effect on this requirement; the next unsignal of the fence must still restore its last permanent state. A permanent payload import behaves as if the target fence was destroyed, and a new fence was created with the same handle but the imported payload. Because importing a fence payload temporarily or permanently detaches the existing payload from a fence, similar usage restrictions to those applied to `vkDestroyFence` are applied to any command that imports a fence payload. Which of these import types is used is referred to as the import operation’s permanence. Each handle type supports either one or both types of permanence.

The implementation must perform the import operation by either referencing or copying the payload referred to by the specified external fence handle, depending on the handle’s type. The import method used is referred to as the handle type’s transference. When using handle types with reference transference, importing a payload to a fence adds the fence to the set of all fences sharing that payload. This set includes the fence from which the payload was exported. Fence signaling, waiting, and resetting operations performed on any fence in the set must behave as if the set were a single fence. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Fence signaling, waiting, and resetting operations performed on the target of copy imports must not affect any other fence or payload.

Export operations have the same transference as the specified handle type’s import operations. Additionally, exporting a fence payload to a handle with copy transference has the same side effects on the source fence’s payload as executing a fence reset operation. If the fence was using a temporarily imported payload, the fence’s prior permanent payload will be restored.

Export operations have the same transference as the specified handle type’s import operations. Additionally, exporting a fence payload to a handle with copy transference has the same side effects on the source fence’s payload as executing a fence reset operation. If the fence was using a temporarily imported payload, the fence’s prior permanent payload will be restored.

Export operations have the same transference as the specified handle type’s import operations. Additionally, exporting a fence payload to a handle with copy transference has the same side effects on the source fence’s payload as executing a fence reset operation. If the fence was using a temporarily imported payload, the fence’s prior permanent payload will be restored.

External synchronization allows implementations to modify an object’s internal state, i.e. payload, without internal synchronization. However, for fences sharing a payload across processes, satisfying the external synchronization requirements of `VkFence` parameters as if all fences in the set were the same object is sometimes infeasible. Satisfying valid usage constraints on the state of a fence would similarly require impractical coordination or levels of trust between processes.
Therefore, these constraints only apply to a specific fence handle, not to its payload. For distinct fence objects which share a payload:

- If multiple commands which queue a signal operation, or which unsignal a fence, are called concurrently, behavior will be as if the commands were called in an arbitrary sequential order.
- If a queue submission command is called with a fence that is sharing a payload, and the payload is already associated with another queue command that has not yet completed execution, either one or both of the commands will cause the fence to become signaled when they complete execution.
- If a fence payload is reset while it is associated with a queue command that has not yet completed execution, the payload will become unsignaled, but may become signaled again when the command completes execution.
- In the preceding cases, any of the devices associated with the fences sharing the payload may be lost, or any of the queue submission or fence reset commands may return VK_ERROR_INITIALIZATION_FAILED.

Other than these non-deterministic results, behavior is well defined. In particular:

- The implementation must not crash or enter an internally inconsistent state where future valid Vulkan commands might cause undefined results,
- Timeouts on future wait commands on fences sharing the payload must be effective.

**Note**

These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared fence for more than synchronizing access to the shared memory. For example, a process should not use a fence with shared payload to tell when commands it submitted to a queue have completed and objects used by those commands may be destroyed, since the other process can accidentally or maliciously cause the fence to signal before the commands actually complete.

When a fence is using an imported payload, its `VkExportFenceCreateInfo::handleTypes` value is specified when creating the fence from which the payload was exported, rather than specified when creating the fence. Additionally, `VkExternalFenceProperties::exportFromImportedHandleTypes` restricts which handle types can be exported from such a fence based on the specific handle type used to import the current payload. Passing a fence to `vkAcquireNextImageKHR` is equivalent to temporarily importing a fence payload to that fence.

**Note**

Because the exportable handle types of an imported fence correspond to its current imported payload, and `vkAcquireNextImageKHR` behaves the same as a temporary import operation for which the source fence is opaque to the application, applications have no way of determining whether any external handle types can be exported from a fence in this state. Therefore, applications must not attempt to export handles from fences using a temporarily imported payload from `vkAcquireNextImageKHR`. 

When importing a fence payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations must perform sufficient validation of external handles to ensure that the operation results in a valid fence which will not cause program termination, device loss, queue stalls, host thread stalls, or corruption of other resources when used as allowed according to its import parameters. If the external handle provided does not meet these requirements, the implementation must fail the fence payload import operation with the error code VK_ERROR_INVALID_EXTERNAL_HANDLE.

To import a fence payload from a Windows handle, call:

```c
// Provided by VK_KHR_external_fence_win32
VkResult vkImportFenceWin32HandleKHR(
    VkDevice device,
    const VkImportFenceWin32HandleInfoKHR* pImportFenceWin32HandleInfo);
```

- `device` is the logical device that created the fence.
- `pImportFenceWin32HandleInfo` is a pointer to a `VkImportFenceWin32HandleInfoKHR` structure specifying the fence and import parameters.

Importing a fence payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release ownership using the `CloseHandle` system call when the handle is no longer needed.

Applications can import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

### Valid Usage

- VUID-vkImportFenceWin32HandleKHR-fence-04448
  fence must not be associated with any queue command that has not yet completed execution on that queue

### Valid Usage (Implicit)

- VUID-vkImportFenceWin32HandleKHR-device-parameter
  `device must` be a valid `VkDevice` handle
- VUID-vkImportFenceWin32HandleKHR-pImportFenceWin32HandleInfo-parameter
  `pImportFenceWin32HandleInfo must` be a valid pointer to a valid `VkImportFenceWin32HandleInfoKHR` structure

### Return Codes

**Success**

- `VK_SUCCESS`
Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The **VkImportFenceWin32HandleInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_external_fence_win32
typedef struct VkImportFenceWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkFenceImportFlags flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportFenceWin32HandleInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **fence** is the fence into which the state will be imported.
- **flags** is a bitmask of `VkFenceImportFlagBits` specifying additional parameters for the fence payload import operation.
- **handleType** is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of `handle`.
- **handle** is `NULL` or the external handle to import.
- **name** is `NULL` or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.

The handle types supported by **handleType** are:

**Table 6. Handle Types Supported by VkImportFenceWin32HandleInfoKHR**

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_B</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
</tbody>
</table>

**Valid Usage**

- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01457
  **handleType** must be a value included in the **Handle Types Supported by VkImportFenceWin32HandleInfoKHR** table
- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01459
If `handleType` is not `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT`, name must be NULL

- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01460
  If `handle` is NULL, name must name a valid synchronization primitive of the type specified by `handleType`

- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01461
  If name is NULL, handle must be a valid handle of the type specified by `handleType`

- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01462
  If `handle` is not NULL, name must be NULL

- VUID-VkImportFenceWin32HandleInfoKHR-handle-01463
  If name is NULL, handle must obey any requirements listed for `handleType` in external fence handle types compatibility

- VUID-VkImportFenceWin32HandleInfoKHR-name-01464
  If name is not NULL, it must obey any requirements listed for `handleType` in external fence handle types compatibility

**Valid Usage (Implicit)**

- VUID-VkImportFenceWin32HandleInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMPORT_FENCE_WIN32_HANDLE_INFO_KHR`

- VUID-VkImportFenceWin32HandleInfoKHR-pNext-pNext
  `pNext` must be NULL

- VUID-VkImportFenceWin32HandleInfoKHR-fence-parameter
  `fence` must be a valid `VkFence` handle

- VUID-VkImportFenceWin32HandleInfoKHR-flags-parameter
  `flags` must be a valid combination of `VkFenceImportFlagBits` values

**Host Synchronization**

- Host access to `fence` must be externally synchronized

To import a fence payload from a POSIX file descriptor, call:

```c
// Provided by VK_KHR_external_fence_fd
VkResult vkImportFenceFdKHR(
    VkDevice device,
    const VkImportFenceFdInfoKHR* pImportFenceFdInfo);
```

- `device` is the logical device that created the fence.
- `pImportFenceFdInfo` is a pointer to a `VkImportFenceFdInfoKHR` structure specifying the fence and import parameters.
Importing a fence payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import.

Applications **can** import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

### Valid Usage

- **VUID-vkImportFenceFdKHR-fence-01463**
  - *fence must not be associated with any queue command that has not yet completed execution on that queue*

### Valid Usage (Implicit)

- **VUID-vkImportFenceFdKHR-device-parameter**
  - *device must be a valid *VkDevice* handle*

- **VUID-vkImportFenceFdKHR-pImportFenceFdInfo-parameter**
  - *pImportFenceFdInfo must be a valid pointer to a valid *VkImportFenceFdInfoKHR* structure*

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_INVALID_EXTERNAL_HANDLE**

The *VkImportFenceFdInfoKHR* structure is defined as:

```c
// Provided by VK_KHR_external_fence_fd
typedef struct VkImportFenceFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkFenceImportFlags flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    int fd;
} VkImportFenceFdInfoKHR;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
• **fence** is the fence into which the payload will be imported.
• **flags** is a bitmask of VkFenceImportFlagBits specifying additional parameters for the fence payload import operation.
• **handleType** is a VkExternalFenceHandleTypeFlagBits value specifying the type of **fd**.
• **fd** is the external handle to import.

The handle types supported by **handleType** are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT</td>
<td>Reference</td>
<td>Temporary, Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT</td>
<td>Copy</td>
<td>Temporary</td>
</tr>
</tbody>
</table>

**Valid Usage**

- **VUID-VkImportFenceFdInfoKHR-handleType-01464**
  - **handleType** must be a value included in the Handle Types Supported by VkImportFenceFdInfoKHR table
- **VUID-VkImportFenceFdInfoKHR-fd-01541**
  - **fd** must obey any requirements listed for **handleType** in external fence handle types compatibility
- **VUID-VkImportFenceFdInfoKHR-handleType-07306**
  - If **handleType** refers to a handle type with copy payload transference semantics, **flags** must contain VK_FENCE_IMPORT_TEMPORARY_BIT

If **handleType** is VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT, the special value -1 for **fd** is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the **VkFence** will have a temporarily imported payload as if a valid file descriptor had been provided.

**Note**

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a -1 file descriptor when exporting a VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT from a **VkFence** which is signaled.

**Valid Usage (Implicit)**

- **VUID-VkImportFenceFdInfoKHR-sType-sType**
  - **sType** must be VK_STRUCTURE_TYPE_IMPORT_FENCE_FD_INFO_KHR
• VUID-VkImportFenceFdInfoKHR-pNext-pNext
  pNext must be NULL

• VUID-VkImportFenceFdInfoKHR-fence-parameter
  fence must be a valid VkFence handle

• VUID-VkImportFenceFdInfoKHR-flags-parameter
  flags must be a valid combination of VkFenceImportFlagBits values

• VUID-VkImportFenceFdInfoKHR-handleType-parameter
  handleType must be a valid VkExternalFenceHandleTypeFlagBits value

---

**Host Synchronization**

- Host access to fence must be externally synchronized

---

Bits which can be set in

- VkImportFenceWin32HandleInfoKHR::flags
- VkImportFenceFdInfoKHR::flags

specifying additional parameters of a fence import operation are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkFenceImportFlagBits {
  VK_FENCE_IMPORT_TEMPORARY_BIT = 0x00000001,
// Provided by VK_KHR_external_fence
  VK_FENCE_IMPORT_TEMPORARY_BIT_KHR = VK_FENCE_IMPORT_TEMPORARY_BIT,
} VkFenceImportFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence
typedef VkFenceImportFlagBits VkFenceImportFlagBitsKHR;
```

- **VK_FENCE_IMPORT_TEMPORARY_BIT** specifies that the fence payload will be imported only temporarily, as described in Importing Fence Payloads, regardless of the permanence of handleType.

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkFenceImportFlags;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence
```
typedef VkFenceImportFlags VkFenceImportFlagsKHR;

VkFenceImportFlags is a bitmask type for setting a mask of zero or more VkFenceImportFlagBits.

### 7.4. Semaphores

Semaphores are a synchronization primitive that can be used to insert a dependency between queue operations or between a queue operation and the host. Binary semaphores have two states—signaled and unsignaled. Timeline semaphores have a strictly increasing 64-bit unsigned integer payload and are signaled with respect to a particular reference value. A semaphore can be signaled after execution of a queue operation is completed, and a queue operation can wait for a semaphore to become signaled before it begins execution. A timeline semaphore can additionally be signaled from the host with the vkSignalSemaphore command and waited on from the host with the vkWaitSemaphores command.

The internal data of a semaphore may include a reference to any resources and pending work associated with signal or unsignal operations performed on that semaphore object, collectively referred to as the semaphore's payload. Mechanisms to import and export that internal data to and from semaphores are provided below. These mechanisms indirectly enable applications to share semaphore state between two or more semaphores and other synchronization primitives across process and API boundaries.

Semaphores are represented by VkSemaphore handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSemaphore)
```

To create a semaphore, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateSemaphore(
    VkDevice                device,
    const VkSemaphoreCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSemaphore*            pSemaphore);
```

- **device** is the logical device that creates the semaphore.
- **pCreateInfo** is a pointer to a VkSemaphoreCreateInfo structure containing information about how the semaphore is to be created.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pSemaphore** is a pointer to a handle in which the resulting semaphore object is returned.

Valid Usage (Implicit)

- VUID-vkCreateSemaphore-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateSemaphore-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkSemaphoreCreateInfo structure

- VUID-vkCreateSemaphore-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateSemaphore-pSemaphore-parameter
  pSemaphore must be a valid pointer to a VkSemaphore handle

---

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkSemaphoreCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSemaphoreCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphoreCreateFlags flags;
} VkSemaphoreCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.

---

**Valid Usage**

- VUID-VkSemaphoreCreateInfo-pNext-06789
  If the pNext chain includes a VkExportMetalObjectCreateInfoEXT structure, its exportObjectType member must be VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT

---

**Valid Usage (Implicit)**

- VUID-VkSemaphoreCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO
Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkExportMetalObjectCreateInfoEXT`, `VkExportSemaphoreCreateInfo`, `VkImportMetalSharedEventInfoEXT`, `VkQueryLowLatencySupportNV`, or `VkSemaphoreTypeCreateInfo`.

The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkExportMetalObjectCreateInfoEXT`.

Flags must be 0.

```
typedef VkFlags VkSemaphoreCreateFlags;
```

`VkSemaphoreCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkSemaphoreTypeCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSemaphoreTypeCreateInfo {
    VkStructureType sType;
    const void*pNext;
    VkSemaphoreType semaphoreType;
    uint64_t initialValue;
} VkSemaphoreTypeCreateInfo;
```

or the equivalent

```
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreTypeCreateInfo VkSemaphoreTypeCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphoreType` is a `VkSemaphoreType` value specifying the type of the semaphore.
- `initialValue` is the initial payload value if `semaphoreType` is `VK_SEMAPHORE_TYPE_TIMELINE`.

To create a semaphore of a specific type, add a `VkSemaphoreTypeCreateInfo` structure to the `pNext` chain of `VkSemaphoreCreateInfo`.

If no `VkSemaphoreTypeCreateInfo` structure is included in the `pNext` chain of `VkSemaphoreCreateInfo`, then the created semaphore will have a default `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`. 
Valid Usage

- VUID-VkSemaphoreTypeCreateInfo-timelineSemaphore-03252
  If the `timelineSemaphore` feature is not enabled, `semaphoreType` must not equal `VK_SEMAPHORE_TYPE_TIMELINE`

- VUID-VkSemaphoreTypeCreateInfo-semaphoreType-03279
  If `semaphoreType` is `VK_SEMAPHORE_TYPE_BINARY`, `initialValue` must be zero

Valid Usage (Implicit)

- VUID-VkSemaphoreTypeCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_TYPE_CREATE_INFO`

- VUID-VkSemaphoreTypeCreateInfo-semaphoreType-parameter
  `semaphoreType` must be a valid `VkSemaphoreType` value

Possible values of `VkSemaphoreTypeCreateInfo::semaphoreType`, specifying the type of a semaphore, are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreType {
    VK_SEMAPHORE_TYPE_BINARY = 0,
    VK_SEMAPHORE_TYPE_TIMELINE = 1,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_TYPE_BINARY_KHR = VK_SEMAPHORE_TYPE_BINARY,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_TYPE_TIMELINE_KHR = VK_SEMAPHORE_TYPE_TIMELINE,
} VkSemaphoreType;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreType VkSemaphoreTypeKHR;
```

- `VK_SEMAPHORE_TYPE_BINARY` specifies a `binary semaphore` type that has a boolean payload indicating whether the semaphore is currently signaled or unsignaled. When created, the semaphore is in the unsignaled state.

- `VK_SEMAPHORE_TYPE_TIMELINE` specifies a `timeline semaphore` type that has a strictly increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. When created, the semaphore payload has the value given by the `initialValue` field of `VkSemaphoreTypeCreateInfo`.

To create a semaphore whose payload can be exported to external handles, add a `VkExportSemaphoreCreateInfo` structure to the `pNext` chain of the `VkSemaphoreCreateInfo`.
structure. The \texttt{VkExportSemaphoreCreateInfo} structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExportSemaphoreCreateInfo {
    VkStructureType sType;
    const \textbf{void}* pNext;
    VkExternalSemaphoreHandleTypeFlags handleTypes;
} VkExportSemaphoreCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_semaphore
typedef VkExportSemaphoreCreateInfo VkExportSemaphoreCreateInfoKHR;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{handleTypes} is a bitmask of \texttt{VkExternalSemaphoreHandleTypeFlagBits} specifying one or more semaphore handle types the application \textbf{can} export from the resulting semaphore. The application \textbf{can} request multiple handle types for the same semaphore.

### Valid Usage

- VUID-VkExportSemaphoreCreateInfo-handleTypes-01124
  The bits in \texttt{handleTypes} \textbf{must} be supported and compatible, as reported by \texttt{VkExternalSemaphoreProperties}.

### Valid Usage (Implicit)

- VUID-VkExportSemaphoreCreateInfo-sType-sType
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_CREATE_INFO}.

- VUID-VkExportSemaphoreCreateInfo-handleTypes-parameter
  \texttt{handleTypes} \textbf{must} be a valid combination of \texttt{VkExternalSemaphoreHandleTypeFlagBits} values.

To specify additional attributes of NT handles exported from a semaphore, add a \texttt{VkExportSemaphoreWin32HandleInfoKHR} structure to the \texttt{pNext} chain of the \texttt{VkSemaphoreCreateInfo} structure. The \texttt{VkExportSemaphoreWin32HandleInfoKHR} structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkExportSemaphoreWin32HandleInfoKHR {
    VkStructureType sType;
    const \textbf{void}* pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
} VkExportSemaphoreWin32HandleInfoKHR;
```
DWORD dwAccess;
LPCWSTR name;
}

VkExportSemaphoreWin32HandleInfoKHR

• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **pAttributes** is a pointer to a Windows **SECURITY_ATTRIBUTES** structure specifying security attributes of the handle.
• **dwAccess** is a **DWORD** specifying access rights of the handle.
• **name** is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created semaphore.

If **VkExportSemaphoreCreateInfo** is not included in the same **pNext** chain, this structure is ignored.

If **VkExportSemaphoreCreateInfo** is included in the **pNext** chain of **VkSemaphoreCreateInfo** with a Windows **handleType**, but either **VkExportSemaphoreWin32HandleInfoKHR** is not included in the **pNext** chain, or it is included but **pAttributes** is set to **NULL**, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”¹. Further, if the structure is not present, the access rights used depend on the handle type.

For handles of the following types:

**VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT**

The implementation **must** ensure the access rights allow both signal and wait operations on the semaphore.

For handles of the following types:

**VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT**

The access rights **must** be:

**GENERIC_ALL**

---

**Valid Usage**

- **VUID-VkExportSemaphoreWin32HandleInfoKHR-handleTypes-01125**
  If **VkExportSemaphoreCreateInfo::handleTypes** does not include **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT** or **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT**, **VkExportSemaphoreWin32HandleInfoKHR** **must** not be included in the **pNext** chain of **VkSemaphoreCreateInfo**
To export a Windows handle representing the payload of a semaphore, call:

```c
// Provided by VK_KHR_external_semaphore_win32
VkResult vkGetSemaphoreWin32HandleKHR(
    VkDevice device,
    const VkSemaphoreGetWin32HandleInfoKHR* pGetWin32HandleInfo,
    HANDLE* pHandle);
```

- `device` is the logical device that created the semaphore being exported.
- `pGetWin32HandleInfo` is a pointer to a `VkSemaphoreGetWin32HandleInfoKHR` structure containing parameters of the export operation.
- `pHandle` will return the Windows handle representing the semaphore state.

For handle types defined as NT handles, the handles returned by `vkGetSemaphoreWin32HandleKHR` are owned by the application. To avoid leaking resources, the application must release ownership of them using the `CloseHandle` system call when they are no longer needed.

Exporting a Windows handle from a semaphore may have side effects depending on the transference of the specified handle type, as described in Importing Semaphore Payloads.

### Valid Usage (Implicit)

- **VUID-vkGetSemaphoreWin32HandleKHR-device-parameter** `device` must be a valid `VkDevice` handle
- **VUID-vkGetSemaphoreWin32HandleKHR-pGetWin32HandleInfo-parameter** `pGetWin32HandleInfo` must be a valid pointer to a valid `VkSemaphoreGetWin32HandleInfoKHR` structure
- **VUID-vkGetSemaphoreWin32HandleKHR-pHandle-parameter** `pHandle` must be a valid pointer to a `HANDLE` value

### Return Codes

**Success**

- **VK_SUCCESS**
Failure

- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkSemaphoreGetWin32HandleInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkSemaphoreGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.

Valid Usage

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01126
  `handleType` must have been included in `VkExportSemaphoreCreateInfo::handleTypes` when the `semaphore`'s current payload was created

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01127
  If `handleType` is defined as an NT handle, `vkGetSemaphoreWin32HandleKHR` must be called no more than once for each valid unique combination of `semaphore` and `handleType`

- VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-01128
  `semaphore` must not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload’s handle type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for `handleType`

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01129
  If `handleType` refers to a handle type with copy payload transference semantics, as defined below in Importing Semaphore Payloads, there must be no queue waiting on `semaphore`

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01130
  If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` must be signaled, or have an associated `semaphore signal operation` pending execution
**Valid Usage (Implicit)**

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01131
  
  `handleType` must be defined as an NT handle or a global share handle

- VUID-VkSemaphoreGetWin32HandleInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_WIN32_HANDLE_INFO_KHR`

- VUID-VkSemaphoreGetWin32HandleInfoKHR-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-parameter
  
  `semaphore` must be a valid `VkSemaphore` handle

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-parameter
  
  `handleType` must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

The `VkQueryLowLatencySupportNV` structure is defined as:

```c
// Provided by VK_NV_low_latency
typedef struct VkQueryLowLatencySupportNV {
    VkStructureType sType;
    const void* pNext;
    void* pQueriedLowLatencyData;
} VkQueryLowLatencySupportNV;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pQueriedLowLatencyData` is used for NVIDIA Reflex Support.

**Valid Usage (Implicit)**

- VUID-VkQueryLowLatencySupportNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_QUERY_LOW_LATENCY_SUPPORT_NV`

- VUID-VkQueryLowLatencySupportNV-pQueriedLowLatencyData-parameter
  
  `pQueriedLowLatencyData` must be a pointer value

To export a POSIX file descriptor representing the payload of a semaphore, call:

```c
// Provided by VK_KHR_external_semaphore_fd
VkResult vkGetSemaphoreFdKHR(
    VkDevice device,
    const VkSemaphoreGetFdInfoKHR* pGetFdInfo,
    VkSemaphoreFdKHR* pSemaphoreFd);```
Each call to `vkGetSemaphoreFdKHR` must create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application must release ownership of the file descriptor when it is no longer needed.

**Note**
Ownership can be released in many ways. For example, the application can call `close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.

Where supported by the operating system, the implementation must set the file descriptor to be closed automatically when an `execve` system call is made.

Exporting a file descriptor from a semaphore may have side effects depending on the transference of the specified handle type, as described in Importing Semaphore State.

### Valid Usage (Implicit)

- VUID-vkGetSemaphoreFdKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetSemaphoreFdKHR-pGetFdInfo-parameter
  - `pGetFdInfo` must be a valid pointer to a valid `VkSemaphoreGetFdInfoKHR` structure
- VUID-vkGetSemaphoreFdKHR-pFd-parameter
  - `pFd` must be a valid pointer to an `int` value

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkSemaphoreGetFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkSemaphoreGetFdInfoKHR {
```
VkStructureType
const void* sType;
pNext;
VkSemaphore semaphore;
VkExternalSemaphoreHandleTypeFlagBits handleType;
}

VkSemaphoreGetFdInfoKHR

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **semaphore** is the semaphore from which state will be exported.
- **handleType** is a *VkExternalSemaphoreHandleTypeFlagBits* value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of **handleType**. See *VkExternalSemaphoreHandleTypeFlagBits* for a description of the properties of the defined external semaphore handle types.

---

**Valid Usage**

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01132**
  
  **handleType must** have been included in *VkExportSemaphoreCreateInfo::handleTypes* when **semaphore**’s current payload was created.

- **VUID-VkSemaphoreGetFdInfoKHR-semaphore-01133**
  
  **semaphore must** not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload’s handle type was included in *VkExternalSemaphoreProperties::exportFromImportedHandleTypes* for **handleType**.

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01134**
  
  If **handleType** refers to a handle type with copy payload transference semantics, as defined below in Importing Semaphore Payloads, there **must** be no queue waiting on **semaphore**.

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01135**
  
  If **handleType** refers to a handle type with copy payload transference semantics, **semaphore** **must** be signalled, or have an associated **semaphore signal operation** pending execution.

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01136**
  
  **handleType must** be defined as a POSIX file descriptor handle.

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-03253**
  
  If **handleType** refers to a handle type with copy payload transference semantics, **semaphore** **must** have been created with a **VkSemaphoreType** of VK_SEMAPHORE_TYPE_BINARY.

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-03254**
  
  If **handleType** refers to a handle type with copy payload transference semantics, **semaphore** **must** have an associated semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) **must** have also been submitted for execution.
To export a Zircon event handle representing the payload of a semaphore, call:

```c
// Provided by VK_FUCHSIA_external_semaphore
VkResult vkGetSemaphoreZirconHandleFUCHSIA(
    VkDevice device,
    const VkSemaphoreGetZirconHandleInfoFUCHSIA* pGetZirconHandleInfo,
    zx_handle_t* pZirconHandle);
```

- `device` is the logical device that created the semaphore being exported.
- `pGetZirconHandleInfo` is a pointer to a `VkSemaphoreGetZirconHandleInfoFUCHSIA` structure containing parameters of the export operation.
- `pZirconHandle` will return the Zircon event handle representing the semaphore payload.

Each call to `vkGetSemaphoreZirconHandleFUCHSIA` must create a Zircon event handle and transfer ownership of it to the application. To avoid leaking resources, the application must release ownership of the Zircon event handle when it is no longer needed.

**Note**
Ownership can be released in many ways. For example, the application can call `zx_handle_close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.

Exporting a Zircon event handle from a semaphore may have side effects depending on the transference of the specified handle type, as described in Importing Semaphore State.
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkSemaphoreGetZirconHandleInfoFUCHSIA structure is defined as:

```c
// Provided by VK_FUCHSIA_external_semaphore
typedef struct VkSemaphoreGetZirconHandleInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetZirconHandleInfoFUCHSIA;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is a VkExternalSemaphoreHandleTypeFlagBits value specifying the type of handle requested.

The properties of the Zircon event handle returned depend on the value of `handleType`. See VkExternalSemaphoreHandleTypeFlagBits for a description of the properties of the defined external semaphore handle types.

Valid Usage

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04758
  `handleType` must have been included in VkExportSemaphoreCreateInfo::handleTypes when `semaphore`’s current payload was created

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-04759
  `semaphore` must not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload’s handle type was included in VkExternalSemaphoreProperties::exportFromImportedHandleTypes for `handleType`

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04760
If `handleType` refers to a handle type with copy payload transference semantics, as defined below in Importing Semaphore Payloads, there **must** be no queue waiting on `semaphore`

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04761
  If `handleType` refers to a handle type with copy payload transference semantics, `semaphore must` be signaled, or have an associated `semaphore signal operation` pending execution

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04762
  `handleType must` be defined as a Zircon event handle

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-04763
  `semaphore must` have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`

**Valid Usage (Implicit)**

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-sType-sType
  `sType must` be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_ZIRCON_HANDLE_INFO_FUCHSIA`

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-pNext-pNext
  `pNext must` be NULL

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-parameter
  `semaphore must` be a valid `VkSemaphore` handle

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-parameter
  `handleType must` be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

To destroy a semaphore, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroySemaphore(
    VkDevice device,
    VkSemaphore semaphore,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the semaphore.
- `semaphore` is the handle of the semaphore to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- VUID-vkDestroySemaphore-semaphore-01137
  All submitted batches that refer to `semaphore must` have completed execution

- VUID-vkDestroySemaphore-semaphore-01138
  If `VkAllocationCallbacks` were provided when `semaphore` was created, a compatible set of callbacks **must** be provided here

- VUID-vkDestroySemaphore-semaphore-01139
If no `VkAllocationCallbacks` were provided when `semaphore` was created, `pAllocator` must be `NULL`.

## Valid Usage (Implicit)

- **VUID-vkDestroySemaphore-device-parameter**  
  `device` must be a valid `VkDevice` handle.

- **VUID-vkDestroySemaphore-semaphore-parameter**  
  If `semaphore` is not `VK_NULL_HANDLE`, `semaphore` must be a valid `VkSemaphore` handle.

- **VUID-vkDestroySemaphore-pAllocator-parameter**  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkDestroySemaphore-semaphore-parent**  
  If `semaphore` is a valid handle, it must have been created, allocated, or retrieved from `device`.

## Host Synchronization

- Host access to `semaphore` must be externally synchronized.

### 7.4.1. Semaphore Signaling

When a batch is submitted to a queue via a `queue submission`, and it includes semaphores to be signaled, it defines a memory dependency on the batch, and defines `semaphore signal operations` which set the semaphores to the signaled state.

In case of semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the semaphore is considered signaled with respect to the counter value set to be signaled as specified in `VkTimelineSemaphoreSubmitInfo` or `VkSemaphoreSignalInfo`.

The first synchronization scope includes every command submitted in the same batch. In the case of `vkQueueSubmit2`, the first synchronization scope is limited to the pipeline stage specified by `VkSemaphoreSubmitInfo::stageMask`. Semaphore signal operations that are defined by `vkQueueSubmit` or `vkQueueSubmit2` additionally include all commands that occur earlier in submission order. Semaphore signal operations that are defined by `vkQueueSubmit` or `vkQueueSubmit2` or `vkQueueBindSparse` additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in signal operation order.

The second synchronization scope includes only the semaphore signal operation.

The first access scope includes all memory access performed by the device.

The second access scope is empty.
7.4.2. Semaphore Waiting

When a batch is submitted to a queue via a queue submission, and it includes semaphores to be waited on, it defines a memory dependency between prior semaphore signal operations and the batch, and defines semaphore wait operations.

Such semaphore wait operations set the semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY to the unsignaled state. In case of semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE a prior semaphore signal operation defines a memory dependency with a semaphore wait operation if the value the semaphore is signaled with is greater than or equal to the value the semaphore is waited with, thus the semaphore will continue to be considered signaled with respect to the counter value waited on as specified in VkTimelineSemaphoreSubmitInfo.

The first synchronization scope includes all semaphore signal operations that operate on semaphores waited on in the same batch, and that happen-before the wait completes.

The second synchronization scope includes every command submitted in the same batch. In the case of vkQueueSubmit, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by the corresponding element of pWaitDstStageMask. In the case of vkQueueSubmit2, the second synchronization scope is limited to the pipeline stage specified by VkSemaphoreSubmitInfo::stageMask. Also, in the case of either vkQueueSubmit2 or vkQueueSubmit, the second synchronization scope additionally includes all commands that occur later in submission order.

The first access scope is empty.

The second access scope includes all memory access performed by the device.

The semaphore wait operation happens-after the first set of operations in the execution dependency, and happens-before the second set of operations in the execution dependency.

Note

Unlike timeline semaphores, fences or events, the act of waiting for a binary semaphore also unsignals that semaphore. Applications must ensure that between two such wait operations, the semaphore is signaled again, with execution dependencies used to ensure these occur in order. Binary semaphore waits and signals should thus occur in discrete 1:1 pairs.

Note

A common scenario for using pWaitDstStageMask with values other than VK_PIPELINE_STAGE_ALL_COMMANDS_BIT is when synchronizing a window system presentation operation against subsequent command buffers which render the next frame. In this case, a presentation image must not be overwritten until the presentation operation completes, but other pipeline stages can execute without waiting. A mask of VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT prevents subsequent color attachment writes from executing until the semaphore signals. Some implementations may be able to execute transfer operations and/or prerasterization work before the semaphore is signaled.
If an image layout transition needs to be performed on a presentable image before it is used in a framebuffer, that can be performed as the first operation submitted to the queue after acquiring the image, and should not prevent other work from overlapping with the presentation operation. For example, a `VkImageMemoryBarrier` could use:

- `srcStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `srcAccessMask = 0`
- `dstStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `dstAccessMask = VK_ACCESS_COLOR_ATTACHMENT_READ_BIT | VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.
- `oldLayout = VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`
- `newLayout = VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

Alternatively, `oldLayout` can be `VK_IMAGE_LAYOUT_UNDEFINED`, if the image’s contents need not be preserved.

This barrier accomplishes a dependency chain between previous presentation operations and subsequent color attachment output operations, with the layout transition performed in between, and does not introduce a dependency between previous work and any pre-rasterization shader stages. More precisely, the semaphore signals after the presentation operation completes, the semaphore wait stalls the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` stage, and there is a dependency from that same stage to itself with the layout transition performed in between.

### 7.4.3. Semaphore State Requirements For Wait Operations

Before waiting on a semaphore, the application must ensure the semaphore is in a valid state for a wait operation. Specifically, when a semaphore wait operation is submitted to a queue:

- A binary semaphore must be signaled, or have an associated semaphore signal operation that is pending execution.
- Any semaphore signal operations on which the pending binary semaphore signal operation depends must also be completed or pending execution.
- There must be no other queue waiting on the same binary semaphore when the operation executes.

### 7.4.4. Host Operations on Semaphores

In addition to semaphore signal operations and semaphore wait operations submitted to device queues, timeline semaphores support the following host operations:

- Query the current counter value of the semaphore using the `vkGetSemaphoreCounterValue` command.
- Wait for a set of semaphores to reach particular counter values using the `vkWaitSemaphores`
• Signal the semaphore with a particular counter value from the host using the `vkSignalSemaphore` command.

To query the current counter value of a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` from the host, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkGetSemaphoreCounterValue(
    VkDevice device,
    VkSemaphore semaphore,
    uint64_t* pValue);
```
or the equivalent command

```c
// Provided by VK_KHR_timeline_semaphore
VkResult vkGetSemaphoreCounterValueKHR(
    VkDevice device,
    VkSemaphore semaphore,
    uint64_t* pValue);
```

• `device` is the logical device that owns the semaphore.

• `semaphore` is the handle of the semaphore to query.

• `pValue` is a pointer to a 64-bit integer value in which the current counter value of the semaphore is returned.

**Note**

If a queue submission command is pending execution, then the value returned by this command may immediately be out of date.

**Valid Usage**

- VUID-vkGetSemaphoreCounterValue-semaphore-03255 `semaphore` must have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`

**Valid Usage (Implicit)**

- VUID-vkGetSemaphoreCounterValue-device-parameter `device` must be a valid `VkDevice` handle

- VUID-vkGetSemaphoreCounterValue-semaphore-parameter `semaphore` must be a valid `VkSemaphore` handle

- VUID-vkGetSemaphoreCounterValue-pValue-parameter
pValue must be a valid pointer to a uint64_t value

- VUID-vkGetSemaphoreCounterValue-semaphore-parent
  semaphore must have been created, allocated, or retrieved from device

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERRORDEVICE_LOST

To wait for a set of semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE to reach particular counter values on the host, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkWaitSemaphores(
    VkDevice device,
    const VkSemaphoreWaitInfo* pWaitInfo,
    uint64_t timeout);
```

or the equivalent command

```c
// Provided by VK_KHR_timeline_semaphore
VkResult vkWaitSemaphoresKHR(
    VkDevice device,
    const VkSemaphoreWaitInfo* pWaitInfo,
    uint64_t timeout);
```

- device is the logical device that owns the semaphores.
- pWaitInfo is a pointer to a VkSemaphoreWaitInfo structure containing information about the wait condition.
- timeout is the timeout period in units of nanoseconds. timeout is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which may be substantially longer than one nanosecond, and may be longer than the requested period.

If the condition is satisfied when vkWaitSemaphores is called, then vkWaitSemaphores returns immediately. If the condition is not satisfied at the time vkWaitSemaphores is called, then vkWaitSemaphores will block and wait until the condition is satisfied or the timeout has expired, whichever is sooner.

If timeout is zero, then vkWaitSemaphores does not wait, but simply returns information about the
current state of the semaphores. \texttt{VK\_TIMEOUT} will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the \texttt{timeout} has expired, \texttt{vkWaitSemaphores} returns \texttt{VK\_SUCCESS}. Otherwise, \texttt{vkWaitSemaphores} returns \texttt{VK\_TIMEOUT} after the \texttt{timeout} has expired.

If device loss occurs (see \texttt{Lost Device}) before the timeout has expired, \texttt{vkWaitSemaphores} \textbf{must} return in finite time with either \texttt{VK\_SUCCESS} or \texttt{VK\_ERROR\_DEVICE\_LOST}.

### Valid Usage (Implicit)
- VUID-vkWaitSemaphores-device-parameter
  \texttt{device} \textbf{must} be a valid \texttt{VkDevice} handle
- VUID-vkWaitSemaphores-pWaitInfo-parameter
  \texttt{pWaitInfo} \textbf{must} be a valid pointer to a valid \texttt{VkSemaphoreWaitInfo} structure

### Return Codes

#### Success
- \texttt{VK\_SUCCESS}
- \texttt{VK\_TIMEOUT}

#### Failure
- \texttt{VK\_ERROR\_OUT\_OF\_HOST\_MEMORY}
- \texttt{VK\_ERROR\_OUT\_OF\_DEVICE\_MEMORY}
- \texttt{VK\_ERROR\_DEVICE\_LOST}

The \texttt{VkSemaphoreWaitInfo} structure is defined as:

```c
// Provided by VK\_VERSION\_1\_2
typedef struct VkSemaphoreWaitInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphoreWaitFlags flags;
    uint32_t semaphoreCount;
    const VkSemaphore* pSemaphores;
    const uint64_t* pValues;
} VkSemaphoreWaitInfo;
```

or the equivalent

```c
// Provided by VK\_KHR\_timeline\_semaphore
typedef VkSemaphoreWaitInfo VkSemaphoreWaitInfoKHR;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is a bitmask of `VkSemaphoreWaitFlagBits` specifying additional parameters for the semaphore wait operation.

• **semaphoreCount** is the number of semaphores to wait on.

• **pSemaphores** is a pointer to an array of `semaphoreCount` semaphore handles to wait on.

• **pValues** is a pointer to an array of `semaphoreCount` timeline semaphore values.

### Valid Usage

- VUID-VkSemaphoreWaitInfo-pSemaphores-03256
  All of the elements of **pSemaphores** must reference a semaphore that was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`

### Valid Usage (Implicit)

- VUID-VkSemaphoreWaitInfo-sType-sType
  **sType** must be `VK_STRUCTURE_TYPE_SEMAPHORE_WAIT_INFO`

- VUID-VkSemaphoreWaitInfo-pNext-pNext
  **pNext** must be NULL

- VUID-VkSemaphoreWaitInfo-flags-parameter
  **flags** must be a valid combination of `VkSemaphoreWaitFlagBits` values

- VUID-VkSemaphoreWaitInfo-pSemaphores-parameter
  **pSemaphores** must be a valid pointer to an array of `semaphoreCount` valid `VkSemaphore` handles

- VUID-VkSemaphoreWaitInfo-pValues-parameter
  **pValues** must be a valid pointer to an array of `semaphoreCount uint64_t` values

- VUID-VkSemaphoreWaitInfo-semaphoreCount-arraylength
  `semaphoreCount` must be greater than 0

Bits which can be set in **VkSemaphoreWaitInfo::flags**, specifying additional parameters of a semaphore wait operation, are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreWaitFlagBits {
    VK_SEMAPHORE_WAIT_ANY_BIT = 0x00000001,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_WAIT_ANY_BIT_KHR = VK_SEMAPHORE_WAIT_ANY_BIT,
} VkSemaphoreWaitFlagBits;
```

or the equivalent
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitFlagBits VkSemaphoreWaitFlagBitsKHR;

- **VK_SEMAPHORE_WAIT_ANY_BIT** specifies that the semaphore wait condition is that at least one of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` has reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`. If **VK_SEMAPHORE_WAIT_ANY_BIT** is not set, the semaphore wait condition is that all of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` have reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`.

// Provided by VK_VERSION_1_2
typedef VkFlags VkSemaphoreWaitFlags;

or the equivalent

// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitFlags VkSemaphoreWaitFlagsKHR;

VkSemaphoreWaitFlags is a bitmask type for setting a mask of zero or more `VkSemaphoreWaitFlagBits`.

To signal a semaphore created with a `VkSemaphoreType` of **VK_SEMAPHORE_TYPE_TIMELINE** with a particular counter value, on the host, call:

// Provided by VK_VERSION_1_2
VkResult vkSignalSemaphore(
    VkDevice device,
    const VkSemaphoreSignalInfo* pSignalInfo);

or the equivalent command

// Provided by VK_KHR_timeline_semaphore
VkResult vkSignalSemaphoreKHR(
    VkDevice device,
    const VkSemaphoreSignalInfo* pSignalInfo);

- `device` is the logical device that owns the semaphore.
- `pSignalInfo` is a pointer to a `VkSemaphoreSignalInfo` structure containing information about the signal operation.

When `vkSignalSemaphore` is executed on the host, it defines and immediately executes a *semaphore signal operation* which sets the timeline semaphore to the given value.

The first synchronization scope is defined by the host execution model, but includes execution of `vkSignalSemaphore` on the host and anything that happened-before it.
The second synchronization scope is empty.

### Valid Usage (Implicit)

- VUID-vkSignalSemaphore-device-parameter
  `- device` must be a valid `VkDevice` handle
- VUID-vkSignalSemaphore-pSignalInfo-parameter
  `- pSignalInfo` must be a valid pointer to a valid `VkSemaphoreSignalInfo` structure

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkSemaphoreSignalInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreSignalInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    uint64_t value;
} VkSemaphoreSignalInfo;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreSignalInfo VkSemaphoreSignalInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the handle of the semaphore to signal.
- `value` is the value to signal.

### Valid Usage

- VUID-VkSemaphoreSignalInfo-semaphore-03257
  `- semaphore` must have been created with `VkSemaphoreType` of

```c
semaphore
```
7.4.5. Importing Semaphore Payloads

Applications can import a semaphore payload into an existing semaphore using an external semaphore handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the implementation must restore the semaphore to its prior permanent state after submitting the next semaphore wait operation. Performing a subsequent temporary import on a semaphore before performing a semaphore wait has no effect on this requirement; the next wait submitted on the semaphore must still restore its last permanent state. A permanent payload import behaves as if the target semaphore was destroyed, and a new semaphore was created with the same handle but the imported payload. Because importing a semaphore payload temporarily or permanently detaches the existing payload from a semaphore, similar usage restrictions to those applied to vkDestroySemaphore are applied to any command that imports a semaphore payload. Which of these import types is used is referred to as the import operation's permanence. Each handle type supports either one or both types of permanence.

The implementation must perform the import operation by either referencing or copying the payload referred to by the specified external semaphore handle, depending on the handle's type. The import method used is referred to as the handle type's transference. When using handle types with reference transference, importing a payload to a semaphore adds the semaphore to the set of all semaphores sharing that payload. This set includes the semaphore from which the payload was exported. Semaphore signaling and waiting operations performed on any semaphore in the set must behave as if the set were a single semaphore. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Semaphore signaling and waiting operations performed on the target of
copy imports **must** not affect any other semaphore or payload.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a semaphore payload to a handle with copy transference has the same side effects on the source semaphore's payload as executing a semaphore wait operation. If the semaphore was using a temporarily imported payload, the semaphore's prior permanent payload will be restored.

**Note**
The permanence and transference of handle types can be found in:

- Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR`
- Handle Types Supported by `VkImportSemaphoreFdInfoKHR`
- Handle Types Supported by `VkImportSemaphoreZirconHandleInfoFUCHSIA`

**External synchronization** allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for semaphores sharing a payload across processes, satisfying the external synchronization requirements of `VkSemaphore` parameters as if all semaphores in the set were the same object is sometimes infeasible. Satisfying the **wait operation state requirements** would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific semaphore handle, not to its payload. For distinct semaphore objects which share a payload, if the semaphores are passed to separate queue submission commands concurrently, behavior will be as if the commands were called in an arbitrary sequential order. If the **wait operation state requirements** are violated for the shared payload by a queue submission command, or if a signal operation is queued for a shared payload that is already signaled or has a pending signal operation, effects **must** be limited to one or more of the following:

- Returning `VK_ERROR_INITIALIZATION_FAILED` from the command which resulted in the violation.
- Losing the logical device on which the violation occurred immediately or at a future time, resulting in a `VK_ERROR_DEVICE_LOST` error from subsequent commands, including the one causing the violation.
- Continuing execution of the violating command or operation as if the semaphore wait completed successfully after an implementation-dependent timeout. In this case, the state of the payload becomes undefined, and future operations on semaphores sharing the payload will be subject to these same rules. The semaphore **must** be destroyed or have its payload replaced by an import operation to again have a well-defined state.

**Note**
These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared semaphore for more than synchronizing access to the shared memory. For example, a process should not use a shared semaphore as part of an execution dependency chain that, when complete, leads to objects being destroyed, if it does not trust other processes sharing the semaphore payload.
When a semaphore is using an imported payload, its `VkExportSemaphoreCreateInfo::handleTypes` value is specified when creating the semaphore from which the payload was exported, rather than specified when creating the semaphore. Additionally, `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` restricts which handle types can be exported from such a semaphore based on the specific handle type used to import the current payload. Passing a semaphore to `vkAcquireNextImageKHR` is equivalent to temporarily importing a semaphore payload to that semaphore.

**Note**
Because the exportable handle types of an imported semaphore correspond to its current imported payload, and `vkAcquireNextImageKHR` behaves the same as a temporary import operation for which the source semaphore is opaque to the application, applications have no way of determining whether any external handle types can be exported from a semaphore in this state. Therefore, applications must not attempt to export external handles from semaphores using a temporarily imported payload from `vkAcquireNextImageKHR`.

When importing a semaphore payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations must perform sufficient validation of external handles to ensure that the operation results in a valid semaphore which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its import parameters, and excepting those side effects allowed for violations of the valid semaphore state for wait operations rules. If the external handle provided does not meet these requirements, the implementation must fail the semaphore payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

In addition, when importing a semaphore payload that is not compatible with the payload type corresponding to the `VkSemaphoreType` the semaphore was created with, the implementation may fail the semaphore payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

**Note**
As the introduction of the external semaphore handle type `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` is preserved for backwards compatibility. However, applications should prefer importing such handle types into semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`.

To import a semaphore payload from a Windows handle, call:

```c
// Provided by VK_KHR_external_semaphore_win32
VkResult vkImportSemaphoreWin32HandleKHR(
    VkDevice device,
    const VkImportSemaphoreWin32HandleInfoKHR* pImportSemaphoreWin32HandleInfo);
```

- `device` is the logical device that created the semaphore.
• **pImportSemaphoreWin32HandleInfo** is a pointer to a **VkImportSemaphoreWin32HandleInfoKHR** structure specifying the semaphore and import parameters.

Importing a semaphore payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application **must** release ownership using the **CloseHandle** system call when the handle is no longer needed.

Applications **can** import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

### Valid Usage (Implicit)

- **VUID-vkImportSemaphoreWin32HandleKHR-device-parameter**
  - **device** must be a valid **VkDevice** handle

- **VUID-vkImportSemaphoreWin32HandleKHR-pImportSemaphoreWin32HandleInfo-parameter**
  - **pImportSemaphoreWin32HandleInfo** must be a valid pointer to a valid **VkImportSemaphoreWin32HandleInfoKHR** structure

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_INVALID_EXTERNAL_HANDLE**

The **VkImportSemaphoreWin32HandleInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkImportSemaphoreWin32HandleInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkSemaphore              semaphore;
    VkSemaphoreImportFlags   flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    HANDLE                    handle;
    LPCWSTR                   name;
} VkImportSemaphoreWin32HandleInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **semaphore** is the semaphore into which the payload will be imported.
• **flags** is a bitmask of `VkSemaphoreImportFlagBits` specifying additional parameters for the semaphore payload import operation.

• **handleType** is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of `handle`.

• **handle** is **NULL** or the external handle to import.

• **name** is **NULL** or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.

The handle types supported by `handleType` are:

**Table 8. Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR`**

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT</code></td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td><code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT</code></td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td><code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT</code></td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
</tbody>
</table>

**Valid Usage**

• VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01140

  `handleType` must be a value included in the **Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR`** table

• VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01466

  If `handleType` is not `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`, `name` must be **NULL**

• VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01467

  If `handle` is **NULL**, `name` must name a valid synchronization primitive of the type specified by `handleType`

• VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01468

  If `name` is **NULL**, `handle` must be a valid handle of the type specified by `handleType`

• VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01469

  If `handle` is not **NULL**, `name` must be **NULL**

• VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01542

  If `handle` is not **NULL**, it must obey any requirements listed for `handleType` in **external semaphore handle types compatibility**

• VUID-VkImportSemaphoreWin32HandleInfoKHR-name-01543

  If `name` is not **NULL**, it must obey any requirements listed for `handleType` in **external semaphore handle types compatibility**

• VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-03261

  If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, the VkSemaphoreCreateInfo::flags field **must** match that of the semaphore from which handle or name was exported

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-03262
  If handleType is VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT or VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, the VkSemaphoreTypeCreateInfo::semaphoreType field **must** match that of the semaphore from which handle or name was exported.

- VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-03322
  If flags contains VK_SEMAPHORE_IMPORT_TEMPORARY_BIT, the VkSemaphoreTypeCreateInfo::semaphoreType field of the semaphore from which handle or name was exported **must not** be VK_SEMAPHORE_TYPE_TIMELINE.

---

**Valid Usage (Implicit)**

- VUID-VkImportSemaphoreWin32HandleInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR

- VUID-VkImportSemaphoreWin32HandleInfoKHR-pNext-pNext
  pNext **must** be NULL

- VUID-VkImportSemaphoreWin32HandleInfoKHR-semaphore-parameter
  semaphore **must** be a valid VkSemaphore handle

- VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-parameter
  flags **must** be a valid combination of VkSemaphoreImportFlagBits values

---

**Host Synchronization**

- Host access to semaphore **must** be externally synchronized.

To import a semaphore payload from a POSIX file descriptor, call:

```c
// Provided by VK_KHR_external_semaphore_fd
VkResult vkImportSemaphoreFdKHR(
    VkDevice device,          // Provided by VK_KHR_external_semaphore_fd
    const VkImportSemaphoreFdInfoKHR* pImportSemaphoreFdInfo);
```

- **device** is the logical device that created the semaphore.

- **pImportSemaphoreFdInfo** is a pointer to a VkImportSemaphoreFdInfoKHR structure specifying the semaphore and import parameters.

Importing a semaphore payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import.
Applications can import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

### Valid Usage

- **VUID-vkImportSemaphoreFdKHR-semaphore-01142**
  - semaphore must not be associated with any queue command that has not yet completed execution on that queue

### Valid Usage (Implicit)

- **VUID-vkImportSemaphoreFdKHR-device-parameter**
  - device must be a valid VkDevice handle
- **VUID-vkImportSemaphoreFdKHR-pImportSemaphoreFdInfo-parameter**
  - pImportSemaphoreFdInfo must be a valid pointer to a valid VkImportSemaphoreFdInfoKHR structure

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkImportSemaphoreFdInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkImportSemaphoreFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    int fd;
} VkImportSemaphoreFdInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **semaphore** is the semaphore into which the payload will be imported.
- **flags** is a bitmask ofVkSemaphoreImportFlagBits specifying additional parameters for the semaphore payload import operation.
• **handleType** is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of `fd`.

• `fd` is the external handle to import.

The handle types supported by `handleType` are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT</code></td>
<td>Reference</td>
<td>Temporary, Permanent</td>
</tr>
<tr>
<td><code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT</code></td>
<td>Copy</td>
<td>Temporary</td>
</tr>
</tbody>
</table>

### Valid Usage

- **VUID-VkImportSemaphoreFdInfoKHR-handleType-01143**
  
  `handleType` **must** be a value included in the **Handle Types Supported by VkImportSemaphoreFdInfoKHR** table.

- **VUID-VkImportSemaphoreFdInfoKHR-fd-01544**
  
  `fd` **must** obey any requirements listed for `handleType` in external semaphore handle types compatibility.

- **VUID-VkImportSemaphoreFdInfoKHR-handleType-03263**
  
  If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreCreateInfo::flags` field **must** match that of the semaphore from which `fd` was exported.

- **VUID-VkImportSemaphoreFdInfoKHR-handleType-07307**
  
  If `handleType` refers to a handle type with copy payload transference semantics, `flags` **must** contain `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`.

- **VUID-VkImportSemaphoreFdInfoKHR-handleType-03264**
  
  If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field **must** match that of the semaphore from which `fd` was exported.

- **VUID-VkImportSemaphoreFdInfoKHR-flags-03323**
  
  If `flags` contains `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field of the semaphore from which `fd` was exported **must** not be `VK_SEMAPHORE_TYPE_TIMELINE`.

If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT`, the special value `-1` for `fd` is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the `VkSemaphore` will have a temporarily imported payload as if a valid file descriptor had been provided.

---

**Note**

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid
sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a -1 file descriptor when exporting a VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT from a VkSemaphore which is signaled.

### Valid Usage (Implicit)

- **VUID-VkImportSemaphoreFdInfoKHR-sType-sType**
  - `sType` must be VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_FD_INFO_KHR
- **VUID-VkImportSemaphoreFdInfoKHR-pNext-pNext**
  - `pNext` must be NULL
- **VUID-VkImportSemaphoreFdInfoKHR-semaphore-parameter**
  - `semaphore` must be a valid VkSemaphore handle
- **VUID-VkImportSemaphoreFdInfoKHR-flags-parameter**
  - `flags` must be a valid combination of VkSemaphoreImportFlagBits values
- **VUID-VkImportSemaphoreFdInfoKHR-handleType-parameter**
  - `handleType` must be a valid VkExternalSemaphoreHandleTypeFlagBits value

### Host Synchronization

- Host access to `semaphore` must be externally synchronized

To import a semaphore payload from a Zircon event handle, call:

```c
// Provided by VK_FUCHSIA_external_semaphore
VkResult vkImportSemaphoreZirconHandleFUCHSIA( VkDevice device,
 const VkImportSemaphoreZirconHandleInfoFUCHSIA* pImportSemaphoreZirconHandleInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreZirconHandleInfo` is a pointer to a `VkImportSemaphoreZirconHandleInfoFUCHSIA` structure specifying the semaphore and import parameters.

Importing a semaphore payload from a Zircon event handle transfers ownership of the handle from the application to the Vulkan implementation. The application must not perform any operations on the handle after a successful import.

Applications can import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.
Valid Usage

- VUID-vkImportSemaphoreZirconHandleFUCHSIA-semaphore-04764
  semaphore must not be associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkImportSemaphoreZirconHandleFUCHSIA-device-parameter
device must be a valid VkDevice handle

- VUID-vkImportSemaphoreZirconHandleFUCHSIA-pImportSemaphoreZirconHandleInfo-parameter
  pImportSemaphoreZirconHandleInfo must be a valid pointer to a valid VkImportSemaphoreZirconHandleInfoFUCHSIA structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkImportSemaphoreZirconHandleInfoFUCHSIA structure is defined as:

```
// Provided by VK_FUCHSIA_external_semaphore
typedef struct VkImportSemaphoreZirconHandleInfoFUCHSIA {
    VkStructureType               sType;
    const void*                   pNext;
    VkSemaphore                   semaphore;
    VkSemaphoreImportFlags        flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    zx_handle_t                   zirconHandle;
} VkImportSemaphoreZirconHandleInfoFUCHSIA;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `semaphore` is the semaphore into which the payload will be imported.
- `flags` is a bitmask of VkSemaphoreImportFlagBits specifying additional parameters for the semaphore payload import operation.
- `handleType` is a VkExternalSemaphoreHandleTypeFlagBits value specifying the type of
• `zirconHandle` is the external handle to import.

The handle types supported by `handleType` are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA</td>
<td>Reference</td>
<td>Temporary, Permanent</td>
</tr>
</tbody>
</table>

## Valid Usage

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-handleType-04765**
  - `handleType` must be a value included in the Table of Handle Types Supported by VkImportSemaphoreZirconHandleInfoFUCHSIA

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-zirconHandle-04766**
  - `zirconHandle` must obey any requirements listed for `handleType` in external semaphore handle types compatibility

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-zirconHandle-04767**
  - `zirconHandle` must have ZX_RIGHTS_BASIC and ZX_RIGHTS_SIGNAL rights

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-semaphoreType-04768**
  - The `VkSemaphoreTypeCreateInfo::semaphoreType` field must not be VK_SEMAPHORE_TYPE_TIMELINE

## Valid Usage (Implicit)

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-sType-sType**
  - `sType` must be VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_ZIRCON_HANDLE_INFO_FUCHSIA

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-pNext-pNext**
  - `pNext` must be NULL

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-semaphore-parameter**
  - `semaphore` must be a valid VkSemaphore handle

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-flags-parameter**
  - `flags` must be a valid combination of VkSemaphoreImportFlagBits values

- **VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-handleType-parameter**
  - `handleType` must be a valid VkExternalSemaphoreHandleTypeFlagBits value

## Host Synchronization

- Host access to `semaphore` must be externally synchronized
Bits which can be set in

- VkImportSemaphoreWin32HandleInfoKHR::flags
- VkImportSemaphoreFdInfoKHR::flags
- VkImportSemaphoreZirconHandleInfoFUCHSIA::flags

specifying additional parameters of a semaphore import operation are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkSemaphoreImportFlagBits {
    VK_SEMAPHORE_IMPORT_TEMPORARY_BIT = 0x00000001,
} VkSemaphoreImportFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_external_semaphore
typedef VkSemaphoreImportFlagBits VkSemaphoreImportFlagBitsKHR;
```

These bits have the following meanings:

- **VK_SEMAPHORE_IMPORT_TEMPORARY_BIT** specifies that the semaphore payload will be imported only temporarily, as described in Importing Semaphore Payloads, regardless of the permanence of handleType.

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkSemaphoreImportFlags;
```

or the equivalent

```c
// Provided by VK_KHR_external_semaphore
typedef VkSemaphoreImportFlags VkSemaphoreImportFlagsKHR;
```

**VkSemaphoreImportFlags** is a bitmask type for setting a mask of zero or more **VkSemaphoreImportFlagBits**.

### 7.5. Events

Events are a synchronization primitive that can be used to insert a fine-grained dependency between commands submitted to the same queue, or between the host and a queue. Events must not be used to insert a dependency between commands submitted to different queues. Events have two states - signaled and unsignaled. An application can signal or unsignal an event either on the host or on the device. A device can be made to wait for an event to become signaled before
executing further operations. No command exists to wait for an event to become signaled on the host, but the current state of an event can be queried.

Events are represented by \texttt{VkEvent} handles:

\begin{verbatim}
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkEvent)
\end{verbatim}

To create an event, call:

\begin{verbatim}
// Provided by VK_VERSION_1_0
VkResult vkCreateEvent(
    VkDevice device,
    const VkEventCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkEvent* pEvent);
\end{verbatim}

- \texttt{device} is the logical device that creates the event.
- \texttt{pCreateInfo} is a pointer to a \texttt{VkEventCreateInfo} structure containing information about how the event is to be created.
- \texttt{pAllocator} controls host memory allocation as described in the Memory Allocation chapter.
- \texttt{pEvent} is a pointer to a handle in which the resulting event object is returned.

When created, the event object is in the unsignaled state.

\section*{Valid Usage}

- VUID-vkCreateEvent-events-04468
  If the \texttt{VK_KHR_portability_subset} extension is enabled, and \texttt{VkPhysicalDevicePortabilitySubsetFeaturesKHR::events} is \texttt{VK_FALSE}, then the implementation does not support events, and \texttt{vkCreateEvent} must not be used.

\section*{Valid Usage (Implicit)}

- VUID-vkCreateEvent-device-parameter
  \texttt{device} must be a valid \texttt{VkDevice} handle

- VUID-vkCreateEvent-pCreateInfo-parameter
  \texttt{pCreateInfo} must be a valid pointer to a valid \texttt{VkEventCreateInfo} structure

- VUID-vkCreateEvent-pAllocator-parameter
  If \texttt{pAllocator} is not \texttt{NULL}, \texttt{pAllocator} must be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure

- VUID-vkCreateEvent-pEvent-parameter
  \texttt{pEvent} must be a valid pointer to a \texttt{VkEvent} handle
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkEventCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkEventCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkEventCreateFlags flags;
} VkEventCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkEventCreateFlagBits` defining additional creation parameters.

Valid Usage

- **VUID-VkEventCreateInfo-pNext-06790**
  If the `pNext` chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its `exportObjectType` member must be `VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT`.

Valid Usage (Implicit)

- **VUID-VkEventCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_EVENT_CREATE_INFO`

- **VUID-VkEventCreateInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkExportMetalObjectCreateInfoEXT` or `VkImportMetalSharedEventInfoEXT`.

- **VUID-VkEventCreateInfo-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkExportMetalObjectCreateInfoEXT`.

- **VUID-VkEventCreateInfo-flags-parameter**
  `flags` must be a valid combination of `VkEventCreateFlagBits` values.
typedef enum VkEventCreateFlagBits {
    VK_EVENT_CREATE_DEVICE_ONLY_BIT = 0x00000001,
    VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR = VK_EVENT_CREATE_DEVICE_ONLY_BIT,
} VkEventCreateFlagBits;

- `VK_EVENT_CREATE_DEVICE_ONLY_BIT` specifies that host event commands will not be used with this event.

typedef VkFlags VkEventCreateFlags;

VkEventCreateFlags is a bitmask type for setting a mask of VkEventCreateFlagBits.

To destroy an event, call:

void vkDestroyEvent(
    VkDevice device,
    VkEvent event,
    const VkAllocationCallbacks* pAllocator);

- `device` is the logical device that destroys the event.
- `event` is the handle of the event to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyEvent-event-01145
  All submitted commands that refer to `event` must have completed execution

- VUID-vkDestroyEvent-event-01146
  If `VkAllocationCallbacks` were provided when `event` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyEvent-event-01147
  If no `VkAllocationCallbacks` were provided when `event` was created, `pAllocator` must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyEvent-device-parameter
  `device` must be a valid VkDevice handle
• **VUID-vkDestroyEvent-event-parameter**
  If `event` is not `VK_NULL_HANDLE`, `event` **must** be a valid `VkEvent` handle

• **VUID-vkDestroyEvent-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

• **VUID-vkDestroyEvent-event-parent**
  If `event` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

---

**Host Synchronization**

• Host access to `event` **must** be externally synchronized

To query the state of an event from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetEventStatus(
    VkDevice device,
    VkEvent event);
```

• `device` is the logical device that owns the event.
• `event` is the handle of the event to query.

Upon success, `vkGetEventStatus` returns the state of the event object with the following return codes:

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EVENT_SET</td>
<td>The event specified by <code>event</code> is signaled.</td>
</tr>
<tr>
<td>VK_EVENT_RESET</td>
<td>The event specified by <code>event</code> is unsignaled.</td>
</tr>
</tbody>
</table>

If a `vkCmdSetEvent` or `vkCmdResetEvent` command is in a command buffer that is in the **pending state**, then the value returned by this command **may** immediately be out of date.

The state of an event **can** be updated by the host. The state of the event is immediately changed, and subsequent calls to `vkGetEventStatus` will return the new state. If an event is already in the requested state, then updating it to the same state has no effect.

---

**Valid Usage**

• **VUID-vkGetEventStatus-event-03940**
  `event` **must** not have been created with `VK_EVENT_CREATE_DEVICE_ONLY_BIT`
Valid Usage (Implicit)

- VUID-vkGetEventStatus-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetEventStatus-event-parameter
  event must be a valid VkEvent handle

- VUID-vkGetEventStatus-event-parent
  event must have been created, allocated, or retrieved from device

Return Codes

Success
- VK_EVENT_SET
- VK_EVENT_RESET

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

To set the state of an event to signaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkSetEvent(
    VkDevice device,
    VkEvent event);
```

- device is the logical device that owns the event.
- event is the event to set.

When vkSetEvent is executed on the host, it defines an event signal operation which sets the event to the signaled state.

If event is already in the signaled state when vkSetEvent is executed, then vkSetEvent has no effect, and no event signal operation occurs.

Note
If a command buffer is waiting for an event to be signaled from the host, the application must signal the event before submitting the command buffer, as described in the queue forward progress section.
Valid Usage

- VUID-vkSetEvent-event-03941
  *event must* not have been created with `VK_EVENT_CREATE_DEVICE_ONLY_BIT`

Valid Usage (Implicit)

- VUID-vkSetEvent-device-parameter
  *device must* be a valid `VkDevice` handle

- VUID-vkSetEvent-event-parameter
  *event must* be a valid `VkEvent` handle

- VUID-vkSetEvent-event-parent
  *event must* have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to *event must* be externally synchronized

Return Codes

Success
- `VK_SUCCESS`

Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To set the state of an event to unsignaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetEvent(
    VkDevice device,
    VkEvent event);
```

- *device* is the logical device that owns the event.
- *event* is the event to reset.

When `vkResetEvent` is executed on the host, it defines an *event unsignal operation* which resets the event to the unsignaled state.

If *event* is already in the unsignaled state when `vkResetEvent` is executed, then `vkResetEvent` has no effect, and no event unsignal operation occurs.
Valid Usage

- **VUID-vkResetEvent-event-03821**
  There must be an execution dependency between `vkResetEvent` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter.

- **VUID-vkResetEvent-event-03822**
  There must be an execution dependency between `vkResetEvent` and the execution of any `vkCmdWaitEvents2` that includes `event` in its `pEvents` parameter.

- **VUID-vkResetEvent-event-03823**
  `event` must not have been created with `VK_EVENT_CREATE_DEVICE_ONLY_BIT`.

Valid Usage (Implicit)

- **VUID-vkResetEvent-device-parameter**
  `device` must be a valid `VkDevice` handle.

- **VUID-vkResetEvent-event-parameter**
  `event` must be a valid `VkEvent` handle.

- **VUID-vkResetEvent-event-parent**
  `event` must have been created, allocated, or retrieved from `device`.

Host Synchronization

- Host access to `event` must be externally synchronized.

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The state of an event can also be updated on the device by commands inserted in command buffers.

To signal an event from a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetEvent2(
    VkCommandBuffer commandBuffer,
    VkEvent event,
)
```
or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdSetEvent2KHR(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    const VkDependencyInfo* pDependencyInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be signaled.
- `pDependencyInfo` is a pointer to a `VkDependencyInfo` structure defining the first scopes of this operation.

When `vkCmdSetEvent2` is submitted to a queue, it defines the first half of memory dependencies defined by `pDependencyInfo`, as well as an event signal operation which sets the event to the signaled state. A memory dependency is defined between the event signal operation and commands that occur earlier in submission order.

The first **synchronization scope** and **access scope** are defined by the union of all the memory dependencies defined by `pDependencyInfo`, and are applied to all operations that occur earlier in submission order. **Queue family ownership transfers** and **image layout transitions** defined by `pDependencyInfo` are also included in the first scopes.

The second **synchronization scope** includes only the event signal operation, and any **queue family ownership transfers** and **image layout transitions** defined by `pDependencyInfo`.

The second **access scope** includes only **queue family ownership transfers** and **image layout transitions**.

Future `vkCmdWaitEvents2` commands rely on all values of each element in `pDependencyInfo` matching exactly with those used to signal the corresponding event. `vkCmdWaitEvents` must not be used to wait on the result of a signal operation defined by `vkCmdSetEvent2`.

**Note**

The extra information provided by `vkCmdSetEvent2` compared to `vkCmdSetEvent` allows implementations to more efficiently schedule the operations required to satisfy the requested dependencies. With `vkCmdSetEvent`, the full dependency information is not known until `vkCmdWaitEvents` is recorded, forcing implementations to insert the required operations at that point and not before.

If `event` is already in the signaled state when `vkCmdSetEvent2` is executed on the device, then `vkCmdSetEvent2` has no effect, no event signal operation occurs, and no dependency is generated.
Valid Usage

- VUID-vkCmdSetEvent2-synchronization2-03824
  The `synchronization2` feature must be enabled

- VUID-vkCmdSetEvent2-dependencyFlags-03825
  The `dependencyFlags` member of `pDependencyInfo` must be 0

- VUID-vkCmdSetEvent2-commandBuffer-03826
  The current device mask of `commandBuffer` must include exactly one physical device

- VUID-vkCmdSetEvent2-srcStageMask-03827
  The `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` must only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- VUID-vkCmdSetEvent2-dstStageMask-03828
  The `dstStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` must only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

Valid Usage (Implicit)

- VUID-vkCmdSetEvent2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetEvent2-event-parameter
  `event` must be a valid `VkEvent` handle

- VUID-vkCmdSetEvent2-pDependencyInfo-parameter
  `pDependencyInfo` must be a valid pointer to a valid `VkDependencyInfo` structure

- VUID-vkCmdSetEvent2-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetEvent2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdSetEvent2-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdSetEvent2-commonparent
  Both of `commandBuffer`, and `event` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>

The `VkDependencyInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDependencyInfo {
    VkStructureType sType;
    const void* pNext;
    VkDependencyFlags dependencyFlags;
    uint32_t memoryBarrierCount;
    const VkMemoryBarrier2* pMemoryBarriers;
   .uint32_t bufferMemoryBarrierCount;
    const VkBufferMemoryBarrier2* pBufferMemoryBarriers;
    .uint32_t imageMemoryBarrierCount;
    const VkImageMemoryBarrier2* pImageMemoryBarriers;
} VkDependencyInfo;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkDependencyInfo VkDependencyInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier2` structures defining memory dependencies between any memory accesses.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier2` structures defining memory dependencies between buffer ranges.
• `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.

• `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier2` structures defining memory dependencies between image subresources.

This structure defines a set of memory dependencies, as well as queue family transfer operations and image layout transitions.

Each member of `pMemoryBarriers`, `pBufferMemoryBarriers`, and `pImageMemoryBarriers` defines a separate memory dependency.

### Valid Usage (Implicit)

- **VUID-VkDependencyInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_DEPENDENCY_INFO`

- **VUID-VkDependencyInfo-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkDependencyInfo-dependencyFlags-parameter**
  
  `dependencyFlags` must be a valid combination of `VkDependencyFlagBits` values

- **VUID-VkDependencyInfo-pMemoryBarriers-parameter**
  
  If `memoryBarrierCount` is not 0, `pMemoryBarriers` must be a valid pointer to an array of `VkMemoryBarrier2` structures

- **VUID-VkDependencyInfo-pBufferMemoryBarriers-parameter**
  
  If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` must be a valid pointer to an array of `VkBufferMemoryBarrier2` structures

- **VUID-VkDependencyInfo-pImageMemoryBarriers-parameter**
  
  If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` must be a valid pointer to an array of `VkImageMemoryBarrier2` structures

To set the state of an event to signaled from a device, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetEvent(
    VkCommandBuffer commandBuffer,  // Provided by VK_VERSION_1_0
    VkEvent event,                  // Provided by VK_VERSION_1_0
    VkPipelineStageFlags stageMask  // Provided by VK_VERSION_1_0
);
```

• `commandBuffer` is the command buffer into which the command is recorded.

• `event` is the event that will be signaled.

• `stageMask` specifies the source stage mask used to determine the first synchronization scope.

`vkCmdSetEvent` behaves identically to `vkCmdSetEvent2`, except that it does not define an access scope, and must only be used with `vkCmdWaitEvents`, not `vkCmdWaitEvents2`. 
Valid Usage

• VUID-vkCmdSetEvent-stageMask-04090
  If the geometryShader feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

• VUID-vkCmdSetEvent-stageMask-04091
  If the tessellationShader feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or
  VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

• VUID-vkCmdSetEvent-stageMask-04092
  If the conditionalRendering feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

• VUID-vkCmdSetEvent-stageMask-04093
  If the fragmentDensityMap feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

• VUID-vkCmdSetEvent-stageMask-04094
  If the transformFeedback feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

• VUID-vkCmdSetEvent-stageMask-04095
  If the meshShader feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT

• VUID-vkCmdSetEvent-stageMask-04096
  If the taskShader feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

• VUID-vkCmdSetEvent-stageMask-07318
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, stageMask must not contain
  VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-vkCmdSetEvent-stageMask-03937
  If the synchronization2 feature is not enabled, stageMask must not be 0

• VUID-vkCmdSetEvent-stageMask-07949
  If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled, stageMask must not contain
  VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

• VUID-vkCmdSetEvent-stageMask-06457
  Any pipeline stage included in stageMask must be supported by the capabilities of the queue family specified by the queueFamilyIndex member of the VkCommandPoolCreateInfo structure that was used to create the VkCommandPool that commandBuffer was allocated from, as specified in the table of supported pipeline stages

• VUID-vkCmdSetEvent-stageMask-01149
  stageMask must not include VK_PIPELINE_STAGE_HOST_BIT

• VUID-vkCmdSetEvent-commandBuffer-01152
  commandBuffer's current device mask must include exactly one physical device
Valid Usage (Implicit)

- VUID-vkCmdSetEvent-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetEvent-event-parameter
  
  `event` must be a valid `VkEvent` handle

- VUID-vkCmdSetEvent-stageMask-parameter
  
  `stageMask` must be a valid combination of `VkPipelineStageFlagBits` values

- VUID-vkCmdSetEvent-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetEvent-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdSetEvent-renderpass
  
  This command must only be called outside of a render pass instance

- VUID-vkCmdSetEvent-commonparent
  
  Both of `commandBuffer`, and `event` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Both</td>
<td>Graphics Compute</td>
<td>Synchronization</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Encode</td>
<td></td>
</tr>
</tbody>
</table>

To unsignal the event from a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdResetEvent2(
    VkCommandBuffer commandBuffer,
    VkEvent event,
)
```
or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdResetEvent2KHR(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags2 stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be unsignaled.
- `stageMask` is a `VkPipelineStageFlags2` mask of pipeline stages used to determine the first synchronization scope.

When `vkCmdResetEvent2` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and defines an event unsignal operation which resets the event to the unsignaled state.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations by `stageMask` or stages that are logically earlier than `stageMask`.

The second synchronization scope includes only the event unsignal operation.

If `event` is already in the unsignaled state when `vkCmdResetEvent2` is executed on the device, then this command has no effect, no event unsignal operation occurs, and no execution dependency is generated.

### Valid Usage

- **VUID-vkCmdResetEvent2-stageMask-03929**
  If the `geometryShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- **VUID-vkCmdResetEvent2-stageMask-03930**
  If the `tessellationShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-vkCmdResetEvent2-stageMask-03931**
  If the `conditionalRendering` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-vkCmdResetEvent2-stageMask-03932**
  If the `fragmentDensityMap` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-vkCmdResetEvent2-stageMask-03933**
If the `transformFeedback` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-vkCmdResetEvent2-stageMask-03934
  If the `meshShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`

- VUID-vkCmdResetEvent2-stageMask-03935
  If the `taskShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`

- VUID-vkCmdResetEvent2-stageMask-07316
  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdResetEvent2-stageMask-04957
  If the `subpassShading` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`

- VUID-vkCmdResetEvent2-stageMask-04995
  If the `invocationMask` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`

- VUID-vkCmdResetEvent2-stageMask-07946
  If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdResetEvent2-synchronization2-03829
  The `synchronization2` feature must be enabled

- VUID-vkCmdResetEvent2-stageMask-03830
  `stageMask` must not include `VK_PIPELINE_STAGE_2_HOST_BIT`

- VUID-vkCmdResetEvent2-event-03831
  There must be an execution dependency between `vkCmdResetEvent2` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter

- VUID-vkCmdResetEvent2-event-03832
  There must be an execution dependency between `vkCmdResetEvent2` and the execution of any `vkCmdWaitEvents2` that includes `event` in its `pEvents` parameter

- VUID-vkCmdResetEvent2-commandBuffer-03833
  `commandBuffer`'s current device mask must include exactly one physical device

---

**Valid Usage (Implicit)**

- VUID-vkCmdResetEvent2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdResetEvent2-event-parameter
  `event` must be a valid `VkEvent` handle

- VUID-vkCmdResetEvent2-stageMask-parameter
  `stageMask` must be a valid combination of `VkPipelineStageFlagBits2` values
• VUID-vkCmdResetEvent2-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdResetEvent2-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

• VUID-vkCmdResetEvent2-renderpass
This command must only be called outside of a render pass instance

• VUID-vkCmdResetEvent2-commonparent
Both of commandBuffer, and event must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

To set the state of an event to unsignaled from a device, call:

```c
// Provided by VK_VERSION_1_0
typedef void vkCmdResetEvent(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags stageMask);
```

• commandBuffer is the command buffer into which the command is recorded.

• event is the event that will be unsignaled.

• stageMask is a bitmask of VkPipelineStageFlagBits specifying the source stage mask used to determine when the event is unsignaled.

vkCmdResetEvent behaves identically to vkCmdResetEvent2.
Valid Usage

- VUID-vkCmdResetEvent-stageMask-04090
  If the `geometryShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-vkCmdResetEvent-stageMask-04091
  If the `tessellationShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-vkCmdResetEvent-stageMask-04092
  If the `conditionalRendering` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- VUID-vkCmdResetEvent-stageMask-04093
  If the `fragmentDensityMap` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- VUID-vkCmdResetEvent-stageMask-04094
  If the `transformFeedback` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-vkCmdResetEvent-stageMask-04095
  If the `meshShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- VUID-vkCmdResetEvent-stageMask-04096
  If the `taskShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- VUID-vkCmdResetEvent-stageMask-07318
  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdResetEvent-stageMask-03937
  If the `synchronization2` feature is not enabled, `stageMask` must not be 0

- VUID-vkCmdResetEvent-stageMask-07949
  If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdResetEvent-stageMask-06458
  Any pipeline stage included in `stageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages

- VUID-vkCmdResetEvent-stageMask-01153
  `stageMask` must not include `VK_PIPELINE_STAGE_HOST_BIT`

- VUID-vkCmdResetEvent-event-03834
  There must be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter
There must be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents2` that includes `event` in its `pEvents` parameter.

`commandBuffer`'s current device mask must include exactly one physical device.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `event` must be a valid `VkEvent` handle.
- `stageMask` must be a valid combination of `VkPipelineStageFlagBits` values.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations.
- This command must only be called outside of a render pass instance.
- Both of `commandBuffer` and `event` must have been created, allocated, or retrieved from the same `VkDevice`.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Outside</td>
<td>Both</td>
<td>Graphics, Compute, Decode, Encode</td>
<td>Synchronization</td>
</tr>
</tbody>
</table>
To wait for one or more events to enter the signaled state on a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdWaitEvents2(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    const VkDependencyInfo* pDependencyInfos);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdWaitEvents2KHR(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    const VkDependencyInfo* pDependencyInfos);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `eventCount` is the length of the `pEvents` array.
- `pEvents` is a pointer to an array of `eventCount` events to wait on.
- `pDependencyInfos` is a pointer to an array of `eventCount` `VkDependencyInfo` structures, defining the second synchronization scope.

When `vkCmdWaitEvents2` is submitted to a queue, it inserts memory dependencies according to the elements of `pDependencyInfos` and each corresponding element of `pEvents`. `vkCmdWaitEvents2` must not be used to wait on event signal operations occurring on other queues, or signal operations executed by `vkCmdSetEvent`.

The first synchronization scope and access scope of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred earlier in submission order than the last event signal operation on element `i` of `pEvents`.

Signal operations for an event at index `i` are only included if:

- The event was signaled by a `vkCmdSetEvent2` command that occurred earlier in submission order with a `dependencyInfo` parameter exactly equal to the element of `pDependencyInfos` at index `i`; or

- The event was created without `VK_EVENT_CREATE_DEVICE_ONLY_BIT`, and the first synchronization scope defined by the element of `pDependencyInfos` at index `i` only includes host operations (`VK_PIPELINE_STAGE_2_HOST_BIT`).

The second synchronization scope and access scope of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred later in submission order than `vkCmdWaitEvents2`.
vkCmdWaitEvents2 is used with vkCmdSetEvent2 to define a memory dependency between two sets of action commands, roughly in the same way as pipeline barriers, but split into two commands such that work between the two may execute unhindered.

Applications should be careful to avoid race conditions when using events. There is no direct ordering guarantee between vkCmdSetEvent2 and vkCmdResetEvent2, vkCmdResetEvent, or vkCmdSetEvent. Another execution dependency (e.g. a pipeline barrier or semaphore with VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT) is needed to prevent such a race condition.

### Valid Usage

- **VUID-vkCmdWaitEvents2-synchronization2-03836**
  The synchronization2 feature must be enabled

- **VUID-vkCmdWaitEvents2-pEvents-03837**
  Members of pEvents must not have been signaled by vkCmdSetEvent

- **VUID-vkCmdWaitEvents2-pEvents-03838**
  For any element i of pEvents, if that event is signaled by vkCmdSetEvent2, that command’s dependencyInfo parameter must be exactly equal to the ith element of pDependencyInfos

- **VUID-vkCmdWaitEvents2-pEvents-03839**
  For any element i of pEvents, if that event is signaled by vkCmdSetEvent2, that command’s dependencyInfo parameter must be exactly equal to the ith element of pDependencyInfos

- **VUID-vkCmdWaitEvents2-pEvents-03840**
  For any element i of pEvents, if barriers in the ith element of pDependencyInfos include only host operations, the ith element of pEvents must be signaled before vkCmdWaitEvents2 is executed

- **VUID-vkCmdWaitEvents2-pEvents-03841**
  For any element i of pEvents, if barriers in the ith element of pDependencyInfos do not include host operations, the ith element of pEvents must be signaled by a corresponding vkCmdSetEvent2 that occurred earlier in submission order

- **VUID-vkCmdWaitEvents2-srcStageMask-03842**
  The srcStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfos must either include only pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from, or include only VK_PIPELINE_STAGE_2_HOST_BIT

- **VUID-vkCmdWaitEvents2-dstStageMask-03843**
  The dstStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfos must only include pipeline stages valid for the queue family that was used to create the command pool that commandBuffer
was allocated from

- VUID-vkCmdWaitEvents2-dependencyFlags-03844
  If `vkCmdWaitEvents2` is being called inside a render pass instance, the `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfos` must not include `VK_PIPELINE_STAGE_2_HOST_BIT`

- VUID-vkCmdWaitEvents2-commandBuffer-03846
  `commandBuffer`'s current device mask must include exactly one physical device

### Valid Usage (Implicit)

- VUID-vkCmdWaitEvents2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdWaitEvents2-pEvents-parameter
  `pEvents` must be a valid pointer to an array of `eventCount` valid `VkEvent` handles

- VUID-vkCmdWaitEvents2-pDependencyInfos-parameter
  `pDependencyInfos` must be a valid pointer to an array of `eventCount` valid `VkDependencyInfo` structures

- VUID-vkCmdWaitEvents2-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdWaitEvents2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdWaitEvents2-eventCount-arraylength
  `eventCount` must be greater than 0

- VUID-vkCmdWaitEvents2-commonparent
  Both of `commandBuffer`, and the elements of `pEvents` must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Decode Encode</td>
<td></td>
</tr>
</tbody>
</table>

To wait for one or more events to enter the signaled state on a device, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdWaitEvents(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    VkPipelineStageFlags srcStageMask,
    VkPipelineStageFlags dstStageMask,
    uint32_t memoryBarrierCount,
    const VkMemoryBarrier* pMemoryBarriers,
    uint32_t bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier* pBufferMemoryBarriers,
    uint32_t imageMemoryBarrierCount,
    constVkImageMemoryBarrier* pImageMemoryBarriers);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `eventCount` is the length of the `pEvents` array.
- `pEvents` is a pointer to an array of event object handles to wait on.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the source stage mask.
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the destination stage mask.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier` structures.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier` structures.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier` structures.

`vkCmdWaitEvents` is largely similar to `vkCmdWaitEvents2`, but can only wait on signal operations defined by `vkCmdSetEvent`. As `vkCmdSetEvent` does not define any access scopes, `vkCmdWaitEvents` defines the first access scope for each event signal operation in addition to its own access scopes.

**Note**
Since `vkCmdSetEvent` does not have any dependency information beyond a stage mask, implementations do not have the same opportunity to perform availability and visibility operations or image layout transitions in advance as they do with `vkCmdSetEvent2` and `vkCmdWaitEvents2`.

When `vkCmdWaitEvents` is submitted to a queue, it defines a memory dependency between prior event signal operations on the same queue or the host, and subsequent commands. `vkCmdWaitEvents` must not be used to wait on event signal operations occurring on other queues.

The first synchronization scope only includes event signal operations that operate on members of `pEvents`, and the operations that happened-before the event signal operations. Event signal operations performed by `vkCmdSetEvent` that occur earlier in submission order are included in the first synchronization scope, if the logically latest pipeline stage in their `stageMask` parameter is logically earlier than or equal to the logically latest pipeline stage in `srcStageMask`. Event signal operations performed by `vkSetEvent` are only included in the first synchronization scope if `VK_PIPELINE_STAGE_HOST_BIT` is included in `srcStageMask`.

The second synchronization scope includes all commands that occur later in submission order. The second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by `dstStageMask`.

The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by `srcStageMask`. Within that, the first access scope only includes the first access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the first access scope includes no accesses.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by `dstStageMask`. Within that, the second access scope only includes the second access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the second access scope includes no accesses.

## Valid Usage

- **VUID-vkCmdWaitEvents-srcStageMask-04090**
  If the geometryShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- **VUID-vkCmdWaitEvents-srcStageMask-04091**
  If the tessellationShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-vkCmdWaitEvents-srcStageMask-04092**
  If the conditionalRendering feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-vkCmdWaitEvents-srcStageMask-04093**
  If the fragmentDensityMap feature is not enabled, `srcStageMask` must not contain
• VUID-vkCmdWaitEvents-srcStageMask-04094
  If the transformFeedback feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

• VUID-vkCmdWaitEvents-srcStageMask-04095
  If the meshShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT

• VUID-vkCmdWaitEvents-srcStageMask-04096
  If the taskShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

• VUID-vkCmdWaitEvents-srcStageMask-07318
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, srcStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-vkCmdWaitEvents-srcStageMask-04097
  If the synchronization2 feature is not enabled, srcStageMask must not be 0

• VUID-vkCmdWaitEvents-srcStageMask-04098
  If the rayQuery feature is not enabled and a memory barrier srcAccessMask includes VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR, srcStageMask must not include any of the VK_PIPELINE_STAGE_*_SHADER_BIT stages except VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

• VUID-vkCmdWaitEvents-dstStageMask-04090
  If the geometryShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

• VUID-vkCmdWaitEvents-dstStageMask-04091
  If the tessellationShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

• VUID-vkCmdWaitEvents-dstStageMask-04092
  If the conditionalRendering feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGECONDITIONAL_RENDERING_BIT_EXT

• VUID-vkCmdWaitEvents-dstStageMask-04093
  If the fragmentDensityMap feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

• VUID-vkCmdWaitEvents-dstStageMask-04094
  If the transformFeedback feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

• VUID-vkCmdWaitEvents-dstStageMask-04095
  If the meshShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT

• VUID-vkCmdWaitEvents-dstStageMask-04096
  If the taskShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

• VUID-vkCmdWaitEvents-dstStageMask-04097
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, dstStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
• VUID-vkCmdWaitEvents-dstStageMask-04096
  If the taskShader feature is not enabled, dstStageMask must not contain
  VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

• VUID-vkCmdWaitEvents-dstStageMask-07318
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled,
  dstStageMask must not contain
  VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-vkCmdWaitEvents-dstStageMask-03937
  If the synchronization2 feature is not enabled, dstStageMask must not be 0

• VUID-vkCmdWaitEvents-dstStageMask-07949
  If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled,
  dstStageMask must not contain
  VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

• VUID-vkCmdWaitEvents-srcAccessMask-02815
  The srcAccessMask member of each element of pMemoryBarriers must only include access
  flags that are supported by one or more of the pipeline stages in srcStageMask, as specified
  in the table of supported access types

• VUID-vkCmdWaitEvents-dstAccessMask-02816
  The dstAccessMask member of each element of pMemoryBarriers must only include access
  flags that are supported by one or more of the pipeline stages in dstStageMask, as specified
  in the table of supported access types

• VUID-vkCmdWaitEvents-pBufferMemoryBarriers-02817
  For any element of pBufferMemoryBarriers, if its srcQueueFamilyIndex and
  dstQueueFamilyIndex members are equal, or if its srcQueueFamilyIndex is the queue family
  index that was used to create the command pool that commandBuffer was allocated from,
  then its srcAccessMask member must only contain access flags that are supported by one
  or more of the pipeline stages in srcStageMask, as specified in the table of supported access
  types

• VUID-vkCmdWaitEvents-pBufferMemoryBarriers-02818
  For any element of pBufferMemoryBarriers, if its srcQueueFamilyIndex and
  dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family
  index that was used to create the command pool that commandBuffer was allocated from,
  then its dstAccessMask member must only contain access flags that are supported by one
  or more of the pipeline stages in dstStageMask, as specified in the table of supported access
  types

• VUID-vkCmdWaitEvents-pImageMemoryBarriers-02819
  For any element of pImageMemoryBarriers, if its srcQueueFamilyIndex and
  dstQueueFamilyIndex members are equal, or if its srcQueueFamilyIndex is the queue family
index that was used to create the command pool that \texttt{commandBuffer} was allocated from, then its srcAccessMask member \textbf{must} only contain access flags that are supported by one or more of the pipeline stages in srcStageMask, as specified in the table of supported access types.

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-02820
  For any element of pImageMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family index that was used to create the command pool that \texttt{commandBuffer} was allocated from, then its dstAccessMask member \textbf{must} only contain access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types.

- VUID-vkCmdWaitEvents-srcStageMask-06459
  Any pipeline stage included in srcStageMask \textbf{must} be supported by the capabilities of the queue family specified by the queueFamilyIndex member of the VkCommandPoolCreateInfo structure that was used to create the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from, as specified in the table of supported pipeline stages.

- VUID-vkCmdWaitEvents-dstStageMask-06460
  Any pipeline stage included in dstStageMask \textbf{must} be supported by the capabilities of the queue family specified by the queueFamilyIndex member of the \texttt{VkCommandPoolCreateInfo} structure that was used to create the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from, as specified in the table of supported pipeline stages.

- VUID-vkCmdWaitEvents-srcStageMask-01158
  srcStageMask \textbf{must} be the bitwise OR of the stageMask parameter used in previous calls to vkCmdSetEvent with any of the elements of pEvents and VK_PIPELINE_STAGE_HOST_BIT if any of the elements of pEvents was set using vkSetEvent.

- VUID-vkCmdWaitEvents-srcQueueFamilyIndex-02803
  The srcQueueFamilyIndex and dstQueueFamilyIndex members of any element of pBufferMemoryBarriers or pImageMemoryBarriers \textbf{must} be equal.

- VUID-vkCmdWaitEvents-commandBuffer-01167
  \texttt{commandBuffer}’s current device mask \textbf{must} include exactly one physical device.

- VUID-vkCmdWaitEvents-pEvents-03847
  Elements of pEvents \textbf{must} not have been signaled by vkCmdSetEvent2.

**Valid Usage (Implicit)**

- VUID-vkCmdWaitEvents-commandBuffer-parameter
  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle.

- VUID-vkCmdWaitEvents-pEvents-parameter
  pEvents \textbf{must} be a valid pointer to an array of eventCount valid VkEvent handles.

- VUID-vkCmdWaitEvents-srcStageMask-parameter
**srcStageMask** must be a valid combination of **VkPipelineStageFlagBits** values

- **VUID-vkCmdWaitEvents-dstStageMask-parameter**
  dstStageMask must be a valid combination of **VkPipelineStageFlagBits** values

- **VUID-vkCmdWaitEvents-pMemoryBarriers-parameter**
  If memoryBarrierCount is not 0, pMemoryBarriers must be a valid pointer to an array of memoryBarrierCount valid **VkMemoryBarrier** structures

- **VUID-vkCmdWaitEvents-pBufferMemoryBarriers-parameter**
  If bufferMemoryBarrierCount is not 0, pBufferMemoryBarriers must be a valid pointer to an array of bufferMemoryBarrierCount valid **VkBufferMemoryBarrier** structures

- **VUID-vkCmdWaitEvents-pImageMemoryBarriers-parameter**
  If imageMemoryBarrierCount is not 0, pImageMemoryBarriers must be a valid pointer to an array of imageMemoryBarrierCount valid **VkImageMemoryBarrier** structures

- **VUID-vkCmdWaitEvents-commandBuffer-recording**
  commandBuffer must be in the recording state

- **VUID-vkCmdWaitEvents-commandBuffer-cmdpool**
  The **VkCommandPool** that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

- **VUID-vkCmdWaitEvents-eventCount-arraylength**
  eventCount must be greater than 0

- **VUID-vkCmdWaitEvents-commonparent**
  Both of commandBuffer, and the elements of pEvents must have been created, allocated, or retrieved from the same **VkDevice**

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the **VkCommandPool** that commandBuffer was allocated from must be externally synchronized

7.6. Pipeline Barriers

To record a pipeline barrier, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdPipelineBarrier2(
    VkCommandBuffer commandBuffer,
    const VkDependencyInfo* pDependencyInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdPipelineBarrier2KHR(
    VkCommandBuffer commandBuffer,
    const VkDependencyInfo* pDependencyInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pDependencyInfo` is a pointer to a `VkDependencyInfo` structure defining the scopes of this operation.

When `vkCmdPipelineBarrier2` is submitted to a queue, it defines memory dependencies between commands that were submitted to the same queue before it, and those submitted to the same queue after it.

The first synchronization scope and access scope of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred earlier in submission order.

The second synchronization scope and access scope of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred later in submission order.

If `vkCmdPipelineBarrier2` is recorded within a render pass instance, the synchronization scopes are limited to operations within the same subpass, or must follow the restrictions for Tile Image Access Synchronization if the render pass instance was started with `vkCmdBeginRendering`.

### Valid Usage

- **VUID-vkCmdPipelineBarrier2-None-07889**
  If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, the render pass must have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include `VK_DEPENDENCY_BY_REGION_BIT` if this command does not, does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT` if this command does not, and has synchronization scopes and access scopes that are all supersets of the scopes defined in this command.

- **VUID-vkCmdPipelineBarrier2-bufferMemoryBarrierCount-01178**
  If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, it must not include any buffer memory barriers.
If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, the `image` member of any image memory barrier included in this command **must** be an attachment used in the current subpass both as an input attachment, and as either a color or depth/stencil attachment.

If `vkCmdPipelineBarrier2` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command **must** be equal.

If `vkCmdPipelineBarrier2` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any memory barrier included in this command **must** be equal.

If `vkCmdPipelineBarrier2` is called within a render pass instance started with `vkCmdBeginRendering`, it **must** adhere to the restrictions in Explicit Render Pass Tile Image Access Synchronization.

The `synchronization2` feature **must** be enabled.
The srcStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfo must only include pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from.

The dstStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfo must only include pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from.

Valid Usage (Implicit)

- VUID-vkCmdPipelineBarrier2-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdPipelineBarrier2-pDependencyInfo-parameter
  pDependencyInfo must be a valid pointer to a valid VkDependencyInfo structure

- VUID-vkCmdPipelineBarrier2-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdPipelineBarrier2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, compute, decode, or encode operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Both</td>
<td>Transfer Graphics</td>
<td>Synchronization</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Compute Decode Encode</td>
<td></td>
</tr>
</tbody>
</table>

To record a pipeline barrier, call:
void vkCmdPipelineBarrier(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags srcStageMask,
    VkPipelineStageFlags dstStageMask,
    VkDependencyFlags dependencyFlags,
    uint32_t memoryBarrierCount,
    const VkMemoryBarrier* pMemoryBarriers,
    uint32_t bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier* pBufferMemoryBarriers,
    uint32_t imageMemoryBarrierCount,
    const VkImageMemoryBarrier* pImageMemoryBarriers);

- commandBuffer is the command buffer into which the command is recorded.
- srcStageMask is a bitmask of VkPipelineStageFlagBits specifying the source stages.
- dstStageMask is a bitmask of VkPipelineStageFlagBits specifying the destination stages.
- dependencyFlags is a bitmask of VkDependencyFlagBits specifying how execution and memory dependencies are formed.
- memoryBarrierCount is the length of the pMemoryBarriers array.
- pMemoryBarriers is a pointer to an array of VkMemoryBarrier structures.
- bufferMemoryBarrierCount is the length of the pBufferMemoryBarriers array.
- pBufferMemoryBarriers is a pointer to an array of VkBufferMemoryBarrier structures.
- imageMemoryBarrierCount is the length of the pImageMemoryBarriers array.
- pImageMemoryBarriers is a pointer to an array of VkImageMemoryBarrier structures.

vkCmdPipelineBarrier operates almost identically to vkCmdPipelineBarrier2, except that the scopes and barriers are defined as direct parameters rather than being defined by an VkDependencyInfo.

When vkCmdPipelineBarrier is submitted to a queue, it defines a memory dependency between commands that were submitted to the same queue before it, and those submitted to the same queue after it.

If vkCmdPipelineBarrier was recorded outside a render pass instance, the first synchronization scope includes all commands that occur earlier in submission order. If vkCmdPipelineBarrier was recorded inside a render pass instance, the first synchronization scope includes only commands that occur earlier in submission order within the same subpass. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the source stage mask specified by srcStageMask.

If vkCmdPipelineBarrier was recorded outside a render pass instance, the second synchronization scope includes all commands that occur later in submission order. If vkCmdPipelineBarrier was recorded inside a render pass instance, the second synchronization scope includes only commands that occur later in submission order within the same subpass. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by dstStageMask.
The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by `srcStageMask`. Within that, the first access scope only includes the first access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the first access scope includes no accesses.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by `dstStageMask`. Within that, the second access scope only includes the second access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the second access scope includes no accesses.

If `dependencyFlags` includes `VK_DEPENDENCY_BY_REGION_BIT`, then any dependency between framebuffer-space pipeline stages is framebuffer-local - otherwise it is framebuffer-global.

---

### Valid Usage

- VUID-vkCmdPipelineBarrier-srcStageMask-04090
  If the geometryShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- VUID-vkCmdPipelineBarrier-srcStageMask-04091
  If the tessellationShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- VUID-vkCmdPipelineBarrier-srcStageMask-04092
  If the conditionalRendering feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`.

- VUID-vkCmdPipelineBarrier-srcStageMask-04093
  If the fragmentDensityMap feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.

- VUID-vkCmdPipelineBarrier-srcStageMask-04094
  If the transformFeedback feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

- VUID-vkCmdPipelineBarrier-srcStageMask-04095
  If the meshShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`.

- VUID-vkCmdPipelineBarrier-srcStageMask-04096
  If the taskShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`.

- VUID-vkCmdPipelineBarrier-srcStageMask-07318
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- VUID-vkCmdPipelineBarrier-srcStageMask-03937
  If the synchronization2 feature is not enabled, `srcStageMask` must not be 0.
If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled, `srcStageMask must not contain VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

If the rayQuery feature is not enabled and a memory barrier `srcAccessMask` includes `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask must not include any of the VK_PIPELINE_STAGE_*_SHADER_BIT stages except VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

If the geometryShader feature is not enabled, `dstStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

If the tessellationShader feature is not enabled, `dstStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

If the conditionalRendering feature is not enabled, `dstStageMask must not contain VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`.

If the transformFeedback feature is not enabled, `dstStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

If the meshShader feature is not enabled, `dstStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`.

If the taskShader feature is not enabled, `dstStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`.

If the shadingRateImage or attachmentFragmentShadingRate are enabled, `dstStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the synchronization2 feature is not enabled, `dstStageMask must not be 0`.

If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled, `dstStageMask must not contain VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

If the rayQuery feature is not enabled and a memory barrier `dstAccessMask` includes `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `dstStageMask must not include any of the...`
VK_PIPELINE_STAGE_*_SHADER_BIT stages except VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

- VUID-vkCmdPipelineBarrier-srcAccessMask-02815
  The `srcAccessMask` member of each element of `pMemoryBarriers` must only include access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the table of supported access types.

- VUID-vkCmdPipelineBarrier-dstAccessMask-02816
  The `dstAccessMask` member of each element of `pMemoryBarriers` must only include access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-02817
  For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the table of supported access types.

- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-02818
  For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02819
  For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the table of supported access types.

- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02820
  For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

- VUID-vkCmdPipelineBarrier-None-07889
  If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, the render pass must have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include `VK_DEPENDENCY_BY_REGION_BIT` if this command does not, does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT` if this command does not, and has synchronization scopes.
and access scopes that are all supersets of the scopes defined in this command

- **VUID-vkCmdPipelineBarrier-bufferMemoryBarrierCount-01178**
  If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, it **must** not include any buffer memory barriers

- **VUID-vkCmdPipelineBarrier-image-04073**
  If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, the image member of any image memory barrier included in this command **must** be an attachment used in the current subpass both as an input attachment, and as either a color or depth/stencil attachment

- **VUID-vkCmdPipelineBarrier-oldLayout-01181**
  If `vkCmdPipelineBarrier` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command **must** be equal

- **VUID-vkCmdPipelineBarrier-srcQueueFamilyIndex-01182**
  If `vkCmdPipelineBarrier` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any memory barrier included in this command **must** be equal

- **VUID-vkCmdPipelineBarrier-none-07890**
  If `vkCmdPipelineBarrier` is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, destination stage masks of all memory barriers **must** only include framebuffer-space stages

- **VUID-vkCmdPipelineBarrier-dependencyFlags-07891**
  If `vkCmdPipelineBarrier` is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, then `dependencyFlags` **must** include `VK_DEPENDENCY_BY_REGION_BIT`

- **VUID-vkCmdPipelineBarrier-none-07892**
  If `vkCmdPipelineBarrier` is called within a render pass instance, the source and destination stage masks of any memory barriers **must** only include graphics pipeline stages

- **VUID-vkCmdPipelineBarrier-dependencyFlags-01186**
  If `vkCmdPipelineBarrier` is called outside of a render pass instance, the dependency flags **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- **VUID-vkCmdPipelineBarrier-none-07893**
  If `vkCmdPipelineBarrier` is called inside a render pass instance, and there is more than one view in the current subpass, dependency flags **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- **VUID-vkCmdPipelineBarrier-shaderTileImageColorReadAccess-08718**
  If `vkCmdPipelineBarrier` is called within a render pass instance and none of the `shaderTileImageColorReadAccess`, `shaderTileImageDepthReadAccess`, `shaderTileImageStencilReadAccess` features are enabled, the render pass **must** not have been started with `vkCmdBeginRendering`

- **VUID-vkCmdPipelineBarrier-none-08719**
  If `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, it **must** adhere to the restrictions in Explicit Render Pass Tile Image Access Synchronization
Any pipeline stage included in srcStageMask must be supported by the capabilities of the queue family specified by the queueFamilyIndex member of the VkCommandPoolCreateInfo structure that was used to create the VkCommandPool that commandBuffer was allocated from, as specified in the table of supported pipeline stages.

Any pipeline stage included in dstStageMask must be supported by the capabilities of the queue family specified by the queueFamilyIndex member of the VkCommandPoolCreateInfo structure that was used to create the VkCommandPool that commandBuffer was allocated from, as specified in the table of supported pipeline stages.

Valid Usage (Implicit)

commandBuffer must be a valid VkCommandBuffer handle.
	srcStageMask must be a valid combination of VkPipelineStageFlagBits values.
	dstStageMask must be a valid combination of VkPipelineStageFlagBits values.

dependencyFlags must be a valid combination of VkDependencyFlagBits values.

If memoryBarrierCount is not 0, pMemoryBarriers must be a valid pointer to an array of memoryBarrierCount valid VkMemoryBarrier structures.

If bufferMemoryBarrierCount is not 0, pBufferMemoryBarriers must be a valid pointer to an array of bufferMemoryBarrierCount valid VkBufferMemoryBarrier structures.

If imageMemoryBarrierCount is not 0, pImageMemoryBarriers must be a valid pointer to an array of imageMemoryBarrierCount valid VkImageMemoryBarrier structures.

commandBuffer must be in the recording state.

The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, compute, decode, or encode operations.

Host Synchronization

Host access to commandBuffer must be externally synchronized.

Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

Bits which **can** be set in `vkCmdPipelineBarrier::dependencyFlags`, specifying how execution and memory dependencies are formed, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDependencyFlagBits {
    VK_DEPENDENCY_BY_REGION_BIT = 0x00000001,
    // Provided by VK_VERSION_1_1
    VKDEPENDENCY_DEVICEGROUP_BIT = 0x00000002,
    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_DEVICEGROUP_BIT_KHR = VK_DEPENDENCY_DEVICEGROUP_BIT,
    // Provided by VK_KHR_multiview
    VKDEPENDENCY_FEEDBACK_LOOP_BIT_KHR = VK_DEPENDENCY_FEEDBACK_LOOP_BIT_EXT = 0x00000008,
    // Provided by VK_KHR_device_group
    VK_DEPENDENCY_VIEW_LOCAL_BIT_KHR = VK_DEPENDENCY_VIEW_LOCAL_BIT,
} VkDependencyFlagBits;
```

- **VK_DEPENDENCY_BY_REGION_BIT** specifies that dependencies will be framebuffer-local.
- **VK_DEPENDENCY_DEVICEGROUP_BIT** specifies that dependencies are non-device-local.
- **VK_DEPENDENCY_FEEDBACK_LOOP_BIT_KHR** specifies that the render pass will write to and read from the same image using the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` layout.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDependencyFlags;
```

`VkDependencyFlags` is a bitmask type for setting a mask of zero or more `VkDependencyFlagBits`.

### 7.6.1. Explicit Render Pass Tile Image Access Synchronization

A fragment shader **can** declare `NonCoherentColorAttachmentReadEXT`, `NonCoherentDepthAttachmentReadEXT`, or `NonCoherentStencilAttachmentReadEXT` execution modes to enable non-coherent tile image reads for color, depth, or stencil, respectively. When non-coherent
tile image reads are enabled, writes via color, depth and stencil attachments are not automatically made visible to the corresponding attachment reads via tile images. For the writes to be made visible, an explicit memory dependency must be inserted between when the attachment is written to and when it is read from by later fragments. Such memory dependencies must be inserted every time a fragment will read values at a particular sample (x, y, layer, sample) coordinate, if those values have been written since the most recent pipeline barrier; or since the start of the render pass instance, if there have been no pipeline barriers since the start of the render pass instance. When such memory dependencies are used the values at all sample locations inside the fragment area are made visible, regardless of coverage.

To insert a memory dependency for explicit render pass tile image synchronization, call vkCmdPipelineBarrier2 inside a render pass instance started with vkCmdBeginRendering. The following restrictions apply for such pipeline barriers:

- dependencyFlags must include VK_DEPENDENCY_BY_REGION_BIT.
- The pipeline barriers can only include memory barriers. That is, buffer memory barriers and image memory barriers must not be used.
- The stages in VkMemoryBarrier2::srcStageMask and VkMemoryBarrier2::dstStageMask are restricted to framebuffer space stages.
- The access types in VkMemoryBarrier2::srcAccessMask and VkMemoryBarrier2::dstAccessMask are restricted to the following types: VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT, VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT, VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT, and VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT.

7.7. Memory Barriers

Memory barriers are used to explicitly control access to buffer and image subresource ranges. Memory barriers are used to transfer ownership between queue families, change image layouts, and define availability and visibility operations. They explicitly define the access types and buffer and image subresource ranges that are included in the access scopes of a memory dependency that is created by a synchronization command that includes them.

7.7.1. Global Memory Barriers

Global memory barriers apply to memory accesses involving all memory objects that exist at the time of its execution.

The VkMemoryBarrier2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2 srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2 dstAccessMask;
} VkMemoryBarrier2;
```
or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkMemoryBarrier2 VkMemoryBarrier2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the first synchronization scope.
- `srcAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the first access scope.
- `dstStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the second synchronization scope.
- `dstAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the second access scope.

This structure defines a memory dependency affecting all device memory.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by `srcStageMask` and `srcAccessMask`.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by `dstStageMask` and `dstAccessMask`.

### Valid Usage

- **VUID-VkMemoryBarrier2-srcStageMask-03929**
  If the `geometryShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- **VUID-VkMemoryBarrier2-srcStageMask-03930**
  If the `tessellationShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-VkMemoryBarrier2-srcStageMask-03931**
  If the `conditionalRendering` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-VkMemoryBarrier2-srcStageMask-03932**
  If the `fragmentDensityMap` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-VkMemoryBarrier2-srcStageMask-03933**
  If the `transformFeedback` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-VkMemoryBarrier2-srcStageMask-03934**
If the meshShader feature is not enabled, srcStageMask must not contain

\( \text{VK\_PIPELINE\_STAGE\_2\_MESH\__SHADER\_BIT\_EXT} \)

- VUID-VkMemoryBarrier2-srcStageMask-03935
  If the taskShader feature is not enabled, srcStageMask must not contain

\( \text{VK\_PIPELINE\_STAGE\_2\_TASK\_SHADER\_BIT\_EXT} \)

- VUID-VkMemoryBarrier2-srcStageMask-07316
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, srcStageMask must not contain

\( \text{VK\_PIPELINE\_STAGE\_2\_FRAGMENT\_SHADING:\_RATE\_ATTACHMENT\_BIT\_KHR} \)

- VUID-VkMemoryBarrier2-srcStageMask-04957
  If the subpassShading feature is not enabled, srcStageMask must not contain

\( \text{VK\_PIPELINE\_STAGE\_2\_SUBPASS\_SHADER\_BIT\_HUAWEI} \)

- VUID-VkMemoryBarrier2-srcStageMask-04995
  If the invocationMask feature is not enabled, srcStageMask must not contain

\( \text{VK\_PIPELINE\_STAGE\_2\_INVOCATION\_MASK\_BIT\_HUAWEI} \)

- VUID-VkMemoryBarrier2-srcStageMask-07946
  If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled, srcStageMask must not contain

\( \text{VK\_PIPELINE\_STAGE\_2\_RAY\_TRACING\_SHADER\_BIT\_KHR} \)

- VUID-VkMemoryBarrier2-srcAccessMask-03900
  If srcAccessMask includes VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT, srcStageMask must include

\( \text{VK\_PIPELINE\_STAGE\_2\_DRAW\_INDIRECT\_BIT}, \text{VK\_PIPELINE\_STAGE\_2\_ACCELERATION\_STRUCTURE\_BUILD\_BIT\_KHR}, \text{VK\_PIPELINE\_STAGE\_2\_ALL\_GRAPHICS\_BIT}, \text{or VK\_PIPELINE\_STAGE\_2\_ALL\_COMMANDS\_BIT} \)

- VUID-VkMemoryBarrier2-srcAccessMask-03901
  If srcAccessMask includes VK_ACCESS_2_INDEX_READ_BIT, srcStageMask must include

\( \text{VK\_PIPELINE\_STAGE\_2\_INDEX\_INPUT\_BIT}, \text{VK\_PIPELINE\_STAGE\_2\_VERTEX\_INPUT\_BIT}, \text{VK\_PIPELINE\_STAGE\_2\_ALL\_GRAPHICS\_BIT}, \text{or VK\_PIPELINE\_STAGE\_2\_ALL\_COMMANDS\_BIT} \)

- VUID-VkMemoryBarrier2-srcAccessMask-03902
  If srcAccessMask includes VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT, srcStageMask must include

\( \text{VK\_PIPELINE\_STAGE\_2\_VERTEX\_ATTRIBUTE\_INPUT\_BIT}, \text{VK\_PIPELINE\_STAGE\_2\_VERTEX\_INPUT\_BIT}, \text{VK\_PIPELINE\_STAGE\_2\_ALL\_GRAPHICS\_BIT}, \text{or VK\_PIPELINE\_STAGE\_2\_ALL\_COMMANDS\_BIT} \)

- VUID-VkMemoryBarrier2-srcAccessMask-03903
  If srcAccessMask includes VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT, srcStageMask must include

\( \text{VK\_PIPELINE\_STAGE\_2\_FRAGMENT\_SHADER\_BIT}, \text{VK\_PIPELINE\_STAGE\_2\_SUBPASS\_SHADER\_BIT\_HUAWEI}, \text{VK\_PIPELINE\_STAGE\_2\_ALL\_GRAPHICS\_BIT}, \text{or VK\_PIPELINE\_STAGE\_2\_ALL\_COMMANDS\_BIT} \)

- VUID-VkMemoryBarrier2-srcAccessMask-03904
  If srcAccessMask includes VK_ACCESS_2_UNIFORM_READ_BIT, srcStageMask must include

\( \text{VK\_PIPELINE\_STAGE\_2\_SHADER\_SAMPLED\_READ\_BIT} \text{, VK\_PIPELINE\_STAGE\_2\_ALL\_GRAPHICS\_BIT}, \text{or VK\_PIPELINE\_STAGE\_2\_ALL\_COMMANDS\_BIT} \text{, or one of the VK\_PIPELINE\_STAGE\_*\_SHADER\_BIT stages} \)

- VUID-VkMemoryBarrier2-srcAccessMask-03905
  If srcAccessMask includes VK_ACCESS_2_SHADER_SAMPLED_READ_BIT, srcStageMask must include

\( \text{VK\_PIPELINE\_STAGE\_2\_SHADER\_SAMPLED\_READ\_BIT} \text{, VK\_PIPELINE\_STAGE\_2\_ALL\_GRAPHICS\_BIT}, \text{or VK\_PIPELINE\_STAGE\_2\_ALL\_COMMANDS\_BIT} \text{, or one of the VK\_PIPELINE\_STAGE\_*\_SHADER\_BIT stages} \)
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkMemoryBarrier2-srcAccessMask-03906
  If srcAccessMask includes VK_ACCESS_2_SHADER_STORAGE_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkMemoryBarrier2-srcAccessMask-03907
  If srcAccessMask includes VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkMemoryBarrier2-srcAccessMask-07454
  If srcAccessMask includes VK_ACCESS_2_SHADER_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkMemoryBarrier2-srcAccessMask-03909
  If srcAccessMask includes VK_ACCESS_2_SHADER_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03910
  If srcAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03911
  If srcAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03912
  If srcAccessMask includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03913
  If srcAccessMask includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03914
  If srcAccessMask includes VK_ACCESS_2_TRANSFER_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT,
  VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT,
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, or
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03915
  If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_WRITE_BIT`, `srcStageMask` must include
  `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_CLEAR_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03916
  If `srcAccessMask` includes `VK_ACCESS_2_HOST_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_HOST_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03917
  If `srcAccessMask` includes `VK_ACCESS_2_HOST_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_HOST_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03918
  If `srcAccessMask` includes `VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03919
  If `srcAccessMask` includes `VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03920
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-04747
  If `srcAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03922
  If `srcAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-03923
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkMemoryBarrier2-srcAccessMask-04994

• VUID-VkMemoryBarrier2-srcAccessMask-06256
  If the rayQuery feature is not enabled and srcAccessMask includes
  VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, srcStageMask must not include any of the
  VK_PIPELINE_STAGE_*_SHADER_BIT stages except
  VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

• VUID-VkMemoryBarrier2-srcAccessMask-07272
  If srcAccessMask includes VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT or
  VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

• VUID-VkMemoryBarrier2-srcAccessMask-04858
  If srcAccessMask includes VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR, srcStageMask must include
  VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR

• VUID-VkMemoryBarrier2-srcAccessMask-04859
  If srcAccessMask includes VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR, srcStageMask must include
  VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR

• VUID-VkMemoryBarrier2-srcAccessMask-04860
  If srcAccessMask includes VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR, srcStageMask must include
  VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR

• VUID-VkMemoryBarrier2-srcAccessMask-04861
  If srcAccessMask includes VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR, srcStageMask must include
  VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR
If srcAccessMask includes VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV, srcStageMask must include VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV.

If srcAccessMask includes VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV, srcStageMask must include VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV.

If srcAccessMask includes VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT, srcStageMask must include VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT.

If srcAccessMask includes VK_ACCESS_2_MICROMAP_READ_BIT_EXT, srcStageMask must include VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT or VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR.

If srcAccessMask includes VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT, srcStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of VK_PIPELINE_STAGE_*_SHADER_BIT stages.

If the geometryShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT.

If the tessellationShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT.

If the conditionalRendering feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT.

If the fragmentDensityMap feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT.

If the transformFeedback feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT.

If the meshShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT.

If the taskShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT.

If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, dstStageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR.
If the `subpassShading` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`.

If the `invocationMask` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`.

If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `dstAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `dstAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `dstAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`, `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `dstAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_2_*_SHADER_BIT` stages.

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_2_*_SHADER_BIT` stages.

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_2_*_SHADER_BIT` stages.

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or
one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkMemoryBarrier2-dstAccessMask-07454**
  If `dstAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

• VUID-VkMemoryBarrier2-dstAccessMask-06256
  If the rayQuery feature is not enabled and dstAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, dstStageMask must not include any of the VK_PIPELINE_STAGE_*_SHADER_BIT stages except VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

• VUID-VkMemoryBarrier2-dstAccessMask-07272
  If dstAccessMask includes VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT or VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

• VUID-VkMemoryBarrier2-dstAccessMask-04858
  If dstAccessMask includes VK_ACCESS_2_VIDEO_DECODER_READ_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_VIDEO_DECODER_BIT_KHR

• VUID-VkMemoryBarrier2-dstAccessMask-04859
  If dstAccessMask includes VK_ACCESS_2_VIDEO_DECODER_WRITE_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_VIDEO_DECODER_BIT_KHR

• VUID-VkMemoryBarrier2-dstAccessMask-04860
  If dstAccessMask includes VK_ACCESS_2_VIDEO_ENCODER_READ_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_VIDEO_ENCODER_BIT_KHR

• VUID-VkMemoryBarrier2-dstAccessMask-04861
  If dstAccessMask includes VK_ACCESS_2_VIDEO_ENCODER_WRITE_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_VIDEO_ENCODER_BIT_KHR

• VUID-VkMemoryBarrier2-dstAccessMask-07455
  If dstAccessMask includes VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV, dstStageMask must include VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV

• VUID-VkMemoryBarrier2-dstAccessMask-07456
  If dstAccessMask includes VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV, dstStageMask must include VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV

• VUID-VkMemoryBarrier2-dstAccessMask-07457
  If dstAccessMask includes VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT, dstStageMask must include
VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT

- VUID-VkMemoryBarrier2-dstAccessMask-07458
  If dstAccessMask includes VK_ACCESS_2_MICROMAP_READ_BIT_EXT, dstStageMask must include
  VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT
  or
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR

- VUID-VkMemoryBarrier2-dstAccessMask-08118
  If dstAccessMask includes VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT, dstStageMask must
  include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or
  one of VK_PIPELINE_STAGE_*_SHADER_BIT stages

Valid Usage (Implicit)

- VUID-VkMemoryBarrier2-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_BARRIER_2

- VUID-VkMemoryBarrier2-srcStageMask-parameter
  srcStageMask must be a valid combination of VkPipelineStageFlagBits2 values

- VUID-VkMemoryBarrier2-srcAccessMask-parameter
  srcAccessMask must be a valid combination of VkAccessFlagBits2 values

- VUID-VkMemoryBarrier2-dstStageMask-parameter
  dstStageMask must be a valid combination of VkPipelineStageFlagBits2 values

- VUID-VkMemoryBarrier2-dstAccessMask-parameter
  dstAccessMask must be a valid combination of VkAccessFlagBits2 values

The VkMemoryBarrier structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryBarrier {
  VkStructureType sType;
  const void* pNext;
  VkAccessFlags srcAccessMask;
  VkAccessFlags dstAccessMask;
} VkMemoryBarrier;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcAccessMask** is a bitmask of VkAccessFlagBits specifying a source access mask.
- **dstAccessMask** is a bitmask of VkAccessFlagBits specifying a destination access mask.

The first access scope is limited to access types in the source access mask specified by srcAccessMask.

The second access scope is limited to access types in the destination access mask specified by dstAccessMask.
Valid Usage (Implicit)

- VUID-VkMemoryBarrier-sType-sType
  
  *sType* must be `VK_STRUCTURE_TYPE_MEMORY_BARRIER`

- VUID-VkMemoryBarrier-pNext-pNext
  
  *pNext* must be `NULL`

- VUID-VkMemoryBarrier-srcAccessMask-parameter
  
  *srcAccessMask* must be a valid combination of `VkAccessFlagBits` values

- VUID-VkMemoryBarrier-dstAccessMask-parameter
  
  *dstAccessMask* must be a valid combination of `VkAccessFlagBits` values

### 7.7.2. Buffer Memory Barriers

Buffer memory barriers only apply to memory accesses involving a specific buffer range. That is, a memory dependency formed from a buffer memory barrier is **scoped** to access via the specified buffer range. Buffer memory barriers **can** also be used to define a queue family ownership transfer for the specified buffer range.

The `VkBufferMemoryBarrier2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBufferMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2 srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2 dstAccessMask;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkBufferMemoryBarrier2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkBufferMemoryBarrier2 VkBufferMemoryBarrier2KHR;
```

- *sType* is a `VkStructureType` value identifying this structure.  
- *pNext* is `NULL` or a pointer to a structure extending this structure.  
- *srcStageMask* is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the first synchronization scope.
• **srcAccessMask** is a `VkAccessFlags2` mask of access flags to be included in the first access scope.

• **dstStageMask** is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the second synchronization scope.

• **dstAccessMask** is a `VkAccessFlags2` mask of access flags to be included in the second access scope.

• **srcQueueFamilyIndex** is the source queue family for a queue family ownership transfer.

• **dstQueueFamilyIndex** is the destination queue family for a queue family ownership transfer.

• **buffer** is a handle to the buffer whose backing memory is affected by the barrier.

• **offset** is an offset in bytes into the backing memory for **buffer**; this is relative to the base offset as bound to the buffer (see `vkBindBufferMemory`).

• **size** is a size in bytes of the affected area of backing memory for **buffer**, or **VK_WHOLE_SIZE** to use the range from **offset** to the end of the buffer.

This structure defines a memory dependency limited to a range of a buffer, and can define a queue family transfer operation for that range.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by **srcStageMask** and **srcAccessMask**.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by **dstStageMask** and **dstAccessMask**.

Both access scopes are limited to only memory accesses to **buffer** in the range defined by **offset** and **size**.

If **buffer** was created with **VK_SHARING_MODE_EXCLUSIVE**, and **srcQueueFamilyIndex** is not equal to **dstQueueFamilyIndex**, this memory barrier defines a queue family transfer operation. When executed on a queue in the family identified by **srcQueueFamilyIndex**, this barrier defines a queue family release operation for the specified buffer range, and the second synchronization and access scopes do not synchronize operations on that queue. When executed on a queue in the family identified by **dstQueueFamilyIndex**, this barrier defines a queue family acquire operation for the specified buffer range, and the first synchronization and access scopes do not synchronize operations on that queue.

A queue family transfer operation is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer. A queue family release operation is defined when **dstQueueFamilyIndex** is one of those values, and a queue family acquire operation is defined when **srcQueueFamilyIndex** is one of those values.

---

**Valid Usage**

• VUID-VkBufferMemoryBarrier2-srcStageMask-03929
  If the geometryShader feature is not enabled, **srcStageMask** must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

• VUID-VkBufferMemoryBarrier2-srcStageMask-03930
  If the tessellationShader feature is not enabled, **srcStageMask** must not contain
VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT or
VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-VkBufferMemoryBarrier2-srcStageMask-03931
  If the conditionalRendering feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT

- VUID-VkBufferMemoryBarrier2-srcStageMask-03932
  If the fragmentDensityMap feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT

- VUID-VkBufferMemoryBarrier2-srcStageMask-03933
  If the transformFeedback feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT

- VUID-VkBufferMemoryBarrier2-srcStageMask-03934
  If the meshShader feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT

- VUID-VkBufferMemoryBarrier2-srcStageMask-03935
  If the taskShader feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT

- VUID-VkBufferMemoryBarrier2-srcStageMask-07316
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled,
  srcStageMask must not contain
  VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkBufferMemoryBarrier2-srcStageMask-04957
  If the subpassShading feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI

- VUID-VkBufferMemoryBarrier2-srcStageMask-04995
  If the invocationMask feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI

- VUID-VkBufferMemoryBarrier2-srcStageMask-07946
  If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled,
  srcStageMask must not contain
  VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03900
  If srcAccessMask includes VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03901
  If srcAccessMask includes VK_ACCESS_2_INDEX_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03902
  If srcAccessMask includes VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- **VUID-VkBufferMemoryBarrier2-srcAccessMask-03903**
  If `srcAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `srcStageMask` must include 
  `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`, `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkBufferMemoryBarrier2-srcAccessMask-03904**
  If `srcAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `srcStageMask` must include 
  `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkBufferMemoryBarrier2-srcAccessMask-03905**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `srcStageMask` must include 
  `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkBufferMemoryBarrier2-srcAccessMask-03906**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `srcStageMask` must include 
  `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkBufferMemoryBarrier2-srcAccessMask-03907**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `srcStageMask` must include 
  `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkBufferMemoryBarrier2-srcAccessMask-03908**
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `srcStageMask` must include 
  `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkBufferMemoryBarrier2-srcAccessMask-03909**
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `srcStageMask` must include 
  `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03913
  If srcAccessMask includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03914
  If srcAccessMask includes VK_ACCESS_2_TRANSFER_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03915
  If srcAccessMask includes VK_ACCESS_2_TRANSFER_WRITE_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_CLEAR_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03916
  If srcAccessMask includes VK_ACCESS_2_HOST_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_HOST_BIT.

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03917
  If srcAccessMask includes VK_ACCESS_2_HOST_WRITE_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_HOST_BIT.

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03918
  If srcAccessMask includes VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT, srcStageMask must include VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03919
  If srcAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT, srcStageMask must include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03920
  If srcAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT, srcStageMask must include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

• VUID-VkBufferMemoryBarrier2-srcAccessMask-04747
  If srcAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT, srcStageMask must include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.
If `srcAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`.

If `srcAccessMask` includes `VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`.

If the rayQuery feature is not enabled and `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` must not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

If the rayQuery feature is not enabled and `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` must not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.
If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-04859
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-04860
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-04861
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-07455
  If `srcAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-07456
  If `srcAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-07457
  If `srcAccessMask` includes `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-07458
  If `srcAccessMask` includes `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-08118
  If `srcAccessMask` includes `VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkBufferMemoryBarrier2-dstStageMask-03929
  If the geometryShader feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- VUID-VkBufferMemoryBarrier2-dstStageMask-03930
  If the tessellationShader feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-VkBufferMemoryBarrier2-dstStageMask-03931
  If the conditionalRendering feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- VUID-VkBufferMemoryBarrier2-dstStageMask-03932
  If the fragmentDensityMap feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- VUID-VkBufferMemoryBarrier2-dstStageMask-03933
If the `transformFeedback` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`.

- **VUID-VkBufferMemoryBarrier2-dstStageMask-03934**

  If the `meshShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`.

- **VUID-VkBufferMemoryBarrier2-dstStageMask-03935**

  If the `taskShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`.

- **VUID-VkBufferMemoryBarrier2-dstStageMask-07316**

  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-VkBufferMemoryBarrier2-dstStageMask-04957**

  If the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-VkBufferMemoryBarrier2-dstStageMask-03900**

  If `dstAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

- **VUID-VkBufferMemoryBarrier2-dstAccessMask-03901**

  If `dstAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

- **VUID-VkBufferMemoryBarrier2-dstAccessMask-03902**

  If `dstAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

- **VUID-VkBufferMemoryBarrier2-dstAccessMask-03903**

• VUID-VkBufferMemoryBarrier2-dstAccessMask-04861
  If dstAccessMask includes VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR

• VUID-VkBufferMemoryBarrier2-dstAccessMask-07455
  If dstAccessMask includes VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV, dstStageMask must include VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV

• VUID-VkBufferMemoryBarrier2-dstAccessMask-07456
  If dstAccessMask includes VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV, dstStageMask must include VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV

• VUID-VkBufferMemoryBarrier2-dstAccessMask-07457
  If dstAccessMask includes VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT, dstStageMask must include VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT

• VUID-VkBufferMemoryBarrier2-dstAccessMask-07458
  If dstAccessMask includes VK_ACCESS_2_MICROMAP_READ_BIT_EXT, dstStageMask must include VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT
  or VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR

• VUID-VkBufferMemoryBarrier2-offset-01187
  offset must be less than the size of buffer

• VUID-VkBufferMemoryBarrier2-size-01188
  If size is not equal to VK_WHOLE_SIZE, size must be greater than 0

• VUID-VkBufferMemoryBarrier2-size-01189
  If size is not equal to VK_WHOLE_SIZE, size must be less than or equal to than the size of buffer minus offset

• VUID-VkBufferMemoryBarrier2-buffer-01931
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-VkBufferMemoryBarrier2-buffer-09095
  If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

• VUID-VkBufferMemoryBarrier2-buffer-09096
  If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

• VUID-VkBufferMemoryBarrier2-srcQueueFamilyIndex-04087
  If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one of srcQueueFamilyIndex or dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL or VK_QUEUE_FAMILY_FOREIGN_EXT
• VUID-VkBufferMemoryBarrier2-None-09097
  If the VK_KHR_external_memory extension is not enabled, and the value of
  VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal
  to Version 1.1, srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

• VUID-VkBufferMemoryBarrier2-None-09098
  If the VK_KHR_external_memory extension is not enabled, and the value of
  VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal
  to Version 1.1, dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

• VUID-VkBufferMemoryBarrier2-srcQueueFamilyIndex-09099
  If the VK_EXT_queue_family_foreign extension is not enabled srcQueueFamilyIndex must
  not be VK_QUEUE_FAMILY_FOREIGN_EXT

• VUID-VkBufferMemoryBarrier2-dstQueueFamilyIndex-09100
  If the VK_EXT_queue_family_foreign extension is not enabled dstQueueFamilyIndex must
  not be VK_QUEUE_FAMILY_FOREIGN_EXT

• VUID-VkBufferMemoryBarrier2-srcStageMask-03851
  If either srcStageMask or dstStageMask includes VK_PIPELINE_STAGE_2_HOST_BIT,
  srcQueueFamilyIndex and dstQueueFamilyIndex must be equal

• VUID-VkBufferMemoryBarrier2-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER_2

• VUID-VkBufferMemoryBarrier2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of
  VkExternalMemoryAcquireUnmodifiedEXT

• VUID-VkBufferMemoryBarrier2-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkBufferMemoryBarrier2-srcStageMask-parameter
  srcStageMask must be a valid combination of VkPipelineStageFlagBits2 values

• VUID-VkBufferMemoryBarrier2-srcAccessMask-parameter
  srcAccessMask must be a valid combination of VkAccessFlagBits2 values

• VUID-VkBufferMemoryBarrier2-dstStageMask-parameter
  dstStageMask must be a valid combination of VkPipelineStageFlagBits2 values

• VUID-VkBufferMemoryBarrier2-dstAccessMask-parameter
  dstAccessMask must be a valid combination of VkAccessFlagBits2 values

• VUID-VkBufferMemoryBarrier2-buffer-parameter
  buffer must be a valid VkBuffer handle

The VkBufferMemoryBarrier structure is defined as:

```c
// Provided by VK_VERSION_1_0
```
typedef struct VkBufferMemoryBarrier {
    VkStructureType sType;
    const void* pNext;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkBufferMemoryBarrier;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a source access mask.
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a destination access mask.
- `srcQueueFamilyIndex` is the source queue family for a queue family ownership transfer.
- `dstQueueFamilyIndex` is the destination queue family for a queue family ownership transfer.
- `buffer` is a handle to the buffer whose backing memory is affected by the barrier.
- `offset` is an offset in bytes into the backing memory for `buffer`; this is relative to the base offset as bound to the buffer (see `vkBindBufferMemory`).
- `size` is a size in bytes of the affected area of backing memory for `buffer`, or `VK_WHOLE_SIZE` to use the range from `offset` to the end of the buffer.

The first access scope is limited to access to memory through the specified buffer range, via access types in the source access mask specified by `srcAccessMask`. If `srcAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT`, a memory domain operation is performed where available memory in the host domain is also made available to the device domain.

The second access scope is limited to access to memory through the specified buffer range, via access types in the destination access mask specified by `dstAccessMask`. If `dstAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT` or `VK_ACCESS_HOST_READ_BIT`, a memory domain operation is performed where available memory in the device domain is also made available to the host domain.

**Note**

When `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` is used, available memory in host domain is automatically made visible to host domain, and any host write is automatically made available to host domain.

If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, and `srcQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a queue family release operation for the specified buffer range, and the second access scope includes no access, as if `dstAccessMask` was 0.

If `dstQueueFamilyIndex` is not equal to `srcQueueFamilyIndex`, and `dstQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a queue family acquire operation for the
specified buffer range, and the first access scope includes no access, as if srcAccessMask was 0.

**Valid Usage**

- **VUID-VkBufferMemoryBarrier-offset-01187**
  
  Offset must be less than the size of buffer.

- **VUID-VkBufferMemoryBarrier-size-01188**
  
  If size is not equal to VK_WHOLE_SIZE, size must be greater than 0.

- **VUID-VkBufferMemoryBarrier-size-01189**
  
  If size is not equal to VK_WHOLE_SIZE, size must be less than or equal to the size of buffer minus offset.

- **VUID-VkBufferMemoryBarrier-buffer-01931**
  
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- **VUID-VkBufferMemoryBarrier-buffer-09095**
  
  If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family.

- **VUID-VkBufferMemoryBarrier-buffer-09096**
  
  If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family.

- **VUID-VkBufferMemoryBarrier-srcQueueFamilyIndex-04087**
  
  If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one of srcQueueFamilyIndex or dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL.

- **VUID-VkBufferMemoryBarrier-None-09097**
  
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL.

- **VUID-VkBufferMemoryBarrier-None-09098**
  
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL.

- **VUID-VkBufferMemoryBarrier-srcQueueFamilyIndex-09099**
  
  If the VK_EXT_queue_family_foreign extension is not enabled, srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_FOREIGN_EXT.

- **VUID-VkBufferMemoryBarrier-dstQueueFamilyIndex-09100**
  
  If the VK_EXT_queue_family_foreign extension is not enabled, dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_FOREIGN_EXT.

- **VUID-VkBufferMemoryBarrier-None-09049**
  
  If the synchronization2 feature is not enabled, and buffer was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, at least one of srcQueueFamilyIndex and...
dstQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED

• VUID-VkBufferMemoryBarrier-None-09050
  If the synchronization2 feature is not enabled, and buffer was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, srcQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED or VK_QUEUE_FAMILY_EXTERNAL

• VUID-VkBufferMemoryBarrier-None-09051
  If the synchronization2 feature is not enabled, and buffer was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED or VK_QUEUE_FAMILY_EXTERNAL

Valid Usage (Implicit)

• VUID-VkBufferMemoryBarrier-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER

• VUID-VkBufferMemoryBarrier-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkExternalMemoryAcquireUnmodifiedEXT

• VUID-VkBufferMemoryBarrier-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkBufferMemoryBarrier-buffer-parameter
  buffer must be a valid VkBuffer handle

VK_WHOLE_SIZE is a special value indicating that the entire remaining length of a buffer following a given offset should be used. It can be specified for VkBufferMemoryBarrier::size and other structures.

#define VK_WHOLE_SIZE (~0ULL)

7.7.3. Image Memory Barriers

Image memory barriers only apply to memory accesses involving a specific image subresource range. That is, a memory dependency formed from an image memory barrier is scoped to access via the specified image subresource range. Image memory barriers can also be used to define image layout transitions or a queue family ownership transfer for the specified image subresource range.

The VkImageMemoryBarrier2 structure is defined as:

// Provided by VK_VERSION_1_3
typedef struct VkImageMemoryBarrier2 {
  VkStructureType sType;
  const void* pNext;
  VkPipelineStageFlags2 srcStageMask;
}
VkAccessFlags2 srcAccessMask;
VkPipelineStageFlags2 dstStageMask;
VkAccessFlags2 dstAccessMask;
VkImageLayout oldLayout;
VkImageLayout newLayout;
uint32_t srcQueueFamilyIndex;
uint32_t dstQueueFamilyIndex;
VkImage image;
VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier2;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkImageMemoryBarrier2 VkImageMemoryBarrier2KHR;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **srcStageMask** is a VkPipelineStageFlags2 mask of pipeline stages to be included in the **first** synchronization scope.
• **srcAccessMask** is a VkAccessFlags2 mask of access flags to be included in the **first** access scope.
• **dstStageMask** is a VkPipelineStageFlags2 mask of pipeline stages to be included in the **second** synchronization scope.
• **dstAccessMask** is a VkAccessFlags2 mask of access flags to be included in the **second** access scope.
• **oldLayout** is the old layout in an **image layout transition**.
• **newLayout** is the new layout in an **image layout transition**.
• **srcQueueFamilyIndex** is the source queue family for a **queue family ownership transfer**.
• **dstQueueFamilyIndex** is the destination queue family for a **queue family ownership transfer**.
• **image** is a handle to the image affected by this barrier.
• **subresourceRange** describes the **image subresource range** within **image** that is affected by this barrier.

This structure defines a memory dependency limited to an image subresource range, and can define a queue family transfer operation and image layout transition for that subresource range.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by **srcStageMask** and **srcAccessMask**.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by **dstStageMask** and **dstAccessMask**.

Both access scopes are limited to only memory accesses to **image** in the subresource range defined by **subresourceRange**.
If `image` was created with `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, this memory barrier defines a queue family transfer operation. When executed on a queue in the family identified by `srcQueueFamilyIndex`, this barrier defines a queue family release operation for the specified image subresource range, and the second synchronization and access scopes do not synchronize operations on that queue. When executed on a queue in the family identified by `dstQueueFamilyIndex`, this barrier defines a queue family acquire operation for the specified image subresource range, and the first synchronization and access scopes do not synchronize operations on that queue.

A queue family transfer operation is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer. A queue family release operation is defined when `dstQueueFamilyIndex` is one of those values, and a queue family acquire operation is defined when `srcQueueFamilyIndex` is one of those values.

If `oldLayout` is not equal to `newLayout`, then the memory barrier defines an image layout transition for the specified image subresource range. If this memory barrier defines a queue family transfer operation, the layout transition is only executed once between the queues.

**Note**

When the old and new layout are equal, the layout values are ignored - data is preserved no matter what values are specified, or what layout the image is currently in.

If `image` has a multi-planar format and the image is disjoint, then including `VK_IMAGE_ASPECT_COLOR_BIT` in the aspectMask member of `subresourceRange` is equivalent to including `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, and (for three-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`.

### Valid Usage

- **VUID-VkImageMemoryBarrier2-srcStageMask-03929**
  If the geometryShader feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- **VUID-VkImageMemoryBarrier2-srcStageMask-03930**
  If the tessellationShader feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-VkImageMemoryBarrier2-srcStageMask-03931**
  If the conditionalRendering feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-VkImageMemoryBarrier2-srcStageMask-03932**
  If the fragmentDensityMap feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-VkImageMemoryBarrier2-srcStageMask-03933**
  If the transformFeedback feature is not enabled, `srcStageMask` **must** not contain
VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT

- VUID-VkImageMemoryBarrier2-srcStageMask-03934
  If the meshShader feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT

- VUID-VkImageMemoryBarrier2-srcStageMask-03935
  If the taskShader feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT

- VUID-VkImageMemoryBarrier2-srcStageMask-07316
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkImageMemoryBarrier2-srcStageMask-04957
  If the subpassShading feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI

- VUID-VkImageMemoryBarrier2-srcStageMask-04995
  If the invocationMask feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI

- VUID-VkImageMemoryBarrier2-srcStageMask-07946
  If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

- VUID-VkImageMemoryBarrier2-srcAccessMask-03900
  If srcAccessMask includes VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03901
  If srcAccessMask includes VK_ACCESS_2_INDEX_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03902
  If srcAccessMask includes VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03903
  If srcAccessMask includes VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03904
  If srcAccessMask includes VK_ACCESS_2_UNIFORM_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of
  the VK_PIPELINE_STAGE_*_SHADER_BIT stages
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, or `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`.
If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_WRITE_BIT`, `srcStageMask` **must** include

- `VK_PIPELINE_STAGE_2_COPY_BIT`,
- `VK_PIPELINE_STAGE_2_BLIT_BIT`,
- `VK_PIPELINE_STAGE_2_RESOLVE_BIT`,
- `VK_PIPELINE_STAGE_2_CLEAR_BIT`,
- `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`,
- `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`,
- `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, or
- `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

If `srcAccessMask` includes `VK_ACCESS_2_HOST_READ_BIT`, `srcStageMask` **must** include

- `VK_PIPELINE_STAGE_2_HOST_BIT`

If `srcAccessMask` includes `VK_ACCESS_2_HOST_WRITE_BIT`, `srcStageMask` **must** include

- `VK_PIPELINE_STAGE_2_HOST_BIT`

If `srcAccessMask` includes `VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT`, `srcStageMask` **must** include

- `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`,
- `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or
- `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

If `srcAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT`, `srcStageMask` **must** include

- `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`,
- `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or
- `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

If `srcAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT`, `srcStageMask` **must** include

- `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`,
- `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`,
- `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or
- `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

If `srcAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT`, `srcStageMask` **must** include

- `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`,
- `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or
- `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

If `srcAccessMask` includes `VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV`, `srcStageMask` **must** include

- `VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV`,
- `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or
- `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

If `srcAccessMask` includes `VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI`, `srcStageMask` **must** include

- `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or
- `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
include VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI

- VUID-VkImageMemoryBarrier2-srcAccessMask-03924
  If `srcAccessMask` includes `VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-srcAccessMask-03925
  If `srcAccessMask` includes `VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-srcAccessMask-03926
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-srcAccessMask-03927
  If `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkImageMemoryBarrier2-srcAccessMask-03928
  If `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkImageMemoryBarrier2-srcAccessMask-06256
  If the rayQuery feature is not enabled and `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` must not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- VUID-VkImageMemoryBarrier2-srcAccessMask-07272
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- VUID-VkImageMemoryBarrier2-srcAccessMask-04858
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`

- VUID-VkImageMemoryBarrier2-srcAccessMask-04859
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODER_BIT_KHR`

- VUID-VkImageMemoryBarrier2-srcAccessMask-04860
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`

- VUID-VkImageMemoryBarrier2-srcAccessMask-04861
If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`.

- **VUID-VkImageMemoryBarrier2-srcAccessMask-07455**
  If `srcAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`.

- **VUID-VkImageMemoryBarrier2-srcAccessMask-07456**
  If `srcAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`.

- **VUID-VkImageMemoryBarrier2-srcAccessMask-07457**
  If `srcAccessMask` includes `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`.

- **VUID-VkImageMemoryBarrier2-srcAccessMask-07458**
  If `srcAccessMask` includes `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`.

- **VUID-VkImageMemoryBarrier2-srcAccessMask-08118**
  If `srcAccessMask` includes `VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

- **VUID-VkImageMemoryBarrier2-dstStageMask-03929**
  If the `geometryShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`.

- **VUID-VkImageMemoryBarrier2-dstStageMask-03930**
  If the `tessellationShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`.

- **VUID-VkImageMemoryBarrier2-dstStageMask-03931**
  If the `conditionalRendering` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`.

- **VUID-VkImageMemoryBarrier2-dstStageMask-03932**
  If the `fragmentDensityMap` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.

- **VUID-VkImageMemoryBarrier2-dstStageMask-03933**
  If the `transformFeedback` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`.

- **VUID-VkImageMemoryBarrier2-dstStageMask-03934**
  If the `meshShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`.

- **VUID-VkImageMemoryBarrier2-dstStageMask-03935**
  If the `taskShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`.

- **VUID-VkImageMemoryBarrier2-dstStageMask-07316**
If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2.FragmentShaderRateAttachment_BIT_KHR`.

- **VUID-VkImageMemoryBarrier2-dstStageMask-04957**
  If the `subpassShading` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2.SubpassShader_BIT_HUAWEI`.

- **VUID-VkImageMemoryBarrier2-dstStageMask-04995**
  If the `invocationMask` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2.InvocationMask_BIT_HUAWEI`.

- **VUID-VkImageMemoryBarrier2-dstStageMask-07946**
  If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2.RayTracingShader_BIT_KHR`.

- **VUID-VkImageMemoryBarrier2-dstAccessMask-03900**
  If `dstAccessMask` includes `VK_ACCESS_2.IndirectCommand.Read_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2.DrawIndirect_BIT`, `VK_PIPELINE_STAGE_2.AccelerationStructureBuild_BIT_KHR`, `VK_PIPELINE_STAGE_2.AllGraphics_BIT`, or `VK_PIPELINE_STAGE_2.AllCommands_BIT`.

- **VUID-VkImageMemoryBarrier2-dstAccessMask-03901**
  If `dstAccessMask` includes `VK_ACCESS_2.Index.Read_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2.IndexInput_BIT`, `VK_PIPELINE_STAGE_2.VertexInput_BIT`, `VK_PIPELINE_STAGE_2.AllGraphics_BIT`, or `VK_PIPELINE_STAGE_2.AllCommands_BIT`.

- **VUID-VkImageMemoryBarrier2-dstAccessMask-03902**

- **VUID-VkImageMemoryBarrier2-dstAccessMask-03903**
  If `dstAccessMask` includes `VK_ACCESS_2.InputAttachment.Read_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2.FragmentShader_BIT`, `VK_PIPELINE_STAGE_2.SubpassShader_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2.AllGraphics_BIT`, or `VK_PIPELINE_STAGE_2.AllCommands_BIT`.

- **VUID-VkImageMemoryBarrier2-dstAccessMask-03904**
  If `dstAccessMask` includes `VK_ACCESS_2.Uniform.Read_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2.AllGraphics_BIT`, `VK_PIPELINE_STAGE_2.AllCommands_BIT`, or one of the `VK_PIPELINE_STAGE_2.\*Shader_BIT` stages.

- **VUID-VkImageMemoryBarrier2-dstAccessMask-03905**
  If `dstAccessMask` includes `VK_ACCESS_2.Shader.Sampled.Read_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2.AllGraphics_BIT`, `VK_PIPELINE_STAGE_2.AllCommands_BIT`, or one of the `VK_PIPELINE_STAGE_2.\*Shader_BIT` stages.

- **VUID-VkImageMemoryBarrier2-dstAccessMask-03906**
  If `dstAccessMask` includes `VK_ACCESS_2.Shader.Storage.Read_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2.AllGraphics_BIT`, `VK_PIPELINE_STAGE_2.AllCommands_BIT`, or one of the `VK_PIPELINE_STAGE_2.\*Shader_BIT` stages.
• **VUID-VkImageMemoryBarrier2-dstAccessMask-03907**
  If `dstAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

• **VUID-VkImageMemoryBarrier2-dstAccessMask-07454**

- **VUID-VkImageMemoryBarrier2-dstAccessMask-03919**
  If `dstAccessMask` includes `VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT`, `dstStageMask` must include VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- **VUID-VkImageMemoryBarrier2-dstAccessMask-03920**
  If `dstAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT`, `dstStageMask` must include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- **VUID-VkImageMemoryBarrier2-dstAccessMask-04747**
  If `dstAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT`, `dstStageMask` must include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- **VUID-VkImageMemoryBarrier2-dstAccessMask-03922**
  If `dstAccessMask` includes `VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT`, `dstStageMask` must include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- **VUID-VkImageMemoryBarrier2-dstAccessMask-03923**
  If `dstAccessMask` includes `VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV`, `dstStageMask` must include VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- **VUID-VkImageMemoryBarrier2-dstAccessMask-04994**
  If `dstAccessMask` includes `VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI`, `dstStageMask` must include VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI

- **VUID-VkImageMemoryBarrier2-dstAccessMask-03924**
  If `dstAccessMask` includes `VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV`, `dstStageMask` must include VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- **VUID-VkImageMemoryBarrier2-dstAccessMask-03925**
  If `dstAccessMask` includes `VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV`, `dstStageMask` must include VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV or
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-03926
  If dstAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT, dstStageMask must include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-03927
  If dstAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkImageMemoryBarrier2-dstAccessMask-03928
  If dstAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-06256
  If the rayQuery feature is not enabled and dstAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, dstStageMask must not include any of the VK_PIPELINE_STAGE_*_SHADER_BIT stages except VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

• VUID-VkImageMemoryBarrier2-dstAccessMask-07272
  If dstAccessMask includes VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT or VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

• VUID-VkImageMemoryBarrier2-dstAccessMask-04858
  If dstAccessMask includes VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR

• VUID-VkImageMemoryBarrier2-dstAccessMask-04859
  If dstAccessMask includes VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR

• VUID-VkImageMemoryBarrier2-dstAccessMask-04860
  If dstAccessMask includes VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR

• VUID-VkImageMemoryBarrier2-dstAccessMask-04861
  If dstAccessMask includes VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR

• VUID-VkImageMemoryBarrier2-dstAccessMask-07455
  If dstAccessMask includes VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV, dstStageMask must include VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV

• VUID-VkImageMemoryBarrier2-dstAccessMask-07456
  If dstAccessMask includes VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV, dstStageMask must include VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV
If `dstAccessMask` includes `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`

If `dstAccessMask` includes `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`

If `dstAccessMask` includes `VK_ACCESS_2_DESCRIPTOR_BUFFER_READ_BIT_EXT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT`
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, `newLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` then image must have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then image must have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set.

If the `synchronization2` feature is not enabled, `oldLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.

If the `synchronization2` feature is not enabled, `newLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.
• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-03938
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL, image must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-03939
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL, image must have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT.

• VUID-VkImageMemoryBarrier2-oldLayout-02088
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR then image must have been created with VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR set.

• VUID-VkImageMemoryBarrier2-image-09117
  If image was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family.

• VUID-VkImageMemoryBarrier2-image-09118
  If image was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family.

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04070
  If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one of srcQueueFamilyIndex or dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL or VK_QUEUE_FAMILY_FOREIGN_EXT.

• VUID-VkImageMemoryBarrier2-None-09119
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL.

• VUID-VkImageMemoryBarrier2-None-09120
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL.

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-09121
  If the VK_EXT_queue_family_foreign extension is not enabled, srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_FOREIGN_EXT.

• VUID-VkImageMemoryBarrier2-dstQueueFamilyIndex-09122
  If the VK_EXT_queue_family_foreign extension is not enabled, dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_FOREIGN_EXT.

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07120
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer.
or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07121
If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07122
If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07123
If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07124
If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07125
If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR

• VUID-VkImageMemoryBarrier2-subresourceRange-01486
subresourceRange.baseMipLevel must be less than the mipLevels specified in VkImageCreateInfo when image was created

• VUID-VkImageMemoryBarrier2-subresourceRange-01724
If subresourceRange.levelCount is not VK_REMAINING_MIP_LEVELS,
subresourceRange.baseMipLevel + subresourceRange.levelCount must be less than or equal to the mipLevels specified in VkImageCreateInfo when image was created

• VUID-VkImageMemoryBarrier2-subresourceRange-01488
  subresourceRange.baseArrayLayer must be less than the arrayLayers specified in VkImageCreateInfo when image was created

• VUID-VkImageMemoryBarrier2-subresourceRange-01725
  If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the arrayLayers specified in VkImageCreateInfo when image was created

• VUID-VkImageMemoryBarrier2-image-01932
  If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-VkImageMemoryBarrier2-image-09241
  If image has a color format that is single-plane, then the aspectMask member of subresourceRange must be VK_IMAGE_ASPECT_COLOR_BIT

• VUID-VkImageMemoryBarrier2-image-09242
  If image has a color format and is not disjoint, then the aspectMask member of subresourceRange must be VK_IMAGE_ASPECT_COLOR_BIT

• VUID-VkImageMemoryBarrier2-image-01672
  If image has a multi-planar format and the image is disjoint, then the aspectMask member of subresourceRange must include at least one multi-planar aspect mask bit or VK_IMAGE_ASPECT_COLOR_BIT

• VUID-VkImageMemoryBarrier2-image-03319
  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is enabled, then the aspectMask member of subresourceRange must include either or both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT

• VUID-VkImageMemoryBarrier2-image-03320
  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is not enabled, then the aspectMask member of subresourceRange must include both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT

• VUID-VkImageMemoryBarrier2-aspectMask-08702
  If the aspectMask member of subresourceRange includes VK_IMAGE_ASPECT_DEPTH_BIT, oldLayout and newLayout must not be one of VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkImageMemoryBarrier2-aspectMask-08703
  If the aspectMask member of subresourceRange includes VK_IMAGE_ASPECT_STENCIL_BIT, oldLayout and newLayout must not be one of VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

• VUID-VkImageMemoryBarrier2-srcStageMask-03854
  If either srcStageMask or dstStageMask includes VK_PIPELINE_STAGE_2_HOST_BIT, srcQueueFamilyIndex and dstQueueFamilyIndex must be equal
If `srcStageMask` includes `VK_PIPELINE_STAGE_2_HOST_BIT`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, `oldLayout` must be one of `VK_IMAGE_LAYOUT_PREINITIALIZED`, `VK_IMAGE_LAYOUT_UNDEFINED`, or `VK_IMAGE_LAYOUT_GENERAL`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER_2`
- Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkExternalMemoryAcquireUnmodifiedEXT` or `VkSampleLocationsInfoEXT`
- The `sType` value of each struct in the `pNext` chain must be unique
- `srcStageMask` must be a valid combination of `VkPipelineStageFlagBits2` values
- `srcAccessMask` must be a valid combination of `VkAccessFlagBits2` values
- `dstStageMask` must be a valid combination of `VkPipelineStageFlagBits2` values
- `dstAccessMask` must be a valid combination of `VkAccessFlagBits2` values
- `oldLayout` must be a valid `VkImageLayout` value
- `newLayout` must be a valid `VkImageLayout` value
- `image` must be a valid `VkImage` handle
- `subresourceRange` must be a valid `VkImageSubresourceRange` structure

The `VkImageMemoryBarrier` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageMemoryBarrier {
    VkStructureType sType;
    const void* pNext;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkImageLayout oldLayout;
} VkImageMemoryBarrier;
```
VkImageMemoryBarrier
{
    VkImageLayout newLayout;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkImage image;
    VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier;

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **srcAccessMask** is a bitmask of **VkAccessFlagBits** specifying a **source access mask**.
- **dstAccessMask** is a bitmask of **VkAccessFlagBits** specifying a **destination access mask**.
- **oldLayout** is the old layout in an **image layout transition**.
- **newLayout** is the new layout in an **image layout transition**.
- **srcQueueFamilyIndex** is the source queue family for a **queue family ownership transfer**.
- **dstQueueFamilyIndex** is the destination queue family for a **queue family ownership transfer**.
- **image** is a handle to the image affected by this barrier.
- **subresourceRange** describes the **image subresource range** within **image** that is affected by this barrier.

The first **access scope** is limited to access to memory through the specified image subresource range, via access types in the **source access mask** specified by **srcAccessMask**. If **srcAccessMask** includes **VK_ACCESS_HOST_WRITE_BIT**, memory writes performed by that access type are also made visible, as that access type is not performed through a resource.

The second **access scope** is limited to access to memory through the specified image subresource range, via access types in the **destination access mask** specified by **dstAccessMask**. If **dstAccessMask** includes **VK_ACCESS_HOST_WRITE_BIT** or **VK_ACCESS_HOST_READ_BIT**, available memory writes are also made visible to accesses of those types, as those access types are not performed through a resource.

If **srcQueueFamilyIndex** is not equal to **dstQueueFamilyIndex**, and **srcQueueFamilyIndex** is equal to the current queue family, then the memory barrier defines a **queue family release operation** for the specified image subresource range, and the second access scope includes no access, as if **dstAccessMask** was **0**.

If **dstQueueFamilyIndex** is not equal to **srcQueueFamilyIndex**, and **dstQueueFamilyIndex** is equal to the current queue family, then the memory barrier defines a **queue family acquire operation** for the specified image subresource range, and the first access scope includes no access, as if **srcAccessMask** was **0**.

If the **synchronization2** feature is not enabled or **oldLayout** is not equal to **newLayout, oldLayout** and **newLayout** define an **image layout transition** for the specified image subresource range.

**Note**
If the **synchronization2** feature is enabled, when the old and new layout are equal, the layout values are ignored - data is preserved no matter what values are
If \textit{image} has a multi-planar format and the image is \textit{disjoint}, then including \texttt{VK_IMAGE_ASPECT_COLOR_BIT} in the \texttt{aspectMask} member of \texttt{subresourceRange} is equivalent to including \texttt{VK_IMAGE_ASPECT_PLANE_0_BIT}, \texttt{VK_IMAGE_ASPECT_PLANE_1_BIT}, and (for three-plane formats only) \texttt{VK_IMAGE_ASPECT_PLANE_2_BIT}.

### Valid Usage

- **VUID-VkImageMemoryBarrier-oldLayout-01208**
  If \texttt{srcQueueFamilyIndex} and \texttt{dstQueueFamilyIndex} define a queue family ownership transfer or \texttt{oldLayout} and \texttt{newLayout} define an image layout transition, and \texttt{oldLayout} or \texttt{newLayout} is \texttt{VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL} then \textit{image} must have been created with \texttt{VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT}

- **VUID-VkImageMemoryBarrier-oldLayout-01209**
  If \texttt{srcQueueFamilyIndex} and \texttt{dstQueueFamilyIndex} define a queue family ownership transfer or \texttt{oldLayout} and \texttt{newLayout} define an image layout transition, and \texttt{oldLayout} or \texttt{newLayout} is \texttt{VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL} then \textit{image} must have been created with \texttt{VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT}

- **VUID-VkImageMemoryBarrier-oldLayout-01210**
  If \texttt{srcQueueFamilyIndex} and \texttt{dstQueueFamilyIndex} define a queue family ownership transfer or \texttt{oldLayout} and \texttt{newLayout} define an image layout transition, and \texttt{oldLayout} or \texttt{newLayout} is \texttt{VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL} then \textit{image} must have been created with \texttt{VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT}

- **VUID-VkImageMemoryBarrier-oldLayout-01211**
  If \texttt{srcQueueFamilyIndex} and \texttt{dstQueueFamilyIndex} define a queue family ownership transfer or \texttt{oldLayout} and \texttt{newLayout} define an image layout transition, and \texttt{oldLayout} or \texttt{newLayout} is \texttt{VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL} then \textit{image} must have been created with \texttt{VK_IMAGE_USAGE_SAMPLED_BIT} or \texttt{VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT}

- **VUID-VkImageMemoryBarrier-oldLayout-01212**
  If \texttt{srcQueueFamilyIndex} and \texttt{dstQueueFamilyIndex} define a queue family ownership transfer or \texttt{oldLayout} and \texttt{newLayout} define an image layout transition, and \texttt{oldLayout} or \texttt{newLayout} is \texttt{VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL} then \textit{image} must have been created with \texttt{VK_IMAGE_USAGE_TRANSFER_SRC_BIT}

- **VUID-VkImageMemoryBarrier-oldLayout-01213**
  If \texttt{srcQueueFamilyIndex} and \texttt{dstQueueFamilyIndex} define a queue family ownership transfer or \texttt{oldLayout} and \texttt{newLayout} define an image layout transition, and \texttt{oldLayout} or \texttt{newLayout} is \texttt{VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL} then \textit{image} must have been created with \texttt{VK_IMAGE_USAGE_TRANSFER_DST_BIT}

- **VUID-VkImageMemoryBarrier-newLayout-01197**
  If \texttt{srcQueueFamilyIndex} and \texttt{dstQueueFamilyIndex} define a queue family ownership transfer or \texttt{oldLayout} and \texttt{newLayout} define an image layout transition, oldLayout must be \texttt{VK_IMAGE_LAYOUT_UNDEFINED} or the current layout of the image subresources affected by the barrier

- **VUID-VkImageMemoryBarrier-newLayout-01198**
If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, newLayout must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED.

• VUID-VkImageMemoryBarrier-oldLayout-01658
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

• VUID-VkImageMemoryBarrier-oldLayout-01659
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04065
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL then image must have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT.

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04066
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT set.

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04067
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then image must have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT.

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04068
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT set.

• VUID-VkImageMemoryBarrier-synchronization2-07793
  If the synchronization2 feature is not enabled, oldLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR.

• VUID-VkImageMemoryBarrier-synchronization2-07794
  If the synchronization2 feature is not enabled, newLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR.

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-03938
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is
VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL, image **must** have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-03939
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL, image **must** have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

• VUID-VkImageMemoryBarrier-oldLayout-02088
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR then image **must** have been created with VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR set

• VUID-VkImageMemoryBarrier-image-09117
  If image was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex **must** be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

• VUID-VkImageMemoryBarrier-image-09118
  If image was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, dstQueueFamilyIndex **must** be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04070
  If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one of srcQueueFamilyIndex or dstQueueFamilyIndex **must** not be VK_QUEUE_FAMILY_EXTERNAL or VK_QUEUE_FAMILY_FOREIGN_EXT

• VUID-VkImageMemoryBarrier-None-09119
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, srcQueueFamilyIndex **must** not be VK_QUEUE_FAMILY_EXTERNAL

• VUID-VkImageMemoryBarrier-None-09120
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, dstQueueFamilyIndex **must** not be VK_QUEUE_FAMILY_EXTERNAL

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-09121
  If the VK_EXT_queue_family_foreign extension is not enabled srcQueueFamilyIndex **must** not be VK_QUEUE_FAMILY_FOREIGN_EXT

• VUID-VkImageMemoryBarrier-dstQueueFamilyIndex-09122
  If the VK_EXT_queue_family_foreign extension is not enabled dstQueueFamilyIndex **must** not be VK_QUEUE_FAMILY_FOREIGN_EXT

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07120
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR then image **must** have been created with VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then image must have been created with either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` usage bits, and the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits, and the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit.

If the `attachmentFeedbackLoopLayout` feature is not enabled, `newLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`.

If `subresourceRange.baseMipLevel` must be less than the `mipLevels` specified in `VkImageCreateInfo` when image was created.

If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` must be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.
subresourceRange.baseArrayLayer must be less than the arrayLayers specified in VkImageCreateInfo when image was created

- VUID-VkImageMemoryBarrier-subresourceRange-01725
  If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the arrayLayers specified in VkImageCreateInfo when image was created

- VUID-VkImageMemoryBarrier-image-01932
  If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkImageMemoryBarrier-image-09241
  If image has a color format that is single-plane, then the aspectMask member of subresourceRange must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkImageMemoryBarrier-image-09242
  If image has a color format and is not disjoint, then the aspectMask member of subresourceRange must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkImageMemoryBarrier-image-01672
  If image has a multi-planar format and the image is disjoint, then the aspectMask member of subresourceRange must include at least one multi-planar aspect mask bit or VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkImageMemoryBarrier-image-03319
  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is enabled, then the aspectMask member of subresourceRange must include either or both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkImageMemoryBarrier-image-03320
  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is not enabled, then the aspectMask member of subresourceRange must include both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkImageMemoryBarrier-aspectMask-08702
  If the aspectMask member of subresourceRange includes VK_IMAGE_ASPECT_DEPTH_BIT, oldLayout and newLayout must not be one of VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkImageMemoryBarrier-aspectMask-08703
  If the aspectMask member of subresourceRange includes VK_IMAGE_ASPECT_STENCIL_BIT, oldLayout and newLayout must not be one of VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

- VUID-VkImageMemoryBarrier-None-09052
  If the synchronization2 feature is not enabled, and image was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, at least one of srcQueueFamilyIndex and dstQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED

- VUID-VkImageMemoryBarrier-None-09053
  If the synchronization2 feature is not enabled, and image was created with a sharing mode...
of VK_SHARING_MODE_CONCURRENT, srcQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED or VK_QUEUE_FAMILY_EXTERNAL

- VUID-VkImageMemoryBarrier-None-09054
  If the synchronization feature is not enabled, and image was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED or VK_QUEUE_FAMILY_EXTERNAL

**Valid Usage (Implicit)**

- VUID-VkImageMemoryBarrier-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER

- VUID-VkImageMemoryBarrier-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkExternalMemoryAcquireUnmodifiedEXT or VkSampleLocationsInfoEXT

- VUID-VkImageMemoryBarrier-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkImageMemoryBarrier-oldLayout-parameter
  oldLayout must be a valid VkImageLayout value

- VUID-VkImageMemoryBarrier-newLayout-parameter
  newLayout must be a valid VkImageLayout value

- VUID-VkImageMemoryBarrier-image-parameter
  image must be a valid VkImage handle

- VUID-VkImageMemoryBarrier-subresourceRange-parameter
  subresourceRange must be a valid VkImageSubresourceRange structure

To facilitate usage of images whose memory is initialized on the host, Vulkan allows image layout transitions to be performed by the host as well, albeit supporting limited layouts.

To perform an image layout transition on the host, call:

```c
// Provided by VK_EXT_host_image_copy
VkResult vkTransitionImageLayoutEXT(
    VkDevice device,
    uint32_t transitionCount,
    const VkHostImageLayoutTransitionInfoEXT* pTransitions);
```

- device is the device which owns pTransitions[i].image.
- transitionCount is the number of image layout transitions to perform.
- pTransitions is a pointer to an array of VkHostImageLayoutTransitionInfoEXT structures specifying the image and subresource ranges within them to transition.
Valid Usage (Implicit)

- VUID-vkTransitionImageLayoutEXT-device-parameter
  *device* must be a valid *VkDevice* handle

- VUID-vkTransitionImageLayoutEXT-pTransitions-parameter
  *pTransitions* must be a valid pointer to an array of *transitionCount* valid
  *VkHostImageLayoutTransitionInfoEXT* structures

- VUID-vkTransitionImageLayoutEXT-transitionCount-arraylength
  *transitionCount* must be greater than 0

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_MEMORY_MAP_FAILED

The *VkHostImageLayoutTransitionInfoEXT* structure is defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkHostImageLayoutTransitionInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkImageLayout oldLayout;
    VkImageLayout newLayout;
    VkImageSubresourceRange subresourceRange;
} VkHostImageLayoutTransitionInfoEXT;
```

- *sType* is a *VkStructureType* value identifying this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- *image* is a handle to the image affected by this layout transition.
- *oldLayout* is the old layout in an *image layout transition*.
- *newLayout* is the new layout in an *image layout transition*.
- *subresourceRange* describes the *image subresource range* within *image* that is affected by this layout transition.

*vkTransitionImageLayoutEXT* does not check whether the device memory associated with an image is
currently in use before performing the layout transition. The application must guarantee that any previously submitted command that reads from or writes to this subresource has completed before the host performs the layout transition.

Note

Image layout transitions performed on the host do not require queue family ownership transfers as the physical layout of the image will not vary between queue families for the layouts supported by this function.

Valid Usage

- VUID-VkHostImageLayoutTransitionInfoEXT-image-09055
  image must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01486
  subresourceRange.baseMipLevel must be less than the mipLevels specified in VkImageCreateInfo when image was created

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01724
  If subresourceRange.levelCount is not VK_REMAINING_MIP_LEVELS,
  subresourceRange.baseMipLevel + subresourceRange.levelCount must be less than or equal to the mipLevels specified in VkImageCreateInfo when image was created

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01488
  subresourceRange.baseArrayLayer must be less than the arrayLayers specified in VkImageCreateInfo when image was created

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01725
  If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS,
  subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the arrayLayers specified in VkImageCreateInfo when image was created

- VUID-VkHostImageLayoutTransitionInfoEXT-image-01932
  If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkHostImageLayoutTransitionInfoEXT-image-09241
  If image has a color format that is single-plane, then the aspectMask member of subresourceRange must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkHostImageLayoutTransitionInfoEXT-image-09242
  If image has a color format and is not disjoint, then the aspectMask member of subresourceRange must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkHostImageLayoutTransitionInfoEXT-image-01672
  If image has a multi-planar format and the image is disjoint, then the aspectMask member of subresourceRange must include at least one multi-planar aspect mask bit or VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkHostImageLayoutTransitionInfoEXT-image-03319
  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is enabled, then the aspectMask member of
The `subresourceRange` must include either or both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`.

- **VUID-VkHostImageLayoutTransitionInfoEXT-image-03320**
  If the image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is not enabled, then the `aspectMask` member of `subresourceRange` must include both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`.

- **VUID-VkHostImageLayoutTransitionInfoEXT-aspectMask-08702**
  If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_DEPTH_BIT`, `oldLayout` and `newLayout` must not be one of `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkHostImageLayoutTransitionInfoEXT-aspectMask-08703**
  If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, `oldLayout` and `newLayout` must not be one of `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- **VUID-VkHostImageLayoutTransitionInfoEXT-oldLayout-09229**
  `oldLayout` must be either `VK_IMAGE_LAYOUT_UNDEFINED` or the current layout of the image subresources as specified in `subresourceRange`.

- **VUID-VkHostImageLayoutTransitionInfoEXT-oldLayout-09230**
  If `oldLayout` is not `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`, it must be one of the layouts in `VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopySrcLayouts`.

- **VUID-VkHostImageLayoutTransitionInfoEXT-newLayout-09057**
  `newLayout` must be one of the layouts in `VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopyDstLayouts`.

---

**Valid Usage (Implicit)**

- **VUID-VkHostImageLayoutTransitionInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_HOST_IMAGE_LAYOUT_TRANSITION_INFO_EXT`.

- **VUID-VkHostImageLayoutTransitionInfoEXT-pNext-pNext**
  `pNext` must be `NULL`.

- **VUID-VkHostImageLayoutTransitionInfoEXT-image-parameter**
  `image` must be a valid `VkImage` handle.

- **VUID-VkHostImageLayoutTransitionInfoEXT-oldLayout-parameter**
  `oldLayout` must be a valid `VkImageLayout` value.

- **VUID-VkHostImageLayoutTransitionInfoEXT-newLayout-parameter**
  `newLayout` must be a valid `VkImageLayout` value.

- **VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-parameter**
  `subresourceRange` must be a valid `VkImageSubresourceRange` structure.
7.7.4. Queue Family Ownership Transfer

Resources created with a `VkSharingMode` of `VK_SHARING_MODE_EXCLUSIVE` must have their ownership explicitly transferred from one queue family to another in order to access their content in a well-defined manner on a queue in a different queue family.

The special queue family index `VK_QUEUE_FAMILY_IGNORED` indicates that a queue family parameter or member is ignored.

```
#define VK_QUEUE_FAMILY_IGNORED           (~0U)
```

Resources shared with external APIs or instances using external memory must also explicitly manage ownership transfers between local and external queues (or equivalent constructs in external APIs) regardless of the `VkSharingMode` specified when creating them.

The special queue family index `VK_QUEUE_FAMILY_EXTERNAL` represents any queue external to the resource's current Vulkan instance, as long as the queue uses the same underlying device group or physical device, and the same driver version as the resource's `VkDevice`, as indicated by `VkPhysicalDeviceIDProperties::deviceUUID` and `VkPhysicalDeviceIDProperties::driverUUID`.

```
#define VK_QUEUE_FAMILY_EXTERNAL          (~1U)
```

or the equivalent

```
#define VK_QUEUE_FAMILY_EXTERNAL_KHR      VK_QUEUE_FAMILY_EXTERNAL
```

The special queue family index `VK_QUEUE_FAMILY_FOREIGN_EXT` represents any queue external to the resource's current Vulkan instance, regardless of the queue's underlying physical device or driver version. This includes, for example, queues for fixed-function image processing devices, media codec devices, and display devices, as well as all queues that use the same underlying device group or physical device, and the same driver version as the resource's `VkDevice`.

```
#define VK_QUEUE_FAMILY_FOREIGN_EXT       (~2U)
```

If memory dependencies are correctly expressed between uses of such a resource between two queues in different families, but no ownership transfer is defined, the contents of that resource are undefined for any read accesses performed by the second queue family.

**Note**

If an application does not need the contents of a resource to remain valid when transferring from one queue family to another, then the ownership transfer should be skipped.
Applications should expect transfers to/from `VK_QUEUE_FAMILY_FOREIGN_EXT` to be more expensive than transfers to/from `VK_QUEUE_FAMILY_EXTERNAL_KHR`.

A queue family ownership transfer consists of two distinct parts:

1. Release exclusive ownership from the source queue family
2. Acquire exclusive ownership for the destination queue family

An application **must** ensure that these operations occur in the correct order by defining an execution dependency between them, e.g. using a semaphore.

A *release operation* is used to release exclusive ownership of a range of a buffer or image subresource range. A release operation is defined by executing a buffer memory barrier (for a buffer range) or an image memory barrier (for an image subresource range) using a pipeline barrier command, on a queue from the source queue family. The `srcQueueFamilyIndex` parameter of the barrier **must** be set to the source queue family index, and the `dstQueueFamilyIndex` parameter to the destination queue family index. `dstAccessMask` is ignored for such a barrier, such that no visibility operation is executed - the value of this mask does not affect the validity of the barrier. The release operation happens-after the availability operation, and happens-before operations specified in the second synchronization scope of the calling command.

An *acquire operation* is used to acquire exclusive ownership of a range of a buffer or image subresource range. An acquire operation is defined by executing a buffer memory barrier (for a buffer range) or an image memory barrier (for an image subresource range) using a pipeline barrier command, on a queue from the destination queue family. The buffer range or image subresource range specified in an acquire operation **must** match exactly that of a previous release operation. The `srcQueueFamilyIndex` parameter of the barrier **must** be set to the source queue family index, and the `dstQueueFamilyIndex` parameter to the destination queue family index. `srcAccessMask` is ignored for such a barrier, such that no availability operation is executed - the value of this mask does not affect the validity of the barrier. The acquire operation happens-after operations in the first synchronization scope of the calling command, and happens-before the visibility operation.

**Note**

Whilst it is not invalid to provide destination or source access masks for memory barriers used for release or acquire operations, respectively, they have no practical effect. Access after a release operation has undefined results, and so visibility for those accesses has no practical effect. Similarly, write access before an acquire operation will produce undefined results for future access, so availability of those writes has no practical use. In an earlier version of the specification, these were required to match on both sides - but this was subsequently relaxed. These masks **should** be set to 0.

If the transfer is via an image memory barrier, and an image layout transition is desired, then the values of `oldLayout` and `newLayout` in the release operation's memory barrier **must** be equal to values of `oldLayout` and `newLayout` in the acquire operation's memory barrier. Although the image layout transition is submitted twice, it will only be executed once. A layout transition specified in this way happens-after the release operation and happens-before the acquire operation.
If the values of srcQueueFamilyIndex and dstQueueFamilyIndex are equal, no ownership transfer is performed, and the barrier operates as if they were both set to VK_QUEUE_FAMILY_IGNORED.

Queue family ownership transfers may perform read and write accesses on all memory bound to the image subresource or buffer range, so applications must ensure that all memory writes have been made available before a queue family ownership transfer is executed. Available memory is automatically made visible to queue family release and acquire operations, and writes performed by those operations are automatically made available.

Once a queue family has acquired ownership of a buffer range or image subresource range of a VK_SHARING_MODE_EXCLUSIVE resource, its contents are undefined to other queue families unless ownership is transferred. The contents of any portion of another resource which aliases memory that is bound to the transferred buffer or image subresource range are undefined after a release or acquire operation.

Note

Because events cannot be used directly for inter-queue synchronization, and because vkCmdSetEvent does not have the queue family index or memory barrier parameters needed by a release operation, the release and acquire operations of a queue family ownership transfer can only be performed using vkCmdPipelineBarrier.

An acquire operation may have a performance penalty when acquiring ownership of a subresource range from one of the special queue families reserved for external memory ownership transfers described above. The application can reduce the performance penalty in some cases by adding a VkExternalMemoryAcquireUnmodifiedEXT structure to thepNext chain of the acquire operation's memory barrier structure.

The VkExternalMemoryAcquireUnmodifiedEXT structure is defined as:

```c
// Provided by VK_EXT_external_memory_acquire_unmodified
typedef struct VkExternalMemoryAcquireUnmodifiedEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 acquireUnmodifiedMemory;
} VkExternalMemoryAcquireUnmodifiedEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- acquireUnmodifiedMemory specifies, if VK_TRUE, that no range of VkDeviceMemory bound to the resource of the memory barrier's subresource range was modified at any time since the resource's most recent release of ownership to the queue family specified by the memory barrier's srcQueueFamilyIndex. If VK_FALSE, it specifies nothing.

If the application releases ownership of the subresource range to one of the special queue families reserved for external memory ownership transfers with a memory barrier structure, and later re-acquires ownership from the same queue family with a memory barrier structure, and if no range
of VkDeviceMemory bound to the resource was modified at any time between the release operation and the acquire operation, then the application should add a VkExternalMemoryAcquireUnmodifiedEXT structure to the pNext chain of the acquire operation's memory barrier structure because this may reduce the performance penalty.

This struct is ignored if acquireUnmodifiedMemory is VK_FALSE. In particular, VK_FALSE does not specify that memory was modified.

This struct is ignored if the memory barrier's srcQueueFamilyIndex is not a special queue family reserved for external memory ownership transfers.

Note

The method by which the application determines whether memory was modified between the release operation and acquire operation is outside the scope of Vulkan.

For any Vulkan operation that accesses a resource, the application must not assume the implementation accesses the resource's memory as read-only, even for apparently read-only operations such as transfer commands and shader reads.

The validity of VkExternalMemoryAcquireUnmodifiedEXT::acquireUnmodifiedMemory is independent of memory ranges outside the ranges of VkDeviceMemory bound to the resource. In particular, it is independent of any implementation-private memory associated with the resource.

Valid Usage

• VUID-VkExternalMemoryAcquireUnmodifiedEXT-acquireUnmodifiedMemory-08922 If acquireUnmodifiedMemory is VK_TRUE, and the memory barrier's srcQueueFamilyIndex is a special queue family reserved for external memory ownership transfers (as described in Queue Family Ownership Transfer), then each range of VkDeviceMemory bound to the resource must have remained unmodified during all time since the resource's most recent release of ownership to the queue family.

Valid Usage (Implicit)

• VUID-VkExternalMemoryAcquireUnmodifiedEXT-sType-sType sType must be VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_ACQUIRE_UNMODIFIED_EXT

7.8. Wait Idle Operations

To wait on the host for the completion of outstanding queue operations for a given queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueWaitIdle(
  VkQueue queue);
```
• queue is the queue on which to wait.

vkQueueWaitIdle is equivalent to having submitted a valid fence to every previously executed queue submission command that accepts a fence, then waiting for all of those fences to signal using vkWaitForFences with an infinite timeout and waitAll set to VK_TRUE.

Valid Usage (Implicit)

• VUID-vkQueueWaitIdle-queue-parameter queue must be a valid VkQueue handle

Host Synchronization

• Host access to queue must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>

</tr>
</tbody>
</table>

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_DEVICE_LOST

To wait on the host for the completion of outstanding queue operations for all queues on a given logical device, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkDeviceWaitIdle(
    VkDevice device);
```

• device is the logical device to idle.

vkDeviceWaitIdle is equivalent to calling vkQueueWaitIdle for all queues owned by device.
Valid Usage (Implicit)

- VUID-vkDeviceWaitIdle-device-parameter
  device must be a valid VkDevice handle

Host Synchronization

- Host access to all VkQueue objects created from device must be externally synchronized

Return Codes

Success
  - VK_SUCCESS

Failure
  - VK_ERROR_OUT_OF_HOST_MEMORY
  - VK_ERROR_OUT_OF_DEVICE_MEMORY
  - VK_ERROR_DEVICE_LOST

7.9. Host Write Ordering Guarantees

When batches of command buffers are submitted to a queue via a queue submission command, it defines a memory dependency with prior host operations, and execution of command buffers submitted to the queue.

The first synchronization scope includes execution of vkQueueSubmit on the host and anything that happened-before it, as defined by the host memory model.

Some systems allow writes that do not directly integrate with the host memory model; these have to be synchronized by the application manually. One example of this is non-temporal store instructions on x86; to ensure these happen-before submission, applications should call _mm_sfence().

The second synchronization scope includes all commands submitted in the same queue submission, and all commands that occur later in submission order.

The first access scope includes all host writes to mappable device memory that are available to the host memory domain.

The second access scope includes all memory access performed by the device.
7.10. Synchronization and Multiple Physical Devices

If a logical device includes more than one physical device, then fences, semaphores, and events all still have a single instance of the signaled state.

A fence becomes signaled when all physical devices complete the necessary queue operations.

Semaphore wait and signal operations all include a device index that is the sole physical device that performs the operation. These indices are provided in the `VkDeviceGroupSubmitInfo` and `VkDeviceGroupBindSparseInfo` structures. Semaphores are not exclusively owned by any physical device. For example, a semaphore can be signaled by one physical device and then waited on by a different physical device.

An event can only be waited on by the same physical device that signaled it (or the host).

7.11. Calibrated timestamps

In order to be able to correlate the time a particular operation took place at on timelines of different time domains (e.g. a device operation vs. a host operation), Vulkan allows querying calibrated timestamps from multiple time domains.

To query calibrated timestamps from a set of time domains, call:

```c
// Provided by VK_EXT_calibrated_timestamps
VkResult vkGetCalibratedTimestampsEXT(
    VkDevice device,
    uint32_t timestampCount,
    const VkCalibratedTimestampInfoEXT* pTimestampInfos,
    uint64_t* pTimestamps,
    uint64_t* pMaxDeviation);
```

- `device` is the logical device used to perform the query.
- `timestampCount` is the number of timestamps to query.
- `pTimestampInfos` is a pointer to an array of `timestampCount` `VkCalibratedTimestampInfoEXT` structures, describing the time domains the calibrated timestamps should be captured from.
- `pTimestamps` is a pointer to an array of `timestampCount` 64-bit unsigned integer values in which the requested calibrated timestamp values are returned.
- `pMaxDeviation` is a pointer to a 64-bit unsigned integer value in which the strictly positive maximum deviation, in nanoseconds, of the calibrated timestamp values is returned.

**Note**
The maximum deviation may vary between calls to `vkGetCalibratedTimestampsEXT` even for the same set of time domains due to implementation and platform specific reasons. It is the application’s responsibility to assess whether the returned maximum deviation makes the timestamp values suitable for any particular purpose and can choose to re-issue the timestamp calibration call.
pursuing a lower deviation value.

Calibrated timestamp values can be extrapolated to estimate future coinciding timestamp values, however, depending on the nature of the time domains and other properties of the platform extrapolating values over a sufficiently long period of time may no longer be accurate enough to fit any particular purpose, so applications are expected to re-calibrate the timestamps on a regular basis.

Valid Usage

- VUID-vkGetCalibratedTimestampsEXT-timeDomain-09246
  The timeDomain value of each VkCalibratedTimestampInfoEXT in pTimestampInfos must be unique

Valid Usage (Implicit)

- VUID-vkGetCalibratedTimestampsEXT-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetCalibratedTimestampsEXT-pTimestampInfos-parameter
  pTimestampInfos must be a valid pointer to an array of timestampCount valid VkCalibratedTimestampInfoEXT structures
- VUID-vkGetCalibratedTimestampsEXT-pTimestamps-parameter
  pTimestamps must be a valid pointer to an array of timestampCount uint64_t values
- VUID-vkGetCalibratedTimestampsEXT-pMaxDeviation-parameter
  pMaxDeviation must be a valid pointer to a uint64_t value
- VUID-vkGetCalibratedTimestampsEXT-timestampCount-arraylength
  timestampCount must be greater than 0

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkCalibratedTimestampInfoEXT structure is defined as:

```c
// Provided by VK_EXT_calibrated_timestamps
typedef struct VkCalibratedTimestampInfoEXT {
    VkStructureType     sType;
    const void*         pNext;
} VkCalibratedTimestampInfoEXT;
```
VkTimeDomainEXT  timeDomain;
} VkCalibratedTimestampInfoEXT;

- *sType* is a VkStructureType value identifying this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- *timeDomain* is a VkTimeDomainEXT value specifying the time domain from which the calibrated timestamp value should be returned.

**Valid Usage**

- VUID-VkCalibratedTimestampInfoEXT-timeDomain-02354
  
  *timeDomain* must be one of the VkTimeDomainEXT values returned by vkGetPhysicalDeviceCalibrateableTimeDomainsEXT

**Valid Usage (Implicit)**

- VUID-VkCalibratedTimestampInfoEXT-sType-sType
  
  *sType* must be VK_STRUCTURE_TYPE_CALIBRATED_TIMESTAMP_INFO_EXT

- VUID-VkCalibratedTimestampInfoEXT-pNext-pNext
  
  *pNext* must be NULL

- VUID-VkCalibratedTimestampInfoEXT-timeDomain-parameter

  *timeDomain* must be a valid VkTimeDomainEXT value

The set of supported time domains consists of:

```
// Provided by VK_EXT_calibrated_timestamps
typedef enum VkTimeDomainEXT {
    VK_TIME_DOMAIN_DEVICE_EXT = 0,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_EXT = 1,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_EXT = 2,
    VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_EXT = 3,
} VkTimeDomainEXT;
```

- **VK_TIME_DOMAIN_DEVICE_EXT** specifies the device time domain. Timestamp values in this time domain use the same units and are comparable with device timestamp values captured using vkCmdWriteTimestamp or vkCmdWriteTimestamp2 and are defined to be incrementing according to the timestampPeriod of the device.

- **VK_TIME_DOMAIN_CLOCK_MONOTONIC_EXT** specifies the CLOCK_MONOTONIC time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX clock_gettime API as computed by this example:

  ```
  Note
  ```
An implementation supporting `VK_EXT_calibrated_timestamps` will use the same time domain for all its `VkQueue` so that timestamp values reported for `VK_TIME_DOMAIN_DEVICE_EXT` can be matched to any timestamp captured through `vkCmdWriteTimestamp` or `vkCmdWriteTimestamp2`.

```c
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

- `VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_EXT` specifies the CLOCK_MONOTONIC_RAW time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX `clock_gettime` API as computed by this example:

```c
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC_RAW, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

- `VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_EXT` specifies the performance counter (QPC) time domain available on Windows. Timestamp values in this time domain are in the same units as those provided by the Windows `QueryPerformanceCounter` API and are comparable with platform timestamp values captured using that API as computed by this example:

```c
LARGE_INTEGER counter;
QueryPerformanceCounter(&counter);
return counter.QuadPart;
```
Chapter 8. Render Pass

Draw commands must be recorded within a render pass instance. Each render pass instance defines a set of image resources, referred to as attachments, used during rendering.

To begin a render pass instance, call:

```
// Provided by VK_VERSION_1_3
void vkCmdBeginRendering(
    VkCommandBuffer commandBuffer,
    const VkRenderingInfo* pRenderingInfo);
```

or the equivalent command

```
// Provided by VK_KHR_dynamic_rendering
void vkCmdBeginRenderingKHR(
    VkCommandBuffer commandBuffer,
    const VkRenderingInfo* pRenderingInfo);
```

- commandBuffer is the command buffer in which to record the command.
- pRenderingInfo is a pointer to a VkRenderingInfo structure specifying details of the render pass instance to begin.

After beginning a render pass instance, the command buffer is ready to record draw commands.

If pRenderingInfo->flags includes VK_RENDERING_RESUMING_BIT then this render pass is resumed from a render pass instance that has been suspended earlier in submission order.

---

### Valid Usage

- VUID-vkCmdBeginRendering-dynamicRendering-06446
  The dynamicRendering feature must be enabled

- VUID-vkCmdBeginRendering-commandBuffer-06068
  If commandBuffer is a secondary command buffer, pRenderingInfo->flags must not include
  VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT

---

### Valid Usage (Implicit)

- VUID-vkCmdBeginRendering-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBeginRendering-pRenderingInfo-parameter
  pRenderingInfo must be a valid pointer to a valid VkRenderingInfo structure

- VUID-vkCmdBeginRendering-commandBuffer-recording

---

467
**commandBuffer** must be in the **recording state**

- VUID-vkCmdBeginRendering-commandBuffer-cmdpool
  The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations

- VUID-vkCmdBeginRendering-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBeginRendering-videocoding
  This command must only be called outside of a video coding scope

---

**Host Synchronization**

- Host access to **commandBuffer** must be externally synchronized

- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

---

**Command Properties**

<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The **VkRenderingInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkRenderingInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderingFlags flags;
    VkRect2D renderArea;
    uint32_t layerCount;
    uint32_t viewMask;
    const VkRenderingAttachmentInfo* pColorAttachments;
    const VkRenderingAttachmentInfo* pDepthAttachment;
    const VkRenderingAttachmentInfo* pStencilAttachment;
} VkRenderingInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering, VK_KHR_dynamic_rendering with VK_QCOM_tile_properties
```
typedef VkRenderingInfo VkRenderingInfoKHR;

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of *VkRenderingFlagBits*.
- **renderArea** is the render area that is affected by the render pass instance.
- **layerCount** is the number of layers rendered to in each attachment when **viewMask** is 0.
- **viewMask** is the view mask indicating the indices of attachment layers that will be rendered when it is not 0.
- **colorAttachmentCount** is the number of elements in **pColorAttachments**.
- **pColorAttachments** is a pointer to an array of colorAttachmentCount *VkRenderingAttachmentInfo* structures describing any color attachments used.
- **pDepthAttachment** is a pointer to a *VkRenderingAttachmentInfo* structure describing a depth attachment.
- **pStencilAttachment** is a pointer to a *VkRenderingAttachmentInfo* structure describing a stencil attachment.

If **viewMask** is not 0, multiview is enabled.

If there is an instance of *VkDeviceGroupRenderPassBeginInfo* included in the **pNext** chain and its **deviceRenderAreaCount** member is not 0, then **renderArea** is ignored, and the render area is defined per-device by that structure.

If multiview is enabled, and the multiviewPerViewRenderAreas feature is enabled, and there is an instance of *VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM* included in the **pNext** chain with **perViewRenderAreaCount** not equal to 0, then the elements of *VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM::pPerViewRenderAreas** override **renderArea** and define a render area for each view. In this case, **renderArea** must be set to an area at least as large as the union of all the per-view render areas.

Each element of the **pColorAttachments** array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a **Location** value of **X**, then it uses the attachment provided in **pColorAttachments[X]**. If the **imageView** member of any element of **pColorAttachments** is **VK_NULL_HANDLE**, writes to the corresponding location by a fragment are discarded.

### Valid Usage

- **VUID-VkRenderingInfo-viewMask-06069**
  If **viewMask** is 0, **layerCount** must not be 0
- **VUID-VkRenderingInfo-multisampledRenderToSingleSampled-06857**
  If none of the **VK_AMD_mixed_attachment_samples** extension, the **VK_NV_framebuffer_mixed_samples** extension, or the **multisampledRenderToSingleSampled** feature are enabled, **imageView** members of **pDepthAttachment**, **pStencilAttachment**, and...
elements of `pColorAttachments` that are not `VK_NULL_HANDLE` must have been created with the same `sampleCount`

- **VUID-VkRenderingInfo-None-08994**
  If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is 0, `renderArea.extent.width` must be greater than 0

- **VUID-VkRenderingInfo-None-08995**
  If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is 0, `renderArea.extent.height` must be greater than 0

- **VUID-VkRenderingInfo-imageView-06858**
  If `multisampled-render-to-single-sampled` is enabled, then all attachments referenced by `imageView` members of `pDepthAttachment`, `pStencilAttachment`, and elements of `pColorAttachments` that are not `VK_NULL_HANDLE` must have a sample count that is either `VK_SAMPLE_COUNT_1_BIT` or equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`

- **VUID-VkRenderingInfo-imageView-06859**
  If `multisampled-render-to-single-sampled` is enabled, then all attachments referenced by `imageView` members of `pDepthAttachment`, `pStencilAttachment`, and elements of `pColorAttachments` that are not `VK_NULL_HANDLE` and have a sample count of `VK_SAMPLE_COUNT_1_BIT` must have been created with `VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT` in their `VkImageCreateInfo::flags`

- **VUID-VkRenderingInfo-pNext-06077**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` must be greater than or equal to 0

- **VUID-VkRenderingInfo-pNext-06078**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` must be greater than or equal to 0

- **VUID-VkRenderingInfo-pNext-07815**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the sum of `renderArea.extent.width` and `renderArea.offset.x` must be less than or equal to `maxFramebufferWidth`

- **VUID-VkRenderingInfo-pNext-07816**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the sum of `renderArea.extent.height` and `renderArea.offset.y` must be less than or equal to `maxFramebufferHeight`

- **VUID-VkRenderingInfo-pNext-06079**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the width of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` must be greater than or equal to `renderArea.offset.x + renderArea.extent.width`

- **VUID-VkRenderingInfo-pNext-06080**
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the height of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` must be greater than or equal to `renderArea.offset.y + renderArea.extent.height`.

- **VUID-VkRenderingInfo-pNext-06083**
  If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, the width of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` must be greater than or equal to the sum of the `offset.x` and `extent.width` members of each element of `pDeviceRenderAreas`.

- **VUID-VkRenderingInfo-pNext-06084**
  If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, the height of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` must be greater than or equal to the sum of the `offset.y` and `extent.height` members of each element of `pDeviceRenderAreas`.

- **VUID-VkRenderingInfo-pDepthAttachment-06085**
  If neither `pDepthAttachment` or `pStencilAttachment` are NULL and the `imageView` member of either structure is not `VK_NULL_HANDLE`, the `imageView` member of each structure must be the same.

- **VUID-VkRenderingInfo-pDepthAttachment-06086**
  If neither `pDepthAttachment` or `pStencilAttachment` are NULL, and the `resolveMode` member of each is not `VK_RESOLVE_MODE_NONE`, the `resolveImageView` member of each structure must be the same.

- **VUID-VkRenderingInfo-colorAttachmentCount-06087**
  If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, that `imageView` must have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`.

- **VUID-VkRenderingInfo-pDepthAttachment-06547**
  If `pDepthAttachment` is not NULL and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->imageView` must have been created with a format that includes a depth component.

- **VUID-VkRenderingInfo-pDepthAttachment-06088**
  If `pDepthAttachment` is not NULL and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->imageView` must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkRenderingInfo-pStencilAttachment-06548**
  If `pStencilAttachment` is not NULL and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->imageView` must have been created with a format that includes a stencil aspect.

- **VUID-VkRenderingInfo-pStencilAttachment-06089**
  If `pStencilAttachment` is not NULL and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->imageView` must have been created with a stencil usage including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkRenderingInfo-colorAttachmentCount-06090**
If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, the layout member of that element of `pColorAttachments` must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderingInfo-colorAttachmentCount-06091**
  If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, if the `resolveMode` member of that element of `pColorAttachments` is not `VK_RESOLVE_MODE_NONE`, its `resolveImageLayout` member must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderingInfo-pDepthAttachment-06092**
  If `pDepthAttachment` is not `NULL` and the `pDepthAttachment->imageView` member is not `VK_NULL_HANDLE`, `pDepthAttachment->layout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`.

- **VUID-VkRenderingInfo-pDepthAttachment-06093**
  If `pDepthAttachment` is not `NULL`, the `pDepthAttachment->imageView` member is not `VK_NULL_HANDLE`, and the `pDepthAttachment->resolveMode` member is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageLayout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`.

- **VUID-VkRenderingInfo-pStencilAttachment-06094**
  If `pStencilAttachment` is not `NULL` and the `pStencilAttachment->imageView` member is not `VK_NULL_HANDLE`, `pStencilAttachment->layout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`.

- **VUID-VkRenderingInfo-pStencilAttachment-06095**
  If `pStencilAttachment` is not `NULL`, the `pStencilAttachment->imageView` member is not `VK_NULL_HANDLE`, and the `pStencilAttachment->resolveMode` member is not `VK_RESOLVE_MODE_NONE`, `pStencilAttachment->resolveImageLayout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`.

- **VUID-VkRenderingInfo-colorAttachmentCount-06096**
  If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, the layout member of that element of `pColorAttachments` must not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderingInfo-colorAttachmentCount-06097**
  If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, if the `resolveMode` member of that element of `pColorAttachments` is not `VK_RESOLVE_MODE_NONE`, its `resolveImageLayout` member must not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderingInfo-pDepthAttachment-06098**
  If `pDepthAttachment` is not `NULL`, the `pDepthAttachment->imageView` member is not `VK_NULL_HANDLE`, and the `pDepthAttachment->resolveMode` member is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkRenderingInfo-pStencilAttachment-06099**
  If `pStencilAttachment` is not `NULL`, the `pStencilAttachment->imageView` member is not `VK_NULL_HANDLE`, `pStencilAttachment->layout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`.
and pStencilAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pStencilAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkRenderingContext-colorAttachmentCount-06100
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, the layout member of that element of pColorAttachments must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkRenderingContext-colorAttachmentCount-06101
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, if the resolveMode member of that element of pColorAttachments is not VK_RESOLVE_MODE_NONE, its resolveImageLayout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkRenderingContext-pDepthAttachment-07732
  If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->layout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkRenderingContext-pDepthAttachment-07733
  If pDepthAttachment is not NULL, pDepthAttachment->imageView is not VK_NULL_HANDLE, and pDepthAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pDepthAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkRenderingContext-pStencilAttachment-07734
  If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->layout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

• VUID-VkRenderingContext-pStencilAttachment-07735
  If pStencilAttachment is not NULL, pStencilAttachment->imageView is not VK_NULL_HANDLE, and pStencilAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pStencilAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkRenderingContext-pDepthAttachment-06102
  If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->resolveMode must be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes

• VUID-VkRenderingContext-pStencilAttachment-06103
  If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->resolveMode must be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes

• VUID-VkRenderingContext-pDepthAttachment-06104
  If pDepthAttachment or pStencilAttachment are both not NULL, pDepthAttachment->imageView
and pStencilAttachment->imageView are both not VK_NULL_HANDLE, and VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone is VK_FALSE, the resolveMode of both structures must be the same value

- VUID-VkRenderingInfo-pDepthAttachment-06105
  If pDepthAttachment or pStencilAttachment are both not NULL, pDepthAttachment->imageView and pStencilAttachment->imageView are both not VK_NULL_HANDLE, VkPhysicalDeviceDepthStencilResolveProperties::independentResolve is VK_FALSE, and the resolveMode of neither structure is VK_RESOLVE_MODE_NONE, the resolveMode of both structures must be the same value

- VUID-VkRenderingInfo-colorAttachmentCount-06106
colorAttachmentCount must be less than or equal to VkPhysicalDeviceLimits::maxColorAttachments

- VUID-VkRenderingInfo-imageView-06107
  If the imageView member of a VkRenderingFragmentDensityMapAttachmentInfoEXT structure included in the pNext chain is not VK_NULL_HANDLE, and the fragmentDensityMapNonSubsampledImages feature is not enabled, valid imageView and resolveImageView members of pDepthAttachment, pStencilAttachment, and each element of pColorAttachments must be a VkImageView created with VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

- VUID-VkRenderingInfo-imageView-06108
  If the imageView member of a VkRenderingFragmentDensityMapAttachmentInfoEXT structure included in the pNext chain is not VK_NULL_HANDLE, and viewMask is not 0, imageView must have a layerCount greater than or equal to the index of the most significant bit in viewMask

- VUID-VkRenderingInfo-imageView-06109
  If the imageView member of a VkRenderingFragmentDensityMapAttachmentInfoEXT structure included in the pNext chain is not VK_NULL_HANDLE, and viewMask is 0, imageView must have a layerCount equal to 1

- VUID-VkRenderingInfo-pNext-06112
  If the pNext chain does not contain VkDeviceGroupRenderPassBeginInfo or its deviceRenderAreaCount member is equal to 0 and the imageView member of a VkRenderingFragmentDensityMapAttachmentInfoEXT structure included in the pNext chain is not VK_NULL_HANDLE, imageView must have a width greater than or equal to \[
\left\lfloor \frac{\text{renderArea}_x + \text{renderArea}_width}{\text{maxFragmentDensityTextureSize}_width} \right\rfloor
\]

- VUID-VkRenderingInfo-pNext-06113
  If the pNext chain contains a VkDeviceGroupRenderPassBeginInfo structure, its deviceRenderAreaCount member is not 0, and the imageView member of a VkRenderingFragmentDensityMapAttachmentInfoEXT structure included in the pNext chain is not VK_NULL_HANDLE, imageView must have a width greater than or equal to \[
\left\lfloor \frac{pDeviceRenderArea_x + pDeviceRenderArea_width}{\text{maxFragmentDensityTextureSize}_width} \right\rfloor
\]
  for each element of pDeviceRenderAreas

- VUID-VkRenderingInfo-pNext-06114
  If the pNext chain does not contain VkDeviceGroupRenderPassBeginInfo or its deviceRenderAreaCount member is equal to 0 and the imageView member of a VkRenderingFragmentDensityMapAttachmentInfoEXT structure included in the pNext chain is not VK_NULL_HANDLE, imageView must have a height greater than or equal to
If the `pNext` chain contains a `VkDeviceGroupRenderPassBeginInfo` structure, its `deviceRenderAreaCount` member is not 0, and the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a height greater than or equal to \[
\left\lfloor \frac{\text{renderAreaY} + \text{renderAreaHeight}}{\text{maxFragmentDensityTexelSize.height}} \right\rfloor \]
for each element of `pDeviceRenderAreas`.

If the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, it must not be equal to the `imageView` or `resolveImageView` member of `pDepthAttachment`, `pStencilAttachment`, or any element of `pColorAttachments`.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0 and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a width greater than or equal to \[
\left\lfloor \frac{\text{shadingRateAreaX} + \text{renderAreaX}}{\text{shadingRateAttachment TexelSize.width}} \right\rfloor \]
for each element of `pDeviceRenderAreas`.

If the `pNext` chain contains a `VkDeviceGroupRenderPassBeginInfo` structure, its `deviceRenderAreaCount` member is not 0, and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a width greater than or equal to \[
\left\lfloor \frac{\text{shadingRateAreaX} + \text{renderAreaX}}{\text{shadingRateAttachment TexelSize.width}} \right\rfloor \]
for each element of `pDeviceRenderAreas`.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0 and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a height greater than or equal to \[
\left\lfloor \frac{\text{renderAreaY} + \text{renderAreaHeight}}{\text{shadingRateAttachment TexelSize.height}} \right\rfloor \]
\nlayerCount must be less than or equal to `maxFramebufferLayers`.

If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is 0, `imageView` must have a `layerCount` that is either equal to 1 or greater than or equal to `layerCount`. 
If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is not `0`, `imageView` must have a `layerCount` that either equal to `1` or greater than or equal to the index of the most significant bit in `viewMask`.

- **VUID-VkRenderingInfo-imageView-06125**
  If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, it must not be equal to the `imageView` or `resolveImageView` member of `pDepthAttachment`, `pStencilAttachment`, or any element of `pColorAttachments`.

- **VUID-VkRenderingInfo-imageView-06126**
  If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, it must not be equal to the `imageView` member of a `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure included in the `pNext` chain.

- **VUID-VkRenderingInfo-multiview-06127**
  If the `multiview` feature is not enabled, `viewMask` must be `0`.

- **VUID-VkRenderingInfo-viewMask-06128**
  The index of the most significant bit in `viewMask` must be less than `maxMultiviewViewCount`.

- **VUID-VkRenderingInfo-perViewRenderAreaCount-07857**
  If the `perViewRenderAreaCount` member of a `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` structure included in the `pNext` chain is not `0`, then the `multiviewPerViewRenderAreas` feature must be enabled.

- **VUID-VkRenderingInfo-perViewRenderAreaCount-07858**
  If the `perViewRenderAreaCount` member of a `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` structure included in the `pNext` chain is not `0`, then `renderArea` must specify a render area that includes the union of all per view render areas.

- **VUID-VkRenderingInfo-None-09044**
  Valid attachments specified by this structure must not be bound to memory locations that are bound to any other valid attachments specified by this structure.

---

**Valid Usage (Implicit)**

- **VUID-VkRenderingInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_RENDERING_INFO`.

- **VUID-VkRenderingInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDeviceGroupRenderPassBeginInfo`, `VkMultisampledRenderToSingleSampledInfoEXT`, `VkMultiviewPerViewAttributesInfoNVX`, `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM`, `VkRenderingFragmentDensityMapAttachmentInfoEXT`, `VkRenderingFragmentShadingRateAttachmentInfoKHR`, or...
• **VUID-VkRenderingInfo-sType-unique**
The `sType` value of each struct in the `pNext` chain must be unique.

• **VUID-VkRenderingInfo-flags-parameter**
  `flags` must be a valid combination of `VkRenderingFlagBits` values.

• **VUID-VkRenderingInfo-pColorAttachments-parameter**
  If `colorAttachmentCount` is not 0, `pColorAttachments` must be a valid pointer to an array of `colorAttachmentCount` valid `VkRenderingAttachmentInfo` structures.

• **VUID-VkRenderingInfo-pDepthAttachment-parameter**
  If `pDepthAttachment` is not `NULL`, `pDepthAttachment` must be a valid pointer to a valid `VkRenderingAttachmentInfo` structure.

• **VUID-VkRenderingInfo-pStencilAttachment-parameter**
  If `pStencilAttachment` is not `NULL`, `pStencilAttachment` must be a valid pointer to a valid `VkRenderingAttachmentInfo` structure.

Bits which can be set in `VkRenderingInfo::flags` describing additional properties of the render pass are:

```c
// Provided by VK_VERSION_1_3
typedef enum VkRenderingFlagBits {
    VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT = 0x00000001,
    VK_RENDERING_SUSPENDING_BIT = 0x00000002,
    VK_RENDERING_RESUMING_BIT = 0x00000004,
} VkRenderingFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingFlagBits VkRenderingFlagBitsKHR;
```

- **VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT** specifies that draw calls for the render pass instance will be recorded in secondary command buffers.
- **VK_RENDERING_RESUMING_BIT** specifies that the render pass instance is resuming an earlier suspended render pass instance.
- **VK_RENDERING_SUSPENDING_BIT** specifies that the render pass instance will be suspended.
- **VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT** specifies that Legacy Dithering is enabled for the render pass instance.
The contents of `pRenderingInfo` must match between suspended render pass instances and the render pass instances that resume them, other than the presence or absence of the `VK_RENDERING_RESUMING_BIT`, `VK_RENDERING_SUSPENDING_BIT`, and `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT` flags. No action or synchronization commands, or other render pass instances, are allowed between suspending and resuming render pass instances.

```c
// Provided by VK_VERSION_1_3
typedef VkFlags VkRenderFlags;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderFlags VkRenderFlagsKHR;
```

`VkRenderFlags` is a bitmask type for setting a mask of zero or more `VkRenderFlagBits`.

The `VkRenderingAttachmentInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkRenderingAttachmentInfo {  
VkStructureType sType;
const void* pNext;
VkImageView imageView;
VkImageLayout imageLayout;
VkResolveModeFlagBits resolveMode;
VkImageView resolveImageView;
VkImageLayout resolveImageLayout;
VkAttachmentLoadOp loadOp;
VkAttachmentStoreOp storeOp;
VkClearValue clearValue;
} VkRenderingAttachmentInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingAttachmentInfo VkRenderingAttachmentInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imageView` is the image view that will be used for rendering.
- `imageLayout` is the layout that `imageView` will be in during rendering.
- `resolveMode` is a `VkResolveModeFlagBits` value defining how multisampled data written to `imageView` will be resolved.
• **resolveImageView** is an image view used to write resolved multisample data at the end of rendering.

• **resolveImageLayout** is the layout that **resolveImageView** will be in during rendering.

• **loadOp** is a **VkAttachmentLoadOp** value defining the load operation for the attachment.

• **storeOp** is a **VkAttachmentStoreOp** value defining the store operation for the attachment.

• **clearValue** is a **VkClearValue** structure defining values used to clear **imageView** when **loadOp** is **VK_ATTACHMENT_LOAD_OP_CLEAR**.

Values in **imageView** are loaded and stored according to the values of **loadOp** and **storeOp**, within the render area for each device specified in **VkRenderingInfo**. If **imageView** is **VK_NULL_HANDLE**, other members of this structure are ignored; writes to this attachment will be discarded, and no load, store, or multisample resolve operations will be performed.

If **resolveMode** is **VK_RESOLVE_MODE_NONE**, then **resolveImageView** is ignored. If **resolveMode** is not **VK_RESOLVE_MODE_NONE**, and **resolveImageView** is not **VK_NULL_HANDLE**, a render pass multisample resolve operation is defined for the attachment subresource.

**Note**

The resolve mode and store operation are independent; it is valid to write both resolved and unresolved values, and equally valid to discard the unresolved values while writing the resolved ones.

Store and resolve operations are only performed at the end of a render pass instance that does not specify the **VK_RENDERING_SUSPENDING_BIT_KHR** flag.

Load operations are only performed at the beginning of a render pass instance that does not specify the **VK_RENDERING_RESUMING_BIT_KHR** flag.

Image contents at the end of a suspended render pass instance remain defined for access by a resuming render pass instance.

### Valid Usage

- **VUID-VkRenderingAttachmentInfo-imageView-06129**
  If **imageView** is not **VK_NULL_HANDLE** and has a non-integer color format, **resolveMode** must be **VK_RESOLVE_MODE_NONE** or **VK_RESOLVE_MODE_AVERAGE_BIT**

- **VUID-VkRenderingAttachmentInfo-imageView-06130**
  If **imageView** is not **VK_NULL_HANDLE** and has an integer color format, **resolveMode** must be **VK_RESOLVE_MODE_NONE** or **VK_RESOLVE_MODE_SAMPLE_ZERO_BIT**

- **VUID-VkRenderingAttachmentInfo-imageView-06861**
  If **imageView** is not **VK_NULL_HANDLE**, **resolveMode** is not **VK_RESOLVE_MODE_NONE**, and the **pNext** chain of **VkRenderingInfo** does not include a **VkMultisampledRenderToSingleSampledInfoEXT** structure with the **multisampledRenderToSingleSampledEnable** field equal to **VK_TRUE**, **imageView** must not have a sample count of **VK_SAMPLE_COUNT_1_BIT**
If `imageView` is not `VK_NULL_HANDLE`, `resolveMode` is not `VK_RESOLVE_MODE_NONE`, and the `pNext` chain of `VkRenderingInfo` does not include a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the `multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`, `resolveImageView` must not be `VK_NULL_HANDLE`.

If `imageView` is not `VK_NULL_HANDLE`, `resolveMode` is not `VK_RESOLVE_MODE_NONE`, the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the `multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`, and `imageView` has a sample count of `VK_SAMPLE_COUNT_1_BIT`, `resolveImageView` must be `VK_NULL_HANDLE`.

If `imageView` is not `VK_NULL_HANDLE`, `resolveImageView` is not `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageView` must have a sample count of `VK_SAMPLE_COUNT_1_BIT`.

If `imageView` is not `VK_NULL_HANDLE`, `resolveImageView` is not `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `imageView` and `resolveImageView` must have the same `VkFormat`.

If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV`.

If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV`.

If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`.
If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`.

- VUID-VkRenderingAttachmentInfo-imageView-06142
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.

- VUID-VkRenderingAttachmentInfo-imageView-06143
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`.

- VUID-VkRenderingAttachmentInfo-imageView-06144
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`.

- VUID-VkRenderingAttachmentInfo-imageView-06145
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`.

- VUID-VkRenderingAttachmentInfo-imageView-06146
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`.

Valid Usage (Implicit)

- VUID-VkRenderingAttachmentInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_RENDERING_ATTACHMENT_INFO`.

- VUID-VkRenderingAttachmentInfo-pNext-pNext
  `pNext` must be `NULL`.

- VUID-VkRenderingAttachmentInfo-imageView-parameter
  If `imageView` is not `VK_NULL_HANDLE`, `imageView` must be a valid `VkImageView` handle.

- VUID-VkRenderingAttachmentInfo-imageLayout-parameter
  `imageLayout` must be a valid `VkImageLayout` value.

- VUID-VkRenderingAttachmentInfo-resolveMode-parameter
  If `resolveMode` is not `0`, `resolveMode` must be a valid `VkResolveModeFlagBits` value.

- VUID-VkRenderingAttachmentInfo-resolveImageView-parameter
  If `resolveImageView` is not `VK_NULL_HANDLE`, `resolveImageView` must be a valid `VkImageView` handle.

- VUID-VkRenderingAttachmentInfo-resolveImageLayout-parameter
  `resolveImageLayout` must be a valid `VkImageLayout` value.

- VUID-VkRenderingAttachmentInfo-loadOp-parameter
  `loadOp` must be a valid `VkAttachmentLoadOp` value.

- VUID-VkRenderingAttachmentInfo-storeOp-parameter
  `storeOp` must be a valid `VkAttachmentStoreOp` value.

- VUID-VkRenderingAttachmentInfo-clearValue-parameter
clearValue must be a valid VkClearValue union

- VUID-VkRenderingAttachmentInfo-commonparent
  Both of imageView, and resolveImageView that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

The VkRenderingFragmentShadingRateAttachmentInfoKHR structure is defined as:

// Provided by VK_KHR_dynamic_rendering with VK_KHR_fragment_shading_rate
typedef struct VkRenderingFragmentShadingRateAttachmentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkImageView imageView;
    VkImageLayout imageLayout;
    VkExtent2D shadingRateAttachmentTexelSize;
} VkRenderingFragmentShadingRateAttachmentInfoKHR;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- imageView is the image view that will be used as a fragment shading rate attachment.
- imageLayout is the layout that imageView will be in during rendering.
- shadingRateAttachmentTexelSize specifies the number of pixels corresponding to each texel in imageView.

This structure can be included in the pNext chain of VkRenderingInfo to define a fragment shading rate attachment. If imageView is VK_NULL_HANDLE, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

Valid Usage

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06147
  If imageView is not VK_NULL_HANDLE, layout must be VK_IMAGE_LAYOUT_GENERAL or VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06148
  If imageView is not VK_NULL_HANDLE, it must have been created with VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06149
  If imageView is not VK_NULL_HANDLE, shadingRateAttachmentTexelSize.width must be a power of two value

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06150
  If imageView is not VK_NULL_HANDLE, shadingRateAttachmentTexelSize.width must be less than or equal to maxFragmentShadingRateAttachmentTexelSize.width

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06151
If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` **must** be

greater than or equal to `minFragmentShadingRateAttachmentTexelSize.width`.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06152**

If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` **must** be a

power of two value.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06153**

If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` **must** be

less than or equal to `maxFragmentShadingRateAttachmentTexelSize.height`.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06154**

If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` **must** be

greater than or equal to `minFragmentShadingRateAttachmentTexelSize.height`.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06155**

If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.width` and

`shadingRateAttachmentTexelSize.height` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06156**

If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.height` and `shadingRateAttachmentTexelSize.width` **must** be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`.

**Valid Usage (Implicit)**

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-sType-sType**

  `sType` **must** be `VK_STRUCTURE_TYPE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR`.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-parameter**

  If `imageView` is not `VK_NULL_HANDLE`, `imageView` **must** be a valid `VkImageView` handle.

• **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageLayout-parameter**

  `imageLayout` **must** be a valid `VkImageLayout` value.

The `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure is defined as:

```c
// Provided by VK_KHR_dynamic_rendering with VK_EXT_fragment_density_map
typedef struct VkRenderingFragmentDensityMapAttachmentInfoEXT {
    VkStructureType   sType;
    const void*       pNext;
    VkImageView       imageView;
    VkImageLayout     imageLayout;
} VkRenderingFragmentDensityMapAttachmentInfoEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `imageView` is the image view that will be used as a fragment density map attachment.
• imageLayout is the layout that imageView will be in during rendering.

This structure can be included in the pNext chain of VkRenderingInfo to define a fragment density map. If this structure is not included in the pNext chain, imageView is treated as VK_NULL_HANDLE.

Valid Usage

• VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-06157
  If imageView is not VK_NULL_HANDLE, layout must be VK_IMAGE_LAYOUT_GENERAL or VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT

• VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-06158
  If imageView is not VK_NULL_HANDLE, it must have been created with VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT

• VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-06159
  If imageView is not VK_NULL_HANDLE, it must not have been created with VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

• VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-apiVersion-07908
  If VK_KHR_multiview is not enabled, VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, and imageView is not VK_NULL_HANDLE, it must have a layerCount equal to 1

Valid Usage (Implicit)

• VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_INFO_EXT

• VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-parameter
  imageView must be a valid VkImageView handle

• VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageLayout-parameter
  imageLayout must be a valid VkImageLayout value

To query the render area granularity for a render pass instance, call:

```c
// Provided by VK_KHR_maintenance5
void vkGetRenderingAreaGranularityKHR(
  VkDevice device,
  const VkRenderingAreaInfoKHR* pRenderingAreaInfo,
  VkExtent2D* pGranularity);
```

• device is the logical device that owns the render pass instance.

• pRenderingAreaInfo is a pointer to a VkRenderingAreaInfoKHR structure specifying details of the render pass instance to query the render area granularity for.

• pGranularity is a pointer to a VkExtent2D structure in which the granularity is returned.

The conditions leading to an optimal renderArea are:
• the offset.x member in renderArea is a multiple of the width member of the returned VkExtent2D (the horizontal granularity).

• the offset.y member in renderArea is a multiple of the height member of the returned VkExtent2D (the vertical granularity).

• either the extent.width member in renderArea is a multiple of the horizontal granularity or offset.x+extent.width is equal to the width of the framebuffer in the VkRenderPassBeginInfo.

• either the extent.height member in renderArea is a multiple of the vertical granularity or offset.y+extent.height is equal to the height of the framebuffer in the VkRenderPassBeginInfo.

Valid Usage (Implicit)

• VUID-vkGetRenderingAreaGranularityKHR-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetRenderingAreaGranularityKHR-pRenderingAreaInfo-parameter
pRenderingAreaInfo must be a valid pointer to a valid VkRenderingAreaInfoKHR structure

• VUID-vkGetRenderingAreaGranularityKHR-pGranularity-parameter
pGranularity must be a valid pointer to a VkExtent2D structure

The VkRenderingAreaInfoKHR structure is defined as:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkRenderingAreaInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkFormat* pColorAttachmentFormats;
    VkFormat depthAttachmentFormat;
    VkFormat stencilAttachmentFormat;
} VkRenderingAreaInfoKHR;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• viewMask is the viewMask used for rendering.

• colorAttachmentCount is the number of entries in pColorAttachmentFormats.

• pColorAttachmentFormats is a pointer to an array of VkFormat values defining the format of color attachments used in the render pass instance.

• depthAttachmentFormat is a VkFormat value defining the format of the depth attachment used in the render pass instance.

• stencilAttachmentFormat is a VkFormat value defining the format of the stencil attachment used in the render pass instance.
Valid Usage (Implicit)

- VUID-VkRenderingAreaInfoKHR-sType-sType
  
  *sType must be VK_STRUCTURE_TYPE_RENDERING_AREA_INFO_KHR*

- VUID-VkRenderingAreaInfoKHR-pNext-pNext
  
  *pNext must be NULL*

To end a render pass instance, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdEndRendering(
    VkCommandBuffer commandBuffer);
```

or the equivalent command

```c
// Provided by VK_KHR_dynamic_rendering
void vkCmdEndRenderingKHR(
    VkCommandBuffer commandBuffer);
```

- *commandBuffer* is the command buffer in which to record the command.

If the value of *pRenderingInfo->flags* used to begin this render pass instance included *VK_RENDERING_SUSPENDING_BIT*, then this render pass is suspended and will be resumed later in submission order.

Valid Usage

- VUID-vkCmdEndRendering-None-06161
  The current render pass instance must have been begun with *vkCmdBeginRendering*

- VUID-vkCmdEndRendering-commandBuffer-06162
  The current render pass instance must have been begun in *commandBuffer*

- VUID-vkCmdEndRendering-None-06781
  This command must not be recorded when transform feedback is active

- VUID-vkCmdEndRendering-None-06999
  If *vkCmdBeginQuery* was called within the render pass, the corresponding *vkCmdEndQuery* must have been called subsequently within the same subpass

Valid Usage (Implicit)

- VUID-vkCmdEndRendering-commandBuffer-parameter
  *commandBuffer must be a valid VkCommandBuffer handle*

- VUID-vkCmdEndRendering-commandBuffer-recording
**commandBuffer** must be in the *recording state*

- VUID-vkCmdEndRendering-commandBuffer-cmdpool
  The *VkCommandPool* that **commandBuffer** was allocated from must support graphics operations
- VUID-vkCmdEndRendering-renderpass
  This command must only be called inside of a render pass instance
- VUID-vkCmdEndRendering-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to **commandBuffer** must be externally synchronized
- Host access to the *VkCommandPool* that **commandBuffer** was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>

</tr>
</tbody>
</table>

**Note**

For more complex rendering graphs, it is possible to pre-define a static *render pass* object, which as well as allowing draw commands, allows the definition of framebuffer-local dependencies between multiple subpasses. These objects have a lot of setup cost compared to **vkCmdBeginRendering**, but use of subpass dependencies can confer important performance benefits on some devices.

The *VkTilePropertiesQCOM* structure is defined as:

```c
// Provided by VK_QCOM_tile_properties
typedef struct VkTilePropertiesQCOM {
    VkStructureType sType;
    void* pNext;
    VkExtent3D tileSize;
    VkExtent2D apronSize;
    VkOffset2D origin;
} VkTilePropertiesQCOM;
```

- **sType** is a *VkStructureType* value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `tileSize` is the dimensions of a tile, with width and height describing the width and height of a tile in pixels, and depth corresponding to the number of slices the tile spans.
• `apronSize` is the dimension of the apron.
• `origin` is the top-left corner of the first tile in attachment space.

All tiles will be tightly packed around the first tile, with edges being multiples of tile width and/or height from the origin.

---

**Note**
Reported value for `apronSize` will be zero and its functionality will be described in a future extension.

---

### Valid Usage (Implicit)

- VUID-VkTilePropertiesQCOM-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_TILE_PROPERTIES_QCOM`
- VUID-VkTilePropertiesQCOM-pNext-pNext
  - `pNext` must be `NULL`

To query the tile properties when using dynamic rendering, call:

```c
// Provided by VK_QCOM_tile_properties
VkResult vkGetDynamicRenderingTilePropertiesQCOM(
    VkDevice device,
    const VkRenderingInfo* pRenderingInfo,
    VkTilePropertiesQCOM* pProperties);
```

- `device` is a logical device associated with the render pass.
- `pRenderingInfo` is a pointer to the `VkRenderingInfo` structure specifying details of the render pass instance in dynamic rendering.
- `pProperties` is a pointer to a `VkTilePropertiesQCOM` structure in which the properties are returned.

---

### Valid Usage (Implicit)

- VUID-vkGetDynamicRenderingTilePropertiesQCOM-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetDynamicRenderingTilePropertiesQCOM-pRenderingInfo-parameter
  - `pRenderingInfo` must be a valid pointer to a valid `VkRenderingInfo` structure
- VUID-vkGetDynamicRenderingTilePropertiesQCOM-pProperties-parameter
  - `pProperties` must be a valid pointer to a `VkTilePropertiesQCOM` structure

---
8.1. Render Pass Objects

A render pass object represents a collection of attachments, subpasses, and dependencies between the subpasses, and describes how the attachments are used over the course of the subpasses.

Render passes are represented by `VkRenderPass` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkRenderPass)
```

An attachment description describes the properties of an attachment including its format, sample count, and how its contents are treated at the beginning and end of each render pass instance.

A subpass represents a phase of rendering that reads and writes a subset of the attachments in a render pass. Rendering commands are recorded into a particular subpass of a render pass instance.

A subpass description describes the subset of attachments that is involved in the execution of a subpass. Each subpass can read from some attachments as input attachments, write to some as color attachments or depth/stencil attachments, perform shader resolve operations to color_attachments or depth/stencil_attachments, and perform multisample resolve operations to resolve attachments. A subpass description can also include a set of preserve attachments, which are attachments that are not read or written by the subpass but whose contents must be preserved throughout the subpass.

A subpass uses an attachment if the attachment is a color, depth/stencil, resolve, depth/stencil resolve, fragment shading rate, or input attachment for that subpass (as determined by the `pColorAttachments`, `pDepthStencilAttachment`, `pResolveAttachments`, `VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment`, `VkFragmentShadingRateAttachmentInfoKHR::pFragmentShadingRateAttachment->attachment`, and `pInputAttachments` members of `VkSubpassDescription`, respectively). A subpass does not use an attachment if that attachment is preserved by the subpass. The first use of an attachment is in the lowest numbered subpass that uses that attachment. Similarly, the last use of an attachment is in the highest numbered subpass that uses that attachment.

The subpasses in a render pass all render to the same dimensions, and fragments for pixel (x,y,layer) in one subpass can only read attachment contents written by previous subpasses at that same (x,y,layer) location. For multi-pixel fragments, the pixel read from an input attachment is selected from the pixels covered by that fragment in an implementation-dependent manner. However, this selection must be made consistently for any fragment with the same shading rate for the lifetime of the `VkDevice`. 
By describing a complete set of subpasses in advance, render passes provide the implementation an opportunity to optimize the storage and transfer of attachment data between subpasses.

In practice, this means that subpasses with a simple framebuffer-space dependency may be merged into a single tiled rendering pass, keeping the attachment data on-chip for the duration of a render pass instance. However, it is also quite common for a render pass to only contain a single subpass.

Subpass dependencies describe execution and memory dependencies between subpasses.

A subpass dependency chain is a sequence of subpass dependencies in a render pass, where the source subpass of each subpass dependency (after the first) equals the destination subpass of the previous dependency.

Execution of subpasses may overlap or execute out of order with regards to other subpasses, unless otherwise enforced by an execution dependency. Each subpass only respects submission order for commands recorded in the same subpass, and the vkCmdBeginRenderPass and vkCmdEndRenderPass commands that delimit the render pass - commands within other subpasses are not included. This affects most other implicit ordering guarantees.

A render pass describes the structure of subpasses and attachments independent of any specific image views for the attachments. The specific image views that will be used for the attachments, and their dimensions, are specified in VkFramebuffer objects. Framebuffers are created with respect to a specific render pass that the framebuffer is compatible with (see Render Pass Compatibility). Collectively, a render pass and a framebuffer define the complete render target state for one or more subpasses as well as the algorithmic dependencies between the subpasses.

The various pipeline stages of the drawing commands for a given subpass may execute concurrently and/or out of order, both within and across drawing commands, whilst still respecting pipeline order. However for a given (x,y,layer,sample) sample location, certain per-sample operations are performed in rasterization order.

VK_ATTACHMENT_UNUSED is a constant indicating that a render pass attachment is not used.

```c
#define VK_ATTACHMENT_UNUSED (~0U)
```

## 8.2. Render Pass Creation

To create a render pass, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateRenderPass(
    VkDevice device,
    const VkRenderPassCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
)`
- `device` is the logical device that creates the render pass.
- `pCreateInfo` is a pointer to a `VkRenderPassCreateInfo` structure describing the parameters of the render pass.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pRenderPass` is a pointer to a `VkRenderPass` handle in which the resulting render pass object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateRenderPass-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkCreateRenderPass-pCreateInfo-parameter
  
  `pCreateInfo` must be a valid pointer to a valid `VkRenderPassCreateInfo` structure

- VUID-vkCreateRenderPass-pAllocator-parameter
  
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateRenderPass-pRenderPass-parameter
  
  `pRenderPass` must be a valid pointer to a `VkRenderPass` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkRenderPassCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassCreateFlags flags;
    uint32_t attachmentCount;
    const VkAttachmentDescription* pAttachments;
    uint32_t subpassCount;
    const VkSubpassDescription* pSubpasses;
    uint32_t dependencyCount;
    const VkSubpassDependency* pDependencies;
} VkRenderPassCreateInfo;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **flags** is a bitmask of `VkRenderPassCreateFlagBits`.

• **attachmentCount** is the number of attachments used by this render pass.

• **pAttachments** is a pointer to an array of `attachmentCount` `VkAttachmentDescription` structures describing the attachments used by the render pass.

• **subpassCount** is the number of subpasses to create.

• **pSubpasses** is a pointer to an array of `subpassCount` `VkSubpassDescription` structures describing each subpass.

• **dependencyCount** is the number of memory dependencies between pairs of subpasses.

• **pDependencies** is a pointer to an array of `dependencyCount` `VkSubpassDependency` structures describing dependencies between pairs of subpasses.

**Note**

Care should be taken to avoid a data race here; if any subpasses access attachments with overlapping memory locations, and one of those accesses is a write, a subpass dependency needs to be included between them.

---

**Valid Usage**

• **VUID-VkRenderPassCreateInfo-attachment-00834**
  If the **attachment** member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, then it **must** be less than `attachmentCount`.

• **VUID-VkRenderPassCreateInfo-fragmentDensityMapAttachment-06471**
  If the `pNext` chain includes a `VkRenderPassFragmentDensityMapCreateInfoEXT` structure and the **fragmentDensityMapAttachment** member is not `VK_ATTACHMENT_UNUSED`, then **attachment** must be less than `attachmentCount`.

• **VUID-VkRenderPassCreateInfo-pAttachments-00836**
  For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.

• **VUID-VkRenderPassCreateInfo-pAttachments-02511**
  For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.

• **VUID-VkRenderPassCreateInfo-pAttachments-01566**

---

492
For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pAttachments-01567**
  For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pNext-01926**
  If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, the `subpass` member of each element of its `pAspectReferences` member **must** be less than `subpassCount`.

- **VUID-VkRenderPassCreateInfo-pNext-01927**
  If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, the `inputAttachmentIndex` member of each element of its `pAspectReferences` member **must** be less than the value of `inputAttachmentCount` in the element of `pSubpasses` identified by its `subpass` member.

- **VUID-VkRenderPassCreateInfo-pNext-01963**
  If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, for any element of the `pInputAttachments` member of any element of `pSubpasses` where the `attachment` member is not `VK_ATTACHMENT_UNUSED`, the `aspectMask` member of the corresponding element of `VkRenderPassInputAttachmentAspectCreateInfo`: `pAspectReferences` **must** only include aspects that are present in images of the format specified by the element of `pAttachments` at `attachment`.

- **VUID-VkRenderPassCreateInfo-pNext-01928**
  If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, and its `subpassCount` member is not zero, that member **must** be equal to the value of `subpassCount`.

- **VUID-VkRenderPassCreateInfo-pNext-01929**
  If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, if its `dependencyCount` member is not zero, it **must** be equal to `dependencyCount`.

- **VUID-VkRenderPassCreateInfo-pNext-02512**
  If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, for any element of its `pDependencies` with a `dependencyFlags` member that does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`, the corresponding element of the `pViewOffsets` member of that `VkRenderPassMultiviewCreateInfo` instance **must** be 0.

- **VUID-VkRenderPassCreateInfo-pNext-02513**
  If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, elements of its `pViewMasks` member **must** either all be 0, or all not be 0.

- **VUID-VkRenderPassCreateInfo-pNext-02514**
  If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, and each element of its `pViewMasks` member is 0, the `dependencyFlags` member of each element of
pDependencies must not include VK_DEPENDENCY_VIEW_LOCAL_BIT

- VUID-VkRenderPassCreateInfo-pNext-02515
  If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, and each element of its pViewMasks member is 0, its correlationMaskCount member must be 0

- VUID-VkRenderPassCreateInfo-pDependencies-00837
  For any element of pDependencies, if the srcSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the srcStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the source subpass

- VUID-VkRenderPassCreateInfo-pDependencies-00838
  For any element of pDependencies, if the dstSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the dstStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the destination subpass

- VUID-VkRenderPassCreateInfo-pDependencies-06866
  For any element of pDependencies, if its srcSubpass is not VK_SUBPASS_EXTERNAL, it must be less than subpassCount

- VUID-VkRenderPassCreateInfo-pDependencies-06867
  For any element of pDependencies, if its dstSubpass is not VK_SUBPASS_EXTERNAL, it must be less than subpassCount

Valid Usage (Implicit)

- VUID-VkRenderPassCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO

- VUID-VkRenderPassCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkRenderPassFragmentDensityMapCreateInfoEXT, VkRenderPassInputAttachmentAspectCreateInfo, or VkRenderPassMultiviewCreateInfo

- VUID-VkRenderPassCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkRenderPassCreateInfo-flags-parameter
  flags must be a valid combination of VkRenderPassCreateFlagBits values

- VUID-VkRenderPassCreateInfo-pAttachments-parameter
  If attachmentCount is not 0, pAttachments must be a valid pointer to an array of attachmentCount valid VkAttachmentDescription structures

- VUID-VkRenderPassCreateInfo-pSubpasses-parameter
  pSubpasses must be a valid pointer to an array of subpassCount valid VkSubpassDescription structures

- VUID-VkRenderPassCreateInfo-pDependencies-parameter
  If dependencyCount is not 0, pDependencies must be a valid pointer to an array of dependencyCount valid VkSubpassDependency structures
Bits which can be set in VkRenderPassCreateInfo::flags, describing additional properties of the render pass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkRenderPassCreateFlagBits {
    // Provided by VK_QCOM_render_pass_transform
    VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM = 0x00000002,
} VkRenderPassCreateFlagBits;
```

• **VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM** specifies that the created render pass is compatible with render pass transform.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkRenderPassCreateFlags;
```

VkRenderPassCreateFlags is a bitmask type for setting a mask of zero or more VkRenderPassCreateFlagBits.

If the VkRenderPassCreateInfo::pNext chain includes a VkRenderPassMultiviewCreateInfo structure, then that structure includes an array of view masks, view offsets, and correlation masks for the render pass.

The VkRenderPassMultiviewCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassMultiviewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t subpassCount;
    const uint32_t* pViewMasks;
    uint32_t dependencyCount;
    const int32_t* pViewOffsets;
    uint32_t correlationMaskCount;
    const uint32_t* pCorrelationMasks;
} VkRenderPassMultiviewCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_multiview
typedef VkRenderPassMultiviewCreateInfo VkRenderPassMultiviewCreateInfoKHR;
```

• **sType** is a VkStructureType value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `subpassCount` is zero or the number of subpasses in the render pass.

• `pViewMasks` is a pointer to an array of `subpassCount` view masks, where each mask is a bitfield of view indices describing which views rendering is broadcast to in each subpass, when multiview is enabled. If `subpassCount` is zero, each view mask is treated as zero.

• `dependencyCount` is zero or the number of dependencies in the render pass.

• `pViewOffsets` is a pointer to an array of `dependencyCount` view offsets, one for each dependency. If `dependencyCount` is zero, each dependency’s view offset is treated as zero. Each view offset controls which views in the source subpass the views in the destination subpass depend on.

• `correlationMaskCount` is zero or the number of correlation masks.

• `pCorrelationMasks` is a pointer to an array of `correlationMaskCount` view masks indicating sets of views that may be more efficient to render concurrently.

When a subpass uses a non-zero view mask, multiview functionality is considered to be enabled. Multiview is all-or-nothing for a render pass - that is, either all subpasses must have a non-zero view mask (though some subpasses may have only one view) or all must be zero. Multiview causes all drawing and clear commands in the subpass to behave as if they were broadcast to each view, where a view is represented by one layer of the framebuffer attachments. All draws and clears are broadcast to each view index whose bit is set in the view mask. The view index is provided in the `ViewIndex` shader input variable, and color, depth/stencil, and input attachments all read/write the layer of the framebuffer corresponding to the view index.

If the view mask is zero for all subpasses, multiview is considered to be disabled and all drawing commands execute normally, without this additional broadcasting.

Some implementations may not support multiview in conjunction with mesh shaders, geometry shaders or tessellation shaders.

When multiview is enabled, the `VK_DEPENDENCY_VIEW_LOCAL_BIT` bit in a dependency can be used to express a view-local dependency, meaning that each view in the destination subpass depends on a single view in the source subpass. Unlike pipeline barriers, a subpass dependency can potentially have a different view mask in the source subpass and the destination subpass. If the dependency is view-local, then each view (dstView) in the destination subpass depends on the view dstView + `pViewOffsets[dependency]` in the source subpass. If there is not such a view in the source subpass, then this dependency does not affect that view in the destination subpass. If the dependency is not view-local, then all views in the destination subpass depend on all views in the source subpass, and the view offset is ignored. A non-zero view offset is not allowed in a self-dependency.

The elements of `pCorrelationMasks` are a set of masks of views indicating that views in the same mask may exhibit spatial coherency between the views, making it more efficient to render them concurrently. Correlation masks must not have a functional effect on the results of the multiview rendering.

When multiview is enabled, at the beginning of each subpass all non-render pass state is undefined. In particular, each time `vkCmdBeginRenderPass` or `vkCmdNextSubpass` is called the graphics pipeline must be bound, any relevant descriptor sets or vertex/index buffers must be bound, and any relevant dynamic state or push constants must be set before they are used.
A multiview subpass can declare that its shaders will write per-view attributes for all views in a single invocation, by setting the VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX bit in the subpass description. The only supported per-view attributes are position and viewport mask, and per-view position and viewport masks are written to output array variables decorated with PositionPerViewNV and ViewportMaskPerViewNV, respectively. If VK_NV_viewport_array2 is not supported and enabled, ViewportMaskPerViewNV must not be used. Values written to elements of PositionPerViewNV and ViewportMaskPerViewNV must not depend on the ViewIndex. The shader must also write to an output variable decorated with Position, and the value written to Position must equal the value written to PositionPerViewNV[ViewIndex]. Similarly, if ViewportMaskPerViewNV is written to then the shader must also write to an output variable decorated with ViewportMaskNV, and the value written to ViewportMaskNV must equal the value written to ViewportMaskPerViewNV[ViewIndex]. Implementations will either use values taken from Position and ViewportMaskNV and invoke the shader once for each view, or will use values taken from PositionPerViewNV and ViewportMaskPerViewNV and invoke the shader fewer times. The values written to Position and ViewportMaskNV must not depend on the values written to PositionPerViewNV and ViewportMaskPerViewNV, or vice versa (to allow compilers to eliminate the unused outputs). All attributes that do not have *PerViewNV counterparts must not depend on ViewIndex.

Per-view attributes are all-or-nothing for a subpass. That is, all pipelines compiled against a subpass that includes the VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX bit must write per-view attributes to the *PerViewNV[] shader outputs, in addition to the non-per-view (e.g. Position) outputs. Pipelines compiled against a subpass that does not include this bit must not include the *PerViewNV[] outputs in their interfaces.

Valid Usage

- VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-00841
  Each view index must not be set in more than one element of pCorrelationMasks

- VUID-VkRenderPassMultiviewCreateInfo-multiview-06555
  If the multiview feature is not enabled, each element of pViewMasks must be 0

- VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-06697
  The index of the most significant bit in each element of pViewMasks must be less than maxMultiviewViewCount

Valid Usage (Implicit)

- VUID-VkRenderPassMultiviewCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_MULTIVIEW_CREATE_INFO

- VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-parameter
  If subpassCount is not 0, pViewMasks must be a valid pointer to an array of subpassCount uint32_t values

- VUID-VkRenderPassMultiviewCreateInfo-pViewOffsets-parameter
  If dependencyCount is not 0, pViewOffsets must be a valid pointer to an array of dependencyCount int32_t values
If `correlationMaskCount` is not 0, `pCorrelationMasks` must be a valid pointer to an array of `correlationMaskCount uint32_t` values.

The `VkMultiviewPerViewAttributesInfoNVX` structure is defined as:

```c
// Provided by VK_KHR_dynamic_rendering with VK_NVX_multiview_per_view_attributes
typedef struct VkMultiviewPerViewAttributesInfoNVX {
    VkStructureType sType;
    const void* pNext;
    VkBool32 perViewAttributes;
    VkBool32 perViewAttributesPositionXOnly;
} VkMultiviewPerViewAttributesInfoNVX;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `perViewAttributes` specifies that shaders compiled for this pipeline write the attributes for all views in a single invocation of each vertex processing stage. All pipelines executed within a render pass instance that includes this bit must write per-view attributes to the *PerViewNV[] shader outputs, in addition to the non-per-view (e.g. Position) outputs.
- `perViewAttributesPositionXOnly` specifies that shaders compiled for this pipeline use per-view positions which only differ in value in the x component. Per-view viewport mask can also be used.

When dynamic render pass instances are being used, instead of specifying `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX` or `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX` in the subpass description flags, the per-attribute properties of the render pass instance must be specified by the `VkMultiviewPerViewAttributesInfoNVX` structure. Include the `VkMultiviewPerViewAttributesInfoNVX` structure in the `pNext` chain of `VkGraphicsPipelineCreateInfo` when creating a graphics pipeline for dynamic rendering, `VkRenderingInfo` when starting a dynamic render pass instance, and `VkCommandBufferInheritanceInfo` when specifying the dynamic render pass instance parameters for secondary command buffers.

**Valid Usage (Implicit)**

- `VUID-VkMultiviewPerViewAttributesInfoNVX-sType-sType
  sType must be VK_STRUCTURE_TYPE_MULTIVIEW_PER_VIEW_ATTRIBUTES_INFO_NVX`

If the `VkRenderPassCreateInfo::pNext` chain includes a `VkRenderPassFragmentDensityMapCreateInfoEXT` structure, then that structure includes a fragment density map attachment for the render pass.

The `VkRenderPassFragmentDensityMapCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_fragment_density_map
```
typedef struct VkRenderPassFragmentDensityMapCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkAttachmentReference fragmentDensityMapAttachment;
} VkRenderPassFragmentDensityMapCreateInfoEXT;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentDensityMapAttachment` is the fragment density map to use for the render pass.

The fragment density map is read at an implementation-dependent time with the following constraints determined by the attachment’s image view flags:

- `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT` specifies that the fragment density map will be read by the device during `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.
- `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT` specifies that the fragment density map will be read by the host during `vkEndCommandBuffer` of the primary command buffer that the render pass is recorded into.
- Otherwise the fragment density map will be read by the host during `vkCmdBeginRenderPass`.

The fragment density map may additionally be read by the device during `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT` for any mode.

If this structure is not present, it is as if `fragmentDensityMapAttachment` was given as `VK_ATTACHMENT_UNUSED`.

**Valid Usage**

- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02548
  If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` must not be an element of `VkSubpassDescription::pInputAttachments`, `VkSubpassDescription::pColorAttachments`, `VkSubpassDescription::pResolveAttachments`, `VkSubpassDescription::pDepthStencilAttachment`, or ` VkSubpassDescription::pPreserveAttachments` for any subpass.

- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02549
  If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, layout must be equal to `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`, or `VK_IMAGE_LAYOUT_GENERAL`.

- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02550
  If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` must reference an attachment with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_LOAD` or `VK_ATTACHMENT_LOAD_OP_DONT_CARE`.

- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-
If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` must reference an attachment with a `storeOp` equal to `VK_ATTACHMENT_STORE_OP_DONT_CARE`.

**Valid Usage (Implicit)**

- `VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_FRAGMENT_DENSITY_MAP_CREATE_INFO_EXT`

- `VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-parameter`  
  `fragmentDensityMapAttachment` must be a valid `VkAttachmentReference` structure

The `VkAttachmentDescription` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkAttachmentDescription {
    VkAttachmentDescriptionFlags  flags;
    VkFormat                      format;
    VkSampleCountFlagBits         samples;
    VkAttachmentLoadOp           loadOp;
    VkAttachmentStoreOp          storeOp;
    VkAttachmentLoadOp           stencilLoadOp;
    VkAttachmentStoreOp          stencilStoreOp;
    VkImageLayout                 initialLayout;
    VkImageLayout                 finalLayout;
} VkAttachmentDescription;
```

- `flags` is a bitmask of `VkAttachmentDescriptionFlagBits` specifying additional properties of the attachment.
- `format` is a `VkFormat` value specifying the format of the image view that will be used for the attachment.
- `samples` is a `VkSampleCountFlagBits` value specifying the number of samples of the image.
- `loadOp` is a `VkAttachmentLoadOp` value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
- `storeOp` is a `VkAttachmentStoreOp` value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
- `stencilLoadOp` is a `VkAttachmentLoadOp` value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
- `stencilStoreOp` is a `VkAttachmentStoreOp` value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- `initialLayout` is the layout the attachment image subresource will be in when a render pass instance begins.
• **finalLayout** is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

If the attachment uses a color format, then **loadOp** and **storeOp** are used, and **stencilLoadOp** and **stencilStoreOp** are ignored. If the format has depth and/or stencil components, **loadOp** and **storeOp** apply only to the depth data, while **stencilLoadOp** and **stencilStoreOp** define how the stencil data is handled. **loadOp** and **stencilLoadOp** define the load operations for the attachment. **storeOp** and **stencilStoreOp** define the store operations for the attachment. If an attachment is not used by any subpass, **loadOp**, **storeOp**, **stencilStoreOp**, and **stencilLoadOp** will be ignored for that attachment, and no load or store ops will be performed. However, any transition specified by **initialLayout** and **finalLayout** will still be executed.

If **flags** includes **VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT**, then the attachment is treated as if it shares physical memory with another attachment in the same render pass. This information limits the ability of the implementation to reorder certain operations (like layout transitions and the loadOp) such that it is not improperly reordered against other uses of the same physical memory via a different attachment. This is described in more detail below.

If a render pass uses multiple attachments that alias the same device memory, those attachments **must** each include the **VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT** bit in their attachment description flags. Attachments aliasing the same memory occurs in multiple ways:

- Multiple attachments being assigned the same image view as part of framebuffer creation.
- Attachments using distinct image views that correspond to the same image subresource of an image.
- Attachments using views of distinct image subresources which are bound to overlapping memory ranges.

**Note**

Render passes **must** include subpass dependencies (either directly or via a subpass dependency chain) between any two subpasses that operate on the same attachment or aliasing attachments and those subpass dependencies **must** include execution and memory dependencies separating uses of the aliases, if at least one of those subpasses writes to one of the aliases. These dependencies **must** not include the **VK_DEPENDENCY_BY_REGION_BIT** if the aliases are views of distinct image subresources which overlap in memory.

Multiple attachments that alias the same memory **must** not be used in a single subpass. A given attachment index **must** not be used multiple times in a single subpass, with one exception: two subpass attachments **can** use the same attachment index if at least one use is as an input attachment and neither use is as a resolve or preserve attachment. In other words, the same view **can** be used simultaneously as an input and color or depth/stencil attachment, but **must** not be used as multiple color or depth/stencil attachments nor as resolve or preserve attachments.

If a set of attachments alias each other, then all except the first to be used in the render pass **must** use an **initialLayout** of **VK_IMAGE_LAYOUT_UNDEFINED**, since the earlier uses of the other aliases make their contents undefined. Once an alias has been used and a different alias has been used after it, the first alias **must** not be used in any later subpasses. However, an application **can** assign the same

501
image view to multiple aliasing attachment indices, which allows that image view to be used multiple times even if other aliases are used in between.

Note

Once an attachment needs the VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT bit, there should be no additional cost of introducing additional aliases, and using these additional aliases may allow more efficient clearing of the attachments on multiple uses via VK_ATTACHMENT_LOAD_OP_CLEAR.

Valid Usage

- VUID-VkAttachmentDescription-format-06698
  format must not be VK_FORMAT_UNDEFINED

- VUID-VkAttachmentDescription-format-06699
  If format includes a color or depth component and loadOp is VK_ATTACHMENT_LOAD_OP_LOAD, then initialLayout must not be VK_IMAGE_LAYOUT_UNDEFINED

- VUID-VkAttachmentDescription-finalLayout-00843
  finalLayout must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

- VUID-VkAttachmentDescription-format-03280
  If format is a color format, initialLayout must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription-format-03281
  If format is a depth/stencil format, initialLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

- VUID-VkAttachmentDescription-format-03282
  If format is a color format, finalLayout must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription-format-03283
  If format is a depth/stencil format, finalLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

- VUID-VkAttachmentDescription-format-06487
  If format is a color format, initialLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkAttachmentDescription-format-06488
  If format is a color format, finalLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkAttachmentDescription-separateDepthStencilLayouts-03284
  If the separateDepthStencilLayouts feature is not enabled, initialLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
• **VUID-VkAttachmentDescription-separateDepthStencilLayouts-03285**
If the separateDepthStencilLayouts feature is not enabled, finalLayout must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

• **VUID-VkAttachmentDescription-format-03286**
If format is a color format, initialLayout must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

• **VUID-VkAttachmentDescription-format-03287**
If format is a color format, finalLayout must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

• **VUID-VkAttachmentDescription-format-06906**
If format is a depth/stencil format which includes both depth and stencil components, initialLayout must not be
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

• **VUID-VkAttachmentDescription-format-06907**
If format is a depth/stencil format which includes both depth and stencil components, finalLayout must not be
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

• **VUID-VkAttachmentDescription-format-03290**
If format is a depth/stencil format which includes only the depth component, initialLayout must not be
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

• **VUID-VkAttachmentDescription-format-03291**
If format is a depth/stencil format which includes only the depth component, finalLayout must not be
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

• **VUID-VkAttachmentDescription-synchronization2-06908**
If the synchronization2 feature is not enabled, initialLayout must not be
VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR,

• **VUID-VkAttachmentDescription-synchronization2-06909**
If the synchronization2 feature is not enabled, finalLayout must not be
VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR,

• **VUID-VkAttachmentDescription-attachmentFeedbackLoopLayout-07309**
If the attachmentFeedbackLoopLayout feature is not enabled, initialLayout must not be
VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT,

• **VUID-VkAttachmentDescription-attachmentFeedbackLoopLayout-07310**
If the `attachmentFeedbackLoopLayout` feature is not enabled, `finalLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`

- **VUID-VkAttachmentDescription-samples-08745**
  `samples` must be a bit value that is set in `imageCreateSampleCounts` (as defined in Image Creation Limits) for the given `format`

- **VUID-VkAttachmentDescription-format-06700**
  If `format` includes a stencil component and `stencilLoadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`

- **VUID-VkAttachmentDescription-format-03292**
  If `format` is a depth/stencil format which includes only the stencil component, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription-format-03293**
  If `format` is a depth/stencil format which includes only the stencil component, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription-format-06242**
  If `format` is a depth/stencil format which includes both depth and stencil components, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription-format-06243**
  If `format` is a depth/stencil format which includes both depth and stencil components, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READONLY_OPTIMAL`

---

**Valid Usage (Implicit)**

- **VUID-VkAttachmentDescription-flags-parameter**
  `flags` must be a valid combination of `VkAttachmentDescriptionFlagBits` values

- **VUID-VkAttachmentDescription-format-parameter**
  `format` must be a valid `VkFormat` value

- **VUID-VkAttachmentDescription-samples-parameter**
  `samples` must be a valid `VkSampleCountFlagBits` value

- **VUID-VkAttachmentDescription-loadOp-parameter**
  `loadOp` must be a valid `VkAttachmentLoadOp` value

- **VUID-VkAttachmentDescription-storeOp-parameter**
  `storeOp` must be a valid `VkAttachmentStoreOp` value

- **VUID-VkAttachmentDescription-stencilLoadOp-parameter**
  `stencilLoadOp` must be a valid `VkAttachmentLoadOp` value

- **VUID-VkAttachmentDescription-stencilStoreOp-parameter**
  `stencilStoreOp` must be a valid `VkAttachmentStoreOp` value

- **VUID-VkAttachmentDescription-initialLayout-parameter**
InitialLayout must be a valid VkImageLayout value

- VUID-VkAttachmentDescription-finalLayout-parameter

FinalLayout must be a valid VkImageLayout value

Bits which can be set in VkAttachmentDescription::flags, describing additional properties of the attachment, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentDescriptionFlagBits {
    VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT = 0x00000001,
} VkAttachmentDescriptionFlagBits;
```

- **VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT** specifies that the attachment aliases the same device memory as other attachments.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkAttachmentDescriptionFlags;
```

**VkAttachmentDescriptionFlags** is a bitmask type for setting a mask of zero or more **VkAttachmentDescriptionFlagBits**.

The **VkRenderPassInputAttachmentAspectCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassInputAttachmentAspectCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t aspectReferenceCount;
    const VkInputAttachmentAspectReference* pAspectReferences;
} VkRenderPassInputAttachmentAspectCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkRenderPassInputAttachmentAspectCreateInfo
VkRenderPassInputAttachmentAspectCreateInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **aspectReferenceCount** is the number of elements in the **pAspectReferences** array.
- **pAspectReferences** is a pointer to an array of **aspectReferenceCount** VkInputAttachmentAspectReference structures containing a mask describing which aspect(s) can be accessed for a given input attachment within a given subpass.
To specify which aspects of an input attachment can be read, add a `VkRenderPassInputAttachmentAspectCreateInfo` structure to the `pNext` chain of the `VkRenderPassCreateInfo` structure:

An application can access any aspect of an input attachment that does not have a specified aspect mask in the `pAspectReferences` array. Otherwise, an application must not access aspect(s) of an input attachment other than those in its specified aspect mask.

### Valid Usage (Implicit)

- **VUID-VkRenderPassInputAttachmentAspectCreateInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO`

- **VUID-VkRenderPassInputAttachmentAspectCreateInfo-pAspectReferences-parameter**
  - `pAspectReferences` must be a valid pointer to an array of `aspectReferenceCount` valid `VkInputAttachmentAspectReference` structures

- **VUID-VkRenderPassInputAttachmentAspectCreateInfo-aspectReferenceCount-arraylength**
  - `aspectReferenceCount` must be greater than 0

The `VkInputAttachmentAspectReference` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkInputAttachmentAspectReference {
    uint32_t subpass;
    uint32_t inputAttachmentIndex;
    VkImageAspectFlags aspectMask;
} VkInputAttachmentAspectReference;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkInputAttachmentAspectReference VkInputAttachmentAspectReferenceKHR;
```

- `subpass` is an index into the `pSubpasses` array of the parent `VkRenderPassCreateInfo` structure.
- `inputAttachmentIndex` is an index into the `pInputAttachments` of the specified subpass.
- `aspectMask` is a mask of which aspect(s) can be accessed within the specified subpass.

This structure specifies an aspect mask for a specific input attachment of a specific subpass in the render pass.

`subpass` and `inputAttachmentIndex` index into the render pass as:

```c
createInfo->pSubpasses[subpass].pInputAttachments[inputAttachmentIndex]
```
Valid Usage

• VUID-VkInputAttachmentAspectReference-aspectMask-01964
  aspectMask must not include VK_IMAGE_ASPECT_METADATA_BIT

• VUID-VkInputAttachmentAspectReference-aspectMask-02250
  aspectMask must not include VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT for any index i

Valid Usage (Implicit)

• VUID-VkInputAttachmentAspectReference-aspectMask-parameter
  aspectMask must be a valid combination of VkImageAspectFlagBits values

• VUID-VkInputAttachmentAspectReference-aspectMask-requiredbitmask
  aspectMask must not be 0

The VkSubpassDescription structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDescription {
    VkSubpassDescriptionFlags flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t inputAttachmentCount;
    const VkAttachmentReference* pInputAttachments;
    uint32_t colorAttachmentCount;
    const VkAttachmentReference* pColorAttachments;
    const VkAttachmentReference* pResolveAttachments;
    const VkAttachmentReference* pDepthStencilAttachment;
    preserveAttachmentCount;
    const uint32_t* pPreserveAttachments;
} VkSubpassDescription;
```

• flags is a bitmask of VkSubpassDescriptionFlagBits specifying usage of the subpass.

• pipelineBindPoint is a VkPipelineBindPoint value specifying the pipeline type supported for this subpass.

• inputAttachmentCount is the number of input attachments.

• pInputAttachments is a pointer to an array of VkAttachmentReference structures defining the input attachments for this subpass and their layouts.

• colorAttachmentCount is the number of color attachments.

• pColorAttachments is a pointer to an array of colorAttachmentCount VkAttachmentReference structures defining the color attachments for this subpass and their layouts.

• pResolveAttachments is NULL or a pointer to an array of colorAttachmentCount VkAttachmentReference structures defining the resolve attachments for this subpass and their layouts.
• **pDepthStencilAttachment** is a pointer to a `VkAttachmentReference` structure specifying the depth/stencil attachment for this subpass and its layout.

• **preserveAttachmentCount** is the number of preserved attachments.

• **pPreserveAttachments** is a pointer to an array of `preserveAttachmentCount` render pass attachment indices identifying attachments that are not used by this subpass, but whose contents must be preserved throughout the subpass.

Each element of the **pInputAttachments** array corresponds to an input attachment index in a fragment shader, i.e. if a shader declares an image variable decorated with a `InputAttachmentIndex` value of `X`, then it uses the attachment provided in **pInputAttachments**[`X`]. Input attachments must also be bound to the pipeline in a descriptor set. If the attachment member of any element of **pInputAttachments** is **VK_ATTACHMENT_UNUSED**, the application must not read from the corresponding input attachment index. Fragment shaders can use subpass input variables to access the contents of an input attachment at the fragment's (x, y, layer) framebuffer coordinates. Input attachments must not be used by any subpasses within a render pass that enables render pass transform.

Each element of the **pColorAttachments** array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a `Location` value of `X`, then it uses the attachment provided in **pColorAttachments**[`X`]. If the attachment member of any element of **pColorAttachments** is **VK_ATTACHMENT_UNUSED**, or if Color Write Enable has been disabled for the corresponding attachment index, then writes to the corresponding location by a fragment shader are discarded.

If **flags** does not include **VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM**, and if **pResolveAttachments** is not **NULL**, each of its elements corresponds to a color attachment (the element in **pColorAttachments** at the same index), and a multisample resolve operation is defined for each attachment unless the resolve attachment index is **VK_ATTACHMENT_UNUSED**.

Similarly, if **flags** does not include **VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM**, and **VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment** is not **NULL** and does not have the value **VK_ATTACHMENT_UNUSED**, it corresponds to the depth/stencil attachment in **pDepthStencilAttachment**, and multisample resolve operation for depth and stencil are defined by **VkSubpassDescriptionDepthStencilResolve::depthResolveMode** and **VkSubpassDescriptionDepthStencilResolve::stencilResolveMode**, respectively. If **VkSubpassDescriptionDepthStencilResolve::depthResolveMode** is **VK_RESOLVE_MODE_NONE** or the **pDepthStencilResolveAttachment** does not have a depth aspect, no resolve operation is performed for the depth attachment. If **VkSubpassDescriptionDepthStencilResolve::stencilResolveMode** is **VK_RESOLVE_MODE_NONE** or the **pDepthStencilResolveAttachment** does not have a stencil aspect, no resolve operation is performed for the stencil attachment.

If the image subresource range referenced by the depth/stencil attachment is created with **VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT**, then the multisample resolve operation uses the sample locations state specified in the **sampleLocationsInfo** member of the element of the **VkRenderPassSampleLocationsBeginInfoEXT::pPostSubpassSampleLocations** for the subpass.

If **pDepthStencilAttachment** is **NULL**, or if its attachment index is **VK_ATTACHMENT_UNUSED**, it indicates that no depth/stencil attachment will be used in the subpass.
The contents of an attachment within the render area become undefined at the start of a subpass $S$ if all of the following conditions are true:

- The attachment is used as a color, depth/stencil, or resolve attachment in any subpass in the render pass.
- There is a subpass $S_1$ that uses or preserves the attachment, and a subpass dependency from $S_1$ to $S$.
- The attachment is not used or preserved in subpass $S$.

In addition, the contents of an attachment within the render area become undefined at the start of a subpass $S$ if all of the following conditions are true:

- $VK\_SUBPASS\_DESCRIPTION\_SHADER\_RESOLVE\_BIT\_QCOM$ is set.
- The attachment is used as a color or depth/stencil in the subpass.

Once the contents of an attachment become undefined in subpass $S$, they remain undefined for subpasses in subpass dependency chains starting with subpass $S$ until they are written again. However, they remain valid for subpasses in other subpass dependency chains starting with subpass $S_1$ if those subpasses use or preserve the attachment.

### Valid Usage

- **VUID-VkSubpassDescription-attachment-06912**
  If the `attachment` member of an element of `pInputAttachments` is not `VK\_ATTACHMENT\_UNUSED`, its `layout` member must not be `VK\_IMAGE\_LAYOUT\_COLOR\_ATTACHMENT\_OPTIMAL` or `VK\_IMAGE\_LAYOUT\_DEPTH\_STENCIL\_ATTACHMENT\_OPTIMAL`.

- **VUID-VkSubpassDescription-attachment-06913**
  If the `attachment` member of an element of `pColorAttachments` is not `VK\_ATTACHMENT\_UNUSED`, its `layout` member must not be `VK\_IMAGE\_LAYOUT\_DEPTH\_STENCIL\_ATTACHMENT\_OPTIMAL` or `VK\_IMAGE\_LAYOUT\_SHADER\_READ\_ONLY\_OPTIMAL`.

- **VUID-VkSubpassDescription-attachment-06914**
  If the `attachment` member of an element of `pResolveAttachments` is not `VK\_ATTACHMENT\_UNUSED`, its `layout` member must not be `VK\_IMAGE\_LAYOUT\_DEPTH\_STENCIL\_ATTACHMENT\_OPTIMAL` or `VK\_IMAGE\_LAYOUT\_SHADER\_READ\_ONLY\_OPTIMAL`.

- **VUID-VkSubpassDescription-attachment-06915**
  If the `attachment` member of `pDepthStencilAttachment` is not `VK\_ATTACHMENT\_UNUSED`, its `layout` member must not be `VK\_IMAGE\_LAYOUT\_COLOR\_ATTACHMENT\_OPTIMAL` or `VK\_IMAGE\_LAYOUT\_SHADER\_READ\_ONLY\_OPTIMAL`.

- **VUID-VkSubpassDescription-attachment-06916**
  If the `attachment` member of an element of `pColorAttachments` is not `VK\_ATTACHMENT\_UNUSED`, its `layout` member must not be `VK\_IMAGE\_LAYOUT\_DEPTH\_ATTACHMENT\_STENCIL\_READ\_ONLY\_OPTIMAL` or `VK\_IMAGE\_LAYOUT\_DEPTH\_READ\_ONLY\_STENCIL\_ATTACHMENT\_OPTIMAL`.

- **VUID-VkSubpassDescription-attachment-06917**
If the attachment member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its layout member **must not be** `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkSubpassDescription-attachment-06918**
  
  If the attachment member of an element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, its layout member **must not be** `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkSubpassDescription-attachment-06919**
  
  If the attachment member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its layout member **must not be** `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkSubpassDescription-attachment-06920**
  
  If the attachment member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its layout member **must not be** `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkSubpassDescription-attachment-06921**
  
  If the attachment member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its layout member **must not be** `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.

- **VUID-VkSubpassDescription-attachment-06922**
  
  If the attachment member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its layout member **must not be** `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.

- **VUID-VkSubpassDescription-pipelineBindPoint-04952**
  
  `pipelineBindPoint` **must be** `VK_PIPELINE_BIND_POINT_GRAPHICS` or `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI`.

- **VUID-VkSubpassDescription-colorAttachmentCount-00845**
  
  `colorAttachmentCount` **must be** less than or equal to `VkPhysicalDeviceLimits::maxColorAttachments`.

- **VUID-VkSubpassDescription-loadOp-00846**
  
  If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then `loadOp` **must not be** `VK_ATTACHMENT_LOAD_OP_CLEAR`.

- **VUID-VkSubpassDescription-pResolveAttachments-00847**
  
  If `pResolveAttachments` is not `NULL`, for each resolve attachment that is not `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must not be** `VK_ATTACHMENT_UNUSED`. 
• VUID-VkSubpassDescription-pResolveAttachments-00848
  If `pResolveAttachments` is not `NULL`, for each resolve attachment that is not `VK_ATTACHMENT_UNUSED`, the corresponding color attachment must not have a sample count of `VK_SAMPLE_COUNT_1_BIT`.

• VUID-VkSubpassDescription-pResolveAttachments-00849
  If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` must have a sample count of `VK_SAMPLE_COUNT_1_BIT`.

• VUID-VkSubpassDescription-pResolveAttachments-00850
  If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` must have the same `VkFormat` as its corresponding color attachment.

• VUID-VkSubpassDescription-pColorAttachments-06868
  If neither the `VK_AMD_mixed_attachment_samples` extension nor the `VK_NV_framebuffer_mixed_samples` extension is enabled, all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` must have the same sample count.

• VUID-VkSubpassDescription-pInputAttachments-02647
  All attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED` must have image formats whose potential format features contain at least `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

• VUID-VkSubpassDescription-pColorAttachments-02648
  All attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` must have image formats whose potential format features contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`.

• VUID-VkSubpassDescription-pResolveAttachments-02649
  All attachments in `pResolveAttachments` that are not `VK_ATTACHMENT_UNUSED` must have image formats whose potential format features contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`.

• VUID-VkSubpassDescription-pDepthStencilAttachment-02650
  If `pDepthStencilAttachment` is not `NULL` and the attachment is not `VK_ATTACHMENT_UNUSED` then it must have an image format whose potential format features contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

• VUID-VkSubpassDescription-linearColorAttachment-06496
  If the `linearColorAttachment` feature is enabled and the image is created with `VK_IMAGE_TILING_LINEAR`, all attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED` must have image formats whose potential format features must contain `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`.

• VUID-VkSubpassDescription-linearColorAttachment-06497
  If the `linearColorAttachment` feature is enabled and the image is created with `VK_IMAGE_TILING_LINEAR`, all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` must have image formats whose potential format features must contain `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`.

• VUID-VkSubpassDescription-linearColorAttachment-06498
  If the `linearColorAttachment` feature is enabled and the image is created with `VK_IMAGE_TILING_LINEAR`, all attachments in `pResolveAttachments` that are not
**VK_ATTACHMENT_UNUSED** must have image formats whose potential format features must contain **VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV**.

- **VUID-VkSubpassDescription-pColorAttachments-01506**
  If the **VK_AMD_mixed_attachment_samples** extension is enabled, all attachments in **pColorAttachments** that are not **VK_ATTACHMENT_UNUSED** must have a sample count that is smaller than or equal to the sample count of **pDepthStencilAttachment** if it is not **VK_ATTACHMENT_UNUSED**.

- **VUID-VkSubpassDescription-pDepthStencilAttachment-01418**
  If neither the **VK_AMD_mixed_attachment_samples** nor the **VK_NV_framebuffer_mixed_samples** extensions are enabled, and if **pDepthStencilAttachment** is not **VK_ATTACHMENT_UNUSED** and any attachments in **pColorAttachments** are not **VK_ATTACHMENT_UNUSED**, they must have the same sample count.

- **VUID-VkSubpassDescription-attachment-00853**
  Each element of **pPreserveAttachments** must not be **VK_ATTACHMENT_UNUSED**.

- **VUID-VkSubpassDescription-pPreserveAttachments-00854**
  Each element of **pPreserveAttachments** must not also be an element of any other member of the subpass description.

- **VUID-VkSubpassDescription-layout-02519**
  If any attachment is used by more than one **VkAttachmentReference** member, then each use must use the same layout.

- **VUID-VkSubpassDescription-flags-00856**
  If **flags** includes **VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX**, it must also include **VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX**.

- **VUID-VkSubpassDescription-flags-03341**
  If **flags** includes **VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM**, and if **pResolveAttachments** is not NULL, then each resolve attachment must be **VK_ATTACHMENT_UNUSED**.

- **VUID-VkSubpassDescription-flags-03343**
  If **flags** includes **VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM**, then the subpass must be the last subpass in a subpass dependency chain.

- **VUID-VkSubpassDescription-pInputAttachments-02868**
  If the render pass is created with **VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM**, each of the elements of **pInputAttachments** must be **VK_ATTACHMENT_UNUSED**.

- **VUID-VkSubpassDescription-pDepthStencilAttachment-04438**
  **pDepthStencilAttachment** and **pColorAttachments** must not contain references to the same attachment.

---

**Valid Usage (Implicit)**

- **VUID-VkSubpassDescription-flags-parameter**
  **flags** must be a valid combination of **VkSubpassDescriptionFlagBits** values.

- **VUID-VkSubpassDescription-pipelineBindPoint-parameter**
pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-VkSubpassDescription-pInputAttachments-parameter
  If inputAttachmentCount is not 0, pInputAttachments must be a valid pointer to an array of inputAttachmentCount valid VkAttachmentReference structures

- VUID-VkSubpassDescription-pColorAttachments-parameter
  If colorAttachmentCount is not 0, pColorAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference structures

- VUID-VkSubpassDescription-pResolveAttachments-parameter
  If colorAttachmentCount is not 0, and pResolveAttachments is not NULL, pResolveAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference structures

- VUID-VkSubpassDescription-pDepthStencilAttachment-parameter
  If pDepthStencilAttachment is not NULL, pDepthStencilAttachment must be a valid pointer to a valid VkAttachmentReference structure

- VUID-VkSubpassDescription-pPreserveAttachments-parameter
  If preserveAttachmentCount is not 0, pPreserveAttachments must be a valid pointer to an array of preserveAttachmentCount uint32_t values

Bits which can be set in VkSubpassDescription::flags, specifying usage of the subpass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSubpassDescriptionFlagBits {
    // Provided by VK_NVX_multiview_per_view_attributes
    VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX = 0x00000001,
    // Provided by VK_NVX_multiview_per_view_attributes
    VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX = 0x00000002,
    // Provided by VK_QCOM_render_pass_shader_resolve
    VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM = 0x00000004,
    // Provided by VK_QCOM_render_pass_shader_resolve
    VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM = 0x00000008,
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT = 0x00000010,
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT = 0x00000020,
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT = 0x00000040,
    // Provided by VK_EXT_legacy_dithering
    VK_SUBPASS_DESCRIPTION_ENABLE_LEGACY_DITHERING_BIT_EXT = 0x00000080,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_ARM = VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_ARM = VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM = VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT,
};
```
VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX specifies that shaders compiled for this subpass write the attributes for all views in a single invocation of each pre-rasterization shader stage. All pipelines compiled against a subpass that includes this bit must write per-view attributes to the *PerViewNV[] shader outputs, in addition to the non-per-view (e.g. Position) outputs.

VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX specifies that shaders compiled for this subpass use per-view positions which only differ in value in the x component. Per-view viewport mask can also be used.

VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM specifies that the framebuffer region is the fragment region, that is, the minimum region dependencies are by pixel rather than by sample, such that any fragment shader invocation can access any sample associated with that fragment shader invocation.

VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM specifies that the subpass performs shader resolve operations.

VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT specifies that this subpass supports pipelines created with VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT.

VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT specifies that this subpass supports pipelines created with VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT.

VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT specifies that this subpass supports pipelines created with VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT.

VK_SUBPASS_DESCRIPTION_ENABLE_LEGACY_DITHERING_BIT_EXT specifies that Legacy Dithering is enabled for this subpass.

**Note**

Shader resolve operations allow for custom resolve operations, but overwriting pixels may have a performance and/or power cost. Furthermore, since the content of any depth stencil attachment or color attachment is undefined at the beginning of a shader resolve subpass, any depth testing, stencil testing, or blending operation which sources these undefined values also has undefined result value.

typedef VkFlags VkSubpassDescriptionFlags;

VkSubpassDescriptionFlags is a bitmask type for setting a mask of zero or more
The `VkAttachmentReference` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkAttachmentReference {
    uint32_t attachment;
    VkImageLayout layout;
} VkAttachmentReference;
```

- `attachment` is either an integer value identifying an attachment at the corresponding index in `VkRenderPassCreateInfo::pAttachments`, or `VK_ATTACHMENT_UNUSED` to signify that this attachment is not used.
- `layout` is a `VkImageLayout` value specifying the layout the attachment uses during the subpass.

### Valid Usage

- **VUID-VkAttachmentReference-layout-03077**
  If `attachment` is not `VK_ATTACHMENT_UNUSED`, `layout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`.

- **VUID-VkAttachmentReference-separateDepthStencilLayouts-03313**
  If the `separateDepthStencilLayouts` feature is not enabled, and `attachment` is not `VK_ATTACHMENT_UNUSED`, `layout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkAttachmentReference-synchronization2-06910**
  If the `synchronization2` feature is not enabled, `layout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.

- **VUID-VkAttachmentReference-attachmentFeedbackLoopLayout-07311**
  If the `attachmentFeedbackLoopLayout` feature is not enabled, `layout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`.

### Valid Usage (Implicit)

- **VUID-VkAttachmentReference-layout-parameter**
  `layout` must be a valid `VkImageLayout` value.

`VK_SUBPASS_EXTERNAL` is a special subpass index value expanding synchronization scope outside a subpass. It is described in more detail by `VkSubpassDependency`.

```c
#define VK_SUBPASS_EXTERNAL (~0U)
```

The `VkSubpassDependency` structure is defined as:
typedef struct VkSubpassDependency {
    uint32_t srcSubpass;
    uint32_t dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkDependencyFlags dependencyFlags;
} VkSubpassDependency;

- **srcSubpass** is the subpass index of the first subpass in the dependency, or **VK_SUBPASS_EXTERNAL**.
- **dstSubpass** is the subpass index of the second subpass in the dependency, or **VK_SUBPASS_EXTERNAL**.
- **srcStageMask** is a bitmask of **VkPipelineStageFlagBits** specifying the source stage mask.
- **dstStageMask** is a bitmask of **VkPipelineStageFlagBits** specifying the destination stage mask.
- **srcAccessMask** is a bitmask of **VkAccessFlagBits** specifying a source access mask.
- **dstAccessMask** is a bitmask of **VkAccessFlagBits** specifying a destination access mask.
- **dependencyFlags** is a bitmask of **VkDependencyFlagBits**.

If **srcSubpass** is equal to **dstSubpass** then the **VkSubpassDependency** does not directly define a dependency. Instead, it enables pipeline barriers to be used in a render pass instance within the identified subpass, where the scopes of one pipeline barrier must be a subset of those described by one subpass dependency. Subpass dependencies specified in this way that include framebuffer-space stages in the **srcStageMask** must only include framebuffer-space stages in **dstStageMask**, and must include **VK_DEPENDENCY_BY_REGION_BIT**. When a subpass dependency is specified in this way for a subpass that has more than one view in its view mask, its **dependencyFlags** must include **VK_DEPENDENCY_VIEW_LOCAL_BIT**.

If **srcSubpass** and **dstSubpass** are not equal, when a render pass instance which includes a subpass dependency is submitted to a queue, it defines a dependency between the subpasses identified by **srcSubpass** and **dstSubpass**.

If **srcSubpass** is equal to **VK_SUBPASS_EXTERNAL**, the first synchronization scope includes commands that occur earlier in submission order than the **vkCmdBeginRenderPass** used to begin the render pass instance. Otherwise, the first set of commands includes all commands submitted as part of the subpass instance identified by **srcSubpass** and any load, store, or multisample resolve operations on attachments used in **srcSubpass**. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the source stage mask specified by **srcStageMask**.

If **dstSubpass** is equal to **VK_SUBPASS_EXTERNAL**, the second synchronization scope includes commands that occur later in submission order than the **vkCmdEndRenderPass** used to end the render pass instance. Otherwise, the second set of commands includes all commands submitted as part of the subpass instance identified by **dstSubpass** and any load, store, and multisample resolve operations on attachments used in **dstSubpass**. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by **dstStageMask**.
The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by \textit{srcStageMask}. It is also limited to access types in the source access mask specified by \textit{srcAccessMask}.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by \textit{dstStageMask}. It is also limited to access types in the destination access mask specified by \textit{dstAccessMask}.

The availability and visibility operations defined by a subpass dependency affect the execution of image layout transitions within the render pass.

\textit{Note}

For non-attachment resources, the memory dependency expressed by subpass dependency is nearly identical to that of a \textit{VkMemoryBarrier} (with matching \textit{srcAccessMask} and \textit{dstAccessMask} parameters) submitted as a part of a \textit{vkCmdPipelineBarrier} (with matching \textit{srcStageMask} and \textit{dstStageMask} parameters). The only difference being that its scopes are limited to the identified subpasses rather than potentially affecting everything before and after.

For attachments however, subpass dependencies work more like a \textit{VkImageMemoryBarrier} defined similarly to the \textit{VkMemoryBarrier} above, the queue family indices set to \texttt{VK_QUEUE_FAMILY_IGNORED}, and layouts as follows:

- The equivalent to \textit{oldLayout} is the attachment's layout according to the subpass description for \textit{srcSubpass}.
- The equivalent to \textit{newLayout} is the attachment's layout according to the subpass description for \textit{dstSubpass}.

\textbf{Valid Usage}

- \textbf{VUID-VkSubpassDependency-srcStageMask-04090}
  If the \textit{geometryShader} feature is not enabled, \textit{srcStageMask} must not contain \texttt{VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT}

- \textbf{VUID-VkSubpassDependency-srcStageMask-04091}
  If the \textit{tessellationShader} feature is not enabled, \textit{srcStageMask} must not contain \texttt{VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT} or \texttt{VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT}

- \textbf{VUID-VkSubpassDependency-srcStageMask-04092}
  If the \textit{conditionalRendering} feature is not enabled, \textit{srcStageMask} must not contain \texttt{VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT}

- \textbf{VUID-VkSubpassDependency-srcStageMask-04093}
  If the \textit{fragmentDensityMap} feature is not enabled, \textit{srcStageMask} must not contain \texttt{VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT}

- \textbf{VUID-VkSubpassDependency-srcStageMask-04094}
If the `transformFeedback` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-VkSubpassDependency-srcStageMask-04095
  If the `meshShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- VUID-VkSubpassDependency-srcStageMask-04096
  If the `taskShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- VUID-VkSubpassDependency-srcStageMask-07318
  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkSubpassDependency-srcStageMask-03937
  If the `synchronization2` feature is not enabled, `srcStageMask` must not be 0

- VUID-VkSubpassDependency-srcStageMask-07949
  If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-VkSubpassDependency-dstStageMask-04090
  If the `geometryShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-VkSubpassDependency-dstStageMask-04091
  If the `tessellationShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-VkSubpassDependency-dstStageMask-04092
  If the `conditionalRendering` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- VUID-VkSubpassDependency-dstStageMask-04093
  If the `fragmentDensityMap` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- VUID-VkSubpassDependency-dstStageMask-04094
  If the `transformFeedback` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-VkSubpassDependency-dstStageMask-04095
  If the `meshShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- VUID-VkSubpassDependency-dstStageMask-04096
  If the `taskShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- VUID-VkSubpassDependency-dstStageMask-07318
  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `dstStageMask` must not contain
If the `synchronization2` feature is not enabled, `dstStageMask` must not be 0.

If neither the `VK_NV_ray_tracing` extension or `rayTracingPipeline` feature are enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

`srcSubpass` must be less than or equal to `dstSubpass`, unless one of them is `VK_SUBPASS_EXTERNAL`, to avoid cyclic dependencies and ensure a valid execution order.

`srcSubpass` and `dstSubpass` must not both be equal to `VK_SUBPASS_EXTERNAL`.

If `srcSubpass` is equal to `dstSubpass` and `srcStageMask` includes a framebuffer-space stage, `dstStageMask` must only contain framebuffer-space stages.

Any access flag included in `srcAccessMask` must be supported by one of the pipeline stages in `srcStageMask`, as specified in the table of supported access types.

Any access flag included in `dstAccessMask` must be supported by one of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

If `srcSubpass` equals `dstSubpass`, and `srcStageMask` and `dstStageMask` both include a framebuffer-space stage, then `dependencyFlags` must include `VK_DEPENDENCY_BY_REGION_BIT`.

If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `srcSubpass` must not be equal to `VK_SUBPASS_EXTERNAL`.

If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `dstSubpass` must not be equal to `VK_SUBPASS_EXTERNAL`.

If `srcSubpass` equals `dstSubpass` and that subpass has more than one bit set in the view mask, then `dependencyFlags` must include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

Valid Usage (Implicit)

`srcStageMask` must be a valid combination of `VkPipelineStageFlagBits` values.

`dstStageMask` must be a valid combination of `VkPipelineStageFlagBits` values.

`srcAccessMask` must be a valid combination of `VkAccessFlagBits` values.
When multiview is enabled, the execution of the multiple views of one subpass may not occur simultaneously or even back-to-back, and rather may be interleaved with the execution of other subpasses. The load and store operations apply to attachments on a per-view basis. For example, an attachment using `VK_ATTACHMENT_LOAD_OP_CLEAR` will have each view cleared on first use, but the first use of one view may be temporally distant from the first use of another view.

**Note**

A good mental model for multiview is to think of a multiview subpass as if it were a collection of individual (per-view) subpasses that are logically grouped together and described as a single multiview subpass in the API. Similarly, a multiview attachment can be thought of like several individual attachments that happen to be layers in a single image. A view-local dependency between two multiview subpasses acts like a set of one-to-one dependencies between corresponding pairs of per-view subpasses. A view-global dependency between two multiview subpasses acts like a set of $N \times M$ dependencies between all pairs of per-view subpasses in the source and destination. Thus, it is a more compact representation which also makes clear the commonality and reuse that is present between views in a subpass. This interpretation motivates the answers to questions like “when does the load op apply” - it is on the first use of each view of an attachment, as if each view was a separate attachment.

The content of each view follows the description in attachment content behavior. In particular, if an attachment is preserved, all views within the attachment are preserved.

If any two subpasses of a render pass activate transform feedback to the same bound transform feedback buffers, a subpass dependency must be included (either directly or via some intermediate subpasses) between them.

If there is no subpass dependency from `VK_SUBPASS_EXTERNAL` to the first subpass that uses an attachment, then an implicit subpass dependency exists from `VK_SUBPASS_EXTERNAL` to the first subpass it is used in. The implicit subpass dependency only exists if there exists an automatic layout transition away from `initialLayout`. The subpass dependency operates as if defined with the following parameters:

```c
VkSubpassDependency implicitDependency = {
    .srcSubpass = VK_SUBPASS_EXTERNAL,
    .dstSubpass = firstSubpass, // First subpass attachment is used in
    .srcStageMask = VK_PIPELINE_STAGE_NONE,
    .dstStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,
    .srcAccessMask = 0,
    .dstAccessMask = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT
}
```
Similarly, if there is no subpass dependency from the last subpass that uses an attachment to `VK_SUBPASS_EXTERNAL`, then an implicit subpass dependency exists from the last subpass it is used in to `VK_SUBPASS_EXTERNAL`. The implicit subpass dependency only exists if there exists an automatic layout transition into `finalLayout`. The subpass dependency operates as if defined with the following parameters:

```c
VkSubpassDependency implicitDependency = {
    .srcSubpass = lastSubpass, // Last subpass attachment is used in
    .dstSubpass = VK_SUBPASS_EXTERNAL,
    .srcStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,
    .dstStageMask = VK_PIPELINE_STAGE_NONE,
    .srcAccessMask = VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
                     VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
    .dstAccessMask = 0,
    .dependencyFlags = 0
};
```

As subpasses may overlap or execute out of order with regards to other subpasses unless a subpass dependency chain describes otherwise, the layout transitions required between subpasses cannot be known to an application. Instead, an application provides the layout that each attachment must be in at the start and end of a render pass, and the layout it must be in during each subpass it is used in. The implementation then must execute layout transitions between subpasses in order to guarantee that the images are in the layouts required by each subpass, and in the final layout at the end of the render pass.

Automatic layout transitions apply to the entire image subresource attached to the framebuffer. If multiview is not enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the number of layers specified by `VkFramebufferCreateInfo::layers`. If multiview is enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the layers corresponding to views which are used by some subpass in the render pass, even if that subpass does not reference the given attachment. If the attachment view is a 2D or 2D array view of a 3D image, even if the attachment view only refers to a subset of the slices of the selected mip level of the 3D image, automatic layout transitions apply to the entire subresource referenced which is the entire mip level in this case.

Automatic layout transitions away from the layout used in a subpass happen-after the availability operations for all dependencies with that subpass as the `srcSubpass`.

Automatic layout transitions into the layout used in a subpass happen-before the visibility operations for all dependencies with that subpass as the `dstSubpass`.  

```c
VK_ACCESS_COLOR_ATTACHMENT_READ_BIT |  
VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |  
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT |  
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
    .dependencyFlags = 0
};
```
Automatic layout transitions away from `initialLayout` happen-after the availability operations for all dependencies with a `srcSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `dstSubpass` uses the attachment that will be transitioned. For attachments created with `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, automatic layout transitions away from `initialLayout` happen-after the availability operations for all dependencies with a `srcSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `dstSubpass` uses any aliased attachment.

Automatic layout transitions into `finalLayout` happen-before the visibility operations for all dependencies with a `dstSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `srcSubpass` uses the attachment that will be transitioned. For attachments created with `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, automatic layout transitions into `finalLayout` happen-before the visibility operations for all dependencies with a `dstSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `srcSubpass` uses any aliased attachment.

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the attachment, thus automatic layout transitions use the sample locations state specified in `VkRenderPassSampleLocationsBeginInfoEXT`.

Automatic layout transitions of an attachment referring to a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` use the sample locations the image subresource range referenced by the attachment was last rendered with. If the current render pass does not use the attachment as a depth/stencil attachment in any subpass that happens-before, the automatic layout transition uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pAttachmentInitialSampleLocations` array for which the `attachmentIndex` member equals the attachment index of the attachment, if one is specified. Otherwise, the automatic layout transition uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pPostSubpassSampleLocations` array for which the `subpassIndex` member equals the index of the subpass that last used the attachment as a depth/stencil attachment, if one is specified.

If no sample locations state has been specified for an automatic layout transition performed on an attachment referring to a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` the contents of the depth aspect of the depth/stencil attachment become undefined as if the layout of the attachment was transitioned from the `VK_IMAGE_LAYOUT_UNDEFINED` layout.

If two subpasses use the same attachment, and both subpasses use the attachment in a read-only layout, no subpass dependency needs to be specified between those subpasses. If an implementation treats those layouts separately, it must insert an implicit subpass dependency between those subpasses to separate the uses in each layout. The subpass dependency operates as if defined with the following parameters:

```cpp
// Used for input attachments
VkPipelineStageFlags inputAttachmentStages = VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT;
VkAccessFlags inputAttachmentDstAccess = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT;

// Used for depth/stencil attachments
```
VkPipelineStageFlags depthStencilAttachmentStages =
    VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT |
    VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT;
VkAccessFlags depthStencilAttachmentDstAccess =
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT;

VkSubpassDependency implicitDependency = {
    .srcSubpass = firstSubpass;
    .dstSubpass = secondSubpass;
    .srcStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .dstStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .srcAccessMask = 0;
    .dstAccessMask = inputAttachmentDstAccess | depthStencilAttachmentDstAccess;
    .dependencyFlags = 0;
};

When drawing using shader objects, or when the graphics pipeline is created with
VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo ::pDynamicStates, the application must specify which types of attachments that are written to during
a render pass will also be accessed as non-attachments in the render pass.

To dynamically set whether a pipeline can access a resource as a non-attachment while it is also
used as an attachment that is written to, call:

// Provided by VK_EXT_attachment_feedback_loop_dynamic_state
void vkCmdSetAttachmentFeedbackLoopEnableEXT(  
    VkCommandBuffer commandBuffer,  
    VkImageAspectFlags aspectMask);

• commandBuffer is the command buffer into which the command will be recorded.
• aspectMask specifies the types of attachments for which feedback loops will be enabled.  
  Attachment types whose aspects are not included in aspectMask will have feedback loops
  disabled.

For attachments that are written to in a render pass, only attachments with the aspects specified in
aspectMask can be accessed as non-attachments by subsequent drawing commands.

Valid Usage

• VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-attachmentFeedbackLoopDynamicState-08862
  The attachmentFeedbackLoopDynamicState feature must be enabled

• VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-aspectMask-08863
  aspectMask must only include VK_IMAGE_ASPECT_NONE, VK_IMAGE_ASPECT_COLOR_BIT,
  VK_IMAGE_ASPECT_DEPTH_BIT, and VK_IMAGE_ASPECT_STENCIL_BIT

• VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-attachmentFeedbackLoopLayout-
If the attachmentFeedbackLoopLayout feature is not enabled, aspectMask must be VK_IMAGE_ASPECT_NONE

Valid Usage (Implicit)

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-aspectMask-parameter
  aspectMask must be a valid combination of VkImageAspectFlagBits values
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

A more extensible version of render pass creation is also defined below.

To create a render pass, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkCreateRenderPass2(
    VkDevice device,
    const VkRenderPassCreateInfo2* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkRenderPass* pRenderPass);
```
or the equivalent command

```c
VkResult vkCreateRenderPass2KHR(
    VkDevice device,
    const VkRenderPassCreateInfo2* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkRenderPass* pRenderPass);
```

- `device` is the logical device that creates the render pass.
- `pCreateInfo` is a pointer to a `VkRenderPassCreateInfo2` structure describing the parameters of the render pass.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pRenderPass` is a pointer to a `VkRenderPass` handle in which the resulting render pass object is returned.

This command is functionally identical to `vkCreateRenderPass`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage (Implicit)

- VUID-vkCreateRenderPass2-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkCreateRenderPass2-pCreateInfo-parameter
  
  `pCreateInfo` must be a valid pointer to a valid `VkRenderPassCreateInfo2` structure

- VUID-vkCreateRenderPass2-pAllocator-parameter
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateRenderPass2-pRenderPass-parameter
  
  `pRenderPass` must be a valid pointer to a `VkRenderPass` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkRenderPassCreateInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_2
```
```c
typedef struct VkRenderPassCreateInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassCreateFlags flags;
    uint32_t attachmentCount;
    const VkAttachmentDescription2* pAttachments;
    uint32_t subpassCount;
    const VkSubpassDescription2* pSubpasses;
    uint32_t dependencyCount;
    const VkSubpassDependency2* pDependencies;
    uint32_t correlatedViewMaskCount;
    const uint32_t* pCorrelatedViewMasks;
} VkRenderPassCreateInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkRenderPassCreateInfo2 VkRenderPassCreateInfo2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **attachmentCount** is the number of attachments used by this render pass.
- **pAttachments** is a pointer to an array of `attachmentCount` `VkAttachmentDescription2` structures describing the attachments used by the render pass.
- **subpassCount** is the number of subpasses to create.
- **pSubpasses** is a pointer to an array of `subpassCount` `VkSubpassDescription2` structures describing each subpass.
- **dependencyCount** is the number of dependencies between pairs of subpasses.
- **pDependencies** is a pointer to an array of `dependencyCount` `VkSubpassDependency2` structures describing dependencies between pairs of subpasses.
- **correlatedViewMaskCount** is the number of correlation masks.
- **pCorrelatedViewMasks** is a pointer to an array of view masks indicating sets of views that may be more efficient to render concurrently.

Parameters defined by this structure with the same name as those in `VkRenderPassCreateInfo` have the identical effect to those parameters; the child structures are variants of those used in `VkRenderPassCreateInfo` which add `sType` and `pNext` parameters, allowing them to be extended.

If the `VkSubpassDescription2::viewMask` member of any element of `pSubpasses` is not zero, *multiview* functionality is considered to be enabled for this render pass.

`correlatedViewMaskCount` and `pCorrelatedViewMasks` have the same effect as `VkRenderPassMultiviewCreateInfo::correlationMaskCount` and `VkRenderPassMultiviewCreateInfo`
Valid Usage

- **VUID-VkRenderPassCreateInfo2-None-03049**
  If any two subpasses operate on attachments with overlapping ranges of the same `VkDeviceMemory` object, and at least one subpass writes to that area of `VkDeviceMemory`, a subpass dependency **must** be included (either directly or via some intermediate subpasses) between them.

- **VUID-VkRenderPassCreateInfo2-attachment-03050**
  If the attachment member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or the attachment indexed by any element of `pPreserveAttachments` in any element of `pSubpasses` is bound to a range of a `VkDeviceMemory` object that overlaps with any other attachment in any subpass (including the same subpass), the `VkAttachmentDescription2` structures describing them **must** include `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` in flags.

- **VUID-VkRenderPassCreateInfo2-attachment-03051**
  If the attachment member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, then it **must** be less than `attachmentCount`.

- **VUID-VkRenderPassCreateInfo2-fragmentDensityMapAttachment-06472**
  If the `pNext` chain includes a `VkRenderPassFragmentDensityMapCreateInfoEXT` structure and the `fragmentDensityMapAttachment` member is not `VK_ATTACHMENT_UNUSED`, then attachment **must** be less than `attachmentCount`.

- **VUID-VkRenderPassCreateInfo2-pSubpasses-06473**
  If the `pSubpasses` `pNext` chain includes a `VkSubpassDescriptionDepthStencilResolve` structure and the `pDepthStencilResolveAttachment` member is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, then attachment **must** be less than `attachmentCount`.

- **VUID-VkRenderPassCreateInfo2-pAttachments-02522**
  For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a layout equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo2-pAttachments-02523**
  For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a layout equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo2-pDependencies-03054**
  For any element of `pDependencies`, if the `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `srcStageMask` member of that dependency **must** be a pipeline stage supported by the pipeline identified by the `pipelineBindPoint` member of the source.
subpass

- **VUID-VkRenderPassCreateInfo2-pDependencies-03055**
  For any element of `pDependencies`, if the `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `dstStageMask` member of that dependency must be a pipeline stage supported by the pipeline identified by the `pipelineBindPoint` member of the destination subpass.

- **VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-03056**
  The set of bits included in any element of `pCorrelatedViewMasks` must not overlap with the set of bits included in any other element of `pCorrelatedViewMasks`.

- **VUID-VkRenderPassCreateInfo2-viewMask-03057**
  If the `viewMask` member of all elements of `pSubpasses` is 0, `correlatedViewMaskCount` must be 0.

- **VUID-VkRenderPassCreateInfo2-viewMask-03058**
  The `viewMask` member of all elements of `pSubpasses` must either all be 0, or all not be 0.

- **VUID-VkRenderPassCreateInfo2-viewMask-03059**
  If the `viewMask` member of all elements of `pSubpasses` is 0, the `dependencyFlags` member of any element of `pDependencies` must not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

- **VUID-VkRenderPassCreateInfo2-pDependencies-03060**
  For any element of `pDependencies` where its `srcSubpass` member equals its `dstSubpass` member, if the `viewMask` member of the corresponding element of `pSubpasses` includes more than one bit, its `dependencyFlags` member must include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

- **VUID-VkRenderPassCreateInfo2-attachment-02525**
  If the `attachment` member of any element of the `pInputAttachments` member of any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, the `aspectMask` member of that element of `pInputAttachments` must only include aspects that are present in images of the format specified by the element of `pAttachments` specified by `attachment`.

- **VUID-VkRenderPassCreateInfo2-srcSubpass-02526**
  The `srcSubpass` member of each element of `pDependencies` must be less than `subpassCount`.

- **VUID-VkRenderPassCreateInfo2-dstSubpass-02527**
  The `dstSubpass` member of each element of `pDependencies` must be less than `subpassCount`.

- **VUID-VkRenderPassCreateInfo2-pAttachments-04585**
  If any element of `pAttachments` is used as a fragment shading rate attachment in any subpass, it must not be used as any other attachment in the render pass.

- **VUID-VkRenderPassCreateInfo2-flags-04521**
  If `flags` includes `VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM`, an element of `pSubpasses` includes an instance of `VkFragmentShadingRateAttachmentInfoKHR` in its `pNext` chain, and the `pFragmentShadingRateAttachment` member of that structure is not equal to `NULL`, the attachment member of `pFragmentShadingRateAttachment` must be `VK_ATTACHMENT_UNUSED`.

- **VUID-VkRenderPassCreateInfo2-pAttachments-04586**
  If any element of `pAttachments` is used as a fragment shading rate attachment in any
subpass, it must have an image format whose potential format features contain
VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkRenderPassCreateInfo2-rasterizationSamples-04905
  If the pipeline is being created with fragment shader state, and the
  VK_QCOM_render_pass_shader_resolve extension is enabled, and if subpass has any input
  attachments, and if the subpass description contains
  VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM, then the sample count of the input
  attachments must equal rasterizationSamples

- VUID-VkRenderPassCreateInfo2-sampleShadingEnable-04906
  If the pipeline is being created with fragment shader state, and the
  VK_QCOM_render_pass_shader_resolve extension is enabled, and if subpass has any input
  attachments, and if the subpass description contains
  VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM, then sampleShadingEnable
  must be false

- VUID-VkRenderPassCreateInfo2-flags-04907
  If flags includes VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM, and if
  pResolveAttachments is not NULL, then each resolve attachment must be
  VK_ATTACHMENT_UNUSED

- VUID-VkRenderPassCreateInfo2-flags-04908
  If flags includes VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM, and if
  pDepthStencilResolveAttachment is not NULL, then the depth/stencil resolve attachment
  must be VK_ATTACHMENT_UNUSED

- VUID-VkRenderPassCreateInfo2-flags-04909
  If flags includes VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM, then the subpass
  must be the last subpass in a subpass dependency chain

- VUID-VkRenderPassCreateInfo2-attachment-06244
  If the attachment member of the pDepthStencilAttachment member of an element of
  pSubpasses is not VK_ATTACHMENT_UNUSED, the layout member of that same structure is either
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  and the pNext chain of that structure does not include a
  VkAttachmentReferenceStencilLayout structure, then the element of pAttachments with an
  index equal to attachment must not have a format that includes both depth and stencil
  components

- VUID-VkRenderPassCreateInfo2-attachment-06245
  If the attachment member of the pDepthStencilAttachment member of an element of
  pSubpasses is not VK_ATTACHMENT_UNUSED and the layout member of that same structure is
  either VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, then the element of pAttachments with an
  index equal to attachment must have a format that includes only a stencil component

- VUID-VkRenderPassCreateInfo2-attachment-06246
  If the attachment member of the pDepthStencilAttachment member of an element of
  pSubpasses is not VK_ATTACHMENT_UNUSED and the layout member of that same structure is
  either VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, then the element of pAttachments with an
  index equal to attachment must not have a format that includes only a stencil component
Valid Usage (Implicit)

- VUID-VkRenderPassCreateInfo2-sType-sType
  The \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO_2}

- VUID-VkRenderPassCreateInfo2-pNext-pNext
  Each \texttt{pNext} member of any structure (including this one) in the \texttt{pNext} chain \textbf{must} be either \texttt{NULL} or a pointer to a valid instance of \texttt{VkRenderPassCreationControlEXT}, \texttt{VkRenderPassCreationFeedbackCreateInfoEXT}, or \texttt{VkRenderPassFragmentDensityMapCreateInfoEXT}

- VUID-VkRenderPassCreateInfo2-sType-unique
  The \texttt{sType} value of each struct in the \texttt{pNext} chain \textbf{must} be unique

- VUID-VkRenderPassCreateInfo2-flags-parameter
  \texttt{flags} \textbf{must} be a valid combination of \texttt{VkRenderPassCreateFlagBits} values

- VUID-VkRenderPassCreateInfo2-pAttachments-parameter
  If \texttt{attachmentCount} is not \texttt{0}, \texttt{pAttachments} \textbf{must} be a valid pointer to an array of \texttt{attachmentCount} valid \texttt{VkAttachmentDescription2} structures

- VUID-VkRenderPassCreateInfo2-pSubpasses-parameter
  \texttt{pSubpasses} \textbf{must} be a valid pointer to an array of \texttt{subpassCount} valid \texttt{VkSubpassDescription2} structures

- VUID-VkRenderPassCreateInfo2-pDependencies-parameter
  If \texttt{dependencyCount} is not \texttt{0}, \texttt{pDependencies} \textbf{must} be a valid pointer to an array of \texttt{dependencyCount} valid \texttt{VkSubpassDependency2} structures

- VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-parameter
  If \texttt{correlatedViewMaskCount} is not \texttt{0}, \texttt{pCorrelatedViewMasks} \textbf{must} be a valid pointer to an array of \texttt{correlatedViewMaskCount \texttt{uint32_t}} values

- VUID-VkRenderPassCreateInfo2-subpassCount-arraylength
  \texttt{subpassCount} \textbf{must} be greater than \texttt{0}

The \texttt{VkAttachmentDescription2} structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescription2 {
    VkStructureType sType;
    const void* pNext;
    VkAttachmentDescriptionFlags flags;
    VkFormat format;
    VkSampleCountFlagBits samples;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkAttachmentLoadOp stencilLoadOp;
    VkAttachmentStoreOp stencilStoreOp;
    VkImageLayout initialLayout;
    VkImageLayout finalLayout;
} VkAttachmentDescription2;
```
or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkAttachmentDescription2 VkAttachmentDescription2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkAttachmentDescriptionFlagBits` specifying additional properties of the attachment.
- **format** is a `VkFormat` value specifying the format of the image that will be used for the attachment.
- **samples** is a `VkSampleCountFlagBits` value specifying the number of samples of the image.
- **loadOp** is a `VkAttachmentLoadOp` value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
- **storeOp** is a `VkAttachmentStoreOp` value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
- **stencilLoadOp** is a `VkAttachmentLoadOp` value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
- **stencilStoreOp** is a `VkAttachmentStoreOp` value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- **initialLayout** is the layout the attachment image subresource will be in when a render pass instance begins.
- **finalLayout** is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

Parameters defined by this structure with the same name as those in `VkAttachmentDescription` have the identical effect to those parameters.

If the `separateDepthStencilLayouts` feature is enabled, and **format** is a depth/stencil format, **initialLayout** and **finalLayout** can be set to a layout that only specifies the layout of the depth aspect.

If the `pNext` chain includes a `VkAttachmentDescriptionStencilLayout` structure, then the **stencilInitialLayout** and **stencilFinalLayout** members specify the initial and final layouts of the stencil aspect of a depth/stencil format, and **initialLayout** and **finalLayout** only apply to the depth aspect. For depth-only formats, the `VkAttachmentDescriptionStencilLayout` structure is ignored. For stencil-only formats, the initial and final layouts of the stencil aspect are taken from the `VkAttachmentDescriptionStencilLayout` structure if present, or **initialLayout** and **finalLayout** if not present.

If **format** is a depth/stencil format, and either **initialLayout** or **finalLayout** does not specify a layout for the stencil aspect, then the application **must** specify the initial and final layouts of the stencil aspect.
aspect by including a `VkAttachmentDescriptionStencilLayout` structure in the `pNext` chain.

### Valid Usage

- **VUID-VkAttachmentDescription2-format-06698**
  - `format must` not be `VK_FORMAT_UNDEFINED`

- **VUID-VkAttachmentDescription2-format-06699**
  - If `format` includes a color or depth component and `loadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout must` not be `VK_IMAGE_LAYOUT_UNDEFINED`

- **VUID-VkAttachmentDescription2-finalLayout-00843**
  - `finalLayout must` not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- **VUID-VkAttachmentDescription2-format-03280**
  - If `format` is a color format, `initialLayout must` not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-03281**
  - If `format` is a depth/stencil format, `initialLayout must` not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-03282**
  - If `format` is a color format, `finalLayout must` not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-03283**
  - If `format` is a depth/stencil format, `finalLayout must` not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-06487**
  - If `format` is a color format, `initialLayout must` not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-06488**
  - If `format` is a color format, `finalLayout must` not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03284**
  - If the `separateDepthStencilLayouts` feature is not enabled, `initialLayout must` not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03285**
  - If the `separateDepthStencilLayouts` feature is not enabled, `finalLayout must` not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`
- **VUID-VkAttachmentDescription2-format-03286**
  If *format* is a color format, *initialLayout* must not be
  
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription2-format-03287**
  If *format* is a color format, *finalLayout* must not be
  
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription2-format-06906**
  If *format* is a depth/stencil format which includes both depth and stencil components, *initialLayout* must not be
  
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription2-format-06907**
  If *format* is a depth/stencil format which includes both depth and stencil components, *finalLayout* must not be
  
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription2-format-03290**
  If *format* is a depth/stencil format which includes only the depth component, *initialLayout* must not be
  
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription2-format-03291**
  If *format* is a depth/stencil format which includes only the depth component, *finalLayout* must not be
  
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription2-synchronization2-06908**
  If the *synchronization2* feature is not enabled, *initialLayout* must not be
  
  VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- **VUID-VkAttachmentDescription2-synchronization2-06909**
  If the *synchronization2* feature is not enabled, *finalLayout* must not be
  
  VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- **VUID-VkAttachmentDescription2-attachmentFeedbackLoopLayout-07309**
  If the *attachmentFeedbackLoopLayout* feature is not enabled, *initialLayout* must not be
  
  VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

- **VUID-VkAttachmentDescription2-attachmentFeedbackLoopLayout-07310**
  If the *attachmentFeedbackLoopLayout* feature is not enabled, *finalLayout* must not be
  
  VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

- **VUID-VkAttachmentDescription2-samples-08745**
  *samples* must be a bit value that is set in *imageCreateSampleCounts* (as defined in *Image Creation Limits*) for the given *format*

- **VUID-VkAttachmentDescription2-pNext-06704**
  If the *pNext* chain does not include a *VkAttachmentDescriptionStencilLayout* structure,
format includes a stencil component, and stencilLoadOp is VK_ATTACHMENT_LOAD_OP_LOAD, then initialLayout must not be VK_IMAGE_LAYOUT_UNDEFINED

- VUID-VkAttachmentDescription2-pNext-06705
  If the pNext chain does includes a VkAttachmentDescriptionStencilLayout structure, format includes a stencil component, and stencilLoadOp is VK_ATTACHMENT_LOAD_OP_LOAD, then VkAttachmentDescriptionStencilLayout::stencilInitialLayout must not be VK_IMAGE_LAYOUT_UNDEFINED

- VUID-VkAttachmentDescription2-format-06249
  If format is a depth/stencil format which includes both depth and stencil components, and initialLayout is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, the pNext chain must include a VkAttachmentDescriptionStencilLayout structure

- VUID-VkAttachmentDescription2-format-06250
  If format is a depth/stencil format which includes both depth and stencil components, and finalLayout is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, the pNext chain must include a VkAttachmentDescriptionStencilLayout structure

- VUID-VkAttachmentDescription2-format-06247
  If the pNext chain does not include a VkAttachmentDescriptionStencilLayout structure and format only includes a stencil component, initialLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription2-format-06248
  If the pNext chain does not include a VkAttachmentDescriptionStencilLayout structure and format only includes a stencil component, finalLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

### Valid Usage (Implicit)

- VUID-VkAttachmentDescription2-sType-sType
  sType must be VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_2

- VUID-VkAttachmentDescription2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkAttachmentDescriptionStencilLayout

- VUID-VkAttachmentDescription2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkAttachmentDescription2-flags-parameter
  flags must be a valid combination of VkAttachmentDescriptionFlagBits values

- VUID-VkAttachmentDescription2-format-parameter
  format must be a valid VkFormat value

- VUID-VkAttachmentDescription2-samples-parameter
  samples must be a valid VkSampleCountFlagBits value

- VUID-VkAttachmentDescription2-loadOp-parameter
loadOp must be a valid VkAttachmentLoadOp value

- VUID-VkAttachmentDescription2-storeOp-parameter
  storeOp must be a valid VkAttachmentStoreOp value

- VUID-VkAttachmentDescription2-stencilLoadOp-parameter
  stencilLoadOp must be a valid VkAttachmentLoadOp value

- VUID-VkAttachmentDescription2-stencilStoreOp-parameter
  stencilStoreOp must be a valid VkAttachmentStoreOp value

- VUID-VkAttachmentDescription2-initialLayout-parameter
  initialLayout must be a valid VkImageLayout value

- VUID-VkAttachmentDescription2-finalLayout-parameter
  finalLayout must be a valid VkImageLayout value

The VkAttachmentDescriptionStencilLayout structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescriptionStencilLayout {
    VkStructureType sType;
    void* pNext;
    VkImageLayout stencilInitialLayout;
    VkImageLayout stencilFinalLayout;
} VkAttachmentDescriptionStencilLayout;
```

or the equivalent

```c
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkAttachmentDescriptionStencilLayout VkAttachmentDescriptionStencilLayoutKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- stencilInitialLayout is the layout the stencil aspect of the attachment image subresource will be in when a render pass instance begins.
- stencilFinalLayout is the layout the stencil aspect of the attachment image subresource will be transitioned to when a render pass instance ends.

Valid Usage

- VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-03308
  stencilInitialLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL,
  or
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03309
  stencilFinalLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03310
  stencilFinalLayout must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

Valid Usage (Implicit)

- VUID-VkAttachmentDescriptionStencilLayout-sType-sType
  sType must be VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_STENCIL_LAYOUT

- VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-parameter
  stencilInitialLayout must be a valid VkImageLayout value

- VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-parameter
  stencilFinalLayout must be a valid VkImageLayout value

The VkSubpassDescription2 structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDescription2 {
    VkStructureType sType;
    const void* pNext;
    VkSubpassDescriptionFlags flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t viewMask;
    uint32_t inputAttachmentCount;
    const VkAttachmentReference2* pInputAttachments;
    uint32_t colorAttachmentCount;
    const VkAttachmentReference2* pColorAttachments;
    const VkAttachmentReference2* pResolveAttachments;
    const VkAttachmentReference2* pDepthStencilAttachment;
    uint32_t preserveAttachmentCount;
    const uint32_t* pPreserveAttachments;
} VkSubpassDescription2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDescription2 VkSubpassDescription2KHR;
```
• **sType** is a VkStructureType value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is a bitmask of VkSubpassDescriptionFlagBits specifying usage of the subpass.

• **pipelineBindPoint** is a VkPipelineBindPoint value specifying the pipeline type supported for this subpass.

• **viewMask** is a bitfield of view indices describing which views rendering is broadcast to in this subpass, when multiview is enabled.

• **inputAttachmentCount** is the number of input attachments.

• **pInputAttachments** is a pointer to an array of VkAttachmentReference2 structures defining the input attachments for this subpass and their layouts.

• **colorAttachmentCount** is the number of color attachments.

• **pColorAttachments** is a pointer to an array of colorAttachmentCount VkAttachmentReference2 structures defining the color attachments for this subpass and their layouts.

• **pResolveAttachments** is NULL or a pointer to an array of colorAttachmentCount VkAttachmentReference2 structures defining the resolve attachments for this subpass and their layouts.

• **pDepthStencilAttachment** is a pointer to a VkAttachmentReference2 structure specifying the depth/stencil attachment for this subpass and its layout.

• **preserveAttachmentCount** is the number of preserved attachments.

• **pPreserveAttachments** is a pointer to an array of preserveAttachmentCount render pass attachment indices identifying attachments that are not used by this subpass, but whose contents must be preserved throughout the subpass.

Parameters defined by this structure with the same name as those in VkSubpassDescription have the identical effect to those parameters.

viewMask has the same effect for the described subpass as VkRenderPassMultiviewCreateInfo::pViewMasks has on each corresponding subpass.

If a VkFragmentShadingRateAttachmentInfoKHR structure is included in the pNext chain, pFragmentShadingRateAttachment is not NULL, and its attachment member is not VK_ATTACHMENT_UNUSED, the identified attachment defines a fragment shading rate attachment for that subpass.

---

**Valid Usage**

- VUID-VkSubpassDescription2-attachment-06912
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL.

- VUID-VkSubpassDescription2-attachment-06913
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL.
• VUID-VkSubpassDescription2-attachment-06914
  If the attachment member of an element of pResolveAttachments is not
  VK_ATTACHMENT_UNUSED, its layout member must not be
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06915
  If the attachment member of pDepthStencilAttachment is not VK_ATTACHMENT_UNUSED, its layout
  member must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06916
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED,
  its layout member must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06917
  If the attachment member of an element of pResolveAttachments is not
  VK_ATTACHMENT_UNUSED, its layout member must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06918
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED,
  its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06919
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED,
  its layout member must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, or
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06920
  If the attachment member of an element of pResolveAttachments is not
  VK_ATTACHMENT_UNUSED, its layout member must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, or
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06921
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED,
  its layout member must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR

• VUID-VkSubpassDescription2-attachment-06922
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED,
  its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkSubpassDescription2-attachment-06923
  If the attachment member of an element of pResolveAttachments is not
  VK_ATTACHMENT_UNUSED, its layout member must not be
  VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR
If the attachment member of pDepthStencilAttachment is not VK_ATTACHMENT_UNUSED and its pNext chain includes a VkAttachmentReferenceStencilLayout structure, the layout member of pDepthStencilAttachment must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

pipelineBindPoint must be VK_PIPELINE_BIND_POINT_GRAPHICS or VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI.

colorAttachmentCount must be less than or equal to VkPhysicalDeviceLimits::maxColorAttachments.

If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then loadOp must not be VK_ATTACHMENT_LOAD_OP_CLEAR.

If pResolveAttachments is not NULL, for each resolve attachment that does not have the value VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have the value VK_ATTACHMENT_UNUSED.

If pResolveAttachments is not NULL, for each resolve attachment that is not VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have a sample count of VK_SAMPLE_COUNT_1_BIT.

Each element of pResolveAttachments must have the same VkFormat as its corresponding color attachment.

If none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature are enabled, all attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have the same sample count.

All attachments in pInputAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain at least VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT.

All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT.
• VUID-VkSubpassDescription2-pResolveAttachments-02899

All attachments in pResolveAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT.

• VUID-VkSubpassDescription2-pDepthStencilAttachment-02900

If pDepthStencilAttachment is not NULL and the attachment is not VK_ATTACHMENT_UNUSED then it must have an image format whose potential format features contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT.

• VUID-VkSubpassDescription2-linearColorAttachment-06499

If the linearColorAttachment feature is enabled and the image is created with VK_IMAGE_TILING_LINEAR, all attachments in pInputAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features must contain VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV.

• VUID-VkSubpassDescription2-linearColorAttachment-06500

If the linearColorAttachment feature is enabled and the image is created with VK_IMAGE_TILING_LINEAR, all attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features must contain VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV.

• VUID-VkSubpassDescription2-linearColorAttachment-06501

If the linearColorAttachment feature is enabled and the image is created with VK_IMAGE_TILING_LINEAR, all attachments in pResolveAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features must contain VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV.

• VUID-VkSubpassDescription2-pColorAttachments-03070

If the VK_AMD_mixed_attachment_samples extension is enabled, all attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have a sample count that is smaller than or equal to the sample count of pDepthStencilAttachment if it is not VK_ATTACHMENT_UNUSED.

• VUID-VkSubpassDescription2-pNext-06870

If the pNext chain includes a VkMultisampledRenderToSingleSampledInfoEXT structure with multisampledRenderToSingleSampledEnable equal to VK_TRUE, then all attachments in pColorAttachments and pDepthStencilAttachment that are not VK_ATTACHMENT_UNUSED must have a sample count that is either VK_SAMPLE_COUNT_1_BIT or equal to VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples.

• VUID-VkSubpassDescription2-pNext-06871

If the pNext chain includes a VkMultisampledRenderToSingleSampledInfoEXT structure with multisampledRenderToSingleSampledEnable equal to VK_TRUE, and pDepthStencilAttachment is not NULL, does not have the value VK_ATTACHMENT_UNUSED, and has a sample count of VK_SAMPLE_COUNT_1_BIT, the pNext chain must also include a VkSubpassDescriptionDepthStencilResolve structure with pDepthStencilResolveAttachment that is either NULL or has the value VK_ATTACHMENT_UNUSED.

• VUID-VkSubpassDescription2-multisampledRenderToSingleSampled-06872

If none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature are enabled, all attachments in pDepthStencilAttachment or pColorAttachments that...
are not `VK_ATTACHMENT_UNUSED` must have the same sample count

- **VUID-VkSubpassDescription2-attachment-03073**
  Each element of `pPreserveAttachments` must not be `VK_ATTACHMENT_UNUSED`

- **VUID-VkSubpassDescription2-pPreserveAttachments-03074**
  Each element of `pPreserveAttachments` must not also be an element of any other member of the subpass description

- **VUID-VkSubpassDescription2-layout-02528**
  If any attachment is used by more than one `VkAttachmentReference2` member, then each use must use the same layout

- **VUID-VkSubpassDescription2-flags-03076**
  If `flags` includes `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX`, it must also include `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX`

- **VUID-VkSubpassDescription2-attachment-02799**
  If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member must be a valid combination of `VkImageAspectFlagBits`

- **VUID-VkSubpassDescription2-attachment-02800**
  If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member must not be 0

- **VUID-VkSubpassDescription2-attachment-02801**
  If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member must not include `VK_IMAGE_ASPECT_METADATA_BIT`

- **VUID-VkSubpassDescription2-attachment-04563**
  If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member must not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index `i`

- **VUID-VkSubpassDescription2-pDepthStencilAttachment-04440**
  An attachment must not be used in both `pDepthStencilAttachment` and `pColorAttachments`

- **VUID-VkSubpassDescription2-multiview-06558**
  If the multiview feature is not enabled, `viewMask` must be 0

- **VUID-VkSubpassDescription2-viewMask-06706**
  The index of the most significant bit in `viewMask` must be less than `maxMultiviewViewCount`

---

**Valid Usage (Implicit)**

- **VUID-VkSubpassDescription2-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_2`

- **VUID-VkSubpassDescription2-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkFragmentShadingRateAttachmentInfoKHR`, `VkMultisampledRenderToSingleSampledInfoEXT`, `VkRenderPassCreationControlEXT`, `VkRenderPassSubpassFeedbackCreateInfoEXT`, or `VkSubpassDescriptionDepthStencilResolve`
• VUID-VkSubpassDescription2-sType-unique
  The sType value of each struct in the pNext chain must be unique.

• VUID-VkSubpassDescription2-flags-parameter
  flags must be a valid combination of VkSubpassDescriptionFlagBits values.

• VUID-VkSubpassDescription2-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value.

• VUID-VkSubpassDescription2-pInputAttachments-parameter
  If inputAttachmentCount is not 0, pInputAttachments must be a valid pointer to an array of inputAttachmentCount valid VkAttachmentReference2 structures.

• VUID-VkSubpassDescription2-pColorAttachments-parameter
  If colorAttachmentCount is not 0, pColorAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference2 structures.

• VUID-VkSubpassDescription2-pResolveAttachments-parameter
  If colorAttachmentCount is not 0, and pResolveAttachments is not NULL, pResolveAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference2 structures.

• VUID-VkSubpassDescription2-pDepthStencilAttachment-parameter
  If pDepthStencilAttachment is not NULL, pDepthStencilAttachment must be a valid pointer to a valid VkAttachmentReference2 structure.

• VUID-VkSubpassDescription2-pPreserveAttachments-parameter
  If preserveAttachmentCount is not 0, pPreserveAttachments must be a valid pointer to an array of preserveAttachmentCount uint32_t values.

The VkSubpassDescriptionDepthStencilResolve structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDescriptionDepthStencilResolve {
    VkStructureType sType;
    const void* pNext;
    VkResolveModeFlagBits depthResolveMode;
    VkResolveModeFlagBits stencilResolveMode;
    const VkAttachmentReference2* pDepthStencilResolveAttachment;
} VkSubpassDescriptionDepthStencilResolve;
```

or the equivalent

```c
// Provided by VK_KHR_depth_stencil_resolve
typedef VkSubpassDescriptionDepthStencilResolve
    VkSubpassDescriptionDepthStencilResolveKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• depthResolveMode is a VkResolveModeFlagBits value describing the depth resolve mode.
• **stencilResolveMode** is a `VkResolveModeFlagBits` value describing the stencil resolve mode.

• **pDepthStencilResolveAttachment** is NULL or a pointer to a `VkAttachmentReference2` structure defining the depth/stencil resolve attachment for this subpass and its layout.

If the **pNext** chain of `VkSubpassDescription2` includes a `VkSubpassDescriptionDepthStencilResolve` structure, then that structure describes **multisample resolve operations** for the depth/stencil attachment in a subpass. If this structure is not included in the **pNext** chain of `VkSubpassDescription2`, or if it is and either **pDepthStencilResolveAttachment** is NULL or its attachment index is `VK_ATTACHMENT_UNUSED`, it indicates that no depth/stencil resolve attachment will be used in the subpass.

### Valid Usage

- **VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03177**
  If **pDepthStencilResolveAttachment** is not NULL and does not have the value `VK_ATTACHMENT_UNUSED`, **pDepthStencilAttachment** must not be NULL or have the value `VK_ATTACHMENT_UNUSED`.

- **VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03179**
  If **pDepthStencilResolveAttachment** is not NULL and does not have the value `VK_ATTACHMENT_UNUSED`, **pDepthStencilAttachment** must not have a sample count of `VK_SAMPLE_COUNT_1_BIT`.

- **VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03180**
  If **pDepthStencilResolveAttachment** is not NULL and does not have the value `VK_ATTACHMENT_UNUSED`, **pDepthStencilResolveAttachment** must have a sample count of `VK_SAMPLE_COUNT_1_BIT`.

- **VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-02651**
  If **pDepthStencilResolveAttachment** is not NULL and does not have the value `VK_ATTACHMENT_UNUSED` then it must have an image format whose potential format features contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03181**
  If **pDepthStencilResolveAttachment** is not NULL and does not have the value `VK_ATTACHMENT_UNUSED` and **VkFormat** of **pDepthStencilResolveAttachment** has a depth component, then the **VkFormat** of **pDepthStencilAttachment** must have a depth component with the same number of bits and numeric format.

- **VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03182**
  If **pDepthStencilResolveAttachment** is not NULL and does not have the value `VK_ATTACHMENT_UNUSED`, and **VkFormat** of **pDepthStencilResolveAttachment** has a stencil component, then the **VkFormat** of **pDepthStencilAttachment** must have a stencil component with the same number of bits and numeric format.

- **VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03178**
  If **pDepthStencilResolveAttachment** is not NULL and does not have the value `VK_ATTACHMENT_UNUSED`, **depthResolveMode** and **stencilResolveMode** must not both be `VK_RESOLVE_MODE_NONE`.

- **VUID-VkSubpassDescriptionDepthStencilResolve-depthResolveMode-03183**
If `pDepthStencilResolveAttachment` is not NULL and does not have the value
`VK_ATTACHMENT_UNUSED` and the `VkFormat` of `pDepthStencilResolveAttachment` has a depth
component, then the value of `depthResolveMode` must be one of the bits set in
`VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes` or
`VK_RESOLVE_MODE_NONE`

- VUID-VkSubpassDescriptionDepthStencilResolve-stencilResolveMode-03184
  If `pDepthStencilResolveAttachment` is not NULL and does not have the value
  `VK_ATTACHMENT_UNUSED` and the `VkFormat` of `pDepthStencilResolveAttachment` has a stencil
  component, then the value of `stencilResolveMode` must be one of the bits set in
  `VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes` or
  `VK_RESOLVE_MODE_NONE`

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03185
  If `pDepthStencilResolveAttachment` is not NULL and does not have the value
  `VK_ATTACHMENT_UNUSED`, the `VkFormat` of `pDepthStencilResolveAttachment` has both depth and
  stencil components, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is
  `VK_FALSE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is
  `VK_FALSE`, then the values of `depthResolveMode` and `stencilResolveMode` must be identical
  or one of them must be `VK_RESOLVE_MODE_NONE`

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06873
  If the `pNext` chain of `VkSubpassDescription2` includes a
  `VkMultisampledRenderToSingleSampledInfoEXT` structure, the
  `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, and `pDepthStencilAttachment`
  is not NULL and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and
  `stencilResolveMode` must not both be `VK_RESOLVE_MODE_NONE`

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06874
  If the `pNext` chain of `VkSubpassDescription2` includes a
  `VkMultisampledRenderToSingleSampledInfoEXT` structure whose
  `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, and `pDepthStencilAttachment`
  is not NULL, does not have the value `VK_ATTACHMENT_UNUSED`, and has a `VkFormat` that has a
  depth component, then the value of `depthResolveMode` must be one of the bits set in
  `VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes` or
  `VK_RESOLVE_MODE_NONE`

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06875
  If the `pNext` chain of `VkSubpassDescription2` includes a
  `VkMultisampledRenderToSingleSampledInfoEXT` structure whose
  `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, and `pDepthStencilAttachment`
  is not NULL, does not have the value `VK_ATTACHMENT_UNUSED`, and has a `VkFormat` with a stencil
  component, then the value of `stencilResolveMode` must be one of the bits set in
  `VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes` or
VK_RESOLVE_MODE_NONE

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06876
  If the pNext chain of VkSubpassDescription2 includes a VkMultisampledRenderToSingleSampledInfoEXT structure whose multisampledRenderToSingleSampledEnable field is VK_TRUE, pDepthStencilAttachment is not NULL, does not have the value VK_ATTACHMENT_UNUSED, and has a VkFormat with both depth and stencil components, and both VkPhysicalDeviceDepthStencilResolveProperties::independentResolve and VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone are VK_FALSE, then the values of depthResolveMode and stencilResolveMode must be identical.

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06877
  If the pNext chain of VkSubpassDescription2 includes a VkMultisampledRenderToSingleSampledInfoEXT structure whose multisampledRenderToSingleSampledEnable field is VK_TRUE, pDepthStencilAttachment is not NULL, does not have the value VK_ATTACHMENT_UNUSED, and has a VkFormat with both depth and stencil components, VkPhysicalDeviceDepthStencilResolveProperties::independentResolve is VK_FALSE, and VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone is VK_TRUE, then the values of depthResolveMode and stencilResolveMode must be identical or one of them must be VK_RESOLVE_MODE_NONE.

Valid Usage (Implicit)

- VUID-VkSubpassDescriptionDepthStencilResolve-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_DEPTH_STENCIL_RESOLVE

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-parameter
  If pDepthStencilResolveAttachment is not NULL, pDepthStencilResolveAttachment must be a valid pointer to a valid VkAttachmentReference2 structure.

The VkFragmentShadingRateAttachmentInfoKHR structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkFragmentShadingRateAttachmentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const VkAttachmentReference2* pFragmentShadingRateAttachment;
    VkExtent2D shadingRateAttachmentTexelSize;
} VkFragmentShadingRateAttachmentInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pFragmentShadingRateAttachment is NULL or a pointer to a VkAttachmentReference2 structure defining the fragment shading rate attachment for this subpass.
• shadingRateAttachmentTexelSize specifies the size of the portion of the framebuffer corresponding to each texel in pFragmentShadingRateAttachment.

If no shading rate attachment is specified, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

**Valid Usage**

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04524**
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, its layout member **must** be equal to VK_IMAGE_LAYOUT_GENERAL or VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04525**
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.width **must** be a power of two value

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04526**
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.width **must** be less than or equal to maxFragmentShadingRateAttachmentTexelSize.width

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04527**
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.width **must** be greater than or equal to minFragmentShadingRateAttachmentTexelSize.width

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04528**
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.height **must** be a power of two value

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04529**
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.height **must** be less than or equal to maxFragmentShadingRateAttachmentTexelSize.height

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04530**
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.height **must** be greater than or equal to minFragmentShadingRateAttachmentTexelSize.height
04531

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the quotient of `shadingRateAttachmentTexelSize.width` and `shadingRateAttachmentTexelSize.height` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04532

If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the quotient of `shadingRateAttachmentTexelSize.height` and `shadingRateAttachmentTexelSize.width` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`

**Valid Usage (Implicit)**

- VUID-VkFragmentShadingRateAttachmentInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-parameter
  If `pFragmentShadingRateAttachment` is not `NULL`, `pFragmentShadingRateAttachment` must be a valid pointer to a valid `VkAttachmentReference2` structure

If the `pNext` chain of `VkSubpassDescription2` or `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure, then that structure describes how multisampled rendering is performed on single sampled attachments in that subpass.

The `VkMultisampledRenderToSingleSampledInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_multisampled_render_to_single_sampled
typedef struct VkMultisampledRenderToSingleSampledInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 multisampledRenderToSingleSampledEnable;
    VkSampleCountFlagBits rasterizationSamples;
} VkMultisampledRenderToSingleSampledInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `multisampledRenderToSingleSampledEnable` controls whether multisampled rendering to single-sampled attachments is performed as described below.
- `rasterizationSamples` is a `VkSampleCountFlagBits` specifying the number of samples used in rasterization.
Valid Usage

- VUID-VkMultisampledRenderToSingleSampledInfoEXT-rasterizationSamples-06878
  The value of `rasterizationSamples` must not be `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkMultisampledRenderToSingleSampledInfoEXT-pNext-06880
  If added to the `pNext` chain of `VkRenderingInfo`, each `imageView` member of any element of
  `VkRenderingInfo::pColorAttachments`, `VkRenderingInfo::pDepthAttachment`, or
  `VkRenderingInfo::pStencilAttachment` that is not `VK_NULL_HANDLE` must have a format
  that supports the sample count specified in `rasterizationSamples`

Valid Usage (Implicit)

- VUID-VkMultisampledRenderToSingleSampledInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_INFO_EXT`

- VUID-VkMultisampledRenderToSingleSampledInfoEXT-rasterizationSamples-parameter
  `rasterizationSamples` must be a valid `VkSampleCountFlagBits` value

If the `pNext` chain of `VkSubpassDescription2` or `VkRenderingInfo` includes a
`VkMultisampledRenderToSingleSampledInfoEXT` structure whose
`multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, the graphics pipelines must have
`VkGraphicsPipelineCreateInfo::rasterizationSamples` equal to
`VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`, and the subpass attachments can have a sample count of `VK_SAMPLE_COUNT_1_BIT`. For attachments with a sample count of `VK_SAMPLE_COUNT_1_BIT`, multisampled rendering is performed to an intermediate multisampled image with `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples` samples, implicitly allocated by the implementation for the duration of the subpass. For such attachments:

- If `loadOp` equals to `VK_ATTACHMENT_LOAD_OP_LOAD`, samples of the implicit image are initialized by
  replicating the value from the corresponding pixel in the attachment.

- If `storeOp` or `stencilStoreOp` is equal to `VK_ATTACHMENT_STORE_OP_STORE`, the implicit image is
  implicitly resolved prior to storage in the attachment.

Memory constraints due to high primitive counts may result in an implicit split of the subpass. This is the equivalent of partial rasterization of geometry in a render pass that ends in `storeOp` and `stencilStoreOp` equal to `VK_ATTACHMENT_STORE_OP_STORE`, followed by another render pass with `loadOp` and `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_LOAD` with appropriate barriers in between. When `VkMultisampledRenderToSingleSampledInfoEXT` is used, the implementation is allowed to resolve attachments with a sample count of `VK_SAMPLE_COUNT_1_BIT` and lose multisampled data on such splits. The implementation may similarly split the render pass at subpass boundaries even if they use the same value for `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`.

The `VkAttachmentReference2` structure is defined as:

```c
// Provided by VK_VERSION_1_2
```
```
typedef struct VkAttachmentReference2 {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachment;
    VkImageLayout layout;
    VkImageAspectFlags aspectMask;
} VkAttachmentReference2;
```

or the equivalent

```
// Provided by VK_KHR_create_renderpass2
typedef VkAttachmentReference2 VkAttachmentReference2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **attachment** is either an integer value identifying an attachment at the corresponding index in `VkRenderPassCreateInfo2::pAttachments`, or `VK_ATTACHMENT_UNUSED` to signify that this attachment is not used.
- **layout** is a `VkImageLayout` value specifying the layout the attachment uses during the subpass.
- **aspectMask** is a mask of which aspect(s) **can** be accessed within the specified subpass as an input attachment.

Parameters defined by this structure with the same name as those in `VkAttachmentReference` have the identical effect to those parameters.

**aspectMask** is ignored when this structure is used to describe anything other than an input attachment reference.

If the `separateDepthStencilLayouts` feature is enabled, and **attachment** has a depth/stencil format, **layout** can be set to a layout that only specifies the layout of the depth aspect.

If **layout** only specifies the layout of the depth aspect of the attachment, the layout of the stencil aspect is specified by the **stencilLayout** member of a `VkAttachmentReferenceStencilLayout` structure included in the **pNext** chain. Otherwise, **layout** describes the layout for all relevant image aspects.

### Valid Usage

- **VUID-VkAttachmentReference2-layout-03077**
  If **attachment** is not `VK_ATTACHMENT_UNUSED`, **layout** must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

- **VUID-VkAttachmentReference2-separateDepthStencilLayouts-03313**
  If the `separateDepthStencilLayouts` feature is not enabled, and **attachment** is not `VK_ATTACHMENT_UNUSED`, **layout** must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`,
• VUID-VkAttachmentReference2-synchronization2-06910
  If the synchronization2 feature is not enabled, layout must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkAttachmentReference2-attachmentFeedbackLoopLayout-07311
  If the attachmentFeedbackLoopLayout feature is not enabled, layout must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

## Valid Usage (Implicit)

• VUID-VkAttachmentReference2-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_2

• VUID-VkAttachmentReference2-pNext-pNext
  `pNext` must be NULL or a pointer to a valid instance of
  VkAttachmentReferenceStencilLayout

• VUID-VkAttachmentReference2-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

• VUID-VkAttachmentReference2-layout-parameter
  layout must be a valid VkImageLayout value

The VkAttachmentReferenceStencilLayout structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReferenceStencilLayout {
    VkStructureType sType;
    void* pNext;
    VkImageLayout stencilLayout;
} VkAttachmentReferenceStencilLayout;
```

or the equivalent

```c
// Provided by VK_KHR_separate_depthStencil_layouts
typedef VkAttachmentReferenceStencilLayout VkAttachmentReferenceStencilLayoutKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `stencilLayout` is a VkImageLayout value specifying the layout the stencil aspect of the
  attachment uses during the subpass.

## Valid Usage

• VUID-VkAttachmentReferenceStencilLayout-stencilLayout-03318
  `stencilLayout` must not be VK_IMAGE_LAYOUT_UNDEFINED, VK_IMAGE_LAYOUT_PREINITIALIZED,
VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_PRESENT_SRC_KHR

Valid Usage (Implicit)

• VUID-VkAttachmentReferenceStencilLayout-sType-sType
  sType must be VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_STENCIL_LAYOUT

• VUID-VkAttachmentReferenceStencilLayout-stencilLayout-parameter
  stencilLayout must be a valid VkImageLayout value

The VkSubpassDependency2 structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDependency2 {
    VkStructureType sType;
    const void* pNext;
    uint32_t srcSubpass;
    uint32_t dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkDependencyFlags dependencyFlags;
    int32_t viewOffset;
} VkSubpassDependency2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDependency2 VkSubpassDependency2KHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• srcSubpass is the subpass index of the first subpass in the dependency, or VK_SUBPASS_EXTERNAL.
• dstSubpass is the subpass index of the second subpass in the dependency, or VK_SUBPASS_EXTERNAL.
• srcStageMask is a bitmask of VkPipelineStageFlagBits specifying the source stage mask.
• dstStageMask is a bitmask of VkPipelineStageFlagBits specifying the destination stage mask.
• `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a source access mask.
• `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a destination access mask.
• `dependencyFlags` is a bitmask of `VkDependencyFlagBits`.
• `viewOffset` controls which views in the source subpass the views in the destination subpass depend on.

Parameters defined by this structure with the same name as those in `VkSubpassDependency` have the identical effect to those parameters.

`viewOffset` has the same effect for the described subpass dependency as `VkRenderPassMultiviewCreateInfo::pViewOffsets` has on each corresponding subpass dependency.

If a `VkMemoryBarrier2` is included in the `pNext` chain, `srcStageMask`, `dstStageMask`, `srcAccessMask`, and `dstAccessMask` parameters are ignored. The synchronization and access scopes instead are defined by the parameters of `VkMemoryBarrier2`.

### Valid Usage

- **VUID-VkSubpassDependency2-srcStageMask-04090**
  If the geometryShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- **VUID-VkSubpassDependency2-srcStageMask-04091**
  If the tessellationShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-VkSubpassDependency2-srcStageMask-04092**
  If the conditionalRendering feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-VkSubpassDependency2-srcStageMask-04093**
  If the fragmentDensityMap feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-VkSubpassDependency2-srcStageMask-04094**
  If the transformFeedback feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-VkSubpassDependency2-srcStageMask-04095**
  If the meshShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- **VUID-VkSubpassDependency2-srcStageMask-04096**
  If the taskShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- **VUID-VkSubpassDependency2-srcStageMask-07318**
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
• VUID-VkSubpassDependency2-srcStageMask-03937
  If the synchronization feature is not enabled, srcStageMask must not be 0

• VUID-VkSubpassDependency2-srcStageMask-07949
  If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled, srcStageMask must not contain VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

• VUID-VkSubpassDependency2-dstStageMask-04090
  If the geometryShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

• VUID-VkSubpassDependency2-dstStageMask-04091
  If the tessellationShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

• VUID-VkSubpassDependency2-dstStageMask-04092
  If the conditionalRendering feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

• VUID-VkSubpassDependency2-dstStageMask-04093
  If the fragmentDensityMap feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

• VUID-VkSubpassDependency2-dstStageMask-04094
  If the transformFeedback feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

• VUID-VkSubpassDependency2-dstStageMask-04095
  If the meshShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT

• VUID-VkSubpassDependency2-dstStageMask-04096
  If the taskShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

• VUID-VkSubpassDependency2-dstStageMask-07318
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, dstStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-VkSubpassDependency2-dstStageMask-03937
  If the synchronization feature is not enabled, dstStageMask must not be 0

• VUID-VkSubpassDependency2-dstStageMask-07949
  If neither the VK_NV_ray_tracing extension or rayTracingPipeline feature are enabled, dstStageMask must not contain VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

• VUID-VkSubpassDependency2-srcSubpass-03084
  srcSubpass must be less than or equal to dstSubpass, unless one of them is VK_SUBPASS_EXTERNAL, to avoid cyclic dependencies and ensure a valid execution order

• VUID-VkSubpassDependency2-srcSubpass-03085
  srcSubpass and dstSubpass must not both be equal to VK_SUBPASS_EXTERNAL

• VUID-VkSubpassDependency2-srcSubpass-06810
If \texttt{srcSubpass} is equal to \texttt{dstSubpass} and \texttt{srcStageMask} includes a framebuffer-space stage, \texttt{dstStageMask} must only contain framebuffer-space stages

- **VUID-VkSubpassDependency2-srcAccessMask-03088**: Any access flag included in \texttt{srcAccessMask} must be supported by one of the pipeline stages in \texttt{srcStageMask}, as specified in the table of supported access types.

- **VUID-VkSubpassDependency2-dstAccessMask-03089**: Any access flag included in \texttt{dstAccessMask} must be supported by one of the pipeline stages in \texttt{dstStageMask}, as specified in the table of supported access types.

- **VUID-VkSubpassDependency2-dependencyFlags-03090**: If \texttt{dependencyFlags} includes \texttt{VK_DEPENDENCY_VIEW_LOCAL_BIT}, \texttt{srcSubpass} must not be equal to \texttt{VK_SUBPASS_EXTERNAL}.

- **VUID-VkSubpassDependency2-dependencyFlags-03091**: If \texttt{dependencyFlags} includes \texttt{VK_DEPENDENCY_VIEW_LOCAL_BIT}, \texttt{dstSubpass} must not be equal to \texttt{VK_SUBPASS_EXTERNAL}.

- **VUID-VkSubpassDependency2-srcSubpass-02245**: If \texttt{srcSubpass} equals \texttt{dstSubpass}, and \texttt{srcStageMask} and \texttt{dstStageMask} both include a framebuffer-space stage, then \texttt{dependencyFlags} must include \texttt{VK_DEPENDENCY_BY_REGION_BIT}.

- **VUID-VkSubpassDependency2-viewOffset-02530**: If \texttt{viewOffset} is not equal to 0, \texttt{srcSubpass} must not be equal to \texttt{dstSubpass}.

- **VUID-VkSubpassDependency2-dependencyFlags-03092**: If \texttt{dependencyFlags} does not include \texttt{VK_DEPENDENCY_VIEW_LOCAL_BIT}, \texttt{viewOffset} must be 0.

### Valid Usage (Implicit)

- **VUID-VkSubpassDependency2-sType-sType**: \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_SUBPASS_DEPENDENCY_2}.

- **VUID-VkSubpassDependency2-pNext-pNext**: \texttt{pNext} must be \texttt{NULL} or a pointer to a valid instance of \texttt{VkMemoryBarrier2}.

- **VUID-VkSubpassDependency2-sType-unique**: The \texttt{sType} value of each struct in the \texttt{pNext} chain must be unique.

- **VUID-VkSubpassDependency2-srcStageMask-parameter**: \texttt{srcStageMask} must be a valid combination of \texttt{VkPipelineStageFlagBits} values.

- **VUID-VkSubpassDependency2-dstStageMask-parameter**: \texttt{dstStageMask} must be a valid combination of \texttt{VkPipelineStageFlagBits} values.

- **VUID-VkSubpassDependency2-srcAccessMask-parameter**: \texttt{srcAccessMask} must be a valid combination of \texttt{VkAccessFlagBits} values.

- **VUID-VkSubpassDependency2-dstAccessMask-parameter**: \texttt{dstAccessMask} must be a valid combination of \texttt{VkAccessFlagBits} values.

- **VUID-VkSubpassDependency2-dependencyFlags-parameter**: \texttt{dependencyFlags} must be a valid combination of \texttt{VkDependencyFlagBits} values.
To destroy a render pass, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyRenderPass(
    VkDevice device,
    VkRenderPass renderPass,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the render pass.
- **renderPass** is the handle of the render pass to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- VUID-vkDestroyRenderPass-renderPass-00873
  All submitted commands that refer to **renderPass** must have completed execution.

- VUID-vkDestroyRenderPass-renderPass-00874
  If **VkAllocationCallbacks** were provided when **renderPass** was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyRenderPass-renderPass-00875
  If no **VkAllocationCallbacks** were provided when **renderPass** was created, **pAllocator** must be **NULL**.

**Valid Usage (Implicit)**

- VUID-vkDestroyRenderPass-device-parameter
  **device** must be a valid **VkDevice** handle.

- VUID-vkDestroyRenderPass-renderPass-parameter
  If **renderPass** is not **VK_NULL_HANDLE**, **renderPass** must be a valid **VkRenderPass** handle.

- VUID-vkDestroyRenderPass-pAllocator-parameter
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure.

- VUID-vkDestroyRenderPass-renderPass-parent
  If **renderPass** is a valid handle, it must have been created, allocated, or retrieved from **device**.

**Host Synchronization**

- Host access to **renderPass** must be externally synchronized.
8.3. Render Pass Compatibility

Framebuffers and graphics pipelines are created based on a specific render pass object. They must only be used with that render pass object, or one compatible with it.

Two attachment references are compatible if they have matching format and sample count, or are both VK_ATTACHMENT_UNUSED or the pointer that would contain the reference is NULL.

Two arrays of attachment references are compatible if all corresponding pairs of attachments are compatible. If the arrays are of different lengths, attachment references not present in the smaller array are treated as VK_ATTACHMENT_UNUSED.

Two render passes are compatible if their corresponding color, input, resolve, and depth/stencil attachment references are compatible and if they are otherwise identical except for:

- Initial and final image layout in attachment descriptions
- Load and store operations in attachment descriptions
- Image layout in attachment references

As an additional special case, if two render passes have a single subpass, the resolve attachment reference and depth/stencil resolve mode compatibility requirements are ignored.

A framebuffer is compatible with a render pass if it was created using the same render pass or a compatible render pass.

8.4. Framebuffers

Render passes operate in conjunction with framebuffers. Framebuffers represent a collection of specific memory attachments that a render pass instance uses.

Framebuffers are represented by VkFramebuffer handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFramebuffer)
```

To create a framebuffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateFramebuffer(
    VkDevice device, 
    const VkFramebufferCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator, 
    VkFramebuffer* pFramebuffer);
```

- `device` is the logical device that creates the framebuffer.
- `pCreateInfo` is a pointer to a VkFramebufferCreateInfo structure describing additional
information about framebuffer creation.

- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pFramebuffer** is a pointer to a VkFramebuffer handle in which the resulting framebuffer object is returned.

### Valid Usage

- VUID-vkCreateFramebuffer-pCreateInfo-02777
  
  If `pCreateInfo->flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and `attachmentCount` is not 0, each element of `pCreateInfo->pAttachments` must have been created on `device`.

### Valid Usage (Implicit)

- VUID-vkCreateFramebuffer-device-parameter
  
  `device` must be a valid `VkDevice` handle.

- VUID-vkCreateFramebuffer-pCreateInfo-parameter
  
  `pCreateInfo` must be a valid pointer to a valid `VkFramebufferCreateInfo` structure.

- VUID-vkCreateFramebuffer-pAllocator-parameter
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- VUID-vkCreateFramebuffer-pFramebuffer-parameter
  
  `pFramebuffer` must be a valid pointer to a `VkFramebuffer` handle.

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkFramebufferCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkFramebufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFramebufferCreateFlags flags;
    VkRenderPass renderPass;
    uint32_t attachmentCount;
    const VkImageView* pAttachments;
} VkFramebufferCreateInfo;
```
uint32_t width;
uint32_t height;
uint32_t layers;
} VkFramebufferCreateInfo;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkFramebufferCreateFlagBits`
- **renderPass** is a render pass defining what render passes the framebuffer will be compatible with. See [Render Pass Compatibility](#) for details.
- **attachmentCount** is the number of attachments.
- **pAttachments** is a pointer to an array of `VkImageView` handles, each of which will be used as the corresponding attachment in a render pass instance. If **flags** includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, this parameter is ignored.
- **width**, **height** and **layers** define the dimensions of the framebuffer. If the render pass uses multiview, then **layers must** be one and each attachment requires a number of layers that is greater than the maximum bit index set in the view mask in the subpasses in which it is used.

It is legal for a subpass to use no color or depth/stencil attachments, either because it has no attachment references or because all of them are `VK_ATTACHMENT_UNUSED`. This kind of subpass can use shader side effects such as image stores and atomics to produce an output. In this case, the subpass continues to use the **width**, **height**, and **layers** of the framebuffer to define the dimensions of the rendering area, and the **rasterizationSamples** from each pipeline's `VkPipelineMultisampleStateCreateInfo` to define the number of samples used in rasterization; however, if `VkPhysicalDeviceFeatures::variableMultisampleRate` is `VK_FALSE`, then all pipelines to be bound with the subpass **must** have the same value for `VkPipelineMultisampleStateCreateInfo::rasterizationSamples`. In all such cases, **rasterizationSamples must** be a bit value that is set in `VkPhysicalDeviceLimits::framebufferNoAttachmentsSampleCounts`.

### Valid Usage

- **VUID-VkFramebufferCreateInfo-attachmentCount-00876**
  attachmentCount **must** be equal to the attachment count specified in **renderPass**

- **VUID-VkFramebufferCreateInfo-flags-02778**
  If **flags** does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT` and attachmentCount is not 0, **pAttachments** **must** be a valid pointer to an array of attachmentCount valid `VkImageView` handles

- **VUID-VkFramebufferCreateInfo-pAttachments-00877**
  If **flags** does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of **pAttachments** that is used as a color attachment or resolve attachment by **renderPass** **must** have been created with a usage value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- **VUID-VkFramebufferCreateInfo-pAttachments-02633**
  If **flags** does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of **pAttachments** that is used as a depth/stencil attachment by **renderPass** **must** have been
created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-VkFramebufferCreateInfo-pAttachments-02634**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as a depth/stencil resolve attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-VkFramebufferCreateInfo-pAttachments-00879**
  If renderpass is not VK_NULL_HANDLE, flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- **VUID-VkFramebufferCreateInfo-pAttachments-02552**
  Each element of pAttachments that is used as a fragment density map attachment by renderPass must not have been created with a flags value including VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

- **VUID-VkFramebufferCreateInfo-renderPass-02553**
  If renderPass has a fragment density map attachment and the fragmentDensityMapNonSubsampledImages feature is not enabled, each element of pAttachments must have been created with a flags value including VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT unless that element is the fragment density map attachment

- **VUID-VkFramebufferCreateInfo-renderPass-06502**
  If renderPass was created with fragment density map offsets other than (0,0), each element of pAttachments must have been created with a flags value including VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM

- **VUID-VkFramebufferCreateInfo-pAttachments-00880**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must have been created with a VkFormat value that matches the VkFormat specified by the corresponding VkAttachmentDescription in renderPass

- **VUID-VkFramebufferCreateInfo-pAttachments-00881**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must have been created with a samples value that matches the samples value specified by the corresponding VkAttachmentDescription in renderPass

- **VUID-VkFramebufferCreateInfo-flags-04533**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have been created with a VkImageCreateInfo::extent.width greater than or equal to width

- **VUID-VkFramebufferCreateInfo-flags-04534**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have been created with a VkImageCreateInfo::extent.height greater than or equal to height

- **VUID-VkFramebufferCreateInfo-flags-04535**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of
pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have been created with a VkImageViewCreateInfo::subresourceRange.layerCount greater than or equal to layers

• VUID-VkFramebufferCreateInfo-renderPass-04536
  If renderPass was specified with non-zero view masks, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have a layerCount greater than the index of the most significant bit set in any of those view masks

• VUID-VkFramebufferCreateInfo-renderPass-02746
  If renderPass was specified with non-zero view masks, each element of pAttachments that is referenced by fragmentDensityMapAttachment must have a layerCount equal to 1 or greater than the index of the most significant bit set in any of those view masks

• VUID-VkFramebufferCreateInfo-renderPass-02747
  If renderPass was specified with non-zero view masks, each element of pAttachments that is referenced by fragmentDensityMapAttachment must have a layerCount equal to 1

• VUID-VkFramebufferCreateInfo-pAttachments-02555
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, an element of pAttachments that is referenced by fragmentDensityMapAttachment must have a width at least as large as
  \[ \left\lceil \frac{\text{width}}{\text{maxFragmentDensityTexelSize.width}} \right\rceil \]

• VUID-VkFramebufferCreateInfo-pAttachments-02556
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, an element of pAttachments that is referenced by fragmentDensityMapAttachment must have a height at least as large as
  \[ \left\lceil \frac{\text{height}}{\text{maxFragmentDensityTexelSize.height}} \right\rceil \]

• VUID-VkFramebufferCreateInfo-flags-04537
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, and renderPass was specified with non-zero view masks, each element of pAttachments that is used as a fragment shading rate attachment by renderPass must have a layerCount that is either 1, or greater than the index of the most significant bit set in any of those view masks

• VUID-VkFramebufferCreateInfo-flags-04538
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, and renderPass was not specified with non-zero view masks, each element of pAttachments that is used as a fragment shading rate attachment by renderPass must have a layerCount that is either 1, or greater than layers

• VUID-VkFramebufferCreateInfo-renderPass-08921
  If renderPass was specified with non-zero view masks, each element of pAttachments that is used as a fragment shading rate attachment must have a layerCount equal to 1 or greater than the index of the most significant bit set in any of those view masks

• VUID-VkFramebufferCreateInfo-flags-04539
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, an element of pAttachments that is used as a fragment shading rate attachment must have a width at least as large as
  \[ \left\lceil \frac{\text{width}}{\text{texelWidth}} \right\rceil \]

• VUID-VkFramebufferCreateInfo-flags-04540
  where texelWidth is the largest value of shadingRateAttachmentTexelSize.width in a VkFragmentShadingRateAttachmentInfoKHR which references that attachment
If flags does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, an element of pAttachments that is used as a fragment shading rate attachment must have a height at least as large as \( \lceil \text{height} / \text{texelHeight} \rceil \), where \( \text{texelHeight} \) is the largest value of `shadingRateAttachmentTexelSize.height` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment.

- **VUID-VkFramebufferCreateInfo-pAttachments-00883**
  If flags does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of pAttachments must only specify a single mip level.

- **VUID-VkFramebufferCreateInfo-pAttachments-00884**
  If flags does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of pAttachments must have been created with the identity swizzle.

- **VUID-VkFramebufferCreateInfo-width-00885**
  width must be greater than 0.

- **VUID-VkFramebufferCreateInfo-width-00886**
  width must be less than or equal to `maxFramebufferWidth`.

- **VUID-VkFramebufferCreateInfo-height-00887**
  height must be greater than 0.

- **VUID-VkFramebufferCreateInfo-height-00888**
  height must be less than or equal to `maxFramebufferHeight`.

- **VUID-VkFramebufferCreateInfo-layers-00889**
  layers must be greater than 0.

- **VUID-VkFramebufferCreateInfo-layers-00890**
  layers must be less than or equal to `maxFramebufferLayers`.

- **VUID-VkFramebufferCreateInfo-renderPass-02531**
  If `renderPass` was specified with non-zero view masks, layers must be 1.

- **VUID-VkFramebufferCreateInfo-flags-03189**
  If the imagelessFramebuffer feature is not enabled, flags must not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`.

- **VUID-VkFramebufferCreateInfo-flags-03190**
  If flags includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the pNext chain must include a `VkFramebufferAttachmentsCreateInfo` structure.

- **VUID-VkFramebufferCreateInfo-flags-03191**
  If flags includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `attachmentImageInfoCount` member of a `VkFramebufferAttachmentsCreateInfo` structure in the pNext chain must be equal to either zero or `attachmentCount`.

- **VUID-VkFramebufferCreateInfo-flags-04541**
  If flags includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the width member of any element of the pAttachmentImageInfos member of a `VkFramebufferAttachmentsCreateInfo` structure.
structure in the pNext chain that is used as an input, color, resolve or depth/stencil attachment in renderPass must be greater than or equal to width

- VUID-VkFramebufferCreateInfo-flags-04542
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the height member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as an input, color, resolve or depth/stencil attachment in renderPass must be greater than or equal to height

- VUID-VkFramebufferCreateInfo-flags-03196
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is referenced by VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment in renderPass must be greater than or equal to \( \lceil \frac{width}{\text{texelWidth}} \rceil \)

- VUID-VkFramebufferCreateInfo-flags-03197
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the height member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that is referenced by VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment in renderPass must be greater than or equal to \( \lceil \frac{height}{\text{texelHeight}} \rceil \)

- VUID-VkFramebufferCreateInfo-flags-04543
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as a fragment shading rate attachment must be greater than or equal to \( \lceil \frac{width}{\text{texelWidth}} \rceil \)

- VUID-VkFramebufferCreateInfo-flags-04544
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the height member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as a fragment shading rate attachment must be greater than or equal to \( \lceil \frac{height}{\text{texelHeight}} \rceil \)

- VUID-VkFramebufferCreateInfo-flags-04545
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the layerCount member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as a fragment shading rate attachment must be either 1, or greater than or equal to layers

- VUID-VkFramebufferCreateInfo-flags-04587
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT and renderPass was specified with non-zero view masks, each element of pAttachments that is used as a fragment shading rate attachment by renderPass must have a layerCount that is either 1, or greater than the index of the most significant bit set in any of those view masks

- VUID-VkFramebufferCreateInfo-renderPass-03198
  If multiview is enabled for renderPass and flags includes
VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the layerCount member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain used as an input, color, resolve, or depth/stencil attachment in renderPass must be greater than the maximum bit index set in the view mask in the subpasses in which it is used in renderPass

- VUID-VkFramebufferCreateInfo-renderPass-04546
  If multiview is not enabled for renderPass and flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the layerCount member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain used as an input, color, resolve, or depth/stencil attachment in renderPass must be greater than the maximum bit index set in the view mask in the subpasses in which it is used in renderPass

- VUID-VkFramebufferCreateInfo-flags-03201
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a color attachment or resolve attachment by renderPass must include VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

- VUID-VkFramebufferCreateInfo-flags-03202
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a depth/stencil attachment by renderPass must include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkFramebufferCreateInfo-flags-03203
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a depth/stencil resolve attachment by renderPass must include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkFramebufferCreateInfo-flags-03204
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as an input attachment by renderPass must include VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkFramebufferCreateInfo-flags-03205
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, at least one element of the pViewFormats member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain must be equal to the corresponding value of VkAttachmentDescription::format used to create renderPass

- VUID-VkFramebufferCreateInfo-flags-04113
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must have been created with VkImageViewCreateInfo::viewType not equal to VK_IMAGE_VIEW_TYPE_3D

- VUID-VkFramebufferCreateInfo-flags-04548
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of
that is used as a fragment shading rate attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkFramebufferCreateInfo-flags-04549
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a fragment shading rate attachment by renderPass must include VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkFramebufferCreateInfo-samples-06881
  If multisampled-render-to-single-sampled is enabled for any subpass, all color, depth/stencil and input attachments used in that subpass which have VkAttachmentDescription::samples or VkAttachmentDescription2::samples equal to VK_SAMPLE_COUNT_1_BIT must have been created with VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT in their VkImageCreateInfo::flags

- VUID-VkFramebufferCreateInfo-samples-07009
  If multisampled-render-to-single-sampled is enabled for any subpass, all color, depth/stencil and input attachments used in that subpass which have VkAttachmentDescription::samples or VkAttachmentDescription2::samples equal to VK_SAMPLE_COUNT_1_BIT must have a format that supports the sample count specified in VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples

Valid Usage (Implicit)

- VUID-VkFramebufferCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_FRAMEBUFFER_CREATE_INFO

- VUID-VkFramebufferCreateInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkFramebufferAttachmentsCreateInfo

- VUID-VkFramebufferCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkFramebufferCreateInfo-flags-parameter
  flags must be a valid combination of VkFramebufferCreateFlagBits values

- VUID-VkFramebufferCreateInfo-renderPass-parameter
  renderPass must be a valid VkRenderPass handle

- VUID-VkFramebufferCreateInfo-commonparent
  Both of renderPass, and the elements of pAttachments that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

The VkFramebufferAttachmentsCreateInfo structure is defined as:

// Provided by VK_VERSION_1_2
typedef struct VkFramebufferAttachmentsCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentImageInfoCount;
    const VkFramebufferAttachmentImageInfo* pAttachmentImageInfos;
} VkFramebufferAttachmentsCreateInfo;

or the equivalent

// Provided by VK_KHR_imageless_framebuffer
typedef VkFramebufferAttachmentsCreateInfo VkFramebufferAttachmentsCreateInfoKHR;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- attachmentImageInfoCount is the number of attachments being described.
- pAttachmentImageInfos is a pointer to an array of VkFramebufferAttachmentImageInfo structures, each structure describing a number of parameters of the corresponding attachment in a render pass instance.

Valid Usage (Implicit)

- VUID-VkFramebufferAttachmentsCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENTS_CREATE_INFO
- VUID-VkFramebufferAttachmentsCreateInfo-pAttachmentImageInfos-parameter
  If attachmentImageInfoCount is not 0, pAttachmentImageInfos must be a valid pointer to an array of attachmentImageInfoCount valid VkFramebufferAttachmentImageInfo structures

The VkFramebufferAttachmentImageInfo structure is defined as:

// Provided by VK_VERSION_1_2
typedef struct VkFramebufferAttachmentImageInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageCreateFlags flags;
    VkImageUsageFlags usage;
    uint32_t width;
    uint32_t height;
    uint32_t layerCount;
    uint32_t viewFormatCount;
    const VkFormat* pViewFormats;
} VkFramebufferAttachmentImageInfo;

or the equivalent
typedef VkFramebufferAttachmentImageInfo VkFramebufferAttachmentImageInfoKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkImageCreateFlagBits`, matching the value of `VkImageCreateInfo::flags` used to create an image that will be used with this framebuffer.
- `usage` is a bitmask of `VkImageUsageFlagBits`, matching the value of `VkImageCreateInfo::usage` used to create an image used with this framebuffer.
- `width` is the width of the image view used for rendering.
- `height` is the height of the image view used for rendering.
- `layerCount` is the number of array layers of the image view used for rendering.
- `viewFormatCount` is the number of entries in the `pViewFormats` array, matching the value of `VkImageFormatListCreateInfo::viewFormatCount` used to create an image used with this framebuffer.
- `pViewFormats` is a pointer to an array of `VkFormat` values specifying all of the formats which can be used when creating views of the image, matching the value of `VkImageFormatListCreateInfo::pViewFormats` used to create an image used with this framebuffer.

Images that can be used with the framebuffer when beginning a render pass, as specified by `VkRenderPassAttachmentBeginInfo`, must be created with parameters that are identical to those specified here.

---

### Valid Usage (Implicit)

- `VUID-VkFramebufferAttachmentImageInfo-sType-sType` sType must be `VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENT_IMAGE_INFO`
- `VUID-VkFramebufferAttachmentImageInfo-pNext-pNext` pNext must be `NULL`
- `VUID-VkFramebufferAttachmentImageInfo-flags-parameter` flags must be a valid combination of `VkImageCreateFlagBits` values
- `VUID-VkFramebufferAttachmentImageInfo-usage-parameter` usage must be a valid combination of `VkImageUsageFlagBits` values
- `VUID-VkFramebufferAttachmentImageInfo-usage-requiredbitmask` usage must not be `0`
- `VUID-VkFramebufferAttachmentImageInfo-pViewFormats-parameter` If `viewFormatCount` is not `0`, `pViewFormats` must be a valid pointer to an array of `viewFormatCount` valid `VkFormat` values

Bits which can be set in `VkFramebufferCreateInfo::flags`, specifying options for framebuffers, are:
typedef enum VkFramebufferCreateFlagBits {
    // Provided by VK_VERSION_1_2
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT = 0x00000001,
    // Provided by VK_KHR_imageless_framebuffer
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR = VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT
} VkFramebufferCreateFlagBits;

- **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT** specifies that image views are not specified, and only attachment compatibility information will be provided via a `VkFramebufferAttachmentImageInfo` structure.

```c
typedef VkFlags VkFramebufferCreateFlags;
```

`VkFramebufferCreateFlags` is a bitmask type for setting a mask of zero or more `VkFramebufferCreateFlagBits`.

To destroy a framebuffer, call:

```c
void vkDestroyFramebuffer(
    VkDevice device,
    VkFramebuffer framebuffer,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the framebuffer.
- **framebuffer** is the handle of the framebuffer to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyFramebuffer-framebuffer-00892**
  All submitted commands that refer to `framebuffer` must have completed execution

- **VUID-vkDestroyFramebuffer-framebuffer-00893**
  If `VkAllocationCallbacks` were provided when `framebuffer` was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyFramebuffer-framebuffer-00894**
  If no `VkAllocationCallbacks` were provided when `framebuffer` was created, `pAllocator` must be `NULL`
Valid Usage (Implicit)

- VUID-vkDestroyFramebuffer-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyFramebuffer-framebuffer-parameter
  If framebuffer is not VK_NULL_HANDLE, framebuffer must be a valid VkFramebuffer handle

- VUID-vkDestroyFramebuffer-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyFramebuffer-framebuffer-parent
  If framebuffer is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to framebuffer must be externally synchronized

8.5. Render Pass Load Operations

Render pass load operations define the initial values of an attachment during a render pass instance.

Load operations for attachments with a depth/stencil format execute in the VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT pipeline stage. Load operations for attachments with a color format execute in the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage. The load operation for each sample in an attachment happens-before any recorded command which accesses the sample in that render pass instance via that attachment or an alias.

Note

Because load operations always happen first, external synchronization with attachment access only needs to synchronize the load operations with previous commands; not the operations within the render pass instance. This does not apply when using VK_ATTACHMENT_LOAD_OP_NONE_EXT.

Load operations only update values within the defined render area for the render pass instance. However, any writes performed by a load operation (as defined by its access masks) to a given attachment may read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, writes to one aspect may also result in read-modify-write operations for the other aspect. If the subresource is in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT layout, implementations must not access pixels outside of the render area.

Note
As entire subresources could be accessed by load operations, applications cannot safely access values outside of the render area during a render pass instance when a load operation that modifies values is used.

Load operations that can be used for a render pass are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentLoadOp {
    VK_ATTACHMENT_LOAD_OP_LOAD = 0,
    VK_ATTACHMENT_LOAD_OP_CLEAR = 1,
    VK_ATTACHMENT_LOAD_OP_DONT_CARE = 2,
    // Provided by VK_EXT_load_store_op_none
    VK_ATTACHMENT_LOAD_OP_NONE_EXT = 1000400000,
} VkAttachmentLoadOp;
```

- **VK_ATTACHMENT_LOAD_OP_LOAD** specifies that the previous contents of the image within the render area will be preserved as the initial values. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`.

- **VK_ATTACHMENT_LOAD_OP_CLEAR** specifies that the contents within the render area will be cleared to a uniform value, which is specified when a render pass instance is begun. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- **VK_ATTACHMENT_LOAD_OP_DONT_CARE** specifies that the previous contents within the area need not be preserved; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- **VK_ATTACHMENT_LOAD_OP_NONE_EXT** specifies that the previous contents of the image will be undefined inside the render pass. No access type is used as the image is not accessed.

During a render pass instance, input and color attachments with color formats that have a component size of 8, 16, or 32 bits must be represented in the attachment's format throughout the instance. Attachments with other floating- or fixed-point color formats, or with depth components may be represented in a format with a precision higher than the attachment format, but must be represented with the same range. When such a component is loaded via the `loadOp`, it will be converted into an implementation-dependent format used by the render pass. Such components must be converted from the render pass format, to the format of the attachment, before they are resolved or stored at the end of a render pass instance via `storeOp`. Conversions occur as described in Numeric Representation and Computation and Fixed-Point Data Conversions.

### 8.6. Render Pass Store Operations

Render pass store operations define how values written to an attachment during a render pass instance are stored to memory.
Store operations for attachments with a depth/stencil format execute in the `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stage. Store operations for attachments with a color format execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage. The store operation for each sample in an attachment happens-after any recorded command which accesses the sample via that attachment or an alias.

**Note**

Because store operations always happen after other accesses in a render pass instance, external synchronization with attachment access in an earlier render pass only needs to synchronize with the store operations; not the operations within the render pass instance. This does not apply when using `VK_ATTACHMENT_STORE_OP_NONE`.

Store operations only update values within the defined render area for the render pass instance. However, any writes performed by a store operation (as defined by its access masks) to a given attachment may read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images writes to one aspect may also result in read-modify-write operations for the other aspect. If the subresource is in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` layout, implementations must not access pixels outside of the render area.

**Note**

As entire subresources could be accessed by store operations, applications cannot safely access values outside of the render area via aliased resources during a render pass instance when a store operation that modifies values is used.

Possible values of `VkAttachmentDescription::storeOp` and `stencilStoreOp`, specifying how the contents of the attachment are treated, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentStoreOp {
    VK_ATTACHMENT_STORE_OP_STORE = 0,
    VK_ATTACHMENT_STORE_OP_DONT_CARE = 1,
    // Provided by VK_VERSION_1_3
    VK_ATTACHMENT_STORE_OP_NONE = 100030100,
    // Provided by VK_KHR_dynamic_rendering
    VK_ATTACHMENT_STORE_OP_NONE_KHR = VK_ATTACHMENT_STORE_OP_NONE,
    // Provided by VK_QCOM_render_pass_store_ops
    VK_ATTACHMENT_STORE_OP_NONE_QCOM = VK_ATTACHMENT_STORE_OP_NONE,
    // Provided by VK_EXT_load_store_op_none
    VK_ATTACHMENT_STORE_OP_NONE_EXT = VK_ATTACHMENT_STORE_OP_NONE,
} VkAttachmentStoreOp;
```

- `VK_ATTACHMENT_STORE_OP_STORE` specifies the contents generated during the render pass and within the render area are written to memory. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.  

570
• **VK_ATTACHMENT_STORE_OP_DONT_CARE** specifies the contents within the render area are not needed after rendering, and **may** be discarded; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT**. For attachments with a color format, this uses the access type **VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT**.

• **VK_ATTACHMENT_STORE_OP_NONE** specifies the contents within the render area are not accessed by the store operation as long as no values are written to the attachment during the render pass. If values are written during the render pass, this behaves identically to **VK_ATTACHMENT_STORE_OP_DONT_CARE** and with matching access semantics.

**Note**

**VK_ATTACHMENT_STORE_OP_DONT_CARE** can cause contents generated during previous render passes to be discarded before reaching memory, even if no write to the attachment occurs during the current render pass.

### 8.7. Render Pass Multisample Resolve Operations

Render pass multisample resolve operations combine sample values from a single pixel in a multisample attachment and store the result to the corresponding pixel in a single sample attachment.

Multisample resolve operations for attachments execute in the **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage. A final resolve operation for all pixels in the render area happens-after any recorded command which writes a pixel via the multisample attachment to be resolved or an explicit alias of it in the subpass that it is specified. Any single sample attachment specified for use in a multisample resolve operation **may** have its contents modified at any point once rendering begins for the render pass instance. Reads from the multisample attachment can be synchronized with **VK_ACCESS_COLOR_ATTACHMENT_READ_BIT**. Access to the single sample attachment can be synchronized with **VK_ACCESS_COLOR_ATTACHMENT_READ_BIT** and **VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT**. These pipeline stage and access types are used whether the attachments are color or depth/stencil attachments.

When using render pass objects, a subpass dependency specified with the above pipeline stages and access flags will ensure synchronization with multisample resolve operations for any attachments that were last accessed by that subpass. This allows later subpasses to read resolved values as input attachments.

Resolve operations only update values within the defined render area for the render pass instance. However, any writes performed by a resolve operation (as defined by its access masks) to a given attachment **may** read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images writes to one aspect **may** also result in read-modify-write operations for the other aspect. If the subresource is in the **VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT** layout, implementations **must** not access pixels outside of the render area.

**Note**

As entire subresources could be accessed by multisample resolve operations,
applications cannot safely access values outside of the render area via aliased resources during a render pass instance when a multisample resolve operation is performed.

Multisample values in a multisample attachment are combined according to the resolve mode used:

```c
// Provided by VK_VERSION_1_2
typedef enum VkResolveModeFlagBits {
    VK_RESOLVE_MODE_NONE = 0,
    VK_RESOLVE_MODE_SAMPLE_ZERO_BIT = 0x00000001,
    VK_RESOLVE_MODE_AVERAGE_BIT = 0x00000002,
    VK_RESOLVE_MODE_MIN_BIT = 0x00000004,
    VK_RESOLVE_MODE_MAX_BIT = 0x00000008,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_NONE_KHR = VK_RESOLVE_MODE_NONE,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_SAMPLE_ZERO_BIT_KHR = VK_RESOLVE_MODE_SAMPLE_ZERO_BIT,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_AVERAGE_BIT_KHR = VK_RESOLVE_MODE_AVERAGE_BIT,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_MIN_BIT_KHR = VK_RESOLVE_MODE_MIN_BIT,
    // Provided by VK_KHR_depth_stencil_resolve
    VK_RESOLVE_MODE_MAX_BIT_KHR = VK_RESOLVE_MODE_MAX_BIT,
} VkResolveModeFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_depth_stencil_resolve
typedef VkResolveModeFlagBits VkResolveModeFlagBitsKHR;
```

- **VK_RESOLVE_MODE_NONE** indicates that no resolve operation is done.
- **VK_RESOLVE_MODE_SAMPLE_ZERO_BIT** indicates that result of the resolve operation is equal to the value of sample 0.
- **VK_RESOLVE_MODE_AVERAGE_BIT** indicates that result of the resolve operation is the average of the sample values.
- **VK_RESOLVE_MODE_MIN_BIT** indicates that result of the resolve operation is the minimum of the sample values.
- **VK_RESOLVE_MODE_MAX_BIT** indicates that result of the resolve operation is the maximum of the sample values.

When no resolve mode is specified, **VK_RESOLVE_MODE_AVERAGE_BIT** is used.

```c
// Provided by VK_VERSION_1_2
typedef VkFlags VkResolveModeFlags;
```
or the equivalent

```c
// Provided by VK_KHR_depth_stencil_resolve
typedef VkResolveModeFlags VkResolveModeFlagsKHR;
```

`VkResolveModeFlags` is a bitmask type for setting a mask of zero or more `VkResolveModeFlagBits`.

### 8.8. Render Pass Commands

An application records the commands for a render pass instance one subpass at a time, by beginning a render pass instance, iterating over the subpasses to record commands for that subpass, and then ending the render pass instance.

To begin a render pass instance, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBeginRenderPass(
    VkCommandBuffer commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    VkSubpassContents contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a `VkRenderPassBeginInfo` structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- `contents` is a `VkSubpassContents` value specifying how the commands in the first subpass will be provided.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

**Valid Usage**

- **VUID-vkCmdBeginRenderPass-initialLayout-00895**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`.

- **VUID-vkCmdBeginRenderPass-initialLayout-01758**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_WRITE_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_WRITE_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

573
VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-vkCmdBeginRenderPass-initialLayout-02842**
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-vkCmdBeginRenderPass-stencilInitialLayout-02843**
  If any of the stencilInitialLayout or stencilFinalLayout member of the VkAttachmentDescriptionStencillayout structures or the stencilLayout member of the VkAttachmentReferenceStencillayout structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-vkCmdBeginRenderPass-initialLayout-00897**
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- **VUID-vkCmdBeginRenderPass-initialLayout-00898**
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_TRANSFER_SRC_BIT

- **VUID-vkCmdBeginRenderPass-initialLayout-00899**
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_TRANSFER_DST_BIT
created with a usage value including VK_IMAGE_USAGE_TRANSFER_DST_BIT

- VUID-vkCmdBeginRenderPass-initialLayout-00900
  If the initialLayout member of any of the VkAttachmentDescription structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is not VK_IMAGE_LAYOUT_UNDEFINED, then each such initialLayout must be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the framebuffer member of pRenderPassBegin.

- VUID-vkCmdBeginRenderPass-srcStageMask-06451
  The srcStageMask members of any element of the pDependencies member of VkRenderPassCreateInfo used to create renderPass must be supported by the capabilities of the queue family identified by the queueFamilyIndex member of the VkCommandPoolCreateInfo used to create the command pool which commandBuffer was allocated from.

- VUID-vkCmdBeginRenderPass-dstStageMask-06452
  The dstStageMask members of any element of the pDependencies member of VkRenderPassCreateInfo used to create renderPass must be supported by the capabilities of the queue family identified by the queueFamilyIndex member of the VkCommandPoolCreateInfo used to create the command pool which commandBuffer was allocated from.

- VUID-vkCmdBeginRenderPass-framebuffer-02532
  For any attachment in framebuffer that is used by renderPass and is bound to memory locations that are also bound to another attachment used by renderPass, and if at least one of those uses causes either attachment to be written to, both attachments must have had the VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT set.

- VUID-vkCmdBeginRenderPass-framebuffer-09045
  If any attachments specified in framebuffer are used by renderPass and are bound to overlapping memory locations, there must be only one that is used as a color attachment, depth/stencil, or resolve attachment in any subpass.

- VUID-vkCmdBeginRenderPass-initialLayout-07000
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including either the VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT and either the VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT or VK_IMAGE_USAGE_SAMPLED_BIT usage bits.

- VUID-vkCmdBeginRenderPass-initialLayout-07001
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value the VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT usage bit.
Valid Usage (Implicit)

- VUID-vkCmdBeginRenderPass-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBeginRenderPass-pRenderPassBegin-parameter
  pRenderPassBegin must be a valid pointer to a valid VkRenderPassBeginInfo structure

- VUID-vkCmdBeginRenderPass-contents-parameter
  contents must be a valid VkSubpassContents value

- VUID-vkCmdBeginRenderPass-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBeginRenderPass-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBeginRenderPass-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBeginRenderPass-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBeginRenderPass-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State Synchronization</td>
</tr>
</tbody>
</table>

Alternatively to begin a render pass, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdBeginRenderPass2(
    VkCommandBuffer       commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
);```

576
const VkSubpassBeginInfo* pSubpassBeginInfo);

or the equivalent command

// Provided by VK_KHR_create_renderpass2
void vkCmdBeginRenderPass2KHR(
  VkCommandBuffer commandBuffer,
  const VkRenderPassBeginInfo* pRenderPassBegin,
  const VkSubpassBeginInfo* pSubpassBeginInfo);

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a `VkRenderPassBeginInfo` structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

Valid Usage

- VUID-vkCmdBeginRenderPass2-framebuffer-02779
  Both the `framebuffer` and `renderPass` members of `pRenderPassBegin` must have been created on the same `VkDevice` that `commandBuffer` was allocated on.

- VUID-vkCmdBeginRenderPass2-initialLayout-03094
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`.

- VUID-vkCmdBeginRenderPass2-initialLayout-02844
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is
    - `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`,
    - `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`,
    - `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`,
    - or
    - `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- VUID-vkCmdBeginRenderPass2-initialLayout-02844
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when
creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-vkCmdBeginRenderPass2-stencilInitialLayout-02845
  If any of the stencilInitialLayout or stencilFinalLayout member of the VkAttachmentDescriptionStencilLayout structures or the stencilLayout member of the VkAttachmentReferenceStencilLayout structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-vkCmdBeginRenderPass2-initialLayout-03097
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

• VUID-vkCmdBeginRenderPass2-initialLayout-03098
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_LAYOUT_TRANSFER_SRC_BIT

• VUID-vkCmdBeginRenderPass2-initialLayout-03099
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_TRANSFER_DST_BIT

• VUID-vkCmdBeginRenderPass2-initialLayout-03100
  If the initialLayout member of any of the VkAttachmentDescription structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is not VK_IMAGE_LAYOUT_UNDEFINED, then each such initialLayout must be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the framebuffer member of pRenderPassBegin
The `srcStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` must be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from.

The `dstStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` must be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from.

For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments must have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set.

If any attachments specified in `framebuffer` are used by `renderPass` and are bound to overlapping memory locations, there must be only one that is used as a color attachment, depth/stencil, or resolve attachment in any subpass.

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` and either the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits.

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle
- `pRenderPassBegin`
pRenderPassBegin must be a valid pointer to a valid VkRenderPassBeginInfo structure

- VUID-vkCmdBeginRenderPass2-pSubpassBeginInfo-parameter
  pSubpassBeginInfo must be a valid pointer to a valid VkSubpassBeginInfo structure

- VUID-vkCmdBeginRenderPass2-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBeginRenderPass2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBeginRenderPass2-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBeginRenderPass2-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBeginRenderPass2-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State Synchronization</td>
</tr>
</tbody>
</table>

The VkRenderPassBeginInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassBeginInfo {
  VkStructureType sType;
  const void* pNext;
  VkRenderPass renderPass;
  VkFramebuffer framebuffer;
  VkRect2D renderArea;
  uint32_t clearValueCount;
  const VkClearValue* pClearValues;
} VkRenderPassBeginInfo;
```
• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **renderPass** is the render pass to begin an instance of.

• **framebuffer** is the framebuffer containing the attachments that are used with the render pass.

• **renderArea** is the render area that is affected by the render pass instance, and is described in more detail below.

• **clearValueCount** is the number of elements in *pClearValues*.

• **pClearValues** is a pointer to an array of **clearValueCount** *VkClearValue* structures containing clear values for each attachment, if the attachment uses a **loadOp** value of 

  ```
  VK_ATTACHMENT_LOAD_OP_CLEAR
  ```

  or if the attachment has a depth/stencil format and uses a **stencilLoadOp** value of 

  ```
  VK_ATTACHMENT_LOAD_OP_CLEAR
  ```

  The array is indexed by attachment number. Only elements corresponding to cleared attachments are used. Other elements of *pClearValues* are ignored.

*renderArea* is the render area that is affected by the render pass instance. The effects of attachment load, store and multisample resolve operations are restricted to the pixels whose x and y coordinates fall within the render area on all attachments. The render area extends to all layers of *framebuffer*. The application must ensure (using scissor if necessary) that all rendering is contained within the render area. The render area, after any transform specified by *VkRenderPassTransformBeginInfoQCOM::transform* is applied, must be contained within the framebuffer dimensions.

If **render pass transform** is enabled, then **renderArea** must equal the framebuffer pre-transformed dimensions. After **renderArea** has been transformed by *VkRenderPassTransformBeginInfoQCOM::transform*, the resulting render area must be contained within the framebuffer dimensions.

If multiview is enabled in **renderPass**, and **multiviewPerViewRenderAreas** feature is enabled, and there is an instance of *VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM* included in the **pNext** chain with **perViewRenderAreaCount** not equal to 0, then the elements of *VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM::pPerViewRenderAreas* override **renderArea** and define a render area for each view. In this case, **renderArea** must be set to an area at least as large as the union of all the per-view render areas.

If the **subpassShading** feature is enabled, then **renderArea** must equal the framebuffer dimensions.

**Note**

There may be a performance cost for using a render area smaller than the framebuffer, unless it matches the render area granularity for the render pass.

### Valid Usage

- **VUID-VkRenderPassBeginInfo-clearValueCount-00902**
  
  **clearValueCount** must be greater than the largest attachment index in **renderPass** specifying a **loadOp** (or **stencilLoadOp**, if the attachment has a depth/stencil format) of 

  ```
  VK_ATTACHMENT_LOAD_OP_CLEAR
  ```
If `clearValueCount` is not 0, `pClearValues` must be a valid pointer to an array of `clearValueCount` `VkClearValue` unions.

`renderPass` must be compatible with the `renderPass` member of the `VkFramebufferCreateInfo` structure specified when creating `framebuffer`.

If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is 0, `renderArea.extent.width` must be greater than 0.

If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is 0, `renderArea.extent.height` must be greater than 0.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` must be greater than or equal to 0.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` must be greater than or equal to 0.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x + renderArea.extent.width` must be less than or equal to `VkFramebufferCreateInfo::width` the `framebuffer` was created with.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y + renderArea.extent.height` must be less than or equal to `VkFramebufferCreateInfo::height` the `framebuffer` was created with.

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.x + extent.width` of each element of `pDeviceRenderAreas` must be less than or equal to `VkFramebufferCreateInfo::width` the `framebuffer` was created with.

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.y + extent.height` of each element of `pDeviceRenderAreas` must be less than or equal to `VkFramebufferCreateInfo::height` the `framebuffer` was created with.

If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that did not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and the `pNext` chain includes a `VkRenderPassAttachmentBeginInfo` structure, its `attachmentCount` must be zero.
If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the attachmentCount of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be equal to the value of VkFramebufferAttachmentsCreateInfo::attachmentImageInfoCount used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-02780
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must have been created on the same VkDevice as framebuffer and renderPass

- VUID-VkRenderPassBeginInfo-framebuffer-03209
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageCreateInfo::flags equal to the flags member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-04627
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView with an inherited usage equal to the usage member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03211
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView with a width equal to the width member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03212
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView with a height equal to the height member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03213
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageViewCreateInfo::subresourceRange.layerCount equal to the layerCount member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03214
If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageFormatListCreateInfo::viewFormatCount equal to the viewFormatCount member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer.

- VUID-VkRenderPassBeginInfo-framebuffer-03215
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a set of elements in VkImageFormatListCreateInfo::pViewFormats equal to the set of elements in the pViewFormats member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer.

- VUID-VkRenderPassBeginInfo-framebuffer-03216
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageViewCreateInfo::format equal to the corresponding value of VkAttachmentDescription::format in renderPass.

- VUID-VkRenderPassBeginInfo-framebuffer-09047
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageCreateInfo::samples equal to the corresponding value of VkAttachmentDescription::samples in renderPass, or VK_SAMPLE_COUNT_1_BIT if renderPass was created with VkMultisampledRenderToSingleSampledInfoEXT structure in the pNext chain with multisampledRenderToSingleSampledEnable equal to VK_TRUE.

- VUID-VkRenderPassBeginInfo-pNext-02869
  If the pNext chain includes VkRenderPassTransformBeginInfoQCOM, renderArea.offset must equal (0,0).

- VUID-VkRenderPassBeginInfo-pNext-02870
  If the pNext chain includes VkRenderPassTransformBeginInfoQCOM, renderArea.extent transformed by VkRenderPassTransformBeginInfoQCOM::transform must equal the framebuffer dimensions.

- VUID-VkRenderPassBeginInfo-perViewRenderAreaCount-07859
  If the perViewRenderAreaCount member of a VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM structure included in the pNext chain is not 0, then the multiviewPerViewRenderAreas feature must be enabled.

- VUID-VkRenderPassBeginInfo-perViewRenderAreaCount-07860
  If the perViewRenderAreaCount member of a VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM structure included in the pNext chain is not 0, then renderArea must specify a render area that includes the union of all per view render areas.
Valid Usage (Implicit)

- **VUID-VkRenderPassBeginInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_BEGIN_INFO`.

- **VUID-VkRenderPassBeginInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDeviceGroupRenderPassBeginInfo`, `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM`, `VkRenderPassAttachmentBeginInfo`, `VkRenderPassSampleLocationsBeginInfoEXT`, or `VkRenderPassTransformBeginInfoQCOM`.

- **VUID-VkRenderPassBeginInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkRenderPassBeginInfo-renderPass-parameter**
  
  `renderPass` must be a valid `VkRenderPass` handle.

- **VUID-VkRenderPassBeginInfo-framebuffer-parameter**
  
  `framebuffer` must be a valid `VkFramebuffer` handle.

- **VUID-VkRenderPassBeginInfo-commonparent**
  
  Both of `framebuffer`, and `renderPass` must have been created, allocated, or retrieved from the same `VkDevice`.

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the image subresource, thus preserving the contents of such depth/stencil attachments across subpass boundaries requires the application to specify these sample locations whenever a layout transition of the attachment may occur. This information can be provided by adding a `VkRenderPassSampleLocationsBeginInfoEXT` structure to the `pNext` chain of `VkRenderPassBeginInfo`.

The `VkRenderPassSampleLocationsBeginInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkRenderPassSampleLocationsBeginInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentInitialSampleLocationsCount;
    const VkAttachmentSampleLocationsEXT* pAttachmentInitialSampleLocations;
    uint32_t postSubpassSampleLocationsCount;
    const VkSubpassSampleLocationsEXT* pPostSubpassSampleLocations;
} VkRenderPassSampleLocationsBeginInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.

- **pNext** is `NULL` or a pointer to a structure extending this structure.

- **attachmentInitialSampleLocationsCount** is the number of elements in the `pAttachmentInitialSampleLocations` array.
• **pAttachmentInitialSampleLocations** is a pointer to an array of `attachmentInitialSampleLocationsCount` `VkAttachmentSampleLocationsEXT` structures specifying the attachment indices and their corresponding sample location state. Each element of **pAttachmentInitialSampleLocations** can specify the sample location state to use in the automatic layout transition performed to transition a depth/stencil attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.

• **postSubpassSampleLocationsCount** is the number of elements in the **pPostSubpassSampleLocations** array.

• **pPostSubpassSampleLocations** is a pointer to an array of `postSubpassSampleLocationsCount` `VkSubpassSampleLocationsEXT` structures specifying the subpass indices and their corresponding sample location state. Each element of **pPostSubpassSampleLocations** can specify the sample location state to use in the automatic layout transition performed to transition the depth/stencil attachment used by the specified subpass to the image layout specified in a dependent subpass or to the final layout of the attachment in case the specified subpass is the last subpass using that attachment. In addition, if `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is **VK_FALSE**, each element of **pPostSubpassSampleLocations** must specify the sample location state that matches the sample locations used by all pipelines that will be bound to a command buffer during the specified subpass. If `variableSampleLocations` is **VK_TRUE**, the sample locations used for rasterization do not depend on **pPostSubpassSampleLocations**.

---

**Valid Usage (Implicit)**

- **VUID-VkRenderPassSampleLocationsBeginInfoEXT-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_RENDER_PASS_SAMPLE_LOCATIONS_BEGIN_INFO_EXT**

- **VUID-VkRenderPassSampleLocationsBeginInfoEXT-pAttachmentInitialSampleLocations-parameter**
  - If `attachmentInitialSampleLocationsCount` is not 0, **pAttachmentInitialSampleLocations** must be a valid pointer to an array of `attachmentInitialSampleLocationsCount` valid `VkAttachmentSampleLocationsEXT` structures

- **VUID-VkRenderPassSampleLocationsBeginInfoEXT-pPostSubpassSampleLocations-parameter**
  - If `postSubpassSampleLocationsCount` is not 0, **pPostSubpassSampleLocations** must be a valid pointer to an array of `postSubpassSampleLocationsCount` valid `VkSubpassSampleLocationsEXT` structures

---

The **VkAttachmentSampleLocationsEXT** structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef structVkAttachmentSampleLocationsEXT {
   uint32_t attachmentIndex;
   VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkAttachmentSampleLocationsEXT;
```
• `attachmentIndex` is the index of the attachment for which the sample locations state is provided.
• `sampleLocationsInfo` is the sample locations state to use for the layout transition of the given attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.

If the image referenced by the framebuffer attachment at index `attachmentIndex` was not created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` then the values specified in `sampleLocationsInfo` are ignored.

### Valid Usage

- VUID-VkAttachmentSampleLocationsEXT-attachmentIndex-01531
  
  `attachmentIndex` must be less than the `attachmentCount` specified in `VkRenderPassCreateInfo` the render pass specified by `VkRenderPassBeginInfo::renderPass` was created with

### Valid Usage (Implicit)

- VUID-VkAttachmentSampleLocationsEXT-sampleLocationsInfo-parameter
  
  `sampleLocationsInfo` must be a valid `VkSampleLocationsInfoEXT` structure

The `VkSubpassSampleLocationsEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSubpassSampleLocationsEXT {
  uint32_t subpassIndex;
  VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkSubpassSampleLocationsEXT;
```

• `subpassIndex` is the index of the subpass for which the sample locations state is provided.
• `sampleLocationsInfo` is the sample locations state to use for the layout transition of the depth/stencil attachment away from the image layout the attachment is used with in the subpass specified in `subpassIndex`.

If the image referenced by the depth/stencil attachment used in the subpass identified by `subpassIndex` was not created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` or if the subpass does not use a depth/stencil attachment, and `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_TRUE` then the values specified in `sampleLocationsInfo` are ignored.

### Valid Usage

- VUID-VkSubpassSampleLocationsEXT-subpassIndex-01532
  
  `subpassIndex` must be less than the `subpassCount` specified in `VkRenderPassCreateInfo` the
To begin a render pass instance with render pass transform enabled, add the VkRenderPassTransformBeginInfoQCOM to the pNext chain of VkRenderPassBeginInfo structure passed to the vkCmdBeginRenderPass command specifying the render pass transform.

The VkRenderPassTransformBeginInfoQCOM structure is defined as:

```c
// Provided by VK_QCOM_render_pass_transform
typedef struct VkRenderPassTransformBeginInfoQCOM {
    VkStructureType sType;
    void* pNext;
    VkSurfaceTransformFlagBitsKHR transform;
} VkRenderPassTransformBeginInfoQCOM;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `transform` is a VkSurfaceTransformFlagBitsKHR value describing the transform to be applied to rasterization.

Valid Usage

- VUID-VkRenderPassTransformBeginInfoQCOM-transform-02871
  `transform` must be VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR, VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR, VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR, or VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR.
- VUID-VkRenderPassTransformBeginInfoQCOM-flags-02872
  The renderpass must have been created with VkRenderPassCreateInfo::flags containing VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM.

Valid Usage (Implicit)

- VUID-VkRenderPassTransformBeginInfoQCOM-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_RENDER_PASS_TRANSFORM_BEGIN_INFO_QCOM.
typedef struct VkSubpassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkSubpassContents contents;
} VkSubpassBeginInfo;

or the equivalent

typedef VkSubpassBeginInfo VkSubpassBeginInfoKHR;

- \textit{sType} is a \textbf{VkStructureType} value identifying this structure.
- \textit{pNext} is NULL or a pointer to a structure extending this structure.
- \textit{contents} is a \textbf{VkSubpassContents} value specifying how the commands in the next subpass will be provided.

\section*{Valid Usage (Implicit)}

- VUID-VkSubpassBeginInfo-sType-sType
  \textit{sType} must be \texttt{VK_STRUCTURE_TYPE_SUBPASS_BEGIN_INFO}
- VUID-VkSubpassBeginInfo-pNext-pNext
  \textit{pNext} must be NULL
- VUID-VkSubpassBeginInfo-contents-parameter
  \textit{contents} must be a valid \textbf{VkSubpassContents} value

Possible values of \texttt{vkCmdBeginRenderPass::contents}, specifying how the commands in the first subpass will be provided, are:

\begin{verbatim}
// Provided by VK_VERSION_1_0
typedef enum VkSubpassContents {
    VK_SUBPASS_CONTENTS_INLINE = 0,
    VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS = 1,
} VkSubpassContents;
\end{verbatim}

- \texttt{VK_SUBPASS_CONTENTS_INLINE} specifies that the contents of the subpass will be recorded inline in the primary command buffer, and secondary command buffers must not be executed within the subpass.
- \texttt{VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS} specifies that the contents are recorded in secondary command buffers that will be called from the primary command buffer, and \texttt{vkCmdExecuteCommands} is the only valid command in the command buffer until \texttt{vkCmdNextSubpass} or \texttt{vkCmdEndRenderPass}. 
If the `pNext` chain of `VkRenderPassBeginInfo` or `VkRenderingInfo` includes a `VkDeviceGroupRenderPassBeginInfo` structure, then that structure includes a device mask and set of render areas for the render pass instance.

The `VkDeviceGroupRenderPassBeginInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupRenderPassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceMask;
    uint32_t deviceRenderAreaCount;
    const VkRect2D* pDeviceRenderAreas;
} VkDeviceGroupRenderPassBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupRenderPassBeginInfo VkDeviceGroupRenderPassBeginInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceMask` is the device mask for the render pass instance.
- `deviceRenderAreaCount` is the number of elements in the `pDeviceRenderAreas` array.
- `pDeviceRenderAreas` is a pointer to an array of `VkRect2D` structures defining the render area for each physical device.

The `deviceMask` serves several purposes. It is an upper bound on the set of physical devices that can be used during the render pass instance, and the initial device mask when the render pass instance begins. In addition, commands transitioning to the next subpass in a render pass instance and commands ending the render pass instance, and, accordingly render pass `load`, `store`, and `multisample resolve` operations and subpass dependencies corresponding to the render pass instance, are executed on the physical devices included in the device mask provided here.

If `deviceRenderAreaCount` is not zero, then the elements of `pDeviceRenderAreas` override the value of `VkRenderPassBeginInfo::renderArea`, and provide a render area specific to each physical device. These render areas serve the same purpose as `VkRenderPassBeginInfo::renderArea`, including controlling the region of attachments that are cleared by `VK_ATTACHMENT_LOAD_OP_CLEAR` and that are resolved into resolve attachments.

If this structure is not present, the render pass instance’s device mask is the value of `VkDeviceGroupCommandBufferBeginInfo::deviceMask`. If this structure is not present or if `deviceRenderAreaCount` is zero, `VkRenderPassBeginInfo::renderArea` is used for all physical devices.
Valid Usage

- **VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00905**
  deviceMask must be a valid device mask value

- **VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00906**
  deviceMask must not be zero

- **VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00907**
  deviceMask must be a subset of the command buffer’s initial device mask

- **VUID-VkDeviceGroupRenderPassBeginInfo-deviceRenderAreaCount-00908**
  deviceRenderAreaCount must either be zero or equal to the number of physical devices in the logical device

- **VUID-VkDeviceGroupRenderPassBeginInfo-offset-06166**
  The offset.x member of any element of pDeviceRenderAreas must be greater than or equal to 0

- **VUID-VkDeviceGroupRenderPassBeginInfo-offset-06167**
  The offset.y member of any element of pDeviceRenderAreas must be greater than or equal to 0

- **VUID-VkDeviceGroupRenderPassBeginInfo-offset-06168**
  The sum of the offset.x and extent.width members of any element of pDeviceRenderAreas must be less than or equal to maxFramebufferWidth

- **VUID-VkDeviceGroupRenderPassBeginInfo-offset-06169**
  The sum of the offset.y and extent.height members of any element of pDeviceRenderAreas must be less than or equal to maxFramebufferHeight

- **VUID-VkDeviceGroupRenderPassBeginInfo-extent-08998**
  The extent.width member of any element of pDeviceRenderAreas must be greater than 0

- **VUID-VkDeviceGroupRenderPassBeginInfo-extent-08999**
  The extent.height member of any element of pDeviceRenderAreas must be greater than 0

Valid Usage (Implicit)

- **VUID-VkDeviceGroupRenderPassBeginInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_RENDER_PASS_BEGIN_INFO

- **VUID-VkDeviceGroupRenderPassBeginInfo-pDeviceRenderAreas-parameter**
  If deviceRenderAreaCount is not 0, pDeviceRenderAreas must be a valid pointer to an array of deviceRenderAreaCount VkRect2D structures

The VkRenderPassAttachmentBeginInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassAttachmentBeginInfo {
    VkStructureType sType;
```
The `VkRenderPassAttachmentBeginInfo` structure is defined as follows:

```c
const void* pNext;
uint32_t attachmentCount;
const VkImageView* pAttachments;
} VkRenderPassAttachmentBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_imageless_framebuffer
typedef VkRenderPassAttachmentBeginInfo VkRenderPassAttachmentBeginInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentCount` is the number of attachments.
- `pAttachments` is a pointer to an array of `VkImageView` handles, each of which will be used as the corresponding attachment in the render pass instance.

### Valid Usage

- **VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03218**
  Each element of `pAttachments` must only specify a single mip level

- **VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03219**
  Each element of `pAttachments` must have been created with the identity swizzle

- **VUID-VkRenderPassAttachmentBeginInfo-pAttachments-04114**
  Each element of `pAttachments` must have been created with `VkImageViewCreateInfo`'s `viewType` not equal to `VK_IMAGE_VIEW_TYPE_3D`

- **VUID-VkRenderPassAttachmentBeginInfo-pAttachments-07010**
  If `multisampled-render-to-single-sampled` is enabled for any subpass, all element of `pAttachments` which have a sample count equal to `VK_SAMPLE_COUNT_1_BIT` must have a format that supports the sample count specified in `VkMultisampledRenderToSingleSampledInfoEXT`'s `rasterizationSamples`

### Valid Usage (Implicit)

- **VUID-VkRenderPassAttachmentBeginInfo-sType-sType**
  `sType` must be `VK_STRUCTURE>Type_RENDER_PASS_ATTACHMENT_BEGIN_INFO`

- **VUID-VkRenderPassAttachmentBeginInfo-pAttachments-parameter**
  If `attachmentCount` is not 0, `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkImageView` handles

If a render pass instance enables multiview and if the `<features-multiview-per-view-render-areas,multiviewPerViewRenderAreas>>` feature is enabled, the `VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM` structure can be included in the `pNext` chain.
of VkRenderPassBeginInfo or VkRenderingInfo

The VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM structure is defined as:

```c
// Provided by VK_QCOM_multiview_per_view_render_areas
typedef struct VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM {
    VkStructureType sType;
    const void* pNext;
    uint32_t perViewRenderAreaCount;
    const VkRect2D* pPerViewRenderAreas;
} VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- perViewRenderAreaCount is the number of elements in the pPerViewRenderAreas array.
- pPerViewRenderAreas is a pointer to an array of VkRect2D structures defining the render area for each view.

If perViewRenderAreaCount is not zero, then the elements of pPerViewRenderAreas override the value of VkRenderPassBeginInfo::renderArea or VkRenderingInfo::renderArea and define per-view render areas for the individual views of a multiview render pass. The render area for the view with view index i is specified by pPerViewRenderAreas[i].

The per-view render areas define per-view regions of attachments that are loaded, stored, and resolved according to the loadOp, storeOp, and resolveMode values of the render pass instance. When per-view render areas are defined, the value of VkRenderPassBeginInfo::renderArea or VkRenderingInfo::renderArea must be set to a render area that includes the union of all per-view render areas, may be used by the implementation for optimizations, but does not affect loads, stores, or resolves.

If this structure is present and if perViewRenderAreaCount is not zero, then perViewRenderAreaCount must be at least one greater than the most significant bit set in any element of VkRenderPassMultiviewCreateInfo::pViewMasks or VkRenderingInfo::viewMask.

If this structure is not present or if perViewRenderAreaCount is zero, VkRenderPassBeginInfo::renderArea or VkRenderingInfo::renderArea is used for all views.

**Valid Usage**

- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07861
  The offset.x member of any element of pPerViewRenderAreas must be greater than or equal to 0.
- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07862
  The offset.y member of any element of pPerViewRenderAreas must be greater than or equal to 0.
- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07863
The sum of the `offset.x` and `extent.width` members of any element of `pPerViewRenderAreas` must be less than or equal to `maxFramebufferWidth`.

- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-offset-07864
  The sum of the `offset.y` and `extent.height` members of any element of `pPerViewRenderAreas` must be less than or equal to `maxFramebufferHeight`.

- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-pNext-07865
  If this structure is in the `pNext` chain of `VkRenderPassBeginInfo` and if the render pass object included an element in `VkRenderPassMultiviewCreateInfo::pViewMasks` that set bit `n`, then `perViewRenderAreaCount` must be at least equal to `n+1`.

- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-pNext-07866
  If this structure is in the `pNext` chain of `VkRenderingInfo` and if `VkRenderingInfo::viewMask` set bit `n`, then `perViewRenderAreaCount` must be at least equal to `n+1`.

Valid Usage (Implicit)

- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_MULTIVIEW_PER_VIEW_RENDERAREAS_RENDER_PASS_BEGIN_INFO_QCOM`.

- VUID-VkMultiviewPerViewRenderAreasRenderPassBeginInfoQCOM-pPerViewRenderAreas-parameter
  If `perViewRenderAreaCount` is not `0`, `pPerViewRenderAreas` must be a valid pointer to an array of `perViewRenderAreaCount` `VkRect2D` structures.

To query the render area granularity, call:

```cpp
// Provided by VK_VERSION_1_0
void vkGetRenderAreaGranularity(
    VkDevice device,
    VkRenderPass renderPass,
    VkExtent2D* pGranularity);
```

- `device` is the logical device that owns the render pass.
- `renderPass` is a handle to a render pass.
- `pGranularity` is a pointer to a `VkExtent2D` structure in which the granularity is returned.

The conditions leading to an optimal `renderArea` are:

- the `offset.x` member in `renderArea` is a multiple of the `width` member of the returned `VkExtent2D` (the horizontal granularity).
- the `offset.y` member in `renderArea` is a multiple of the `height` member of the returned `VkExtent2D` (the vertical granularity).
- either the `extent.width` member in `renderArea` is a multiple of the horizontal granularity or `offset.x+extent.width` is equal to the `width` of the `framebuffer` in the `VkRenderPassBeginInfo`.
• either the `extent.height` member in `renderArea` is a multiple of the vertical granularity or `offset.y+extent.height` is equal to the `height` of the framebuffer in the `VkRenderPassBeginInfo`.

Subpass dependencies are not affected by the render area, and apply to the entire image subresources attached to the framebuffer as specified in the description of automatic layout transitions. Similarly, pipeline barriers are valid even if their effect extends outside the render area.

### Valid Usage (Implicit)

- VUID-vkGetRenderAreaGranularity-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetRenderAreaGranularity-renderPass-parameter
  - `renderPass` must be a valid `VkRenderPass` handle
- VUID-vkGetRenderAreaGranularity-pGranularity-parameter
  - `pGranularity` must be a valid pointer to a `VkExtent2D` structure
- VUID-vkGetRenderAreaGranularity-renderPass-parent
  - `renderPass` must have been created, allocated, or retrieved from `device`

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdNextSubpass(
    VkCommandBuffer commandBuffer,
    VkSubpassContents contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `contents` specifies how the commands in the next subpass will be provided, in the same fashion as the corresponding parameter of `vkCmdBeginRenderPass`.

The subpass index for a render pass begins at zero when `vkCmdBeginRenderPass` is recorded, and increments each time `vkCmdNextSubpass` is recorded.

After transitioning to the next subpass, the application can record the commands for that subpass.

### Valid Usage

- VUID-vkCmdNextSubpass-None-00909
  - The current subpass index must be less than the number of subpasses in the render pass minus one
- VUID-vkCmdNextSubpass-None-02349
  - This command must not be recorded when transform feedback is active
Valid Usage (Implicit)

- VUID-vkCmdNextSubpass-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdNextSubpass-contents-parameter
  contents must be a valid VkSubpassContents value

- VUID-vkCmdNextSubpass-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdNextSubpass-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdNextSubpass-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdNextSubpass-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdNextSubpass-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State Synchronization</td>
</tr>
</tbody>
</table>

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```c
// Provided by VK_VERSION_1_2
def void vkCmdNextSubpass2(
    VkCommandBuffer commandBuffer,
    const VkSubpassBeginInfo* pSubpassBeginInfo,
    const VkSubpassEndInfo* pSubpassEndInfo);
```
or the equivalent command

```c
// Provided by VK_KHR_create_renderpass2
void vkCmdNextSubpass2KHR(
    VkCommandBuffer commandBuffer,
    const VkSubpassBeginInfo* pSubpassBeginInfo,
    const VkSubpassEndInfo* pSubpassEndInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.
- `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfo` structure containing information about how the previous subpass will be ended.

`vkCmdNextSubpass2` is semantically identical to `vkCmdNextSubpass`, except that it is extensible, and that `contents` is provided as part of an extensible structure instead of as a flat parameter.

Valid Usage

- VUID-vkCmdNextSubpass2-None-03102
  The current subpass index **must** be less than the number of subpasses in the render pass minus one

- VUID-vkCmdNextSubpass2-None-02350
  This command **must** not be recorded when transform feedback is active

Valid Usage (Implicit)

- VUID-vkCmdNextSubpass2-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdNextSubpass2-pSubpassBeginInfo-parameter
  `pSubpassBeginInfo` **must** be a valid pointer to a valid `VkSubpassBeginInfo` structure

- VUID-vkCmdNextSubpass2-pSubpassEndInfo-parameter
  `pSubpassEndInfo` **must** be a valid pointer to a valid `VkSubpassEndInfo` structure

- VUID-vkCmdNextSubpass2-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdNextSubpass2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdNextSubpass2-renderpass
  This command **must** only be called inside of a render pass instance

- VUID-vkCmdNextSubpass2-videocoding
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>State</td>
<td>Synchronization</td>
</tr>
</tbody>
</table>

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdEndRenderPass(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer in which to end the current render pass instance.

Ending a render pass instance performs any multisample resolve operations on the final subpass.

Valid Usage

- VUID-vkCmdEndRenderPass-None-00910
  The current subpass index **must** be equal to the number of subpasses in the render pass minus one
- VUID-vkCmdEndRenderPass-None-02351
  This command **must** not be recorded when transform feedback is active
- VUID-vkCmdEndRenderPass-None-06170
  The current render pass instance **must** not have been begun with `vkCmdBeginRendering`
- VUID-vkCmdEndRenderPass-None-07004
  If `vkCmdBeginQuery*` was called within a subpass of the render pass, the corresponding `vkCmdEndQuery*` **must** have been called subsequently within the same subpass
Valid Usage (Implicit)

- VUID-vkCmdEndRenderPass-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdEndRenderPass-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdEndRenderPass-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdEndRenderPass-renderpass
  This command must only be called inside of a render pass instance
- VUID-vkCmdEndRenderPass-videoencoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdEndRenderPass-bufferlevel
  `commandBuffer` must be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the ` VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<td>Action State Synchronization</td>
</tr>
</tbody>
</table>

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdEndRenderPass2(
    VkCommandBuffer commandBuffer,
    const VkSubpassEndInfo* pSubpassEndInfo);
```
```c
void vkCmdEndRenderPass2KHR(
    VkCommandBuffer commandBuffer,
    const VkSubpassEndInfo* pSubpassEndInfo);
```

- `commandBuffer` is the command buffer in which to end the current render pass instance.
- `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfo` structure containing information about how the last subpass will be ended.

`vkCmdEndRenderPass2` is semantically identical to `vkCmdEndRenderPass`, except that it is extensible.

### Valid Usage

- **VUID-vkCmdEndRenderPass2-None-03103**
  The current subpass index **must** be equal to the number of subpasses in the render pass minus one

- **VUID-vkCmdEndRenderPass2-None-02352**
  This command **must** not be recorded when transform feedback is active

- **VUID-vkCmdEndRenderPass2-None-06171**
  The current render pass instance **must** not have been begun with `vkCmdBeginRendering`

- **VUID-vkCmdEndRenderPass2-None-07005**
  If `vkCmdBeginQuery*` was called within a subpass of the render pass, the corresponding `vkCmdEndQuery*` **must** have been called subsequently within the same subpass

### Valid Usage (Implicit)

- **VUID-vkCmdEndRenderPass2-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdEndRenderPass2-pSubpassEndInfo-parameter**
  `pSubpassEndInfo` **must** be a valid pointer to a valid `VkSubpassEndInfo` structure

- **VUID-vkCmdEndRenderPass2-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdEndRenderPass2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdEndRenderPass2-renderpass**
  This command **must** only be called inside of a render pass instance

- **VUID-vkCmdEndRenderPass2-videocoding**
  This command **must** only be called outside of a video coding scope

- **VUID-vkCmdEndRenderPass2-bufferlevel**
  `commandBuffer` **must** be a primary `VkCommandBuffer`
**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>

</table>

The `VkSubpassEndInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassEndInfo {
    VkStructureType sType;
    const void* pNext;
} VkSubpassEndInfo;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassEndInfo VkSubpassEndInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.

**Valid Usage (Implicit)**

- VUID-VkSubpassEndInfo-sType-sType
  `sType must be VK_STRUCTURE_TYPE_SUBPASS_END_INFO`
- VUID-VkSubpassEndInfo-pNext-pNext
  `pNext must be NULL or a pointer to a valid instance of VkSubpassFragmentDensityMapOffsetEndInfoQCOM`
- VUID-VkSubpassEndInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

If the `VkSubpassEndInfo::pNext` chain includes a `VkSubpassFragmentDensityMapOffsetEndInfoQCOM`
structure, then that structure includes an array of fragment density map offsets per layer for the render pass.

The `VkSubpassFragmentDensityMapOffsetEndInfoQCOM` structure is defined as:

```c
// Provided by VK_QCOM_fragment_density_map_offset
typedef struct VkSubpassFragmentDensityMapOffsetEndInfoQCOM {
    VkStructureType sType;
    const void* pNext;
    uint32_t fragmentDensityOffsetCount;
    const VkOffset2D* pFragmentDensityOffsets;
} VkSubpassFragmentDensityMapOffsetEndInfoQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentDensityOffsetCount` is the number of offsets being specified.
- `pFragmentDensityOffsets` is a pointer to an array of `VkOffset2D` structs, each of which describes the offset per layer.

The array elements are given per layer as defined by Fetch Density Value, where index = layer. Each (x,y) offset is in framebuffer pixels and shifts the fetch of the fragment density map by that amount. Offsets can be positive or negative.

Offset values specified for any subpass that is not the last subpass in the render pass are ignored. If the `VkSubpassEndInfo::pNext` chain for the last subpass of a render pass does not include `VkSubpassFragmentDensityMapOffsetEndInfoQCOM`, or if `fragmentDensityOffsetCount` is zero, then the offset (0,0) is used for Fetch Density Value.

### Valid Usage

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityMapOffsets-06503
  If the `fragmentDensityMapOffsets` feature is not enabled or fragment density map is not enabled in the render pass, `fragmentDensityOffsetCount` must equal 0

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityMapAttachment-06504
  If `VkSubpassDescription::fragmentDensityMapAttachment` is not is not `VK_ATTACHMENT_UNUSED` and was not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM`, `fragmentDensityOffsetCount` must equal 0

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pDepthStencilAttachment-06505
  If `VkSubpassDescription::pDepthStencilAttachment` is not is not `VK_ATTACHMENT_UNUSED` and was not created with `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM`, `fragmentDensityOffsetCount` must equal 0

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pInputAttachments-06506
If any element of VkSubpassDescription::pInputAttachments is not VK_ATTACHMENT_UNUSED and was not created with VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM, fragmentDensityOffsetCount must equal 0

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pColorAttachments-06507
  If any element of VkSubpassDescription::pColorAttachments is not VK_ATTACHMENT_UNUSED and was not created with VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM, fragmentDensityOffsetCount must equal 0

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pResolveAttachments-06508
  If any element of VkSubpassDescription::pResolveAttachments is not VK_ATTACHMENT_UNUSED and was not created with VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM, fragmentDensityOffsetCount must equal 0

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pPreserveAttachments-06509
  If any element of VkSubpassDescription::pPreserveAttachments is not VK_ATTACHMENT_UNUSED and was not created with VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM, fragmentDensityOffsetCount must equal 0

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityOffsetCount-06510
  If fragmentDensityOffsetCount is not 0 and multiview is enabled for the render pass, fragmentDensityOffsetCount must equal the layerCount that was specified in creating the fragment density map attachment view

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityOffsetCount-06511
  If fragmentDensityOffsetCount is not 0 and multiview is not enabled for the render pass, fragmentDensityOffsetCount must equal 1

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-x-06512
  The x component of each element of pFragmentDensityOffsets must be an integer multiple of fragmentDensityOffsetGranularity.width

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-y-06513
  The y component of each element of pFragmentDensityOffsets must be an integer multiple of fragmentDensityOffsetGranularity.height

**Valid Usage (Implicit)**

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBPASS_FRAGMENT_DENSITY_MAP_OFFSET_END_INFO_QCOM

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pFragmentDensityOffsets-parameter
  If fragmentDensityOffsetCount is not 0, pFragmentDensityOffsets must be a valid pointer to an array of fragmentDensityOffsetCount VkOffset2D structures
8.9. Render Pass Creation Feedback

A `VkRenderPassCreationControlEXT` structure can be included in the `pNext` chain of `VkRenderPassCreateInfo2` or `pNext` chain of `VkSubpassDescription2`. The `VkRenderPassCreationControlEXT` structure is defined as:

```c
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassCreationControlEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 disallowMerging;
} VkRenderPassCreationControlEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `disallowMerging` is a boolean value indicating whether subpass merging will be disabled.

If a `VkRenderPassCreationControlEXT` structure is included in the `pNext` chain of `VkRenderPassCreateInfo2` and its value of `disallowMerging` is `VK_TRUE`, the implementation will disable subpass merging for the entire render pass. If a `VkRenderPassCreationControlEXT` structure is included in the `pNext` chain of `VkSubpassDescription2` and its value of `disallowMerging` is `VK_TRUE`, the implementation will disable merging the described subpass with previous subpasses in the render pass.

**Valid Usage (Implicit)**

- `VUID-VkRenderPassCreationControlEXT-sType-sType` sType must be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATION_CONTROL_EXT`

To obtain feedback about the creation of a render pass, include a `VkRenderPassCreationFeedbackCreateInfoEXT` structure in the `pNext` chain of `VkRenderPassCreateInfo2`. The `VkRenderPassCreationFeedbackCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassCreationFeedbackCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassCreationFeedbackCreateInfoEXT* pRenderPassFeedback;
} VkRenderPassCreationFeedbackCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pRenderPassFeedback` is a pointer to a `VkRenderPassCreationFeedbackCreateInfoEXT` structure in which feedback is returned.
Valid Usage (Implicit)

- **VUID-VkRenderPassCreationFeedbackCreateInfoEXT-sType-sType**
  
  The *sType* must be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATION_FEEDBACK_CREATE_INFO_EXT`.

- **VUID-VkRenderPassCreationFeedbackCreateInfoEXT-pRenderPassFeedback-parameter**
  
  The *pRenderPassFeedback* must be a valid pointer to a `VkRenderPassCreationFeedbackInfoEXT` structure.

The `VkRenderPassCreationFeedbackInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassCreationFeedbackInfoEXT {
    uint32_t postMergeSubpassCount;
} VkRenderPassCreationFeedbackInfoEXT;
```

- **postMergeSubpassCount** is the subpass count after merge.

Feedback about the creation of a subpass can be obtained by including a `VkRenderPassSubpassFeedbackCreateInfoEXT` structure in the *pNext* chain of `VkSubpassDescription2`. The `VkRenderPassSubpassFeedbackCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassSubpassFeedbackCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassSubpassFeedbackInfoEXT* pSubpassFeedback;
} VkRenderPassSubpassFeedbackCreateInfoEXT;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pSubpassFeedback** is a pointer to a `VkRenderPassSubpassFeedbackInfoEXT` structure in which feedback is returned.

Valid Usage (Implicit)

- **VUID-VkRenderPassSubpassFeedbackCreateInfoEXT-sType-sType**
  
  The *sType* must be `VK_STRUCTURE_TYPE_RENDER_PASS_SUBPASS_FEEDBACK_CREATE_INFO_EXT`.

- **VUID-VkRenderPassSubpassFeedbackCreateInfoEXT-pSubpassFeedback-parameter**
  
  The *pSubpassFeedback* must be a valid pointer to a `VkRenderPassSubpassFeedbackInfoEXT` structure.

The `VkRenderPassSubpassFeedbackInfoEXT` structure is defined as:
```c
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassSubpassFeedbackInfoEXT {
    VkSubpassMergeStatusEXT subpassMergeStatus;
    char description[VK_MAX_DESCRIPTION_SIZE];
    uint32_t postMergeIndex;
} VkRenderPassSubpassFeedbackInfoEXT;
```

- **subpassMergeStatus** is a `VkSubpassMergeStatusEXT` value specifying information about whether the subpass is merged with previous subpass and the reason why it is not merged.
- **description** is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which provides additional details.
- **postMergeIndex** is the subpass index after the subpass merging.

Possible values of `VkRenderPassSubpassFeedbackInfoEXT::subpassMergeStatus` are:

```c
// Provided by VK_EXT_subpass_merge_feedback
typedef enum VkSubpassMergeStatusEXT {
    VK_SUBPASS_MERGE_STATUS_MERGED_EXT = 0,
    VK_SUBPASS_MERGE_STATUS_DISALLOWED_EXT = 1,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SIDE_EFFECTS_EXT = 2,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SAMPLES_MISMATCH_EXT = 3,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_VIEWS_MISMATCH_EXT = 4,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_ALIASING_EXT = 5,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPENDENCIES_EXT = 6,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INCOMPATIBLE_INPUT_ATTACHMENT_EXT = 7,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_TOO_MANY_ATTACHMENTS_EXT = 8,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INSUFFICIENT_STORAGE_EXT = 9,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPTH_STENCIL_COUNT_EXT = 10,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_RESOLVE_ATTACHMENT_REUSE_EXT = 11,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SINGLE_SUBPASS_EXT = 12,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_UNSPECIFIED_EXT = 13,
} VkSubpassMergeStatusEXT;
```

- **VK_SUBPASS_MERGE_STATUS_MERGED_EXT** specifies the subpass is merged with a previous subpass.
- **VK_SUBPASS_MERGE_STATUS_DISALLOWED_EXT** specifies the subpass is disallowed to merge with previous subpass. If the render pass does not allow subpass merging, then all subpass statuses are set to this value. If a subpass description does not allow subpass merging, then only that subpass’s status is set to this value.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SIDE_EFFECTS_EXT** specifies the subpass is not merged because it contains side effects.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SAMPLES_MISMATCH_EXT** specifies the subpass is not merged because sample count is not compatible with previous subpass.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_VIEWS_MISMATCH_EXT** specifies the subpass is not merged because view masks do not match with previous subpass.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_ALIASING_EXT** specifies the subpass is not merged because of
8.10. Common Render Pass Data Races (Informative)

Due to the complexity of how rendering is performed, there are several ways an application can accidentally introduce a data race, usually by doing something that may seem benign but actually cannot be supported. This section indicates a number of the more common cases as guidelines to help avoid them.

8.10.1. Sampling from a read-only attachment

Vulkan includes read-only layouts for depth/stencil images, that allow the images to be both read during a render pass for the purposes of depth/stencil tests, and read as a non-attachment.

However, because `VK_ATTACHMENT_STORE_OP_STORE` and `VK_ATTACHMENT_STORE_OP_DONT_CARE` may perform write operations, even if no recorded command writes to an attachment, reading from an image while also using it as an attachment with these store operations can result in a data race. If the reads from the non-attachment are performed in a fragment shader where the accessed samples match those covered by the fragment shader, no data race will occur as store operations are guaranteed to operate after fragment shader execution for the set of samples the fragment covers. Notably, input attachments can also be used for this case. Reading other samples or in any other shader stage can result in unexpected behavior due to the potential for a data race, and validation errors should be generated for doing so. In practice, many applications have shipped reading samples outside of the covered fragment without any observable issue, but there is no guarantee that this will always work, and it is not advisable to rely on this in new or re-worked code bases. As `VK_ATTACHMENT_STORE_OP_NONE` is guaranteed to perform no writes, applications wishing to read an image as both an attachment and a non-attachment should make use of this.
8.10.2. Non-overlapping access between resources

When relying on non-overlapping accesses between attachments and other resources, it is important to note that load and store operations have fairly wide alignment requirements - potentially affecting entire subresources and adjacent depth/stencil aspects. This makes it invalid to access a non-attachment subresource that is simultaneously being used as an attachment where either access performs a write operation.

The only exception to this is if a subresource is in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, in which case the overlap is defined to occur at a per-pixel granularity, and applications can read data from pixels outside the render area without introducing a data race.

8.10.3. Depth/stencil and input attachments

When rendering to only the depth OR stencil aspect of an image, an input attachment accessing the other aspect will not cause a data race only under very specific conditions. To avoid a data race, the aspect not being written must be in a read-only layout, and writes to it must be disabled in the draw state. For example, to read from stencil while writing depth, the attachment must be in `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` (or equivalent), and the stencil write mask must be set to 0. Similarly to read from depth while writing stencil, the attachment must be in `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` (or equivalent), and depth write enable must be set to `VK_FALSE`.

8.10.4. Synchronization Options

There are several synchronization options available to synchronize between accesses to resources within a render pass. Some of the options are outlined below:

- A `VkSubpassDependency` in a render pass object can synchronize attachment writes and multisample resolve operations from a prior subpass for subsequent input attachment reads.
- A `vkCmdPipelineBarrier` inside a subpass can synchronize prior attachment writes in the subpass with subsequent input attachment reads.
- A `vkCmdPipelineBarrier` inside a subpass can synchronize prior attachment writes in the subpass with subsequent non-attachment reads if the attachment is in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout.
- If a subresource is used as a color and input attachment, and the pipeline performing the read was created with `VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT`
- If a subresource is used as a depth and input attachment, and the pipeline performing the read was created with `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT`
- If a subresource is used as a stencil and input attachment, and the pipeline performing the read was created with `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`
• If a subresource is used as two separate non-attachment resources, writes to a pixel or individual sample in a fragment shader can be synchronized with access to the same pixel or sample in another fragment shader by using one of the fragment interlock execution modes.
Chapter 9. Shaders

A shader specifies programmable operations that execute for each vertex, control point, tessellated vertex, primitive, fragment, or workgroup in the corresponding stage(s) of the graphics and compute pipelines.

Graphics pipelines include vertex shader execution as a result of primitive assembly, followed, if enabled, by tessellation control and evaluation shaders operating on patches, geometry shaders, if enabled, operating on primitives, and fragment shaders, if present, operating on fragments generated by Rasterization. In this specification, vertex, tessellation control, tessellation evaluation and geometry shaders are collectively referred to as pre-rasterization shader stages and occur in the logical pipeline before rasterization. The fragment shader occurs logically after rasterization.

Only the compute shader stage is included in a compute pipeline. Compute shaders operate on compute invocations in a workgroup.

Shaders can read from input variables, and read from and write to output variables. Input and output variables can be used to transfer data between shader stages, or to allow the shader to interact with values that exist in the execution environment. Similarly, the execution environment provides constants describing capabilities.

Shader variables are associated with execution environment-provided inputs and outputs using built-in decorations in the shader. The available decorations for each stage are documented in the following subsections.

9.1. Shader Objects

Shaders may be compiled and linked into pipeline objects as described in Pipelines chapter, or if the shaderObject feature is enabled they may be compiled into individual per-stage shader objects which can be bound on a command buffer independently from one another. Unlike pipelines, shader objects are not intrinsically tied to any specific set of state. Instead, state is specified dynamically in the command buffer.

Each shader object represents a single compiled shader stage, which may optionally be linked with one or more other stages.

Shader objects are represented by VkShaderEXT handles:

```cpp
// Provided by VK_EXT_shader_object
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderEXT)
```

9.1.1. Shader Object Creation

Shader objects may be created from shader code provided as SPIR-V, or in an opaque, implementation-defined binary format specific to the physical device.

To create one or more shader objects, call:
Provided by VK_EXT_shader_object

```
VkResult vkCreateShadersEXT(
    VkDevice device, 
    uint32_t createInfoCount, 
    const VkShaderCreateInfoEXT* pCreateInfos, 
    const VkAllocationCallbacks* pAllocator, 
    VkShaderEXT* pShaders);
```

- **device** is the logical device that creates the shader objects.
- **createInfoCount** is the length of the **pCreateInfos** and **pShaders** arrays.
- **pCreateInfos** is a pointer to an array of **VkShaderCreateInfoEXT** structures.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pShaders** is a pointer to an array of **VkShaderEXT** handles in which the resulting shader objects are returned.

When this function returns, whether or not it succeeds, it is guaranteed that every element of **pShaders** will have been overwritten by either **VK_NULL_HANDLE** or a valid **VkShaderEXT** handle.

This means that whenever shader creation fails, the application can determine which shader the returned error pertains to by locating the first **VK_NULL_HANDLE** element in **pShaders**. It also means that an application can reliably clean up from a failed call by iterating over the **pShaders** array and destroying every element that is not **VK_NULL_HANDLE**.

### Valid Usage

- **VUID-vkCreateShadersEXT-None-08400**
  The **shaderObject** feature must be enabled

- **VUID-vkCreateShadersEXT-pCreateInfos-08401**
  If **createInfoCount** is 1, there must be no element of **pCreateInfos** whose **flags** member includes **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT**

- **VUID-vkCreateShadersEXT-pCreateInfos-08402**
  If the **flags** member of any element of **pCreateInfos** includes **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT**, the **flags** member of all other elements of **pCreateInfos** whose **stage** is **VK_SHADER_STAGE_VERTEX_BIT**, **VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT**, **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT**, **VK_SHADER_STAGE_GEOMETRY_BIT**, or **VK_SHADER_STAGE_FRAGMENT_BIT** must also include **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT**

- **VUID-vkCreateShadersEXT-pCreateInfos-08403**
  If the **flags** member of any element of **pCreateInfos** includes **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT**, the **flags** member of all other elements of **pCreateInfos** whose **stage** is **VK_SHADER_STAGE_TASK_BIT_EXT** or **VK_SHADER_STAGE_MESH_BIT_EXT** must also include **VK_SHADER>Create_LINK_STAGE_BIT_EXT**

- **VUID-vkCreateShadersEXT-pCreateInfos-08404**
  If the **flags** member of any element of **pCreateInfos** whose **stage** is
VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, there must be no member of pCreateInfos whose stage is VK_SHADER_STAGE_VERTEX_BIT and whose flags member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

- VUID-vkCreateShadersEXT-pCreateInfos-08405
  If there is any element of pCreateInfos whose stage is VK_SHADER_STAGE_MESH_BIT_EXT and whose flags member includes both VK_SHADER_CREATE_LINK_STAGE_BIT_EXT and VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT, there must be no element of pCreateInfos whose stage is VK_SHADER_STAGE_TASK_BIT_EXT and whose flags member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

- VUID-vkCreateShadersEXT-pCreateInfos-08409
  For each element of pCreateInfos whose flags member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, if there is any other element of pCreateInfos whose stage is logically later than the stage of the former and whose flags member also includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, the nextStage of the former must be equal to the stage of the element with the logically earliest stage following the stage of the former whose flags member also includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT

- VUID-vkCreateShadersEXT-pCreateInfos-08410
  The stage member of each element of pCreateInfos whose flags member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT must be unique

- VUID-vkCreateShadersEXT-pCreateInfos-08411
  The codeType member of all elements of pCreateInfos whose flags member includes VK_SHADER_CREATE_LINK_STAGE_BIT_EXT must be the same

- VUID-vkCreateShadersEXT-pCreateInfos-08867
  If pCreateInfos contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements’ flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements’ codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT stage’s pCode contains an OpExecutionMode instruction specifying the type of subdivision, it must match the subdivision type specified in the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage

- VUID-vkCreateShadersEXT-pCreateInfos-08868
  If pCreateInfos contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements’ flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements’ codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT stage’s pCode contains an OpExecutionMode instruction specifying the orientation of triangles, it must match the triangle orientation specified in the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage

- VUID-vkCreateShadersEXT-pCreateInfos-08869
  If pCreateInfos contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements’ flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements’ codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT stage’s pCode contains an OpExecutionMode instruction specifying PointMode, the
VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage must also contain an OpExecutionMode instruction specifying PointMode

- VUID-vkCreateShadersEXT-pCreateInfos-08870
  If pCreateInfos contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements' flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements' codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT stage's pCode contains an OpExecutionMode instruction specifying the spacing of segments on the edges of tessellated primitives, it must match the segment spacing specified in the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage.

- VUID-vkCreateShadersEXT-pCreateInfos-08871
  If pCreateInfos contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements' flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements' codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT stage's pCode contains an OpExecutionMode instruction specifying the output patch size, it must match the output patch size specified in the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage.

Valid Usage (Implicit)

- VUID-vkCreateShadersEXT-device-parameter
  device must be a valid VkDevice handle.

- VUID-vkCreateShadersEXT-pCreateInfos-parameter
  pCreateInfos must be a valid pointer to an array of createInfoCount valid VkShaderCreateInfoEXT structures.

- VUID-vkCreateShadersEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure.

- VUID-vkCreateShadersEXT-pShaders-parameter
  pShaders must be a valid pointer to an array of createInfoCount VkShaderEXT handles.

- VUID-vkCreateShadersEXT-createInfoCount-arraylength
  createInfoCount must be greater than 0.

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED
The **VkShaderCreateInfoEXT** structure is defined as:

```c
// Provided by VK_EXT_shader_object
typedef struct VkShaderCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkShaderCreateFlagsEXT flags;
    VkShaderStageFlagBits stage;
    VkShaderStageFlags nextStage;
    VkShaderCodeTypeEXT codeType;
    size_t codeSize;
    const void* pCode;
    const char* pName;
    uint32_t setLayoutCount;
    const VkDescriptorSetLayout* pSetLayouts;
    uint32_t pushConstantRangeCount;
    const VkPushConstantRange* pPushConstantRanges;
    const VkSpecializationInfo* pSpecializationInfo;
} VkShaderCreateInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkShaderCreateFlagBitsEXT** describing additional parameters of the shader.
- **stage** is a **VkShaderStageFlagBits** value specifying a single shader stage.
- **nextStage** is a bitmask of **VkShaderStageFlagBits** specifying zero or stages which **may** be used as a logically next bound stage when drawing with the shader bound.
- **codeType** is a **VkShaderCodeTypeEXT** value specifying the type of the shader code pointed to be **pCode**.
- **codeSize** is the size in bytes of the shader code pointed to be **pCode**.
- **pName** is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.
- **setLayoutCount** is the number of descriptor set layouts pointed to by **pSetLayouts**.
- **pSetLayouts** is a pointer to an array of **VkDescriptorSetLayout** objects used by the shader stage.
- **pushConstantRangeCount** is the number of push constant ranges pointed to by **pPushConstantRanges**.
- **pPushConstantRanges** is a pointer to an array of **VkPushConstantRange** structures used by the shader stage.
- **pSpecializationInfo** is a pointer to a **VkSpecializationInfo** structure, as described in
Specialization Constants, or NULL.

Valid Usage

- **VUID-VkShaderCreateInfoEXT-codeSize-08735**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `codeSize` **must** be a multiple of 4

- **VUID-VkShaderCreateInfoEXT-pCode-08736**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** point to valid SPIR-V code, formatted and packed as described by the Khronos SPIR-V Specification

- **VUID-VkShaderCreateInfoEXT-pCode-08737**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** adhere to the validation rules described by the Validation Rules within a Module section of the SPIR-V Environment appendix

- **VUID-VkShaderCreateInfoEXT-pCode-08738**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** declare the Shader capability for SPIR-V code

- **VUID-VkShaderCreateInfoEXT-pCode-08739**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` **must** not declare any capability that is not supported by the API, as described by the Capabilities section of the SPIR-V Environment appendix

- **VUID-VkShaderCreateInfoEXT-pCode-08740**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `pCode` declares any of the SPIR-V extensions listed in the SPIR-V Environment appendix, one of the corresponding requirements **must** be satisfied

- **VUID-VkShaderCreateInfoEXT-pCode-08741**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `pCode` declares any of the SPIR-V extensions listed in the SPIR-V Environment appendix, one of the corresponding requirements **must** be satisfied

- **VUID-VkShaderCreateInfoEXT-flags-08412**
  If `stage` is not `VK_SHADER_STAGE_TASK_BIT_EXT`, `VK_SHADER_STAGE_MESH_BIT_EXT`, `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, or `VK_SHADER_STAGE_FRAGMENT_BIT`, `flags` **must** not include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`

- **VUID-VkShaderCreateInfoEXT-flags-08486**
  If `stage` is not `VK_SHADER_STAGE_FRAGMENT_BIT`, `flags` **must** not include `VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT`

- **VUID-VkShaderCreateInfoEXT-flags-08487**
  If the `attachmentFragmentShadingRate` feature is not enabled, `flags` **must** not include
• VUID-VkShaderCreateInfoEXT-flags-08488
  If stage is not VK_SHADER_STAGE_FRAGMENT_BIT, flags must not include
  VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT

• VUID-VkShaderCreateInfoEXT-flags-08489
  If the fragmentDensityMap feature is not enabled, flags must not include
  VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT

• VUID-VkShaderCreateInfoEXT-flags-08992
  If flags includes VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT, stage must be one of
  VK_SHADER_STAGE_MESH_BIT_EXT, VK_SHADER_STAGE_TASK_BIT_EXT, or
  VK_SHADER_STAGE_COMPUTE_BIT

• VUID-VkShaderCreateInfoEXT-flags-08485
  If stage is not VK_SHADER_STAGE_COMPUTE_BIT, flags must not include
  VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT

• VUID-VkShaderCreateInfoEXT-flags-08414
  If stage is not VK_SHADER_STAGE_MESH_BIT_EXT, flags must not include
  VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT

• VUID-VkShaderCreateInfoEXT-flags-08416
  If flags includes both VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT and
  VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT, the local workgroup size in the X
  dimension of the shader must be a multiple of maxSubgroupSize

• VUID-VkShaderCreateInfoEXT-flags-08417
  If flags includes VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT but not
  VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT and no
  VkShaderRequiredSubgroupSizeCreateInfoEXT structure is included in the pNext chain,
  the local workgroup size in the X dimension of the shader must be a multiple of
  subgroupSize

• VUID-VkShaderCreateInfoEXT-stage-08418
  stage must not be VK_SHADER_STAGE_ALL_GRAPHICS or VK_SHADER_STAGE_ALL

• VUID-VkShaderCreateInfoEXT-stage-08419
  If the tessellationShader feature is not enabled, stage must not be
  VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT or
  VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

• VUID-VkShaderCreateInfoEXT-stage-08420
  If the geometryShader feature is not enabled, stage must not be
  VK_SHADER_STAGE_GEOMETRY_BIT

• VUID-VkShaderCreateInfoEXT-stage-08421
  If the taskShader feature is not enabled, stage must not be VK_SHADER_STAGE_TASK_BIT_EXT

• VUID-VkShaderCreateInfoEXT-stage-08422
  If the meshShader feature is not enabled, stage must not be VK_SHADER_STAGE_MESH_BIT_EXT

• VUID-VkShaderCreateInfoEXT-stage-08425
  stage must not be VK_SHADER_STAGE_SUBPASS_SHADING_BIT_HUAWEI
• VUID-VkShaderCreateInfoEXT-stage-08426
  stage must not be VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI

• VUID-VkShaderCreateInfoEXT-nextStage-08427
  If stage is VK_SHADER_STAGE_VERTEX_BIT, nextStage must not include any bits other than
  VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_GEOMETRY_BIT, and
  VK_SHADER_STAGE_FRAGMENT_BIT

• VUID-VkShaderCreateInfoEXT-nextStage-08428
  If the tessellationShader feature is not enabled, nextStage must not include
  VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT or
  VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

• VUID-VkShaderCreateInfoEXT-nextStage-08429
  If the geometryShader feature is not enabled, nextStage must not include
  VK_SHADER_STAGE_GEOMETRY_BIT

• VUID-VkShaderCreateInfoEXT-nextStage-08430
  If stage is VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, nextStage must not include any bits
  other than VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

• VUID-VkShaderCreateInfoEXT-nextStage-08431
  If stage is VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, nextStage must not include any
  bits other than VK_SHADER_STAGE_GEOMETRY_BIT and VK_SHADER_STAGE_FRAGMENT_BIT

• VUID-VkShaderCreateInfoEXT-nextStage-08433
  If stage is VK_SHADER_STAGE_GEOMETRY_BIT, nextStage must not include any bits other than
  VK_SHADER_STAGE_FRAGMENT_BIT

• VUID-VkShaderCreateInfoEXT-nextStage-08434
  If stage is VK_SHADER_STAGE_FRAGMENT_BIT or VK_SHADER_STAGE_COMPUTE_BIT, nextStage must
  be 0

• VUID-VkShaderCreateInfoEXT-nextStage-08435
  If stage is VK_SHADER_STAGE_TASK_BIT_EXT, nextStage must not include any bits other than
  VK_SHADER_STAGE_MESH_BIT_EXT

• VUID-VkShaderCreateInfoEXT-nextStage-08436
  If stage is VK_SHADER_STAGE_MESH_BIT_EXT, nextStage must not include any bits other than
  VK_SHADER_STAGE_FRAGMENT_BIT

• VUID-VkShaderCreateInfoEXT-pName-08440
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, pName must be the name of an OpEntryPoint in
  pCode with an execution model that matches stage

• VUID-VkShaderCreateInfoEXT-pCode-08492
  If codeType is VK_SHADER_CODE_TYPE_BINARY_EXT, pCode must be aligned to 16 bytes

• VUID-VkShaderCreateInfoEXT-pCode-08493
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, pCode must be aligned to 4 bytes

• VUID-VkShaderCreateInfoEXT-pCode-08448
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the identified entry point includes any
  variable in its interface that is declared with the ClipDistance BuiltIn decoration, that
  variable must not have an array size greater than VkPhysicalDeviceLimits::maxClipDistances
• VUID-VkShaderCreateInfoEXT-pCode-08449
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the identified entry point includes any variable in its interface that is declared with the `CullDistance` BuiltIn decoration, that variable must not have an array size greater than `VkPhysicalDeviceLimits::maxCullDistances`.

• VUID-VkShaderCreateInfoEXT-pCode-08450
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the identified entry point includes any variables in its interface that are declared with the `ClipDistance` or `CullDistance` BuiltIn decoration, those variables must not have array sizes which sum to more than `VkPhysicalDeviceLimits::maxCombinedClipAndCullDistances`.

• VUID-VkShaderCreateInfoEXT-pCode-08451
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the identified entry point includes any variable in its interface that is declared with the `SampleMask` BuiltIn decoration, that variable must not have an array size greater than `VkPhysicalDeviceLimits::maxSampleMaskWords`.

• VUID-VkShaderCreateInfoEXT-pCode-08452
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_VERTEX_BIT`, the identified entry point must not include any input variable in its interface that is decorated with `CullDistance`.

• VUID-VkShaderCreateInfoEXT-pCode-08453
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is either `VK_SHADER_STAGE_TESSellation_CONTROL_BIT` or `VK_SHADER_STAGE_TESSellation_Evaluation_BIT`, and the identified entry point has an `OpExecutionMode` instruction specifying a patch size with `OutputVertices`, the patch size must be greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`.

• VUID-VkShaderCreateInfoEXT-pCode-08454
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point must have an `OpExecutionMode` instruction specifying a maximum output vertex count that is greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxGeometryOutputVertices`.

• VUID-VkShaderCreateInfoEXT-pCode-08455
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point must have an `OpExecutionMode` instruction specifying an invocation count that is greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxGeometryShaderInvocations`.

• VUID-VkShaderCreateInfoEXT-pCode-08456
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is a pre-rasterization shader stage, and the identified entry point writes to `Layer` for any primitive, it must write the same value to `Layer` for all vertices of a given primitive.

• VUID-VkShaderCreateInfoEXT-pCode-08457
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is a pre-rasterization shader stage, and the identified entry point writes to `ViewportIndex` for any primitive, it must write the same value to `ViewportIndex` for all vertices of a given primitive.
• **VUID-VkShaderCreateInfoEXT-pCode-08458**
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, the identified entry point must not include any output variables in its interface decorated with `CullDistance`.

• **VUID-VkShaderCreateInfoEXT-pCode-08459**
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragDepth` in any execution path, all execution paths that are not exclusive to helper invocations must either discard the fragment, or write or initialize the value of `FragDepth`.

• **VUID-VkShaderCreateInfoEXT-pCode-08460**
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, the shader code in `pCode` must be valid as described by the Khronos SPIR-V Specification after applying the specializations provided in `pSpecializationInfo`, if any, and then converting all specialization constants into fixed constants.

• **VUID-VkShaderCreateInfoEXT-codeType-08872**
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` must contain an `OpExecutionMode` instruction specifying the type of subdivision.

• **VUID-VkShaderCreateInfoEXT-codeType-08873**
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` must contain an `OpExecutionMode` instruction specifying the orientation of triangles generated by the tessellator.

• **VUID-VkShaderCreateInfoEXT-codeType-08874**
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` must contain an `OpExecutionMode` instruction specifying the spacing of segments on the edges of tessellated primitives.

• **VUID-VkShaderCreateInfoEXT-codeType-08875**
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` must contain an `OpExecutionMode` instruction specifying the output patch size.

---

**Valid Usage (Implicit)**

- **VUID-VkShaderCreateInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT`.

- **VUID-VkShaderCreateInfoEXT-pNext-pNext**
  `pNext` must be `NULL` or a pointer to a valid instance of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo`.

- **VUID-VkShaderCreateInfoEXT-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkShaderCreateInfoEXT-flags-parameter**
  `flags` must be a valid combination of `VkShaderCreateFlagBitsEXT` values.

- **VUID-VkShaderCreateInfoEXT-stage-parameter**

\textbf{stage must} be a valid \texttt{VkShaderStageFlagBits} value

- VUID-VkShaderCreateInfoEXT-nextStage-parameter
  \textbf{nextStage must} be a valid combination of \texttt{VkShaderStageFlagBits} values

- VUID-VkShaderCreateInfoEXT-codeType-parameter
  \textbf{codeType must} be a valid \texttt{VkShaderCodeTypeEXT} value

- VUID-VkShaderCreateInfoEXT-pCode-parameter
  \textbf{pCode must} be a valid pointer to an array of \texttt{codeSize} bytes

- VUID-VkShaderCreateInfoEXT-pName-parameter
  If \texttt{pName} is not NULL, \textbf{pName must} be a null-terminated UTF-8 string

- VUID-VkShaderCreateInfoEXT-pSetLayouts-parameter
  If \texttt{setLayoutCount} is not zero, and \texttt{pSetLayouts} is not NULL, \textbf{pSetLayouts must} be a valid pointer to an array of \texttt{setLayoutCount} valid \texttt{VkDescriptorSetLayout} handles

- VUID-VkShaderCreateInfoEXT-pPushConstantRanges-parameter
  If \texttt{pushConstantRangeCount} is not zero, and \texttt{pPushConstantRanges} is not NULL, \textbf{pPushConstantRanges must} be a valid pointer to an array of \texttt{pushConstantRangeCount} valid \texttt{VkPushConstantRange} structures

- VUID-VkShaderCreateInfoEXT-pSpecializationInfo-parameter
  If \texttt{pSpecializationInfo} is not NULL, \textbf{pSpecializationInfo must} be a valid pointer to a valid \texttt{VkSpecializationInfo} structure

- VUID-VkShaderCreateInfoEXT-codeSize-arraylength
  \textbf{codeSize must} be greater than zero

\begin{verbatim}
// Provided by VK_EXT_shader_object
typedef VkFlags VkShaderCreateFlagsEXT;

VkShaderCreateFlagsEXT is a bitmask type for setting a mask of zero or more
VkShaderCreateFlagBitsEXT.

Possible values of the flags member of VkShaderCreateInfoEXT specifying how a shader object is
created, are:

\begin{verbatim}
// Provided by VK_EXT_shader_object
typedef enum VkShaderCreateFlagBitsEXT {
    VK_SHADER_CREATE_LINK_STAGE_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_shader_object with VK_EXT_subgroup_size_control or
    VK_VERSION_1_3
    VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT = 0x00000002,
    // Provided by VK_EXT_shader_object with VK_EXT_subgroup_size_control or
    VK_VERSION_1_3
    VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT = 0x00000004,
    // Provided by VK_EXT_shader_object with VK_EXT_mesh_shader or VK_NV_mesh_shader
    VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT = 0x00000008,
    // Provided by VK_EXT_shader_object with VK_KHR_device_group or VK_VERSION_1_1
    VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT = 0x00000010
} VkShaderCreateFlagBitsEXT;
\end{verbatim}
\end{verbatim}
• **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** specifies that a shader is linked to all other shaders created in the same `vkCreateShadersEXT` call whose `VkShaderCreateInfoEXT` structures’ flags include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`.

• **VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT** specifies that the `SubgroupSize` may vary in a task, mesh, or compute shader.

• **VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT** specifies that the subgroup sizes must be launched with all invocations active in a task, mesh, or compute shader.

• **VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT** specifies that a mesh shader must only be used without a task shader. Otherwise, the mesh shader must only be used with a task shader.

• **VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT** specifies that a compute shader can be used with `vkCmdDispatchBase` with a non-zero base workgroup.

• **VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT** specifies that a fragment shader can be used with a fragment shading rate attachment.

• **VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT** specifies that a fragment shader can be used with a fragment density map attachment.

---

**Note**

The behavior of `VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT` and `VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT` differs subtly from the behavior of `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` and `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT` in that the shader bit allows, but does not require the shader to be used with that type of attachment. This means that the application need not create multiple shaders when it does not know in advance whether the shader will be used with or without the attachment type, or when it needs the same shader to be compatible with usage both with and without. This may come at some performance cost on some implementations, so applications should still only set bits that are actually necessary.

Shader objects can be created using different types of shader code. Possible values of `VkShaderCreateInfoEXT::codeType`, are:

---

```c
// Provided by VK_EXT_shader_object
typedef enum VkShaderCodeTypeEXT {
    VK_SHADER_CODE_TYPE_BINARY_EXT = 0,
    VK_SHADER_CODE_TYPE_SPIRV_EXT = 1,
} VkShaderCodeTypeEXT;
```
• **VK_SHADER_CODE_TYPE_BINARY_EXT** specifies shader code in an opaque, implementation-defined binary format specific to the physical device.

• **VK_SHADER_CODE_TYPE_SPIRV_EXT** specifies shader code in SPIR-V format.

### 9.1.2. Binary Shader Code

Binary shader code can be retrieved from a shader object using the command:

```c
// Provided by VK_EXT_shader_object
VkResult vkGetShaderBinaryDataEXT(
    VkDevice device,                        // Logical device that shader was created from.
    VkShaderEXT shader,                    // Shader object to retrieve binary shader code from.
    size_t*pDataSize,                      // Pointer to a size_t value related to the size of the binary shader code.
    void*pData);                           // Pointer to a buffer.
```

- `device` is the logical device that shader object was created from.
- `shader` is the shader object to retrieve binary shader code from.
- `pDataSize` is a pointer to a `size_t` value related to the size of the binary shader code, as described below.
- `pData` is either `NULL` or a pointer to a buffer.

If `pData` is `NULL`, then the size of the binary shader code is returned in `pDataSize`. Otherwise, `pDataSize` must point to a variable set by the user to the size of the buffer, in bytes, pointed to by `pData`, and on return the variable is overwritten with the amount of data actually written to `pData`. If `pDataSize` is less than the size of the binary shader code, nothing is written to `pData`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`.

**Note**

The behavior of this command when `pDataSize` is too small differs from how some other getter-type commands work in Vulkan. Because shader binary data is only usable in its entirety, it would never be useful for the implementation to return partial data. Because of this, nothing is written to `pData` unless `pDataSize` is large enough to fit the data in its entirety.

Binary shader code retrieved using `vkGetShaderBinaryDataEXT` can be passed to a subsequent call to `vkCreateShadersEXT` on a compatible physical device by specifying `VK_SHADER_CODE_TYPE_BINARY_EXT` in the `codeType` member of `VkShaderCreateInfoEXT`.

The shader code returned by repeated calls to this function with the same `VkShaderEXT` is guaranteed to be invariant for the lifetime of the `VkShaderEXT` object.

### Valid Usage

- **VUID-vkGetShaderBinaryDataEXT-None-08461**
  The `shaderObject` feature must be enabled
If `pData` is not NULL, it must be aligned to 16 bytes

### Valid Usage (Implicit)

- **VUID-vkGetShaderBinaryDataEXT-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetShaderBinaryDataEXT-shader-parameter**
  
  `shader` must be a valid `VkShaderEXT` handle

- **VUID-vkGetShaderBinaryDataEXT-pDataSize-parameter**
  
  `pDataSize` must be a valid pointer to a `size_t` value

- **VUID-vkGetShaderBinaryDataEXT-pData-parameter**
  
  If the value referenced by `pDataSize` is not 0, and `pData` is not NULL, `pData` must be a valid pointer to an array of `pDataSize` bytes

- **VUID-vkGetShaderBinaryDataEXT-shader-parent**
  
  `shader` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

### 9.1.3. Binary Shader Compatibility

Binary shader compatibility means that binary shader code returned from a call to `vkGetShaderBinaryDataEXT` can be passed to a later call to `vkCreateShadersEXT`, potentially on a different logical and/or physical device, and that this will result in the successful creation of a shader object functionally equivalent to the shader object that the code was originally queried from.

Binary shader code queried from `vkGetShaderBinaryDataEXT` is not guaranteed to be compatible across all devices, but implementations are required to provide some compatibility guarantees. Applications may determine binary shader compatibility using either (or both) of two mechanisms.

Guaranteed compatibility of shader binaries is expressed through a combination of the `shaderBinaryUUID` and `shaderBinaryVersion` members of the `VkPhysicalDeviceShaderObjectPropertiesEXT` structure queried from a physical device. Binary shaders retrieved from a physical device with a certain `shaderBinaryUUID` are guaranteed to be
compatible with all other physical devices reporting the same `shaderBinaryUUID` and the same or higher `shaderBinaryVersion`.

Whenever a new version of an implementation incorporates any changes that affect the output of `vkGetShaderBinaryDataEXT`, the implementation should either increment `shaderBinaryVersion` if binary shader code retrieved from older versions remains compatible with the new implementation, or else replace `shaderBinaryUUID` with a new value if backward compatibility has been broken. Binary shader code queried from a device with a matching `shaderBinaryUUID` and lower `shaderBinaryVersion` relative to the device on which `vkCreateShadersEXT` is being called may be suboptimal for the new device in ways that do not change shader functionality, but it is still guaranteed to be usable to successfully create the shader object(s).

### Note

Implementations are encouraged to share `shaderBinaryUUID` between devices and driver versions to the maximum extent their hardware naturally allows, and are strongly discouraged from ever changing the `shaderBinaryUUID` for the same hardware except unless absolutely necessary.

In addition to the shader compatibility guarantees described above, it is valid for an application to call `vkCreateShadersEXT` with binary shader code created on a device with a different or unknown `shaderBinaryUUID` and/or higher `shaderBinaryVersion`. In this case, the implementation may use any unspecified means of its choosing to determine whether the provided binary shader code is usable. If it is, the `vkCreateShadersEXT` call must return `VK_SUCCESS`, and the created shader object is guaranteed to be valid. Otherwise, in the absence of some other error, the `vkCreateShadersEXT` call must return `VK_ERROR_INCOMPATIBLE_SHADER_BINARY_EXT` to indicate that the provided binary shader code is not compatible with the device.

### 9.1.4. Binding Shader Objects

Once shader objects have been created, they can be bound to the command buffer using the command:

```c
// Provided by VK_EXT_shader_object
void vkCmdBindShadersEXT(
    VkCommandBuffer commandBuffer,  // Provided by VK_EXT_shader_object
    uint32_t stageCount,            // Provided by VK_EXT_shader_object
    const VkShaderStageFlagBits* pStages,  // Provided by VK_EXT_shader_object
    const VkShaderEXT* pShaders);  // Provided by VK_EXT_shader_object
```

- `commandBuffer` is the command buffer that the shader object will be bound to.
- `stageCount` is the length of the `pStages` and `pShaders` arrays.
- `pStages` is a pointer to an array of `VkShaderStageFlagBits` values specifying one stage per array index that is affected by the corresponding value in the `pShaders` array.
- `pShaders` is a pointer to an array of `VkShaderEXT` handles and/or `VK_NULL_HANDLE` values describing the shader binding operations to be performed on each stage in `pStages`. 
When binding linked shaders, an application may bind them in any combination of one or more calls to `vkCmdBindShadersEXT` (i.e., shaders that were created linked together do not need to be bound in the same `vkCmdBindShadersEXT` call).

Any shader object bound to a particular stage may be unbound by setting its value in `pShaders` to `VK_NULL_HANDLE`. If `pShaders` is `NULL`, `vkCmdBindShadersEXT` behaves as if `pShaders` was an array of `stageCount` `VK_NULL_HANDLE` values (i.e., any shaders bound to the stages specified in `pStages` are unbound).

### Valid Usage

- **VUID-vkCmdBindShadersEXT-None-08462**
  The shaderObject feature must be enabled

- **VUID-vkCmdBindShadersEXT-pStages-08463**
  Every element of `pStages` must be unique

- **VUID-vkCmdBindShadersEXT-pStages-08464**
  `pStages` must not contain `VK_SHADER_STAGE_ALL_GRAPHICS` or `VK_SHADER_STAGE_ALL`

- **VUID-vkCmdBindShadersEXT-pStages-08465**
  `pStages` must not contain `VK_SHADER_STAGE_RAYGEN_BIT_KHR`, `VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR`, `VK_SHADER_STAGE_MISS_BIT_KHR`, `VK_SHADER_STAGE_INTERSECTION_BIT_KHR`, or `VK_SHADER_STAGE_CALLABLE_BIT_KHR`

- **VUID-vkCmdBindShadersEXT-pStages-08467**
  `pStages` must not contain `VK_SHADER_STAGE_SUBPASS_SHADING_BIT_HUAWEI`

- **VUID-vkCmdBindShadersEXT-pStages-08468**
  `pStages` must not contain `VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI`

- **VUID-vkCmdBindShadersEXT-pShaders-08469**
  For each element of `pStages`, if `pShaders` is not `NULL`, and the element of the `pShaders` array with the same index is not `VK_NULL_HANDLE`, it must have been created with a stage equal to the corresponding element of `pStages`

- **VUID-vkCmdBindShadersEXT-pShaders-08470**
  If `pStages` contains both `VK_SHADER_STAGE_TASK_BIT_EXT` and `VK_SHADER_STAGE_VERTEX_BIT`, and `pShaders` is not `NULL`, and the same index in `pShaders` as `VK_SHADER_STAGE_TASK_BIT_EXT` in `pStages` is not `VK_NULL_HANDLE`, the same index in `pShaders` as `VK_SHADER_STAGE_TASK_BIT_EXT` in `pStages` must be `VK_NULL_HANDLE`

- **VUID-vkCmdBindShadersEXT-pShaders-08471**
  If `pStages` contains both `VK_SHADER_STAGE_MESH_BIT_EXT` and `VK_SHADER_STAGE_VERTEX_BIT`, and `pShaders` is not `NULL`, and the same index in `pShaders` as `VK_SHADER_STAGE_MESH_BIT_EXT` in `pStages` is not `VK_NULL_HANDLE`, the same index in `pShaders` as `VK_SHADER_STAGE_MESH_BIT_EXT` in `pStages` must be `VK_NULL_HANDLE`

- **VUID-vkCmdBindShadersEXT-pShaders-08474**
  If the tessellationShader feature is not enabled, and `pStages` contains `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, and `pShaders` is not `NULL`, the same index or
indices in `pShaders` must be `VK_NULL_HANDLE`

- **VUID-vkCmdBindShadersEXT-pShaders-08475**
  If the `geometryShader` feature is not enabled, and `pStages` contains `VK_SHADER_STAGE_GEOMETRY_BIT`, and `pShaders` is not `NULL`, the same index in `pShaders` must be `VK_NULL_HANDLE`

- **VUID-vkCmdBindShadersEXT-pShaders-08490**
  If the `taskShader` feature is not enabled, and `pStages` contains `VK_SHADER_STAGE_TASK_BIT_EXT`, and `pShaders` is not `NULL`, the same index in `pShaders` must be `VK_NULL_HANDLE`

- **VUID-vkCmdBindShadersEXT-pShaders-08491**
  If the `meshShader` feature is not enabled, and `pStages` contains `VK_SHADER_STAGE_MESH_BIT_EXT`, and `pShaders` is not `NULL`, the same index in `pShaders` must be `VK_NULL_HANDLE`

- **VUID-vkCmdBindShadersEXT-pShaders-08476**
  If `pStages` contains `VK_SHADER_STAGE_COMPUTE_BIT`, the `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- **VUID-vkCmdBindShadersEXT-pShaders-08477**
  If `pStages` contains `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, or `VK_SHADER_STAGE_FRAGMENT_BIT`, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdBindShadersEXT-pShaders-08478**
  If `pStages` contains `VK_SHADER_STAGE_MESH_BIT_EXT` or `VK_SHADER_STAGE_TASK_BIT_EXT`, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

---

**Valid Usage (Implicit)**

- **VUID-vkCmdBindShadersEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdBindShadersEXT-pStages-parameter**
  `pStages` must be a valid pointer to an array of `stageCount` valid `VkShaderStageFlagBits` values

- **VUID-vkCmdBindShadersEXT-pShaders-parameter**
  If `pShaders` is not `NULL`, `pShaders` must be a valid pointer to an array of `stageCount` valid or `VK_NULL_HANDLE` `VkShaderEXT` handles

- **VUID-vkCmdBindShadersEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdBindShadersEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- **VUID-vkCmdBindShadersEXT-videocoding**
  This command must only be called outside of a video coding scope
9.1.5. Setting State

Whenever shader objects are used to issue drawing commands, the appropriate dynamic state setting commands **must** have been called to set the relevant state in the command buffer prior to drawing:

- `vkCmdSetViewportWithCount`
- `vkCmdSetScissorWithCount`
- `vkCmdSetRasterizerDiscardEnable`

If a shader is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetVertexInputEXT`
- `vkCmdSetPrimitiveTopology`
- `vkCmdSetPatchControlPointsEXT`, if `primitiveTopology` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`
- `vkCmdSetPrimitiveRestartEnable`

If a shader is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetTessellationDomainOriginEXT`

If `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetViewportWithCount`
- `vkCmdSetScissorWithCount`
- `vkCmdSetRasterizerDiscardEnable`
command buffer prior to drawing:

- vkCmdSetRasterizationSamplesEXT
- vkCmdSetSampleMaskEXT
- vkCmdSetAlphaToCoverageEnableEXT
- vkCmdSetAlphaToOneEnableEXT, if the alphaToOne feature is enabled on the device
- vkCmdSetPolygonModeEXT
- vkCmdSetLineWidth, if polygonMode is VK_POLYGON_MODE_LINE, or if a shader is bound to the VK_SHADER_STAGE_VERTEX_BIT stage and primitiveTopology is a line topology, or if a shader which outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage
- vkCmdSetCullMode
- vkCmdSetFrontFace, if cullMode is not VK_CULL_MODE_NONE, or if stencilTestEnable is VK_TRUE, or if the fragment shader uses a variable decorated with FrontFacing
- vkCmdSetDepthTestEnable
- vkCmdSetDepthWriteEnable
- vkCmdSetDepthCompareOp, if depthTestEnable is VK_TRUE
- vkCmdSetDepthBoundsTestEnable, if the depthBounds feature is enabled on the device
- vkCmdSetDepthBounds, if depthBoundsTestEnable is VK_TRUE
- vkCmdSetDepthBiasEnable
- vkCmdSetDepthBias or vkCmdSetDepthBias2EXT, if depthBiasEnable is VK_TRUE
- vkCmdSetDepthClampEnableEXT, if the depthClamp feature is enabled on the device
- vkCmdSetStencilTestEnable
- vkCmdSetStencilOp, if stencilTestEnable is VK_TRUE
- vkCmdSetStencilCompareMask, if stencilTestEnable is VK_TRUE
- vkCmdSetStencilWriteMask, if stencilTestEnable is VK_TRUE
- vkCmdSetStencilReference, if stencilTestEnable is VK_TRUE

If a shader is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and rasterizerDiscardEnable is VK_FALSE, the following commands must have been called in the command buffer prior to drawing:

- vkCmdSetLogicOpEnableEXT, if the logicOp feature is enabled on the device
- vkCmdSetLogicOpEXT, if logicOpEnable is VK_TRUE
- vkCmdSetColorBlendEnableEXT, with values set for every color attachment in the render pass instance active at draw time
- vkCmdSetColorBlendEquationEXT or vkCmdSetColorBlendAdvancedEXT, for every attachment whose index in pColorBlendEnables is a pointer to a value of VK_TRUE
- vkCmdSetBlendConstants, if any index in pColorBlendEnables is VK_TRUE, and the same index in pColorBlendEquations is a VkColorBlendEquationEXT structure with any VkBlendFactor member
with a value of VK_BLEND_FACTOR_CONSTANT_COLOR, VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR, VK_BLEND_FACTOR_CONSTANT_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA

- `vkCmdSetColorWriteMaskEXT`

If the `pipelineFragmentShadingRate` feature is enabled on the device, and a shader is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and `rasterizerDiscardEnable` is `VK_FALSE`, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetFragmentShadingRateKHR`

If the `geometryStreams` feature is enabled on the device, and a shader is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetRasterizationStreamEXT`

If the `VK_EXT_discard_rectangles` extension is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetDiscardRectangleEnableEXT`
- `vkCmdSetDiscardRectangleModeEXT`, if `discardRectangleEnable` is `VK_TRUE`
- `vkCmdSetDiscardRectangleEXT`, if `discardRectangleEnable` is `VK_TRUE`

If the `VK_EXT_conservative_rasterization` extension is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetConservativeRasterizationModeEXT`
- `vkCmdSetExtraPrimitiveOverestimationSizeEXT`, if `conservativeRasterizationMode` is `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`

If the `depthClipEnable` feature is enabled on the device, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetDepthClipEnableEXT`

If the `VK_EXT_sample_locations` extension is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands **must** have been called in the command buffer prior to drawing:

- `vkCmdSetSampleLocationsEnableEXT`
- `vkCmdSetSampleLocationsEXT`, if `sampleLocationsEnable` is `VK_TRUE`

If the `VK_EXT_provoking_vertex` extension is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, and a shader is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, the following command **must** have been called in the command buffer prior to drawing:

- `vkCmdSetProvokingVertexModeEXT`

If the `VK_EXT_line_rasterization` extension is enabled on the device, and `rasterizerDiscardEnable` is
VK_FALSE, and if polygonMode is VK_POLYGON_MODE_LINE or a shader is bound to the VK_SHADER_STAGE_VERTEX_BIT stage and primitiveTopology is a line topology or a shader which outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, the following commands must have been called in the command buffer prior to drawing:

- vkCmdSetLineRasterizationModeEXT
- vkCmdSetLineStippleEnableEXT
- vkCmdSetLineStippleEXT, if stippledLineEnable is VK_TRUE

If the depthClipControl feature is enabled on the device, the following command must have been called in the command buffer prior to drawing:

- vkCmdSetDepthClipNegativeOneToOneEXT

If the colorWriteEnable feature is enabled on the device, a shader is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and rasterizerDiscardEnable is VK_FALSE, the following command must have been called in the command buffer prior to drawing:

- vkCmdSetColorWriteEnableEXT, with values set for every color attachment in the render pass instance active at draw time

If the attachmentFeedbackLoopDynamicState feature is enabled on the device, a shader is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and rasterizerDiscardEnable is VK_FALSE, the following command must have been called in the command buffer prior to drawing:

- vkCmdSetAttachmentFeedbackLoopEnableEXT, for each image aspect corresponding to an attachment type used by the render pass instance which can use feedback loops

If the VK_NV_clip_space_w_scaling extension is enabled on the device, the following commands must have been called in the command buffer prior to drawing:

- vkCmdSetViewportWScalingEnableNV
- vkCmdSetViewportWScalingNV, if viewportWScalingEnable is VK_TRUE

If the VK_NV_viewport_swizzle extension is enabled on the device, the following command must have been called in the command buffer prior to drawing:

- vkCmdSetViewportSwizzleNV

If the VK_NV_fragment_coverage_to_color extension is enabled on the device, and a shader is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and rasterizerDiscardEnable is VK_FALSE, the following commands must have been called in the command buffer prior to drawing:

- vkCmdSetCoverageToColorEnableNV
- vkCmdSetCoverageToColorLocationNV, if coverageToColorEnable is VK_TRUE

If the VK_NV_framebuffer_mixed_samples extension is enabled on the device, and rasterizerDiscardEnable is VK_FALSE, the following commands must have been called in the
command buffer prior to drawing:

- `vkCmdSetCoverageModulationModeNV`
- `vkCmdSetCoverageModulationTableEnableNV`, if `coverageModulationMode` is not `VK_COVERAGE_MODULATION_MODE_NONE_NV`
- `vkCmdSetCoverageModulationTableNV`, if `coverageModulationTableEnable` is `VK_TRUE`

If the `coverageReductionMode` feature is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, the following command must have been called in the command buffer prior to drawing:

- `vkCmdSetCoverageReductionModeNV`

If the `representativeFragmentTest` feature is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, the following command must have been called in the command buffer prior to drawing:

- `vkCmdSetRepresentativeFragmentTestEnableNV`

If the `shadingRateImage` feature is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands must have been called in the command buffer prior to drawing:

- `vkCmdSetCoarseSampleOrderNV`
- `vkCmdSetShadingRateImageEnableNV`
- `vkCmdSetViewportShadingRatePaletteNV`, if `shadingRateImageEnable` is `VK_TRUE`

If the `exclusiveScissor` feature is enabled on the device, the following commands must have been called in the command buffer prior to drawing:

- `vkCmdSetExclusiveScissorEnableNV`
- `vkCmdSetExclusiveScissorNV`, if any value in `pExclusiveScissorEnables` is `VK_TRUE`

State can be set either at any time before or after shader objects are bound, but all required state must be set prior to issuing drawing commands.

### 9.1.6. Interaction with Pipelines

Calling `vkCmdBindShadersEXT` causes the pipeline bind points corresponding to each stage in `pStages` to be disturbed, meaning that any pipelines that had previously been bound to those pipeline bind points are no longer bound.

If `VK_PIPELINE_BIND_POINT_GRAPHICS` is disturbed (i.e., if `pStages` contains any graphics stage), any graphics pipeline state that the previously bound pipeline did not specify as dynamic becomes undefined, and must be set in the command buffer before issuing drawing commands using shader objects.

Calls to `vkCmdBindPipeline` likewise disturb the shader stage(s) corresponding to `pipelineBindPoint`, meaning that any shaders that had previously been bound to any of those stages are no longer bound, even if the pipeline was created without shaders for some of those stages.
9.1.7. Shader Object Destruction

To destroy a shader object, call:

```c
// Provided by VK_EXT_shader_object
define vkDestroyShaderEXT
void vkDestroyShaderEXT(
    VkDevice device,
    VkShaderEXT shader,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the shader object.
- `shader` is the handle of the shader object to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Destroying a shader object used by one or more command buffers in the recording or executable state causes those command buffers to move into the invalid state.

**Valid Usage**

- VUID-vkDestroyShaderEXT-None-08481
  The shaderObject feature must be enabled

- VUID-vkDestroyShaderEXT-shader-08482
  All submitted commands that refer to shader must have completed execution

- VUID-vkDestroyShaderEXT-pAllocator-08483
  If VkAllocationCallbacks were provided when shader was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyShaderEXT-pAllocator-08484
  If no VkAllocationCallbacks were provided when shader was created, pAllocator must be NULL

**Valid Usage (Implicit)**

- VUID-vkDestroyShaderEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyShaderEXT-shader-parameter
  shader must be a valid VkShaderEXT handle

- VUID-vkDestroyShaderEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyShaderEXT-shader-parent
  shader must have been created, allocated, or retrieved from device
9.2. Shader Modules

Shader modules contain shader code and one or more entry points. Shaders are selected from a shader module by specifying an entry point as part of pipeline creation. The stages of a pipeline can use shaders that come from different modules. The shader code defining a shader module must be in the SPIR-V format, as described by the Vulkan Environment for SPIR-V appendix.

Shader modules are represented by VkShaderModule handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderModule)
```

To create a shader module, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateShaderModule(  
  VkDevice device,  
  const VkShaderModuleCreateInfo* pCreateInfo,  
  const VkAllocationCallbacks* pAllocator,  
  VkShaderModule* pShaderModule);
```

- `device` is the logical device that creates the shader module.
- `pCreateInfo` is a pointer to a VkShaderModuleCreateInfo structure.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pShaderModule` is a pointer to a VkShaderModule handle in which the resulting shader module object is returned.

Once a shader module has been created, any entry points it contains can be used in pipeline shader stages as described in Compute Pipelines and Graphics Pipelines.

**Note**

If the maintenance5 feature is enabled, shader module creation can be omitted entirely. Instead, applications should provide the VkShaderModuleCreateInfo structure directly into pipeline creation by chaining it to VkPipelineShaderStageCreateInfo. This avoids the overhead of creating and managing an additional object.
Valid Usage

- VUID-vkCreateShaderModule-pCreateInfo-06904
  If pCreateInfo is not NULL, pCreateInfo->pNext must be NULL or a pointer to a VkShaderModuleValidationCacheCreateInfoEXT structure

Valid Usage (Implicit)

- VUID-vkCreateShaderModule-device-parameter
device must be a valid VkDevice handle
- VUID-vkCreateShaderModule-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkShaderModuleCreateInfo structure
- VUID-vkCreateShaderModule-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateShaderModule-pShaderModule-parameter
  pShaderModule must be a valid pointer to a VkShaderModule handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_SHADER_NV

The VkShaderModuleCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkShaderModuleCreateInfo {
  VkStructureType sType;
  const void* pNext;
  VkShaderModuleCreateFlags flags;
  size_t codeSize;
  const uint32_t* pCode;
} VkShaderModuleCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
• **flags** is reserved for future use.

• **codeSize** is the size, in bytes, of the code pointed to by **pCode**.

• **pCode** is a pointer to code that is used to create the shader module. The type and format of the code is determined from the content of the memory addressed by **pCode**.

**Valid Usage**

• VUID-VkShaderModuleCreateInfo-codeSize-08735
  If pCode is a pointer to SPIR-V code, **codeSize** **must** be a multiple of 4

• VUID-VkShaderModuleCreateInfo-pCode-08736
  If pCode is a pointer to SPIR-V code, **pCode** **must** point to valid SPIR-V code, formatted and packed as described by the **Khronos SPIR-V Specification**

• VUID-VkShaderModuleCreateInfo-pCode-08737
  If pCode is a pointer to SPIR-V code, **pCode** **must** adhere to the validation rules described by the **Validation Rules within a Module** section of the **SPIR-V Environment** appendix

• VUID-VkShaderModuleCreateInfo-pCode-08738
  If pCode is a pointer to SPIR-V code, **pCode** **must** declare the **Shader** capability for SPIR-V code

• VUID-VkShaderModuleCreateInfo-pCode-08739
  If pCode is a pointer to SPIR-V code, **pCode** **must** not declare any capability that is not supported by the API, as described by the **Capabilities** section of the **SPIR-V Environment** appendix

• VUID-VkShaderModuleCreateInfo-pCode-08740
  If pCode is a pointer to SPIR-V code, and **pCode** declares any of the capabilities listed in the **SPIR-V Environment** appendix, one of the corresponding requirements **must** be satisfied

• VUID-VkShaderModuleCreateInfo-pCode-08741
  If pCode is a pointer to SPIR-V code, **pCode** **must** not declare any SPIR-V extension that is not supported by the API, as described by the **Extension** section of the **SPIR-V Environment** appendix

• VUID-VkShaderModuleCreateInfo-pCode-08742
  If pCode is a pointer to SPIR-V code, and **pCode** declares any of the SPIR-V extensions listed in the **SPIR-V Environment** appendix, one of the corresponding requirements **must** be satisfied

• VUID-VkShaderModuleCreateInfo-pCode-07912
  If the **VK_NV_gsl_shader** extension is not enabled, **pCode** **must** be a pointer to SPIR-V code

• VUID-VkShaderModuleCreateInfo-pCode-01379
  If **pCode** is a pointer to GLSL code, it **must** be valid GLSL code written to the **GL_KHR_vulkan_gls1** GLSL extension specification

• VUID-VkShaderModuleCreateInfo-codeSize-01085
  **codeSize** **must** be greater than 0
Valid Usage (Implicit)

- VUID-VkShaderModuleCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO

- VUID-VkShaderModuleCreateInfo-flags-zerobitmask
  flags must be 0

- VUID-VkShaderModuleCreateInfo-pCode-parameter
  pCode must be a valid pointer to an array of \( \frac{\text{codeSize}}{4} \) uint32_t values

// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderModuleCreateFlags;

VkShaderModuleCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

To use a VkValidationCacheEXT to cache shader validation results, add a VkShaderModuleValidationCacheCreateInfoEXT structure to the pNext chain of the VkShaderModuleCreateInfo structure, specifying the cache object to use.

The VkShaderModuleValidationCacheCreateInfoEXT struct is defined as:

// Provided by VK_EXT_validation_cache
typedef struct VkShaderModuleValidationCacheCreateInfoEXT {
  VkStructureType sType;
  const void* pNext;
  VkValidationCacheEXT validationCache;
} VkShaderModuleValidationCacheCreateInfoEXT;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- validationCache is the validation cache object from which the results of prior validation attempts will be written, and to which new validation results for this VkShaderModule will be written (if not already present).

Valid Usage (Implicit)

- VUID-VkShaderModuleValidationCacheCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SHADER_MODULE_VALIDATION_CACHE_CREATE_INFO_EXT

- VUID-VkShaderModuleValidationCacheCreateInfoEXT-validationCache-parameter
  validationCache must be a valid VkValidationCacheEXT handle

To destroy a shader module, call:
```c
void vkDestroyShaderModule(
    VkDevice device,  
    VkShaderModule shaderModule,  
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the shader module.
- **shaderModule** is the handle of the shader module to destroy.
- **pAllocator** controls host memory allocation as described in the *Memory Allocation* chapter.

A shader module **can** be destroyed while pipelines created using its shaders are still in use.

### Valid Usage

- **VUID-vkDestroyShaderModule-shaderModule-01092**
  If VkAllocationCallbacks were provided when shaderModule was created, a compatible set of callbacks **must** be provided here.

- **VUID-vkDestroyShaderModule-shaderModule-01093**
  If no VkAllocationCallbacks were provided when shaderModule was created, **pAllocator must be NULL**

### Valid Usage (Implicit)

- **VUID-vkDestroyShaderModule-device-parameter**
  *device must be a valid VkDevice handle*

- **VUID-vkDestroyShaderModule-shaderModule-parameter**
  If shaderModule is not VK_NULL_HANDLE, shaderModule **must be a valid VkShaderModule handle**

- **VUID-vkDestroyShaderModule-pAllocator-parameter**
  If pAllocator is not NULL, **pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure**

- **VUID-vkDestroyShaderModule-shaderModule-parent**
  If shaderModule is a valid handle, it **must have been created, allocated, or retrieved from device**

### Host Synchronization

- Host access to shaderModule **must be externally synchronized**
9.3. Shader Module Identifiers

Shader modules have unique identifiers associated with them. To query an implementation provided identifier, call:

```c
// Provided by VK_EXT_shader_module_identifier
void vkGetShaderModuleIdentifierEXT(
    VkDevice device,
    VkShaderModule shaderModule,
    VkShaderModuleIdentifierEXT* pIdentifier);
```

- `device` is the logical device that created the shader module.
- `shaderModule` is the handle of the shader module.
- `pIdentifier` is a pointer to the returned `VkShaderModuleIdentifierEXT`.

The identifier returned by the implementation must only depend on `shaderIdentifierAlgorithmUUID` and information provided in the `VkShaderModuleCreateInfo` which created `shaderModule`. The implementation may return equal identifiers for two different `VkShaderModuleCreateInfo` structures if the difference does not affect pipeline compilation. Identifiers are only meaningful on different `VkDevice` objects if the device the identifier was queried from had the same `shaderModuleIdentifierAlgorithmUUID` as the device consuming the identifier.

**Valid Usage**

- VUID-vkGetShaderModuleIdentifierEXT-shaderModuleIdentifier-06884
  shaderModuleIdentifier feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkGetShaderModuleIdentifierEXT-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetShaderModuleIdentifierEXT-shaderModule-parameter
  `shaderModule` must be a valid `VkShaderModule` handle
- VUID-vkGetShaderModuleIdentifierEXT-pIdentifier-parameter
  `pIdentifier` must be a valid pointer to a `VkShaderModuleIdentifierEXT` structure
- VUID-vkGetShaderModuleIdentifierEXT-shaderModule-parent
  `shaderModule` must have been created, allocated, or retrieved from `device`

`VkShaderModuleCreateInfo` structures have unique identifiers associated with them. To query an implementation provided identifier, call:

```c
// Provided by VK_EXT_shader_module_identifier
void vkGetShaderModuleCreateInfoIdentifierEXT(
    VkDevice device,
    VkShaderModule shaderModule,
    VkShaderModuleCreateInfoIdentifierEXT* pIdentifier);
```
VkDevice device,  
const VkShaderModuleCreateInfo* pCreateInfo,  
VkShaderModuleIdentifierEXT* pIdentifier);

• device is the logical device that can create a VkShaderModule from pCreateInfo.
• pCreateInfo is a pointer to a VkShaderModuleCreateInfo structure.
• pIdentifier is a pointer to the returned VkShaderModuleIdentifierEXT.

The identifier returned by implementation must only depend on shaderIdentifierAlgorithmUUID and information provided in the VkShaderModuleCreateInfo. The implementation may return equal identifiers for two different VkShaderModuleCreateInfo structures if the difference does not affect pipeline compilation. Identifiers are only meaningful on different VkDevice objects if the device the identifier was queried from had the same shaderModuleIdentifierAlgorithmUUID as the device consuming the identifier.

The identifier returned by the implementation in vkGetShaderModuleCreateInfoIdentifierEXT must be equal to the identifier returned by vkGetShaderModuleIdentifierEXT given equivalent definitions of VkShaderModuleCreateInfo and any chained pNext structures.

Valid Usage

• VUID-vkGetShaderModuleCreateInfoIdentifierEXT-shaderModuleIdentifier-06885 shaderModuleIdentifier feature must be enabled

Valid Usage (Implicit)

• VUID-vkGetShaderModuleCreateInfoIdentifierEXT-device-parameter  
device must be a valid VkDevice handle
• VUID-vkGetShaderModuleCreateInfoIdentifierEXT-pCreateInfo-parameter  
pCreateInfo must be a valid pointer to a valid VkShaderModuleCreateInfo structure
• VUID-vkGetShaderModuleCreateInfoIdentifierEXT-pIdentifier-parameter  
pIdentifier must be a valid pointer to a VkShaderModuleIdentifierEXT structure

VkShaderModuleIdentifierEXT represents a shader module identifier returned by the implementation.

// Provided by VK_EXT_shader_module_identifier
typedef struct VkShaderModuleIdentifierEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t identifierSize;
    uint8_t identifier[VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT];
} VkShaderModuleIdentifierEXT;
• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• identifierSize is the size, in bytes, of valid data returned in identifier.
• identifier is a buffer of opaque data specifying an identifier.

Any returned values beyond the first identifierSize bytes are undefined. Implementations must return an identifierSize greater than 0, and less-or-equal to VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT.

Two identifiers are considered equal if identifierSize is equal and the first identifierSize bytes of identifier compare equal.

Implementations may return a different identifierSize for different modules. Implementations should ensure that identifierSize is large enough to uniquely define a shader module.

Valid Usage (Implicit)

- VUID-VkShaderModuleIdentifierEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SHADER_MODULE_IDENTIFIER_EXT
- VUID-VkShaderModuleIdentifierEXT-pNext-pNext
  pNext must be NULL

VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT is the length in bytes of a shader module identifier, as returned in VkShaderModuleIdentifierEXT::identifierSize.

#define VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT 32

9.4. Binding Shaders

Before a shader can be used it must be first bound to the command buffer.

Calling vkCmdBindPipeline binds all stages corresponding to the VkPipelineBindPoint. Calling vkCmdBindShadersEXT binds all stages in pStages.

The following table describes the relationship between shader stages and pipeline bind points:
<table>
<thead>
<tr>
<th>Shader stage</th>
<th>Pipeline bind point</th>
<th>behavior controlled</th>
</tr>
</thead>
<tbody>
<tr>

</table>

### 9.5. Shader Execution

At each stage of the pipeline, multiple invocations of a shader may execute simultaneously. Further, invocations of a single shader produced as the result of different commands may execute simultaneously. The relative execution order of invocations of the same shader type is undefined. Shader invocations may complete in a different order than that in which the primitives they originated from were drawn or dispatched by the application. However, fragment shader outputs
are written to attachments in rasterization order.

The relative execution order of invocations of different shader types is largely undefined. However, when invoking a shader whose inputs are generated from a previous pipeline stage, the shader invocations from the previous stage are guaranteed to have executed far enough to generate input values for all required inputs.

9.5.1. Shader Termination

A shader invocation that is terminated has finished executing instructions.

Executing OpReturn in the entry point, or executing OpTerminateInvocation in any function will terminate an invocation. Implementations may also terminate a shader invocation when OpKill is executed in any function; otherwise it becomes a helper invocation.

In addition to the above conditions, helper invocations are terminated when all non-helper invocations in the same derivative group either terminate or become helper invocations via OpDemoteToHelperInvocationEXT or OpKill.

A shader stage for a given command completes execution when all invocations for that stage have terminated.

9.6. Shader Memory Access Ordering

The order in which image or buffer memory is read or written by shaders is largely undefined. For some shader types (vertex, tessellation evaluation, and in some cases, fragment), even the number of shader invocations that may perform loads and stores is undefined.

In particular, the following rules apply:

- **Vertex** and **tessellation evaluation** shaders will be invoked at least once for each unique vertex, as defined in those sections.

- **Fragment** shaders will be invoked zero or more times, as defined in that section.

- The relative execution order of invocations of the same shader type is undefined. A store issued by a shader when working on primitive B might complete prior to a store for primitive A, even if primitive A is specified prior to primitive B. This applies even to fragment shaders; while fragment shader outputs are always written to the framebuffer in rasterization order, stores executed by fragment shader invocations are not.

- The relative execution order of invocations of different shader types is largely undefined.

  **Note**

  The above limitations on shader invocation order make some forms of synchronization between shader invocations within a single set of primitives unimplementable. For example, having one invocation poll memory written by another invocation assumes that the other invocation has been launched and will complete its writes in finite time.
The Memory Model appendix defines the terminology and rules for how to correctly communicate between shader invocations, such as when a write is Visible-To a read, and what constitutes a Data Race.

Applications must not cause a data race.

The SPIR-V SubgroupMemory, CrossWorkgroupMemory, and AtomicCounterMemory memory semantics are ignored. Sequentially consistent atomics and barriers are not supported and SequentiallyConsistent is treated as AcquireRelease. SequentiallyConsistent should not be used.

9.7. Shader Inputs and Outputs

Data is passed into and out of shaders using variables with input or output storage class, respectively. User-defined inputs and outputs are connected between stages by matching their Location decorations. Additionally, data can be provided by or communicated to special functions provided by the execution environment using BuiltIn decorations.

In many cases, the same BuiltIn decoration can be used in multiple shader stages with similar meaning. The specific behavior of variables decorated as BuiltIn is documented in the following sections.

9.8. Task Shaders

Task shaders operate in conjunction with the mesh shaders to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline. Its primary purpose is to create a variable amount of subsequent mesh shader invocations.

Task shaders are invoked via the execution of the programmable mesh shading pipeline.

The task shader has no fixed-function inputs other than variables identifying the specific workgroup and invocation. In the TaskNV Execution Model the number of mesh shader workgroups to create is specified via a TaskCountNV decorated output variable. In the TaskEXT Execution Model the number of mesh shader workgroups to create is specified via the OpEmitMeshTasksEXT instruction.

The task shader can write additional outputs to task memory, which can be read by all of the mesh shader workgroups it created.

9.8.1. Task Shader Execution

Task workloads are formed from groups of work items called workgroups and processed by the task shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Task shaders execute in global workgroups which are divided into a number of local workgroups with a size that can be set by assigning a value to the LocalSize or LocalSizeId execution mode or via an object decorated by the WorkgroupSize decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup. If the subpass includes multiple views in its view mask, a Task shader using TaskEXT Execution Model may be invoked separately for each view.
9.9. Mesh Shaders

Mesh shaders operate in workgroups to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline. Each workgroup emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

Mesh shaders are invoked via the execution of the programmable mesh shading pipeline.

The only inputs available to the mesh shader are variables identifying the specific workgroup and invocation and, if applicable, any outputs written to task memory by the task shader that spawned the mesh shader’s workgroup. The mesh shader can operate without a task shader as well.

The invocations of the mesh shader workgroup write an output mesh, comprising a set of primitives with per-primitive attributes, a set of vertices with per-vertex attributes, and an array of indices identifying the mesh vertices that belong to each primitive. The primitives of this mesh are then processed by subsequent graphics pipeline stages, where the outputs of the mesh shader form an interface with the fragment shader.

9.9.1. Mesh Shader Execution

Mesh workloads are formed from groups of work items called workgroups and processed by the mesh shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Mesh shaders execute in global workgroups which are divided into a number of local workgroups with a size that can be set by assigning a value to the LocalSize or LocalSizeId execution mode or via an object decorated by the WorkgroupSize decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

The global workgroups may be generated explicitly via the API, or implicitly through the task shader’s work creation mechanism. If the subpass includes multiple views in its view mask, a Mesh shader using MeshEXT Execution Model may be invoked separately for each view.

9.10. Cluster Culling Shaders

Cluster Culling shaders are invoked via the execution of the Programmable Cluster Culling Shading pipeline.

The only inputs available to the cluster culling shader are variables identifying the specific workgroup and invocation.

Cluster Culling shaders operate in workgroups to perform cluster-based culling and produce zero or more cluster drawing command that will be processed by subsequent stages of the graphics pipeline.

The Cluster Drawing Command(CDC) is very similar to the MDI command, invocations in workgroup can emit zero of more CDC to draw zero or more visible cluster.
9.10.1. Cluster Culling Shader Execution

Cluster Culling workloads are formed from groups of work items called workgroups and processed by the cluster culling shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Cluster Culling shaders execute in *global workgroups* which are divided into a number of *local workgroups* with a size that can be set by assigning a value to the `LocalSize` or `LocalSizeId` execution mode or via an object decorated by the `WorkgroupSize` decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

9.11. Vertex Shaders

Each vertex shader invocation operates on one vertex and its associated vertex attribute data, and outputs one vertex and associated data. Graphics pipelines using primitive shading must include a vertex shader, and the vertex shader stage is always the first shader stage in the graphics pipeline.

9.11.1. Vertex Shader Execution

A vertex shader must be executed at least once for each vertex specified by a drawing command. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view. During execution, the shader is presented with the index of the vertex and instance for which it has been invoked. Input variables declared in the vertex shader are filled by the implementation with the values of vertex attributes associated with the invocation being executed.

If the same vertex is specified multiple times in a drawing command (e.g. by including the same index value multiple times in an index buffer) the implementation may reuse the results of vertex shading if it can statically determine that the vertex shader invocations will produce identical results.

*Note*

It is implementation-dependent when and if results of vertex shading are reused, and thus how many times the vertex shader will be executed. This is true also if the vertex shader contains stores or atomic operations (see `vertexPipelineStoresAndAtomics`).

9.12. Tessellation Control Shaders

The tessellation control shader is used to read an input patch provided by the application and to produce an output patch. Each tessellation control shader invocation operates on an input patch (after all control points in the patch are processed by a vertex shader) and its associated data, and outputs a single control point of the output patch and its associated data, and can also output additional per-patch data. The input patch is sized according to the `patchControlPoints` member of `VkPipelineTessellationStateCreateInfo`, as part of input assembly.

The input patch can also be dynamically sized with `patchControlPoints` parameter of `vkCmdSetPatchControlPointsEXT`. 
To **dynamically set** the number of control points per patch, call:

```c
// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
void vkCmdSetPatchControlPointsEXT(
    VkCommandBuffer commandBuffer,  
    uint32_t patchControlPoints);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **patchControlPoints** specifies the number of control points per patch.

This command sets the number of control points per patch for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` set in `VkPipelineDynamicStateCreateInfo ::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineTessellationStateCreateInfo ::patchControlPoints` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetPatchControlPointsEXT-None-08574**
  Either the `extendedDynamicState2PatchControlPoints` feature or the `shaderObject` feature or both **must** be enabled

- **VUID-vkCmdSetPatchControlPointsEXT-patchControlPoints-04874**
  `patchControlPoints` **must** be greater than zero and less than or equal to `VkPhysicalDeviceLimits ::maxTessellationPatchSize`

### Valid Usage (Implicit)

- **VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-recording**
  `commandBuffer` **must** be in the **recording state**

- **VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdSetPatchControlPointsEXT-videocoding**
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
The size of the output patch is controlled by the `OpExecutionMode OutputVertices` specified in the tessellation control or tessellation evaluation shaders, which must be specified in at least one of the shaders. The size of the input and output patches must each be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`.

### 9.12.1. Tessellation Control Shader Execution

A tessellation control shader is invoked at least once for each output vertex in a patch. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.

Inputs to the tessellation control shader are generated by the vertex shader. Each invocation of the tessellation control shader can read the attributes of any incoming vertices and their associated data. The invocations corresponding to a given patch execute logically in parallel, with undefined relative execution order. However, the `OpControlBarrier` instruction can be used to provide limited control of the execution order by synchronizing invocations within a patch, effectively dividing tessellation control shader execution into a set of phases. Tessellation control shaders will read undefined values if one invocation reads a per-vertex or per-patch output written by another invocation at any point during the same phase, or if two invocations attempt to write different values to the same per-patch output in a single phase.

### 9.13. Tessellation Evaluation Shaders

The Tessellation Evaluation Shader operates on an input patch of control points and their associated data, and a single input barycentric coordinate indicating the invocation's relative position within the subdivided patch, and outputs a single vertex and its associated data.

### 9.13.1. Tessellation Evaluation Shader Execution

A tessellation evaluation shader is invoked at least once for each unique vertex generated by the tessellator. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

A geometry shader is invoked at least once for each primitive produced by the tessellation stages, or at least once for each primitive generated by primitive assembly when tessellation is not in use. A shader can request that the geometry shader runs multiple instances. A geometry shader is invoked at least once for each instance. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.

9.15. Fragment Shaders

Fragment shaders are invoked as a fragment operation in a graphics pipeline. Each fragment shader invocation operates on a single fragment and its associated data. With few exceptions, fragment shaders do not have access to any data associated with other fragments and are considered to execute in isolation of fragment shader invocations associated with other fragments.

9.16. Compute Shaders

Compute shaders are invoked via vkCmdDispatch and vkCmdDispatchIndirect commands. In general, they have access to similar resources as shader stages executing as part of a graphics pipeline.

Compute workloads are formed from groups of work items called workgroups and processed by the compute shader in the current compute pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Compute shaders execute in global workgroups which are divided into a number of local workgroups with a size that can be set by assigning a value to the LocalSize or LocalSizeId execution mode or via an object decorated by the WorkgroupSize decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

9.17. Ray Generation Shaders

A ray generation shader is similar to a compute shader. Its main purpose is to execute ray tracing queries using OpTraceRayKHR instructions and process the results.

9.17.1. Ray Generation Shader Execution

One ray generation shader is executed per ray tracing dispatch. Its location in the shader binding table (see Shader Binding Table for details) is passed directly into vkCmdTraceRaysKHR using the pRaygenShaderBindingTable parameter or vkCmdTraceRaysNV using the raygenShaderBindingTableBuffer and raygenShaderBindingOffset parameters.

9.18. Intersection Shaders

Intersection shaders enable the implementation of arbitrary, application defined geometric primitives. An intersection shader for a primitive is executed whenever its axis-aligned bounding box is hit by a ray.
Like other ray tracing shader domains, an intersection shader operates on a single ray at a time. It also operates on a single primitive at a time. It is therefore the purpose of an intersection shader to compute the ray-primitive intersections and report them. To report an intersection, the shader calls the OpReportIntersectionKHR instruction.

An intersection shader communicates with any-hit and closest shaders by generating attribute values that they can read. Intersection shaders cannot read or modify the ray payload.

### 9.18.1. Intersection Shader Execution

The order in which intersections are found along a ray, and therefore the order in which intersection shaders are executed, is unspecified.

The intersection shader of the closest AABB which intersects the ray is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

### 9.19. Any-Hit Shaders

The any-hit shader is executed after the intersection shader reports an intersection that lies within the current \([t_{\min}, t_{\max}]\) of the ray. The main use of any-hit shaders is to programmatically decide whether or not an intersection will be accepted. The intersection will be accepted unless the shader calls the OpIgnoreIntersectionKHR instruction. Any-hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and can read or modify the ray payload.

#### 9.19.1. Any-Hit Shader Execution

The order in which intersections are found along a ray, and therefore the order in which any-hit shaders are executed, is unspecified.

The any-hit shader of the closest hit is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

### 9.20. Closest Hit Shaders

Closest hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and can read or modify the ray payload. They also have access to a number of system-generated values. Closest hit shaders can call OpTraceRayKHR to recursively trace rays.

#### 9.20.1. Closest Hit Shader Execution

Exactly one closest hit shader is executed when traversal is finished and an intersection has been found and accepted.

### 9.21. Miss Shaders

Miss shaders can access the ray payload and can trace new rays through the OpTraceRayKHR instruction, but cannot access attributes since they are not associated with an intersection.
9.21.1. Miss Shader Execution

A miss shader is executed instead of a closest hit shader if no intersection was found during traversal.

9.22. Callable Shaders

Callable shaders can access a callable payload that works similarly to ray payloads to do subroutine work.

9.22.1. Callable Shader Execution

A callable shader is executed by calling `OpExecuteCallableKHR` from an allowed shader stage.

9.23. Interpolation decorations

Variables in the `Input` storage class in a fragment shader's interface are interpolated from the values specified by the primitive being rasterized.

**Note**

Interpolation decorations can be present on input and output variables in pre-rasterization shaders but have no effect on the interpolation performed.

An undecorated input variable will be interpolated with perspective-correct interpolation according to the primitive type being rasterized. Lines and polygons are interpolated in the same way as the primitive's clip coordinates. If the `NoPerspective` decoration is present, linear interpolation is instead used for lines and polygons. For points, as there is only a single vertex, input values are never interpolated and instead take the value written for the single vertex.

If the `Flat` decoration is present on an input variable, the value is not interpolated, and instead takes its value directly from the provoking vertex. Fragment shader inputs that are signed or unsigned integers, integer vectors, or any double-precision floating-point type must be decorated with `Flat`.

Interpolation of input variables is performed at an implementation-defined position within the fragment area being shaded. The position is further constrained as follows:

- If the `Centroid` decoration is used, the interpolation position used for the variable must also fall within the bounds of the primitive being rasterized.
- If the `Sample` decoration is used, the interpolation position used for the variable must be at the position of the sample being shaded by the current fragment shader invocation.
- If a sample count of 1 is used, the interpolation position must be at the center of the fragment area.

**Note**

As `Centroid` restricts the possible interpolation position to the covered area of the primitive, the position can be forced to vary between neighboring fragments when
it otherwise would not. Derivatives calculated based on these differing locations can produce inconsistent results compared to undecorated inputs. It is recommended that input variables used in derivative calculations are not decorated with `Centroid`.

If the `PerVertexKHR` decoration is present on an input variable, the value is not interpolated, and instead values from all input vertices are available in an array. Each index of the array corresponds to one of the vertices of the primitive that produced the fragment.

If the `CustomInterpAMD` decoration is present on an input variable, the value cannot be accessed directly; instead the extended instruction `InterpolateAtVertexAMD` must be used to obtain values from the input vertices.

### 9.24. Static Use

A SPIR-V module declares a global object in memory using the `OpVariable` instruction, which results in a pointer `x` to that object. A specific entry point in a SPIR-V module is said to *statically use* that object if that entry point's call tree contains a function containing a instruction with `x` as an `id` operand. A shader entry point also *statically uses* any variables explicitly declared in its interface.

### 9.25. Scope

A *scope* describes a set of shader invocations, where each such set is a *scope instance*. Each invocation belongs to one or more scope instances, but belongs to no more than one scope instance for each scope.

The operations available between invocations in a given scope instance vary, with smaller scopes generally able to perform more operations, and with greater efficiency.

#### 9.25.1. Cross Device

All invocations executed in a Vulkan instance fall into a single *cross device scope instance*.

Whilst the `CrossDevice` scope is defined in SPIR-V, it is disallowed in Vulkan. API synchronization commands can be used to communicate between devices.

#### 9.25.2. Device

All invocations executed on a single device form a *device scope instance*.

If the `vulkanMemoryModel` and `vulkanMemoryModelDeviceScope` features are enabled, this scope is represented in SPIR-V by the `Device Scope`, which can be used as a `Memory Scope` for barrier and atomic operations.

If both the `shaderDeviceClock` and `vulkanMemoryModelDeviceScope` features are enabled, using the `Device Scope` with the `OpReadClockKHR` instruction will read from a clock that is consistent across invocations in the same device scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this can...
only be done with API synchronization primitives.

Invocations executing on different devices in a device group operate in separate device scope instances.

**9.25.3. Queue Family**

Invocations executed by queues in a given queue family form a *queue family scope instance*.

This scope is identified in SPIR-V as the *QueueFamily Scope* if the `vulkanMemoryModel` feature is enabled, or if not, the *Device Scope*, which can be used as a *Memory Scope* for barrier and atomic operations.

If the `shaderDeviceClock` feature is enabled, but the `vulkanMemoryModelDeviceScope` feature is not enabled, using the *Device Scope* with the `OpReadClockKHR` instruction will read from a clock that is consistent across invocations in the same queue family scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this can only be done with API synchronization primitives.

Each invocation in a queue family scope instance must be in the same *device scope instance*.

**9.25.4. Command**

Any shader invocations executed as the result of a single command such as `vkCmdDispatch` or `vkCmdDraw` form a *command scope instance*. For indirect drawing commands with `drawCount` greater than one, invocations from separate draws are in separate command scope instances. For ray tracing shaders, an invocation group is an implementation-dependent subset of the set of shader invocations of a given shader stage which are produced by a single trace rays command.

There is no specific *Scope* for communication across invocations in a command scope instance. As this has a clear boundary at the API level, coordination here can be performed in the API, rather than in SPIR-V.

Each invocation in a command scope instance must be in the same *queue-family scope instance*.

For shaders without defined *workgroups*, this set of invocations forms an *invocation group* as defined in the SPIR-V specification.

**9.25.5. Primitive**

Any fragment shader invocations executed as the result of rasterization of a single primitive form a *primitive scope instance*.

There is no specific *Scope* for communication across invocations in a primitive scope instance.

Any generated *helper invocations* are included in this scope instance.

Each invocation in a primitive scope instance must be in the same *command scope instance*.

Any input variables decorated with *Flat* are uniform within a primitive scope instance.
9.25.6. Shader Call

Any shader-call-related invocations that are executed in one or more ray tracing execution models form a shader call scope instance.

The ShaderCallKHR Scope can be used as Memory Scope for barrier and atomic operations.

Each invocation in a shader call scope instance must be in the same queue family scope instance.

9.25.7. Workgroup

A local workgroup is a set of invocations that can synchronize and share data with each other using memory in the Workgroup storage class.

The Workgroup Scope can be used as both an Execution Scope and Memory Scope for barrier and atomic operations.

Each invocation in a local workgroup must be in the same command scope instance.

Only task, mesh, and compute shaders have defined workgroups - other shader types cannot use workgroup functionality. For shaders that have defined workgroups, this set of invocations forms an invocation group as defined in the SPIR-V specification.

When variables declared with the Workgroup storage class are explicitly laid out (hence they are also decorated with Block), the amount of storage consumed is the size of the largest Block variable, not counting any padding at the end. The amount of storage consumed by the non-Block variables declared with the Workgroup storage class is implementation-dependent. However, the amount of storage consumed may not exceed the largest block size that would be obtained if all active non-Block variables declared with Workgroup storage class were assigned offsets in an arbitrary order by successively taking the smallest valid offset according to the Standard Storage Buffer Layout rules, and with Boolean values considered as 32-bit integer values for the purpose of this calculation. (This is equivalent to using the GLSL std430 layout rules.)

9.25.8. Subgroup

A subgroup (see the subsection “Control Flow” of section 2 of the SPIR-V 1.3 Revision 1 specification) is a set of invocations that can synchronize and share data with each other efficiently.

The Subgroup Scope can be used as both an Execution Scope and Memory Scope for barrier and atomic operations. Other subgroup features allow the use of group operations with subgroup scope.

If the shaderSubgroupClock feature is enabled, using the Subgroup Scope with the OpReadClockKHR instruction will read from a clock that is consistent across invocations in the same subgroup.

For shaders that have defined workgroups, each invocation in a subgroup must be in the same local workgroup.

In other shader stages, each invocation in a subgroup must be in the same device scope instance.

Only shader stages that support subgroup operations have defined subgroups.
Note

In shaders, there are two kinds of uniformity that are of primary interest to applications: uniform within an invocation group (a.k.a. dynamically uniform), and uniform within a subgroup scope.

While one could make the assumption that being uniform in invocation group implies being uniform in subgroup scope, it is not necessarily the case for shader stages without defined workgroups.

For shader stages with defined workgroups however, the relationship between invocation group and subgroup scope is well defined as a subgroup is a subset of the workgroup, and the workgroup is the invocation group. If a value is uniform in invocation group, it is by definition also uniform in subgroup scope. This is important if writing code like:

```glsl
uniform texture2D Textures[];
uint dynamicallyUniformValue = gl_WorkGroupID.x;
vec4 value = texelFetch(Textures[dynamicallyUniformValue], coord, 0);

// subgroupUniformValue is guaranteed to be uniform within the subgroup.
// This value also happens to be dynamically uniform.
vec4 subgroupUniformValue = subgroupBroadcastFirst(dynamicallyUniformValue);
```

In shader stages without defined workgroups, this gets complicated. Due to scoping rules, there is no guarantee that a subgroup is a subset of the invocation group, which in turn defines the scope for dynamically uniform. In graphics, the invocation group is a single draw command, except for multi-draw situations, and indirect draws with drawCount > 1, where there are multiple invocation groups, one per `DrawIndex`.
Another problematic scenario is when a shader attempts to help the compiler notice that a value is uniform in subgroup scope to potentially improve performance.

```
vec4 value = texelFetch(Textures[notActuallyDynamicallyUniformAnymore], coord, 0);
```

For implementations where subgroups are packed across draws, the implementation must make sure to handle descriptor indexing correctly. From the specification's point of view, a dynamically uniform index does not require `NonUniform` decoration, and such an implementation will likely either promote descriptor indexing into `NonUniform` on its own, or handle non-uniformity implicitly.

### 9.25.9. Quad

A *quad scope instance* is formed of four shader invocations.

In a fragment shader, each invocation in a quad scope instance is formed of invocations in neighboring framebuffer locations \((x_i, y_i)\), where:

- \(i\) is the index of the invocation within the scope instance.
- \(w\) and \(h\) are the number of pixels the fragment covers in the x and y axes.
- \(w\) and \(h\) are identical for all participating invocations.
- \((x_0) = (x_1 - w) = (x_2) = (x_3 - w)\)
- \((y_0) = (y_1) = (y_2 - h) = (y_3 - h)\)
- Each invocation has the same layer and sample indices.

In a compute shader, if the `DerivativeGroupQuadsNV` execution mode is specified, each invocation in a
quad scope instance is formed of invocations with adjacent local invocation IDs \((x_i, y_i)\), where:

- \(i\) is the index of the invocation within the quad scope instance.
- \((x_0) = (x_1 - 1) = (x_2) = (x_3 - 1)\)
- \((y_0) = (y_1) = (y_2 - 1) = (y_3 - 1)\)
- \(x_0\) and \(y_0\) are integer multiples of 2.
- Each invocation has the same \(z\) coordinate.

In a compute shader, if the \texttt{DerivativeGroupLinearNV} execution mode is specified, each invocation in a quad scope instance is formed of invocations with adjacent local invocation indices \((l_i)\), where:

- \(i\) is the index of the invocation within the quad scope instance.
- \((l_0) = (l_1 - 1) = (l_2 - 2) = (l_3 - 3)\)
- \(l_0\) is an integer multiple of 4.

In all shaders, each invocation in a quad scope instance is formed of invocations in adjacent subgroup invocation indices \((s_i)\), where:

- \(i\) is the index of the invocation within the quad scope instance.
- \((s_0) = (s_1 - 1) = (s_2 - 2) = (s_3 - 3)\)
- \(s_0\) is an integer multiple of 4.

Each invocation in a quad scope instance must be in the same subgroup.

In a fragment shader, each invocation in a quad scope instance must be in the same primitive scope instance.

Fragment and compute shaders have defined quad scope instances. If the \texttt{quadOperationsInAllStages} limit is supported, any shader stages that support subgroup operations also have defined quad scope instances.

### 9.25.10. Fragment Interlock

A fragment interlock scope instance is formed of fragment shader invocations based on their framebuffer locations \((x, y, \text{layer}, \text{sample})\), executed by commands inside a single subpass.

The specific set of invocations included varies based on the execution mode as follows:

- If the \texttt{SampleInterlockOrderedEXT} or \texttt{SampleInterlockUnorderedEXT} execution modes are used, only invocations with identical framebuffer locations \((x, y, \text{layer}, \text{sample})\) are included.
- If the \texttt{PixelInterlockOrderedEXT} or \texttt{PixelInterlockUnorderedEXT} execution modes are used, fragments with different sample ids are also included.
- If the \texttt{ShadingRateInterlockOrderedEXT} or \texttt{ShadingRateInterlockUnorderedEXT} execution modes are used, fragments from neighbouring framebuffer locations are also included. The shading rate image or fragment shading rate determines these fragments.

Only fragment shaders with one of the above execution modes have defined fragment interlock
scope instances.

There is no specific Scope value for communication across invocations in a fragment interlock scope instance. However, this is implicitly used as a memory scope by OpBeginInvocationInterlockEXT and OpEndInvocationInterlockEXT.

Each invocation in a fragment interlock scope instance must be in the same queue family scope instance.

9.25.11. Invocation

The smallest scope is a single invocation; this is represented by the Invocation Scope in SPIR-V.

Fragment shader invocations must be in a primitive scope instance.

Invocations in fragment shaders that have a defined fragment interlock scope must be in a fragment interlock scope instance.

Invocations in shaders that have defined workgroups must be in a local workgroup.

Invocations in shaders that have a defined subgroup scope must be in a subgroup.

Invocations in shaders that have a defined quad scope must be in a quad scope instance.

All invocations in all stages must be in a command scope instance.

*Group operations* are executed by multiple invocations within a scope instance; with each invocation involved in calculating the result. This provides a mechanism for efficient communication between invocations in a particular scope instance.

Group operations all take a Scope defining the desired scope instance to operate within. Only the Subgroup scope can be used for these operations; the subgroupSupportedOperations limit defines which types of operation can be used.

Basic group operations include the use of OpGroupNonUniformElect, OpControlBarrier, OpMemoryBarrier, and atomic operations.

OpGroupNonUniformElect can be used to choose a single invocation to perform a task for the whole group. Only the invocation with the lowest id in the group will return true.

The Memory Model appendix defines the operation of barriers and atomics.

9.26.2. Vote Group Operations

The vote group operations allow invocations within a group to compare values across a group. The types of votes enabled are:
• Do all active group invocations agree that an expression is true?
• Do any active group invocations evaluate an expression to true?
• Do all active group invocations have the same value of an expression?

**Note**
These operations are useful in combination with control flow in that they allow for developers to check whether conditions match across the group and choose potentially faster code-paths in these cases.

### 9.26.3. Arithmetic Group Operations

The arithmetic group operations allow invocations to perform scans and reductions across a group. The operators supported are add, mul, min, max, and, or, xor.

For reductions, every invocation in a group will obtain the cumulative result of these operators applied to all values in the group. For exclusive scans, each invocation in a group will obtain the cumulative result of these operators applied to all values in invocations with a lower index in the group. Inclusive scans are identical to exclusive scans, except the cumulative result includes the operator applied to the value in the current invocation.

The order in which these operators are applied is implementation-dependent.

The ballot group operations allow invocations to perform more complex votes across the group. The ballot functionality allows all invocations within a group to provide a boolean value and get as a result what each invocation provided as their boolean value. The broadcast functionality allows values to be broadcast from an invocation to all other invocations within the group.

### 9.26.5. Shuffle Group Operations

The shuffle group operations allow invocations to read values from other invocations within a group.

The shuffle relative group operations allow invocations to read values from other invocations within the group relative to the current invocation in the group. The relative operations supported allow data to be shifted up and down through the invocations within a group.

### 9.26.7. Clustered Group Operations

The clustered group operations allow invocations to perform an operation among partitions of a group, such that the operation is only performed within the group invocations within a partition. The partitions for clustered group operations are consecutive power-of-two size groups of invocations and the cluster size **must** be known at pipeline creation time. The operations supported are add, mul, min, max, and, or, xor.
9.27. Quad Group Operations

Quad group operations (OpGroupNonUniformQuad*) are a specialized type of group operations that only operate on quad scope instances. Whilst these instructions do include a Scope parameter, this scope is always overridden; only the quad scope instance is included in its execution scope.

Fragment shaders that statically execute quad group operations must launch sufficient invocations to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.

The index used to select participating invocations is i, as described for a quad scope instance, defined as the quad index in the SPIR-V specification.

For OpGroupNonUniformQuadBroadcast this value is equal to Index. For OpGroupNonUniformQuadSwap, it is equal to the implicit Index used by each participating invocation.

9.28. Derivative Operations

Derivative operations calculate the partial derivative for an expression P as a function of an invocation’s x and y coordinates.

Derivative operations operate on a set of invocations known as a derivative group as defined in the SPIR-V specification. A derivative group is equivalent to the quad scope instance for a compute shader invocation, or the primitive scope instance for a fragment shader invocation.

Derivatives are calculated assuming that P is piecewise linear and continuous within the derivative group. All dynamic instances of explicit derivative instructions (OpDPdx*, OpDPdy*, and OpFwidth*) must be executed in control flow that is uniform within a derivative group. For other derivative operations, results are undefined if a dynamic instance is executed in control flow that is not uniform within the derivative group.

Fragment shaders that statically execute derivative operations must launch sufficient invocations to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.

Note

In a compute shader, it is the application’s responsibility to ensure that sufficient invocations are launched.

Derivative operations calculate their results as the difference between the result of P across invocations in the quad. For fine derivative operations (OpDPdxFine and OpDPdyFine), the values of DPdx(Pi) are calculated as

\[ DPdx(P_0) = DPdx(P_1) = P_1 - P_0 \]

\[ DPdx(P_2) = DPdx(P_3) = P_3 - P_2 \]
and the values of \( \text{DPdy}(P_i) \) are calculated as

\[
\begin{align*}
\text{DPdy}(P_0) &= \text{DPdy}(P_2) = P_2 - P_0 \\
\text{DPdy}(P_1) &= \text{DPdy}(P_3) = P_3 - P_1
\end{align*}
\]

where \( i \) is the index of each invocation as described in \textit{Quad}.

Coarse derivative operations (\texttt{OpDPdxCoarse} and \texttt{OpDPdyCoarse}), calculate their results in roughly the same manner, but \textbf{may} only calculate two values instead of four (one for each of \( \text{DPdx} \) and \( \text{DPdy} \)), reusing the same result no matter the originating invocation. If an implementation does this, it \textbf{should} use the fine derivative calculations described for \( P_0 \).

\textit{Note}

Derivative values are calculated between fragments rather than pixels. If the fragment shader invocations involved in the calculation cover multiple pixels, these operations cover a wider area, resulting in larger derivative values. This in turn will result in a coarser LOD being selected for image sampling operations using derivatives.

Applications may want to account for this when using multi-pixel fragments; if pixel derivatives are desired, applications should use explicit derivative operations and divide the results by the size of the fragment in each dimension as follows:

\[
\begin{align*}
\text{DPdx}(P_n)' &= \text{DPdx}(P_n) / w \\
\text{DPdy}(P_n)' &= \text{DPdy}(P_n) / h
\end{align*}
\]

where \( w \) and \( h \) are the size of the fragments in the quad, and \( \text{DPdx}(P_n)' \) and \( \text{DPdy}(P_n)' \) are the pixel derivatives.

The results for \texttt{OpDPdx} and \texttt{OpDPdy} \textbf{may} be calculated as either fine or coarse derivatives, with implementations favouring the most efficient approach. Implementations \textbf{must} choose coarse or fine consistently between the two.

Executing \texttt{OpFwidthFine}, \texttt{OpFwidthCoarse}, or \texttt{OpFwidth} is equivalent to executing the corresponding \texttt{OpDPdx*} and \texttt{OpDPdy*} instructions, taking the absolute value of the results, and summing them.

Executing an \texttt{OpImage*Sample*ImplicitLod} instruction is equivalent to executing \texttt{OpDPdx(Coordinate)} and \texttt{OpDPdy(Coordinate)}, and passing the results as the \texttt{Grad} operands \( dx \) and \( dy \).

\textit{Note}

It is expected that using the \texttt{ImplicitLod} variants of sampling functions will be substantially more efficient than using the \texttt{ExplicitLod} variants with explicitly
9.29. Helper Invocations

When performing derivative or quad group operations in a fragment shader, additional invocations may be spawned in order to ensure correct results. These additional invocations are known as helper invocations and can be identified by a non-zero value in the HelperInvocation built-in. Stores and atomics performed by helper invocations must not have any effect on memory except for the Function, Private and Output storage classes, and values returned by atomic instructions in helper invocations are undefined.

Note

While storage to Output storage class has an effect even in helper invocations, it does not mean that helper invocations have an effect on the framebuffer. Output variables in fragment shaders can be read from as well, and they behave more like Private variables for the duration of the shader invocation.

For group operations other than derivative and quad group operations, helper invocations may be treated as inactive even if they would be considered otherwise active.

Helper invocations may become permanently inactive if all invocations in a quad scope instance become helper invocations.

9.30. Cooperative Matrices

A cooperative matrix type is a SPIR-V type where the storage for and computations performed on the matrix are spread across the invocations in a scope instance. These types give the implementation freedom in how to optimize matrix multiplies.

SPIR-V defines the types and instructions, but does not specify rules about what sizes/combinations are valid, and it is expected that different implementations may support different sizes.

To enumerate the supported cooperative matrix types and operations, call:

```c
// Provided by VK_KHR_cooperative_matrix
VkResult vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkCooperativeMatrixPropertiesKHR* pProperties);
```

- `physicalDevice` is the physical device.
- `pPropertyCount` is a pointer to an integer related to the number of cooperative matrix properties available or queried.
- `pProperties` is either NULL or a pointer to an array of `VkCooperativeMatrixPropertiesKHR` structures.
If `pProperties` is `NULL`, then the number of cooperative matrix properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of cooperative matrix properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available cooperative matrix properties were returned.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-physicalDevice-parameter**
  - `physicalDevice` **must** be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-pPropertyCount-parameter**
  - `pPropertyCount` **must** be a valid pointer to a `uint32_t` value

- **VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-pProperties-parameter**
  - If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkCooperativeMatrixPropertiesKHR` structures

### Return Codes

**Success**
- `VK_SUCCESS`  
- `VK_INCOMPLETE`  

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`  
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To enumerate the supported cooperative matrix types and operations, call:

```c
// Provided by VK_NV_cooperative_matrix
VkResult vkGetPhysicalDeviceCooperativeMatrixPropertiesNV(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkCooperativeMatrixPropertiesNV* pProperties);
```

- `physicalDevice` is the physical device.

- `pPropertyCount` is a pointer to an integer related to the number of cooperative matrix properties available or queried.

- `pProperties` is either `NULL` or a pointer to an array of `VkCooperativeMatrixPropertiesNV` structures.
If `pProperties` is `NULL`, then the number of cooperative matrix properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of cooperative matrix properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available cooperative matrix properties were returned.

**Valid Usage (Implicit)**

- `VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-physicalDevice-parameter` `physicalDevice` must be a valid `VkPhysicalDevice` handle
- `VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-pPropertyCount-parameter` `pPropertyCount` must be a valid pointer to a `uint32_t` value
- `VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-pProperties-parameter` If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkCooperativeMatrixPropertiesNV` structures

**Return Codes**

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Each `VkCooperativeMatrixPropertiesKHR` or `VkCooperativeMatrixPropertiesNV` structure describes a single supported combination of types for a matrix multiply/add operation ( `OpCooperativeMatrixMulAddKHR` or `OpCooperativeMatrixMulAddNV` ). The multiply can be described in terms of the following variables and types (in SPIR-V pseudocode):

```spir-v
%A is of type `OpTypeCooperativeMatrixKHR` %AType %scope %MSize %KSize %MatrixAKHR
%B is of type `OpTypeCooperativeMatrixKHR` %BType %scope %KSize %NSize %MatrixBKHR
%C is of type `OpTypeCooperativeMatrixKHR` % CType %scope %MSize %NSize
%MatrixAccumulatorKHR
%Result is of type `OpTypeCooperativeMatrixKHR` %ResultType %scope %MSize %NSize
%MatrixAccumulatorKHR

%Result = %A * %B + %C // using `OpCooperativeMatrixMulAddKHR`
```
A matrix multiply with these dimensions is known as an \( M \times N \times K \) matrix multiply.

The `VkCooperativeMatrixPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_cooperative_matrix
typedef struct VkCooperativeMatrixPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t MSize;
    uint32_t NSize;
    uint32_t KSize;
    VkComponentTypeKHR AType;
    VkComponentTypeKHR BType;
    VkComponentTypeKHR CType;
    VkComponentTypeKHR ResultType;
    VkBool32 saturatingAccumulation;
    VkScopeKHR scope;
} VkCooperativeMatrixPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `MSize` is the number of rows in matrices \( A \), \( C \), and \( \text{Result} \).
- `KSize` is the number of columns in matrix \( A \) and rows in matrix \( B \).
- `NSize` is the number of columns in matrices \( B \), \( C \), \( \text{Result} \).
- `AType` is the component type of matrix \( A \), of type `VkComponentTypeKHR`.
- `BType` is the component type of matrix \( B \), of type `VkComponentTypeKHR`.
- ` CType` is the component type of matrix \( C \), of type `VkComponentTypeKHR`.
- `ResultType` is the component type of matrix \( \text{Result} \), of type `VkComponentTypeKHR`.
- `saturatingAccumulation` indicates whether the `SaturatingAccumulation` operand to `OpCooperativeMatrixMulAddKHR` must be present.
- `scope` is the scope of all the matrix types, of type `VkScopeKHR`.

If some types are preferred over other types (e.g. for performance), they **should** appear earlier in the list enumerated by `vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR`.

At least one entry in the list **must** have power of two values for all of `MSize`, `KSize`, and `NSize`. 
Valid Usage (Implicit)

- **VUID-VkCooperativeMatrixPropertiesKHR-sType-sType**
  
  *sType must be* `VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_PROPERTIES_KHR`

- **VUID-VkCooperativeMatrixPropertiesKHR-pNext-pNext**
  
  *pNext must be* `NULL`

- **VUID-VkCooperativeMatrixPropertiesKHR-AType-parameter**
  
  *AType must be a valid* `VkComponentTypeKHR` value

- **VUID-VkCooperativeMatrixPropertiesKHR-BType-parameter**
  
  *BType must be a valid* `VkComponentTypeKHR` value

- **VUID-VkCooperativeMatrixPropertiesKHR-CType-parameter**
  
  *CType must be a valid* `VkComponentTypeKHR` value

- **VUID-VkCooperativeMatrixPropertiesKHR-ResultType-parameter**
  
  *ResultType must be a valid* `VkComponentTypeKHR` value

- **VUID-VkCooperativeMatrixPropertiesKHR-scope-parameter**
  
  *scope must be a valid* `VkScopeKHR` value

The **VkCooperativeMatrixPropertiesNV** structure is defined as:

```c
// Provided by VK_NV_cooperative_matrix
typedef struct VkCooperativeMatrixPropertiesNV {
    VkStructureType sType;
    void* pNext;
    uint32_t MSize;
    uint32_t NSize;
    uint32_t KSize;
    VkComponentTypeNV AType;
    VkComponentTypeNV BType;
    VkComponentTypeNV CType;
    VkComponentTypeNV DType;
    VkScopeNV scope;
} VkCooperativeMatrixPropertiesNV;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **MSize** is the number of rows in matrices A, C, and D.
- **KSize** is the number of columns in matrix A and rows in matrix B.
- **NSize** is the number of columns in matrices B, C, D.
- **AType** is the component type of matrix A, of type `VkComponentTypeNV`.
- **BType** is the component type of matrix B, of type `VkComponentTypeNV`.
- **CType** is the component type of matrix C, of type `VkComponentTypeNV`. 
• **DType** is the component type of matrix D, of type `VkComponentTypeNV`.

• **scope** is the scope of all the matrix types, of type `VkScopeNV`.

If some types are preferred over other types (e.g. for performance), they **should** appear earlier in the list enumerated by `vkGetPhysicalDeviceCooperativeMatrixPropertiesNV`.

At least one entry in the list **must** have power of two values for all of `MSize`, `KSize`, and `NSize`.

### Valid Usage (Implicit)

- **VUID-VkCooperativeMatrixPropertiesNV-sType-sType**
  * `sType` **must** be `VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_PROPERTIES_NV`

- **VUID-VkCooperativeMatrixPropertiesNV-pNext-pNext**
  * `pNext` **must** be `NULL`

- **VUID-VkCooperativeMatrixPropertiesNV-AType-parameter**
  * `AType` **must** be a valid `VkComponentTypeNV` value

- **VUID-VkCooperativeMatrixPropertiesNV-BType-parameter**
  * `BType` **must** be a valid `VkComponentTypeNV` value

- **VUID-VkCooperativeMatrixPropertiesNV-CType-parameter**
  * `CType` **must** be a valid `VkComponentTypeNV` value

- **VUID-VkCooperativeMatrixPropertiesNV-DType-parameter**
  * `DType` **must** be a valid `VkComponentTypeNV` value

- **VUID-VkCooperativeMatrixPropertiesNV-scope-parameter**
  * `scope` **must** be a valid `VkScopeNV` value

Possible values for `VkScopeKHR` include:

```c
// Provided by VK_KHR_cooperative_matrix
typedef enum VkScopeKHR {
    VK_SCOPE_DEVICE_KHR = 1,
    VK_SCOPE_WORKGROUP_KHR = 2,
    VK_SCOPE_SUBGROUP_KHR = 3,
    VK_SCOPE_QUEUE_FAMILY_KHR = 5,
    // Provided by VK_NV_cooperative_matrix
    VK_SCOPE_DEVICE_NV = VK_SCOPE_DEVICE_KHR,
    // Provided by VK_NV_cooperative_matrix
    VK_SCOPE_WORKGROUP_NV = VK_SCOPE_WORKGROUP_KHR,
    // Provided by VK_NV_cooperative_matrix
    VK_SCOPE_SUBGROUP_NV = VK_SCOPE_SUBGROUP_KHR,
    // Provided by VK_NV_cooperative_matrix
    VK_SCOPE_QUEUE_FAMILY_NV = VK_SCOPE_QUEUE_FAMILY_KHR,
} VkScopeKHR;
```

or the equivalent
typedef VkScopeKHR VkScopeNV;

- **VK_SCOPE_DEVICE_KHR** corresponds to SPIR-V Device scope.
- **VK_SCOPE_WORKGROUP_KHR** corresponds to SPIR-V Workgroup scope.
- **VK_SCOPE_SUBGROUP_KHR** corresponds to SPIR-V Subgroup scope.
- **VK_SCOPE_QUEUE_FAMILY_KHR** corresponds to SPIR-V QueueFamily scope.

All enum values match the corresponding SPIR-V value.

Possible values for **VkComponentTypeKHR** include:

```cpp
typedef enum VkComponentTypeKHR {
    VK_COMPONENT_TYPE_FLOAT16_KHR = 0,
    VK_COMPONENT_TYPE_FLOAT32_KHR = 1,
    VK_COMPONENT_TYPE_FLOAT64_KHR = 2,
    VK_COMPONENT_TYPE_SINT8_KHR = 3,
    VK_COMPONENT_TYPE_SINT16_KHR = 4,
    VK_COMPONENT_TYPE_SINT32_KHR = 5,
    VK_COMPONENT_TYPE_SINT64_KHR = 6,
    VK_COMPONENT_TYPE_UINT8_KHR = 7,
    VK_COMPONENT_TYPE_UINT16_KHR = 8,
    VK_COMPONENT_TYPE_UINT32_KHR = 9,
    VK_COMPONENT_TYPE_UINT64_KHR = 10,
    VK_COMPONENT_TYPE_FLOAT16_NV = VK_COMPONENT_TYPE_FLOAT16_KHR,
    VK_COMPONENT_TYPE_FLOAT32_NV = VK_COMPONENT_TYPE_FLOAT32_KHR,
    VK_COMPONENT_TYPE_FLOAT64_NV = VK_COMPONENT_TYPE_FLOAT64_KHR,
    VK_COMPONENT_TYPE_SINT8_NV = VK_COMPONENT_TYPE_SINT8_KHR,
    VK_COMPONENT_TYPE_SINT16_NV = VK_COMPONENT_TYPE_SINT16_KHR,
    VK_COMPONENT_TYPE_SINT32_NV = VK_COMPONENT_TYPE_SINT32_KHR,
    VK_COMPONENT_TYPE_SINT64_NV = VK_COMPONENT_TYPE_SINT64_KHR,
    VK_COMPONENT_TYPE_UINT8_NV = VK_COMPONENT_TYPE_UINT8_KHR,
    VK_COMPONENT_TYPE_UINT16_NV = VK_COMPONENT_TYPE_UINT16_KHR,
    VK_COMPONENT_TYPE_UINT32_NV = VK_COMPONENT_TYPE_UINT32_KHR,
    VK_COMPONENT_TYPE_UINT64_NV = VK_COMPONENT_TYPE_UINT64_KHR,
}
```
or the equivalent

```c
// Provided by VK_NV_cooperative_matrix
typedef VkComponentTypeKHR VkComponentTypeNV;
```

- `VK_COMPONENT_TYPE_FLOAT16_KHR` corresponds to SPIR-V `OpTypeFloat 16`.
- `VK_COMPONENT_TYPE_FLOAT32_KHR` corresponds to SPIR-V `OpTypeFloat 32`.
- `VK_COMPONENT_TYPE_FLOAT64_KHR` corresponds to SPIR-V `OpTypeFloat 64`.
- `VK_COMPONENT_TYPE_SINT8_KHR` corresponds to SPIR-V `OpTypeInt 8`.
- `VK_COMPONENT_TYPE_SINT16_KHR` corresponds to SPIR-V `OpTypeInt 16`.
- `VK_COMPONENT_TYPE_SINT32_KHR` corresponds to SPIR-V `OpTypeInt 32`.
- `VK_COMPONENT_TYPE_SINT64_KHR` corresponds to SPIR-V `OpTypeInt 64`.
- `VK_COMPONENT_TYPE_UINT8_KHR` corresponds to SPIR-V `OpTypeInt 8`.
- `VK_COMPONENT_TYPE_UINT16_KHR` corresponds to SPIR-V `OpTypeInt 16`.
- `VK_COMPONENT_TYPE_UINT32_KHR` corresponds to SPIR-V `OpTypeInt 32`.
- `VK_COMPONENT_TYPE_UINT64_KHR` corresponds to SPIR-V `OpTypeInt 64`.

### 9.31. Validation Cache

Validation cache objects allow the result of internal validation to be reused, both within a single application run and between multiple runs. Reuse within a single run is achieved by passing the same validation cache object when creating supported Vulkan objects. Reuse across runs of an application is achieved by retrieving validation cache contents in one run of an application, saving the contents, and using them to preinitialize a validation cache on a subsequent run. The contents of the validation cache objects are managed by the validation layers. Applications can manage the host memory consumed by a validation cache object and control the amount of data retrieved from a validation cache object.

Validation cache objects are represented by `VkValidationCacheEXT` handles:

```c
// Provided by VK_EXT_validation_cache
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkValidationCacheEXT)
```

To create validation cache objects, call:

```c
// Provided by VK_EXT_validation_cache
VkResult vkCreateValidationCacheEXT(
    VkDevice device,
    const VkValidationCacheCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
);```
• **device** is the logical device that creates the validation cache object.
• **pCreateInfo** is a pointer to a `VkValidationCacheCreateInfoEXT` structure containing the initial parameters for the validation cache object.
• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
• **pValidationCache** is a pointer to a `VkValidationCacheEXT` handle in which the resulting validation cache object is returned.

**Note**
Applications **can** track and manage the total host memory size of a validation cache object using the **pAllocator**. Applications **can** limit the amount of data retrieved from a validation cache object in `vkGetValidationCacheDataEXT`. Implementations **should** not internally limit the total number of entries added to a validation cache object or the total host memory consumed.

Once created, a validation cache **can** be passed to the `vkCreateShaderModule` command by adding this object to the `VkShaderModuleCreateInfo` structure's **pNext** chain. If a `VkShaderModuleValidationCacheCreateInfoEXT` object is included in the `VkShaderModuleCreateInfo::pNext` chain, and its `validationCache` field is not `VK_NULL_HANDLE`, the implementation will query it for possible reuse opportunities and update it with new content. The use of the validation cache object in these commands is internally synchronized, and the same validation cache object **can** be used in multiple threads simultaneously.

**Note**
Implementations **should** make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the duration of the `vkCreateShaderModule` command.

### Valid Usage (Implicit)

- VUID-vkCreateValidationCacheEXT-device-parameter
  **device** **must** be a valid `VkDevice` handle

- VUID-vkCreateValidationCacheEXT-pCreateInfo-parameter
  **pCreateInfo** **must** be a valid pointer to a valid `VkValidationCacheCreateInfoEXT` structure

- VUID-vkCreateValidationCacheEXT-pAllocator-parameter
  If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateValidationCacheEXT-pValidationCache-parameter
  **pValidationCache** **must** be a valid pointer to a `VkValidationCacheEXT` handle
Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkValidationCacheCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_validation_cache
typedef struct VkValidationCacheCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkValidationCacheCreateFlagsEXT flags;
    size_t initialDataSize;
    const void* pInitialData;
} VkValidationCacheCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `initialDataSize` is the number of bytes in `pInitialData`. If `initialDataSize` is zero, the validation cache will initially be empty.
- `pInitialData` is a pointer to previously retrieved validation cache data. If the validation cache data is incompatible (as defined below) with the device, the validation cache will be initially empty. If `initialDataSize` is zero, `pInitialData` is ignored.

Valid Usage

- VUID-VkValidationCacheCreateInfoEXT-initialDataSize-01534
  If `initialDataSize` is not 0, it **must** be equal to the size of `pInitialData`, as returned by `vkGetValidationCacheDataEXT` when `pInitialData` was originally retrieved

- VUID-VkValidationCacheCreateInfoEXT-initialDataSize-01535
  If `initialDataSize` is not 0, `pInitialData` **must** have been retrieved from a previous call to `vkGetValidationCacheDataEXT`

Valid Usage (Implicit)

- VUID-VkValidationCacheCreateInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_VALIDATION_CACHE_CREATE_INFO_EXT`

- VUID-VkValidationCacheCreateInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
• VUID-VkValidationCacheCreateInfoEXT-flags-zerobitmask
  flags must be 0

• VUID-VkValidationCacheCreateInfoEXT-pInitialData-parameter
  If initialDataSize is not 0, pInitialData must be a valid pointer to an array of initialDataSize bytes

```c
// Provided by VK_EXT_validation_cache
typedef VkFlags VkValidationCacheCreateFlagsEXT;
```

VkValidationCacheCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

Validation cache objects can be merged using the command:

```c
// Provided by VK_EXT_validation_cache
VkResult vkMergeValidationCachesEXT(
  VkDevice device,
  VkValidationCacheEXT dstCache,
  uint32_t srcCacheCount,
  const VkValidationCacheEXT* pSrcCaches);
```

• device is the logical device that owns the validation cache objects.
• dstCache is the handle of the validation cache to merge results into.
• srcCacheCount is the length of the pSrcCaches array.
• pSrcCaches is a pointer to an array of validation cache handles, which will be merged into dstCache. The previous contents of dstCache are included after the merge.

Note
The details of the merge operation are implementation-dependent, but implementations should merge the contents of the specified validation caches and prune duplicate entries.

Valid Usage

• VUID-vkMergeValidationCachesEXT-dstCache-01536
  dstCache must not appear in the list of source caches

Valid Usage (Implicit)

• VUID-vkMergeValidationCachesEXT-device-parameter
  device must be a valid VkDevice handle
• VUID-vkMergeValidationCachesEXT-dstCache-parameter
  671
**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

Data can be retrieved from a validation cache object using the command:

```c
// Provided by VK_EXT_validation_cache
VkResult vkGetValidationCacheDataEXT(
    VkDevice device,
    VkValidationCacheEXT validationCache,
    size_t* pDataSize,
    void* pData);
```

- `device` is the logical device that owns the validation cache.
- `validationCache` is the validation cache to retrieve data from.
- `pDataSize` is a pointer to a value related to the amount of data in the validation cache, as described below.
- `pData` is either `NULL` or a pointer to a buffer.

If `pData` is `NULL`, then the maximum size of the data that can be retrieved from the validation cache, in bytes, is returned in `pDataSize`. Otherwise, `pDataSize` must point to a variable set by the user to the size of the buffer, in bytes, pointed to by `pData`, and on return the variable is overwritten with
the amount of data actually written to pData. If pDataSize is less than the maximum size that can be retrieved by the validation cache, at most pDataSize bytes will be written to pData, and vkGetValidationCacheDataEXT will return VK_INCOMPLETE instead of VK_SUCCESS, to indicate that not all of the validation cache was returned.

Any data written to pData is valid and can be provided as the pInitialData member of the VkValidationCacheCreateInfoEXT structure passed to vkCreateValidationCacheEXT.

Two calls to vkGetValidationCacheDataEXT with the same parameters must retrieve the same data unless a command that modifies the contents of the cache is called between them.

Applications can store the data retrieved from the validation cache, and use these data, possibly in a future run of the application, to populate new validation cache objects. The results of validation, however, may depend on the vendor ID, device ID, driver version, and other details of the device. To enable applications to detect when previously retrieved data is incompatible with the device, the initial bytes written to pData must be a header consisting of the following members:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Size</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>4</td>
<td>length in bytes of the entire validation cache header written as a stream of bytes, with the least significant byte first</td>
</tr>
<tr>
<td>4</td>
<td>4</td>
<td>a VkValidationCacheHeaderVersionEXT value written as a stream of bytes, with the least significant byte first</td>
</tr>
<tr>
<td>8</td>
<td>VK_UUID_SIZE</td>
<td>a layer commit ID expressed as a UUID, which uniquely identifies the version of the validation layers used to generate these validation results</td>
</tr>
</tbody>
</table>

The first four bytes encode the length of the entire validation cache header, in bytes. This value includes all fields in the header including the validation cache version field and the size of the length field.

The next four bytes encode the validation cache version, as described for VkValidationCacheHeaderVersionEXT. A consumer of the validation cache should use the cache version to interpret the remainder of the cache header.

If pDataSize is less than what is necessary to store this header, nothing will be written to pData and zero will be written to pDataSize.

Valid Usage (Implicit)

- VUID-vkGetValidationCacheDataEXT-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetValidationCacheDataEXT-validationCache-parameter
validationCache must be a valid VkValidationCacheEXT handle
• VUID-vkGetValidationCacheDataEXT-pDataSize-parameter
pDataSize must be a valid pointer to a size_t value

• VUID-vkGetValidationCacheDataEXT-pData-parameter
If the value referenced by pDataSize is not 0, and pData is not NULL, pData must be a valid pointer to an array of pDataSize bytes

• VUID-vkGetValidationCacheDataEXT-validationCache-parent
validationCache must have been created, allocated, or retrieved from device

Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

Possible values of the second group of four bytes in the header returned by vkGetValidationCacheDataEXT, encoding the validation cache version, are:

```
// Provided by VK_EXT_validation_cache
typedef enum VkValidationCacheHeaderVersionEXT {
    VK_VALIDATION_CACHE_HEADER_VERSION_ONE_EXT = 1,
} VkValidationCacheHeaderVersionEXT;
```

• VK_VALIDATION_CACHE_HEADER_VERSION_ONE_EXT specifies version one of the validation cache.

To destroy a validation cache, call:

```
// Provided by VK_EXT_validation_cache
void vkDestroyValidationCacheEXT(
    VkDevice device,                // device
    VkValidationCacheEXT validationCache, // validationCache
    const VkAllocationCallbacks* pAllocator); // pAllocator
```

• device is the logical device that destroys the validation cache object.
• validationCache is the handle of the validation cache to destroy.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

• VUID-vkDestroyValidationCacheEXT-validationCache-01537
If `VkAllocationCallbacks` were provided when `validationCache` was created, a compatible set of callbacks **must** be provided here

- VUID-vkDestroyValidationCacheEXT-validationCache-01538
  If no `VkAllocationCallbacks` were provided when `validationCache` was created, `pAllocator` **must** be `NULL`

### Valid Usage (Implicit)

- VUID-vkDestroyValidationCacheEXT-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkDestroyValidationCacheEXT-validationCache-parameter
  If `validationCache` is not `VK_NULL_HANDLE`, `validationCache` **must** be a valid `VkValidationCacheEXT` handle

- VUID-vkDestroyValidationCacheEXT-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyValidationCacheEXT-validationCache-parent
  If `validationCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `validationCache` **must** be externally synchronized
Chapter 10. Pipelines

The following figure shows a block diagram of the Vulkan pipelines. Some Vulkan commands specify geometric objects to be drawn or computational work to be performed, while others specify state controlling how objects are handled by the various pipeline stages, or control data transfer between memory organized as images and buffers. Commands are effectively sent through a processing pipeline, either a graphics pipeline, a ray tracing pipeline, or a compute pipeline.

The graphics pipeline can be operated in two modes, as either primitive shading or mesh shading pipeline.

**Primitive Shading**

The first stage of the graphics pipeline (Input Assembler) assembles vertices to form geometric primitives such as points, lines, and triangles, based on a requested primitive topology. In the next stage (Vertex Shader) vertices can be transformed, computing positions and attributes for each vertex. If tessellation and/or geometry shaders are supported, they can then generate multiple primitives from a single input primitive, possibly changing the primitive topology or generating additional attribute data in the process.

**Cluster Culling Shading**

When using the Cluster Culling Shader, a compute-like shader will perform cluster-based culling, a set of new built-in output variables are used to express visible cluster, in addition, a new built-in function is used to emit these variables from the cluster culling shader to the Input Assembler(IA) stage, then IA can use these variables to fetches vertices of visible cluster and drive vertex shader to work.

**Mesh Shading**

When using the mesh shading pipeline input primitives are not assembled implicitly, but explicitly through the (Mesh Shader). The work on the mesh pipeline is initiated by the application drawing a set of mesh tasks.

If an optional (Task Shader) is active, each task triggers the execution of a task shader workgroup that will generate a new set of tasks upon completion. Each of these spawned tasks, or each of the original dispatched tasks if no task shader is present, triggers the execution of a mesh shader workgroup that produces an output mesh with a variable-sized number of primitives assembled from vertices stored in the output mesh.

**Common**

The final resulting primitives are clipped to a clip volume in preparation for the next stage, Rasterization. The rasterizer produces a series of fragments associated with a region of the framebuffer, from a two-dimensional description of a point, line segment, or triangle. These fragments are processed by fragment operations to determine whether generated values will be written to the framebuffer. Fragment shading determines the values to be written to the framebuffer attachments. Framebuffer operations then read and write the color and depth/stencil attachments of the framebuffer for a given subpass of a render pass instance. The attachments can...
be used as input attachments in the fragment shader in a later subpass of the same render pass.

The **compute pipeline** is a separate pipeline from the graphics pipeline, which operates on one-, two-, or three-dimensional workgroups which **can** read from and write to buffer and image memory.

This ordering is meant only as a tool for describing Vulkan, not as a strict rule of how Vulkan is implemented, and we present it only as a means to organize the various operations of the pipelines. Actual ordering guarantees between pipeline stages are explained in detail in the **synchronization chapter**.

![Figure 2. Block diagram of the Vulkan pipeline](image)

Each pipeline is controlled by a monolithic object created from a description of all of the shader stages and any relevant fixed-function stages. **Linking** the whole pipeline together allows the optimization of shaders based on their input/outputs and eliminates expensive draw time state validation.

A pipeline object is bound to the current state using `vkCmdBindPipeline`. Any pipeline object state that is specified as **dynamic** is not applied to the current state when the pipeline object is bound, but is instead set by dynamic state setting commands.

No state, including dynamic state, is inherited from one command buffer to another.

Compute, ray tracing, and graphics pipelines are each represented by `VkPipeline` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipeline)
```
10.1. Compute Pipelines

Compute pipelines consist of a single static compute shader stage and the pipeline layout.

The compute pipeline represents a compute shader and is created by calling `vkCreateComputePipelines` with `module` and `pName` selecting an entry point from a shader module, where that entry point defines a valid compute shader, in the `VkPipelineShaderStageCreateInfo` structure contained within the `VkComputePipelineCreateInfo` structure.

To create compute pipelines, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateComputePipelines(
    VkDevice device, VkPipelineCache pipelineCache,
    uint32_t createInfoCount, const VkComputePipelineCreateInfo* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkPipeline* pPipelines);
```

- **device** is the logical device that creates the compute pipelines.
- **pipelineCache** is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- **createInfoCount** is the length of the `pCreateInfos` and `pPipelines` arrays.
- **pCreateInfos** is a pointer to an array of `VkComputePipelineCreateInfo` structures.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pPipelines** is a pointer to an array of `VkPipeline` handles in which the resulting compute pipeline objects are returned.

### Valid Usage

- **VUID-vkCreateComputePipelines-flags-00695**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the `basePipelineIndex` member of that same element is not `-1`, `basePipelineIndex` must be less than the index into `pCreateInfos` that corresponds to that element.

- **VUID-vkCreateComputePipelines-flags-00696**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline must have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set.

- **VUID-vkCreateComputePipelines-pipelineCache-02873**
  If `pipelineCache` was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, host access to `pipelineCache` must be externally synchronized.
Valid Usage (Implicit)

• VUID-vkCreateComputePipelines-device-parameter
device must be a valid VkDevice handle

• VUID-vkCreateComputePipelines-pipelineCache-parameter
If pipelineCache is not VK_NULL_HANDLE, pipelineCache must be a valid VkPipelineCache handle

• VUID-vkCreateComputePipelines-pCreateInfos-parameter
pCreateInfos must be a valid pointer to an array of createInfoCount valid VkComputePipelineCreateInfo structures

• VUID-vkCreateComputePipelines-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateComputePipelines-pPipelines-parameter
pPipelines must be a valid pointer to an array of createInfoCount VkPipeline handles

• VUID-vkCreateComputePipelines-createInfoCount-arraylength
createInfoCount must be greater than 0

• VUID-vkCreateComputePipelines-pipelineCache-parent
If pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success
• VK_SUCCESS
• VK_PIPELINE_COMPILE_REQUIRED_EXT

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INVALID_SHADER_NV

The VkComputePipelineCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkComputePipelineCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    VkPipelineShaderStageCreateInfo stage;
    VkPipelineLayout layout;
    VkPipeline basePipelineHandle;
} VkComputePipelineCreateInfo;
```
int32_t basePipelineIndex;
}

VkComputePipelineCreateInfo

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of *VkPipelineCreateFlagBits* specifying how the pipeline will be generated.
- **stage** is a *VkPipelineShaderStageCreateInfo* structure describing the compute shader.
- **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- **basePipelineHandle** is a pipeline to derive from.
- **basePipelineIndex** is an index into the *pCreateInfos* parameter to use as a pipeline to derive from.

The parameters *basePipelineHandle* and *basePipelineIndex* are described in more detail in **Pipeline Derivatives**.

If a *VkPipelineCreateFlags2CreateInfoKHR* structure is present in the *pNext* chain, *VkPipelineCreateFlags2CreateInfoKHR::flags* from that structure is used instead of *flags* from this structure.

### Valid Usage

- **VUID-VkComputePipelineCreateInfo-flags-07984**
  If *flags* contains the *VK_PIPELINE_CREATE_DERIVATIVE_BIT* flag, and *basePipelineIndex* is -1, *basePipelineHandle* must be a valid compute *VkPipeline* handle.

- **VUID-VkComputePipelineCreateInfo-flags-07985**
  If *flags* contains the *VK_PIPELINE_CREATE_DERIVATIVE_BIT* flag, and *basePipelineHandle* is *VK_NULL_HANDLE*, *basePipelineIndex* must be a valid index into the calling command's *pCreateInfos* parameter.

- **VUID-VkComputePipelineCreateInfo-flags-07986**
  If *flags* contains the *VK_PIPELINE_CREATE_DERIVATIVE_BIT* flag, *basePipelineIndex* must be -1 or *basePipelineHandle* must be *VK_NULL_HANDLE*.

- **VUID-VkComputePipelineCreateInfo-layout-07987**
  If a push constant block is declared in a shader, a push constant range in *layout* must match both the shader stage and range.

- **VUID-VkComputePipelineCreateInfo-layout-07988**
  If a resource variables is declared in a shader, a descriptor slot in *layout* must match the shader stage.

- **VUID-VkComputePipelineCreateInfo-layout-07989**
  If a resource variables is declared in a shader, and the descriptor type is not *VK_DESCRIPTOR_TYPE_MUTABLE_EXT*, a descriptor slot in *layout* must match the descriptor type.

- **VUID-VkComputePipelineCreateInfo-layout-07981**
If a resource variables is declared in a shader as an array, a descriptor slot in layout must match the descriptor count

- VUID-VkComputePipelineCreateInfo-flags-03365
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR

- VUID-VkComputePipelineCreateInfo-flags-03366
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR

- VUID-VkComputePipelineCreateInfo-flags-03367
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR

- VUID-VkComputePipelineCreateInfo-flags-03368
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR

- VUID-VkComputePipelineCreateInfo-flags-03369
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR

- VUID-VkComputePipelineCreateInfo-flags-04945
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV

- VUID-VkComputePipelineCreateInfo-flags-09007
  If flags includes VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV, then the VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines feature must be enabled

- VUID-VkComputePipelineCreateInfo-flags-09008
  If flags includes VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV, then the pNext chain must include a pointer to a valid instance of VkComputePipelineIndirectBufferInfoNV specifying the address where the pipeline’s metadata will be saved

- VUID-VkComputePipelineCreateInfo-pipelineCreationCacheControl-02875
  If the pipelineCreationCacheControl feature is not enabled, flags must not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT or VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT

- VUID-VkComputePipelineCreateInfo-stage-00701
  The stage member of stage must be VK_SHADER_STAGE_COMPUTE_BIT

- VUID-VkComputePipelineCreateInfo-stage-00702
  The shader code for the entry point identified by stage and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter

- VUID-VkComputePipelineCreateInfo-layout-01687
  The number of resources in layout accessible to the compute shader stage must be less than or equal to VkPhysicalDeviceLimits::maxPerStageResources
If `shaderEnqueue` is not enabled, `flags` must not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`.

If `flags` does not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`, the shader specified by `stage` must not declare the `ShaderEnqueueAMDX` capability.

If `VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount` is not 0, it must be 1.

`flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT`.

`flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_CREATE_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineCompilerControlCreateInfoAMD`, `VkPipelineCreateFlags2CreateInfoKHR`, `VkPipelineCreationFeedbackCreateInfo`, `VkPipelineRobustnessCreateInfoEXT`, or `VkSubpassShadingPipelineCreateInfoHUAWEI`.
- The `sType` value of each struct in the `pNext` chain must be unique.
- `flags` must be a valid combination of `VkPipelineCreateFlagBits` values.
- `stage` must be a valid `VkPipelineShaderStageCreateInfo` structure.
- `layout` must be a valid `VkPipelineLayout` handle.
- Both of `basePipelineHandle`, and `layout` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

The `VkPipelineShaderStageCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineShaderStageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineShaderStageCreateFlags flags;
} VkPipelineShaderStageCreateInfo;
```
```c
VkShaderStageFlagBits stage;
VkShaderModule module;
const char* pName;
const VkSpecializationInfo* pSpecializationInfo;
}
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkPipelineShaderStageCreateFlagBits` specifying how the pipeline shader stage will be generated.
- **stage** is a `VkShaderStageFlagBits` value specifying a single pipeline stage.
- **module** is optionally a `VkShaderModule` object containing the shader code for this stage.
- **pName** is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.
- **pSpecializationInfo** is a pointer to a `VkSpecializationInfo` structure, as described in Specialization Constants, or `NULL`.

If `module` is not `VK_NULL_HANDLE`, the shader code used by the pipeline is defined by `module`. If `module` is `VK_NULL_HANDLE`, the shader code is defined by the chained `VkShaderModuleCreateInfo` if present.

If the `shaderModuleIdentifier` feature is enabled, applications can omit shader code for `stage` and instead provide a module identifier. This is done by including a `VkPipelineShaderStageModuleIdentifierCreateInfoEXT` struct with `identifierSize` not equal to 0 in the `pNext` chain. A shader stage created in this way is equivalent to one created using a shader module with the same identifier. The identifier allows an implementation to look up a pipeline without consuming a valid SPIR-V module. If a pipeline is not found, pipeline compilation is not possible and the implementation must fail as specified by `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT`.

When an identifier is used in lieu of a shader module, implementations may fail pipeline compilation with `VK_PIPELINE_COMPILE_REQUIRED` for any reason.

**Note**

The rationale for the relaxed requirement on implementations to return a pipeline with `VkPipelineShaderStageModuleIdentifierCreateInfoEXT` is that layers or tools may intercept pipeline creation calls and require the full SPIR-V context to operate correctly. ICDs are not expected to fail pipeline compilation if the pipeline exists in a cache somewhere.

Applications can use identifiers when creating pipelines with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`. When creating such pipelines, `VK_SUCCESS` may be returned, but subsequently fail when referencing the pipeline in a `VkPipelineLibraryCreateInfoKHR` struct. Applications must allow pipeline compilation to fail during link steps with `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` as it may not be possible to determine if a pipeline can be created from identifiers until the link step.
Valid Usage

• VUID-VkPipelineShaderStageCreateInfo-stage-00704
  If the geometryShader feature is not enabled, stage must not be VK_SHADER_STAGE_GEOMETRY_BIT

• VUID-VkPipelineShaderStageCreateInfo-stage-00705
  If the tessellationShader feature is not enabled, stage must not be VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT or VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

• VUID-VkPipelineShaderStageCreateInfo-stage-02091
  If the meshShaders feature is not enabled, stage must not be VK_SHADER_STAGE_MESH_BIT_EXT

• VUID-VkPipelineShaderStageCreateInfo-stage-02092
  If the taskShaders feature is not enabled, stage must not be VK_SHADER_STAGE_TASK_BIT_EXT

• VUID-VkPipelineShaderStageCreateInfo-clustercullingShader-07813
  If the clustercullingShader feature is not enabled, stage must not be VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI

• VUID-VkPipelineShaderStageCreateInfo-stage-00706
  stage must not be VK_SHADER_STAGE_ALL_GRAPHICS, or VK_SHADER_STAGE_ALL

• VUID-VkPipelineShaderStageCreateInfo-pName-00707
  pName must be the name of an OpEntryPoint in module with an execution model that matches stage

• VUID-VkPipelineShaderStageCreateInfo-maxClipDistances-00708
  If the identified entry point includes any variable in its interface that is declared with the ClipDistance BuiltIn decoration, that variable must not have an array size greater than VkPhysicalDeviceLimits::maxClipDistances

• VUID-VkPipelineShaderStageCreateInfo-maxCullDistances-00709
  If the identified entry point includes any variable in its interface that is declared with the CullDistance BuiltIn decoration, that variable must not have an array size greater than VkPhysicalDeviceLimits::maxCullDistances

• VUID-VkPipelineShaderStageCreateInfo-maxCombinedClipAndCullDistances-00710
  If the identified entry point includes any variables in its interface that are declared with the ClipDistance or CullDistance BuiltIn decoration, those variables must not have array sizes which sum to more than VkPhysicalDeviceLimits::maxCombinedClipAndCullDistances

• VUID-VkPipelineShaderStageCreateInfo-maxSampleMaskWords-00711
  If the identified entry point includes any variable in its interface that is declared with the SampleMask BuiltIn decoration, that variable must not have an array size greater than VkPhysicalDeviceLimits::maxSampleMaskWords

• VUID-VkPipelineShaderStageCreateInfo-stage-00713
  If stage is VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT or VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, and the identified entry point has an OpExecutionMode instruction specifying a patch size with OutputVertices, the patch size must be greater than 0 and less than or equal to VkPhysicalDeviceLimits::maxTessellationPatchSize
If `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point must have an `OpExecutionMode` instruction specifying a maximum output vertex count that is greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxGeometryOutputVertices`.

If `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point must have an `OpExecutionMode` instruction specifying an invocation count that is greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxGeometryShaderInvocations`.

If `stage` is either `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, or `VK_SHADER_STAGE_GEOMETRY_BIT`, and the identified entry point writes to `Layer` for any primitive, it must write the same value to `Layer` for all vertices of a given primitive.

If `stage` is either `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, or `VK_SHADER_STAGE_GEOMETRY_BIT`, and the identified entry point writes to `ViewportIndex` for any primitive, it must write the same value to `ViewportIndex` for all vertices of a given primitive.

If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragDepth` in any execution path, all execution paths that are not exclusive to helper invocations must either discard the fragment, or write or initialize the value of `FragDepth`.

If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragStencilRefEXT` in any execution path, all execution paths that are not exclusive to helper invocations must either discard the fragment, or write or initialize the value of `FragStencilRefEXT`.

If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set, the `subgroupSizeControl` feature must be enabled.

If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag set, the `computeFullSubgroups` feature must be enabled.

If `flags` includes `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT`, `stage` must be one of `VK_SHADER_STAGE_MESH_BIT_EXT`, `VK_SHADER_STAGE_TASK_BIT_EXT`, or `VK_SHADER_STAGE_COMPUTE_BIT`.

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, `flags` must not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set.

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, the `subgroupSizeControl` feature must be enabled, and `stage` must be a valid...
bit specified in requiredSubgroupSizeStages

- **VUID-VkPipelineShaderStageCreateInfo-pNext-02756**
  If a VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is included in the pNext chain and stage is VK_SHADER_STAGE_COMPUTE_BIT, VK_SHADER_STAGE_MESH_BIT_EXT, or VK_SHADER_STAGE_TASK_BIT_EXT, the local workgroup size of the shader must be less than or equal to the product of VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize and maxComputeWorkgroupSubgroups.

- **VUID-VkPipelineShaderStageCreateInfo-pNext-02757**
  If a VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is included in the pNext chain, and flags has the VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT flag set, the local workgroup size in the X dimension of the pipeline must be a multiple of VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize.

- **VUID-VkPipelineShaderStageCreateInfo-flags-02758**
  If flags has both the VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT and VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT flags set and no VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is included in the pNext chain, the local workgroup size in the X dimension of the pipeline must be a multiple of maxSubgroupSize.

- **VUID-VkPipelineShaderStageCreateInfo-flags-02759**
  If flags has the VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT flag set and flags does not have the VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT flag set and no VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is included in the pNext chain, the local workgroup size in the X dimension of the pipeline must be a multiple of subgroupSize.

- **VUID-VkPipelineShaderStageCreateInfo-module-08987**
  If module uses the OpTypeCooperativeMatrixKHR instruction with a Scope equal to Subgroup, then the local workgroup size in the X dimension of the pipeline must be a multiple of subgroupSize.

- **VUID-VkPipelineShaderStageCreateInfo-stage-06844**
  If a shader module identifier is specified for this stage, a VkShaderModuleCreateInfo structure must not be present in the pNext chain.

- **VUID-VkPipelineShaderStageCreateInfo-stage-06845**
  If a shader module identifier is not specified for this stage, module must be a valid VkShaderModule or there must be a valid VkShaderModuleCreateInfo structure in the pNext chain.

- **VUID-VkPipelineShaderStageCreateInfo-stage-08771**
  If a shader module identifier is not specified for this stage, and neither the maintenance5 nor graphicsPipelineLibrary feature are enabled, module must be a valid VkShaderModule.

- **VUID-VkPipelineShaderStageCreateInfo-stage-06848**
  If a shader module identifier is specified for this stage, module must be VK_NULL_HANDLE.

- **VUID-VkPipelineShaderStageCreateInfo-pSpecializationInfo-06849**
  If a shader module identifier is not specified, the shader code used by the pipeline must be valid as described by the Khronos SPIR-V Specification after applying the specializations provided in pSpecializationInfo, if any, and then converting all specialization constants into fixed constants.
Valid Usage (Implicit)

- **VUID-VkPipelineShaderStageCreateInfo-sType-sType**
  
  The `sType` member of any struct in the `pNext` chain must be `VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO`.

- **VUID-VkPipelineShaderStageCreateInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDebugUtilsObjectNameInfoEXT`, `VkPipelineRobustnessCreateInfoEXT`, `VkPipelineShaderStageModuleIdentifierCreateInfoEXT`, `VkPipelineShaderStageNodeCreateInfoAMDX`, `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo`, `VkShaderModuleCreateInfo`, or `VkShaderModuleValidationCacheCreateInfoEXT`.

- **VUID-VkPipelineShaderStageCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkPipelineShaderStageCreateInfo-flags-parameter**
  
  The `flags` member of `VkPipelineShaderStageCreateInfo` specifying how a pipeline shader stage is created, are:

  Possible values of the `flags` member of `VkPipelineShaderStageCreateInfo` specifying how a pipeline shader stage is created, are:

  - **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT**
    
    The value of `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` is `0x00000001`.

  - **VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT**
    
    The value of `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` is `0x00000002`.

  - **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT**
    
    The value of `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` is `687`.

---

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineShaderStageCreateFlags;
```

`VkPipelineShaderStageCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineShaderStageCreateFlagBits` values.

Possible values of the `flags` member of `VkPipelineShaderStageCreateInfo` specifying how a pipeline shader stage is created, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineShaderStageCreateFlagBits {
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT = 0x00000001,
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT = 0x00000002,
    // Provided by VK_EXT_subgroup_size_control
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT =
```
• **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT** specifies that the `SubgroupSize` may vary in the shader stage.

• **VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT** specifies that the subgroup sizes must be launched with all invocations active in the task, mesh, or compute stage.

**Note**

If **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT** and **VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT** are specified and `minSubgroupSize` does not equal `maxSubgroupSize` and no required subgroup size is specified, then the only way to guarantee that the ‘X’ dimension of the local workgroup size is a multiple of `SubgroupSize` is to make it a multiple of `maxSubgroupSize`. Under these conditions, you are guaranteed full subgroups but not any particular subgroup size.

Bits which can be set by commands and structures, specifying one or more shader stages, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkShaderStageFlagBits {
    VK_SHADER_STAGE_VERTEX_BIT = 0x00000001,
    VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT = 0x00000002,
    VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT = 0x00000004,
    VK_SHADER_STAGE_GEOMETRY_BIT = 0x00000008,
    VK_SHADER_STAGE_FRAGMENT_BIT = 0x00000010,
    VK_SHADER_STAGE_COMPUTE_BIT = 0x00000020,
    VK_SHADER_STAGE_ALL_GRAPHICS = 0x0000001F,
    VK_SHADER_STAGE_ALL = 0x7FFFFFFF,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_RAYGEN_BIT_KHR = 0x00000100,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_ANY_HIT_BIT_KHR = 0x00000200,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR = 0x00000400,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_MISS_BIT_KHR = 0x00000800,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_INTERSECTION_BIT_KHR = 0x00001000,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_CALLABLE_BIT_KHR = 0x00002000,
    // Provided by VK_EXT_mesh_shader
    VK_SHADER_STAGE_TASK_BIT_EXT = 0x00000040,
    // Provided by VK_EXT_mesh_shader
    VK_SHADER_STAGE_MESH_BIT_EXT = 0x00000080,
} VkShaderStageFlagBits;
```
• **VK_SHADER_STAGE_VERTEX_BIT** specifies the vertex stage.

• **VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT** specifies the tessellation control stage.

• **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT** specifies the tessellation evaluation stage.

• **VK_SHADER_STAGE_GEOMETRY_BIT** specifies the geometry stage.

• **VK_SHADER_STAGE_FRAGMENT_BIT** specifies the fragment stage.

• **VK_SHADER_STAGE_COMPUTE_BIT** specifies the compute stage.

• **VK_SHADER_STAGE_ALL_GRAPHICS** is a combination of bits used as shorthand to specify all graphics stages defined above (excluding the compute stage).

• **VK_SHADER_STAGE_ALL** is a combination of bits used as shorthand to specify all shader stages supported by the device, including all additional stages which are introduced by extensions.

• **VK_SHADER_STAGE_TASK_BIT_EXT** specifies the task stage.

• **VK_SHADER_STAGE_MESH_BIT_EXT** specifies the mesh stage.

• **VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI** specifies the cluster culling stage.

• **VK_SHADER_STAGE_RAYGEN_BIT_KHR** specifies the ray generation stage.

• **VK_SHADER_STAGE_ANY_HIT_BIT_KHR** specifies the any-hit stage.

• **VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR** specifies the closest hit stage.

• **VK_SHADER_STAGE_MISS_BIT_KHR** specifies the miss stage.

• **VK_SHADER_STAGE_INTERSECTION_BIT_KHR** specifies the intersection stage.

• **VK_SHADER_STAGE_CALLABLE_BIT_KHR** specifies the callable stage.
**Note**

`VK_SHADER_STAGE_ALL_GRAPHICS` only includes the original five graphics stages included in Vulkan 1.0, and not any stages added by extensions. Thus, it may not have the desired effect in all cases.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderStageFlags;
```

`VkShaderStageFlags` is a bitmask type for setting a mask of zero or more `VkShaderStageFlagBits`.

The `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is defined as:

```cpp
// Provided by VK_VERSION_1_3
typedef struct VkPipelineShaderStageRequiredSubgroupSizeCreateInfo {
    VkStructureType sType;
    void* pNext;
    uint32_t requiredSubgroupSize;
} VkPipelineShaderStageRequiredSubgroupSizeCreateInfo;
```

or the equivalent

```cpp
// Provided by VK_EXT_subgroup_size_control
typedef VkPipelineShaderStageRequiredSubgroupSizeCreateInfo
    VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT;
```

or the equivalent

```cpp
// Provided by VK_EXT_shader_object
typedef VkPipelineShaderStageRequiredSubgroupSizeCreateInfo
    VkShaderRequiredSubgroupSizeCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `requiredSubgroupSize` is an unsigned integer value specifying the required subgroup size for the newly created pipeline shader stage.

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain of `VkPipelineShaderStageCreateInfo`, it specifies that the pipeline shader stage being compiled has a required subgroup size.

If a `VkShaderRequiredSubgroupSizeCreateInfoEXT` structure is included in the `pNext` chain of `VkShaderCreateInfoEXT`, it specifies that the shader being compiled has a required subgroup size.
Valid Usage

• VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02760
  requiredSubgroupSize must be a power-of-two integer

• VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02761
  requiredSubgroupSize must be greater or equal to minSubgroupSize

• VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02762
  requiredSubgroupSize must be less than or equal to maxSubgroupSize

Valid Usage (Implicit)

• VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-sType-sType
  sType must be
  VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_REQUIRED(Subgroup Size CREATE INFO

A subpass shading pipeline is a compute pipeline which must be called only in a subpass of a render pass with work dimensions specified by render area size. The subpass shading pipeline shader is a compute shader allowed to access input attachments specified in the calling subpass. To create a subpass shading pipeline, call `vkCreateComputePipelines` with `VkSubpassShadingPipelineCreateInfoHUAWEI` in the `pNext` chain of `VkComputePipelineCreateInfo`.

The `VkSubpassShadingPipelineCreateInfoHUAWEI` structure is defined as:

```c
// Provided by VK_HUAWEI_subpass_shading
typedef struct VkSubpassShadingPipelineCreateInfoHUAWEI {
    VkStructureType sType;
    void* pNext;
    VkRenderPass renderPass;
    uint32_t subpass;
} VkSubpassShadingPipelineCreateInfoHUAWEI;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `renderPass` is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline must only be used with a render pass instance compatible with the one provided. See Render Pass Compatibility for more information.
• `subpass` is the index of the subpass in the render pass where this pipeline will be used.
Valid Usage

- VUID-VkSubpassShadingPipelineCreateInfoHUAWEI-subpass-04946
  subpass must be created with VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI bind point

Valid Usage (Implicit)

- VUID-VkSubpassShadingPipelineCreateInfoHUAWEI-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBPASS_SHADING_PIPELINE_CREATE_INFO_HUAWEI

A subpass shading pipeline's workgroup size is a 2D vector with number of power-of-two in width and height. The maximum number of width and height is implementation-dependent, and may vary for different formats and sample counts of attachments in a render pass.

To query the maximum workgroup size, call:

```c
// Provided by VK_HUAWEI_subpass_shading
VkResult vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI(
    VkDevice device,
    VkRenderPass renderpass,
    VkExtent2D* pMaxWorkgroupSize);
```

- `device` is a handle to a local device object that was used to create the given render pass.
- `renderPass` is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline must only be used with a render pass instance compatible with the one provided. See Render Pass Compatibility for more information.
- `pMaxWorkgroupSize` is a pointer to a VkExtent2D structure.

Valid Usage (Implicit)

- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-device-parameter
  device must be a valid VkDevice handle
- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-renderpass-parameter
  renderpass must be a valid VkRenderPass handle
- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-pMaxWorkgroupSize-parameter
  pMaxWorkgroupSize must be a valid pointer to a VkExtent2D structure
- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-renderpass-parent
  renderpass must have been created, allocated, or retrieved from device
Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_SURFACE_LOST_KHR

The `VkPipelineRobustnessCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_pipeline_robustness
typedef struct VkPipelineRobustnessCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRobustnessBufferBehaviorEXT storageBuffers;
    VkPipelineRobustnessBufferBehaviorEXT uniformBuffers;
    VkPipelineRobustnessBufferBehaviorEXT vertexInputs;
    VkPipelineRobustnessImageBehaviorEXT images;
} VkPipelineRobustnessCreateInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **storageBuffers** sets the behaviour of out of bounds accesses made to resources bound as:
  - `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`
  - `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`
  - `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`

- **uniformBuffers** describes the behaviour of out of bounds accesses made to resources bound as:
  - `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`
  - `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`
  - `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`
  - `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`

- **vertexInputs** describes the behaviour of out of bounds accesses made to vertex input attributes

- **images** describes the behaviour of out of bounds accesses made to resources bound as:
  - `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`
  - `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`

Resources bound as `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` will have the robustness behavior that covers
its active descriptor type.

The scope of the effect of \texttt{VkPipelineRobustnessCreateInfoEXT} depends on which structure's \texttt{pNext} chain it is included in.

- \texttt{VkGraphicsPipelineCreateInfo}, \texttt{VkRayTracingPipelineCreateInfoKHR}, \texttt{VkComputePipelineCreateInfo}:
The robustness behavior described by \texttt{VkPipelineRobustnessCreateInfoEXT} applies to all accesses through this pipeline

- \texttt{VkPipelineShaderStageCreateInfo}:
The robustness behavior described by \texttt{VkPipelineRobustnessCreateInfoEXT} applies to all accesses emanating from the shader code of this shader stage

If \texttt{VkPipelineRobustnessCreateInfoEXT} is specified for both a pipeline and a pipeline stage, the \texttt{VkPipelineRobustnessCreateInfoEXT} specified for the pipeline stage will take precedence.

When \texttt{VkPipelineRobustnessCreateInfoEXT} is specified for a pipeline, it only affects the subset of the pipeline that is specified by the create info, as opposed to subsets linked from pipeline libraries. For \texttt{VkGraphicsPipelineCreateInfo}, that subset is specified by \texttt{VkGraphicsPipelineLibraryCreateInfoEXT::flags}. For \texttt{VkRayTracingPipelineCreateInfoKHR}, that subset is specified by the specific stages in \texttt{VkRayTracingPipelineCreateInfoKHR::pStages}.

### Valid Usage

- \texttt{VUID-VkPipelineRobustnessCreateInfoEXT-pipelineRobustness-06926}  
  If the \texttt{pipelineRobustness} feature is not enabled, \texttt{storageBuffers} must be \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT}

- \texttt{VUID-VkPipelineRobustnessCreateInfoEXT-pipelineRobustness-06927}  
  If the \texttt{pipelineRobustness} feature is not enabled, \texttt{uniformBuffers} must be \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT}

- \texttt{VUID-VkPipelineRobustnessCreateInfoEXT-pipelineRobustness-06928}  
  If the \texttt{pipelineRobustness} feature is not enabled, \texttt{vertexInputs} must be \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT}

- \texttt{VUID-VkPipelineRobustnessCreateInfoEXT-pipelineRobustness-06929}  
  If the \texttt{pipelineRobustness} feature is not enabled, \texttt{images} must be \texttt{VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT_EXT}

- \texttt{VUID-VkPipelineRobustnessCreateInfoEXT-robustImageAccess-06930}  
  If the \texttt{robustImageAccess} feature is not supported, \texttt{images} must not be \texttt{VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_EXT}

- \texttt{VUID-VkPipelineRobustnessCreateInfoEXT-robustBufferAccess2-06931}  
  If the \texttt{robustBufferAccess2} feature is not supported, \texttt{storageBuffers} must not be \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT}

- \texttt{VUID-VkPipelineRobustnessCreateInfoEXT-robustBufferAccess2-06932}  
  If the \texttt{robustBufferAccess2} feature is not supported, \texttt{uniformBuffers} must not be \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT}

- \texttt{VUID-VkPipelineRobustnessCreateInfoEXT-robustBufferAccess2-06933}  
  If the \texttt{robustBufferAccess2} feature is not supported, \texttt{storageBuffers} must not be \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT}
If the robustBufferAccess2 feature is not supported, vertexInputs must not be
VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT

- VUID-VkPipelineRobustnessCreateInfoEXT-robustImageAccess2-06934
If the robustImageAccess2 feature is not supported, images must not be
VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2_EXT

Valid Usage (Implicit)

- VUID-VkPipelineRobustnessCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_ROBUSTNESS_CREATE_INFO_EXT

- VUID-VkPipelineRobustnessCreateInfoEXT-storageBuffers-parameter
  storageBuffers must be a valid VkPipelineRobustnessBufferBehaviorEXT value

- VUID-VkPipelineRobustnessCreateInfoEXT-uniformBuffers-parameter
  uniformBuffers must be a valid VkPipelineRobustnessBufferBehaviorEXT value

- VUID-VkPipelineRobustnessCreateInfoEXT-vertexInputs-parameter
  vertexInputs must be a valid VkPipelineRobustnessBufferBehaviorEXT value

- VUID-VkPipelineRobustnessCreateInfoEXT-images-parameter
  images must be a valid VkPipelineRobustnessImageBehaviorEXT value

Possible values of the storageBuffers, uniformBuffers, and vertexInputs members of
VkPipelineRobustnessCreateInfoEXT are:

```c
// Provided by VK_EXT_pipeline_robustness
typedef enum VkPipelineRobustnessBufferBehaviorEXT {
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT = 0,
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DISABLED_EXT = 1,
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT = 2,
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT = 3,
} VkPipelineRobustnessBufferBehaviorEXT;
```

- **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT** specifies that this pipeline stage follows the behavior of robustness features that are enabled on the device that created this pipeline

- **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DISABLED_EXT** specifies that buffer accesses by this pipeline stage to the relevant resource types must not be out of bounds

- **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT** specifies that out of bounds accesses by this pipeline stage to the relevant resource types behave as if the robustBufferAccess feature is enabled

- **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT** specifies that out of bounds accesses by this pipeline stage to the relevant resource types behave as if the robustBufferAccess2 feature is enabled

Possible values of the images member of VkPipelineRobustnessCreateInfoEXT are:

```c
// Provided by VK_EXT_pipeline_robustness
typedef enum VkPipelineRobustnessImageBehaviorEXT {
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT_EXT = 0,
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DISABLED_EXT = 1,
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_EXT = 2,
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2_EXT = 3,
} VkPipelineRobustnessImageBehaviorEXT;
```

- **VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT_EXT** specifies that this pipeline stage follows the behavior of robustness features that are enabled on the device that created this pipeline.
- **VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DISABLED_EXT** specifies that image accesses by this pipeline stage to the relevant resource types **must** not be out of bounds.
- **VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_EXT** specifies that out of bounds accesses by this pipeline stage to images behave as if the `robustImageAccess` feature is enabled.
- **VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2_EXT** specifies that out of bounds accesses by this pipeline stage to images behave as if the `robustImageAccess2` feature is enabled.

An identifier can be provided instead of shader code in an attempt to compile pipelines without providing complete SPIR-V to the implementation.

The `VkPipelineShaderStageModuleIdentifierCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_shader_module_identifier
typedef struct VkPipelineShaderStageModuleIdentifierCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t identifierSize;
    const uint8_t* pIdentifier;
} VkPipelineShaderStageModuleIdentifierCreateInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **identifierSize** is the size, in bytes, of the buffer pointed to by `pIdentifier`.
- **pIdentifier** is a pointer to a buffer of opaque data specifying an identifier.

Any identifier can be used. If the pipeline being created with identifier requires compilation to complete the pipeline creation call, pipeline compilation **must** fail as defined by `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT`.

`pIdentifier` and `identifierSize` can be obtained from an `VkShaderModuleIdentifierEXT` queried earlier.
Valid Usage

- VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-pNext-06850
  If this structure is included in a pNext chain and identifierSize is not equal to 0, the shaderModuleIdentifier feature must be enabled.

- VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-pNext-06851
  If this struct is included in a pNext chain of VkPipelineShaderStageCreateInfo and identifierSize is not equal to 0, the pipeline must be created with the VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT flag set.

- VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-identifierSize-06852
  identifierSize must be less-or-equal to VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT.

Valid Usage (Implicit)

- VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_MODULE_IDENTIFIER_CREATE_INFO_EXT.

- VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-pIdentifier-parameter
  If identifierSize is not 0, pIdentifier must be a valid pointer to an array of identifierSize uint8_t values.

If a compute pipeline is going to be used in Device-Generated Commands by specifying its pipeline token with VkBindPipelineIndirectCommandCommandNV, then that pipeline's associated metadata must be saved at a specified buffer device address for later use in indirect command generation. The buffer device address must be specified at the time of compute pipeline creation with VkComputePipelineIndirectBufferInfoNV structure in the pNext chain of VkComputePipelineCreateInfo.

The VkComputePipelineIndirectBufferInfoNV structure is defined as:

```c
// Provided by VK_NV_device_generated_commands_compute
typedef struct VkComputePipelineIndirectBufferInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkDeviceAddress deviceAddress;
    VkDeviceSize size;
    VkDeviceAddress pipelineDeviceAddressCaptureReplay;
} VkComputePipelineIndirectBufferInfoNV;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- deviceAddress is the address where the pipeline’s metadata will be stored.
- size is the size of pipeline’s metadata that was queried using...
vkGetPipelineIndirectMemoryRequirementsNV.

- **pipelineDeviceAddressCaptureReplay** is the device address where pipeline’s metadata was originally saved and can now be used to re-populate deviceAddress for replay.

If **pipelineDeviceAddressCaptureReplay** is zero, no specific address is requested. If **pipelineDeviceAddressCaptureReplay** is not zero, then it **must** be an address retrieved from an identically created pipeline on the same implementation. The pipeline metadata **must** also be placed on an identically created buffer and at the same offset using the **vkCmdUpdatePipelineIndirectBufferNV** command.

### Valid Usage

- **VUID-VkComputePipelineIndirectBufferInfoNV-deviceGeneratedComputePipelines-09009**
  The **VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV**::deviceGeneratedComputePipelines feature **must** be enabled

- **VUID-VkComputePipelineIndirectBufferInfoNV-flags-09010**
  The pipeline creation flags in **VkComputePipelineCreateInfo**::flags **must** include **VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV**

- **VUID-VkComputePipelineIndirectBufferInfoNV-deviceAddress-09011**
  deviceAddress **must** be aligned to the **VkMemoryRequirements2**::alignment, as returned by **vkGetPipelineIndirectMemoryRequirementsNV**

- **VUID-VkComputePipelineIndirectBufferInfoNV-deviceAddress-09012**
  deviceAddress **must** have been allocated from a buffer that was created with usage **VK_BUFFER_USAGE_TRANSFER_DST_BIT** and **VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT**

- **VUID-VkComputePipelineIndirectBufferInfoNV-size-09013**
  size **must** be greater than or equal to the **VkMemoryRequirements2**::size, as returned by **vkGetPipelineIndirectMemoryRequirementsNV**

- **VUID-VkComputePipelineIndirectBufferInfoNV-pipelineDeviceAddressCaptureReplay-09014**
  If **pipelineDeviceAddressCaptureReplay** is non-zero then the **VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV**::deviceGeneratedComputeCaptureReplay feature **must** be enabled

- **VUID-VkComputePipelineIndirectBufferInfoNV-pipelineDeviceAddressCaptureReplay-09015**
  If **pipelineDeviceAddressCaptureReplay** is non-zero then that address **must** have been allocated with flag **VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT** set

- **VUID-VkComputePipelineIndirectBufferInfoNV-pipelineDeviceAddressCaptureReplay-09016**
  If **pipelineDeviceAddressCaptureReplay** is non-zero, the pipeline **must** have been recreated for replay

- **VUID-VkComputePipelineIndirectBufferInfoNV-pipelineDeviceAddressCaptureReplay-09017**
  **pipelineDeviceAddressCaptureReplay** **must** satisfy the alignment and size requirements similar to deviceAddress
Valid Usage (Implicit)

- VUID-VkComputePipelineIndirectBufferInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_INDIRECT_BUFFER_INFO_NV

- VUID-VkComputePipelineIndirectBufferInfoNV-pNext-pNext
  pNext must be NULL

To save a compute pipeline's metadata at a device address call:

```c
void vkCmdUpdatePipelineIndirectBufferNV(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipeline pipeline);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying the type of pipeline whose metadata will be saved.
- `pipeline` is the pipeline whose metadata will be saved.

`vkCmdUpdatePipelineIndirectBufferNV` is only allowed outside of a render pass. This command is treated as a “transfer” operation for the purposes of synchronization barriers. The writes to the address must be synchronized using stages `VK_PIPELINE_STAGE_2_COPY_BIT` and `VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV` and with access masks `VK_ACCESS_MEMORY_WRITE_BIT` and `VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV` respectively before using the results in preprocessing.

Valid Usage

- VUID-vkCmdUpdatePipelineIndirectBufferNV-pipelineBindPoint-09018
  pipelineBindPoint must be VK_PIPELINE_BIND_POINT_COMPUTE

- VUID-vkCmdUpdatePipelineIndirectBufferNV-pipeline-09019
  pipeline must have been created with VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV flag set

- VUID-vkCmdUpdatePipelineIndirectBufferNV-pipeline-09020
  pipeline must have been created with VkComputePipelineIndirectBufferInfoNV structure specifying a valid address where its metadata will be saved

- VUID-vkCmdUpdatePipelineIndirectBufferNV-deviceGeneratedComputePipelines-09021
  The `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV`::deviceGeneratedComputePipelines feature must be enabled
Valid Usage (Implicit)

- VUID-vkCmdUpdatePipelineIndirectBufferNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdUpdatePipelineIndirectBufferNV-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-vkCmdUpdatePipelineIndirectBufferNV-pipeline-parameter
  pipeline must be a valid VkPipeline handle

- VUID-vkCmdUpdatePipelineIndirectBufferNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdUpdatePipelineIndirectBufferNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdUpdatePipelineIndirectBufferNV-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdUpdatePipelineIndirectBufferNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdUpdatePipelineIndirectBufferNV-commonparent
  Both of commandBuffer, and pipeline must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

10.2. Graphics Pipelines

Graphics pipelines consist of multiple shader stages, multiple fixed-function pipeline stages, and a pipeline layout.
To create graphics pipelines, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateGraphicsPipelines(
    VkDevice device,
    VkPipelineCache pipelineCache,
    uint32_t createInfoCount,
    const VkGraphicsPipelineCreateInfo* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkPipeline* pPipelines);
```

- `device` is the logical device that creates the graphics pipelines.
- `pipelineCache` is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of `VkGraphicsPipelineCreateInfo` structures.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelines` is a pointer to an array of `VkPipeline` handles in which the resulting graphics pipeline objects are returned.

The `VkGraphicsPipelineCreateInfo` structure includes an array of `VkPipelineShaderStageCreateInfo` structures for each of the desired active shader stages, as well as creation information for all relevant fixed-function stages, and a pipeline layout.

### Valid Usage

- **VUID-vkCreateGraphicsPipelines-flags-00720**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the `basePipelineIndex` member of that same element is not `-1`, `basePipelineIndex` must be less than the index into `pCreateInfos` that corresponds to that element.

- **VUID-vkCreateGraphicsPipelines-flags-00721**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline must have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set.

- **VUID-vkCreateGraphicsPipelines-pipelineCache-02876**
  If `pipelineCache` was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, host access to `pipelineCache` must be externally synchronized.

### Note

An implicit cache may be provided by the implementation or a layer. For this reason, it is still valid to set
VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT on flags for any element of pCreateInfos while passing VK_NULL_HANDLE for pipelineCache.

Valid Usage (Implicit)

- VUID-vkCreateGraphicsPipelines-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateGraphicsPipelines-pipelineCache-parameter
If pipelineCache is not VK_NULL_HANDLE, pipelineCache must be a valid VkPipelineCache handle

- VUID-vkCreateGraphicsPipelines-pCreateInfos-parameter
pCreateInfos must be a valid pointer to an array of createInfoCount valid VkGraphicsPipelineCreateInfo structures

- VUID-vkCreateGraphicsPipelines-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateGraphicsPipelines-pPipelines-parameter
pPipelines must be a valid pointer to an array of createInfoCount VkPipeline handles

- VUID-vkCreateGraphicsPipelines-createInfoCount-arraylength
createInfoCount must be greater than 0

- VUID-vkCreateGraphicsPipelines-pipelineCache-parent
If pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_PIPELINE_COMPILE_REQUIRED_EXT

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_SHADER_NV

The VkGraphicsPipelineCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkGraphicsPipelineCreateInfo {
    VkStructureType       sType;
    const void*           pNext;
    VkPipelineCreateFlags flags;
} VkGraphicsPipelineCreateInfo;
```
uint32_t stageCount;
const VkPipelineShaderStageCreateInfo* pStages;
const VkPipelineVertexInputStateCreateInfo* pVertexInputState;
const VkPipelineInputAssemblyStateCreateInfo* pInputAssemblyState;
const VkPipelineTessellationStateCreateInfo* pTessellationState;
const VkPipelineViewportStateCreateInfo* pViewportState;
const VkPipelineRasterizationStateCreateInfo* pRasterizationState;
const VkPipelineMultisampleStateCreateInfo* pMultisampleState;
const VkPipelineDepthStencilStateCreateInfo* pDepthStencilState;
const VkPipelineColorBlendStateCreateInfo* pColorBlendState;
const VkPipelineDynamicStateCreateInfo* pDynamicState;
VkPipelineLayout layout;
VkRenderPass renderPass;
uint32_t subpass;
VkPipeline basePipelineHandle;
int32_t basePipelineIndex;
} VkGraphicsPipelineCreateInfo;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **flags** is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
• **stageCount** is the number of entries in the **pStages** array.
• **pStages** is a pointer to an array of `stageCount` `VkPipelineShaderStageCreateInfo` structures describing the set of the shader stages to be included in the graphics pipeline.
• **pVertexInputState** is a pointer to a `VkPipelineVertexInputStateCreateInfo` structure. It is ignored if the pipeline includes a mesh shader stage. It **can** be `NULL` if the pipeline is created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state set.
• **pInputAssemblyState** is a pointer to a `VkPipelineInputAssemblyStateCreateInfo` structure which determines input assembly behavior for vertex shading, as described in Drawing Commands. If the `VK_EXT_extended_dynamic_state3` extension is enabled, it **can** be `NULL` if the pipeline is created with both `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE`, and `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic states set and `dynamicPrimitiveTopologyUnrestricted` is `VK_TRUE`. It is ignored if the pipeline includes a mesh shader stage.
• **pTessellationState** is a pointer to a `VkPipelineTessellationStateCreateInfo` structure defining tessellation state used by tessellation shaders. It **can** be `NULL` if the pipeline is created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state set.
• **pViewportState** is a pointer to a `VkPipelineViewportStateCreateInfo` structure defining viewport state used when rasterization is enabled. If the `VK_EXT_extended_dynamic_state3` extension is enabled, it **can** be `NULL` if the pipeline is created with both `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`, and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic states set.
• **pRasterizationState** is a pointer to a `VkPipelineRasterizationStateCreateInfo` structure defining rasterization state. If the `VK_EXT_extended_dynamic_state3` extension is enabled, it **can** be `NULL` if the pipeline is created with all of `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT`, `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE`, and `VK_DYNAMIC_STATE_POLYGON_MODE_EXT`,...
VK_DYNAMIC_STATE_CULL_MODE, VK_DYNAMIC_STATE_FRONT_FACE, VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE, VK_DYNAMIC_STATE_DEPTH_BIAS, and VK_DYNAMIC_STATE_LINE_WIDTH dynamic states set.

- **pMultisampleState** is a pointer to a VkPipelineMultisampleStateCreateInfo structure defining multisample state used when rasterization is enabled. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT, VK_DYNAMIC_STATE_SAMPLE_MASK_EXT, and VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic states set, and either alphaToOne is disabled on the device or VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT is set, in which case VkPipelineMultisampleStateCreateInfo::sampleShadingEnable is assumed to be VK_FALSE.

- **pDepthStencilState** is a pointer to a VkPipelineDepthStencilStateCreateInfo structure defining depth/stencil state used when rasterization is enabled for depth or stencil attachments accessed during rendering. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE, VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE, VK_DYNAMIC_STATE_DEPTH_COMPARE_OP, VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_OP, and VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic states set.

- **pColorBlendState** is a pointer to a VkPipelineColorBlendStateCreateInfo structure defining color blend state used when rasterization is enabled for any color attachments accessed during rendering. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT, VK_DYNAMIC_STATE_LOGIC_OP_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT, VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic states set.

- **pDynamicState** is a pointer to a VkPipelineDynamicStateCreateInfo structure defining which properties of the pipeline state object are dynamic and can be changed independently of the pipeline state. This can be NULL, which means no state in the pipeline is considered dynamic.

- **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.

- **renderPass** is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline must only be used with a render pass instance compatible with the one provided. See Render Pass Compatibility for more information.

- **subpass** is the index of the subpass in the render pass where this pipeline will be used.

- **basePipelineHandle** is a pipeline to derive from.

- **basePipelineIndex** is an index into the pCreateInfos parameter to use as a pipeline to derive from.

The parameters basePipelineHandle and basePipelineIndex are described in more detail in Pipeline Derivatives.

If any shader stage fails to compile, the compile log will be reported back to the application, and VK_ERROR_INVALID_SHADER_NV will be generated.

### Note

With VK_EXT_extended_dynamic_state3, it is possible that many of the
VkGraphicsPipelineCreateInfo members above can be NULL because all their state is dynamic and therefore ignored. This is optional so the application can still use a valid pointer if it needs to set the pNext or flags fields to specify state for other extensions.

The state required for a graphics pipeline is divided into vertex input state, pre-rasterization shader state, fragment shader state, and fragment output state.

**Vertex Input State**

Vertex input state is defined by:

- VkPipelineVertexInputStateCreateInfo
- VkPipelineInputAssemblyStateCreateInfo

If this pipeline specifies pre-rasterization state either directly or by including it as a pipeline library and its pStages includes a vertex shader, this state must be specified to create a complete graphics pipeline.

If a pipeline includes VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT in VkGraphicsPipelineLibraryCreateInfoEXT::flags either explicitly or as a default, and either the conditions requiring this state for a complete graphics pipeline are met or this pipeline does not specify pre-rasterization state in any way, that pipeline must specify this state directly.

**Pre-Rasterization Shader State**

Pre-rasterization shader state is defined by:

- VkPipelineShaderStageCreateInfo entries for:
  - Vertex shaders
  - Tessellation control shaders
  - Tessellation evaluation shaders
  - Geometry shaders
  - Task shaders
  - Mesh shaders
- Within the VkPipelineLayout, all descriptor sets with pre-rasterization shader bindings if VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT was specified.
  - If VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT was not specified, the full pipeline layout must be specified.
- VkPipelineViewportStateCreateInfo
- VkPipelineRasterizationStateCreateInfo
- VkPipelineTessellationStateCreateInfo
- VkRenderPass and subpass parameter
- The viewMask parameter of VkPipelineRenderingCreateInfo (formats are ignored)
- VkPipelineDiscardRectangleStateCreateInfoEXT
This state **must** be specified to create a complete graphics pipeline.

If either the `pNext` chain includes a `VkGraphicsPipelineLibraryCreateInfoEXT` structure with `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` included in `flags`, or it is not specified and would default to include that value, this state **must** be specified in the pipeline.

**Fragment Shader State**

Fragment shader state is defined by:

- A `VkPipelineShaderStageCreateInfo` entry for the fragment shader
- Within the `VkPipelineLayout`, all descriptor sets with fragment shader bindings if `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` was specified.
  - If `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` was not specified, the full pipeline layout must be specified.
- `VkPipelineMultisampleStateCreateInfo` if sample shading is enabled or `renderpass` is not `VK_NULL_HANDLE`
- `VkPipelineDepthStencilStateCreateInfo`
- `VkRenderPass` and `subpass` parameter
- The `viewMask` parameter of `VkPipelineRenderingCreateInfo` (formats are ignored)
- `VkPipelineFragmentShadingRateStateCreateInfoKHR`
- `VkPipelineFragmentShadingRateEnumStateCreateInfoNV`
- `VkPipelineRepresentativeFragmentTestStateCreateInfoNV`
- Inclusion/omission of the `VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` flag
- Inclusion/omission of the `VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT` flag

If a pipeline specifies pre-rasterization state either directly or by including it as a pipeline library and `rasterizerDiscardEnable` is set to `VK_FALSE` or `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` is used, this state **must** be specified to create a complete graphics pipeline.

If a pipeline includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT` in `VkGraphicsPipelineLibraryCreateInfoEXT::flags` either explicitly or as a default, and either the conditions requiring this state for a complete graphics pipeline are met or this pipeline does not specify pre-rasterization state in any way, that pipeline **must** specify this state directly.

**Fragment Output State**

Fragment output state is defined by:

- `VkPipelineColorBlendStateCreateInfo`
- `VkRenderPass` and `subpass` parameter
- `VkPipelineMultisampleStateCreateInfo`
If a pipeline specifies **pre-rasterization state** either directly or by including it as a pipeline library and `rasterizerDiscardEnable` is set to `VK_FALSE` or `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` is used, this state **must** be specified to create a complete graphics pipeline.

If a pipeline includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT` in `VkGraphicsPipelineLibraryCreateInfoEXT::flags` either explicitly or as a default, and either the conditions requiring this state for a complete graphics pipeline are met or this pipeline does not specify **pre-rasterization state** in any way, that pipeline **must** specify this state directly.

**Dynamic State**

Dynamic state values set via `pDynamicState` **must** be ignored if the state they correspond to is not otherwise statically set by one of the state subsets used to create the pipeline. Additionally, setting dynamic state values **must** not modify whether state in a linked library is static or dynamic; this is set and unchangeable when the library is created. For example, if a pipeline only included **pre-rasterization shader state**, then any dynamic state value corresponding to depth or stencil testing has no effect. Any linked library that has dynamic state enabled that same dynamic state **must** also be enabled in all the other linked libraries to which that dynamic state applies.

**Complete Graphics Pipelines**

A complete graphics pipeline always includes **pre-rasterization shader state**, with other subsets included depending on that state as specified in the above sections.

**Graphics Pipeline Library Layouts**

If different subsets are linked together with pipeline layouts created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, the final effective pipeline layout is effectively the union of the linked pipeline layouts. When binding descriptor sets for this pipeline, the pipeline layout used **must** be compatible with this union. This pipeline layout **can** be overridden when linking with `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT` by providing a `VkPipelineLayout` that is **compatible** with this union other than `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, or when linking without `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT` by providing a `VkPipelineLayout` that is fully **compatible** with this union.

If a `VkPipelineCreateFlags2CreateInfoKHR` structure is present in the `pNext` chain, `VkPipelineCreateFlags2CreateInfoKHR::flags` from that structure is used instead of `flags` from this structure.

**Valid Usage**

- **VUID-VkGraphicsPipelineCreateInfo-flags-07984**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` **must** be a valid graphics `VkPipeline` handle
If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` must be a valid index into the calling command’s `pCreateInfos` parameter.

If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, `basePipelineIndex` must be `-1` or `basePipelineHandle` must be `VK_NULL_HANDLE`.

If a push constant block is declared in a shader, a push constant range in `layout` must match both the shader stage and range.

If a `resource variables` is declared in a shader, a descriptor slot in `layout` must match the shader stage.

If a `resource variables` is declared in a shader as an array, a descriptor slot in `layout` must match the descriptor count.

If the pipeline requires pre-rasterization shader state the geometric shader stages provided in `pStages` must be either from the mesh shading pipeline (`stage` is `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`) or from the primitive shading pipeline (`stage` is `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, or `VK_SHADER_STAGE_GEOMETRY_BIT`).

If the pipeline requires pre-rasterization shader state the `stage` member of one element of `pStages` must be either `VK_SHADER_STAGE_VERTEX_BIT` or `VK_SHADER_STAGE_MESH_BIT_EXT`.

The shader stages for `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT` must use either the TaskNV and MeshNV Execution Model or the TaskEXT and MeshEXT Execution Model, but must not use both.

If the pipeline requires pre-rasterization shader state and `pStages` includes a tessellation control shader stage, it must include a tessellation evaluation shader stage.

If the pipeline requires pre-rasterization shader state and `pStages` includes a tessellation evaluation shader stage, it must include a tessellation control shader stage.

If the pipeline requires pre-rasterization shader state and `pStages` includes a tessellation control shader stage, and the `VK_EXT_extended_dynamic_state3` extension is not enabled or
the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state is not set, `pTessellationState` must be a valid pointer to a valid `VkPipelineTessellationStateCreateInfo` structure

- VUID-VkGraphicsPipelineCreateInfo-pTessellationState-09023
  If `pTessellationState` is not `NULL` it must be a pointer to a valid `VkPipelineTessellationStateCreateInfo` structure

- VUID-VkGraphicsPipelineCreateInfo-pStages-00732
  If the pipeline requires `pre-rasterization shader state` and `pStages` includes tessellation shader stages, the shader code of at least one stage must contain an `OpExecutionMode` instruction specifying the type of subdivision in the pipeline

- VUID-VkGraphicsPipelineCreateInfo-pStages-00733
  If the pipeline requires `pre-rasterization shader state` and `pStages` includes tessellation shader stages, and the shader code of both stages contain an `OpExecutionMode` instruction specifying the type of subdivision in the pipeline, they must both specify the same subdivision mode

- VUID-VkGraphicsPipelineCreateInfo-pStages-00734
  If the pipeline requires `pre-rasterization shader state` and `pStages` includes tessellation shader stages, the shader code of at least one stage must contain an `OpExecutionMode` instruction specifying the output patch size in the pipeline

- VUID-VkGraphicsPipelineCreateInfo-pStages-00735
  If the pipeline requires `pre-rasterization shader state` and `pStages` includes tessellation shader stages, and the shader code of both contain an `OpExecutionMode` instruction specifying the out patch size in the pipeline, they must both specify the same patch size

- VUID-VkGraphicsPipelineCreateInfo-pStages-08888
  If the pipeline is being created with `pre-rasterization shader state` and `vertex input state` and `pStages` includes tessellation shader stages, and either `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state is not enabled or `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, the topology member of `pInputAssembly` must be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`

- VUID-VkGraphicsPipelineCreateInfo-topology-08773
  If the pipeline is being created with `pre-rasterization shader state` and `vertex input state` and the `topology` member of `pInputAssembly` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, and either `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state is not enabled or `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, then `pStages` must include tessellation shader stages

- VUID-VkGraphicsPipelineCreateInfo-TemplateTessellationEvaluation-07723
  If the pipeline is being created with a `TessellationEvaluation Execution Model`, no `Geometry Execution Model`, uses the `PointMode` Execution Mode, and `shaderTessellationAndGeometryPointSize` is enabled, a `PointSize` decorated variable must be written to if `maintenance5` is not enabled

- VUID-VkGraphicsPipelineCreateInfo-topology-08889
  If the pipeline is being created with `pre-rasterization shader state` and `vertex input state` and the `topology` member of `pInputAssembly` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, and either `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state is not enabled or `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, then `pStages` must include tessellation shader stages
VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state is not enabled or
dynamicPrimitiveTopologyUnrestricted is VK_FALSE, a PointSize decorated variable must be
written to if maintenance5 is not enabled

- VUID-VkGraphicsPipelineCreateInfo-maintenance5-08775
  If maintenance5 is enabled and a PointSize decorated variable is written to, all execution
  paths must write to a PointSize decorated variable

- VUID-VkGraphicsPipelineCreateInfo-TessellationEvaluation-07724
  If the pipeline is being created with a TessellationEvaluation Execution Model, no Geometry
  Execution Model, uses the PointMode Execution Mode, and shaderTessellationAndGeometryPointSize is not enabled, a PointSize decorated variable must not be written to

- VUID-VkGraphicsPipelineCreateInfo-shaderTessellationAndGeometryPointSize-08776
  If the pipeline is being created with a Geometry Execution Model, uses the OutputPoints
  Execution Mode, and shaderTessellationAndGeometryPointSize is enabled, a PointSize decorated variable must be written to for every vertex emitted if maintenance5 is not enabled

- VUID-VkGraphicsPipelineCreateInfo-Geometry-07726
  If the pipeline is being created with a Geometry Execution Model, uses the OutputPoints
  Execution Mode, and shaderTessellationAndGeometryPointSize is not enabled, a PointSize decorated variable must not be written to

- VUID-VkGraphicsPipelineCreateInfo-pStages-00738
  If the pipeline requires pre-rasterization shader state and pStages includes a geometry
  shader stage, and does not include any tessellation shader stages, its shader code must
  contain an OpExecutionMode instruction specifying an input primitive type that is
  compatible with the primitive topology specified in pInputAssembly

- VUID-VkGraphicsPipelineCreateInfo-pStages-00739
  If the pipeline requires pre-rasterization shader state and pStages includes a geometry
  shader stage, and also includes tessellation shader stages, its shader code must contain an
  OpExecutionMode instruction specifying an input primitive type that is compatible with the
  primitive topology that is output by the tessellation stages

- VUID-VkGraphicsPipelineCreateInfo-pStages-00740
  If the pipeline requires pre-rasterization shader state and fragment shader state,
  includes both a fragment shader and a geometry shader, and the fragment shader code
  reads from an input variable that is decorated with PrimitiveId, then the geometry shader
  code must write to a matching output variable, decorated with PrimitiveId, in all
  execution paths

- VUID-VkGraphicsPipelineCreateInfo-PrimitiveId-06264
  If the pipeline requires pre-rasterization shader state, it includes a mesh shader and the
  fragment shader code reads from an input variable that is decorated with PrimitiveId, then the mesh shader code must write to a matching output variable, decorated with PrimitiveId, in all execution paths

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06038
  If renderPass is not VK_NULL_HANDLE and the pipeline is being created with fragment
  shader state the fragment shader must not read from any input attachment that is
defined as `VK_ATTACHMENT_UNUSED` in `subpass`

- VUID-VkGraphicsPipelineCreateInfo-pStages-00742  
  If the pipeline requires pre-rasterization shader state and multiple pre-rasterization shader stages are included in `pStages`, the shader code for the entry points identified by those `pStages` and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter

- VUID-VkGraphicsPipelineCreateInfo-None-04889  
  If the pipeline requires pre-rasterization shader state and fragment shader state, the fragment shader and last pre-rasterization shader stage and any relevant state must adhere to the pipeline linking rules described in the Shader Interfaces chapter

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06041  
  If `renderPass` is not `VK_NULL_HANDLE`, and the pipeline is being created with fragment output interface state, then for each color attachment in the subpass, if the potential format features of the format of the corresponding attachment description do not contain `VK_FORMATFeatureCOLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`

- VUID-VkGraphicsPipelineCreateInfo-renderPass-07609  
  If `renderPass` is not `VK_NULL_HANDLE`, and the pipeline is being created with fragment output interface state, and the `pColorBlendState` pointer is not NULL, and the subpass uses color attachments, the `attachmentCount` member of `pColorBlendState` must be equal to the `colorAttachmentCount` used to create `subpass`

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04130  
  If the pipeline requires pre-rasterization shader state, and `pViewportState->pViewports` is not dynamic, then `pViewportState->pViewports` must be a valid pointer to an array of `pViewportState->viewportCount` valid `VkViewport` structures

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04131  
  If the pipeline requires pre-rasterization shader state, and `pViewportState->pScissors` is not dynamic, then `pViewportState->pScissors` must be a valid pointer to an array of `pViewportState->scissorCount` `VkRect2D` structures

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00749  
  If the pipeline requires pre-rasterization shader state, and the `wideLines` feature is not enabled, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_LINE_WIDTH`, the `lineWidth` member of `pRasterizationState` must be 1.0

- VUID-VkGraphicsPipelineCreateInfo-rasterizerDiscardEnable-09024  
  If the pipeline requires pre-rasterization shader state, and the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state is enabled or the `rasterizerDiscardEnable` member of `pRasterizationState` is `VK_FALSE`, and either the `VK_EXT_extended_dynamic_state3` extension is not enabled, or either the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` or `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic states are not set, `pViewportState` must be a valid pointer to a valid `VkPipelineViewportStateCreateInfo` structure

- VUID-VkGraphicsPipelineCreateInfo-pViewportState-09025  
  If `pViewportState` is not NULL it must be a valid pointer to a valid `VkPipelineViewportStateCreateInfo` structure
If the pipeline requires pre-rasterization shader state, and the graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE} dynamic state enabled, \texttt{pViewportState} must be a valid pointer to a valid \texttt{VkPipelineViewportStateCreateInfo} structure.

If the pipeline requires fragment output interface state, and the \texttt{VK_EXT_extended_dynamic_state3} extension is not enabled or any of the \texttt{VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT}, \texttt{VK_DYNAMIC_STATE_SAMPLE_MASK_EXT}, or \texttt{VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT} dynamic states is not set, or \texttt{alphaToOne} is enabled on the device and \texttt{VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT} is not set, \texttt{pMultisampleState} must be a valid pointer to a valid \texttt{VkPipelineMultisampleStateCreateInfo} structure.

If \texttt{pMultisampleState} is not \texttt{NULL} it must be a valid pointer to a valid \texttt{VkPipelineMultisampleStateCreateInfo} structure.

If the pipeline is being created with fragment shader state, the \texttt{VkPipelineMultisampleStateCreateInfo::alphaToCoverageEnable} is not ignored and is \texttt{VK_TRUE}, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

If \texttt{renderPass} is not \texttt{VK_NULL_HANDLE}, the pipeline is being created with fragment shader state, and \texttt{subpass} uses a depth/stencil attachment, and the \texttt{VK_EXT_extended_dynamic_state3} extension is not enabled or any of the \texttt{VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE}, \texttt{VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE}, \texttt{VK_DYNAMIC_STATE_DEPTH_COMPARE_OP}, \texttt{VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE}, \texttt{VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE}, \texttt{VK_DYNAMIC_STATE_STENCIL_OP}, or \texttt{VK_DYNAMIC_STATE_DEPTH_BOUNDS} dynamic states are not set, \texttt{pDepthStencilState} must be a valid pointer to a valid \texttt{VkPipelineDepthStencilStateCreateInfo} structure.

If \texttt{pDepthStencilState} is not \texttt{NULL} it must be a valid pointer to a valid \texttt{VkPipelineDepthStencilStateCreateInfo} structure.

If \texttt{renderPass} is not \texttt{VK_NULL_HANDLE}, the pipeline is being created with fragment output interface state, and \texttt{subpass} uses color attachments, and \texttt{VK_EXT_extended_dynamic_state3} extension is not enabled, or any of the \texttt{VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT}, \texttt{VK_DYNAMIC_STATE_LOGIC_OP_EXT}, \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT}, \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT}, \texttt{VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT}, or \texttt{VK_DYNAMIC_STATE_BLEND_CONSTANTS} dynamic states are not set, \texttt{pColorBlendState} must be a valid pointer to a valid \texttt{VkPipelineColorBlendStateCreateInfo} structure.

If the pipeline requires pre-rasterization shader state, the \texttt{depthBiasClamp} feature is not enabled, no element of the \texttt{pDynamicStates} member of \texttt{pDynamicState} is \texttt{VK_DYNAMIC_STATE_DEPTH_BIAS}, and the \texttt{depthBiasEnable} member of \texttt{pRasterizationState} is
VK_TRUE, the depthBiasClamp member of pRasterizationState must be 0.0.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-02510**
  If the pipeline requires fragment shader state, and the VK_EXT_depth_range_unrestricted extension is not enabled and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DEPTH_BOUNDS, and the depthBoundsTestEnable member of pDepthStencilState is VK_TRUE, the minDepthBounds and maxDepthBounds members of pDepthStencilState must be between 0.0 and 1.0, inclusive.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07610**
  If the pipeline requires fragment shader state or fragment output interface state, and rasterizationSamples and sampleLocationsInfo are not dynamic, andVkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable included in the pNext chain of pMultisampleState is VK_TRUE, sampleLocationsInfo.sampleLocationGridSize.width must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.width as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07611**
  If the pipeline requires fragment shader state or fragment output interface state, and rasterizationSamples and sampleLocationsInfo are not dynamic, and VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable the included in the pNext chain of pMultisampleState is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT is used, sampleLocationsInfo.sampleLocationGridSize.height must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.height as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07612**
  If the pipeline requires fragment shader state or fragment output interface state, and rasterizationSamples and sampleLocationsInfo are not dynamic, and VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable included in the pNext chain of pMultisampleState is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT is used, sampleLocationsInfo.sampleLocationsPerPixel must equal rasterizationSamples.

- **VUID-VkGraphicsPipelineCreateInfo-sampleLocationsEnable-01524**
  If the pipeline requires fragment shader state, and the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT structure included in the pNext chain of pMultisampleState is VK_TRUE, the fragment shader code must not statically use the extended instruction InterpolateAtSample.

- **VUID-VkGraphicsPipelineCreateInfo-multisampledRenderToSingleSampled-06853**
  If the pipeline requires fragment output interface state, and none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature are enabled, rasterizationSamples is not dynamic, and if subpass uses color and/or depth/stencil attachments, then the rasterizationSamples member of pMultisampleState must be the same as the sample count for those subpass attachments.
If the pipeline requires fragment output interface state, and the VK_AMD_mixed_attachment_samples extension is enabled, rasterizationSamples is not dynamic, and if subpass uses color and/or depth/stencil attachments, then the rasterizationSamples member of pMultisampleState must equal the maximum of the sample counts of those subpass attachments.

If renderPass is not VK_NULL_HANDLE, the VK_EXT_multisampled_render_to_single_sampled extension is enabled, rasterizationSamples is not dynamic, and subpass has a VkMultisampledRenderToSingleSampledInfoEXT structure included in the VkSubpassDescription2::pNext chain with multisampledRenderToSingleSampledEnable equal to VK_TRUE, then the rasterizationSamples member of pMultisampleState must be equal to VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples.

If the pipeline requires fragment output interface state, the VK_NV_framebuffer_mixed_samples extension is enabled, rasterizationSamples is not dynamic, and if subpass has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled, then the rasterizationSamples member of pMultisampleState must be the same as the sample count of the depth/stencil attachment.

If the pipeline requires fragment output interface state, the VK_NV_framebuffer_mixed_samples extension is enabled, rasterizationSamples is not dynamic, and if subpass has any color attachments, then the rasterizationSamples member of pMultisampleState must be greater than or equal to the sample count for those subpass attachments.

If the pipeline requires fragment output interface state, the VK_NV_coverage_reduction_mode extension is enabled, and rasterizationSamples is not dynamic, the coverage reduction mode specified by VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode, the rasterizationSamples member of pMultisampleState and the sample counts for the color and depth/stencil attachments (if the subpass has them) must be a valid combination returned by vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV.

If the pipeline requires fragment output interface state, rasterizationSamples is not dynamic, and subpass does not use any color and/or depth/stencil attachments, then the rasterizationSamples member of pMultisampleState must follow the rules for a zero-attachment subpass.

If renderPass is not VK_NULL_HANDLE, subpass must be a valid subpass within renderPass.

If renderPass is not VK_NULL_HANDLE, the pipeline is being created with prerasterization shader state, subpass viewMask is not 0, and multiviewTessellationShader is not enabled, then pStages must not include tessellation shaders.
If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, `subpass` viewMask is not 0, and `multiviewGeometryShader` is not enabled, then `pStages` **must** not include a geometry shader.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06049
  If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, and `subpass` viewMask is not 0, all of the shaders in the pipeline **must** not write to the `Layer` built-in output.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06050
  If `renderPass` is not `VK_NULL_HANDLE` and the pipeline is being created with pre-rasterization shader state, and `subpass` viewMask is not 0, then all of the shaders in the pipeline **must** not include variables decorated with the `Layer` built-in decoration in their interfaces.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-07717
  If `renderPass` is not `VK_NULL_HANDLE` and the pipeline is being created with pre-rasterization shader state, and `subpass` viewMask is not 0, then all of the shaders in the pipeline **must** not include variables decorated with the `ViewMask` built-in decoration in their interfaces.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-07064
  If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, `subpass` viewMask is not 0, and `multiviewMeshShader` is not enabled, then `pStages` **must** not include a mesh shader.

- VUID-VkGraphicsPipelineCreateInfo-flags-00764
  `flags` **must** not contain the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag.

- VUID-VkGraphicsPipelineCreateInfo-pStages-01565
  If the pipeline requires fragment shader state and an input attachment was referenced by an `aspectMask` at `renderPass` creation time, the fragment shader **must** only read from the aspects that were specified for that input attachment.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-01688
  The number of resources in `layout` accessible to each shader stage that is used by the pipeline **must** be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-01715
  If the pipeline requires pre-rasterization shader state, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV`, and the `viewportWScalingEnable` member of a `VkPipelineViewportWScalingStateCreateInfoNV` structure, included in the `pNext` chain of `pViewportState`, is `VK_TRUE`, the `pViewportWScalings` member of the `VkPipelineViewportWScalingStateCreateInfoNV` **must** be a pointer to an array of `VkPipelineViewportWScalingStateCreateInfoNV::_viewportCount` valid `VkViewportWScalingNV` structures.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04056
  If the pipeline requires pre-rasterization shader state, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV`, and if `pViewportState->pNext` chain includes a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure, and if its `exclusiveScissorCount` member is not 0, then its `pExclusiveScissors` member **must** be a
valid pointer to an array of exclusiveScissorCount VkRect2D structures

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07854
  If VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV is included in the pDynamicStates array then the implementation must support at least specVersion 2 of the VK_NV_scissor_exclusive extension

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04057
  If the pipeline requires pre-rasterization shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV, and if pViewportState->pNext chain includes a VkPipelineViewportShadingRateImageStateCreateInfoNV structure, then its pShadingRatePalettes member must be a valid pointer to an array of viewportCount valid VkShadingRatePaletteNV structures

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07855
  If VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT is included in the pDynamicStates array then the implementation must support at least specVersion 2 of the VK_EXT_discard_rectangles extension

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07856
  If VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT is included in the pDynamicStates array then the implementation must support at least specVersion 2 of the VK_EXT_discard_rectangles extension

- VUID-VkGraphicsPipelineCreateInfo-pStages-02097
  If the pipeline requires vertex input state, and pVertexInputState is not dynamic, then pVertexInputState must be a valid pointer to a valid VkPipelineVertexInputStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-Input-07904
  If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, and VkVertexInputAttributeDescription::format has a 64-bit component, then the scalar width associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must contain a location in VkVertexInputAttributeDescription::location

- VUID-VkGraphicsPipelineCreateInfo-Input-08733
  If the pipeline requires vertex input state and pVertexInputState is not dynamic, then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription::format

- VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-08929
  If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, and VkVertexInputAttributeDescription::format has a 64-bit component, then the scalar width associated with all Input variables of the corresponding Location in the
**Vertex Execution Model OpEntryPoint must** be 64-bit

- **VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-08930**
  If the pipeline is being created with *vertex input state* and *pVertexInputState* is not dynamic, and the scalar width associated with a *Location* decorated *Input* variable in the *Vertex Execution Model OpEntryPoint* is 64-bit, then the corresponding *VkVertexInputAttributeDescription::format* must have a 64-bit component.

- **VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-09198**
  If the pipeline is being created with *vertex input state* and *pVertexInputState* is not dynamic, and *VkVertexInputAttributeDescription::format* has a 64-bit component, then all *Input* variables at the corresponding *Location* in the *Vertex Execution Model OpEntryPoint* must not use components that are not present in the format.

- **VUID-VkGraphicsPipelineCreateInfo-dynamicPrimitiveTopologyUnrestricted-09031**
  If the pipeline requires *vertex input state*, and the *VK_EXT_extended_dynamic_state3* extension is not enabled, or either *VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE*, or *VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY* dynamic states are not set, or *dynamicPrimitiveTopologyUnrestricted* is *VK_FALSE*, *pInputAssemblyState* must be a valid pointer to a valid *VkPipelineInputAssemblyStateCreateInfo* structure.

- **VUID-VkGraphicsPipelineCreateInfo-pInputAssemblyState-09032**
  If *pInputAssemblyState* is not NULL it must be a valid pointer to a valid *VkPipelineInputAssemblyStateCreateInfo* structure.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-02317**
  If the pipeline requires *pre-rasterization shader state*, the *Xfb execution mode* can be specified by no more than one shader stage in *pStages*.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-02318**
  If the pipeline requires *pre-rasterization shader state*, and any shader stage in *pStages* specifies *Xfb execution mode* it must be the last *pre-rasterization shader stage*.

- **VUID-VkGraphicsPipelineCreateInfo-rasterizationStream-02319**
  If the pipeline requires *pre-rasterization shader state*, and a *VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream* value other than zero is specified, all variables in the output interface of the entry point being compiled decorated with *Position, PointSize, ClipDistance*, or *CullDistance* must be decorated with identical *Stream* values that match the *rasterizationStream*.

- **VUID-VkGraphicsPipelineCreateInfo-rasterizationStream-02320**
  If the pipeline requires *pre-rasterization shader state*, and a *VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream* is zero, or not specified, all variables in the output interface of the entry point being compiled decorated with *Position, PointSize, ClipDistance*, or *CullDistance* must be decorated with a *Stream* value of zero, or must not specify the *Stream* decoration.

- **VUID-VkGraphicsPipelineCreateInfo-geometryStreams-02321**
  If the pipeline requires *pre-rasterization shader state*, and the last *pre-rasterization shader stage* is a geometry shader, and that geometry shader uses the *GeometryStreams* capability, then *VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams* feature must be enabled.

- **VUID-VkGraphicsPipelineCreateInfo-None-02322**
If the pipeline requires pre-rasterization shader state, and there are any mesh shader stages in the pipeline there must not be any shader stage in the pipeline with a Xfb execution mode

- **VUID-VkGraphicsPipelineCreateInfo-lineRasterizationMode-02766**
  If the pipeline requires pre-rasterization shader state and at least one of fragment output interface state or fragment shader state, and pMultisampleState is not NULL, the lineRasterizationMode member of a VkPipelineRasterizationLineStateCreateInfoEXT structure included in the pNext chain of pRasterizationState is VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT or VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT, then the alphaToCoverageEnable, alphaToOneEnable, and sampleShadingEnable members of pMultisampleState must all be VK_FALSE

- **VUID-VkGraphicsPipelineCreateInfo-stippledLineEnable-02767**
  If the pipeline requires pre-rasterization shader state, the stippledLineEnable member of VkPipelineRasterizationLineStateCreateInfoEXT is VK_TRUE, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_LINE_STIPPLE_EXT, then the lineStippleFactor member of VkPipelineRasterizationLineStateCreateInfoEXT must be in the range [1, 256]

- **VUID-VkGraphicsPipelineCreateInfo-flags-03372**
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR

- **VUID-VkGraphicsPipelineCreateInfo-flags-03373**
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR

- **VUID-VkGraphicsPipelineCreateInfo-flags-03374**
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR

- **VUID-VkGraphicsPipelineCreateInfo-flags-03375**
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR

- **VUID-VkGraphicsPipelineCreateInfo-flags-03376**
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR

- **VUID-VkGraphicsPipelineCreateInfo-flags-03377**
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR

- **VUID-VkGraphicsPipelineCreateInfo-flags-03577**
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR

- **VUID-VkGraphicsPipelineCreateInfo-flags-04947**
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03378**
  If the extendedDynamicState feature is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is less than Version 1.3 there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_CULL_MODE, VK_DYNAMIC_STATE_FRONT_FACE, VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY, VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT, or VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT,
VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE, VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE, VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE, VK_DYNAMIC_STATE_DEPTH_COMPARE_OP, VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE, or VK_DYNAMIC_STATE_STENCIL_OP

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03379**
  If the pipeline requires pre-rasterization shader state, and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT is included in the pDynamicStates array then viewportCount must be zero

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03380**
  If the pipeline requires pre-rasterization shader state, and VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT is included in the pDynamicStates array then scissorCount must be zero

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04132**
  If the pipeline requires pre-rasterization shader state, and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT is included in the pDynamicStates array then VK_DYNAMIC_STATE_VIEWPORT must not be present

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04133**
  If the pipeline requires pre-rasterization shader state, and VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT is included in the pDynamicStates array then VK_DYNAMIC_STATE_SCISSOR must not be present

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07065**
  If the pipeline requires pre-rasterization shader state, and includes a mesh shader, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY, or VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04868**
  If the extendedDynamicState2 feature is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is less than Version 1.3 there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE, VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE, or VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04869**
  If the extendedDynamicState2LogicOp feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_LOGIC_OP_EXT

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04870**
  If the extendedDynamicState2PatchControlPoints feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07066**
  If the pipeline requires pre-rasterization shader state, and includes a mesh shader, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE, or VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT

- **VUID-VkGraphicsPipelineCreateInfo-flags-02877**
  If flags includes VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV, then the deviceGeneratedCommands feature must be enabled
If the pipeline requires pre-rasterization shader state and flags includes `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`, then all stages must not specify Xfb execution mode.

If the pipeline is not created with a complete set of state, or `VkPipelineLibraryCreateInfoKHR::libraryCount` is not 0, `VkGraphicsPipelineShaderGroupsCreateInfoNV::groupCount` and `VkGraphicsPipelineShaderGroupsCreateInfoNV::pipelineCount` must be 0.

If the pipeline is created with a complete set of state, and `VkPipelineLibraryCreateInfoKHR::libraryCount` is 0, and the pNext chain includes an instance of `VkGraphicsPipelineShaderGroupsCreateInfoNV`, `VkGraphicsPipelineShaderGroupsCreateInfoNV::groupCount` must be greater than 0.

If the pipelineCreationCacheControl feature is not enabled, flags must not include `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` or `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`.

If the pipelineProtectedAccess feature is not enabled, flags must not include `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT` or `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`.

Flags must not include both `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT` and `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`.

If the pipeline requires pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in pDynamicState->pDynamicStates, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width` must be greater than or equal to 1.

If the pipeline requires pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in pDynamicState->pDynamicStates, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height` must be greater than or equal to 1.

If the pipeline requires pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in pDynamicState->pDynamicStates, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width` must be a power-of-two value.

If the pipeline requires pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in pDynamicState->pDynamicStates, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width` must be a power-of-two value.
::fragmentSize.height must be a power-of-two value

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04498
  If the pipeline requires pre-rasterization shader state or fragment shader state and 
  VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState- 
  >pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width 
  must be less than or equal to 4

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04499
  If the pipeline requires pre-rasterization shader state or fragment shader state and 
  VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState- 
  >pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height must be less than or equal to 4

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04500
  If the pipeline requires pre-rasterization shader state or fragment shader state and 
  VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState- 
  >pDynamicStates and the pipelineFragmentShadingRate feature is not enabled, 
  VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width and 
  VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height must both be equal to 1

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06567
  If the pipeline requires pre-rasterization shader state or fragment shader state and 
  VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState- 
  >pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0] must be a valid VkFragmentShadingRateCombinerOpKHR value

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06568
  If the pipeline requires pre-rasterization shader state or fragment shader state and 
  VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState- 
  >pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1] must be a valid VkFragmentShadingRateCombinerOpKHR value

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04501
  If the pipeline requires pre-rasterization shader state or fragment shader state and 
  VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState- 
  >pDynamicStates and the primitiveFragmentShadingRate feature is not enabled, 
  VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0] must be 
  VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04502
  If the pipeline requires pre-rasterization shader state or fragment shader state and 
  VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState- 
  >pDynamicStates and the attachmentFragmentShadingRate feature is not enabled, 
  VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1] must be 
  VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR

- VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04503
  If the pipeline requires pre-rasterization shader state and the 
  primitiveFragmentShadingRateWithMultipleViewports limit is not supported, 
  VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT is not included in pDynamicState->pDynamicStates,
and `VkPipelineViewportStateCreateInfo::viewportCount` is greater than 1, entry points specified in `pStages` **must** not write to the `PrimitiveShadingRateKHR` built-in.

- **VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04504**
  If the pipeline requires pre-rasterization shader state and the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and entry points specified in `pStages` write to the `ViewportIndex` built-in, they **must** not also write to the `PrimitiveShadingRateKHR` built-in.

- **VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04505**
  If the pipeline requires pre-rasterization shader state and the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and entry points specified in `pStages` write to the `ViewportMaskNV` built-in, they **must** not also write to the `PrimitiveShadingRateKHR` built-in.

- **VUID-VkGraphicsPipelineCreateInfo-fragmentShadingRateNonTrivialCombinerOps-04506**
  If the pipeline requires pre-rasterization shader state or fragment shader state, the `fragmentShadingRateNonTrivialCombinerOps` limit is not supported, and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, elements of `VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`.

- **VUID-VkGraphicsPipelineCreateInfo-None-06569**
  If the pipeline requires fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRateType` **must** be a valid `VkFragmentShadingRateTypeNV` value.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06570**
  If the pipeline requires fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate` **must** be a valid `VkFragmentShadingRateNV` value.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06571**
  If the pipeline requires fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[0]` **must** be a valid `VkFragmentShadingRateCombinerOpKHR` value.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06572**
  If the pipeline requires fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[1]` **must** be a valid `VkFragmentShadingRateCombinerOpKHR` value.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04569**
  If the pipeline requires fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the `fragmentShadingRateEnums` feature is not enabled,
• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04570
If the pipeline requires fragment shader state and
VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the pipelineFragmentShadingRate feature is not enabled,
VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate must be equal to
VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04571
If the pipeline requires fragment shader state and
VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the primitiveFragmentShadingRate feature is not enabled,
VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[0] must be
VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04572
If the pipeline requires fragment shader state and
VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the attachmentFragmentShadingRate feature is not enabled,
VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[1] must be
VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR or
VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR

• VUID-VkGraphicsPipelineCreateInfo-fragmentShadingRateNonTrivialCombinerOps-04573
If the pipeline requires fragment shader state, and the
fragmentShadingRateNonTrivialCombinerOps limit is not supported and
VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, elements of VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps must be
VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR or
VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR

• VUID-VkGraphicsPipelineCreateInfo-None-04574
If the pipeline requires fragment shader state, and the
supersampleFragmentShadingRates feature is not enabled,
VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate must not be equal to
VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV,
VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV,
VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV,
VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV

• VUID-VkGraphicsPipelineCreateInfo-None-04575
If the pipeline requires fragment shader state, and the
noInvocationFragmentShadingRates feature is not enabled,
VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate must not be equal to
VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03578
All elements of the pDynamicStates member of pDynamicState must not be
VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04807
If the pipeline requires pre-rasterization shader state and the vertexInputDynamicState feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_VERTEX_INPUT_EXT
If the pipeline requires pre-rasterization shader state, and includes a mesh shader, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_VERTEX_INPUT_EXT.

If the colorWriteEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT.

If the pipeline requires fragment shader state, and the VK_QCOM_render_pass_shader_resolve extension is enabled, rasterizationSamples is not dynamic, and if subpass has any input attachments, and if the subpass description contains VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM, then the sample count of the input attachments must equal rasterizationSamples.

If the pipeline requires fragment shader state, and the VK_QCOM_render_pass_shader_resolve extension is enabled, and if the subpass description contains VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM, then sampleShadingEnable must be false.

If flags includes VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM, then the subpass must be the last subpass in a subpass dependency chain.

If flags includes VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM, and if pResolveAttachments is not NULL, then each resolve attachment must be VK_ATTACHMENT_UNUSED.

If the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, renderPass must be VK_NULL_HANDLE or a valid render pass object.

If the dynamicRendering feature is not enabled and the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, renderPass must not be VK_NULL_HANDLE.

If the multiview feature is not enabled, the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::viewMask must be 0.

If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, the index of the most significant bit in VkPipelineRenderingCreateInfo::viewMask must be less than maxMultiviewViewCount.

If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, the index of the most significant bit in VkPipelineRenderingCreateInfo::viewMask must be less than maxMultiviewViewCount.
VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::colorAttachmentCount is not 0, VkPipelineRenderingCreateInfo::pColorAttachmentFormats must be a valid pointer to an array of colorAttachmentCount valid VkFormat values

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06580
  If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, each element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats must be a valid VkFormat value

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06582
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and any element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats is not VK_FORMAT_UNDEFINED, that format must be a format with potential format features that include VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06583
  If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::depthAttachmentFormat must be a valid VkFormat value

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06584
  If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::stencilAttachmentFormat must be a valid VkFormat value

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06585
  If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::depthAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format with potential format features that include VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06586
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format with potential format features that include VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06587
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::depthAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format that includes a depth component

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06588
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format that includes a stencil component

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06589
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::depthAttachmentFormat is not VK_FORMAT_UNDEFINED, and VkPipelineRenderingCreateInfo::stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, depthAttachmentFormat must equal stencilAttachmentFormat
If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with fragment shader state and fragment output interface state, and either of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` or `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` are not `VK_FORMAT_UNDEFINED`, and the `VK_EXT_extended_dynamic_state3` extension is not enabled or any of the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`, `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`, or `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic states are not set, `pDepthStencilState` must be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure.

If `pDepthStencilState` is not `NULL` it must be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure.

If `renderPass` is `VK_NULL_HANDLE` and the pipeline is being created with fragment shader state but not fragment output interface state, and the `VK_EXT_extended_dynamic_state3` extension is not enabled, or any of the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`, `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_OP`, or `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic states are not set, `pDepthStencilState` must be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure.

If `pDepthStencilState` is not `NULL` it must be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure.

If `renderPass` is `VK_NULL_HANDLE` and the pipeline is being created with fragment output interface state, `pColorBlendState->attachmentCount` must be equal to `VkPipelineRenderingCreateInfo::colorAttachmentCount`.

If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, `VkPipelineRenderingCreateInfo::viewMask` is not `0`, and the `multiviewTessellationShader` feature is not enabled, then `pStages` must not include...
 tessellation shaders

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06058
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, VkPipelineRenderingCreateInfo::viewMask is not 0, and the multiviewGeometryShader feature is not enabled, then pStages must not include a geometry shader

• VUID-VkGraphicsPipelineCreateInfo-renderPass-07718
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, and VkPipelineRenderingCreateInfo::viewMask is not 0, all of the shaders in the pipeline must not write to the Layer built-in output

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06059
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, and VkPipelineRenderingCreateInfo::viewMask is not 0, all of the shaders in the pipeline must not include variables decorated with the Layer built-in decoration in their interfaces

• VUID-VkGraphicsPipelineCreateInfo-renderPass-07719
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, and VkPipelineRenderingCreateInfo::viewMask is not 0, all of the shaders in the pipeline must not include variables decorated with the ViewIndex built-in decoration in their interfaces

• VUID-VkGraphicsPipelineCreateInfo-renderPass-07720
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, and VkPipelineRenderingCreateInfo::viewMask is not 0, and multiviewMeshShader is not enabled, then pStages must not include a mesh shader

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06061
  If the pipeline requires fragment shader state and renderPass is VK_NULL_HANDLE, fragment shaders in pStages must not include the InputAttachment capability

• VUID-VkGraphicsPipelineCreateInfo-renderPass-08710
  If the pipeline requires fragment shader state and renderPass is not VK_NULL_HANDLE, fragment shaders in pStages must not include any of the TileImageColorReadAccessEXT, TileImageDepthReadAccessEXT, or TileImageStencilReadAccessEXT capabilities

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06062
  If the pipeline requires fragment output interface state and renderPass is VK_NULL_HANDLE, for each color attachment format defined by the pColorAttachmentFormats member of VkPipelineRenderingCreateInfo, if its potential format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06063
  If the pipeline requires fragment output interface state and renderPass is VK_NULL_HANDLE, if the pNext chain includes VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV, the colorAttachmentCount member of that structure must be equal to the value of VkPipelineRenderingCreateInfo::colorAttachmentCount

• VUID-VkGraphicsPipelineCreateInfo-flags-06591
If `pStages` includes a fragment shader stage, and the fragment shader declares the `EarlyFragmentTests` execution mode, the `flags` member of `VkPipelineDepthStencilStateCreateInfo` must not include `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT` or `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06482**
  If the pipeline requires fragment output interface state and the `flags` member of `VkPipelineColorBlendStateCreateInfo` includes `VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT`, `renderpass` must not be `VK_NULL_HANDLE`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06483**
  If the pipeline requires fragment output interface state and the `flags` member of `VkPipelineDepthStencilStateCreateInfo` includes `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT` or `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`, `renderpass` must not be `VK_NULL_HANDLE`.

- **VUID-VkGraphicsPipelineCreateInfo-pColorAttachmentSamples-06592**
  If the fragment output interface state, elements of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` must be valid `VkSampleCountFlagBits` values.

- **VUID-VkGraphicsPipelineCreateInfo-depthStencilAttachmentSamples-06593**
  If the fragment output interface state and the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` is not 0, it must be a valid `VkSampleCountFlagBits` value.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06484**
  If the pipeline requires fragment shader state and the `flags` member of `VkPipelineDepthStencilStateCreateInfo` includes `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT`, `subpass` must have been created with `VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06485**
  If the pipeline requires fragment shader state and the `flags` member of `VkPipelineDepthStencilStateCreateInfo` includes `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`, `subpass` must have been created with `VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06486**
  If the pipeline requires fragment shader state and the `flags` member of `VkPipelineDepthStencilStateCreateInfo` includes `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`, `subpass` must have been created with `VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`.
If \texttt{VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount} is not 0, it must be equal to stageCount.

If \texttt{renderPass} is \texttt{VK_NULL_HANDLE}, the pipeline is being created with pre-rasterization shader state or fragment shader state, and \texttt{VkMultiviewPerViewAttributesInfoNVX::perViewAttributesPositionXOnly} is \texttt{VK_TRUE} then \texttt{VkMultiviewPerViewAttributesInfoNVX::perViewAttributes} must also be \texttt{VK_TRUE}.

If \texttt{VkGraphicsPipelineLibraryCreateInfoEXT::flags} includes only one of \texttt{VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT} or \texttt{VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT}, and an element of \texttt{VkPipelineLibraryCreateInfoKHR::pLibraries} includes the other flag, the value of \texttt{VkMultiviewPerViewAttributesInfoNVX::perViewAttributes} specified in both this pipeline and the library must be equal.

If one element of \texttt{VkPipelineLibraryCreateInfoKHR::pLibraries} includes \texttt{VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT} and another element includes \texttt{VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT}, the value of \texttt{VkMultiviewPerViewAttributesInfoNVX::perViewAttributes} specified in both libraries must be equal.

If the pipeline requires pre-rasterization shader state or fragment shader state, \texttt{pStages} must be a valid pointer to an array of stageCount valid \texttt{VkPipelineShaderStageCreateInfo} structures.

If the \texttt{VK_EXT_extended_dynamic_state3} extension is not enabled, or any of the \texttt{VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT}, \texttt{VK_DYNAMIC_STATE_SAMPLE_MASK_EXT}, or \texttt{VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT} dynamic states are not set, or \texttt{alphaToOne} is enabled on the device and \texttt{VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT} is not set, then \texttt{pMultisampleState} must be a valid pointer to a valid \texttt{VkPipelineMultisampleStateCreateInfo} structure.
If \( pRasterizationState \) is not \( \text{NULL} \) it \textbf{must} be a valid pointer to a valid \texttt{VkPipelineRasterizationStateCreateInfo} structure.

If the pipeline requires fragment shader state or pre-rasterization shader state, \texttt{layout} \textbf{must} be a valid \texttt{VkPipelineLayout} handle.

If \( \text{pre-rasterization shader state, fragment shader state, or fragment output state} \), and \( \text{renderPass} \) is not \( \text{VK_NULL_HANDLE} \), \( \text{renderPass} \) \textbf{must} be a valid \texttt{VkRenderPass} handle.

If the pipeline requires \( \text{pre-rasterization shader state or fragment shader state} \), \( \text{stageCount} \) \textbf{must} be greater than \( 0 \).

If the \texttt{graphicsPipelineLibrary} feature is not enabled, \texttt{flags} \textbf{must} not include \( \texttt{VK_PIPELINE_CREATE_LIBRARY_BIT_KHR} \).

If the pipeline defines, or includes as libraries, all the state subsets required for a complete graphics pipeline, \texttt{flags} \textbf{must} not include \( \texttt{VK_PIPELINE_CREATE_LIBRARY_BIT_KHR} \).

If \texttt{flags} includes \( \texttt{VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT} \), pipeline libraries included via \texttt{VkPipelineLibraryCreateInfoKHR} \textbf{must} have been created with \( \texttt{VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT} \).

If \texttt{flags} includes \( \texttt{VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT} \), \texttt{flags} \textbf{must} also include \( \texttt{VK_PIPELINE_CREATE_LIBRARY_BIT_KHR} \).

If \texttt{flags} includes \( \texttt{VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT} \), pipeline libraries included via \texttt{VkPipelineLibraryCreateInfoKHR} \textbf{must} have been created with \( \texttt{VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT} \).

Any pipeline libraries included via \texttt{VkPipelineLibraryCreateInfoKHR::pLibraries} \textbf{must} not include any state subset already defined by this structure or defined by any other pipeline library in \texttt{VkPipelineLibraryCreateInfoKHR::pLibraries}.

If \texttt{VkGraphicsPipelineLibraryCreateInfoEXT::flags} includes only one of \( \texttt{VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT} \) or \( \texttt{VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT} \), and an element of \texttt{VkPipelineLibraryCreateInfoKHR::pLibraries} includes the other flag, and \texttt{layout} was not created with \( \texttt{VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT} \), then the \texttt{layout} used by this pipeline and the library \textbf{must} be \textit{identically defined}.

If one element of \texttt{VkPipelineLibraryCreateInfoKHR::pLibraries} includes \( \texttt{VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT} \) and another element
includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and the layout specified by either library was not created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, then the layout used by each library must be identically defined.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06614**
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other subset, and layout was created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, then the layout used by each library must also have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06615**
  If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` and another element includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and the layout specified by either library was created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, then the layout used by both libraries must have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06616**
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other subset, and layout was created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, elements of the `pSetLayouts` array which layout was created with that are not `VK_NULL_HANDLE` must be identically defined to the element at the same index of `pSetLayouts` used to create the library's layout.

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06617**
  If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` and another element includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and the layout specified by either library was created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, elements of the `pSetLayouts` array which either layout was created with that are not `VK_NULL_HANDLE` must be identically defined to the element at the same index of `pSetLayouts` used to create the other library's layout.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06618**
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other flag, any descriptor set layout \( N \) specified by layout in both this pipeline and the library which include bindings accessed by shader stages in each must be identically defined.

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06619**
  If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes...
VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, any descriptor set layout \( N \) specified by layout in both libraries which include bindings accessed by shader stages in each **must be identically defined**

- **VUID-VkGraphicsPipelineCreateInfo-flags-06620**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other flag, push constants specified in layout in both this pipeline and the library which are available to shader stages in each **must be identically defined**

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06621**
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, push constants specified in layout in both this pipeline and the library which are available to shader stages in each **must be identically defined**

- **VUID-VkGraphicsPipelineCreateInfo-flags-06679**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other subset, and any element of the pSetLayouts array which layout was created with was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create the library's layout **must not be** VK_NULL_HANDLE

- **VUID-VkGraphicsPipelineCreateInfo-flags-06680**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other subset, and any element of the pSetLayouts array used to create each library's layout was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create this pipeline's layout **must not be** VK_NULL_HANDLE

- **VUID-VkGraphicsPipelineCreateInfo-flags-06681**
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and any element of the pSetLayouts array used to create each library's layout was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create the other library's layout **must not be** VK_NULL_HANDLE

- **VUID-VkGraphicsPipelineCreateInfo-flags-06756**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other subset, and any element
of the pSetLayouts array which layout was created with was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create the library's layout must not have shader bindings for shaders in the other subset

- VUID-VkGraphicsPipelineCreateInfo-flags-06757
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of
  VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of
  VkPipelineLibraryCreateInfoKHR::pLibraries includes the other subset, and any element of the pSetLayouts array used to create the library's layout was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create this pipeline's layout must not have shader bindings for shaders in the other subset

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06758
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes
  VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and any element of the pSetLayouts array used to create each library's layout was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create the other library's layout must not have shader bindings for shaders in the other subset

- VUID-VkGraphicsPipelineCreateInfo-flags-06682
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes both
  VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, layout must have been created with no elements of the pSetLayouts array set to VK_NULL_HANDLE

- VUID-VkGraphicsPipelineCreateInfo-flags-06683
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes at least one of and no more than two of
  VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, or
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and an element of
  VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, the value of subpass must be equal to that used to create the library

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06623
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes at least one of and no more than two of
  VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, or
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and another element of
  VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, the value of subpass used to create each library must be identical

- VUID-VkGraphicsPipelineCreateInfo-renderpass-06624
  If renderpass is not VK_NULL_HANDLE, VkGraphicsPipelineLibraryCreateInfoEXT::flags
includes at least one of and no more than two of
VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT,
VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or
VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and an element of
VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, renderPass
must be compatible with that used to create the library

• VUID-VkGraphicsPipelineCreateInfo-renderpass-06625
If renderpass is VK_NULL_HANDLE, VkGraphicsPipelineLibraryCreateInfoEXT::flags
includes at least one of and no more than two of
VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT,
VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or
VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and an element of
VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, the value of
renderPass used to create that library must also be VK_NULL_HANDLE

• VUID-VkGraphicsPipelineCreateInfo-flags-06626
If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes at least one of and no more
than two of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT,
VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or
VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, an element of
VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, and
renderPass is VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::viewMask
used by this pipeline and that specified by the library must be identical

• VUID-VkGraphicsPipelineCreateInfo-pLibraries-06627
If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes at least one of
and no more than two of
VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT,
VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or
VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, another element of
VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, and
renderPass was VK_NULL_HANDLE for both libraries, the value of
VkPipelineRenderingCreateInfo::viewMask set by each library must be identical

• VUID-VkGraphicsPipelineCreateInfo-pLibraries-06628
If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes at least one of
and no more than two of
VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT,
VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or
VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and another element of
VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, the
renderPass objects used to create each library must be compatible or all equal to
VK_NULL_HANDLE

• VUID-VkGraphicsPipelineCreateInfo-pMultisampleState-06629
If the pipeline requires fragment shader state pMultisampleState must be NULL or a valid
pointer to a valid VkPipelineMultisampleStateCreateInfo structure

• VUID-VkGraphicsPipelineCreateInfo-renderpass-06631
If the pipeline requires fragment shader state and renderpass is not VK_NULL_HANDLE,
then **pMultisampleState must not be NULL**

- **VUID-VkGraphicsPipelineCreateInfo-Input-06632**
  If the pipeline requires fragment shader state with a fragment shader that either enables sample shading or decorates any variable in the Input storage class with Sample, then **pMultisampleState must not be NULL**

- **VUID-VkGraphicsPipelineCreateInfo-flags-06633**
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT` with a `pMultisampleState` that was not NULL, and an element of `VkPipelineLibraryCreateInfoKHR::plibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, **pMultisampleState must be identically defined** to that used to create the library

- **VUID-VkGraphicsPipelineCreateInfo-plibraries-06634**
  If an element of `VkPipelineLibraryCreateInfoKHR::plibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT` with a `pMultisampleState` that was not NULL, and if `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, **pMultisampleState must be identically defined** to that used to create the library

- **VUID-VkGraphicsPipelineCreateInfo-plibraries-06635**
  If one element of `VkPipelineLibraryCreateInfoKHR::plibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT` and a value of `pMultisampleState->sampleShading` equal `VK_TRUE`, and if a different element of `VkPipelineLibraryCreateInfoKHR::plibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, the **pMultisampleState used to create each library must be identically defined**

- **VUID-VkGraphicsPipelineCreateInfo-flags-06636**
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and an element of `VkPipelineLibraryCreateInfoKHR::plibraries` includes the other flag, values specified in `VkPipelineFragmentShadingRateStateCreateInfoKHR` for both this pipeline and that library **must be identical**

- **VUID-VkGraphicsPipelineCreateInfo-plibraries-06639**
  If one element of `VkPipelineLibraryCreateInfoKHR::plibraries` includes
VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, values specified in VkPipelineFragmentShadingRateStateCreateInfoKHR for both this pipeline and that library must be identical

- **VUID-VkGraphicsPipelineCreateInfo-flags-06640**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, pStages must be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures

- **VUID-VkGraphicsPipelineCreateInfo-flags-09041**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and the VK_EXT_extended_dynamic_state3 extension is not enabled, or any of the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT, VK_DYNAMIC_STATE_SAMPLE_MASK_EXT, or VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic states are not set, or alphaToOne is enabled on the device and VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT is not set, pMultisampleState must be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure

- **VUID-VkGraphicsPipelineCreateInfo-flags-09042**
  If pRasterizationState is not NULL it must be a valid pointer to a valid VkPipelineRasterizationStateCreateInfo structure

- **VUID-VkGraphicsPipelineCreateInfo-flags-06642**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and the layout must be a valid VkPipelineLayout handle

- **VUID-VkGraphicsPipelineCreateInfo-flags-06643**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and renderPass is not VK_NULL_HANDLE, renderPass must be a valid VkRenderPass handle

- **VUID-VkGraphicsPipelineCreateInfo-flags-06644**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, stageCount must be greater than 0

- **VUID-VkGraphicsPipelineCreateInfo-flags-06645**
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags is non-zero, if flags includes VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR, any libraries must have also been created with VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06646**
  If VkPipelineLibraryCreateInfoKHR::pLibraries includes more than one library, and any library was created with VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR, all libraries must have also been created with VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR
If `VkPipelineLibraryCreateInfoKHR::pLibraries` includes at least one library, `VkGraphicsPipelineLibraryCreateInfoEXT::flags` is non-zero, and any library was created with `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`, `flags` must include `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`.

If the pipeline includes a complete set of state, `VkPipelineLayout` must be a valid pipeline layout.

If the pipeline includes a complete set of state specified entirely by libraries, and each library was created with a `VkPipelineLayout` created without `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, then `layout` must be compatible with the layouts in those libraries.

If `flags` includes `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT`, the pipeline includes a complete set of state specified entirely by libraries, and each library was created with a `VkPipelineLayout` created without `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, then `layout` must be compatible with the union of the libraries’ pipeline layouts other than the inclusion/exclusion of `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`.

If `flags` does not include `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT`, the pipeline includes a complete set of state specified entirely by libraries, and each library was created with a `VkPipelineLayout` created without `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, then `layout` must be compatible with the union of the libraries' pipeline layouts.

If `conservativePointAndLineRasterization` is not supported; the pipeline is being created with vertex input state and pre-rasterization shader state; the pipeline does not include a geometry shader; and the value of `VkPipelineInputAssemblyStateCreateInfo::topology` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, and either `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state is not enabled or `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, then `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode` must be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`.

If `conservativePointAndLineRasterization` is not supported, the pipeline requires pre-rasterization shader state, and the pipeline includes a geometry shader with either the `OutputPoints` or `OutputLineStrip` execution modes, `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode` must be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`.

If `conservativePointAndLineRasterization` is not supported, the pipeline requires pre-rasterization shader state, and the pipeline includes a mesh shader with either the `OutputPoints` or `OutputLinesNV` execution modes,
VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode must be VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT

- VUID-VkGraphicsPipelineCreateInfo-pStages-06894
  If the pipeline requires pre-rasterization shader state but not fragment shader state, elements of pStages must not have stage set to VK_SHADER_STAGE_FRAGMENT_BIT

- VUID-VkGraphicsPipelineCreateInfo-pStages-06895
  If the pipeline requires fragment shader state but not pre-rasterization shader state, elements of pStages must not have stage set to a shader stage which participates in pre-rasterization

- VUID-VkGraphicsPipelineCreateInfo-pStages-06896
  If the pipeline requires pre-rasterization shader state, all elements of pStages must have a stage set to a shader stage which participates in fragment shader state or pre-rasterization shader state

- VUID-VkGraphicsPipelineCreateInfo-stage-06897
  If the pipeline requires fragment shader state and/or pre-rasterization shader state, any value of stage must not be set in more than one element of pStages

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3TessellationDomainOrigin-07370
  If the extendedDynamicState3TessellationDomainOrigin feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClampEnable-07371
  If the extendedDynamicState3DepthClampEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3PolygonMode-07372
  If the extendedDynamicState3PolygonMode feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_POLYGON_MODE_EXT

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RasterizationSamples-07373
  If the extendedDynamicState3RasterizationSamples feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3SampleMask-07374
  If the extendedDynamicState3SampleMask feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_SAMPLE_MASK_EXT

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3AlphaToCoverageEnable-07375
  If the extendedDynamicState3AlphaToCoverageEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3AlphaToOneEnable-07376
  If the extendedDynamicState3AlphaToOneEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT
• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LogicOpEnable-07377
  If the extendedDynamicState3LogicOpEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendEnable-07378
  If the extendedDynamicState3ColorBlendEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorWriteMask-07380
  If the extendedDynamicState3ColorWriteMask feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RasterizationStream-07381
  If the extendedDynamicState3RasterizationStream feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ConservativeRasterizationMode-07382
  If the extendedDynamicState3ConservativeRasterizationMode feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ExtraPrimitiveOverestimationSize-07383
  If the extendedDynamicState3ExtraPrimitiveOverestimationSize feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClipEnable-07384
  If the extendedDynamicState3DepthClipEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3SampleLocationsEnable-07385
  If the extendedDynamicState3SampleLocationsEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendAdvanced-07386
  If the extendedDynamicState3ColorBlendAdvanced feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT

If the `extendedDynamicState3ProvokingVertexMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT`.

If the `extendedDynamicState3LineRasterizationMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT`.

If the `extendedDynamicState3LineStippleEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT`.

If the `extendedDynamicState3DepthClipNegativeOneToOne` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT`.

If the `extendedDynamicState3ViewportWScalingEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV`.

If the `extendedDynamicState3ViewportSwizzle` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV`.

If the `extendedDynamicState3CoverageToColorEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV`.

If the `extendedDynamicState3CoverageToColorLocation` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV`.

If the `extendedDynamicState3CoverageModulationMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV`.

If the `extendedDynamicState3CoverageModulationTableEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV`.
If the `extendedDynamicState3CoverageModulationTableEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageModulationTable-07397**
  If the `extendedDynamicState3CoverageModulationTable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageReductionMode-07398**
  If the `extendedDynamicState3CoverageReductionMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RepresentativeFragmentTestEnable-07399**
  If the `extendedDynamicState3RepresentativeFragmentTestEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ShadingRateImageEnable-07400**
  If the `extendedDynamicState3ShadingRateImageEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV

- **VUID-VkGraphicsPipelineCreateInfo-flags-07401**
  `flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT

- **VUID-VkGraphicsPipelineCreateInfo-flags-07997**
  `flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07730**
  If the pipeline requires pre-rasterization shader state, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_VIEWPORT` or `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`, and if `multiviewPerViewViewports` is enabled, then the index of the most significant bit in each element of `VkRenderPassMultiviewCreateInfo::pViewMasks` **must** be less than `pViewportState::viewportCount

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07731**
  If the pipeline requires pre-rasterization shader state, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_SCISSOR` or `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`, and if `multiviewPerViewViewports` is enabled, then the index of the most significant bit in each element of `VkRenderPassMultiviewCreateInfo::pViewMasks` **must** be less than `pViewportState::scissorCount

- **VUID-VkGraphicsPipelineCreateInfo-pStages-08711**
  If `pStages` includes a fragment shader stage, `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` is not set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares
the EarlyFragmentTests execution mode and uses OpDepthAttachmentReadEXT, the depthWriteEnable member of VkPipelineDepthStencilStateCreateInfo must be VK_FALSE

• VUID-VkGraphicsPipelineCreateInfo-pStages-08712
  If pStages includes a fragment shader stage, VK_DYNAMIC_STATE_STENCIL_WRITE_MASK is not set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the value of VkStencilOpState::writeMask for both front and back in VkPipelineDepthStencilStateCreateInfo must be 0

• VUID-VkGraphicsPipelineCreateInfo-renderPass-08744
  If renderPass is VK_NULL_HANDLE, the pipeline requires fragment output state or fragment shader state, the pipeline enables sample shading, rasterizationSamples is not dynamic, and the pNext chain includes a VkPipelineRenderingCreateInfo structure, rasterizationSamples must be a bit value that is set in imageCreateSampleCounts (as defined in Image Creation Limits) for every element of depthAttachmentFormat, stencilAttachmentFormat and the pColorAttachmentFormats array which is not VK_FORMAT_UNDEFINED

• VUID-VkGraphicsPipelineCreateInfo-flags-08897
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT, pre-rasterization shader state is specified either in a library or by the inclusion of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and that state includes a vertex shader stage in pStages, the pipeline must define vertex input state

• VUID-VkGraphicsPipelineCreateInfo-flags-08898
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT, and pre-rasterization shader state is not specified, the pipeline must define vertex input state

• VUID-VkGraphicsPipelineCreateInfo-flags-08899
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, pre-rasterization shader state is specified either in a library or by the inclusion of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and that state includes a vertex shader stage in pStages, the pipeline must either define pre-rasterization shader state or include that state in a linked pipeline library

• VUID-VkGraphicsPipelineCreateInfo-flags-08900
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT the pipeline must define pre-rasterization shader state

• VUID-VkGraphicsPipelineCreateInfo-flags-08901
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, the pipeline must either define pre-rasterization shader state or include that state in a linked pipeline library

• VUID-VkGraphicsPipelineCreateInfo-flags-08903
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, pre-rasterization shader state is specified either in a library or by the inclusion of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and that state either includes VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE or has pRasterizationState-
rasterizerDiscardEnable set to VK_FALSE, the pipeline must define fragment shader state

• VUID-VkGraphicsPipelineCreateInfo-flags-08904
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and pre-rasterization shader state is not specified, the pipeline must define fragment shader state

• VUID-VkGraphicsPipelineCreateInfo-flags-08906
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, pre-rasterization shader state is specified either in a library or by the inclusion of VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and that state either includes VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE or has pRasterizationState->rasterizerDiscardEnable set to VK_FALSE, the pipeline must define fragment output interface state

• VUID-VkGraphicsPipelineCreateInfo-flags-08907
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, pre-rasterization shader state is not specified, the pipeline must define fragment output interface state

• VUID-VkGraphicsPipelineCreateInfo-None-09043
  If pDynamicState->pDynamicStates does not include VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the colorWriteMask member of the corresponding element of pColorBlendState->pAttachments must either include all of VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, and VK_COLOR_COMPONENT_B_BIT, or none of them

Valid Usage (Implicit)

• VUID-VkGraphicsPipelineCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO

• VUID-VkGraphicsPipelineCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkAttachmentSampleCountInfoAMD, VkGraphicsPipelineLibraryCreateInfoEXT, VkGraphicsPipelineShaderGroupsCreateInfoNV, VkMultiviewPerViewAttributesInfoNVX, VkPipelineCompilerControlCreateInfoAMD, VkPipelineCreateFlags2CreateInfoKHR, VkPipelineCreationFeedbackCreateInfo, VkPipelineDiscardRectangleStateCreateInfoEXT, VkPipelineFragmentShadingRateEnumStateCreateInfoNV, VkPipelineFragmentShadingRateStateCreateInfoKHR, VkPipelineLibraryCreateInfoKHR, VkPipelineRenderingCreateInfo, VkPipelineRepresentativeFragmentTestStateCreateInfoNV, or VkPipelineRobustnessCreateInfoEXT

• VUID-VkGraphicsPipelineCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkGraphicsPipelineCreateInfo-flags-parameter
  flags must be a valid combination of VkPipelineCreateFlagBits values
If \( \text{pDynamicState} \) is not NULL, \( \text{pDynamicState} \) must be a valid pointer to a valid \text{VkPipelineDynamicStateCreateInfo} structure.

Each of \text{basePipelineHandle}, \text{layout}, \text{and renderPass} that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same \text{VkDevice}.

The \text{VkPipelineRenderingCreateInfo} structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPipelineRenderingCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkFormat* pColorAttachmentFormats;
    VkFormat depthAttachmentFormat;
    VkFormat stencilAttachmentFormat;
} VkPipelineRenderingCreateInfo;
```

or the equivalent:

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkPipelineRenderingCreateInfo VkPipelineRenderingCreateInfoKHR;
```

- \text{sType} is a \text{VkStructureType} value identifying this structure.
- \text{pNext} is NULL or a pointer to a structure extending this structure.
- \text{viewMask} is the viewMask used for rendering.
- \text{colorAttachmentCount} is the number of entries in \text{pColorAttachmentFormats}.
- \text{pColorAttachmentFormats} is a pointer to an array of \text{VkFormat} values defining the format of color attachments used in this pipeline.
- \text{depthAttachmentFormat} is a \text{VkFormat} value defining the format of the depth attachment used in this pipeline.
- \text{stencilAttachmentFormat} is a \text{VkFormat} value defining the format of the stencil attachment used in this pipeline.

When a pipeline is created without a \text{VkRenderPass}, if the \text{pNext} chain of \text{VkGraphicsPipelineCreateInfo} includes this structure, it specifies the view mask and format of attachments used for rendering. If this structure is not specified, and the pipeline does not include a \text{VkRenderPass}, \text{viewMask} and \text{colorAttachmentCount} are 0, and \text{depthAttachmentFormat} and \text{stencilAttachmentFormat} are \text{VK_FORMAT_UNDEFINED}. If a graphics pipeline is created with a valid \text{VkRenderPass}, parameters of this structure are ignored.

If \text{depthAttachmentFormat}, \text{stencilAttachmentFormat}, or any element of \text{pColorAttachmentFormats} is
it indicates that the corresponding attachment is unused within the render pass. Valid formats indicate that an attachment can be used - but it is still valid to set the attachment to NULL when beginning rendering.

Valid Usage (Implicit)

- VUID-VkPipelineRenderingCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_RENDERING_CREATE_INFO

The VkPipelineCreateFlags2CreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkPipelineCreateFlags2CreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags2KHR flags;
} VkPipelineCreateFlags2CreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkPipelineCreateFlagBits2KHR specifying how a pipeline will be generated.

If this structure is included in the `pNext` chain of a pipeline creation structure, `flags` is used instead of the corresponding `flags` value passed in that creation structure, allowing additional creation flags to be specified.

Valid Usage (Implicit)

- VUID-VkPipelineCreateFlags2CreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_CREATE_FLAGS_2_CREATE_INFO_KHR

- VUID-VkPipelineCreateFlags2CreateInfoKHR-flags-parameter
  flags must be a valid combination of VkPipelineCreateFlagBits2KHR values

- VUID-VkPipelineCreateFlags2CreateInfoKHR-flags-requiredbitmask
  flags must not be 0

Bits which can be set in VkPipelineCreateFlags2CreateInfoKHR::flags, specifying how a pipeline is created, are:

```c
// Provided by VK_KHR_maintenance5
// Flag bits for VkPipelineCreateFlagBits2KHR
typedef VkFlags64 VkPipelineCreateFlagBits2KHR;
static const VkPipelineCreateFlagBits2KHR VK_PIPELINE_CREATE_2_DISABLE_OPTIMIZATION_BIT_KHR = 0x00000001ULL;
static const VkPipelineCreateFlagBits2KHR
```
VK_PIPELINE_CREATE_2_ALLOW_DERIVATIVES_BIT_KHR = 0x00000002ULL;
static const VkPipelineCreateFlagBits2KHR VK_PIPELINE_CREATE_2_DERIVATIVE_BIT_KHR = 0x00000004ULL;
// Provided by VK_KHR_maintenance5 with VK_VERSION_1_1 or VK_KHR_device_group
static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_VIEW_INDEX_FROM_DEVICE_INDEX_BIT_KHR = 0x00000008ULL;
// Provided by VK_KHR_maintenance5 with VK_VERSION_1_1 or VK_KHR_device_group
static const VkPipelineCreateFlagBits2KHR VK_PIPELINE_CREATE_2_DISPATCH_BASE_BIT_KHR = 0x00000010ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_pipeline_executable_properties
static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_CAPTURE_STATISTICS_BIT_KHR = 0x00000040ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_pipeline_executable_properties

VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_AABBS_BIT_KHR = 0x00002000ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_ray_tracing_pipeline
static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR = 0x00004000ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_ray_tracing_pipeline
static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR = 0x00008000ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_ray_tracing_pipeline
static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR = 0x00010000ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_ray_tracing_pipeline
static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_LIBRARY_BIT_KHR = 0x00000800ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_pipeline_library
static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR = 0x00001000ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_device_group
static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_AABBS_BIT_KHR = 0x00002000ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_device_group
static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR = 0x00004000ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_device_group
static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR = 0x00008000ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_device_group
static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR = 0x00010000ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_device_group

static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_DISABLE_OPTIMIZATION_BIT_KHR = 0x00020000ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_ray_tracing_pipeline

static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_ALLOW_DERIVATIVES_BIT_KHR = 0x00040000ULL;
// Provided by VK_KHR_maintenance5 with VK_NV_device_generated_commands

static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_DERIVATIVE_BIT_KHR = 0x40000000ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_dynamic_rendering and VK_KHR_fragment_shading_rate

• VK_PIPELINE_CREATE_2_DISABLE_OPTIMIZATION_BIT_KHR specifies that the created pipeline will not be optimized. Using this flag may reduce the time taken to create the pipeline.

• VK_PIPELINE_CREATE_2_ALLOW_DERIVATIVES_BIT_KHR specifies that the pipeline to be created is allowed to be the parent of a pipeline that will be created in a subsequent pipeline creation call.

• VK_PIPELINE_CREATE_2_DERIVATIVE_BIT_KHR specifies that the pipeline to be created will be a child
of a previously created parent pipeline.

- **VK_PIPELINE_CREATE_2_VIEW_INDEX_FROM_DEVICE_INDEX_BIT_KHR** specifies that any shader input variables decorated as `ViewIndex` will be assigned values as if they were decorated as `DeviceIndex`.

- **VK_PIPELINE_CREATE_2_DISPATCH_BASE_BIT_KHR** specifies that a compute pipeline can be used with `vkCmdDispatchBase` with a non-zero base workgroup.

- **VK_PIPELINE_CREATE_2_DEFER_COMPILE_BIT_NV** specifies that a pipeline is created with all shaders in the deferred state. Before using the pipeline the application must call `vkCompileDeferredNV` exactly once on each shader in the pipeline before using the pipeline.

- **VK_PIPELINE_CREATE_2_CAPTURE_STATISTICS_BIT_KHR** specifies that the shader compiler should capture statistics for the pipeline executables produced by the compile process which can later be retrieved by calling `vkGetPipelineExecutableStatisticsKHR`. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time.

- **VK_PIPELINE_CREATE_2_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR** specifies that the shader compiler should capture the internal representations of pipeline executables produced by the compile process which can later be retrieved by calling `vkGetPipelineExecutableInternalRepresentationsKHR`. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time. When capturing IR from pipelines created with pipeline libraries, there is no guarantee that IR from libraries can be retrieved from the linked pipeline. Applications should retrieve IR from each library, and any linked pipelines, separately.

- **VK_PIPELINE_CREATE_2_LIBRARY_BIT_KHR** specifies that the pipeline cannot be used directly, and instead defines a pipeline library that can be combined with other pipelines using the `VkPipelineLibraryCreateInfoKHR` structure. This is available in ray tracing and graphics pipelines.

- **VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR** specifies that an any-hit shader will always be present when an any-hit shader would be executed. A NULL any-hit shader is an any-hit shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.

- **VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR** specifies that a closest hit shader will always be present when a closest hit shader would be executed. A NULL closest hit shader is a closest hit shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.

- **VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR** specifies that a miss shader will always be present when a miss shader would be executed. A NULL miss shader is a miss shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.

- **VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR** specifies that an intersection shader will always be present when an intersection shader would be executed. A NULL intersection shader is an intersection shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.

- **VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR** specifies that triangle primitives will
be skipped during traversal using `OpTraceRayKHR`.

- `VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_AABBS_BIT_KHR` specifies that AABB primitives will be skipped during traversal using `OpTraceRayKHR`.

- `VK_PIPELINE_CREATE_2_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR` specifies that the shader group handles can be saved and reused on a subsequent run (e.g. for trace capture and replay).

- `VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_NV` specifies that the pipeline can be used in combination with `Device-Generated Commands`.

- `VK_PIPELINE_CREATE_2_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_KHR` specifies that pipeline creation will fail if a compile is required for creation of a valid `VkPipeline` object; `VK_PIPELINE_COMPILE_REQUIRED` will be returned by pipeline creation, and the `VkPipeline` will be set to `VK_NULL_HANDLE`.

- When creating multiple pipelines, `VK_PIPELINE_CREATE_2_EARLY_RETURN_ON_FAILURE_BIT_KHR` specifies that control will be returned to the application if any individual pipeline returns a result which is not `VK_SUCCESS` rather than continuing to create additional pipelines.

- `VK_PIPELINE_CREATE_2_RAY_TRACING_ALLOW_MOTION_BIT_NV` specifies that the pipeline is allowed to use `OpTraceRayMotionNV`.

- `VK_PIPELINE_CREATE_2_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` specifies that the pipeline will be used with a fragment shading rate attachment.

- `VK_PIPELINE_CREATE_2_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT` specifies that the pipeline will be used with a fragment density map attachment.

- `VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT` specifies that pipeline libraries being linked into this library should have link time optimizations applied. If this bit is omitted, implementations should instead perform linking as rapidly as possible.

- `VK_PIPELINE_CREATE_2_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT` specifies that pipeline libraries should retain any information necessary to later perform an optimal link with `VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT`.

- `VK_PIPELINE_CREATE_2_DESCRIPTOR_BUFFER_BIT_EXT` specifies that a pipeline will be used with descriptor buffers, rather than descriptor sets.

- `VK_PIPELINE_CREATE_2_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` specifies that the pipeline may be used with an attachment feedback loop including color attachments.

- `VK_PIPELINE_CREATE_2_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` specifies that the pipeline may be used with an attachment feedback loop including depth-stencil attachments.

- `VK_PIPELINE_CREATE_2_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT` specifies that the pipeline can be used with acceleration structures which reference an opacity micromap array.

- `VK_PIPELINE_CREATE_2_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV` specifies that the pipeline can be used with acceleration structures which reference a displacement micromap array.

- `VK_PIPELINE_CREATE_2_NO_PROTECTED_ACCESS_BIT_EXT` specifies that the pipeline must not be bound to a protected command buffer.

- `VK_PIPELINE_CREATE_2_PROTECTED_ACCESS_ONLY_BIT_EXT` specifies that the pipeline must not be bound to an unprotected command buffer.
It is valid to set both `VK_PIPELINE_CREATE_2_ALLOW_DERIVATIVES_BIT_KHR` and `VK_PIPELINE_CREATE_2_DERIVATIVE_BIT_KHR`. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See Pipeline Derivatives for more information.

When an implementation is looking up a pipeline in a pipeline cache, if that pipeline is being created using linked libraries, implementations should always return an equivalent pipeline created with `VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT` if available, whether or not that bit was specified.

**Note**

Using `VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT` (or not) when linking pipeline libraries is intended as a performance tradeoff between host and device. If the bit is omitted, linking should be faster and produce a pipeline more rapidly, but performance of the pipeline on the target device may be reduced. If the bit is included, linking may be slower but should produce a pipeline with device performance comparable to a monolithically created pipeline. Using both options can allow latency-sensitive applications to generate a suboptimal but usable pipeline quickly, and then perform an optimal link in the background, substituting the result for the suboptimally linked pipeline as soon as it is available.

```c
// Provided by VK_KHR_maintenance5
typedef VkFlags64 VkPipelineCreateFlags2KHR;
```

`VkPipelineCreateFlags2KHR` is a bitmask type for setting a mask of zero or more `VkPipelineCreateFlagBits2KHR`.

Bits which can be set in

- `VkGraphicsPipelineCreateInfo::flags`
- `VkComputePipelineCreateInfo::flags`
- `VkRayTracingPipelineCreateInfoKHR::flags`
- `VkRayTracingPipelineCreateInfoNV::flags`

specify how a pipeline is created, and are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCreateFlagBits {
    VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT = 0x00000001,
    VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT = 0x00000002,
    VK_PIPELINE_CREATE_DERIVATIVE_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_PIPELINE_CREATE_DISPATCH_BASE_BIT = 0x00000010,
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT = 0x00000100,
};
```
// Provided by VK_VERSION_1_3
VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT = 0x00000200,
// Provided by VK_KHR_dynamic_rendering with VK_KHR_fragment_shading_rate
VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR = 0x00000000,
// Provided by VK_KHR_dynamic_rendering with VK_EXT_fragment_density_map
VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT = 0x00400000,
// Provided by VK_KHR_ray_tracing_pipeline
VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR = 0x00004000,
// Provided by VK_KHR_ray_tracing_pipeline
VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR = 0x00008000,
// Provided by VK_KHR_ray_tracing_pipeline
VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR = 0x00010000,

// Provided by VK_KHR_device_group
VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT_KHR = VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT,
// Provided by VK_KHR_device_group
VK_PIPELINE_CREATE_DISPATCH_BASE_KHR = VK_PIPELINE_CREATE_DISPATCH_BASE,
// Provided by VK_EXT_pipeline_creation_cache_control
VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT = VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT,
// Provided by VK_EXT_pipeline_creation_cache_control
VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT_EXT = VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT

VkPipelineCreateFlagBits

- **VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT** specifies that the created pipeline will not be optimized. Using this flag **may** reduce the time taken to create the pipeline.

- **VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT** specifies that the pipeline to be created is allowed to be the parent of a pipeline that will be created in a subsequent pipeline creation call.

- **VK_PIPELINE_CREATE_DERIVATIVE_BIT** specifies that the pipeline to be created will be a child of a previously created parent pipeline.

- **VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT** specifies that any shader input variables decorated as `ViewIndex` will be assigned values as if they were decorated as `DeviceIndex`.

- **VK_PIPELINE_CREATE_DISPATCH_BASE** specifies that a compute pipeline **can** be used with `vkCmdDispatchBase` with a non-zero base workgroup.

- **VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV** specifies that a pipeline is created with all shaders in the deferred state. Before using the pipeline the application **must** call `vkCompileDeferredNV` exactly once on each shader in the pipeline before using the pipeline.

- **VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR** specifies that the shader compiler should capture statistics for the pipeline executables produced by the compile process which **can** later be retrieved by calling `vkGetPipelineExecutableStatisticsKHR`. Enabling this flag **must** not affect the final compiled pipeline but **may** disable pipeline caching or otherwise affect pipeline creation time.

- **VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR** specifies that the shader compiler should capture the internal representations of pipeline executables produced by the compile process which **can** later be retrieved by calling `vkGetPipelineExecutableInternalRepresentationsKHR`. Enabling this flag **must** not affect the
final compiled pipeline but **may** disable pipeline caching or otherwise affect pipeline creation time. When capturing IR from pipelines created with pipeline libraries, there is no guarantee that IR from libraries **can** be retrieved from the linked pipeline. Applications **should** retrieve IR from each library, and any linked pipelines, separately.

- **VK_PIPELINE_CREATE_LIBRARY_BIT_KHR** specifies that the pipeline **cannot** be used directly, and instead defines a **pipeline library** that **can** be combined with other pipelines using the `VkPipelineLibraryCreateInfoKHR` structure. This is available in ray tracing and graphics pipelines.

- **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR** specifies that an any-hit shader will always be present when an any-hit shader would be executed. A NULL any-hit shader is an any-hit shader which is effectively **VK_SHADER_UNUSED_KHR**, such as from a shader group consisting entirely of zeros.

- **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR** specifies that a closest hit shader will always be present when a closest hit shader would be executed. A NULL closest hit shader is a closest hit shader which is effectively **VK_SHADER_UNUSED_KHR**, such as from a shader group consisting entirely of zeros.

- **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR** specifies that a miss shader will always be present when a miss shader would be executed. A NULL miss shader is a miss shader which is effectively **VK_SHADER_UNUSED_KHR**, such as from a shader group consisting entirely of zeros.

- **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR** specifies that an intersection shader will always be present when an intersection shader would be executed. A NULL intersection shader is an intersection shader which is effectively **VK_SHADER_UNUSED_KHR**, such as from a shader group consisting entirely of zeros.

- **VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR** specifies that triangle primitives will be skipped during traversal using `OpTraceRayKHR`.

- **VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR** specifies that AABB primitives will be skipped during traversal using `OpTraceRayKHR`.

- **VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR** specifies that the shader group handles **can** be saved and reused on a subsequent run (e.g. for trace capture and replay).

- **VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV** specifies that the pipeline can be used in combination with Device-Generated Commands.

- **VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT** specifies that pipeline creation will fail if a compile is required for creation of a valid `VkPipeline` object; **VK_PIPELINE_COMPILE_REQUIRED** will be returned by pipeline creation, and the `VkPipeline` will be set to **VK_NULL_HANDLE**.

- When creating multiple pipelines, **VK_PIPELINE_CREATE_EARLY_RETURN_ON.FAILURE_BIT** specifies that control will be returned to the application if any individual pipeline returns a result which is not **VK_SUCCESS** rather than continuing to create additional pipelines.

- **VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV** specifies that the pipeline is allowed to use `OpTraceRayMotionNV`.

- **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies that the
pipeline will be used with a fragment shading rate attachment and dynamic rendering.

- **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT** specifies that the pipeline will be used with a fragment density map attachment and dynamic rendering.

- **VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT** specifies that pipeline libraries being linked into this library should have link time optimizations applied. If this bit is omitted, implementations should instead perform linking as rapidly as possible.

- **VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT** specifies that pipeline libraries should retain any information necessary to later perform an optimal link with **VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT**.

- **VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT** specifies that a pipeline will be used with descriptor buffers, rather than descriptor sets.

- **VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** specifies that the pipeline may be used with an attachment feedback loop including color attachments. It is ignored if **VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT** is set in **pDynamicStates**.

- **VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** specifies that the pipeline may be used with an attachment feedback loop including depth-stencil attachments. It is ignored if **VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT** is set in **pDynamicStates**.

- **VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT** specifies that the pipeline can be used with acceleration structures which reference an opacity micromap array.

- **VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV** specifies that the pipeline can be used with acceleration structures which reference a displacement micromap array.

- **VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT** specifies that the pipeline must not be bound to a protected command buffer.

- **VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT** specifies that the pipeline must not be bound to an unprotected command buffer.

It is valid to set both **VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT** and **VK_PIPELINE_CREATE_DERIVATIVE_BIT**. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See [Pipeline Derivatives](#) for more information.

When an implementation is looking up a pipeline in a pipeline cache, if that pipeline is being created using linked libraries, implementations should always return an equivalent pipeline created with **VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT** if available, whether or not that bit was specified.

**Note**

Using **VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT** (or not) when linking pipeline libraries is intended as a performance tradeoff between host and device. If the bit is omitted, linking should be faster and produce a pipeline more rapidly, but performance of the pipeline on the target device may be reduced. If the bit is included, linking may be slower but should produce a pipeline with device performance comparable to a monolithically created pipeline. Using both options can allow latency-sensitive applications to generate a suboptimal but usable pipeline quickly, and then perform an optimal link in the background, substituting
the result for the suboptimally linked pipeline as soon as it is available.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCreateFlags;
```

**VkPipelineCreateFlags** is a bitmask type for setting a mask of zero or more **VkPipelineCreateFlagBits**.

The **VkGraphicsPipelineLibraryCreateInfoEXT** structure is defined as:

```c
// Provided by VK_EXT_graphics_pipeline_library
typedef struct VkGraphicsPipelineLibraryCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkGraphicsPipelineLibraryFlagsEXT flags;
} VkGraphicsPipelineLibraryCreateInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkGraphicsPipelineLibraryFlagBitsEXT** specifying the subsets of the graphics pipeline that are being compiled.

If a **VkGraphicsPipelineLibraryCreateInfoEXT** structure is included in the **pNext** chain of **VkGraphicsPipelineCreateInfo**, it specifies the subsets of the graphics pipeline being created, excluding any subsets from linked pipeline libraries. If the pipeline is created with pipeline libraries, state from those libraries is aggregated with said subset.

If this structure is omitted, and either **VkGraphicsPipelineCreateInfo::flags** includes **VK_PIPELINE_CREATE_LIBRARY_BIT_KHR** or the **VkGraphicsPipelineCreateInfo::pNext** chain includes a **VkPipelineLibraryCreateInfoKHR** structure with a **libraryCount** greater than 0, it is as if **flags** is 0. Otherwise if this structure is omitted, it is as if **flags** includes all possible subsets of the graphics pipeline (i.e. a complete graphics pipeline).

### Valid Usage (Implicit)

- VUID-VkGraphicsPipelineLibraryCreateInfoEXT-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_LIBRARY_CREATE_INFO_EXT**

- VUID-VkGraphicsPipelineLibraryCreateInfoEXT-flags-parameter
  **flags** must be a valid combination of **VkGraphicsPipelineLibraryFlagBitsEXT** values

- VUID-VkGraphicsPipelineLibraryCreateInfoEXT-flags-requiredbitmask
  **flags** must not be 0
typedef VkFlags VkGraphicsPipelineLibraryFlagsEXT;

VkGraphicsPipelineLibraryFlagsEXT is a bitmask type for setting a mask of zero or more VkGraphicsPipelineLibraryFlagBitsEXT.

Possible values of the flags member of VkGraphicsPipelineLibraryCreateInfoEXT, specifying the subsets of a graphics pipeline to compile are:

```c
// Provided by VK_EXT_graphics_pipeline_library
typedef enum VkGraphicsPipelineLibraryFlagBitsEXT {
    VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT = 0x00000001,
    VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT = 0x00000002,
    VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT = 0x00000004,
    VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT = 0x00000008,
} VkGraphicsPipelineLibraryFlagBitsEXT;
```

- **VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT** specifies that a pipeline will include vertex input interface state.
- **VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT** specifies that a pipeline will include pre-rasterization shader state.
- **VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT** specifies that a pipeline will include fragment shader state.
- **VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT** specifies that a pipeline will include fragment output interface state.

The VkPipelineDynamicStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDynamicStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDynamicStateCreateFlags flags;
    uint32_t dynamicStateCount;
    const VkDynamicState* pDynamicStates;
} VkPipelineDynamicStateCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **dynamicStateCount** is the number of elements in the pDynamicStates array.
- **pDynamicStates** is a pointer to an array of VkDynamicState values specifying which pieces of pipeline state will use the values from dynamic state commands rather than from pipeline state creation information.
Valid Usage

- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-01442
  Each element of pDynamicStates must be unique

Valid Usage (Implicit)

- VUID-VkPipelineDynamicStateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_DYNAMIC_STATE_CREATE_INFO
- VUID-VkPipelineDynamicStateCreateInfo-pNext-pNext
  pNext must be NULL
- VUID-VkPipelineDynamicStateCreateInfo-flags-zerobitmask
  flags must be 0
- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-parameter
  If dynamicStateCount is not 0, pDynamicStates must be a valid pointer to an array of
dynamicStateCount valid VkDynamicState values

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDynamicStateCreateFlags;

VkPipelineDynamicStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for
future use.

The source of different pieces of dynamic state is specified by the
VkPipelineDynamicStateCreateInfo::pDynamicStates property of the currently active pipeline, each
of whose elements must be one of the values:

// Provided by VK_VERSION_1_0
typedef enum VkDynamicState {
    VK_DYNAMIC_STATE_VIEWPORT = 0,
    VK_DYNAMIC_STATE_SCISSOR = 1,
    VK_DYNAMIC_STATE_LINE_WIDTH = 2,

} VkDynamicState;

- **VK_DYNAMIC_STATE_VIEWPORT** specifies that the `pViewports` state in `VkPipelineViewportStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetViewport` before any drawing commands. The number of viewports used by a pipeline is still specified by the `viewportCount` member of `VkPipelineViewportStateCreateInfo`.

- **VK_DYNAMIC_STATE_SCISSOR** specifies that the `pScissors` state in `VkPipelineViewportStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetScissor` before any drawing commands. The number of scissor rectangles used by a pipeline is still specified by the `scissorCount` member of `VkPipelineViewportStateCreateInfo`.

- **VK_DYNAMIC_STATE_LINE_WIDTH** specifies that the `lineWidth` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetLineWidth` before any drawing commands that generate line primitives for the rasterizer.

- **VK_DYNAMIC_STATE_DEPTH_BIAS** specifies that any instance of `VkDepthBiasRepresentationInfoEXT` included in the `pNext` chain of `VkPipelineRasterizationStateCreateInfo` as well as the `depthBiasConstantFactor`, `depthBiasClamp` and `depthBiasSlopeFactor` states in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with either `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` before any draws are performed with depth bias enabled.

- **VK_DYNAMIC_STATE_BLEND_CONSTANTS** specifies that the `blendConstants` state in `VkPipelineColorBlendStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetBlendConstants` before any draws are performed with a pipeline state with `VkPipelineColorBlendAttachmentState` member `blendEnable` set to `VK_TRUE` and any of the blend functions using a constant blend color.

- **VK_DYNAMIC_STATE_DEPTH_BOUNDS** specifies that the `minDepthBounds` and `maxDepthBounds` states of `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthBounds` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `depthBoundsTestEnable` set to `VK_TRUE`.

- **VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK** specifies that the `compareMask` state in `VkPipelineDepthStencilStateCreateInfo` for both `front` and `back` will be ignored and **must** be set dynamically with `vkCmdSetStencilCompareMask` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to `VK_TRUE`.

- **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** specifies that the `writeMask` state in `VkPipelineDepthStencilStateCreateInfo` for both `front` and `back` will be ignored and **must** be set dynamically with `vkCmdSetStencilWriteMask` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to `VK_TRUE`.

- **VK_DYNAMIC_STATE_STENCIL_REFERENCE** specifies that the `reference` state in `VkPipelineDepthStencilStateCreateInfo` for both `front` and `back` will be ignored and **must** be set dynamically with `vkCmdSetStencilReference` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to `VK_TRUE`.

• **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV** specifies that the pViewportWScalings state in VkPipelineViewportWScalingStateCreateInfoNV will be ignored and must be set dynamically with vkCmdSetViewportWScalingNV before any draws are performed with a pipeline state with VkPipelineViewportWScalingStateCreateInfoNV member viewportScalingEnable set to VK_TRUE.

• **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT** specifies that the pDiscardRectangles state in VkPipelineDiscardRectangleStateCreateInfoEXT will be ignored and must be set dynamically with vkCmdSetDiscardRectangleNV before any draws are performed with a pipeline state with VkPipelineDiscardRectangleStateCreateInfoEXT.

• **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT** specifies that the presence of the VkPipelineDiscardRectangleStateCreateInfoEXT structure in the VkGraphicsPipelineCreateInfo chain with a discardRectangleCount greater than zero does not implicitly enable discard rectangles and they must be enabled dynamically with vkCmdSetDiscardRectangleEnableEXT before any draw commands. This is available on implementations that support at least specVersion 2 of the VK_EXT_discard_rectangles extension.

• **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT** specifies that the discardRectangleMode state in VkPipelineDiscardRectangleStateCreateInfoEXT will be ignored and must be set dynamically with vkCmdSetDiscardRectangleModeEXT before any draw commands. This is available on implementations that support at least specVersion 2 of the VK_EXT_discard_rectangles extension.

• **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** specifies that the sampleLocationsInfo state in VkPipelineSampleLocationsStateCreateInfoEXT will be ignored and must be set dynamically with vkCmdSetSampleLocationsEXT before any draw or clear commands. Enabling custom sample locations is still indicated by the sampleLocationsEnable member of VkPipelineSampleLocationsStateCreateInfoEXT.

• **VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV** specifies that the pExclusiveScissors state in VkPipelineViewportExclusiveScissorStateCreateInfoNV will be ignored and must be set dynamically with vkCmdSetExclusiveScissorNV before any drawing commands.

• **VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV** specifies that the exclusive scissors must be explicitly enabled with vkCmdSetExclusiveScissorEnableNV and the exclusiveScissorCount value in VkPipelineViewportExclusiveScissorStateCreateInfoNV will not implicitly enable them. This is available on implementations that support at least specVersion 2 of the VK_NV_scissor_exclusive extension.

• **VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV** specifies that the pShadingRatePalettes state in VkPipelineViewportShadingRateImageStateCreateInfoNV will be ignored and must be set dynamically with vkCmdSetViewportShadingRatePaletteNV before any drawing commands.

• **VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV** specifies that the coarse sample order state in VkPipelineViewportCoarseSampleOrderStateCreateInfoNV will be ignored and must be set dynamically with vkCmdSetCoarseSampleOrderNV before any drawing commands.

• **VK_DYNAMIC_STATE_LINE_STIPPLE_EXT** specifies that the lineStippleFactor and lineStipplePattern state in VkPipelineRasterizationLineStateCreateInfoEXT will be ignored and must be set dynamically with vkCmdSetLineStippleEXT before any draws are performed with a pipeline state with VkPipelineRasterizationLineStateCreateInfoEXT member stippledLineEnable set to VK_TRUE.

• **VK_DYNAMIC_STATE_CULL_MODE** specifies that the cullMode state in VkPipelineRasterizationStateCreateInfo will be ignored and must be set dynamically with vkCmdSetCullMode before any drawing commands.
• **VK_DYNAMIC_STATE_FRONT_FACE** specifies that the `frontFace` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetFrontFace` before any drawing commands.

• **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY** specifies that the `topology` state in ` VkPipelineInputAssemblyStateCreateInfo` only specifies the topology class, and the specific topology order and adjacency must be set dynamically with `vkCmdSetPrimitiveTopology` before any drawing commands.

• **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** specifies that the `viewportCount` and `pViewports` state in `VkPipelineViewportStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetViewportWithCount` before any draw call.

• **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** specifies that the `scissorCount` and `pScissors` state in `VkPipelineViewportStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetScissorWithCount` before any draw call.

• **VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE** specifies that the `stride` state in `VkVertexInputBindingDescription` will be ignored and must be set dynamically with `vkCmdBindVertexBuffers2` before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE** specifies that the `depthTestEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetDepthTestEnable` before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE** specifies that the `depthWriteEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetDepthWriteEnable` before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_COMPARE_OP** specifies that the `depthCompareOp` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetDepthCompareOp` before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE** specifies that the `depthBoundsTestEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetDepthBoundsTestEnable` before any draw call.

• **VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE** specifies that the `stencilTestEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetStencilTestEnable` before any draw call.

• **VK_DYNAMIC_STATE_STENCIL_OP** specifies that the `failOp`, `passOp`, `depthFailOp`, and `compareOp` states in `VkPipelineDepthStencilStateCreateInfo` for both `front` and `back` will be ignored and must be set dynamically with `vkCmdSetStencilOp` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to `VK_TRUE`.

• **VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT** specifies that the `patchControlPoints` state in `VkPipelineTessellationStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetPatchControlPointsEXT` before any drawing commands.

• **VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE** specifies that the `rasterizerDiscardEnable` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetRasterizerDiscardEnable` before any drawing commands.

• **VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE** specifies that the `depthBiasEnable` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and must be set dynamically with
vkCmdSetDepthBiasEnable before any drawing commands.

- **VK_DYNAMIC_STATE_LOGIC_OP_EXT** specifies that the logicOp state in VkPipelineColorBlendStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetLogicOpEXT before any drawing commands.

- **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE** specifies that the primitiveRestartEnable state in VkPipelineInputAssemblyStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetPrimitiveRestartEnable before any drawing commands.

- **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** specifies that state in VkPipelineFragmentShadingRateStateCreateInfoKHR and VkPipelineFragmentShadingRateEnumStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetFragmentShadingRateKHR or vkCmdSetFragmentShadingRateEnumNV before any drawing commands.

- **VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR** specifies that the default stack size computation for the pipeline will be ignored and **must** be set dynamically with vkCmdSetRayTracingPipelineStackSizeKHR before any ray tracing calls are performed.

- **VK_DYNAMIC_STATE_VERTEX_INPUT_EXT** specifies that the pVertexInputState state will be ignored and **must** be set dynamically with vkCmdSetVertexInputEXT before any drawing commands.

- **VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT** specifies that the pColorWriteEnables state in VkPipelineColorWriteCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetColorWriteEnableEXT before any draw call.

- **VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT** specifies that the domainOrigin state in VkPipelineTessellationDomainOriginStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetTessellationDomainOriginEXT before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT** specifies that the depthClampEnable state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthClampEnableEXT before any draw call.

- **VK_DYNAMIC_STATE_POLYGON_MODE_EXT** specifies that the polygonMode state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetPolygonModeEXT before any draw call.

- **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** specifies that the rasterizationSamples state in VkPipelineMultisampleStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetRasterizationSamplesEXT before any draw call.

- **VK_DYNAMIC_STATE_SAMPLE_MASK_EXT** specifies that the pSampleMask state in VkPipelineMultisampleStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetSampleMaskEXT before any draw call.

- **VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT** specifies that the alphaToCoverageEnable state in VkPipelineMultisampleStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetAlphaToCoverageEnableEXT before any draw call.

- **VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT** specifies that the alphaToOneEnable state in VkPipelineMultisampleStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetAlphaToOneEnableEXT before any draw call.

- **VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT** specifies that the logicOpEnable state in VkPipelineColorBlendStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetLogicOpEXT before any drawing commands.
VkPipelineColorBlendStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetLogicOpEnableEXT before any draw call.

- **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT** specifies that the **blendEnable** state in VkPipelineColorBlendAttachmentState will be ignored and **must** be set dynamically with vkCmdSetColorBlendEnableEXT before any draw call.

- **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT** specifies that the **srcColorBlendFactor**, **dstColorBlendFactor**, **colorBlendOp**, **srcAlphaBlendFactor**, **dstAlphaBlendFactor**, and **alphaBlendOp** states in VkPipelineColorBlendAttachmentState will be ignored and **must** be set dynamically with vkCmdSetColorBlendEquationEXT before any draw call.

- **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** specifies that the **colorWriteMask** state in VkPipelineColorBlendAttachmentState will be ignored and **must** be set dynamically with vkCmdSetColorWriteMaskEXT before any draw call.

- **VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT** specifies that the **rasterizationStream** state in VkPipelineRasterizationStateStreamCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetRasterizationStreamEXT before any draw call.

- **VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT** specifies that the **conservativeRasterizationMode** state in VkPipelineRasterizationConservativeStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetConservativeRasterizationModeEXT before any draw call.

- **VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT** specifies that the **extraPrimitiveOverestimationSize** state in VkPipelineRasterizationConservativeStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetExtraPrimitiveOverestimationSizeEXT before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT** specifies that the **depthClipEnable** state in VkPipelineRasterizationDepthClipStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetDepthClipEnableEXT before any draw call.

- **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT** specifies that the **sampleLocationsEnable** state in VkPipelineSampleLocationsStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetSampleLocationsEnableEXT before any draw call.

- **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT** specifies that the **colorBlendOp** state in VkPipelineColorBlendAttachmentState, and **srcPremultiplied**, **dstPremultiplied**, and **blendOverlap** states in VkPipelineColorBlendAdvancedStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetColorBlendAdvancedEXT before any draw call.

- **VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT** specifies that the **provokingVertexMode** state in VkPipelineRasterizationProvokingVertexStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetProvokingVertexModeEXT before any draw call.

- **VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT** specifies that the **lineRasterizationMode** state in VkPipelineRasterizationLineStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetLineRasterizationModeEXT before any draw call.

- **VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT** specifies that the **stippledLineEnable** state in VkPipelineRasterizationLineStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetLineStippleEnableEXT before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT** specifies that the **negativeOneToOne** state in
VkPipelineViewportDepthClipControlCreateInfoEXT will be ignored and **must** be set dynamically with `vkCmdSetDepthClipNegativeOneToOneEXT` before any draw call.

* **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV** specifies that the `viewportWScalingEnable` state in VkPipelineViewportWScalingStateCreateInfoNV will be ignored and **must** be set dynamically with `vkCmdSetViewportWScalingEnableNV` before any draw call.

* **VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV** specifies that the `viewportCount`, and `pViewportSwizzles` states in VkPipelineViewportSwizzleStateCreateInfoNV will be ignored and **must** be set dynamically with `vkCmdSetViewportSwizzleNV` before any draw call.

* **VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV** specifies that the `coverageToColorEnable` state in VkPipelineCoverageToColorStateCreateInfoNV will be ignored and **must** be set dynamically with `vkCmdSetCoverageToColorEnableNV` before any draw call.

* **VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV** specifies that the `coverageToColorLocation` state in VkPipelineCoverageToColorStateCreateInfoNV will be ignored and **must** be set dynamically with `vkCmdSetCoverageToColorLocationNV` before any draw call.

* **VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV** specifies that the `coverageModulationMode` state in VkPipelineCoverageModulationStateCreateInfoNV will be ignored and **must** be set dynamically with `vkCmdSetCoverageModulationModeNV` before any draw call.

* **VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV** specifies that the `coverageModulationTableEnable` state in VkPipelineCoverageModulationStateCreateInfoNV will be ignored and **must** be set dynamically with `vkCmdSetCoverageModulationTableEnableNV` before any draw call.

* **VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV** specifies that the `representativeFragmentTestEnable` state in VkPipelineRepresentativeFragmentTestStateCreateInfoNV will be ignored and **must** be set dynamically with `vkCmdSetRepresentativeFragmentTestEnableNV` before any draw call.

* **VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV** specifies that the `coverageReductionMode` state in VkPipelineCoverageReductionStateCreateInfoNV will be ignored and **must** be set dynamically with `vkCmdSetCoverageReductionModeNV` before any draw call.

* **VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT** specifies that the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` and `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` flags will be ignored and **must** be set dynamically with `vkCmdSetAttachmentFeedbackLoopEnableEXT` before any draw call.
10.2.1. Valid Combinations of Stages for Graphics Pipelines

Primitive processing can be handled either on a per primitive basis by the vertex, tessellation, and geometry shader stages, or on a per mesh basis using task and mesh shader stages. If the pipeline includes a mesh shader stage, it uses the mesh pipeline, otherwise it uses the primitive pipeline.

If a task shader is omitted, the task shading stage is skipped.

If tessellation shader stages are omitted, the tessellation shading and fixed-function stages of the pipeline are skipped.

If a geometry shader is omitted, the geometry shading stage is skipped.

If a fragment shader is omitted, fragment color outputs have undefined values, and the fragment depth value is determined by Fragment Operations state. This can be useful for depth-only rendering.

Presence of a shader stage in a pipeline is indicated by including a valid VkPipelineShaderStageCreateInfo with module and pName selecting an entry point from a shader module, where that entry point is valid for the stage specified by stage.

Presence of some of the fixed-function stages in the pipeline is implicitly derived from enabled shaders and provided state. For example, the fixed-function tessellator is always present when the pipeline has valid Tessellation Control and Tessellation Evaluation shaders.

For example:

- Depth/stencil-only rendering in a subpass with no color attachments
  - Active Pipeline Shader Stages
    - Vertex Shader
  - Required: Fixed-Function Pipeline Stages
    - VkPipelineVertexInputStateCreateInfo
    - VkPipelineInputAssemblyStateCreateInfo
    - VkPipelineViewportStateCreateInfo
    - VkPipelineRasterizationStateCreateInfo
    - VkPipelineMultisampleStateCreateInfo
    - VkPipelineDepthStencilStateCreateInfo

- Color-only rendering in a subpass with no depth/stencil attachment
  - Active Pipeline Shader Stages
    - Vertex Shader
    - Fragment Shader
  - Required: Fixed-Function Pipeline Stages
    - VkPipelineVertexInputStateCreateInfo
    - VkPipelineInputAssemblyStateCreateInfo
10.2.2. Graphics Pipeline Shader Groups

Graphics pipelines can contain multiple shader groups that can be bound individually. Each shader group behaves as if it was a pipeline using the shader group’s state. When the pipeline is bound by
regular means, it behaves as if the state of group 0 is active, use
vkCmdBindPipelineShaderGroupNV to bind an individual shader group.

The primary purpose of shader groups is allowing the device to bind different pipeline state using
Device-Generated Commands.

The VkGraphicsPipelineShaderGroupsCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkGraphicsPipelineShaderGroupsCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t groupCount;
    const VkGraphicsShaderGroupCreateInfoNV* pGroups;
    uint32_t pipelineCount;
    const VkPipeline* pPipelines;
} VkGraphicsPipelineShaderGroupsCreateInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `groupCount` is the number of elements in the `pGroups` array.
- `pGroups` is a pointer to an array of VkGraphicsShaderGroupCreateInfoNV structures specifying
  which state of the original VkGraphicsPipelineCreateInfo each shader group overrides.
- `pipelineCount` is the number of elements in the `pPipelines` array.
- `pPipelines` is a pointer to an array of graphics VkPipeline structures which are referenced
  within the created pipeline, including all their shader groups.

When referencing shader groups by index, groups defined in the referenced pipelines are treated
as if they were defined as additional entries in `pGroups`. They are appended in the order they appear
in the `pPipelines` array and in the `pGroups` array when those pipelines were defined.

The application must maintain the lifetime of all such referenced pipelines based on the pipelines
that make use of them.

**Valid Usage**

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-groupCount-02879
groupCount must be at least 1 and as maximum
  VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxGraphicsShaderGroupCount

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-groupCount-02880
  The sum of `groupCount` including those groups added from referenced `pPipelines` must
  also be as maximum `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV`:
  maxGraphicsShaderGroupCount

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02881
  The state of the first element of `pGroups` must match its equivalent within the parent’s
VkGraphicsPipelineCreateInfo

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02882
  Each element of `pGroups` must in combination with the rest of the pipeline state yield a valid state configuration

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02884
  All elements of `pGroups` must use the same shader stage combinations unless any mesh shader stage is used, then either combination of task and mesh or just mesh shader is valid

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02885
  Mesh and regular primitive shading stages cannot be mixed across `pGroups`

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pPipelines-02886
  Each element of `pPipelines` must have been created with identical state to the pipeline currently created except the state that can be overridden by `VkGraphicsShaderGroupCreateInfoNV`

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-deviceGeneratedCommands-02887
  The `deviceGeneratedCommands` feature must be enabled

Valid Usage (Implicit)

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_SHADER_GROUPS_CREATE_INFO_NV`

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-parameter
  If `groupCount` is not 0, `pGroups` must be a valid pointer to an array of `groupCount` valid `VkGraphicsShaderGroupCreateInfoNV` structures

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pPipelines-parameter
  If `pipelineCount` is not 0, `pPipelines` must be a valid pointer to an array of `pipelineCount` valid `VkPipeline` handles

The `VkGraphicsShaderGroupCreateInfoNV` structure provides the state overrides for each shader group. Each shader group behaves like a pipeline that was created from its state as well as the remaining parent's state. It is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkGraphicsShaderGroupCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    const VkPipelineVertexInputStateCreateInfo* pVertexInputState;
    const VkPipelineTessellationStateCreateInfo* pTessellationState;
} VkGraphicsShaderGroupCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• stageCount is the number of entries in the pStages array.
• pStages is a pointer to an array VkPipelineShaderStageCreateInfo structures specifying the set of the shader stages to be included in this shader group.
• pVertexInputState is a pointer to a VkPipelineVertexInputStateCreateInfo structure.
• pTessellationState is a pointer to a VkPipelineTessellationStateCreateInfo structure, and is ignored if the shader group does not include a tessellation control shader stage and tessellation evaluation shader stage.

Valid Usage

• VUID-VkGraphicsShaderGroupCreateInfoNV-stageCount-02888
  For stageCount, the same restrictions as in VkGraphicsPipelineCreateInfo::stageCount apply
• VUID-VkGraphicsShaderGroupCreateInfoNV-pStages-02889
  For pStages, the same restrictions as in VkGraphicsPipelineCreateInfo::pStages apply
• VUID-VkGraphicsShaderGroupCreateInfoNV-pVertexInputState-02890
  For pVertexInputState, the same restrictions as in VkGraphicsPipelineCreateInfo::pVertexInputState apply
• VUID-VkGraphicsShaderGroupCreateInfoNV-pTessellationState-02891
  For pTessellationState, the same restrictions as in VkGraphicsPipelineCreateInfo::pTessellationState apply

Valid Usage (Implicit)

• VUID-VkGraphicsShaderGroupCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_GRAPHICS_SHADER_GROUP_CREATE_INFO_NV
• VUID-VkGraphicsShaderGroupCreateInfoNV-pNext-pNext
  pNext must be NULL
• VUID-VkGraphicsShaderGroupCreateInfoNV-pStages-parameter
  pStages must be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures
• VUID-VkGraphicsShaderGroupCreateInfoNV-stageCount-arraylength
  stageCount must be greater than 0

10.3. Ray Tracing Pipelines

Ray tracing pipelines consist of multiple shader stages, fixed-function traversal stages, and a pipeline layout.

VK_SHADER_UNUSED_KHR is a special shader index used to indicate that a ray generation, miss, or callable shader member is not used.
```c
#define VK_SHADER_UNUSED_KHR (~0U)

or the equivalent

```c
#define VK_SHADER_UNUSED_NV VK_SHADER_UNUSED_KHR

```c
To create ray tracing pipelines, call:

```c
// Provided by VK_NV_ray_tracing
VkResult vkCreateRayTracingPipelinesNV(
    VkDevice device,
    VkPipelineCache pipelineCache,
    uint32_t createInfoCount,
    const VkRayTracingPipelineCreateInfoNV* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkPipeline* pPipelines);
```

- `device` is the logical device that creates the ray tracing pipelines.
- `pipelineCache` is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled, or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of `VkRayTracingPipelineCreateInfoNV` structures.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelines` is a pointer to an array in which the resulting ray tracing pipeline objects are returned.

### Valid Usage

- **VUID-vkCreateRayTracingPipelinesNV-flags-03415**
  If the flags member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the `basePipelineIndex` member of that same element is not -1, `basePipelineIndex` must be less than the index into `pCreateInfos` that corresponds to that element

- **VUID-vkCreateRayTracingPipelinesNV-flags-03416**
  If the flags member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline must have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set

- **VUID-vkCreateRayTracingPipelinesNV-flags-03816**
  If the flags member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag, `flags` must not contain the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag

- **VUID-vkCreateRayTracingPipelinesNV-pipelineCache-02903**
  If `pipelineCache` was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`,
Valid Usage (Implicit)

- **VUID-vkCreateRayTracingPipelinesNV-device-parameter**
  
  `device` must be a valid `VkDevice` handle.

- **VUID-vkCreateRayTracingPipelinesNV-pipelineCache-parameter**
  
  If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` must be a valid `VkPipelineCache` handle.

- **VUID-vkCreateRayTracingPipelinesNV-pCreateInfos-parameter**
  
  `pCreateInfos` must be a valid pointer to an array of `createInfoCount` valid `VkRayTracingPipelineCreateInfoNV` structures.

- **VUID-vkCreateRayTracingPipelinesNV-pAllocator-parameter**
  
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkCreateRayTracingPipelinesNV-pPipelines-parameter**
  
  `pPipelines` must be a valid pointer to an array of `createInfoCount` `VkPipeline` handles.

- **VUID-vkCreateRayTracingPipelinesNV-createInfoCount-arraylength**
  
  `createInfoCount` must be greater than 0.

- **VUID-vkCreateRayTracingPipelinesNV-pipelineCache-parent**
  
  If `pipelineCache` is a valid handle, it must have been created, allocated, or retrieved from `device`.

Return Codes

**Success**

- `VK_SUCCESS`
- `VK_PIPELINE_COMPILE_REQUIRED_EXT`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_SHADER_NV`

To create ray tracing pipelines, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkCreateRayTracingPipelinesKHR(  
    VkDevice device,  
    VkDeferredOperationKHR deferredOperation,  
    VkPipelineCache pipelineCache,  
    uint32_t createInfoCount,  
    // ...  
)`
```c
const VkRayTracingPipelineCreateInfoKHR* pCreateInfos,
const VkAllocationCallbacks* pAllocator,
VkPipeline* pPipelines);
```

- **device** is the logical device that creates the ray tracing pipelines.
- **deferredOperation** is `VK_NULL_HANDLE` or the handle of a valid `VkDeferredOperationKHR` request deferral object for this command.
- **pipelineCache** is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled, or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- **createInfoCount** is the length of the `pCreateInfos` and `pPipelines` arrays.
- **pCreateInfos** is a pointer to an array of `VkRayTracingPipelineCreateInfoKHR` structures.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pPipelines** is a pointer to an array in which the resulting ray tracing pipeline objects are returned.

The **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS** error is returned if the implementation is unable to reuse the shader group handles provided in `VkRayTracingShaderGroupCreateInfoKHR ::pShaderGroupCaptureReplayHandle` when `VkPhysicalDeviceRayTracingPipelineFeaturesKHR ::rayTracingPipelineShaderGroupHandleCaptureReplay` is enabled.

---

### Valid Usage

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03415**
  If the **flags** member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the **basePipelineIndex** member of that same element is not -1, **basePipelineIndex** must be less than the index into `pCreateInfos` that corresponds to that element

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03416**
  If the **flags** member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline must have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03816**
  **flags** must not contain the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag

- **VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-02903**
  If pipelineCache was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, host access to pipelineCache must be externally synchronized

- **VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03677**
  If deferredOperation is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object

- **VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03678**
  Any previous deferred operation that was associated with `deferredOperation` must be complete
The rayTracingPipeline feature must be enabled

If deferredOperation is not VK_NULL_HANDLE, the flags member of elements of pCreateInfos must not include VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT

Valid Usage (Implicit)

device must be a valid VkDevice handle

If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

If pipelineCache is not VK_NULL_HANDLE, pipelineCache must be a valid VkPipelineCache handle

pCreateInfos must be a valid pointer to an array of createInfoCount valid VkRayTracingPipelineCreateInfoKHR structures

If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

pPipelines must be a valid pointer to an array of createInfoCount VkPipeline handles

createInfoCount must be greater than 0

If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

If pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success

VK_SUCCESS
VK_OPERATION_DEFERRED_KHR
VK_OPERATION_NOT_DEFERRED_KHR
VK_PIPELINE_COMPILE_REQUIRED_EXT
The `VkRayTracingPipelineCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkRayTracingPipelineCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    uint32_t groupCount;
    const VkRayTracingShaderGroupCreateInfoNV* pGroups;
    uint32_t maxRecursionDepth;
    VkPipelineLayout layout;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkRayTracingPipelineCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array of `VkPipelineShaderStageCreateInfo` structures specifying the set of the shader stages to be included in the ray tracing pipeline.
- `groupCount` is the number of entries in the `pGroups` array.
- `pGroups` is a pointer to an array of `VkRayTracingShaderGroupCreateInfoNV` structures describing the set of the shader stages to be included in each shader group in the ray tracing pipeline.
- `maxRecursionDepth` is the maximum recursion depth of shaders executed by this pipeline.
- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- `basePipelineHandle` is a pipeline to derive from.
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in Pipeline Derivatives.

If a `VkPipelineCreateFlags2CreateInfoKHR` structure is present in the `pNext` chain,
VkPipelineCreateFlags2CreateInfoKHR::flags from that structure is used instead of flags from this structure.

**Valid Usage**

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-07984**
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineIndex is -1, basePipelineHandle must be a valid ray tracing VkPipeline handle.

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-07985**
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineHandle is VK_NULL_HANDLE, basePipelineIndex must be a valid index into the calling command's pCreateInfos parameter.

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-07986**
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineHandle is VK_NULL_HANDLE, basePipelineIndex must be a valid index into the calling command's pCreateInfos parameter.

- **VUID-VkRayTracingPipelineCreateInfoNV-stage-06232**
  The stage member of at least one element of pStages must be 777.
VK_SHADER_STAGE_RAYGEN_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoNV-flags-03456
  flags must not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoNV-maxRecursionDepth-03457
  maxRecursionDepth must be less than or equal to
  VkPhysicalDeviceRayTracingPropertiesNV::maxRecursionDepth

• VUID-VkRayTracingPipelineCreateInfoNV-flags-03458
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoNV-flags-03459
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoNV-flags-03460
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoNV-flags-03461
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoNV-flags-03462
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoNV-flags-03463
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoNV-flags-03588
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoNV-flags-04948
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV

• VUID-VkRayTracingPipelineCreateInfoNV-flags-02957
  flags must not include both VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV and
  VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT at the same time

• VUID-VkRayTracingPipelineCreateInfoNV-pipelineStageCreationFeedbackCount-06651
  If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it
  must be equal to stageCount

• VUID-VkRayTracingPipelineCreateInfoNV-stage-06898
  The stage value in all pStages elements must be one of VK_SHADER_STAGE_RAYGEN_BIT_KHR,
  VK_SHADER_STAGE_ANY_HIT_BIT_KHR, VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR,
  VK_SHADER_STAGE_MISS_BIT_KHR, VK_SHADER_STAGE_INTERSECTION_BIT_KHR, or
  VK_SHADER_STAGE_CALLABLE_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoNV-flags-07402
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT

• VUID-VkRayTracingPipelineCreateInfoNV-flags-07998
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV
Valid Usage (Implicit)

- VUID-VkRayTracingPipelineCreateInfoNV-sType-sType
  \textbf{sType} must be \texttt{VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CREATE_INFO_NV}

- VUID-VkRayTracingPipelineCreateInfoNV-pNext-pNext
  Each \texttt{pNext} member of any structure (including this one) in the \texttt{pNext} chain must be either \texttt{NULL} or a pointer to a valid instance of \texttt{VkPipelineCreateFlags2CreateInfoKHR} or \texttt{VkPipelineCreationFeedbackCreateInfo}

- VUID-VkRayTracingPipelineCreateInfoNV-sType-unique
  The \texttt{sType} value of each struct in the \texttt{pNext} chain must be unique

- VUID-VkRayTracingPipelineCreateInfoNV-flags-parameter
  flags must be a valid combination of \texttt{VkPipelineCreateFlagBits} values

- VUID-VkRayTracingPipelineCreateInfoNV-pStages-parameter
  \texttt{pStages} must be a valid pointer to an array of \texttt{stageCount} valid \texttt{VkPipelineShaderStageCreateInfo} structures

- VUID-VkRayTracingPipelineCreateInfoNV-pGroups-parameter
  \texttt{pGroups} must be a valid pointer to an array of \texttt{groupCount} valid \texttt{VkRayTracingShaderGroupCreateInfoNV} structures

- VUID-VkRayTracingPipelineCreateInfoNV-layout-parameter
  \texttt{layout} must be a valid \texttt{VkPipelineLayout} handle

- VUID-VkRayTracingPipelineCreateInfoNV-stageCount-arraylength
  \texttt{stageCount} must be greater than 0

- VUID-VkRayTracingPipelineCreateInfoNV-groupCount-arraylength
  \texttt{groupCount} must be greater than 0

- VUID-VkRayTracingPipelineCreateInfoNV-commonparent
  Both of \texttt{basePipelineHandle}, and \texttt{layout} that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same \texttt{VkDevice}

The \texttt{VkRayTracingPipelineCreateInfoKHR} structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingPipelineCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    uint32_t groupCount;
    const VkRayTracingShaderGroupCreateInfoKHR* pGroups;
    uint32_t maxPipelineRayRecursionDepth;
    const VkPipelineLibraryCreateInfoKHR* pLibraryInfo;
    const VkRayTracingPipelineInterfaceCreateInfoKHR* pLibraryInterface;
    const VkPipelineDynamicStateCreateInfo* pDynamicState;
    VkPipelineLayout layout;
} VkRayTracingPipelineCreateInfoKHR;
```
VK_PIPELINE_CREATE_LIBRARY_BIT_KHR is specified, this pipeline defines a pipeline library which cannot be bound as a ray tracing pipeline directly. Instead, pipeline libraries define common shaders and shader groups which can be included in future pipeline creation.

If pipeline libraries are included in pLibraryInfo, shaders defined in those libraries are treated as if they were defined as additional entries in pStages, appended in the order they appear in the pLibraries array and in the pStages array when those libraries were defined.

When referencing shader groups in order to obtain a shader group handle, groups defined in those libraries are treated as if they were defined as additional entries in pGroups, appended in the order
they appear in the `pLibraries` array and in the `pGroups` array when those libraries were defined. The shaders these groups reference are set when the pipeline library is created, referencing those specified in the pipeline library, not in the pipeline that includes it.

The default stack size for a pipeline if `VK_DYNAMIC_STATERAY_TRACING_PIPELINE_STACK_SIZE_KHR` is not provided is computed as described in Ray Tracing Pipeline Stack.

If a `VkPipelineCreateFlags2CreateInfoKHR` structure is present in the `pNext` chain, `VkPipelineCreateFlags2CreateInfoKHR::flags` from that structure is used instead of `flags` from this structure.

### Valid Usage

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-07984**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` must be a valid ray tracing `VkPipeline` handle.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-07985**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` must be a valid index into the calling command's `pCreateInfos` parameter.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-07986**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, `basePipelineIndex` must be -1 or `basePipelineHandle` must be `VK_NULL_HANDLE`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-07987**
  If a push constant block is declared in a shader, a push constant range in `layout` must match both the shader stage and range.

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-07988**
  If a `resource variables` is declared in a shader, a descriptor slot in `layout` must match the shader stage.

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-07990**
  If a `resource variables` is declared in a shader, and the descriptor type is not `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`, a descriptor slot in `layout` must match the descriptor type.

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-07991**
  If a `resource variables` is declared in a shader as an array, a descriptor slot in `layout` must match the descriptor count.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pStages-03426**
  The shader code for the entry points identified by `pStages`, and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter.

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-03428**
  The number of resources in `layout` accessible to each shader stage that is used by the pipeline must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-02904**
flags must not include VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV

- VUID-VkRayTracingPipelineCreateInfoKHR-pipelineCreationCacheControl-02905
  If the pipelineCreationCacheControl feature is not enabled, flags must not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT or VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT

- VUID-VkRayTracingPipelineCreateInfoKHR-stage-03425
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, the stage member of at least one element of pStages, including those implicitly added by pLibraryInfo, must be VK_SHADER_STAGE_RAYGEN_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-maxPipelineRayRecursionDepth-03589
  maxPipelineRayRecursionDepth must be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayRecursionDepth

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03465
  If flags includes VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, pLibraryInterface must not be NULL

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03590
  If pLibraryInfo is not NULL and its libraryCount member is greater than 0, pLibraryInterface must not be NULL

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraries-03591
  Each element of pLibraryInfo->pLibraries must have been created with the value of maxPipelineRayRecursionDepth equal to that in this pipeline

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03592
  If pLibraryInfo is not NULL, each element of its pLibraries member must have been created with a layout that is compatible with the layout in this pipeline

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03593
  If pLibraryInfo is not NULL, each element of its pLibraries member must have been created with values of the maxPipelineRayPayloadSize and maxPipelineRayHitAttributeSize members of pLibraryInterface equal to those in this pipeline

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03594
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR bit set

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-04718
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR bit set

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-04719
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR bit set

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-04720
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the
VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR bit set

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-04721
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR bit set

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-04722
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR bit set

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-04723
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR bit set

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-03470
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR, for any element of pGroups with a type of VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, the anyHitShader of that element must not be VK_SHADER_UNUSED_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-03471
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, for any element of pGroups with a type of VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, the closestHitShader of that element must not be VK_SHADER_UNUSED_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03596
  If the rayTraversalPrimitiveCulling feature is not enabled, flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03597
  If the rayTraversalPrimitiveCulling feature is not enabled, flags must not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-06546
  flags must not include both VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR and VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-03598
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR, rayTracingPipelineShaderGroupHandleCaptureReplay must be enabled

• VUID-VkRayTracingPipelineCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03599
If `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay` is `VK_TRUE` and the `pShaderGroupCaptureReplayHandle` member of any element of `pGroups` is not `NULL`, `flags` must include `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`.

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-07999
  If `pLibraryInfo` is `NULL` or its `libraryCount` is `0`, `stageCount` must not be `0`.

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-08700
  If `flags` does not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` and either `pLibraryInfo` is `NULL` or its `libraryCount` is `0`, `groupCount` must not be `0`.

- VUID-VkRayTracingPipelineCreateInfoKHR-pDynamicStates-03602
  Any element of the `pDynamicStates` member of `pDynamicState` must be `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR`.

- VUID-VkRayTracingPipelineCreateInfoKHR-pipelineStageCreationFeedbackCount-06652
  If `VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount` is not `0`, it must be equal to `stageCount`.

- VUID-VkRayTracingPipelineCreateInfoKHR-stage-06899
  The `stage` value in all `pStages` elements must be one of `VK_SHADER_STAGE_RAYGEN_BIT_KHR`, `VK_SHADER_STAGE_ANY_HIT_BIT_KHR`, `VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR`, `VK_SHADER_STAGE_MISS_BIT_KHR`, `VK_SHADER_STAGE_INTERSECTION_BIT_KHR`, or `VK_SHADER_STAGE_CALLABLE_BIT_KHR`.

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-07403
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT` bit set.

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-08701
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV` bit set.

**Valid Usage (Implicit)**

- VUID-VkRayTracingPipelineCreateInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CREATE_INFO_KHR`.

- VUID-VkRayTracingPipelineCreateInfoKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineCreateFlags2CreateInfoKHR`, `VkPipelineCreationFeedbackCreateInfo`, or `VkPipelineRobustnessCreateInfoEXT`.

- VUID-VkRayTracingPipelineCreateInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique.

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-parameter
  `flags` must be a valid combination of `VkPipelineCreateFlagBits` values.
• VUID-VkRayTracingPipelineCreateInfoKHR-pStages-parameter
  If stageCount is not 0, pStages must be a valid pointer to an array of stageCount valid
  VkPipelineShaderStageCreateInfo structures.

• VUID-VkRayTracingPipelineCreateInfoKHR-pGroups-parameter
  If groupCount is not 0, pGroups must be a valid pointer to an array of groupCount valid
  VkRayTracingShaderGroupCreateInfoKHR structures.

• VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-parameter
  If pLibraryInfo is not NULL, pLibraryInfo must be a valid pointer to a valid
  VkPipelineLibraryCreateInfoKHR structure.

• VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInterface-parameter
  If pLibraryInterface is not NULL, pLibraryInterface must be a valid pointer to a valid
  VkRayTracingPipelineInterfaceCreateInfoKHR structure.

• VUID-VkRayTracingPipelineCreateInfoKHR-pDynamicState-parameter
  If pDynamicState is not NULL, pDynamicState must be a valid pointer to a valid
  VkPipelineDynamicStateCreateInfo structure.

• VUID-VkRayTracingPipelineCreateInfoKHR-layout-parameter
  layout must be a valid VkPipelineLayout handle.

• VUID-VkRayTracingPipelineCreateInfoKHR-commonparent
  Both of basePipelineHandle, and layout that are valid handles of non-ignored parameters
  must have been created, allocated, or retrieved from the same VkDevice

The VkRayTracingShaderGroupCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkRayTracingShaderGroupCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkRayTracingShaderGroupTypeKHR type;
    uint32_t generalShader;
    uint32_t closestHitShader;
    uint32_t anyHitShader;
    uint32_t intersectionShader;
} VkRayTracingShaderGroupCreateInfoNV;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• type is the type of hit group specified in this structure.

• generalShader is the index of the ray generation, miss, or callable shader from
  VkRayTracingPipelineCreateInfoNV::pStages in the group if the shader group has type of
  VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV, and VK_SHADER_UNUSED_NV otherwise.

• closestHitShader is the optional index of the closest hit shader from
  VkRayTracingPipelineCreateInfoNV::pStages in the group if the shader group has type of
  VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV
• Any hit shader is the optional index of the any-hit shader from `VkRayTracingPipelineCreateInfoNV::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV`, and `VK_SHADER_UNUSED_NV` otherwise.

• Intersection shader is the index of the intersection shader from `VkRayTracingPipelineCreateInfoNV::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV`, and `VK_SHADER_UNUSED_NV` otherwise.

Valid Usage

• VUID-VkRayTracingShaderGroupCreateInfoNV-type-02413
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV` then `generalShader` must be a valid index into `VkRayTracingPipelineCreateInfoNV::pStages` referring to a shader of `VK_SHADER_STAGE_RAYGEN_BIT_NV`, `VK_SHADER_STAGE_MISS_BIT_NV`, or `VK_SHADER_STAGE_CALLABLE_BIT_NV`.

• VUID-VkRayTracingShaderGroupCreateInfoNV-type-02414
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV` then `closestHitShader`, `anyHitShader`, and `intersectionShader` must be `VK_SHADER_UNUSED_NV`.

• VUID-VkRayTracingShaderGroupCreateInfoNV-type-02415
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV` then `intersectionShader` must be a valid index into `VkRayTracingPipelineCreateInfoNV::pStages` referring to a shader of `VK_SHADER_STAGE_INTERSECTION_BIT_NV`.

• VUID-VkRayTracingShaderGroupCreateInfoNV-type-02416
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV` then `intersectionShader` must be `VK_SHADER_UNUSED_NV`.

• VUID-VkRayTracingShaderGroupCreateInfoNV-closestHitShader-02417
  `closestHitShader` must be either `VK_SHADER_UNUSED_NV` or a valid index into `VkRayTracingPipelineCreateInfoNV::pStages` referring to a shader of `VK_SHADER_STAGE_CLOSEST_HIT_BIT_NV`.

• VUID-VkRayTracingShaderGroupCreateInfoNV-anyHitShader-02418
  `anyHitShader` must be either `VK_SHADER_UNUSED_NV` or a valid index into `VkRayTracingPipelineCreateInfoNV::pStages` referring to a shader of `VK_SHADER_STAGE_ANY_HIT_BIT_NV`.

Valid Usage (Implicit)

• VUID-VkRayTracingShaderGroupCreateInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_NV`.

• VUID-VkRayTracingShaderGroupCreateInfoNV-pNext-pNext
  `pNext` must be `NULL`.

• VUID-VkRayTracingShaderGroupCreateInfoNV-type-parameter
  `type` must be a valid `VkRayTracingShaderGroupTypeKHR` value.
The `VkRayTracingShaderGroupCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingShaderGroupCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkRayTracingShaderGroupTypeKHR type;
    uint32_t generalShader;
    uint32_t closestHitShader;
    uint32_t anyHitShader;
    uint32_t intersectionShader;
    const void* pShaderGroupCaptureReplayHandle;
} VkRayTracingShaderGroupCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `type` is the type of hit group specified in this structure.
- `generalShader` is the index of the ray generation, miss, or callable shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- `closestHitShader` is the optional index of the closest hit shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- `anyHitShader` is the optional index of the any-hit shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- `intersectionShader` is the index of the intersection shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- `pShaderGroupCaptureReplayHandle` is `NULL` or a pointer to replay information for this shader group queried from `vkGetRayTracingCaptureReplayShaderGroupHandlesKHR`, as described in Ray Tracing Capture Replay. Ignored if `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay` is `VK_FALSE`.

If the pipeline is created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` and the `pipelineLibraryGroupHandles` feature is enabled, `pShaderGroupCaptureReplayHandle` is inherited by all pipelines which link against this pipeline and remains bitwise identical for any pipeline which references this pipeline library.
Valid Usage

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03474**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR` then `generalShader` must be a valid index into `VkRayTracingPipelineCreateInfoKHR::pStages` referring to a shader of `VK_SHADER_STAGE_RAYGEN_BIT_KHR`, `VK_SHADER_STAGE_MISS_BIT_KHR`, or `VK_SHADER_STAGE_CALLABLE_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03475**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR` then `closestHitShader`, `anyHitShader`, and `intersectionShader` must be `VK_SHADER_UNUSED_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03476**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR` then `intersectionShader` must be a valid index into `VkRayTracingPipelineCreateInfoKHR::pStages` referring to a shader of `VK_SHADER_STAGE_INTERSECTION_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03477**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` then `intersectionShader` must be `VK_SHADER_UNUSED_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-closestHitShader-03478**
  `closestHitShader` must be either `VK_SHADER_UNUSED_KHR` or a valid index into `VkRayTracingPipelineCreateInfoKHR::pStages` referring to a shader of `VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-anyHitShader-03479**
  `anyHitShader` must be either `VK_SHADER_UNUSED_KHR` or a valid index into `VkRayTracingPipelineCreateInfoKHR::pStages` referring to a shader of `VK_SHADER_STAGE_ANY_HIT_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03603**
  If `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplayMixed` is `VK_FALSE` then `pShaderGroupCaptureReplayHandle` must not be provided if it has not been provided on a previous call to ray tracing pipeline creation.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03604**
  If `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplayMixed` is `VK_FALSE` then the caller must guarantee that no ray tracing pipeline creation commands with `pShaderGroupCaptureReplayHandle` provided execute simultaneously with ray tracing pipeline creation commands without `pShaderGroupCaptureReplayHandle` provided.

Valid Usage (Implicit)

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_KHR`.
• VUID-VkRayTracingShaderGroupCreateInfoKHR-pNext-pNext
  pNext must be NULL

• VUID-VkRayTracingShaderGroupCreateInfoKHR-type-parameter
  type must be a valid VkRayTracingShaderGroupTypeKHR value

Possible values of type in VkRayTracingShaderGroupCreateInfoKHR are:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef enum VkRayTracingShaderGroupTypeKHR {
    VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR = 0,
    VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR = 1,
    VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR = 2,
    // Provided by VK_NV_ray_tracing
    VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV =
    VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR,
    // Provided by VK_NV_ray_tracing
    VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV =
    VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR,
    // Provided by VK_NV_ray_tracing
    VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV =
    VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR,
} VkRayTracingShaderGroupTypeKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkRayTracingShaderGroupTypeKHR VkRayTracingShaderGroupTypeNV;
```

• VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR indicates a shader group with a single
  VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, or
  VK_SHADER_STAGE_CALLABLE_BIT_KHR shader in it.

• VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR specifies a shader group that only
  hits triangles and must not contain an intersection shader, only closest hit and any-hit shaders.

• VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR specifies a shader group that only
  intersects with custom geometry and must contain an intersection shader and may contain
  closest hit and any-hit shaders.

Note
For current group types, the hit group type could be inferred from the presence or
absence of the intersection shader, but we provide the type explicitly for future hit
groups that do not have that property.

The VkRayTracingPipelineInterfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
```
typedef struct VkRayTracingPipelineInterfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxPipelineRayPayloadSize;
    uint32_t maxPipelineRayHitAttributeSize;
} VkRayTracingPipelineInterfaceCreateInfoKHR;

• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **maxPipelineRayPayloadSize** is the maximum payload size in bytes used by any shader in the pipeline.
• **maxPipelineRayHitAttributeSize** is the maximum attribute structure size in bytes used by any shader in the pipeline.

maxPipelineRayPayloadSize is calculated as the maximum number of bytes used by any block declared in the *RayPayloadKHR* or *IncomingRayPayloadKHR* storage classes. maxPipelineRayHitAttributeSize is calculated as the maximum number of bytes used by any block declared in the *HitAttributeKHR* storage class. As variables in these storage classes do not have explicit offsets, the size should be calculated as if each variable has a scalar alignment equal to the largest scalar alignment of any of the block’s members.

**Note**
There is no explicit upper limit for maxPipelineRayPayloadSize, but in practice it should be kept as small as possible. Similar to invocation local memory, it must be allocated for each shader invocation and for devices which support many simultaneous invocations, this storage can rapidly be exhausted, resulting in failure.

**Valid Usage**

• VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-maxPipelineRayHitAttributeSize-03605
  maxPipelineRayHitAttributeSize must be less than or equal to
  VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayHitAttributeSize

**Valid Usage (Implicit)**

• VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_INTERFACE_CREATE_INFO_KHR

• VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

To query the opaque handles of shaders in the ray tracing pipeline, call:
Provided by VK_KHR_ray_tracing_pipeline

```c
VkResult vkGetRayTracingShaderGroupHandlesKHR(
    VkDevice device,
    VkPipeline pipeline,
    uint32_t firstGroup,
    uint32_t groupCount,
    size_t dataSize,
    void* pData);
```

or the equivalent command

Provided by VK_NV_ray_tracing

```c
VkResult vkGetRayTracingShaderGroupHandlesNV(
    VkDevice device,
    VkPipeline pipeline,
    uint32_t firstGroup,
    uint32_t groupCount,
    size_t dataSize,
    void* pData);
```

- **device** is the logical device containing the ray tracing pipeline.
- **pipeline** is the ray tracing pipeline object containing the shaders.
- **firstGroup** is the index of the first group to retrieve a handle for from the `VkRayTracingPipelineCreateInfoKHR::pGroups` or `VkRayTracingPipelineCreateInfoNV::pGroups` array.
- **groupCount** is the number of shader handles to retrieve.
- **dataSize** is the size in bytes of the buffer pointed to by **pData**.
- **pData** is a pointer to a user-allocated buffer where the results will be written.

If **pipeline** was created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` and the `pipelineLibraryGroupHandles` feature is enabled applications can query group handles from that pipeline, even if the pipeline is a library and is never bound to a command buffer. These group handles remain bitwise identical for any **pipeline** which references the pipeline library. Group indices are assigned as-if the pipeline was created without `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`.

### Valid Usage

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-04619 **pipeline** must be a ray tracing pipeline
- VUID-vkGetRayTracingShaderGroupHandlesKHR-firstGroup-04050 **firstGroup** must be less than the number of shader groups in **pipeline**
- VUID-vkGetRayTracingShaderGroupHandlesKHR-firstGroup-02419 The sum of **firstGroup** and **groupCount** must be less than or equal to the number of shader groups in **pipeline**
• VUID-vkGetRayTracingShaderGroupHandlesKHR-dataSize-02420
  
  *dataSize must be at least* \( \text{VkPhysicalDeviceRayTracingPipelinePropertiesKHR}::\text{shaderGroupHandleSize} \times \text{groupCount} \)

• VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-07828
  
  If the pipelineLibraryGroupHandles feature is not enabled, pipeline must not have been created with \( \text{VK_PIPELINE_CREATE_LIBRARY_BIT_KHR} \)

---

**Valid Usage (Implicit)**

• VUID-vkGetRayTracingShaderGroupHandlesKHR-device-parameter
  
  device must be a valid \( \text{VkDevice} \) handle

• VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parameter
  
  pipeline must be a valid \( \text{VkPipeline} \) handle

• VUID-vkGetRayTracingShaderGroupHandlesKHR-pData-parameter
  
  pData must be a valid pointer to an array of dataSize bytes

• VUID-vkGetRayTracingShaderGroupHandlesKHR-dataSize-arraylength
  
  dataSize must be greater than 0

• VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parent
  
  pipeline must have been created, allocated, or retrieved from device

---

**Return Codes**

**Success**

• VK_SUCCESS

**Failure**

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

---

To query the opaque capture data of shader groups in a ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkGetRayTracingCaptureReplayShaderGroupHandlesKHR(
    VkDevice device,  // logical device containing the ray tracing pipeline.
    VkPipeline pipeline,  // ray tracing pipeline object containing the shaders.
    uint32_t firstGroup,  // first shader group index to query.
    uint32_t groupCount,  // number of shader groups to query.
    size_t dataSize,  // size in bytes of the opaque capture data.
    void* pData);  // pointer to the opaque capture data.
```
• **firstGroup** is the index of the first group to retrieve a handle for from the `VkRayTracingPipelineCreateInfoKHR::pGroups` array.

• **groupCount** is the number of shader handles to retrieve.

• **dataSize** is the size in bytes of the buffer pointed to by `pData`.

• **pData** is a pointer to a user-allocated buffer where the results will be written.

Once queried, this opaque data can be provided at pipeline creation time (in a subsequent execution), using `VkRayTracingShaderGroupCreateInfoKHR::pShaderGroupCaptureReplayHandle`, as described in Ray Tracing Capture Replay.

If `pipeline` was created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` and the `pipelineLibraryGroupHandles` feature is enabled applications can query capture replay group handles from that pipeline. The capture replay handle remains bitwise identical for any `pipeline` which references the pipeline library. Group indices are assigned as-if the pipeline was created without `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`.

### Valid Usage

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-04620
  - `pipeline` must be a ray tracing pipeline

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-04051
  - `firstGroup` must be less than the number of shader groups in `pipeline`

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-03483
  - The sum of `firstGroup` and `groupCount` must be less than or equal to the number of shader groups in `pipeline`

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-03484
  - `dataSize` must be at least `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleCaptureReplaySize × groupCount`

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03606
  - `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay` must be enabled to call this function

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-03607
  - `pipeline` must have been created with a flags that included `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-07829
  - If the `pipelineLibraryGroupHandles` feature is not enabled, `pipeline` must not have been created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`

### Valid Usage (Implicit)

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
• VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-parameter
  pipeline must be a valid VkPipeline handle

• VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pData-parameter
  pData must be a valid pointer to an array of dataSize bytes

• VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-arraylength
  dataSize must be greater than 0

• VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-parent
  pipeline must have been created, allocated, or retrieved from device

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

Ray tracing pipelines can contain more shaders than a graphics or compute pipeline, so to allow parallel compilation of shaders within a pipeline, an application can choose to defer compilation until a later point in time.

To compile a deferred shader in a pipeline call:

```
// Provided by VK_NV_ray_tracing
VkResult vkCompileDeferredNV(
  VkDevice device,
  VkPipeline pipeline,
  uint32_t shader);
```

• device is the logical device containing the ray tracing pipeline.
• pipeline is the ray tracing pipeline object containing the shaders.
• shader is the index of the shader to compile.

Valid Usage

• VUID-vkCompileDeferredNV-pipeline-04621
  pipeline must be a ray tracing pipeline

• VUID-vkCompileDeferredNV-pipeline-02237
  pipeline must have been created with VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV

• VUID-vkCompileDeferredNV-shader-02238
  shader must not have been called as a deferred compile before
Valid Usage (Implicit)

- VUID-vkCompileDeferredNV-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkCompileDeferredNV-pipeline-parameter
  
  `pipeline` must be a valid `VkPipeline` handle

- VUID-vkCompileDeferredNV-pipeline-parent
  
  `pipeline` must have been created, allocated, or retrieved from `device`

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To query the pipeline stack size of shaders in a shader group in the ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline

VkDeviceSize vkGetRayTracingShaderGroupStackSizeKHR(
    VkDevice device,  
    VkPipeline pipeline,  
    uint32_t group,  
    VkShaderGroupShaderKHR groupShader);
```

- `device` is the logical device containing the ray tracing pipeline.
- `pipeline` is the ray tracing pipeline object containing the shaders groups.
- `group` is the index of the shader group to query.
- `groupShader` is the type of shader from the group to query.

The return value is the ray tracing pipeline stack size in bytes for the specified shader as called from the specified shader group.

Valid Usage

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-04622
  
  `pipeline` must be a ray tracing pipeline

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-group-03608
  
  The value of `group` must be less than the number of shader groups in `pipeline`

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-groupShader-03609
The shader identified by `groupShader` in `group` must not be `VK_SHADER_UNUSED_KHR`.

### Valid Usage (Implicit)

- **VUID-vkGetRayTracingShaderGroupStackSizeKHR-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-parameter**
  - `pipeline` must be a valid `VkPipeline` handle

- **VUID-vkGetRayTracingShaderGroupStackSizeKHR-groupShader-parameter**
  - `groupShader` must be a valid `VkShaderGroupShaderKHR` value

- **VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-parent**
  - `pipeline` must have been created, allocated, or retrieved from `device`

Possible values of `groupShader` in `vkGetRayTracingShaderGroupStackSizeKHR` are:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef enum VkShaderGroupShaderKHR {
    VK_SHADER_GROUP_SHADER_GENERAL_KHR = 0,
    VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR = 1,
    VK_SHADER_GROUP_SHADER_ANY_HIT_KHR = 2,
    VK_SHADER_GROUP_SHADER_INTERSECTION_KHR = 3,
} VkShaderGroupShaderKHR;
```

- `VK_SHADER_GROUP_SHADER_GENERAL_KHR` uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::generalShader`
- `VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR` uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::closestHitShader`
- `VK_SHADER_GROUP_SHADER_ANY_HIT_KHR` uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::anyHitShader`
- `VK_SHADER_GROUP_SHADER_INTERSECTION_KHR` uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::intersectionShader`

To **dynamically set** the stack size for a ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdSetRayTracingPipelineStackSizeKHR(
    VkCommandBuffer commandBuffer,  commandBuffer,
    uint32_t pipelineStackSize);  pipelineStackSize);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineStackSize` is the stack size to use for subsequent ray tracing trace commands.

This command sets the stack size for subsequent ray tracing commands when the ray tracing
pipeline is created with `VK_DYNAMIC_STATERAY_TRACING_PIPELINE_STACK_SIZE_KHR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, the stack size is computed as described in Ray Tracing Pipeline Stack.

### Valid Usage

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-pipelineStackSize-03610
  pipelineStackSize **must** be large enough for any dynamic execution through the shaders in the ray tracing pipeline used by a subsequent trace call

### Valid Usage (Implicit)

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-parameter
  commandBuffer **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-cmdpool
  The `VkCommandPool` that commandBuffer was allocated from **must** support compute operations
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the `VkCommandPool` that commandBuffer was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>

### 10.4. Pipeline Destruction

To destroy a pipeline, call:
void vkDestroyPipeline(
    VkDevice device,
    VkPipeline pipeline,
    const VkAllocationCallbacks* pAllocator);

- `device` is the logical device that destroys the pipeline.
- `pipeline` is the handle of the pipeline to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyPipeline-pipeline-00765**
  All submitted commands that refer to `pipeline` must have completed execution

- **VUID-vkDestroyPipeline-pipeline-00766**
  If `VkAllocationCallbacks` were provided when `pipeline` was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyPipeline-pipeline-00767**
  If no `VkAllocationCallbacks` were provided when `pipeline` was created, `pAllocator` must be `NULL`

### Valid Usage (Implicit)

- **VUID-vkDestroyPipeline-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkDestroyPipeline-pipeline-parameter**
  If `pipeline` is not `VK_NULL_HANDLE`, `pipeline` must be a valid `VkPipeline` handle

- **VUID-vkDestroyPipeline-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyPipeline-pipeline-parent**
  If `pipeline` is a valid handle, it must have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `pipeline` must be externally synchronized

---

### 10.5. Multiple Pipeline Creation

Multiple pipelines can be created simultaneously by passing an array of `VkGraphicsPipelineCreateInfo`, `VkRayTracingPipelineCreateInfoKHR`,...
VkRayTracingPipelineCreateInfoNV, or VkComputePipelineCreateInfo structures into the vkCreateGraphicsPipelines, vkCreateRayTracingPipelinesKHR, vkCreateRayTracingPipelinesNV, and vkCreateComputePipelines commands, respectively. Applications can group together similar pipelines to be created in a single call, and implementations are encouraged to look for reuse opportunities within a group-create.

When an application attempts to create many pipelines in a single command, it is possible that some subset may fail creation. In that case, the corresponding entries in the pPipelines output array will be filled with VK_NULL_HANDLE values. If any pipeline fails creation despite valid arguments (for example, due to out of memory errors), the VkResult code returned by vkCreate*Pipelines will indicate why. The implementation will attempt to create all pipelines, and only return VK_NULL_HANDLE values for those that actually failed.

If creation fails for a pipeline that had VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT set, pipelines at an index in the pPipelines array greater than or equal to that of the failing pipeline must be set to VK_NULL_HANDLE.

If multiple pipelines fail to be created, the VkResult must be the return value of any of the pipelines which did not return VK_SUCCESS.

10.6. Pipeline Derivatives

A pipeline derivative is a child pipeline created from a parent pipeline, where the child and parent are expected to have much commonality.

The goal of derivative pipelines is that they be cheaper to create using the parent as a starting point, and that it be more efficient (on either host or device) to switch/bind between children of the same parent.

A derivative pipeline is created by setting the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag in the Vk*PipelineCreateInfo structure. If this is set, then exactly one of basePipelineHandle or basePipelineIndex members of the structure must have a valid handle/index, and specifies the parent pipeline. If basePipelineHandle is used, the parent pipeline must have already been created. If basePipelineIndex is used, then the parent is being created in the same command. VK_NULL_HANDLE acts as the invalid handle for basePipelineHandle, and -1 is the invalid index for basePipelineIndex. If basePipelineIndex is used, the base pipeline must appear earlier in the array. The base pipeline must have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set.

10.7. Pipeline Cache

Pipeline cache objects allow the result of pipeline construction to be reused between pipelines and between runs of an application. Reuse between pipelines is achieved by passing the same pipeline cache object when creating multiple related pipelines. Reuse across runs of an application is achieved by retrieving pipeline cache contents in one run of an application, saving the contents, and using them to preinitialize a pipeline cache on a subsequent run. The contents of the pipeline cache objects are managed by the implementation. Applications can manage the host memory consumed by a pipeline cache object and control the amount of data retrieved from a pipeline.
Pipeline cache objects are represented by `VkPipelineCache` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineCache)
```

### 10.7.1. Creating a Pipeline Cache

To create pipeline cache objects, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineCache(
    VkDevice device, 
    const VkPipelineCacheCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator, 
    VkPipelineCache* pPipelineCache);
```

- `device` is the logical device that creates the pipeline cache object.
- `pCreateInfo` is a pointer to a `VkPipelineCacheCreateInfo` structure containing initial parameters for the pipeline cache object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelineCache` is a pointer to a `VkPipelineCache` handle in which the resulting pipeline cache object is returned.

**Note**

Applications can track and manage the total host memory size of a pipeline cache object using the `pAllocator`. Applications can limit the amount of data retrieved from a pipeline cache object in `vkGetPipelineCacheData`. Implementations should not internally limit the total number of entries added to a pipeline cache object or the total host memory consumed.

Once created, a pipeline cache can be passed to the `vkCreateGraphicsPipelines`, `vkCreateRayTracingPipelinesKHR`, `vkCreateRayTracingPipelinesNV`, and `vkCreateComputePipelines` commands. If the pipeline cache passed into these commands is not `VK_NULL_HANDLE`, the implementation will query it for possible reuse opportunities and update it with new content. The use of the pipeline cache object in these commands is internally synchronized, and the same pipeline cache object can be used in multiple threads simultaneously.

If flags of `pCreateInfo` includes `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, all commands that modify the returned pipeline cache object must be externally synchronized.

**Note**

Implementations should make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the
duration of the `vkCreate*Pipelines` commands.

Valid Usage (Implicit)

- **VUID-vkCreatePipelineCache-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkCreatePipelineCache-pCreateInfo-parameter**
  - `pCreateInfo` must be a valid pointer to a valid `VkPipelineCacheCreateInfo` structure
- **VUID-vkCreatePipelineCache-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreatePipelineCache-pPipelineCache-parameter**
  - `pPipelineCache` must be a valid pointer to a `VkPipelineCache` handle

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineCacheCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineCacheCreateInfo {
    VkStructureType  sType;
    const void*      pNext;
    VkPipelineCacheCreateFlags flags;
    size_t           initialDataSize;
    const void*      pInitialData;
} VkPipelineCacheCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCacheCreateFlagBits` specifying the behavior of the pipeline cache.
- `initialDataSize` is the number of bytes in `pInitialData`. If `initialDataSize` is zero, the pipeline cache will initially be empty.
- `pInitialData` is a pointer to previously retrieved pipeline cache data. If the pipeline cache data is incompatible (as defined below) with the device, the pipeline cache will be initially empty. If
**Valid Usage**

- **VUID-VkPipelineCacheCreateInfo-initialDataSize-00768**
  If `initialDataSize` is not 0, it **must** be equal to the size of `pInitialData`, as returned by `vkGetPipelineCacheData` when `pInitialData` was originally retrieved.

- **VUID-VkPipelineCacheCreateInfo-initialDataSize-00769**
  If `initialDataSize` is not 0, `pInitialData` **must** have been retrieved from a previous call to `vkGetPipelineCacheData`.

- **VUID-VkPipelineCacheCreateInfo-pipelineCreationCacheControl-02892**
  If the `pipelineCreationCacheControl` feature is not enabled, **flags** **must** not include `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`.

**Valid Usage (Implicit)**

- **VUID-VkPipelineCacheCreateInfo-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_CACHE_CREATE_INFO`.

- **VUID-VkPipelineCacheCreateInfo-pNext-pNext**
  `pNext` **must** be `NULL`.

- **VUID-VkPipelineCacheCreateInfo-flags-parameter**
  `flags` **must** be a valid combination of `VkPipelineCacheCreateFlagBits` values.

- **VUID-VkPipelineCacheCreateInfo-pInitialData-parameter**
  If `initialDataSize` is not 0, `pInitialData` **must** be a valid pointer to an array of `initialDataSize` bytes.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCacheCreateFlags;
```

`VkPipelineCacheCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineCacheCreateFlagBits`.

Bits which **can** be set in `VkPipelineCacheCreateInfo::flags`, specifying behavior of the pipeline cache, are:

```c
// Provided by VK_EXT_pipeline_creation_cache_control
typedef enum VkPipelineCacheCreateFlagBits {
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT = 0x00000001,
    // Provided by VK_EXT_pipeline_creation_cache_control
    VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT = VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT,
};
```
vkPipelineCacheCreateFlagBits;

- **VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT** specifies that all commands that modify the created VkPipelineCache will be externally synchronized. When set, the implementation may skip any unnecessary processing needed to support simultaneous modification from multiple threads where allowed.

### 10.7.2. Merging Pipeline Caches

Pipeline cache objects can be merged using the command:

```c
// Provided by VK_VERSION_1_0
VkResult vkMergePipelineCaches(
    VkDevice device,
    VkPipelineCache dstCache,
    uint32_t srcCacheCount,
    const VkPipelineCache* pSrcCaches);
```

- **device** is the logical device that owns the pipeline cache objects.
- **dstCache** is the handle of the pipeline cache to merge results into.
- **srcCacheCount** is the length of the pSrcCaches array.
- **pSrcCaches** is a pointer to an array of pipeline cache handles, which will be merged into dstCache. The previous contents of dstCache are included after the merge.

**Note**

The details of the merge operation are implementation-dependent, but implementations should merge the contents of the specified pipelines and prune duplicate entries.

### Valid Usage

- VUID-vkMergePipelineCaches-dstCache-00770
  dstCache must not appear in the list of source caches

### Valid Usage (Implicit)

- VUID-vkMergePipelineCaches-device-parameter
device must be a valid VkDevice handle
- VUID-vkMergePipelineCaches-dstCache-parameter
dstCache must be a valid VkPipelineCache handle
- VUID-vkMergePipelineCaches-pSrcCaches-parameter
  pSrcCaches must be a valid pointer to an array of srcCacheCount valid VkPipelineCache handles
Host Synchronization

- Host access to dstCache must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

10.7.3. Retrieving Pipeline Cache Data

Data can be retrieved from a pipeline cache object using the command:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetPipelineCacheData(
    VkDevice device,
    VkPipelineCache pipelineCache,
    size_t* pDataSize,
    void* pData);
```

- device is the logical device that owns the pipeline cache.
- pipelineCache is the pipeline cache to retrieve data from.
- pDataSize is a pointer to a size_t value related to the amount of data in the pipeline cache, as described below.
- pData is either NULL or a pointer to a buffer.

If pData is NULL, then the maximum size of the data that can be retrieved from the pipeline cache, in bytes, is returned in pDataSize. Otherwise, pDataSize must point to a variable set by the user to the size of the buffer, in bytes, pointed to by pData, and on return the variable is overwritten with the amount of data actually written to pData. If pDataSize is less than the maximum size that can be retrieved by the pipeline cache, at most pDataSize bytes will be written to pData, and VK_INCOMPLETE
will be returned instead of \texttt{VK_SUCCESS}, to indicate that not all of the pipeline cache was returned.

Any data written to \texttt{pData} is valid and \textbf{can} be provided as the \texttt{pInitialData} member of the \texttt{VkPipelineCacheCreateInfo} structure passed to \texttt{vkCreatePipelineCache}.

Two calls to \texttt{vkGetPipelineCacheData} with the same parameters \textbf{must} retrieve the same data unless a command that modifies the contents of the cache is called between them.

The initial bytes written to \texttt{pData} \textbf{must} be a header as described in the Pipeline Cache Header section.

If \texttt{pDataSize} is less than what is necessary to store this header, nothing will be written to \texttt{pData} and zero will be written to \texttt{pDataSize}.

### Valid Usage (Implicit)

- \textbf{VUID-vkGetPipelineCacheData-device-parameter} \texttt{device} \textbf{must} be a valid \texttt{VkDevice} handle
- \textbf{VUID-vkGetPipelineCacheData-pipelineCache-parameter} \texttt{pipelineCache} \textbf{must} be a valid \texttt{VkPipelineCache} handle
- \textbf{VUID-vkGetPipelineCacheData-pDataSize-parameter} \texttt{pDataSize} \textbf{must} be a valid pointer to a \texttt{size_t} value
- \textbf{VUID-vkGetPipelineCacheData-pData-parameter} if the value referenced by \texttt{pDataSize} is not \texttt{0}, and \texttt{pData} is not \texttt{NULL}, \texttt{pData} \textbf{must} be a valid pointer to an array of \texttt{pDataSize} bytes
- \textbf{VUID-vkGetPipelineCacheData-pipelineCache-parent} \texttt{pipelineCache} \textbf{must} have been created, allocated, or retrieved from \texttt{device}

### Return Codes

#### Success

- \texttt{VK_SUCCESS}
- \texttt{VK_INCOMPLETE}

#### Failure

- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}

### 10.7.4. Pipeline Cache Header

Applications \textbf{can} store the data retrieved from the pipeline cache, and use these data, possibly in a future run of the application, to populate new pipeline cache objects. The results of pipeline compiles, however, \textbf{may} depend on the vendor ID, device ID, driver version, and other details of the device. To enable applications to detect when previously retrieved data is incompatible with the
device, the pipeline cache data must begin with a valid pipeline cache header.

Note
Structures described in this section are not part of the Vulkan API and are only used to describe the representation of data elements in pipeline cache data. Accordingly, the valid usage clauses defined for structures defined in this section do not define valid usage conditions for APIs accepting pipeline cache data as input, as providing invalid pipeline cache data as input to any Vulkan API commands will result in the provided pipeline cache data being ignored.

Version one of the pipeline cache header is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineCacheHeaderVersionOne {
    uint32_t headerSize;
    VkPipelineCacheHeaderVersion headerVersion;
    uint32_t vendorID;
    uint32_t deviceID;
    uint8_t pipelineCacheUUID[VK_UUID_SIZE];
} VkPipelineCacheHeaderVersionOne;
```

- headerSize is the length in bytes of the pipeline cache header.
- headerVersion is a VkPipelineCacheHeaderVersion enum value specifying the version of the header. A consumer of the pipeline cache should use the cache version to interpret the remainder of the cache header.
- vendorID is the VkPhysicalDeviceProperties::vendorID of the implementation.
- deviceID is the VkPhysicalDeviceProperties::deviceID of the implementation.
- pipelineCacheUUID is the VkPhysicalDeviceProperties::pipelineCacheUUID of the implementation.

Unlike most structures declared by the Vulkan API, all fields of this structure are written with the least significant byte first, regardless of host byte-order.

The C language specification does not define the packing of structure members. This layout assumes tight structure member packing, with members laid out in the order listed in the structure, and the intended size of the structure is 32 bytes. If a compiler produces code that diverges from that pattern, applications must employ another method to set values at the correct offsets.

Valid Usage

- VUID-VkPipelineCacheHeaderVersionOne-headerSize-04967
  headerSize must be 32
- VUID-VkPipelineCacheHeaderVersionOne-headerVersion-04968
  headerVersion must be VK_PIPELINE_CACHE_HEADER_VERSION_ONE
- VUID-VkPipelineCacheHeaderVersionOne-headerSize-08990
  headerSize must not exceed the size of the pipeline cache
Valid Usage (Implicit)

- **VUID-VkPipelineCacheHeaderVersionOne-headerVersion-parameter**
  
  `headerVersion` must be a valid `VkPipelineCacheHeaderVersion` value

Possible values of the `headerVersion` value of the pipeline cache header are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCacheHeaderVersion {
    VK_PIPELINE_CACHE_HEADER_VERSION_ONE = 1,
} VkPipelineCacheHeaderVersion;
```

- `VK_PIPELINE_CACHE_HEADER_VERSION_ONE` specifies version one of the pipeline cache, described by `VkPipelineCacheHeaderVersionOne`.

### 10.7.5. Destroying a Pipeline Cache

To destroy a pipeline cache, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipelineCache(
    VkDevice device,        // device is the logical device that destroys the pipeline cache object.
    VkPipelineCache pipelineCache,       // pipelineCache is the handle of the pipeline cache to destroy.
    const VkAllocationCallbacks* pAllocator);    // pAllocator controls host memory allocation as described in the Memory Allocation chapter.
```

Valid Usage

- **VUID-vkDestroyPipelineCache-pipelineCache-00771**
  
  If `VkAllocationCallbacks` were provided when `pipelineCache` was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyPipelineCache-pipelineCache-00772**
  
  If no `VkAllocationCallbacks` were provided when `pipelineCache` was created, `pAllocator` must be `NULL`

Valid Usage (Implicit)

- **VUID-vkDestroyPipelineCache-device-parameter**
  
  `device` must be a valid `VkDevice` handle
Host Synchronization

- Host access to pipelineCache must be externally synchronized

10.8. Specialization Constants

Specialization constants are a mechanism whereby constants in a SPIR-V module can have their constant value specified at the time the VkPipeline is created. This allows a SPIR-V module to have constants that can be modified while executing an application that uses the Vulkan API.

Note

Specialization constants are useful to allow a compute shader to have its local workgroup size changed at runtime by the user, for example.

Each VkPipelineShaderStageCreateInfo structure contains a pSpecializationInfo member, which can be NULL to indicate no specialization constants, or point to a VkSpecializationInfo structure.

The VkSpecializationInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationInfo {
    uint32_t mapEntryCount;
    const VkSpecializationMapEntry* pMapEntries;
    size_t dataSize;
    const void* pData;
} VkSpecializationInfo;
```

- **mapEntryCount** is the number of entries in the pMapEntries array.
- **pMapEntries** is a pointer to an array of VkSpecializationMapEntry structures, which map constant IDs to offsets in pData.
- **dataSize** is the byte size of the pData buffer.
- **pData** contains the actual constant values to specialize with.
**Valid Usage**

- VUID-VkSpecializationInfo-offset-00773
  The `offset` member of each element of `pMapEntries` must be less than `dataSize`

- VUID-VkSpecializationInfo-pMapEntries-00774
  The `size` member of each element of `pMapEntries` must be less than or equal to `dataSize` minus `offset`

- VUID-VkSpecializationInfo-constantID-04911
  The `constantID` value of each element of `pMapEntries` must be unique within `pMapEntries`

**Valid Usage (Implicit)**

- VUID-VkSpecializationInfo-pMapEntries-parameter
  If `mapEntryCount` is not 0, `pMapEntries` must be a valid pointer to an array of `mapEntryCount` valid `VkSpecializationMapEntry` structures

- VUID-VkSpecializationInfo-pData-parameter
  If `dataSize` is not 0, `pData` must be a valid pointer to an array of `dataSize` bytes

The `VkSpecializationMapEntry` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationMapEntry {
    uint32_t constantID;
    uint32_t offset;
    size_t size;
} VkSpecializationMapEntry;
```

- `constantID` is the ID of the specialization constant in SPIR-V.
- `offset` is the byte offset of the specialization constant value within the supplied data buffer.
- `size` is the byte size of the specialization constant value within the supplied data buffer.

If a `constantID` value is not a specialization constant ID used in the shader, that map entry does not affect the behavior of the pipeline.

**Valid Usage**

- VUID-VkSpecializationMapEntry-constantID-00776
  For a `constantID` specialization constant declared in a shader, `size` must match the byte size of the `constantID`. If the specialization constant is of type `boolean`, `size` must be the byte size of `VkBool32`

In human readable SPIR-V:
From the above we have three specialization constants, one for each of the x, y & z elements of the WorkgroupSize vector.

Now to specialize the above via the specialization constants mechanism:

```c
const VkSpecializationMapEntry entries[] =
{
   {
      .constantID = 13,
      .offset = 0 * sizeof(uint32_t),
      .size = sizeof(uint32_t)
   },
   {
      .constantID = 42,
      .offset = 1 * sizeof(uint32_t),
      .size = sizeof(uint32_t)
   },
   {
      .constantID = 3,
      .offset = 2 * sizeof(uint32_t),
      .size = sizeof(uint32_t)
   }
};
const uint32_t data[] = { 16, 8, 4 }; // our workgroup size is 16x8x4

const VkSpecializationInfo info =
{
   .mapEntryCount = 3,
   .pMapEntries = entries,
   .dataSize = 3 * sizeof(uint32_t),
   .pData = data,
};
```

Then when calling `vkCreateComputePipelines`, and passing the `VkSpecializationInfo` we defined as the `pSpecializationInfo` parameter of `VkPipelineShaderStageCreateInfo`, we will create a compute pipeline with the runtime specified local workgroup size.
Another example would be that an application has a SPIR-V module that has some platform-dependent constants they wish to use.

In human readable SPIR-V:

```
OpDecorate %1 SpecId 0; // decorate our signed 32-bit integer constant
OpDecorate %2 SpecId 12; // decorate our 32-bit floating-point constant
%32 = OpTypeInt 32 1; // declare a signed 32-bit type
%float = OpTypeFloat 32; // declare a 32-bit floating-point type
%1 = OpSpecConstant %i32 -1; // some signed 32-bit integer constant
%2 = OpSpecConstant %float 0.5; // some 32-bit floating-point constant
```

From the above we have two specialization constants, one is a signed 32-bit integer and the second is a 32-bit floating-point value.

Now to specialize the above via the specialization constants mechanism:

```
struct SpecializationData {
    int32_t data0;
    float data1;
};

class VkSpecializationMapEntry entries[] =
{
    {
        .constantID = 0,
        .offset = offsetof(SpecializationData, data0),
        .size = sizeof(SpecializationData::data0)
    },
    {
        .constantID = 12,
        .offset = offsetof(SpecializationData, data1),
        .size = sizeof(SpecializationData::data1)
    }
};

SpecializationData data;
data.data0 = -42; // set the data for the 32-bit integer
data.data1 = 42.0f; // set the data for the 32-bit floating-point

class VkSpecializationInfo info =
{
    .mapEntryCount = 2,
    .pMapEntries = entries,
    .dataSize = sizeof(data),
    .pdata = &data,
};
```

It is legal for a SPIR-V module with specializations to be compiled into a pipeline where no
specialization information was provided. SPIR-V specialization constants contain default values such that if a specialization is not provided, the default value will be used. In the examples above, it would be valid for an application to only specialize some of the specialization constants within the SPIR-V module, and let the other constants use their default values encoded within the OpSpecConstant declarations.

10.9. Pipeline Libraries

A pipeline library is a special pipeline that was created using the VK_PIPELINE_CREATE_LIBRARY_BIT_KHR and cannot be bound, instead it defines a set of pipeline state which can be linked into other pipelines. For ray tracing pipelines this includes shaders and shader groups. For graphics pipelines this includes distinct library types defined by VkGraphicsPipelineLibraryFlagBitsEXT. The application must maintain the lifetime of a pipeline library based on the pipelines that link with it.

This linkage is achieved by using the following structure within the appropriate creation mechanisms:

The VkPipelineLibraryCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_pipeline_library
typedef struct VkPipelineLibraryCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t libraryCount;
    const VkPipeline* pLibraries;
} VkPipelineLibraryCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `libraryCount` is the number of pipeline libraries in `pLibraries`.
- `pLibraries` is a pointer to an array of VkPipeline structures specifying pipeline libraries to use when creating a pipeline.

Valid Usage

- VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-03381
  Each element of `pLibraries` must have been created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR
- VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-06855
  If any library in `pLibraries` was created with a shader stage with VkPipelineShaderStageModuleIdentifierCreateInfoEXT and `identifierSize` not equal to 0, the pipeline must be created with the VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT flag set
- VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-08096
If any element of `pLibraries` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, all elements must have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- VUID-VkPipelineLibraryCreateInfoKHR-pipeline-07404
  If `pipeline` is being created with `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT`, every element of `pLibraries` must have been created with `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT`.

- VUID-VkPipelineLibraryCreateInfoKHR-pipeline-07405
  If `pipeline` is being created without `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT`, every element of `pLibraries` must have been created without `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT`.

- VUID-VkPipelineLibraryCreateInfoKHR-pipeline-07406
  If `pipeline` is being created with `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`, every element of `pLibraries` must have been created with `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`.

- VUID-VkPipelineLibraryCreateInfoKHR-pipeline-07407
  If `pipeline` is being created without `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`, every element of `pLibraries` must have been created without `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`.

Valid Usage (Implicit)

- VUID-VkPipelineLibraryCreateInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_LIBRARY_CREATE_INFO_KHR`.

- VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-parameter
  If `libraryCount` is not 0, `pLibraries` must be a valid pointer to an array of `libraryCount` valid `VkPipeline` handles.

Pipelines created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` libraries can depend on other pipeline libraries in `VkPipelineLibraryCreateInfoKHR`.

A pipeline library is considered in-use, as long as one of the linking pipelines is in-use. This applies recursively if a pipeline library includes other pipeline libraries.

### 10.10. Pipeline Binding

Once a pipeline has been created, it can be bound to the command buffer using the command:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindPipeline(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipeline pipeline);
```
• commandBuffer is the command buffer that the pipeline will be bound to.

• pipelineBindPoint is a VkPipelineBindPoint value specifying to which bind point the pipeline is bound. Binding one does not disturb the others.

• pipeline is the pipeline to be bound.

Once bound, a pipeline binding affects subsequent commands that interact with the given pipeline type in the command buffer until a different pipeline of the same type is bound to the bind point, or until the pipeline bind point is disturbed by binding a shader object as described in Interaction with Pipelines. Commands that do not interact with the given pipeline type must not be affected by the pipeline state.

Valid Usage

• VUID-vkCmdBindPipeline-pipelineBindPoint-00777
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_COMPUTE, the VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdBindPipeline-pipelineBindPoint-00778
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_GRAPHICS, the VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdBindPipeline-pipelineBindPoint-00779
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_COMPUTE, pipeline must be a compute pipeline

• VUID-vkCmdBindPipeline-pipelineBindPoint-00780
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_GRAPHICS, pipeline must be a graphics pipeline

• VUID-vkCmdBindPipeline-pipeline-00781
  If the variableMultisampleRate feature is not supported, pipeline is a graphics pipeline, the current subpass uses no attachments, and this is not the first call to this function with a graphics pipeline after transitioning to the current subpass, then the sample count specified by this pipeline must match that set in the previous pipeline

• VUID-vkCmdBindPipeline-variableSampleLocations-01525
  If VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations is VK_FALSE, and pipeline is a graphics pipeline created with a VkPipelineSampleLocationsStateCreateInfoEXT structure having its sampleLocationsEnable member set to VK_TRUE but without VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT enabled then the current render pass instance must have been begun by specifying a VkRenderPassSampleLocationsBeginInfoEXT structure whose pPostSubpassSampleLocations member contains an element with a subpassIndex matching the current subpass index and the sampleLocationsInfo member of that element must match the sampleLocationsInfo specified in VkPipelineSampleLocationsStateCreateInfoEXT when the pipeline was created

• VUID-vkCmdBindPipeline-None-02323
  This command must not be recorded when transform feedback is active

• VUID-vkCmdBindPipeline-pipelineBindPoint-02391
If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, the `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdBindPipeline-pipelineBindPoint-02392
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, `pipeline` must be a ray tracing pipeline

- VUID-vkCmdBindPipeline-pipelineBindPoint-06721
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, `commandBuffer` must not be a protected command buffer

- VUID-vkCmdBindPipeline-pipelineProtectedAccess-07408
  If the `pipelineProtectedAccess` feature is enabled, and `commandBuffer` is a protected command buffer, `pipeline` must have been created without `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT`

- VUID-vkCmdBindPipeline-pipelineProtectedAccess-07409
  If the `pipelineProtectedAccess` feature is enabled, and `commandBuffer` is not a protected command buffer, `pipeline` must have been created without `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`

- VUID-vkCmdBindPipeline-pipeline-03382
  `pipeline` must not have been created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` set

- VUID-vkCmdBindPipeline-commandBuffer-04808
  If `commandBuffer` is a secondary command buffer with `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled and `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, then the `pipeline` must have been created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` or `VK_DYNAMIC_STATE_VIEWPORT`, and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` or `VK_DYNAMIC_STATE_SCISSOR` enabled

- VUID-vkCmdBindPipeline-commandBuffer-04809
  If `commandBuffer` is a secondary command buffer with `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled and `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS` and `pipeline` was created with `VkPipelineDiscardRectangleStateCreateInfoEXT` structure and its `discardRectangleCount` member is not 0, or the pipeline was created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` enabled, then the `pipeline` must have been created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` enabled

- VUID-vkCmdBindPipeline-pipelineBindPoint-04881
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS` and the `provokingVertexModePerPipeline` limit is `VK_FALSE`, then pipeline's `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode` must be the same as that of any other pipelines previously bound to this bind point within the current render pass instance, including any pipeline already bound when beginning the render pass instance

- VUID-vkCmdBindPipeline-pipelineBindPoint-04949
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI`, the `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdBindPipeline-pipelineBindPoint-04950
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI`, `pipeline` must be a
subpass shading pipeline

- **VUID-vkCmdBindPipeline-pipelineBind-06653**
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, `pipeline` must have been created without `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`.

### Valid Usage (Implicit)

- **VUID-vkCmdBindPipeline-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdBindPipeline-pipelineBindPoint-parameter**
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value.

- **VUID-vkCmdBindPipeline-pipeline-parameter**
  `pipeline` must be a valid `VkPipeline` handle.

- **VUID-vkCmdBindPipeline-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdBindPipeline-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.

- **VUID-vkCmdBindPipeline-videocoding**
  This command must only be called outside of a video coding scope.

- **VUID-vkCmdBindPipeline-commonparent**
  Both of `commandBuffer`, and `pipeline` must have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

Possible values of `vkCmdBindPipeline::pipelineBindPoint`, specifying the bind point of a pipeline object, are:
typedef enum VkPipelineBindPoint {
    VK_PIPELINE_BIND_POINT_GRAPHICS = 0,
    VK_PIPELINE_BIND_POINT_COMPUTE = 1,
} VkPipelineBindPoint;

#ifdef VK_ENABLE_BETA_EXTENSIONS
    VK_PIPELINE_BIND_POINT_EXECUTION_GRAPH_AMDX = 1000134000,
#endif

// Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR = 1000165000,
// Provided by VK_HUAWEI_subpass_shading
    VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI = 1000369003,
// Provided by VK_NV_ray_tracing
    VK_PIPELINE_BIND_POINT_RAY_TRACING_NV = VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR,
} VkPipelineBindPoint;

• VK_PIPELINE_BIND_POINT_COMPUTE specifies binding as a compute pipeline.
• VK_PIPELINE_BIND_POINT_GRAPHICS specifies binding as a graphics pipeline.
• VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR specifies binding as a ray tracing pipeline.
• VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI specifies binding as a subpass shading pipeline.
• VK_PIPELINE_BIND_POINT_EXECUTION_GRAPH_AMDX specifies binding as an execution graph pipeline.

For pipelines that were created with the support of multiple shader groups (see Graphics Pipeline Shader Groups), the regular vkCmdBindPipeline command will bind Shader Group 0. To explicitly bind a shader group use:

// Provided by VK_NV.device_generated_commands
def void vkCmdBindPipelineShaderGroupNV(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipeline pipeline,
    uint32_t groupIndex);

• commandBuffer is the command buffer that the pipeline will be bound to.
• pipelineBindPoint is a VkPipelineBindPoint value specifying the bind point to which the pipeline will be bound.
• pipeline is the pipeline to be bound.
• groupIndex is the shader group to be bound.

Valid Usage

• VUID-vkCmdBindPipelineShaderGroupNV-groupIndex-02893
groupIndex must be 0 or less than the effective VkGraphicsPipelineShaderGroupsCreateInfoNV::groupCount including the referenced
pipelines

- **VUID-vkCmdBindPipelineShaderGroupNV-pipelineBindPoint-02894**
  The `pipelineBindPoint` must be `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdBindPipelineShaderGroupNV-groupIndex-02895**
  The same restrictions as `vkCmdBindPipeline` apply as if the bound pipeline was created only with the Shader Group from the `groupIndex` information

- **VUID-vkCmdBindPipelineShaderGroupNV-deviceGeneratedCommands-02896**
  The `deviceGeneratedCommands` feature must be enabled

---

**Valid Usage (Implicit)**

- **VUID-vkCmdBindPipelineShaderGroupNV-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdBindPipelineShaderGroupNV-pipelineBindPoint-parameter**
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value

- **VUID-vkCmdBindPipelineShaderGroupNV-pipeline-parameter**
  `pipeline` must be a valid `VkPipeline` handle

- **VUID-vkCmdBindPipelineShaderGroupNV-commandBuffer-recording**
  `commandBuffer` must be in the `recording state`

- **VUID-vkCmdBindPipelineShaderGroupNV-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- **VUID-vkCmdBindPipelineShaderGroupNV-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdBindPipelineShaderGroupNV-commonparent**
  Both of `commandBuffer`, and `pipeline` must have been created, allocated, or retrieved from the same `VkDevice`

---

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

---

10.10.1. Interaction with Shader Objects

If the shaderObject feature is enabled, applications can use both pipelines and shader objects at the same time. The interaction between pipelines and shader objects is described in Interaction with Pipelines.

10.11. Dynamic State

When a pipeline object is bound, any pipeline object state that is not specified as dynamic is applied to the command buffer state. Pipeline object state that is specified as dynamic is not applied to the command buffer state at this time. Instead, dynamic state can be modified at any time and persists for the lifetime of the command buffer, or until modified by another dynamic state setting command, or made invalid by another pipeline bind with that state specified as static.

When a pipeline object is bound, the following applies to each state parameter:

- If the state is not specified as dynamic in the new pipeline object, then that command buffer state is overwritten by the state in the new pipeline object. Before any draw or dispatch call with this pipeline there must not have been any calls to any of the corresponding dynamic state setting commands after this pipeline was bound.

- If the state is specified as dynamic in the new pipeline object, then that command buffer state is not disturbed. Before any draw or dispatch call with this pipeline there must have been at least one call to each of the corresponding dynamic state setting commands. The state-setting commands must be recorded after command buffer recording was begun, or after the last command binding a pipeline object with that state specified as static, whichever was the latter.

- If the state is not included (corresponding pointer in VkGraphicsPipelineCreateInfo was NULL or was ignored) in the new pipeline object, then that command buffer state is not disturbed. For example, mesh shading pipelines do not include vertex input state and therefore do not disturb any such command buffer state.

Dynamic state that does not affect the result of operations can be left undefined.

Note

For example, if blending is disabled by the pipeline object state then the dynamic color blend constants do not need to be specified in the command buffer, even if this state is specified as dynamic in the pipeline object.

10.12. Pipeline Properties and Shader Information

When a pipeline is created, its state and shaders are compiled into zero or more device-specific executables, which are used when executing commands against that pipeline. To query the properties of these pipeline executables, call:

```
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutablePropertiesKHR(
    VkDevice device,
```
const VkPipelineInfoKHR* pPipelineInfo,
uint32_t* pExecutableCount,
VkPipelineExecutablePropertiesKHR* pProperties);  

• device is the device that created the pipeline.  
• pPipelineInfo describes the pipeline being queried.  
• pExecutableCount is a pointer to an integer related to the number of pipeline executables available or queried, as described below.  
• pProperties is either NULL or a pointer to an array of VkPipelineExecutablePropertiesKHR structures.

If pProperties is NULL, then the number of pipeline executables associated with the pipeline is returned in pExecutableCount. Otherwise, pExecutableCount must point to a variable set by the user to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If pExecutableCount is less than the number of pipeline executables associated with the pipeline, at most pExecutableCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available properties were returned.

Valid Usage  
• VUID-vkGetPipelineExecutablePropertiesKHR-pipelineExecutableInfo-03270  
The pipelineExecutableInfo feature must be enabled

• VUID-vkGetPipelineExecutablePropertiesKHR-pipeline-03271  
The pipeline member of pPipelineInfo must have been created with device

Valid Usage (Implicit)  
• VUID-vkGetPipelineExecutablePropertiesKHR-device-parameter  
device must be a valid VkDevice handle

• VUID-vkGetPipelineExecutablePropertiesKHR-pPipelineInfo-parameter  
pPipelineInfo must be a valid pointer to a valid VkPipelineInfoKHR structure

• VUID-vkGetPipelineExecutablePropertiesKHR-pExecutableCount-parameter  
pExecutableCount must be a valid pointer to a uint32_t value

• VUID-vkGetPipelineExecutablePropertiesKHR-pProperties-parameter  
If the value referenced by pExecutableCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pExecutableCount VkPipelineExecutablePropertiesKHR structures
Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkPipelineExecutablePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutablePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkShaderStageFlags stages;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
    uint32_t subgroupSize;
} VkPipelineExecutablePropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stages` is a bitmask of zero or more `VkShaderStageFlagBits` indicating which shader stages (if any) were principally used as inputs to compile this pipeline executable.
- `name` is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a short human readable name for this pipeline executable.
- `description` is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a human readable description for this pipeline executable.
- `subgroupSize` is the subgroup size with which this pipeline executable is dispatched.

Not all implementations have a 1:1 mapping between shader stages and pipeline executables and some implementations may reduce a given shader stage to fixed function hardware programming such that no pipeline executable is available. No guarantees are provided about the mapping between shader stages and pipeline executables and `stages` should be considered a best effort hint. Because the application cannot rely on the `stages` field to provide an exact description, `name` and `description` provide a human readable name and description which more accurately describes the given pipeline executable.

Valid Usage (Implicit)

- VUID-VkPipelineExecutablePropertiesKHR-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_PROPERTIES_KHR`
To query the pipeline properties call:

```c
// Provided by VK_EXT_pipeline_properties
VkResult vkGetPipelinePropertiesEXT(
    VkDevice device,
    const VkPipelineInfoEXT* pPipelineInfo,
    VkBaseOutStructure* pPipelineProperties);
```

- `device` is the logical device that created the pipeline.
- `pPipelineInfo` is a pointer to a `VkPipelineInfoEXT` structure which describes the pipeline being queried.
- `pPipelineProperties` is a pointer to a `VkBaseOutStructure` structure in which the pipeline properties will be written.

To query a pipeline's `pipelineIdentifier` pass a `VkPipelinePropertiesIdentifierEXT` structure in `pPipelineProperties`. Each pipeline is associated with a `pipelineIdentifier` and the identifier is implementation specific.

### Valid Usage

- **VUID-vkGetPipelinePropertiesEXT-pipeline-06738**
  The `pipeline` member of `pPipelineInfo` must have been created with `device`

- **VUID-vkGetPipelinePropertiesEXT-pPipelineProperties-06739**
  `pPipelineProperties` must be a valid pointer to a `VkPipelinePropertiesIdentifierEXT` structure

- **VUID-vkGetPipelinePropertiesEXT-None-06766**
  The `pipelinePropertiesIdentifier` feature must be enabled

### Valid Usage (Implicit)

- **VUID-vkGetPipelinePropertiesEXT-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetPipelinePropertiesEXT-pPipelineInfo-parameter**
  `pPipelineInfo` must be a valid pointer to a valid `VkPipelineInfoEXT` structure

### Return Codes

**Success**
- `VK_SUCCESS`
The `VkPipelinePropertiesIdentifierEXT` structure is defined as:

```c
// Provided by VK_EXT_pipeline_properties
typedef struct VkPipelinePropertiesIdentifierEXT {
    VkStructureType sType;
    void* pNext;
    uint8_t pipelineIdentifier[VK_UUID_SIZE];
} VkPipelinePropertiesIdentifierEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pipelineIdentifier** is an array of `VK_UUID_SIZE uint8_t` values into which the pipeline identifier will be written.

### Valid Usage (Implicit)

- VUID-VkPipelinePropertiesIdentifierEXT-sType-sType
  sType **must** be `VK_STRUCTURE_TYPE_PIPELINE_PROPERTIES_IDENTIFIER_EXT`
- VUID-VkPipelinePropertiesIdentifierEXT-pNext-pNext
  pNext **must** be `NULL`

The `VkPipelineInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipeline pipeline;
} VkPipelineInfoKHR;
```

or the equivalent

```c
// Provided by VK_EXT_pipeline_properties
typedef VkPipelineInfoKHR VkPipelineInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pipeline** is a `VkPipeline` handle.
Valid Usage (Implicit)

- VUID-VkPipelineInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_INFO_KHR
- VUID-VkPipelineInfoKHR-pNext-pNext
  pNext must be NULL
- VUID-VkPipelineInfoKHR-pipeline-parameter
  pipeline must be a valid VkPipeline handle

Each pipeline executable may have a set of statistics associated with it that are generated by the pipeline compilation process. These statistics may include things such as instruction counts, amount of spilling (if any), maximum number of simultaneous threads, or anything else which may aid developers in evaluating the expected performance of a shader. To query the compile time statistics associated with a pipeline executable, call:

```c
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutableStatisticsKHR(
    VkDevice device,
    const VkPipelineExecutableInfoKHR* pExecutableInfo,
    uint32_t* pStatisticCount,
    VkPipelineExecutableStatisticKHR* pStatistics);
```

- `device` is the device that created the pipeline.
- `pExecutableInfo` describes the pipeline executable being queried.
- `pStatisticCount` is a pointer to an integer related to the number of statistics available or queried, as described below.
- `pStatistics` is either NULL or a pointer to an array of VkPipelineExecutableStatisticKHR structures.

If `pStatistics` is NULL, then the number of statistics associated with the pipeline executable is returned in `pStatisticCount`. Otherwise, `pStatisticCount` must point to a variable set by the user to the number of elements in the `pStatistics` array, and on return the variable is overwritten with the number of structures actually written to `pStatistics`. If `pStatisticCount` is less than the number of statistics associated with the pipeline executable, at most `pStatisticCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available statistics were returned.

Valid Usage

- VUID-vkGetPipelineExecutableStatisticsKHR-pipelineExecutableInfo-03272
  The pipelineExecutableInfo feature must be enabled
- VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03273
  The pipeline member of pExecutableInfo must have been created with device
• **VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03274**
The *pipeline* member of *pExecutableInfo* must have been created with *VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR*.

### Valid Usage (Implicit)

- **VUID-vkGetPipelineExecutableStatisticsKHR-device-parameter**
  *device* must be a valid *VkDevice* handle.

- **VUID-vkGetPipelineExecutableStatisticsKHR-pExecutableInfo-parameter**
  *pExecutableInfo* must be a valid pointer to a valid *VkPipelineExecutableInfoKHR* structure.

- **VUID-vkGetPipelineExecutableStatisticsKHR-pStatisticCount-parameter**
  *pStatisticCount* must be a valid pointer to a *uint32_t* value.

- **VUID-vkGetPipelineExecutableStatisticsKHR-pStatistics-parameter**
  If the value referenced by *pStatisticCount* is not 0, and *pStatistics* is not NULL, *pStatistics* must be a valid pointer to an array of *pStatisticCount* *VkPipelineExecutableStatisticKHR* structures.

### Return Codes

**Success**
- *VK_SUCCESS*
- *VK_INCOMPLETE*

**Failure**
- *VK_ERROR_OUT_OF_HOST_MEMORY*
- *VK_ERROR_OUT_OF_DEVICE_MEMORY*

The *VkPipelineExecutableInfoKHR* structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipeline pipeline;
    uint32_t executableIndex;
} VkPipelineExecutableInfoKHR;
```

- *sType* is a *VkStructureType* value identifying this structure.
- *pNext* is *NULL* or a pointer to a structure extending this structure.
- *pipeline* is the pipeline to query.
- *executableIndex* is the index of the pipeline executable to query in the array of executable
properties returned by `vkGetPipelineExecutablePropertiesKHR`.

Valid Usage

• VUID-VkPipelineExecutableInfoKHR-executableIndex-03275
  `executableIndex` must be less than the number of pipeline executables associated with `pipeline` as returned in the `pExecutableCount` parameter of `vkGetPipelineExecutablePropertiesKHR`.

Valid Usage (Implicit)

• VUID-VkPipelineExecutableInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INFO_KHR`.

• VUID-VkPipelineExecutableInfoKHR-pNext-pNext
  `pNext` must be `NULL`.

• VUID-VkPipelineExecutableInfoKHR-pipeline-parameter
  `pipeline` must be a valid `VkPipeline` handle.

The `VkPipelineExecutableStatisticKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableStatisticKHR {
    VkStructureType sType;
    void* pNext;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
    VkPipelineExecutableStatisticFormatKHR format;
    VkPipelineExecutableStatisticValueKHR value;
} VkPipelineExecutableStatisticKHR;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `name` is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a short human readable name for this statistic.

• `description` is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a human readable description for this statistic.

• `format` is a `VkPipelineExecutableStatisticFormatKHR` value specifying the format of the data found in `value`.

• `value` is the value of this statistic.
Valid Usage (Implicit)

- VUID-VkPipelineExecutableStatisticKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_STATISTIC_KHR

- VUID-VkPipelineExecutableStatisticKHR-pNext-pNext
  pNext must be NULL

The VkPipelineExecutableStatisticFormatKHR enum is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef enum VkPipelineExecutableStatisticFormatKHR {
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR = 0,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR = 1,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR = 2,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR = 3,
} VkPipelineExecutableStatisticFormatKHR;
```

- VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR specifies that the statistic is returned as a 32-bit boolean value which must be either VK_TRUE or VK_FALSE and should be read from the b32 field of VkPipelineExecutableStatisticValueKHR.

- VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR specifies that the statistic is returned as a signed 64-bit integer and should be read from the i64 field of VkPipelineExecutableStatisticValueKHR.

- VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR specifies that the statistic is returned as an unsigned 64-bit integer and should be read from the u64 field of VkPipelineExecutableStatisticValueKHR.

- VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR specifies that the statistic is returned as a 64-bit floating-point value and should be read from the f64 field of VkPipelineExecutableStatisticValueKHR.

The VkPipelineExecutableStatisticValueKHR union is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef union VkPipelineExecutableStatisticValueKHR {
    VkBool32 b32;
    int64_t i64;
    uint64_t u64;
    double f64;
} VkPipelineExecutableStatisticValueKHR;
```

- b32 is the 32-bit boolean value if the VkPipelineExecutableStatisticFormatKHR is VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR.

- i64 is the signed 64-bit integer value if the VkPipelineExecutableStatisticFormatKHR is VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR.
• `u64` is the unsigned 64-bit integer value if the `VkPipelineExecutableStatisticFormatKHR` is `VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR`.

• `f64` is the 64-bit floating-point value if the `VkPipelineExecutableStatisticFormatKHR` is `VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR`.

Each pipeline executable may have one or more text or binary internal representations associated with it which are generated as part of the compile process. These may include the final shader assembly, a binary form of the compiled shader, or the shader compiler’s internal representation at any number of intermediate compile steps. To query the internal representations associated with a pipeline executable, call:

```c
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutableInternalRepresentationsKHR(
    VkDevice device,
    const VkPipelineExecutableInfoKHR* pExecutableInfo,
    uint32_t* pInternalRepresentationCount,
    VkPipelineExecutableInternalRepresentationKHR* pInternalRepresentations);
```

• `device` is the device that created the pipeline.

• `pExecutableInfo` describes the pipeline executable being queried.

• `pInternalRepresentationCount` is a pointer to an integer related to the number of internal representations available or queried, as described below.

• `pInternalRepresentations` is either `NULL` or a pointer to an array of `VkPipelineExecutableInternalRepresentationKHR` structures.

If `pInternalRepresentations` is `NULL`, then the number of internal representations associated with the pipeline executable is returned in `pInternalRepresentationCount`. Otherwise, `pInternalRepresentationCount` must point to a variable set by the user to the number of elements in the `pInternalRepresentations` array, and on return the variable is overwritten with the number of structures actually written to `pInternalRepresentations`. If `pInternalRepresentationCount` is less than the number of internal representations associated with the pipeline executable, at most `pInternalRepresentationCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available representations were returned.

While the details of the internal representations remain implementation-dependent, the implementation should order the internal representations in the order in which they occur in the compiled pipeline with the final shader assembly (if any) last.

### Valid Usage

- `VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipelineExecutableInfo-03276`
  The `pipelineExecutableInfo` feature must be enabled

- `VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipeline-03277`
  The `pipeline` member of `pExecutableInfo` must have been created with `device`

- `VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipeline-03278`
The pipeline member of pExecutableInfo must have been created with VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR

Valid Usage (Implicit)

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pExecutableInfo-parameter
pExecutableInfo must be a valid pointer to a valid VkPipelineExecutableInfoKHR structure

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pInternalRepresentationCount-parameter
pInternalRepresentationCount must be a valid pointer to a uint32_t value

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pInternalRepresentations-parameter
If the value referenced by pInternalRepresentationCount is not 0, and
pInternalRepresentations is not NULL, pInternalRepresentations must be a valid pointer to
an array of pInternalRepresentationCount
VkPipelineExecutableInternalRepresentationKHR structures

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkPipelineExecutableInternalRepresentationKHR structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableInternalRepresentationKHR {
    VkStructureType sType;
    void* pNext;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
    VkBool32 isText;
    size_t dataSize;
    void* pData;
} VkPipelineExecutableInternalRepresentationKHR;
```
• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **name** is an array of *VK_MAX_DESCRIPTION_SIZE* char containing a null-terminated UTF-8 string which is a short human readable name for this internal representation.

• **description** is an array of *VK_MAX_DESCRIPTION_SIZE* char containing a null-terminated UTF-8 string which is a human readable description for this internal representation.

• **isText** specifies whether the returned data is text or opaque data. If **isText** is **VK_TRUE** then the data returned in **pData** is text and is guaranteed to be a null-terminated UTF-8 string.

• **dataSize** is an integer related to the size, in bytes, of the internal representation’s data, as described below.

• **pData** is either **NULL** or a pointer to a block of data into which the implementation will write the internal representation.

If **pData** is **NULL**, then the size, in bytes, of the internal representation data is returned in **dataSize**. Otherwise, **dataSize** must be the size of the buffer, in bytes, pointed to by **pData** and on return **dataSize** is overwritten with the number of bytes of data actually written to **pData** including any trailing null character. If **dataSize** is less than the size, in bytes, of the internal representation’s data, at most **dataSize** bytes of data will be written to **pData**, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available representation was returned.

If **isText** is **VK_TRUE** and **pData** is not **NULL** and **dataSize** is not zero, the last byte written to **pData** will be a null character.

**Valid Usage (Implicit)**

- VUID-VkPipelineExecutableInternalRepresentationKHR-sType-sType
  - **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INTERNAL_REPRESENTATION_KHR**

- VUID-VkPipelineExecutableInternalRepresentationKHR-pNext-pNext
  - **pNext** must be **NULL**

Information about a particular shader that has been compiled as part of a pipeline object can be extracted by calling:

```c
// Provided by VK_AMD_shader_info
VkResult vkGetShaderInfoAMD(
    VkDevice device,  // device that created pipeline.
    VkPipeline pipeline,  // target of the query.
    VkShaderStageFlagBits shaderStage,  // shader stage.
    VkShaderInfoTypeAMD infoType,  // info type.
    size_t pInfoSize,  // size of the buffer pointed to by pInfo.
    void* pInfo);  // pointer to the buffer.
```

- **device** is the device that created **pipeline**.

- **pipeline** is the target of the query.
• shaderStage is a VkShaderStageFlagBits specifying the particular shader within the pipeline about which information is being queried.

• infoType describes what kind of information is being queried.

• pInfoSize is a pointer to a value related to the amount of data the query returns, as described below.

• pInfo is either NULL or a pointer to a buffer.

If pInfo is NULL, then the maximum size of the information that can be retrieved about the shader, in bytes, is returned in pInfoSize. Otherwise, pInfoSize must point to a variable set by the user to the size of the buffer, in bytes, pointed to by pInfo, and on return the variable is overwritten with the amount of data actually written to pInfo. If pInfoSize is less than the maximum size that can be retrieved by the pipeline cache, then at most pInfoSize bytes will be written to pInfo, and VK_INCOMPLETE will be returned, instead of VK_SUCCESS, to indicate that not all required of the pipeline cache was returned.

Not all information is available for every shader and implementations may not support all kinds of information for any shader. When a certain type of information is unavailable, the function returns VK_ERROR_FEATURE_NOT_PRESENT.

If information is successfully and fully queried, the function will return VK_SUCCESS.

For infoType VK_SHADER_INFO_TYPE_STATISTICS_AMD, a VkShaderStatisticsInfoAMD structure will be written to the buffer pointed to by pInfo. This structure will be populated with statistics regarding the physical device resources used by that shader along with other miscellaneous information and is described in further detail below.

For infoType VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD, pInfo is a pointer to a UTF-8 null-terminated string containing human-readable disassembly. The exact formatting and contents of the disassembly string are vendor-specific.

The formatting and contents of all other types of information, including infoType VK_SHADER_INFO_TYPE_BINARY_AMD, are left to the vendor and are not further specified by this extension.

---

**Valid Usage (Implicit)**

- VUID-vkGetShaderInfoAMD-device-parameter device must be a valid VkDevice handle
- VUID-vkGetShaderInfoAMD-pipeline-parameter pipeline must be a valid VkPipeline handle
- VUID-vkGetShaderInfoAMD-shaderStage-parameter shaderStage must be a valid VkShaderStageFlagBits value
- VUID-vkGetShaderInfoAMD-infoType-parameter infoType must be a valid VkShaderInfoTypeAMD value
- VUID-vkGetShaderInfoAMD-pInfoSize-parameter pInfoSize must be a valid pointer to a size_t value
• VUID-vkGetShaderInfoAMD-pInfo-parameter
If the value referenced by pInfoSize is not 0, and pInfo is not NULL, pInfo must be a valid
pointer to an array of pInfoSize bytes

• VUID-vkGetShaderInfoAMD-pipeline-parent
pipeline must have been created, allocated, or retrieved from device

Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_FEATURE_NOT_PRESENT
• VK_ERROR_OUT_OF_HOST_MEMORY

Possible values of vkGetShaderInfoAMD::infoType, specifying the information being queried from a
shader, are:

```
// Provided by VK_AMD_shader_info
typedef enum VkShaderInfoTypeAMD {
    VK_SHADER_INFO_TYPE_STATISTICS_AMD = 0,
    VK_SHADER_INFO_TYPE_BINARY_AMD = 1,
    VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD = 2,
} VkShaderInfoTypeAMD;
```

• VK_SHADER_INFO_TYPE_STATISTICS_AMD specifies that device resources used by a shader will be
queried.

• VK_SHADER_INFO_TYPE_BINARY_AMD specifies that implementation-specific information will be
queried.

• VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD specifies that human-readable disassembly of a shader.

The VkShaderStatisticsInfoAMD structure is defined as:

```
// Provided by VK_AMD_shader_info
typedef struct VkShaderStatisticsInfoAMD {
    VkShaderStageFlags shaderStageMask;
    VkShaderResourceUsageAMD resourceUsage;
    uint32_t numPhysicalVgprs;
    uint32_t numPhysicalSgprs;
    uint32_t numAvailableVgprs;
    uint32_t numAvailableSgprs;
    uint32_t computeWorkGroupSize[3];
} VkShaderStatisticsInfoAMD;
```
shaderStageMask are the combination of logical shader stages contained within this shader.

resourceUsage is a VkShaderResourceUsageAMD structure describing internal physical device resources used by this shader.

numPhysicalVgprs is the maximum number of vector instruction general-purpose registers (VGPRs) available to the physical device.

numPhysicalSgprs is the maximum number of scalar instruction general-purpose registers (SGPRs) available to the physical device.

numAvailableVgprs is the maximum limit of VGPRs made available to the shader compiler.

numAvailableSgprs is the maximum limit of SGPRs made available to the shader compiler.

computeWorkGroupSize is the local workgroup size of this shader in { X, Y, Z } dimensions.

Some implementations may merge multiple logical shader stages together in a single shader. In such cases, shaderStageMask will contain a bitmask of all of the stages that are active within that shader. Consequently, if specifying those stages as input to vkGetShaderInfoAMD, the same output information may be returned for all such shader stage queries.

The number of available VGPRs and SGPRs (numAvailableVgprs and numAvailableSgprs respectively) are the shader-addressable subset of physical registers that is given as a limit to the compiler for register assignment. These values may further be limited by implementations due to performance optimizations where register pressure is a bottleneck.

The VkShaderResourceUsageAMD structure is defined as:

```c
// Provided by VK_AMD_shader_info
typedef struct VkShaderResourceUsageAMD {
    uint32_t numUsedVgprs;
    uint32_t numUsedSgprs;
    uint32_t ldsSizePerLocalWorkGroup;
    size_t ldsUsageSizeInBytes;
    size_t scratchMemUsageInBytes;
} VkShaderResourceUsageAMD;
```

- numUsedVgprs is the number of vector instruction general-purpose registers used by this shader.
- numUsedSgprs is the number of scalar instruction general-purpose registers used by this shader.
- ldsSizePerLocalWorkGroup is the maximum local data store size per work group in bytes.
- ldsUsageSizeInBytes is the LDS usage size in bytes per work group by this shader.
- scratchMemUsageInBytes is the scratch memory usage in bytes by this shader.

10.13. Pipeline Compiler Control

The compilation of a pipeline can be tuned by adding a VkPipelineCompilerControlCreateInfoAMD structure to the pNext chain of VkGraphicsPipelineCreateInfo or VkComputePipelineCreateInfo.
typedef struct VkPipelineCompilerControlCreateInfoAMD {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCompilerControlFlagsAMD compilerControlFlags;
} VkPipelineCompilerControlCreateInfoAMD;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• compilerControlFlags is a bitmask of VkPipelineCompilerControlFlagBitsAMD affecting how the pipeline will be compiled.

Valid Usage (Implicit)

• VUID-VkPipelineCompilerControlCreateInfoAMD-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_COMPILER_CONTROL_CREATE_INFO_AMD
• VUID-VkPipelineCompilerControlCreateInfoAMD-compilerControlFlags-zerobitmask
  compilerControlFlags must be 0

There are currently no available flags for this extension; flags will be added by future versions of this extension.

typedef enum VkPipelineCompilerControlFlagBitsAMD {
} VkPipelineCompilerControlFlagBitsAMD;

typedef VkFlags VkPipelineCompilerControlFlagsAMD;

 VkPipelineCompilerControlFlagsAMD is a bitmask type for setting a mask of zero or more VkPipelineCompilerControlFlagBitsAMD.

10.14. Pipeline Creation Feedback

Feedback about the creation of a particular pipeline object can be obtained by adding a VkPipelineCreationFeedbackCreateInfo structure to the pNext chain of VkGraphicsPipelineCreateInfo, VkRayTracingPipelineCreateInfoKHR, VkRayTracingPipelineCreateInfoNV, or VkComputePipelineCreateInfo. The VkPipelineCreationFeedbackCreateInfo structure is defined as:

typedef struct VkPipeline CreationFeedbackCreateInfo {
    VkStructureType sType;
    const void* pNext;
} VkPipelineCreationFeedbackCreateInfo;
VkPipelineCreationFeedback* pPipelineCreationFeedback;
uint32_t pipelineStageCreationFeedbackCount;
VkPipelineCreationFeedback* pPipelineStageCreationFeedbacks;
} VkPipelineCreationFeedbackCreateInfo;

or the equivalent

// Provided by VK_EXT_pipeline_creation_feedback
typedef VkPipelineCreationFeedbackCreateInfo VkPipelineCreationFeedbackCreateInfoEXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• pPipelineCreationFeedback is a pointer to a VkPipelineCreationFeedback structure.
• pipelineStageCreationFeedbackCount is the number of elements in pPipelineStageCreationFeedbacks.
• pPipelineStageCreationFeedbacks is a pointer to an array of pipelineStageCreationFeedbackCount VkPipelineCreationFeedback structures.

An implementation should write pipeline creation feedback to pPipelineCreationFeedback and may write pipeline stage creation feedback to pPipelineStageCreationFeedbacks. An implementation must set or clear the VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT in VkPipelineCreationFeedback::flags for pPipelineCreationFeedback and every element of pPipelineStageCreationFeedbacks.

Note
One common scenario for an implementation to skip per-stage feedback is when VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT is set in pPipelineCreationFeedback.

When chained to VkRayTracingPipelineCreateInfoKHR, VkRayTracingPipelineCreateInfoNV, or VkGraphicsPipelineCreateInfo, the i element of pPipelineStageCreationFeedbacks corresponds to the i element of VkRayTracingPipelineCreateInfoKHR::pStages, VkRayTracingPipelineCreateInfoNV::pStages, or VkGraphicsPipelineCreateInfo::pStages. When chained to VkComputePipelineCreateInfo, the first element of pPipelineStageCreationFeedbacks corresponds to VkComputePipelineCreateInfo::stage.

Valid Usage (Implicit)

• VUID-VkPipelineCreationFeedbackCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_CREATION_FEEDBACK_CREATE_INFO

• VUID-VkPipelineCreationFeedbackCreateInfo-pPipelineCreationFeedback-parameter
  pPipelineCreationFeedback must be a valid pointer to a VkPipelineCreationFeedback structure

• VUID-VkPipelineCreationFeedbackCreateInfo-pPipelineStageCreationFeedbacks-parameter
If `pipelineStageCreationFeedbackCount` is not 0, `pPipelineStageCreationFeedbacks` must be a valid pointer to an array of `pipelineStageCreationFeedbackCount` `VkPipelineCreationFeedback` structures.

The `VkPipelineCreationFeedback` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPipelineCreationFeedback {
    VkPipelineCreationFeedbackFlags flags;
    uint64_t duration;
} VkPipelineCreationFeedback;
```

or the equivalent

```c
// Provided by VK_EXT_pipeline_creation_feedback
typedef VkPipelineCreationFeedback VkPipelineCreationFeedbackEXT;
```

- `flags` is a bitmask of `VkPipelineCreationFeedbackFlagBits` providing feedback about the creation of a pipeline or of a pipeline stage.
- `duration` is the duration spent creating a pipeline or pipeline stage in nanoseconds.

If the `VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT` is not set in `flags`, an implementation must not set any other bits in `flags`, and the values of all other `VkPipelineCreationFeedback` data members are undefined.

Possible values of the `flags` member of `VkPipelineCreationFeedback` are:

```c
// Provided by VK_VERSION_1_3
typedef enum VkPipelineCreationFeedbackFlagBits {
    VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT = 0x00000001,
    VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT = 0x00000002,
    VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT = 0x00000004,
    VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT_EXT = VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT,
    VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT_EXT = VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT,
    VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT_EXT = VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT,
} VkPipelineCreationFeedbackFlagBits;
```

or the equivalent

```c
// Provided by VK_EXT_pipeline_creation_feedback
typedef VkPipelineCreationFeedbackFlagBits VkPipelineCreationFeedbackFlagBitsEXT;
```
* **VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT** indicates that the feedback information is valid.

* **VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT** indicates that a readily usable pipeline or pipeline stage was found in the `pipelineCache` specified by the application in the pipeline creation command.

An implementation **should** set the **VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT** bit if it was able to avoid the large majority of pipeline or pipeline stage creation work by using the `pipelineCache` parameter of `vkCreateGraphicsPipelines`, `vkCreateRayTracingPipelinesKHR`, `vkCreateRayTracingPipelinesNV`, or `vkCreateComputePipelines`. When an implementation sets this bit for the entire pipeline, it **may** leave it unset for any stage.

**Note**

Implementations are encouraged to provide a meaningful signal to applications using this bit. The intention is to communicate to the application that the pipeline or pipeline stage was created “as fast as it gets” using the pipeline cache provided by the application. If an implementation uses an internal cache, it is discouraged from setting this bit as the feedback would be unactionable.

* **VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT** indicates that the base pipeline specified by the `basePipelineHandle` or `basePipelineIndex` member of the `Vk*PipelineCreateInfo` structure was used to accelerate the creation of the pipeline.

An implementation **should** set the **VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT** bit if it was able to avoid a significant amount of work by using the base pipeline.

**Note**

While “significant amount of work” is subjective, implementations are encouraged to provide a meaningful signal to applications using this bit. For example, a 1% reduction in duration may not warrant setting this bit, while a 50% reduction would.

```c
// Provided by VK_VERSION_1_3
typedef VkFlags VkPipelineCreationFeedbackFlags;
```

or the equivalent

```c
// Provided by VK_EXT_pipeline_creation_feedback
typedef VkPipelineCreationFeedbackFlags VkPipelineCreationFeedbackFlagsEXT;
```

`VkPipelineCreationFeedbackFlags` is a bitmask type for providing zero or more `VkPipelineCreationFeedbackFlagBits`. 837
Chapter 11. Memory Allocation

Vulkan memory is broken up into two categories, *host memory* and *device memory*.

### 11.1. Host Memory

Host memory is memory needed by the Vulkan implementation for non-device-visible storage.

*Note*

This memory *may* be used to store the implementation's representation and state of Vulkan objects.

Vulkan provides applications the opportunity to perform host memory allocations on behalf of the Vulkan implementation. If this feature is not used, the implementation will perform its own memory allocations. Since most memory allocations are off the critical path, this is not meant as a performance feature. Rather, this *can* be useful for certain embedded systems, for debugging purposes (e.g. putting a guard page after all host allocations), or for memory allocation logging.

Allocators are provided by the application as a pointer to a *VkAllocationCallbacks* structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkAllocationCallbacks {
    void* pUserData;
    PFN_vkAllocationFunction pfnAllocation;
    PFN_vkReallocationFunction pfnReallocation;
    PFN_vkFreeFunction pfnFree;
    PFN_vkInternalAllocationNotification pfnInternalAllocation;
    PFN_vkInternalFreeNotification pfnInternalFree;
} VkAllocationCallbacks;
```

- *pUserData* is a value to be interpreted by the implementation of the callbacks. When any of the callbacks in *VkAllocationCallbacks* are called, the Vulkan implementation will pass this value as the first parameter to the callback. This value *can* vary each time an allocator is passed into a command, even when the same object takes an allocator in multiple commands.

- *pfnAllocation* is a *PFN_vkAllocationFunction* pointer to an application-defined memory allocation function.

- *pfnReAllocation* is a *PFN_vkReallocationFunction* pointer to an application-defined memory reallocation function.

- *pfnFree* is a *PFN_vkFreeFunction* pointer to an application-defined memory free function.

- *pfnInternalAllocation* is a *PFN_vkInternalAllocationNotification* pointer to an application-defined function that is called by the implementation when the implementation makes internal allocations.

- *pfnInternalFree* is a *PFN_vkInternalFreeNotification* pointer to an application-defined function that is called by the implementation when the implementation frees internal allocations.
Valid Usage

- VUID-VkAllocationCallbacks-pfnAllocation-00632
  `pfnAllocation` must be a valid pointer to a valid user-defined `PFN_vkAllocationFunction`

- VUID-VkAllocationCallbacks-pfnReallocation-00633
  `pfnReallocation` must be a valid pointer to a valid user-defined `PFN_vkReallocationFunction`

- VUID-VkAllocationCallbacks-pfnFree-00634
  `pfnFree` must be a valid pointer to a valid user-defined `PFN_vkFreeFunction`

- VUID-VkAllocationCallbacks-pfnInternalAllocation-00635
  If either of `pfnInternalAllocation` or `pfnInternalFree` is not NULL, both must be valid callbacks

The type of `pfnAllocation` is:

```c
// Provided by VK_VERSION_1_0
typedef void* (VKAPI_PTR *PFN_vkAllocationFunction)(
    void* pUserData,
    size_t size,
    size_t alignment,
    VkSystemAllocationScope allocationScope);
```

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `size` is the size in bytes of the requested allocation.
- `alignment` is the requested alignment of the allocation in bytes and must be a power of two.
- `allocationScope` is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described here.

If `pfnAllocation` is unable to allocate the requested memory, it must return NULL. If the allocation was successful, it must return a valid pointer to memory allocation containing at least `size` bytes, and with the pointer value being a multiple of `alignment`.

Note
Correct Vulkan operation cannot be assumed if the application does not follow these rules.

For example, `pfnAllocation` (or `pfnReallocation`) could cause termination of running Vulkan instance(s) on a failed allocation for debugging purposes, either directly or indirectly. In these circumstances, it cannot be assumed that any part of any affected `VkInstance` objects are going to operate correctly (even `vkDestroyInstance`), and the application must ensure it cleans up properly via other means (e.g. process termination).
If `pfnAllocation` returns `NULL`, and if the implementation is unable to continue correct processing of the current command without the requested allocation, it **must** treat this as a runtime error, and generate `VK_ERROR_OUT_OF_HOST_MEMORY` at the appropriate time for the command in which the condition was detected, as described in Return Codes.

If the implementation is able to continue correct processing of the current command without the requested allocation, then it **may** do so, and **must** not generate `VK_ERROR_OUT_OF_HOST_MEMORY` as a result of this failed allocation.

The type of `pfnReallocation` is:

```c
// Provided by VK_VERSION_1_0
typedef void* (VKAPI_PTR *PFN_vkReallocationFunction)(
    void* pUserData,
    void* pOriginal,
    size_t size,
    size_t alignment,
    VkSystemAllocationScope allocationScope);
```

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `pOriginal` **must** be either `NULL` or a pointer previously returned by `pfnReallocation` or `pfnAllocation` of a compatible allocator.
- `size` is the size in bytes of the requested allocation.
- `alignment` is the requested alignment of the allocation in bytes and **must** be a power of two.
- `allocationScope` is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described here.

If the reallocation was successful, `pfnReallocation` **must** return an allocation with enough space for `size` bytes, and the contents of the original allocation from bytes zero to `min(original size, new size) - 1` **must** be preserved in the returned allocation. If `size` is larger than the old size, the contents of the additional space are undefined. If satisfying these requirements involves creating a new allocation, then the old allocation **should** be freed.

If `pOriginal` is `NULL`, then `pfnReallocation` **must** behave equivalently to a call to `PFN_vkAllocationFunction` with the same parameter values (without `pOriginal`).

If `size` is zero, then `pfnReallocation` **must** behave equivalently to a call to `PFN_vkFreeFunction` with the same `pUserData` parameter value, and `pMemory` equal to `pOriginal`.

If `pOriginal` is non-`NULL`, the implementation **must** ensure that `alignment` is equal to the `alignment` used to originally allocate `pOriginal`.

If this function fails and `pOriginal` is non-`NULL` the application **must** not free the old allocation.

`pfnReallocation` **must** follow the same rules for return values as `PFN_vkAllocationFunction`.

The type of `pfnFree` is:
pUserData is the value specified for VkAllocationCallbacks::pUserData in the allocator specified by the application.

pMemory is the allocation to be freed.

pMemory may be NULL, which the callback must handle safely. If pMemory is non-NULL, it must be a pointer previously allocated by pfnAllocation or pfnReallocation. The application should free this memory.

The type of pfnInternalAllocation is:

typedef void (VKAPI_PTR *PFN_vkInternalAllocationNotification)(
    void* pUserData,
    size_t size,
    VkInternalAllocationType allocationType,
    VkSystemAllocationScope allocationScope);

pUserData is the value specified for VkAllocationCallbacks::pUserData in the allocator specified by the application.

size is the requested size of an allocation.

allocationType is a VkInternalAllocationType value specifying the requested type of an allocation.

allocationScope is a VkSystemAllocationScope value specifying the allocation scope of the lifetime of the allocation, as described here.

This is a purely informational callback.

The type of pfnInternalFree is:

typedef void (VKAPI_PTR *PFN_vkInternalFreeNotification)(
    void* pUserData,
    size_t size,
    VkInternalAllocationType allocationType,
    VkSystemAllocationScope allocationScope);

pUserData is the value specified for VkAllocationCallbacks::pUserData in the allocator specified by the application.

size is the requested size of an allocation.
• allocationType is a VkInternalAllocationType value specifying the requested type of an allocation.

• allocationScope is a VkSystemAllocationScope value specifying the allocation scope of the lifetime of the allocation, as described here.

Each allocation has an allocation scope defining its lifetime and which object it is associated with. Possible values passed to the allocationScope parameter of the callback functions specified by VkAllocationCallbacks, indicating the allocation scope, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSystemAllocationScope {
    VK_SYSTEM_ALLOCATION_SCOPE_COMMAND = 0,
    VK_SYSTEM_ALLOCATION_SCOPE_OBJECT = 1,
    VK_SYSTEM_ALLOCATION_SCOPE_CACHE = 2,
    VK_SYSTEM_ALLOCATION_SCOPE_DEVICE = 3,
    VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE = 4,
} VkSystemAllocationScope;
```

• VK_SYSTEM_ALLOCATION_SCOPE_COMMAND specifies that the allocation is scoped to the duration of the Vulkan command.

• VK_SYSTEM_ALLOCATION_SCOPE_OBJECT specifies that the allocation is scoped to the lifetime of the Vulkan object that is being created or used.

• VK_SYSTEM_ALLOCATION_SCOPE_CACHE specifies that the allocation is scoped to the lifetime of a VkPipelineCache or VkValidationCacheEXT object.

• VK_SYSTEM_ALLOCATION_SCOPE_DEVICE specifies that the allocation is scoped to the lifetime of the Vulkan device.

• VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE specifies that the allocation is scoped to the lifetime of the Vulkan instance.

Most Vulkan commands operate on a single object, or there is a single object that is being created or manipulated. When an allocation uses an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_OBJECT or VK_SYSTEM_ALLOCATION_SCOPE_CACHE, the allocation is scoped to the object being created or manipulated.

When an implementation requires host memory, it will make callbacks to the application using the most specific allocator and allocation scope available:

• If an allocation is scoped to the duration of a command, the allocator will use the VK_SYSTEM_ALLOCATION_SCOPE_COMMAND allocation scope. The most specific allocator available is used: if the object being created or manipulated has an allocator, that object's allocator will be used, else if the parent VkDevice has an allocator it will be used, else if the parent VkInstance has an allocator it will be used. Else,

• If an allocation is associated with a VkValidationCacheEXT or VkPipelineCache object, the allocator will use the VK_SYSTEM_ALLOCATION_SCOPE_CACHE allocation scope. The most specific allocator available is used (cache, else device, else instance). Else,
• If an allocation is scoped to the lifetime of an object, that object is being created or manipulated by the command, and that object's type is not VkDevice or VkInstance, the allocator will use an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_OBJECT. The most specific allocator available is used (object, else device, else instance). Else,

• If an allocation is scoped to the lifetime of a device, the allocator will use an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_DEVICE. The most specific allocator available is used (device, else instance). Else,

• If the allocation is scoped to the lifetime of an instance and the instance has an allocator, its allocator will be used with an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE.

• Otherwise an implementation will allocate memory through an alternative mechanism that is unspecified.

Objects that are allocated from pools do not specify their own allocator. When an implementation requires host memory for such an object, that memory is sourced from the object's parent pool's allocator.

The application is not expected to handle allocating memory that is intended for execution by the host due to the complexities of differing security implementations across multiple platforms. The implementation will allocate such memory internally and invoke an application provided informational callback when these internal allocations are allocated and freed. Upon allocation of executable memory, pfnInternalAllocation will be called. Upon freeing executable memory, pfnInternalFree will be called. An implementation will only call an informational callback for executable memory allocations and frees.

The allocationType parameter to the pfnInternalAllocation and pfnInternalFree functions may be one of the following values:

// Provided by VK_VERSION_1_0
typedef enum VkInternalAllocationType {
    VK_INTERNAL_ALLOCATION_TYPE_EXECUTABLE = 0,
} VkInternalAllocationType;

• VK_INTERNAL_ALLOCATION_TYPE_EXECUTABLE specifies that the allocation is intended for execution by the host.

An implementation must only make calls into an application-provided allocator during the execution of an API command. An implementation must only make calls into an application-provided allocator from the same thread that called the provoking API command. The implementation should not synchronize calls to any of the callbacks. If synchronization is needed, the callbacks must provide it themselves. The informational callbacks are subject to the same restrictions as the allocation callbacks.

If an implementation intends to make calls through a VkAllocationCallbacks structure between the time a vkCreate* command returns and the time a corresponding vkDestroy* command begins, that implementation must save a copy of the allocator before the vkCreate* command returns. The callback functions and any data structures they rely upon must remain valid for the lifetime of the object they are associated with.
If an allocator is provided to a `vkCreate*` command, a compatible allocator must be provided to the corresponding `vkDestroy*` command. Two `VkAllocationCallbacks` structures are compatible if memory allocated with `pfnAllocation` or `pfnReallocation` in each can be freed with `pfnReallocation` or `pfnFree` in the other. An allocator must not be provided to a `vkDestroy*` command if an allocator was not provided to the corresponding `vkCreate*` command.

If a non-NULL allocator is used, the `pfnAllocation`, `pfnReallocation` and `pfnFree` members must be non-NULL and point to valid implementations of the callbacks. An application can choose to not provide informational callbacks by setting both `pfnInternalAllocation` and `pfnInternalFree` to NULL. `pfnInternalAllocation` and `pfnInternalFree` must either both be NULL or both be non-NULL.

If `pfnAllocation` or `pfnReallocation` fail, the implementation may fail object creation and/or generate a `VK_ERROR_OUT_OF_HOST_MEMORY` error, as appropriate.

Allocation callbacks must not call any Vulkan commands.

The following sets of rules define when an implementation is permitted to call the allocator callbacks.

`pfnAllocation` or `pfnReallocation` may be called in the following situations:

- Allocations scoped to a `VkDevice` or `VkInstance` may be allocated from any API command.
- Allocations scoped to a command may be allocated from any API command.
- Allocations scoped to a `VkPipelineCache` may only be allocated from:
  - `vkCreatePipelineCache`
  - `vkMergePipelineCaches` for `dstCache`
  - `vkCreateGraphicsPipelines` for `pipelineCache`
  - `vkCreateComputePipelines` for `pipelineCache`
- Allocations scoped to a `VkValidationCacheEXT` may only be allocated from:
  - `vkCreateValidationCacheEXT`
  - `vkMergeValidationCachesEXT` for `dstCache`
  - `vkCreateShaderModule` for `validationCache` in `VkShaderModuleValidationCacheCreateInfoEXT`
- Allocations scoped to a `VkDescriptorPool` may only be allocated from:
  - any command that takes the pool as a direct argument
  - `vkAllocateDescriptorSets` for the `descriptorPool` member of its `pAllocateInfo` parameter
  - `vkCreateDescriptorPool`
- Allocations scoped to a `VkCommandPool` may only be allocated from:
  - any command that takes the pool as a direct argument
  - `vkCreateCommandPool`
  - `vkAllocateCommandBuffers` for the `commandPool` member of its `pAllocateInfo` parameter
  - any `vkCmd*` command whose `commandBuffer` was allocated from that `VkCommandPool`
• Allocations scoped to any other object **may** only be allocated in that object's **vkCreate** command.

**PFNFree** or **PFNReallocation** with zero size, **may** be called in the following situations:

• Allocations scoped to a **VkDevice** or **VkInstance** **may** be freed from any API command.

• Allocations scoped to a command **must** be freed by any API command which allocates such memory.

• Allocations scoped to a **VkPipelineCache** **may** be freed from **vkDestroyPipelineCache**.

• Allocations scoped to a **VkValidationCacheEXT** **may** be freed from **vkDestroyValidationCacheEXT**.

• Allocations scoped to a **VkDescriptorPool** **may** be freed from
  ◦ any command that takes the pool as a direct argument

• Allocations scoped to a **VkCommandPool** **may** be freed from:
  ◦ any command that takes the pool as a direct argument
  ◦ **vkResetCommandBuffer** whose **commandBuffer** was allocated from that **VkCommandPool**

• Allocations scoped to any other object **may** be freed in that object's **vkDestroy** command.

• Any command that allocates host memory **may** also free host memory of the same scope.

---

### 11.2. Device Memory

**Device memory** is memory that is visible to the device — for example the contents of the image or buffer objects, which **can** be natively used by the device.

#### 11.2.1. Device Memory Properties

Memory properties of a physical device describe the memory heaps and memory types available.

To query memory properties, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceMemoryProperties(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceMemoryProperties* pMemoryProperties);
```

• **physicalDevice** is the handle to the device to query.

• **pMemoryProperties** is a pointer to a **VkPhysicalDeviceMemoryProperties** structure in which the properties are returned.

---

**Valid Usage (Implicit)**

• **VUID-vkGetPhysicalDeviceMemoryProperties-physicalDevice-parameter**
  **physicalDevice** **must** be a valid **VkPhysicalDevice** handle

• **VUID-vkGetPhysicalDeviceMemoryProperties-pMemoryProperties-parameter**
The `VkPhysicalDeviceMemoryProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceMemoryProperties {
    uint32_t memoryTypeCount;
    VkMemoryType memoryTypes[VK_MAX_MEMORY_TYPES];
    uint32_t memoryHeapCount;
    VkMemoryHeap memoryHeaps[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryProperties;
```

- `memoryTypeCount` is the number of valid elements in the `memoryTypes` array.
- `memoryTypes` is an array of `VK_MAX_MEMORY_TYPES` `VkMemoryType` structures describing the memory types that can be used to access memory allocated from the heaps specified by `memoryHeaps`.
- `memoryHeapCount` is the number of valid elements in the `memoryHeaps` array.
- `memoryHeaps` is an array of `VK_MAX_MEMORY_HEAPS` `VkMemoryHeap` structures describing the memory heaps from which memory can be allocated.

The `VkPhysicalDeviceMemoryProperties` structure describes a number of memory heaps as well as a number of memory types that can be used to access memory allocated in those heaps. Each heap describes a memory resource of a particular size, and each memory type describes a set of memory properties (e.g. host cached vs. uncached) that can be used with a given memory heap. Allocations using a particular memory type will consume resources from the heap indicated by that memory type’s heap index. More than one memory type may share each heap, and the heaps and memory types provide a mechanism to advertise an accurate size of the physical memory resources while allowing the memory to be used with a variety of different properties.

The number of memory heaps is given by `memoryHeapCount` and is less than or equal to `VK_MAX_MEMORY_HEAPS`. Each heap is described by an element of the `memoryHeaps` array as a `VkMemoryHeap` structure. The number of memory types available across all memory heaps is given by `memoryTypeCount` and is less than or equal to `VK_MAX_MEMORY_TYPES`. Each memory type is described by an element of the `memoryTypes` array as a `VkMemoryType` structure.

At least one heap must include `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` in `VkMemoryHeap::flags`. If there are multiple heaps that all have similar performance characteristics, they may all include `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT`. In a unified memory architecture (UMA) system there is often only a single memory heap which is considered to be equally “local” to the host and to the device, and such an implementation must advertise the heap as device-local.

Each memory type returned by `vkGetPhysicalDeviceMemoryProperties` must have its `propertyFlags` set to one of the following values:

- 0
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT`
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_LOCOHERENT_BIT_AMD`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD`
VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD | VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD

• VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD | VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD | VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD | VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORYPROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD | VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORYPROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD | VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD

• VK_MEMORYPROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORYPROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD | VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORYPROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD | VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD

There must be at least one memory type with both the VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT and VK_MEMORY_PROPERTY_HOST_COHERENT_BIT bits set in its propertyFlags. There must be at least one memory type with the VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT bit set in its propertyFlags. If the deviceCoherentMemory feature is enabled, there must be at least one memory type with the VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD bit set in its propertyFlags.

For each pair of elements \( X \) and \( Y \) returned in memoryTypes, \( X \) must be placed at a lower index position than \( Y \) if:

- the set of bit flags returned in the propertyFlags member of \( X \) is a strict subset of the set of bit flags returned in the propertyFlags member of \( Y \); or

- the propertyFlags members of \( X \) and \( Y \) are equal, and \( X \) belongs to a memory heap with greater performance (as determined in an implementation-specific manner); or

- the propertyFlags members of \( Y \) includes VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD or VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD and \( X \) does not

\[ \text{Note} \]

There is no ordering requirement between \( X \) and \( Y \) elements for the case their propertyFlags members are not in a subset relation. That potentially allows more than one possible way to order the same set of memory types. Notice that the list of all allowed memory property flag combinations is written in a valid order. But if
instead \texttt{VK\_MEMORY\_PROPERTY\_DEVICE\_LOCAL\_BIT} was before \texttt{VK\_MEMORY\_PROPERTY\_HOST\_VISIBLE\_BIT} | \texttt{VK\_MEMORY\_PROPERTY\_HOST\_COHERENT\_BIT}, the list would still be in a valid order.

There may be a performance penalty for using device coherent or uncached device memory types, and using these accidentally is undesirable. In order to avoid this, memory types with these properties always appear at the end of the list; but are subject to the same rules otherwise.

This ordering requirement enables applications to use a simple search loop to select the desired memory type along the lines of:

```c
// Find a memory in `memoryTypeBitsRequirement` that includes all of 'requiredProperties'
int32_t findProperties(const VkPhysicalDeviceMemoryProperties* pMemoryProperties,
                        uint32_t memoryTypeBitsRequirement,
                        VkMemoryPropertyFlags requiredProperties)
{
    const uint32_t memoryCount = pMemoryProperties->memoryTypeCount;
    for (uint32_t memoryIndex = 0; memoryIndex < memoryCount; ++memoryIndex)
    {
        const uint32_t memoryTypeBits = (1 << memoryIndex);
        const bool isRequiredMemoryType = memoryTypeBitsRequirement & memoryTypeBits;
        const VkMemoryPropertyFlags properties = pMemoryProperties->memoryTypes[memoryIndex].propertyFlags;
        const bool hasRequiredProperties = (properties & requiredProperties) == requiredProperties;

        if (isRequiredMemoryType && hasRequiredProperties)
            return static_cast<int32_t>(memoryIndex);
    }

    // failed to find memory type
    return -1;
}
```

// Try to find an optimal memory type, or if it does not exist try fallback memory type
// 'device' is the VkDevice
// 'image' is the VkImage that requires memory to be bound
// 'memoryProperties' properties as returned by vkGetPhysicalDeviceMemoryProperties
// 'requiredProperties' are the property flags that must be present
// 'optimalProperties' are the property flags that are preferred by the application
VkMemoryRequirements memoryRequirements;
vkGetImageMemoryRequirements(device, image, &memoryRequirements);
int32_t memoryType = findProperties(&memoryProperties, memoryRequirements.memoryTypeBits, optimalProperties);
if (memoryType == -1) // not found; try fallback properties
    memoryType = findProperties(&memoryProperties, memoryRequirements.memoryTypeBits, optimalProperties);
```
VK_MAX_MEMORY_TYPES is the length of an array of VkMemoryType structures describing memory types, as returned in VkPhysicalDeviceMemoryProperties::memoryTypes.

#define VK_MAX_MEMORY_TYPES 32U

VK_MAX_MEMORY_HEAPS is the length of an array of VkMemoryHeap structures describing memory heaps, as returned in VkPhysicalDeviceMemoryProperties::memoryHeaps.

#define VK_MAX_MEMORY_HEAPS 16U

To query memory properties, call:

// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceMemoryProperties2(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceMemoryProperties2* pMemoryProperties);

or the equivalent command

// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceMemoryProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceMemoryProperties2* pMemoryProperties);

- physicalDevice is the handle to the device to query.
- pMemoryProperties is a pointer to a VkPhysicalDeviceMemoryProperties2 structure in which the properties are returned.

vkGetPhysicalDeviceMemoryProperties2 behaves similarly to vkGetPhysicalDeviceMemoryProperties, with the ability to return extended information in a pNext chain of output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceMemoryProperties2-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceMemoryProperties2-pMemoryProperties-parameter pMemoryProperties must be a valid pointer to a VkPhysicalDeviceMemoryProperties2 structure

The VkPhysicalDeviceMemoryProperties2 structure is defined as:
```c
typedef struct VkPhysicalDeviceMemoryProperties2 {
    VkStructureType sType;
    void* pNext;
    VkPhysicalDeviceMemoryProperties memoryProperties;
} VkPhysicalDeviceMemoryProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceMemoryProperties2 VkPhysicalDeviceMemoryProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryProperties` is a `VkPhysicalDeviceMemoryProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceMemoryProperties`.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMemoryProperties2-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_PROPERTIES_2`
- VUID-VkPhysicalDeviceMemoryProperties2-pNext-pNext
  - `pNext` must be `NULL` or a pointer to a valid instance of `VkPhysicalDeviceMemoryBudgetPropertiesEXT`
- VUID-VkPhysicalDeviceMemoryProperties2-sType-unique
  - The `sType` value of each struct in the `pNext` chain must be unique

The `VkMemoryHeap` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryHeap {
    VkDeviceSize size;
    VkMemoryHeapFlags flags;
} VkMemoryHeap;
```

- `size` is the total memory size in bytes in the heap.
- `flags` is a bitmask of `VkMemoryHeapFlagBits` specifying attribute flags for the heap.

Bits which may be set in `VkMemoryHeap::flags`, indicating attribute flags for the heap, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkMemoryHeapFlagBits {
    VK_MEMORY_HEAP_DEVICE_LOCAL_BIT = 0x00000001,
};
```
• **VK_MEMORY_HEAP_DEVICE_LOCAL_BIT** specifies that the heap corresponds to device-local memory. Device-local memory may have different performance characteristics than host-local memory, and may support different memory property flags.

• **VK_MEMORY_HEAP_MULTI_INSTANCE_BIT** specifies that in a logical device representing more than one physical device, there is a per-physical device instance of the heap memory. By default, an allocation from such a heap will be replicated to each physical device's instance of the heap.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryHeapFlags;
```

**VkMemoryHeapFlags** is a bitmask type for setting a mask of zero or more **VkMemoryHeapFlagBits**.

The **VkMemoryType** structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryType {
    VkMemoryPropertyFlags propertyFlags;
    uint32_t heapIndex;
} VkMemoryType;
```

- **heapIndex** describes which memory heap this memory type corresponds to, and **must** be less than **memoryHeapCount** from the **VkPhysicalDeviceMemoryProperties** structure.

- **propertyFlags** is a bitmask of **VkMemoryPropertyFlagBits** of properties for this memory type.

Bits which may be set in **VkMemoryType::propertyFlags**, indicating properties of a memory type, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkMemoryPropertyFlagBits {
    VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT = 0x00000001,
    VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT = 0x00000002,
    VK_MEMORY_PROPERTY_HOST_COHERENT_BIT = 0x00000004,
    VK_MEMORY_PROPERTY_HOST_CACHED_BIT = 0x00000008,
    VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_MEMORY_PROPERTY_PROTECTED_BIT = 0x00000020,
    // Provided by VK_AMD_device_coherent_memory
    VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD = 0x00000040,
    // Provided by VK_AMD_device_coherent_memory
    VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD = 0x00000080,
}
```
• **VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT** bit specifies that memory allocated with this type is the most efficient for device access. This property will be set if and only if the memory type belongs to a heap with the **VK_MEMORY_HEAP_DEVICE_LOCAL_BIT** set.

• **VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT** bit specifies that memory allocated with this type can be mapped for host access using **vkMapMemory**.

• **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** bit specifies that the host cache management commands **vkFlushMappedMemoryRanges** and **vkInvalidateMappedMemoryRanges** are not needed to flush host writes to the device or make device writes visible to the host, respectively.

• **VK_MEMORY_PROPERTY_HOST_CACHED_BIT** bit specifies that memory allocated with this type is cached on the host. Host memory accesses to uncached memory are slower than to cached memory, however uncached memory is always host coherent.

• **VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT** bit specifies that the memory type only allows device access to the memory. Memory types must not have both **VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT** and **VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT** set. Additionally, the object’s backing memory may be provided by the implementation lazily as specified in Lazy Allocated Memory.

• **VK_MEMORY_PROPERTY_PROTECTED_BIT** bit specifies that the memory type only allows device access to the memory, and allows protected queue operations to access the memory. Memory types must not have **VK_MEMORY_PROPERTY_PROTECTED_BIT** set and any of **VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT**, **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT**, or **VK_MEMORY_PROPERTY_HOST_CACHED_BIT** set.

• **VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD** bit specifies that device accesses to allocations of this memory type are automatically made available and visible.

• **VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD** bit specifies that memory allocated with this type is not cached on the device. Uncached device memory is always device coherent.

• **VK_MEMORY_PROPERTY_RDMA_CAPABLE_BIT_NV** bit specifies that external devices can access this memory directly.

For any memory allocated with both the **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** and the **VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD**, host or device accesses also perform automatic memory domain transfer operations, such that writes are always automatically available and visible to both host and device memory domains.

**Note**

Device coherence is a useful property for certain debugging use cases (e.g. crash analysis, where performing separate coherence actions could mean values are not reported correctly). However, device coherent accesses may be slower than equivalent accesses without device coherence, particularly if they are also device uncached. For device uncached memory in particular, repeated accesses to the same or neighbouring memory locations over a short time period (e.g. within a
frame) may be slower than it would be for the equivalent cached memory type. As such, it is generally inadvisable to use device coherent or device uncached memory except when really needed.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryPropertyFlags;
```

`VkMemoryPropertyFlags` is a bitmask type for setting a mask of zero or more `VkMemoryPropertyFlagBits`.

If the `VkPhysicalDeviceMemoryBudgetPropertiesEXT` structure is included in the `pNext` chain of `VkPhysicalDeviceMemoryProperties2`, it is filled with the current memory budgets and usages.

The `VkPhysicalDeviceMemoryBudgetPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_memory_budget
typedef struct VkPhysicalDeviceMemoryBudgetPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize heapBudget[VK_MAX_MEMORY_HEAPS];
    VkDeviceSize heapUsage[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryBudgetPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `heapBudget` is an array of `VK_MAX_MEMORY_HEAPS` `VkDeviceSize` values in which memory budgets are returned, with one element for each memory heap. A heap's budget is a rough estimate of how much memory the process can allocate from that heap before allocations may fail or cause performance degradation. The budget includes any currently allocated device memory.
- `heapUsage` is an array of `VK_MAX_MEMORY_HEAPS` `VkDeviceSize` values in which memory usages are returned, with one element for each memory heap. A heap's usage is an estimate of how much memory the process is currently using in that heap.

The values returned in this structure are not invariant. The `heapBudget` and `heapUsage` values must be zero for array elements greater than or equal to `VkPhysicalDeviceMemoryProperties::memoryHeapCount`. The `heapBudget` value must be non-zero for array elements less than `VkPhysicalDeviceMemoryProperties::memoryHeapCount`. The `heapBudget` value must be less than or equal to `VkMemoryHeap::size` for each heap.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceMemoryBudgetPropertiesEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_BUDGET_PROPERTIES_EXT`
11.2.2. Device Memory Objects

A Vulkan device operates on data in device memory via memory objects that are represented in the API by a `VkDeviceMemory` handle:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeviceMemory)
```

11.2.3. Device Memory Allocation

To allocate memory objects, call:

```
// Provided by VK_VERSION_1_0
VkResult vkAllocateMemory(
    VkDevice device,
    const VkMemoryAllocateInfo* pAllocateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDeviceMemory* pMemory);
```

- `device` is the logical device that owns the memory.
- `pAllocateInfo` is a pointer to a `VkMemoryAllocateInfo` structure describing parameters of the allocation. A successfully returned allocation must use the requested parameters—no substitution is permitted by the implementation.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pMemory` is a pointer to a `VkDeviceMemory` handle in which information about the allocated memory is returned.

Allocations returned by `vkAllocateMemory` are guaranteed to meet any alignment requirement of the implementation. For example, if an implementation requires 128 byte alignment for images and 64 byte alignment for buffers, the device memory returned through this mechanism would be 128-byte aligned. This ensures that applications can correctly suballocate objects of different types (with potentially different alignment requirements) in the same memory object.

When memory is allocated, its contents are undefined with the following constraint:

- The contents of unprotected memory must not be a function of the contents of data protected memory objects, even if those memory objects were previously freed.

**Note**

The contents of memory allocated by one application should not be a function of data from protected memory objects of another application, even if those memory objects were previously freed.

The maximum number of valid memory allocations that can exist simultaneously within a `VkDevice` may be restricted by implementation- or platform-dependent limits. The `maxMemoryAllocationCount` feature describes the number of allocations that can exist simultaneously.
before encountering these internal limits.

---

**Note**

For historical reasons, if `maxMemoryAllocationCount` is exceeded, some implementations may return `VK_ERROR_TOO_MANY_OBJECTS`. Exceeding this limit will result in undefined behavior, and an application should not rely on the use of the returned error code in order to identify when the limit is reached.

---

**Note**

Many protected memory implementations involve complex hardware and system software support, and often have additional and much lower limits on the number of simultaneous protected memory allocations (from memory types with the `VK_MEMORY_PROPERTY_PROTECTED_BIT` property) than for non-protected memory allocations. These limits can be system-wide, and depend on a variety of factors outside of the Vulkan implementation, so they cannot be queried in Vulkan. Applications **should** use as few allocations as possible from such memory types by suballocating aggressively, and be prepared for allocation failure even when there is apparently plenty of capacity remaining in the memory heap. As a guideline, the Vulkan conformance test suite requires that at least 80 minimum-size allocations can exist concurrently when no other uses of protected memory are active in the system.

---

Some platforms **may** have a limit on the maximum size of a single allocation. For example, certain systems **may** fail to create allocations with a size greater than or equal to 4GB. Such a limit is implementation-dependent, and if such a failure occurs then the error `VK_ERROR_OUT_OF_DEVICE_MEMORY` **must** be returned. This limit is advertised in `VkPhysicalDeviceMaintenance3Properties::maxMemoryAllocationSize`.

The cumulative memory size allocated to a heap **can** be limited by the size of the specified heap. In such cases, allocated memory is tracked on a per-device and per-heap basis. Some platforms allow overallocation into other heaps. The overallocation behavior **can** be specified through the `VK_AMD_memory_overallocation_behavior` extension.

If the `VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT:: pageableDeviceLocalMemory` feature is enabled, memory allocations made from a heap that includes `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` in `VkMemoryHeap::flags` **may** be transparently moved to host-local memory allowing multiple applications to share device-local memory. If there is no space left in device-local memory when this new allocation is made, other allocations **may** be moved out transparently to make room. The operating system will determine which allocations to move to device-local memory or host-local memory based on platform-specific criteria. To help the operating system make good choices, the application **should** set the appropriate memory priority with `VkMemoryPriorityAllocateInfoEXT` and adjust it as necessary with `vkSetDeviceMemoryPriorityEXT`. Higher priority allocations will moved to device-local memory first.

Memory allocations made on heaps without the `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` property will not be transparently promoted to device-local memory by the operating system.
Valid Usage

• VUID-vkAllocateMemory-pAllocateInfo-01713
  pAllocateInfo->allocationSize must be less than or equal to
  VkPhysicalDeviceMemoryProperties::memoryHeaps[memindex].size where memindex =
  VkPhysicalDeviceMemoryProperties::memoryTypes[pAllocateInfo->memoryTypeIndex]
  .heapIndex as returned by vkGetPhysicalDeviceMemoryProperties for the
  VkPhysicalDevice that device was created from

• VUID-vkAllocateMemory-pAllocateInfo-01714
  pAllocateInfo->memoryTypeIndex must be less than VkPhysicalDeviceMemoryProperties
  ::memoryTypeCount as returned by vkGetPhysicalDeviceMemoryProperties for the
  VkPhysicalDevice that device was created from

• VUID-vkAllocateMemory-deviceCoherentMemory-02790
  If the deviceCoherentMemory feature is not enabled, pAllocateInfo->memoryTypeIndex must
  not identify a memory type supporting VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VUID-vkAllocateMemory-maxMemoryAllocationCount-04101
  There must be less than VkPhysicalDeviceLimits::maxMemoryAllocationCount device memory
  allocations currently allocated on the device

Valid Usage (Implicit)

• VUID-vkAllocateMemory-device-parameter
  device must be a valid VkDevice handle

• VUID-vkAllocateMemory-pAllocateInfo-parameter
  pAllocateInfo must be a valid pointer to a valid VkMemoryAllocateInfo structure

• VUID-vkAllocateMemory-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid
  VkAllocationCallbacks structure

• VUID-vkAllocateMemory-pMemory-parameter
  pMemory must be a valid pointer to a VkDeviceMemory handle

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_INVALID_EXTERNAL_HANDLE
  • VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR
The *VkMemoryAllocateInfo* structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize allocationSize;
    uint32_t memoryTypeIndex;
} VkMemoryAllocateInfo;
```

- `sType` is a *VkStructureType* value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `allocationSize` is the size of the allocation in bytes.
- `memoryTypeIndex` is an index identifying a memory type from the `memoryTypes` array of the *VkPhysicalDeviceMemoryProperties* structure.

The internal data of an allocated device memory object must include a reference to implementation-specific resources, referred to as the memory object's *payload*. Applications can also import and export that internal data to and from device memory objects to share data between Vulkan instances and other compatible APIs. A *VkMemoryAllocateInfo* structure defines a memory import operation if its `pNext` chain includes one of the following structures:

- *VkImportMemoryWin32HandleInfoKHR* with a non-zero `handleType` value
- *VkImportMemoryFdInfoKHR* with a non-zero `handleType` value
- *VkImportMemoryHostPointerInfoEXT* with a non-zero `handleType` value
- *VkImportAndroidHardwareBufferInfoANDROID* with a non-`NULL` `buffer` value
- *VkImportMemoryZirconHandleInfoFUCHSIA* with a non-zero `handleType` value
- *VkImportMemoryBufferCollectionFUCHSIA*
- *VkImportScreenBufferInfoQNX* with a non-`NULL` `buffer` value

If the parameters define an import operation and the external handle type is

```
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT,
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT,
```

or

```
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT,
```

`allocationSize` is ignored. The implementation must query the size of these allocations from the OS.

Whether device memory objects constructed via a memory import operation hold a reference to their payload depends on the properties of the handle type used to perform the import, as defined below for each valid handle type. Importing memory must not modify the content of the memory. Implementations must ensure that importing memory does not enable the importing Vulkan instance to access any memory or resources in other Vulkan instances other than that corresponding to the memory object imported. Implementations must also ensure accessing imported memory which has not been initialized does not allow the importing Vulkan instance to obtain data from the exporting Vulkan instance or vice-versa.
Note

How exported and imported memory is isolated is left to the implementation, but applications should be aware that such isolation may prevent implementations from placing multiple exportable memory objects in the same physical or virtual page. Hence, applications should avoid creating many small external memory objects whenever possible.

Importing memory must not increase overall heap usage within a system. However, it must affect the following per-process values:

- VkPhysicalDeviceMaintenance3Properties::maxMemoryAllocationCount
- VkPhysicalDeviceMemoryBudgetPropertiesEXT::heapUsage

When performing a memory import operation, it is the responsibility of the application to ensure the external handles and their associated payloads meet all valid usage requirements. However, implementations must perform sufficient validation of external handles and payloads to ensure that the operation results in a valid memory object which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its allocation parameters. If the external handle provided does not meet these requirements, the implementation must fail the memory import operation with the error code VK_ERROR_INVALID_EXTERNAL_HANDLE. If the parameters define an export operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, implementations should not strictly follow memoryTypeIndex. Instead, they should modify the allocation internally to use the required memory type for the application's given usage. This is because for an export operation, there is currently no way for the client to know the memory type index before allocating.

Valid Usage

- VUID-VkMemoryAllocateInfo-None-06657
  The parameters must not define more than one import operation

- VUID-VkMemoryAllocateInfo-allocationSize-07897
  If the parameters do not define an import or export operation, allocationSize must be greater than 0

- VUID-VkMemoryAllocateInfo-allocationSize-07899
  If the parameters define an export operation and the handle type is not VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, allocationSize must be greater than 0

- VUID-VkMemoryAllocateInfo-buffer-06380
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA, and VkMemoryDedicatedAllocateInfo::buffer is present and non-NULL, VkImportMemoryBufferCollectionFUCHSIA::collection and VkImportMemoryBufferCollectionFUCHSIA::index must match VkBufferCollectionBufferCreateInfoFUCHSIA::collection and VkBufferCollectionBufferCreateInfoFUCHSIA::index, respectively, of the VkBufferCollectionBufferCreateInfoFUCHSIA structure used to create the
VkMemoryDedicatedAllocateInfo::buffer

- VUID-VkMemoryAllocateInfo-image-06381
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA, and VkMemoryDedicatedAllocateInfo::image is present and non-NULL, VkImportMemoryBufferCollectionFUCHSIA::collection and VkImportMemoryBufferCollectionFUCHSIA::index must match VkBufferCollectionImageCreateInfoFUCHSIA::collection and VkBufferCollectionImageCreateInfoFUCHSIA::index, respectively, of the VkBufferCollectionImageCreateInfoFUCHSIA structure used to create the VkMemoryDedicatedAllocateInfo::image

- VUID-VkMemoryAllocateInfo-allocationSize-06382
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA, allocationSize must match VkMemoryRequirements::size value retrieved by vkGetImageMemoryRequirements or vkGetBufferMemoryRequirements for image-based or buffer-based collections respectively

- VUID-VkMemoryAllocateInfo-pNext-06383
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA, the pNext chain must include a VkMemoryDedicatedAllocateInfo structure with either its image or buffer field set to a value other than VK_NULL_HANDLE

- VUID-VkMemoryAllocateInfo-image-06384
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA and VkMemoryDedicatedAllocateInfo::image is not VK_NULL_HANDLE, the image must be created with a VkBufferCollectionImageCreateInfoFUCHSIA structure chained to its VkImageCreateInfo::pNext pointer

- VUID-VkMemoryAllocateInfo-buffer-06385
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA and VkMemoryDedicatedAllocateInfo::buffer is not VK_NULL_HANDLE, the buffer must be created with a VkBufferCollectionBufferCreateInfoFUCHSIA structure chained to its VkBufferCreateInfo::pNext pointer

- VUID-VkMemoryAllocateInfo-memoryTypeIndex-06386
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA, memoryTypeIndex must be from VkBufferCollectionPropertiesFUCHSIA as retrieved by vkGetBufferCollectionPropertiesFUCHSIA

- VUID-VkMemoryAllocateInfo-pNext-00639
  If the pNext chain includes a VkExportMemoryAllocateInfo structure, and any of the handle types specified in VkExportMemoryAllocateInfo::handleTypes require a dedicated allocation, as reported by vkGetPhysicalDeviceImageFormatProperties2 in VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures, or by vkGetPhysicalDeviceExternalBufferProperties in VkExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures, the pNext chain must include a VkMemoryDedicatedAllocateInfo or VkDedicatedAllocationMemoryAllocateInfoNV structure with either its image or buffer member set to a value other than VK_NULL_HANDLE

- VUID-VkMemoryAllocateInfo-pNext-00640
  If the pNext chain includes a VkExportMemoryAllocateInfo structure, it must not include a VkExportMemoryAllocateInfoNV or VkExportMemoryWin32HandleInfoNV structure
If the `pNext` chain includes a `VkImportMemoryWin32HandleInfoKHR` structure, it must not include a `VkImportMemoryWin32HandleInfoNV` structure.

If the parameters define an import operation, the external handle specified was created by the Vulkan API, and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT`, then the values of `allocationSize` and `memoryTypeIndex` must match those specified when the payload being imported was created.

If the parameters define an import operation and the external handle specified was created by the Vulkan API, the device mask specified by `VkMemoryAllocateFlagsInfo` must match the mask specified when the payload being imported was allocated.

If the parameters define an import operation and the external handle specified was created by the Vulkan API, the list of physical devices that comprise the logical device passed to `vkAllocateMemory` must match the list of physical devices that comprise the logical device on which the payload was originally allocated.

If the parameters define an import operation and the external handle is an NT handle or a global share handle created outside of the Vulkan API, the value of `memoryTypeIndex` must be one of those returned by `vkGetMemoryWin32HandlePropertiesKHR`.

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, then the values of `allocationSize` and `memoryTypeIndex` must match those specified when the payload being imported was created.

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, `allocationSize` must match the size specified when creating the Direct3D 12 heap from which the payload was extracted.

If the parameters define an import operation and the external handle is a POSIX file descriptor created outside of the Vulkan API, the value of `memoryTypeIndex` must be one of those returned by `vkGetMemoryFdPropertiesKHR`.

If the protectedMemory feature is not enabled, the `VkMemoryAllocateInfo::memoryTypeIndex` must not indicate a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`.

If the parameters define an import operation and the external handle is a host pointer, the value of `memoryTypeIndex` must be one of those returned by `vkGetMemoryHostPointerPropertiesEXT`.
If the parameters define an import operation and the external handle is a host pointer, `allocationSize` must be an integer multiple of `VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment`.

If the parameters define an import operation and the external handle is a host pointer, the `pNext` chain must not include a `VkDedicatedAllocationMemoryAllocateInfoNV` structure with either its `image` or `buffer` field set to a value other than `VK_NULL_HANDLE`.

If the parameters define an import operation and the external handle is a host pointer, the `pNext` chain must not include a `VkMemoryDedicatedAllocateInfo` structure with either its `image` or `buffer` field set to a value other than `VK_NULL_HANDLE`.

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, `allocationSize` must be the size returned by `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer.

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, and the `pNext` chain does not include a `VkMemoryDedicatedAllocateInfo` structure or the `VkMemoryDedicatedAllocateInfo::image` is `VK_NULL_HANDLE`, the Android hardware buffer must have an `AHardwareBuffer_Desc::format` of `AHARDWAREBUFFER_FORMAT_BLOB` and an `AHardwareBuffer_Desc::usage` that includes `AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER`.

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, `memoryTypeIndex` must be one of those returned by `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer.

If the parameters do not define an import operation, and the `pNext` chain includes a `VkExportMemoryAllocateInfo` structure with `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID` included in its `handleTypes` member, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `image` not equal to `VK_NULL_HANDLE`, then `allocationSize` must be 0.

If the parameters define an export operation, the handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, and the `pNext` chain does not include a `VkMemoryDedicatedAllocateInfo` structure, `allocationSize` must be greater than 0.

If the parameters define an export operation, the handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `buffer` set to a valid `VkBuffer` object, `allocationSize` must be greater than 0.
If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` with `image` that is not `VK_NULL_HANDLE`, the Android hardware buffer's `AHardwareBuffer::usage` must include at least one of `AHARDWAREBUFFER_USAGE_GPU_FRAMEBUFFER`, `AHARDWAREBUFFER_USAGE_GPU_SAMPLED_IMAGE` or `AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER`.

If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` with `image` that is not `VK_NULL_HANDLE`, the format of `image` must be `VK_FORMAT_UNDEFINED` or the format returned by `vkGetAndroidHardwareBufferPropertiesANDROID` in `VkAndroidHardwareBufferFormatPropertiesANDROID::format` for the Android hardware buffer.

If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `image` that is not `VK_NULL_HANDLE`, the width, height, and array layer dimensions of `image` and the Android hardware buffer's `AHardwareBuffer_Desc` must be identical.

If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `image` that is not `VK_NULL_HANDLE`, and the Android hardware buffer's `AHardwareBuffer::usage` includes `AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE`, the `image` must have a complete mipmap chain.

If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `image` that is not `VK_NULL_HANDLE`, and the Android hardware buffer's `AHardwareBuffer::usage` does not include `AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE`, the `image` must have exactly one mipmap level.

If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `image` that is not `VK_NULL_HANDLE`, each bit set in the usage of `image` must be listed in `AHardwareBuffer Usage Equivalence`, and if there is a corresponding `AHARDWAREBUFFER_USAGE` bit listed that bit must be included in the Android hardware buffer's `AHardwareBuffer_Desc::usage`.

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX`, `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX::screenBufferImport` must be enabled.

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX`, `allocationSize` must be the size...
- VUID-VkMemoryAllocateInfo-memoryTypeIndex-08943
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX, memoryTypeIndex must be one of those returned by vkGetScreenBufferPropertiesQNX for the QNX Screen buffer

- VUID-VkMemoryAllocateInfo-pNext-08944
  If the parameters define an import operation, the external handle is a QNX Screen buffer, and the pNext chain includes a VkMemoryDedicatedAllocateInfo with image that is not VK_NULL_HANDLE, the QNX Screen's buffer must be a valid QNX Screen buffer

- VUID-VkMemoryAllocateInfo-pNext-08945
  If the parameters define an import operation, the external handle is a QNX Screen buffer, and the pNext chain includes a VkMemoryDedicatedAllocateInfo structure with image that is not VK_NULL_HANDLE, the format of image must be VK_FORMAT_UNDEFINED or the format returned by vkGetScreenBufferPropertiesQNX in VkScreenBufferFormatPropertiesQNX::format for the QNX Screen buffer

- VUID-VkMemoryAllocateInfo-pNext-08946
  If the parameters define an import operation, the external handle is a QNX Screen buffer, and the pNext chain includes a VkMemoryDedicatedAllocateInfo structure with image that is not VK_NULL_HANDLE, the width, height, and array layer dimensions of image and the QNX Screen buffer's _screen_buffer must be identical

- VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03329
  If VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress is not zero, VkMemoryAllocateFlagsInfo::flags must include VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT

- VUID-VkMemoryAllocateInfo-flags-03330
  If VkMemoryAllocateFlagsInfo::flags includes VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, the bufferDeviceAddressCaptureReplay feature must be enabled

- VUID-VkMemoryAllocateInfo-flags-03331
  If VkMemoryAllocateFlagsInfo::flags includes VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT, the bufferDeviceAddress feature must be enabled

- VUID-VkMemoryAllocateInfo-pNext-03332
  If the pNext chain includes a VkImportMemoryHostPointerInfoEXT structure, VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress must be zero

- VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03333
  If the parameters define an import operation, VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress must be zero

- VUID-VkMemoryAllocateInfo-None-04749
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the value of memoryTypeIndex must be an index identifying a memory type from the memoryTypeBits field of the VkMemoryZirconHandlePropertiesFUCHSIA structure populated by a call to vkGetMemoryZirconHandlePropertiesFUCHSIA
If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA`, the value of `allocationSize` must be greater than 0.

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA`, the value of `allocationSize` must be less than or equal to the size of the VMO as determined by `zx_vmo_get_size(handle)` where `handle` is the VMO handle to the imported external memory.

If the `pNext` chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its `exportObjectType` member must be `VK_EXPORT_METAL_OBJECT_TYPE_METAL_BUFFER_BIT_EXT`.

Valid Usage (Implicit)

- `VUID-VkMemoryAllocateInfo-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO`.
- `VUID-VkMemoryAllocateInfo-pNext-pNext`  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDedicatedAllocationMemoryAllocateInfoNV`, `VkExportMemoryAllocateInfo`, `VkExportMemoryWin32HandleInfoKHR`, `VkExportMetalObjectCreateInfoEXT`, `VkImportAndroidHardwareBufferInfoANDROID`, `VkImportMemoryBufferCollectionFUCHSIA`, `VkImportSpoolCameraTextureInfoEXT`, `VkImportVideoSurfaceInfoVULKAN`, `VkImportMemoryFdInfoKHR`, `VkImportMemoryHostPointerInfoEXT`, `VkImportMemoryWin32HandleInfoKHR`, `VkImportMemoryWin32HandleInfoNV`, `VkImportMemoryZirconHandleInfoFUCHSIA`, `VkImportMetalBufferInfoEXT`, `VkImportScreenBufferInfoQNX`, `VkMemoryAllocateFlagsInfo`, `VkMemoryOpaqueCaptureAddressAllocateInfo`, or `VkMemoryPriorityAllocateInfoEXT`.
- `VUID-VkMemoryAllocateInfo-sType-unique`  
  The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkExportMetalObjectCreateInfoEXT`.

If the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure, then that structure includes a handle of the sole buffer or image resource that the memory can be bound to.

The `VkMemoryDedicatedAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkBuffer buffer;
} VkMemoryDedicatedAllocateInfo;
```
or the equivalent

```c
// Provided by VK_KHR_dedicated_allocation
typedef VkMemoryDedicatedAllocateInfo VkMemoryDedicatedAllocateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is `VK_NULL_HANDLE` or a handle of an image which this memory will be bound to.
- `buffer` is `VK_NULL_HANDLE` or a handle of a buffer which this memory will be bound to.

### Valid Usage

- **VUID-VkMemoryDedicatedAllocateInfo-image-01432**
  At least one of `image` and `buffer` must be `VK_NULL_HANDLE`

- **VUID-VkMemoryDedicatedAllocateInfo-image-02964**
  If `image` is not `VK_NULL_HANDLE` and the memory is not an imported Android Hardware Buffer or an imported QNX Screen buffer, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the image

- **VUID-VkMemoryDedicatedAllocateInfo-image-01434**
  If `image` is not `VK_NULL_HANDLE`, `image` must have been created without `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` set in `VkImageCreateInfo::flags`

- **VUID-VkMemoryDedicatedAllocateInfo-buffer-02965**
  If `buffer` is not `VK_NULL_HANDLE` and the memory is not an imported Android Hardware Buffer or an imported QNX Screen buffer, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the buffer

- **VUID-VkMemoryDedicatedAllocateInfo-buffer-01436**
  If `buffer` is not `VK_NULL_HANDLE`, `buffer` must have been created without `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` set in `VkBufferCreateInfo::flags`

- **VUID-VkMemoryDedicatedAllocateInfo-image-01876**
  If `image` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation with handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, and the external handle was created by the Vulkan API, then the memory being imported must also be a dedicated image allocation and `image` must be identical to the image associated with the imported memory

- **VUID-VkMemoryDedicatedAllocateInfo-buffer-01877**
  If `buffer` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation with handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`,
VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT,
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT,
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT,
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT, or
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, and the external handle was created
by the Vulkan API, then the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory

• VUID-VkMemoryDedicatedAllocateInfo-image-01878
If image is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, the memory being imported must also be a dedicated image allocation and image must be identical to the image associated with the imported memory

• VUID-VkMemoryDedicatedAllocateInfo-buffer-01879
If buffer is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory

• VUID-VkMemoryDedicatedAllocateInfo-image-01797
If image is not VK_NULL_HANDLE, image must not have been created with VK_IMAGE_CREATE_DISJOINT_BIT set in VkImageCreateInfo::flags

• VUID-VkMemoryDedicatedAllocateInfo-image-04751
If image is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the memory being imported must also be a dedicated image allocation and image must be identical to the image associated with the imported memory

• VUID-VkMemoryDedicatedAllocateInfo-buffer-04752
If buffer is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory

Valid Usage (Implicit)

• VUID-VkMemoryDedicatedAllocateInfo-sType-sType
sType must be VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO

• VUID-VkMemoryDedicatedAllocateInfo-image-parameter
If image is not VK_NULL_HANDLE, image must be a valid VkImage handle

• VUID-VkMemoryDedicatedAllocateInfo-buffer-parameter
If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle

• VUID-VkMemoryDedicatedAllocateInfo-commonparent
Both of buffer, and image that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice
If the `pNext` chain includes a `VkDedicatedAllocationMemoryAllocateInfoNV` structure, then that structure includes a handle of the sole buffer or image resource that the memory can be bound to.

The `VkDedicatedAllocationMemoryAllocateInfoNV` structure is defined as:

```c
// Provided by VK_NV_dedicated_allocation
typedef struct VkDedicatedAllocationMemoryAllocateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkBuffer buffer;
} VkDedicatedAllocationMemoryAllocateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is `VK_NULL_HANDLE` or a handle of an image which this memory will be bound to.
- `buffer` is `VK_NULL_HANDLE` or a handle of a buffer which this memory will be bound to.

### Valid Usage

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00649**
  At least one of `image` and `buffer` must be `VK_NULL_HANDLE`

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00650**
  If `image` is not `VK_NULL_HANDLE`, the image must have been created with `VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation` equal to `VK_TRUE`

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-00651**
  If `buffer` is not `VK_NULL_HANDLE`, the buffer must have been created with `VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation` equal to `VK_TRUE`

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00652**
  If `image` is not `VK_NULL_HANDLE`, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the image

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-00653**
  If `buffer` is not `VK_NULL_HANDLE`, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the buffer

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00654**
  If `image` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation, the memory being imported must also be a dedicated image allocation and `image` must be identical to the image associated with the imported memory

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-00655**
  If `buffer` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation, the memory being imported must also be a dedicated buffer allocation and `buffer` must be identical to the buffer associated with the imported memory
Valid Usage (Implicit)

- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_MEMORY_ALLOCATE_INFO_NV`

- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-parameter
  
  If `image` is not `VK_NULL_HANDLE`, `image` must be a valid `VkImage` handle

- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-parameter
  
  If `buffer` is not `VK_NULL_HANDLE`, `buffer` must be a valid `VkBuffer` handle

- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-commonparent
  
  Both of `buffer` and `image` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

If the `pNext` chain includes a `VkMemoryPriorityAllocateInfoEXT` structure, then that structure includes a priority for the memory.

The `VkMemoryPriorityAllocateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_memory_priority
typedef struct VkMemoryPriorityAllocateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    float priority;
} VkMemoryPriorityAllocateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `priority` is a floating-point value between `0` and `1`, indicating the priority of the allocation relative to other memory allocations. Larger values are higher priority. The granularity of the priorities is implementation-dependent.

Memory allocations with higher priority may be more likely to stay in device-local memory when the system is under memory pressure.

If this structure is not included, it is as if the `priority` value were `0.5`.

Valid Usage

- VUID-VkMemoryPriorityAllocateInfoEXT-priority-02602
  
  `priority` must be between `0` and `1`, inclusive

Valid Usage (Implicit)

- VUID-VkMemoryPriorityAllocateInfoEXT-sType-sType
To modify the priority of an existing memory allocation, call:

```c
void vkSetDeviceMemoryPriorityEXT(
    VkDevice device,
    VkDeviceMemory memory,
    float priority);
```

- `device` is the logical device that owns the memory.
- `memory` is the `VkDeviceMemory` object to which the new priority will be applied.
- `priority` is a floating-point value between 0 and 1, indicating the priority of the allocation relative to other memory allocations. Larger values are higher priority. The granularity of the priorities is implementation-dependent.

Memory allocations with higher priority may be more likely to stay in device-local memory when the system is under memory pressure.

**Valid Usage**

- VUID-vkSetDeviceMemoryPriorityEXT-priority-06258  
  `priority` must be between 0 and 1, inclusive

**Valid Usage (Implicit)**

- VUID-vkSetDeviceMemoryPriorityEXT-device-parameter  
  `device` must be a valid `VkDevice` handle
- VUID-vkSetDeviceMemoryPriorityEXT-memory-parameter  
  `memory` must be a valid `VkDeviceMemory` handle
- VUID-vkSetDeviceMemoryPriorityEXT-memory-parent  
  `memory` must have been created, allocated, or retrieved from `device`

When allocating memory whose payload may be exported to another process or Vulkan instance, add a `VkExportMemoryAllocateInfo` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure, specifying the handle types that may be exported.

The `VkExportMemoryAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExportMemoryAllocateInfo {
    VkStructureType sType;
    const void* pNext;
} VkExportMemoryAllocateInfo;
```
VkExternalMemoryHandleTypeFlags handleTypes;
} VkExportMemoryAllocateInfo;

or the equivalent

// Provided by VK_KHR_external_memory
typedef VkExportMemoryAllocateInfo VkExportMemoryAllocateInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **handleTypes** is zero or a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more memory handle types the application can export from the resulting allocation. The application can request multiple handle types for the same allocation.

### Valid Usage

- VUID-VkExportMemoryAllocateInfo-handleTypes-00656
  The bits in **handleTypes** must be supported and compatible, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`.

### Valid Usage (Implicit)

- VUID-VkExportMemoryAllocateInfo-sType-sType
  **sType** must be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO`.
- VUID-VkExportMemoryAllocateInfo-handleTypes-parameter
  **handleTypes** must be a valid combination of `VkExternalMemoryHandleTypeFlagBits` values.

When allocating memory that may be exported to another process or Vulkan instance, add a `VkExportMemoryAllocateInfoNV` structure to the **pNext** chain of the `VkMemoryAllocateInfo` structure, specifying the handle types that may be exported.

The `VkExportMemoryAllocateInfoNV` structure is defined as:

// Provided by VK_NV_external_memory
typedef struct VkExportMemoryAllocateInfoNV {
    VkStructureType                      sType;
    const void*                          pNext;
    VkExternalMemoryHandleTypeFlagsNV    handleTypes;
} VkExportMemoryAllocateInfoNV;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
• **handleTypes** is a bitmask of `VkExternalMemoryHandleTypeFlagBitsNV` specifying one or more memory handle types that **may** be exported. Multiple handle types **may** be requested for the same allocation as long as they are compatible, as reported by `vkGetPhysicalDeviceExternalImageFormatPropertiesNV`.

### Valid Usage (Implicit)

- **VUID-VkExportMemoryAllocateInfoNV-sType-sType**
sType **must** be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO_NV`
- **VUID-VkExportMemoryAllocateInfoNV-handleTypes-parameter**
  handleTypes **must** be a valid combination of `VkExternalMemoryHandleTypeFlagBitsNV` values

#### 11.2.4. Win32 External Memory

To specify additional attributes of NT handles exported from a memory object, add a `VkExportMemoryWin32HandleInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkExportMemoryWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkExportMemoryWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD dwAccess;
    LPCWSTR name;
} VkExportMemoryWin32HandleInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pAttributes** is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- **dwAccess** is a `DWORD` specifying access rights of the handle.
- **name** is a null-terminated UTF-16 string to associate with the payload referenced by NT handles exported from the created memory.

If `VkExportMemoryAllocateInfo` is not included in the same `pNext` chain, this structure is ignored.

If `VkExportMemoryAllocateInfo` is included in the `pNext` chain of `VkMemoryAllocateInfo` with a Windows `handleType`, but either `VkExportMemoryWin32HandleInfoKHR` is not included in the `pNext` chain, or it is included but `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights used depend on the handle type.
For handles of the following types:

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`

The implementation must ensure the access rights allow read and write access to the memory.

### Valid Usage

- **VUID-VkExportMemoryWin32HandleInfoKHR-handleTypes-00657**
  
  If `VkExportMemoryAllocateInfo::handleTypes` does not include `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, a `VkExportMemoryWin32HandleInfoKHR` structure must not be included in the `pNext` chain of `VkMemoryAllocateInfo`.

### Valid Usage (Implicit)

- **VUID-VkExportMemoryWin32HandleInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_KHR`.

- **VUID-VkExportMemoryWin32HandleInfoKHR-pAttributes-parameter**
  
  If `pAttributes` is not `NULL`, `pAttributes` must be a valid pointer to a valid `SECURITY_ATTRIBUTES` value.

To import memory from a Windows handle, add a `VkImportMemoryWin32HandleInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure.

The `VkImportMemoryWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkImportMemoryWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportMemoryWin32HandleInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.

- **pNext** is `NULL` or a pointer to a structure extending this structure.

- **handleType** is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of `handle` or `name`.

- **handle** is `NULL` or the external handle to import.
Importing memory object payloads from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release handle ownership using the `CloseHandle` system call when the handle is no longer needed. For handle types defined as NT handles, the imported memory object holds a reference to its payload.

**Note**
Non-NT handle import operations do not add a reference to their associated payload. If the original object owning the payload is destroyed, all resources and handles sharing that payload will become invalid.

Applications can import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation must create a distinct `VkDeviceMemory` object.

### Valid Usage

- **VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00658**
  If `handleType` is not 0, it must be supported for import, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`.

- **VUID-VkImportMemoryWin32HandleInfoKHR-handle-00659**
  The memory from which `handle` was exported, or the memory named by `name` must have been created on the same underlying physical device as `device`.

- **VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00660**
  If `handleType` is not 0, it must be defined as an NT handle or a global share handle.

- **VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01439**
  If `handleType` is not `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, `name` must be NULL.

- **VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01440**
  If `handleType` is not 0 and `handle` is NULL, `name` must name a valid memory resource of the type specified by `handleType`.
