Chapter 1. Preamble

Copyright 2014-2022 The Khronos Group Inc.

This Specification is protected by copyright laws and contains material proprietary to Khronos. Except as described by these terms, it or any components may not be reproduced, republished, distributed, transmitted, displayed, broadcast or otherwise exploited in any manner without the express prior written permission of Khronos.

Khronos grants a conditional copyright license to use and reproduce the unmodified Specification for any purpose, without fee or royalty, EXCEPT no licenses to any patent, trademark or other intellectual property rights are granted under these terms. Parties desiring to implement the Specification and make use of Khronos trademarks in relation to that implementation, and receive reciprocal patent license protection under the Khronos IP Policy must become Adopters and confirm the implementation as conformant under the process defined by Khronos for this Specification; see https://www.khronos.org/adopters.

Khronos makes no, and expressly disclaims any, representations or warranties, express or implied, regarding this Specification, including, without limitation: merchantability, fitness for a particular purpose, non-infringement of any intellectual property, correctness, accuracy, completeness, timeliness, and reliability. Under no circumstances will Khronos, or any of its Promoters, Contributors or Members, or their respective partners, officers, directors, employees, agents or representatives be liable for any damages, whether direct, indirect, special or consequential damages for lost revenues, lost profits, or otherwise, arising from or in connection with these materials.

This Specification has been created under the Khronos Intellectual Property Rights Policy, which is Attachment A of the Khronos Group Membership Agreement available at https://www.khronos.org/files/member_agreement.pdf.

This Specification contains substantially unmodified functionality from, and is a successor to, Khronos specifications including OpenGL, OpenGL ES and OpenCL.

The Khronos Intellectual Property Rights defines the terms 'Scope', 'Compliant Portion', and 'Necessary Patent Claims'.

Some parts of this Specification are purely informative and so are EXCLUDED from the Scope of this Specification. The Document Conventions section of the Introduction defines how these parts of the Specification are identified.

Where this Specification uses technical terminology, defined in the Glossary or otherwise, that refer to enabling technologies that are not expressly set forth in this Specification, those enabling technologies are EXCLUDED from the Scope of this Specification. For clarity, enabling technologies not disclosed with particularity in this Specification (e.g. semiconductor manufacturing technology, hardware architecture, processor architecture or microarchitecture, memory architecture, compiler technology, object oriented technology, basic operating system technology, compression technology, algorithms, and so on) are NOT to be considered expressly set forth; only those application program interfaces and data structures disclosed with particularity are included in the Scope of this Specification.
For purposes of the Khronos Intellectual Property Rights Policy as it relates to the definition of Necessary Patent Claims, all recommended or optional features, behaviors and functionality set forth in this Specification, if implemented, are considered to be included as Compliant Portions.

Where this Specification identifies specific sections of external references, only those specifically identified sections define normative functionality. The Khronos Intellectual Property Rights Policy excludes external references to materials and associated enabling technology not created by Khronos from the Scope of this specification, and any licenses that may be required to implement such referenced materials and associated technologies must be obtained separately and may involve royalty payments.

This document contains extensions which are not ratified by Khronos, and as such is not a ratified Specification, though it contains text from (and is a superset of) the ratified Vulkan Specification. The ratified versions of the Vulkan Specification can be found at https://registry.khronos.org/vulkan/specs/1.2/html/vkspec.html (core only) and https://registry.khronos.org/vulkan/specs/1.2-khr-extensions/html/vkspec.html (core with KHR extensions).

Khronos and Vulkan are registered trademarks of The Khronos Group Inc. OpenCL is a trademark of Apple Inc.; and OpenGL and OpenGL ES are registered trademarks of Hewlett Packard Enterprise, all used under license by Khronos. ASTC is a trademark of ARM Holdings PLC. All other product names, trademarks, and/or company names are used solely for identification and belong to their respective owners.
Chapter 2. Introduction

This document, referred to as the “Vulkan Specification” or just the “Specification” hereafter, describes the Vulkan Application Programming Interface (API). Vulkan is a C99 API designed for explicit control of low-level graphics and compute functionality.

The canonical version of the Specification is available in the official Vulkan Registry (https://registry.khronos.org/vulkan/). The source files used to generate the Vulkan specification are stored in the Vulkan Documentation Repository (https://github.com/KhronosGroup/Vulkan-Docs). The source repository additionally has a public issue tracker and allows the submission of pull requests that improve the specification.

2.1. Document Conventions

The Vulkan specification is intended for use by both implementors of the API and application developers seeking to make use of the API, forming a contract between these parties. Specification text may address either party; typically the intended audience can be inferred from context, though some sections are defined to address only one of these parties. (For example, Valid Usage sections only address application developers). Any requirements, prohibitions, recommendations or options defined by normative terminology are imposed only on the audience of that text.

Structure and enumerated types defined in extensions that were promoted to core in a later version of Vulkan are now defined in terms of the equivalent Vulkan core interfaces. This affects the Vulkan Specification, the Vulkan header files, and the corresponding XML Registry.

2.1.1. Informative Language

Some language in the specification is purely informative, intended to give background or suggestions to implementors or developers.

If an entire chapter or section contains only informative language, its title will be suffixed with “(Informative)".

All NOTEs are implicitly informative.

2.1.2. Normative Terminology

Within this specification, the key words must, required, should, recommended, may, and optional are to be interpreted as described in RFC 2119 - Key words for use in RFCs to Indicate Requirement Levels (https://www.ietf.org/rfc/rfc2119.txt). The additional key word optionally is an alternate form of optional, for use where grammatically appropriate.

These key words are highlighted in the specification for clarity. In text addressing application developers, their use expresses requirements that apply to application behavior. In text addressing implementors, their use expresses requirements that apply to implementations.
In text addressing application developers, the additional key words *can* and *cannot* are to be interpreted as describing the capabilities of an application, as follows:

**can**

This word means that the application is able to perform the action described.

**cannot**

This word means that the API and/or the execution environment provide no mechanism through which the application can express or accomplish the action described.

These key words are never used in text addressing implementors.

*Note*

There is an important distinction between *cannot* and *must not*, as used in this Specification. *Cannot* means something the application literally is unable to express or accomplish through the API, while *must not* means something that the application is capable of expressing through the API, but that the consequences of doing so are undefined and potentially unrecoverable for the implementation (see Valid Usage).

Unless otherwise noted in the section heading, all sections and appendices in this document are normative.

### 2.1.3. Technical Terminology

The Vulkan Specification makes use of common engineering and graphics terms such as Pipeline, Shader, and Host to identify and describe Vulkan API constructs and their attributes, states, and behaviors. The Glossary defines the basic meanings of these terms in the context of the Specification. The Specification text provides fuller definitions of the terms and may elaborate, extend, or clarify the Glossary definitions. When a term defined in the Glossary is used in normative language within the Specification, the definitions within the Specification govern and supersede any meanings the terms may have in other technical contexts (i.e. outside the Specification).

### 2.1.4. Normative References

References to external documents are considered normative references if the Specification uses any of the normative terms defined in Normative Terminology to refer to them or their requirements, either as a whole or in part.

The following documents are referenced by normative sections of the specification:

https://registry.khronos.org/spir-v/.

Chapter 3. Fundamentals

This chapter introduces fundamental concepts including the Vulkan architecture and execution model, API syntax, queues, pipeline configurations, numeric representation, state and state queries, and the different types of objects and shaders. It provides a framework for interpreting more specific descriptions of commands and behavior in the remainder of the Specification.

3.1. Host and Device Environment

The Vulkan Specification assumes and requires: the following properties of the host environment with respect to Vulkan implementations:

- The host must have runtime support for 8, 16, 32 and 64-bit signed and unsigned two's-complement integers, all addressable at the granularity of their size in bytes.
- The host must have runtime support for 32- and 64-bit floating-point types satisfying the range and precision constraints in the Floating Point Computation section.
- The representation and endianness of these types on the host must match the representation and endianness of the same types on every physical device supported.

Note
Since a variety of data types and structures in Vulkan may be accessible by both host and physical device operations, the implementation should be able to access such data efficiently in both paths in order to facilitate writing portable and performant applications.

3.2. Execution Model

This section outlines the execution model of a Vulkan system.

Vulkan exposes one or more devices, each of which exposes one or more queues which may process work asynchronously to one another. The set of queues supported by a device is partitioned into families. Each family supports one or more types of functionality and may contain multiple queues with similar characteristics. Queues within a single family are considered compatible with one another, and work produced for a family of queues can be executed on any queue within that family. This specification defines the following types of functionality that queues may support: video decode, video encode, graphics, compute, transfer and sparse memory management.

Note
A single device may report multiple similar queue families rather than, or as well as, reporting multiple members of one or more of those families. This indicates that while members of those families have similar capabilities, they are not directly compatible with one another.

Device memory is explicitly managed by the application. Each device may advertise one or more heaps, representing different areas of memory. Memory heaps are either device-local or host-local,
but are always visible to the device. Further detail about memory heaps is exposed via memory types available on that heap. Examples of memory areas that may be available on an implementation include:

- **device-local** is memory that is physically connected to the device.
- **device-local, host visible** is device-local memory that is visible to the host.
- **host-local, host visible** is memory that is local to the host and visible to the device and host.

On other architectures, there may only be a single heap that can be used for any purpose.

### 3.2.1. Queue Operation

Vulkan queues provide an interface to the execution engines of a device. Commands for these execution engines are recorded into command buffers ahead of execution time, and then submitted to a queue for execution. Once submitted to a queue, command buffers will begin and complete execution without further application intervention, though the order of this execution is dependent on a number of implicit and explicit ordering constraints.

Work is submitted to queues using *queue submission commands* that typically take the form `vkQueue*` (e.g. `vkQueueSubmit`, `vkQueueBindSparse`), and can take a list of semaphores upon which to wait before work begins and a list of semaphores to signal once work has completed. The work itself, as well as signaling and waiting on the semaphores are all *queue operations*. Queue submission commands return control to the application once queue operations have been submitted - they do not wait for completion.

There are no implicit ordering constraints between queue operations on different queues, or between queues and the host, so these may operate in any order with respect to each other. Explicit ordering constraints between different queues or with the host can be expressed with semaphores and fences.

Command buffer submissions to a single queue respect *submission order* and other implicit ordering guarantees, but otherwise may overlap or execute out of order. Other types of batches and queue submissions against a single queue (e.g. sparse memory binding) have no implicit ordering constraints with any other queue submission or batch. Additional explicit ordering constraints between queue submissions and individual batches can be expressed with semaphores and fences.

Before a fence or semaphore is signaled, it is guaranteed that any previously submitted queue operations have completed execution, and that memory writes from those queue operations are available to future queue operations. Waiting on a signaled semaphore or fence guarantees that previous writes that are available are also visible to subsequent commands.

Command buffer boundaries, both between primary command buffers of the same or different batches or submissions as well as between primary and secondary command buffers, do not introduce any additional ordering constraints. In other words, submitting the set of command buffers (which can include executing secondary command buffers) between any semaphore or fence operations execute the recorded commands as if they had all been recorded into a single primary command buffer, except that the current state is reset on each boundary. Explicit ordering constraints can be expressed with explicit synchronization primitives.
There are a few implicit ordering guarantees between commands within a command buffer, but only covering a subset of execution. Additional explicit ordering constraints can be expressed with the various explicit synchronization primitives.

Note
Implementations have significant freedom to overlap execution of work submitted to a queue, and this is common due to deep pipelining and parallelism in Vulkan devices.

Commands recorded in command buffers can perform actions, set state that persists across commands, synchronize other commands, or indirectly launch other commands, with some commands fulfilling several of these roles. The “Command Properties” section for each such command lists which of these roles the command takes. State setting commands update the current state of the command buffer. Some commands that perform actions (e.g. draw/dispatch) do so based on the current state set cumulatively since the start of the command buffer. The work involved in performing action commands is often allowed to overlap or to be reordered, but doing so must not alter the state to be used by each action command. In general, action commands are those commands that alter framebuffer attachments, read/write buffer or image memory, or write to query pools.

Synchronization commands introduce explicit execution and memory dependencies between two sets of action commands, where the second set of commands depends on the first set of commands. These dependencies enforce both that the execution of certain pipeline stages in the later set occurs after the execution of certain stages in the source set, and that the effects of memory accesses performed by certain pipeline stages occur in order and are visible to each other. When not enforced by an explicit dependency or implicit ordering guarantees, action commands may overlap execution or execute out of order, and may not see the side effects of each other’s memory accesses.

3.3. Object Model

The devices, queues, and other entities in Vulkan are represented by Vulkan objects. At the API level, all objects are referred to by handles. There are two classes of handles, dispatchable and non-dispatchable. Dispatchable handle types are a pointer to an opaque type. This pointer may be used by layers as part of intercepting API commands, and thus each API command takes a dispatchable type as its first parameter. Each object of a dispatchable type must have a unique handle value during its lifetime.

Non-dispatchable handle types are a 64-bit integer type whose meaning is implementation-dependent. If the privateData feature is enabled for a VkDevice, each object of a non-dispatchable type created on that device must have a handle value that is unique among objects created on that device, for the duration of the object’s lifetime. Otherwise, non-dispatchable handles may encode object information directly in the handle rather than acting as a reference to an underlying object, and thus may not have unique handle values. If handle values are not unique, then destroying one such handle must not cause identical handles of other types to become invalid, and must not cause identical handles of the same type to become invalid if that handle value has been created more times than it has been destroyed.
All objects created or allocated from a `VkDevice` (i.e. with a `VkDevice` as the first parameter) are private to that device, and **must** not be used on other devices.

### 3.3.1. Object Lifetime

Objects are created or allocated by `vkCreate*` and `vkAllocate*` commands, respectively. Once an object is created or allocated, its “structure” is considered to be immutable, though the contents of certain object types is still free to change. Objects are destroyed or freed by `vkDestroy*` and `vkFree*` commands, respectively.

Objects that are allocated (rather than created) take resources from an existing pool object or memory heap, and when freed return resources to that pool or heap. While object creation and destruction are generally expected to be low-frequency occurrences during runtime, allocating and freeing objects **can** occur at high frequency. Pool objects help accommodate improved performance of the allocations and frees.

It is an application’s responsibility to track the lifetime of Vulkan objects, and not to destroy them while they are still in use.

The ownership of application-owned memory is immediately acquired by any Vulkan command it is passed into. Ownership of such memory **must** be released back to the application at the end of the duration of the command, so that the application **can** alter or free this memory as soon as all the commands that acquired it have returned.

The following object types are consumed when they are passed into a Vulkan command and not further accessed by the objects they are used to create. They **must** not be destroyed in the duration of any API command they are passed into:

- `VkShaderModule`
- `VkPipelineCache`
- `VkValidationCacheEXT`

A `VkRenderPass` or `VkPipelineLayout` object passed as a parameter to create another object is not further accessed by that object after the duration of the command it is passed into. A `VkRenderPass` used in a command buffer follows the rules described below.

`VkDescriptorSetLayout` objects **may** be accessed by commands that operate on descriptor sets allocated using that layout, and those descriptor sets **must** not be updated with `vkUpdateDescriptorSets` after the descriptor set layout has been destroyed. Otherwise, a `VkDescriptorSetLayout` object passed as a parameter to create another object is not further accessed by that object after the duration of the command it is passed into.

The application **must** not destroy any other type of Vulkan object until all uses of that object by the device (such as via command buffer execution) have completed.

The following Vulkan objects **must** not be destroyed while any command buffers using the object are in the **pending state**:

- `VkEvent`
• VkQueryPool
• VkBuffer
• VkBufferView
• VkImage
• VkImageView
• VkPipeline
• VkSampler
• VkSamplerYcbcrConversion
• VkDescriptorPool
• VkFramebuffer
• VkRenderPass
• VkCommandBuffer
• VkCommandPool
• VkDeviceMemory
• VkSampler
• VkIndirectCommandsLayoutNV
• VkAccelerationStructureNV
• VkAccelerationStructureKHR

Destroying these objects will move any command buffers that are in the **recording or executable state**, and are using those objects, to the **invalid state**.

The following Vulkan objects **must** not be destroyed while any queue is executing commands that use the object:

• VkFence
• VkSemaphore
• VkCommandBuffer
• VkCommandPool

In general, objects **can** be destroyed or freed in any order, even if the object being freed is involved in the use of another object (e.g. use of a resource in a view, use of a view in a descriptor set, use of a pipeline library in another pipeline, use of a referenced pipeline for additional graphics shader groups in another pipeline, use of a **bottom level acceleration structure** in an instance referenced by a **top level acceleration structure**, use of an object in a command buffer, binding of a memory allocation to a resource), as long as any object that uses the freed object is not further used in any way except to be destroyed or to be reset in such a way that it no longer uses the other object (such as resetting a command buffer). If the object has been reset, then it **can** be used as if it never used the freed object. An exception to this is when there is a parent/child relationship between objects. In this case, the application **must** not destroy a parent object before its children, except when the parent is explicitly defined to free its children when it is destroyed (e.g. for pool objects, as defined
VkCommandPool objects are parents of VkCommandBuffer objects. VkDescriptorPool objects are parents of VkDescriptorSet objects. VkDevice objects are parents of many object types (all that take a VkDevice as a parameter to their creation).

The following Vulkan objects have specific restrictions for when they can be destroyed:

- **VkQueue** objects cannot be explicitly destroyed. Instead, they are implicitly destroyed when the VkDevice object they are retrieved from is destroyed.
- Destroying a pool object implicitly frees all objects allocated from that pool. Specifically, destroying VkCommandPool frees all VkCommandBuffer objects that were allocated from it, and destroying VkDescriptorPool frees all VkDescriptorSet objects that were allocated from it.
- **VkDevice** objects can be destroyed when all VkQueue objects retrieved from them are idle, and all objects created from them have been destroyed. This includes the following objects:
  - VkFence
  - VkSemaphore
  - VkEvent
  - VkQueryPool
  - VkBuffer
  - VkBufferView
  - VkImage
  - VkImageView
  - VkShaderModule
  - VkPipelineCache
  - VkPipeline
  - VkPipelineLayout
  - VkSampler
  - VkSamplerYcbcrConversion
  - VkDescriptorSetLayout
  - VkDescriptorPool
  - VkFramebuffer
  - VkRenderPass
  - VkCommandPool
  - VkCommandBuffer
  - VkDeviceMemory
  - VkValidationCacheEXT
  - VkAccelerationStructureNV
• **VkAccelerationStructureKHR**

• **VkPhysicalDevice** objects **cannot** be explicitly destroyed. Instead, they are implicitly destroyed when the **VkInstance** object they are retrieved from is destroyed.

• **VkInstance** objects **can** be destroyed once all **VkDevice** objects created from any of its **VkPhysicalDevice** objects have been destroyed.

### 3.3.2. External Object Handles

As defined above, the scope of object handles created or allocated from a **VkDevice** is limited to that logical device. Objects which are not in scope are said to be external. To bring an external object into scope, an external handle **must** be exported from the object in the source scope and imported into the destination scope.

**Note**
The scope of external handles and their associated resources **may** vary according to their type, but they **can** generally be shared across process and API boundaries.

### 3.4. Application Binary Interface

The mechanism by which Vulkan is made available to applications is platform- or implementation-defined. On many platforms the C interface described in this Specification is provided by a shared library. Since shared libraries can be changed independently of the applications that use them, they present particular compatibility challenges, and this Specification places some requirements on them.

Shared library implementations **must** use the default Application Binary Interface (ABI) of the standard C compiler for the platform, or provide customized API headers that cause application code to use the implementation’s non-default ABI. An ABI in this context means the size, alignment, and layout of C data types; the procedure calling convention; and the naming convention for shared library symbols corresponding to C functions. Customizing the calling convention for a platform is usually accomplished by defining **calling convention macros** appropriately in **vk_platform.h**.

On platforms where Vulkan is provided as a shared library, library symbols beginning with “vk” and followed by a digit or uppercase letter are reserved for use by the implementation. Applications which use Vulkan **must** not provide definitions of these symbols. This allows the Vulkan shared library to be updated with additional symbols for new API versions or extensions without causing symbol conflicts with existing applications.

Shared library implementations **should** provide library symbols for commands in the highest version of this Specification they support, and for **Window System Integration** extensions relevant to the platform. They **may** also provide library symbols for commands defined by additional extensions.

**Note**
These requirements and recommendations are intended to allow implementors to take advantage of platform-specific conventions for SDKs, ABIs, library versioning mechanisms, etc. while still minimizing the code changes necessary to port
Applications or libraries between platforms. Platform vendors, or providers of the de facto standard Vulkan shared library for a platform, are encouraged to document what symbols the shared library provides and how it will be versioned when new symbols are added.

Applications should only rely on shared library symbols for commands in the minimum core version required by the application. vkGetInstanceProcAddr and vkGetDeviceProcAddr should be used to obtain function pointers for commands in core versions beyond the application’s minimum required version.

3.5. Command Syntax and Duration

The Specification describes Vulkan commands as functions or procedures using C99 syntax. Language bindings for other languages such as C++ and JavaScript may allow for stricter parameter passing, or object-oriented interfaces.

Vulkan uses the standard C types for the base type of scalar parameters (e.g. types from `<stdint.h>`), with exceptions described below, or elsewhere in the text when appropriate:

VkBool32 represents boolean True and False values, since C does not have a sufficiently portable built-in boolean type:

```
// Provided by VK_VERSION_1_0
typedef uint32_t VkBool32;
```

VK_TRUE represents a boolean True (unsigned integer 1) value, and VK_FALSE a boolean False (unsigned integer 0) value.

All values returned from a Vulkan implementation in a VkBool32 will be either VK_TRUE or VK_FALSE.

Applications must not pass any other values than VK_TRUE or VK_FALSE into a Vulkan implementation where a VkBool32 is expected.

VK_TRUE is a constant representing a VkBool32 True value.

```
#define VK_TRUE                           1U
```

VK_FALSE is a constant representing a VkBool32 False value.

```
#define VK_FALSE                          0U
```

VkDeviceSize represents device memory size and offset values:

```
// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceSize;
```
VkDeviceAddress represents device buffer address values:

```c
// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceAddress;
```

Commands that create Vulkan objects are of the form `vkCreate*` and take `Vk*CreateInfo` structures with the parameters needed to create the object. These Vulkan objects are destroyed with commands of the form `vkDestroy*`.

The last in-parameter to each command that creates or destroys a Vulkan object is `pAllocator`. The `pAllocator` parameter can be set to a non-NULL value such that allocations for the given object are delegated to an application provided callback; refer to the Memory Allocation chapter for further details.

Commands that allocate Vulkan objects owned by pool objects are of the form `vkAllocate*`, and take `Vk*AllocateInfo` structures. These Vulkan objects are freed with commands of the form `vkFree*`. These objects do not take allocators; if host memory is needed, they will use the allocator that was specified when their parent pool was created.

Commands are recorded into a command buffer by calling API commands of the form `vkCmd*`. Each such command may have different restrictions on where it can be used: in a primary and/or secondary command buffer, inside and/or outside a render pass, and in one or more of the supported queue types. These restrictions are documented together with the definition of each such command.

The duration of a Vulkan command refers to the interval between calling the command and its return to the caller.

### 3.5.1. Lifetime of Retrieved Results

Information is retrieved from the implementation with commands of the form `vkGet*` and `vkEnumerate*`.

Unless otherwise specified for an individual command, the results are invariant; that is, they will remain unchanged when retrieved again by calling the same command with the same parameters, so long as those parameters themselves all remain valid.

### 3.6. Threading Behavior

Vulkan is intended to provide scalable performance when used on multiple host threads. All commands support being called concurrently from multiple threads, but certain parameters, or components of parameters are defined to be externally synchronized. This means that the caller must guarantee that no more than one thread is using such a parameter at a given time.

More precisely, Vulkan commands use simple stores to update the state of Vulkan objects. A parameter declared as externally synchronized may have its contents updated at any time during the host execution of the command. If two commands operate on the same object and at least one of the commands declares the object to be externally synchronized, then the caller must guarantee
not only that the commands do not execute simultaneously, but also that the two commands are separated by an appropriate memory barrier (if needed).

**Note**
Memory barriers are particularly relevant for hosts based on the ARM CPU architecture, which is more weakly ordered than many developers are accustomed to from x86/x64 programming. Fortunately, most higher-level synchronization primitives (like the pthread library) perform memory barriers as a part of mutual exclusion, so mutexing Vulkan objects via these primitives will have the desired effect.

Similarly the application **must** avoid any potential data hazard of application-owned memory that has its ownership temporarily acquired by a Vulkan command. While the ownership of application-owned memory remains acquired by a command the implementation may read the memory at any point, and it may write non-\texttt{const} qualified memory at any point. Parameters referring to non-\texttt{const} qualified application-owned memory are not marked explicitly as \textit{externally synchronized} in the Specification.

If an application is using **deferred host operations** in a command, and that operation is successfully deferred, object parameters and application-owned memory passed to that command may be accessed at any time until the deferred operation is complete.

Many object types are \textit{immutable}, meaning the objects cannot change once they have been created. These types of objects never need external synchronization, except that they must not be destroyed while they are in use on another thread. In certain special cases mutable object parameters are internally synchronized, making external synchronization unnecessary. Any command parameters that are not labeled as externally synchronized are either not mutated by the command or are internally synchronized. Additionally, certain objects related to a command’s parameters (e.g. command pools and descriptor pools) may be affected by a command, and must also be externally synchronized. These implicit parameters are documented as described below.

Parameters of commands that are externally synchronized are listed below.

**Externally Synchronized Parameters**

- The \texttt{instance} parameter in \texttt{vkDestroyInstance}
- The \texttt{device} parameter in \texttt{vkDestroyDevice}
- The \texttt{queue} parameter in \texttt{vkQueueSubmit}
- The \texttt{fence} parameter in \texttt{vkQueueSubmit}
- The \texttt{queue} parameter in \texttt{vkQueueWaitIdle}
- The \texttt{memory} parameter in \texttt{vkFreeMemory}
- The \texttt{memory} parameter in \texttt{vkMapMemory}
- The \texttt{memory} parameter in \texttt{vkUnmapMemory}
- The \texttt{buffer} parameter in \texttt{vkBindBufferMemory}
• The `image` parameter in `vkBindImageMemory`
• The `queue` parameter in `vkQueueBindSparse`
• The `fence` parameter in `vkQueueBindSparse`
• The `fence` parameter in `vkDestroyFence`
• The `semaphore` parameter in `vkDestroySemaphore`
• The `event` parameter in `vkDestroyEvent`
• The `event` parameter in `vkSetEvent`
• The `event` parameter in `vkResetEvent`
• The `queryPool` parameter in `vkDestroyQueryPool`
• The `buffer` parameter in `vkDestroyBuffer`
• The `bufferView` parameter in `vkDestroyBufferView`
• The `image` parameter in `vkDestroyImage`
• The `imageView` parameter in `vkDestroyImageView`
• The `shaderModule` parameter in `vkDestroyShaderModule`
• The `pipelineCache` parameter in `vkDestroyPipelineCache`
• The `dstCache` parameter in `vkMergePipelineCaches`
• The `pipeline` parameter in `vkDestroyPipeline`
• The `pipelineLayout` parameter in `vkDestroyPipelineLayout`
• The `sampler` parameter in `vkDestroySampler`
• The `descriptorSetLayout` parameter in `vkDestroyDescriptorSetLayout`
• The `descriptorPool` parameter in `vkDestroyDescriptorPool`
• The `descriptorPool` parameter in `vkResetDescriptorPool`
• The `descriptorPool` member of the `pAllocateInfo` parameter in `vkAllocateDescriptorSets`
• The `descriptorPool` parameter in `vkFreeDescriptorSets`
• The `framebuffer` parameter in `vkDestroyFramebuffer`
• The `renderPass` parameter in `vkDestroyRenderPass`
• The `commandPool` parameter in `vkDestroyCommandPool`
• The `commandPool` parameter in `vkResetCommandPool`
• The `commandPool` member of the `pAllocateInfo` parameter in `vkAllocateCommandBuffers`
• The `commandPool` parameter in `vkFreeCommandBuffers`
• The `commandBuffer` parameter in `vkBeginCommandBuffer`
• The `commandBuffer` parameter in `vkEndCommandBuffer`
• The `commandBuffer` parameter in `vkResetCommandBuffer`
• The `commandBuffer` parameter in `vkCmdBindPipeline`
• The `commandBuffer` parameter in `vkCmdSetViewport`
- The `commandBuffer` parameter in `vkCmdSetScissor`
- The `commandBuffer` parameter in `vkCmdSetLineWidth`
- The `commandBuffer` parameter in `vkCmdSetDepthBias`
- The `commandBuffer` parameter in `vkCmdSetBlendConstants`
- The `commandBuffer` parameter in `vkCmdSetDepthBounds`
- The `commandBuffer` parameter in `vkCmdSetStencilCompareMask`
- The `commandBuffer` parameter in `vkCmdSetStencilWriteMask`
- The `commandBuffer` parameter in `vkCmdSetStencilReference`
- The `commandBuffer` parameter in `vkCmdBindDescriptorSets`
- The `commandBuffer` parameter in `vkCmdBindIndexBuffer`
- The `commandBuffer` parameter in `vkCmdBindVertexBuffer`
- The `commandBuffer` parameter in `vkCmdDraw`
- The `commandBuffer` parameter in `vkCmdDrawIndexed`
- The `commandBuffer` parameter in `vkCmdDrawIndirect`
- The `commandBuffer` parameter in `vkCmdDrawIndexedIndirect`
- The `commandBuffer` parameter in `vkCmdDispatch`
- The `commandBuffer` parameter in `vkCmdDispatchIndirect`
- The `commandBuffer` parameter in `vkCmdCopyBuffer`
- The `commandBuffer` parameter in `vkCmdCopyImage`
- The `commandBuffer` parameter in `vkCmdBlitImage`
- The `commandBuffer` parameter in `vkCmdCopyBufferToImage`
- The `commandBuffer` parameter in `vkCmdCopyImageToBuffer`
- The `commandBuffer` parameter in `vkCmdUpdateBuffer`
- The `commandBuffer` parameter in `vkCmdFillBuffer`
- The `commandBuffer` parameter in `vkCmdClearColorImage`
- The `commandBuffer` parameter in `vkCmdClearDepthStencilImage`
- The `commandBuffer` parameter in `vkCmdClearAttachments`
- The `commandBuffer` parameter in `vkCmdResolveImage`
- The `commandBuffer` parameter in `vkCmdSetEvent`
- The `commandBuffer` parameter in `vkCmdResetEvent`
- The `commandBuffer` parameter in `vkCmdWaitEvents`
- The `commandBuffer` parameter in `vkCmdPipelineBarrier`
- The `commandBuffer` parameter in `vkCmdBeginQuery`
- The `commandBuffer` parameter in `vkCmdEndQuery`
- The `commandBuffer` parameter in `vkCmdResetQueryPool`
• The commandBuffer parameter in vkCmdWriteTimestamp
• The commandBuffer parameter in vkCmdCopyQueryPoolResults
• The commandBuffer parameter in vkCmdPushConstants
• The commandBuffer parameter in vkCmdBeginRenderPass
• The commandBuffer parameter in vkCmdNextSubpass
• The commandBuffer parameter in vkCmdEndRenderPass
• The commandBuffer parameter in vkCmdExecuteCommands
• The commandBuffer parameter in vkCmdSetDeviceMask
• The commandBuffer parameter in vkCmdDispatchBase
• The commandPool parameter in vkTrimCommandPool
• The ycbcrConversion parameter in vkDestroySamplerYcbcrConversion
• The descriptorUpdateTemplate parameter in vkDestroyDescriptorUpdateTemplate
• The commandBuffer parameter in vkCmdDrawIndirectCount
• The commandBuffer parameter in vkCmdDrawIndexedIndirectCount
• The commandBuffer parameter in vkCmdBeginRenderPass2
• The commandBuffer parameter in vkCmdNextSubpass2
• The commandBuffer parameter in vkCmdEndRenderPass2
• The privateDataSlot parameter in vkDestroyPrivateDataSlot
• The commandBuffer parameter in vkCmdSetEvent2
• The commandBuffer parameter in vkCmdResetEvent2
• The commandBuffer parameter in vkCmdWaitEvents2
• The commandBuffer parameter in vkCmdPipelineBarrier2
• The commandBuffer parameter in vkCmdWriteTimestamp2
• The queue parameter in vkQueueSubmit2
• The fence parameter in vkQueueSubmit2
• The commandBuffer parameter in vkCmdCopyBuffer2
• The commandBuffer parameter in vkCmdCopyImage2
• The commandBuffer parameter in vkCmdCopyBufferToImage2
• The commandBuffer parameter in vkCmdCopyImageToBuffer2
• The commandBuffer parameter in vkCmdBlitImage2
• The commandBuffer parameter in vkCmdResolveImage2
• The commandBuffer parameter in vkCmdBeginRendering
• The commandBuffer parameter in vkCmdEndRendering
• The commandBuffer parameter in vkCmdSetCullMode
• The commandBuffer parameter in vkCmdSetFrontFace
• The `commandBuffer` parameter in `vkCmdSetPrimitiveTopology`
• The `commandBuffer` parameter in `vkCmdSetViewportWithCount`
• The `commandBuffer` parameter in `vkCmdSetScissorWithCount`
• The `commandBuffer` parameter in `vkCmdBindVertexBuffers2`
• The `commandBuffer` parameter in `vkCmdSetDepthTestEnable`
• The `commandBuffer` parameter in `vkCmdSetDepthWriteEnable`
• The `commandBuffer` parameter in `vkCmdSetDepthCompareOp`
• The `commandBuffer` parameter in `vkCmdSetDepthBoundsTestEnable`
• The `commandBuffer` parameter in `vkCmdSetStencilTestEnable`
• The `commandBuffer` parameter in `vkCmdSetStencilOp`
• The `commandBuffer` parameter in `vkCmdSetRasterizerDiscardEnable`
• The `commandBuffer` parameter in `vkCmdSetDepthBiasEnable`
• The `commandBuffer` parameter in `vkCmdSetPrimitiveRestartEnable`
• The `surface` parameter in `vkDestroySurfaceKHR`
• The `surface` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`
• The `oldSwapchain` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`
• The `swapchain` parameter in `vkDestroySwapchainKHR`
• The `swapchain` parameter in `vkAcquireNextImageKHR`
• The `semaphore` parameter in `vkAcquireNextImageKHR`
• The `fence` parameter in `vkAcquireNextImageKHR`
• The `queue` parameter in `vkQueuePresentKHR`
• The `surface` parameter in `vkGetDeviceGroupSurfacePresentModesKHR`
• The `surface` parameter in `vkGetPhysicalDevicePresentRectanglesKHR`

• The `commandBuffer` parameter in `vkCmdDrawMeshTasksIndirectCountEXT`

For `VkPipelineCache` objects created with flags containing `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, the above table is extended with the `pipelineCache` parameter to `vkCreate*Pipelines` being externally synchronized.

There are also a few instances where a command can take in a user allocated list whose contents are externally synchronized parameters. In these cases, the caller must guarantee that at most one thread is using a given element within the list at a given time. These parameters are listed below.

## Externally Synchronized Parameter Lists

• Each element of the `pFences` parameter in `vkResetFences`
• Each element of the `pDescriptorSets` parameter in `vkFreeDescriptorSets`
• Each element of the `pCommandBuffers` parameter in `vkFreeCommandBuffers`
• Each element of the `pWaitSemaphores` member of the `pPresentInfo` parameter in `vkQueuePresentKHR`
• Each element of the `pSwapchains` member of the `pPresentInfo` parameter in `vkQueuePresentKHR`
• The `surface` member of each element of the `pCreateInfos` parameter in `vkCreateSharedSwapchainsKHR`
• The `oldSwapchain` member of each element of the `pCreateInfos` parameter in `vkCreateSharedSwapchainsKHR`

In addition, there are some implicit parameters that need to be externally synchronized. For example, when a `commandBuffer` parameter needs to be externally synchronized, it implies that the `commandPool` from which that command buffer was allocated also needs to be externally synchronized. The implicit parameters and their associated object are listed below.

**Implicit Externally Synchronized Parameters**

- All `VkPhysicalDevice` objects enumerated from `instance` in `vkDestroyInstance`
- All `VkQueue` objects created from `device` in `vkDestroyDevice`
- All `VkQueue` objects created from `device` in `vkDeviceWaitIdle`
- Any `VkDescriptorSet` objects allocated from `descriptorPool` in `vkResetDescriptorPool`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkBeginCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkEndCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkResetCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindPipeline`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetViewport`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetScissor`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetLineWidth`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBias`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetBlendConstants`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBounds`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilCompareMask`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilWriteMask`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilReference`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindDescriptorSets`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindIndexBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindVertexBuffers`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDraw`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexed`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndirect`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatch`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatchIndirect`
• The VkCommandPool that commandBuffer was allocated from, in vkCmdCopyBuffer
• The VkCommandPool that commandBuffer was allocated from, in vkCmdCopyImage
• The VkCommandPool that commandBuffer was allocated from, in vkCmdBlitImage
• The VkCommandPool that commandBuffer was allocated from, in vkCmdCopyBufferToImage
• The VkCommandPool that commandBuffer was allocated from, in vkCmdCopyImageToBuffer
• The VkCommandPool that commandBuffer was allocated from, in vkCmdUpdateBuffer
• The VkCommandPool that commandBuffer was allocated from, in vkCmdFillBuffer
• The VkCommandPool that commandBuffer was allocated from, in vkCmdClearColorImage
• The VkCommandPool that commandBuffer was allocated from, in vkCmdClearDepthStencilImage
• The VkCommandPool that commandBuffer was allocated from, in vkCmdClearAttachments
• The VkCommandPool that commandBuffer was allocated from, in vkCmdResolveImage
• The VkCommandPool that commandBuffer was allocated from, in vkCmdSetEvent
• The VkCommandPool that commandBuffer was allocated from, in vkCmdResetEvent
• The VkCommandPool that commandBuffer was allocated from, in vkCmdWaitEvents
• The VkCommandPool that commandBuffer was allocated from, in vkCmdPipelineBarrier
• The VkCommandPool that commandBuffer was allocated from, in vkCmdBeginQuery
• The VkCommandPool that commandBuffer was allocated from, in vkCmdEndQuery
• The VkCommandPool that commandBuffer was allocated from, in vkCmdResetQueryPool
• The VkCommandPool that commandBuffer was allocated from, in vkCmdWriteQueryPoolResults
• The VkCommandPool that commandBuffer was allocated from, in vkCmdBeginRenderPass
• The VkCommandPool that commandBuffer was allocated from, in vkCmdNextSubpass
• The VkCommandPool that commandBuffer was allocated from, in vkCmdEndRenderPass
• The VkCommandPool that commandBuffer was allocated from, in vkCmdExecuteCommands
• The VkCommandPool that commandBuffer was allocated from, in vkCmdSetDeviceMask
• The VkCommandPool that commandBuffer was allocated from, in vkCmdDispatchBase
• The VkCommandPool that commandBuffer was allocated from, in vkCmdDrawIndirectCount
• The VkCommandPool that commandBuffer was allocated from, in vkCmdDrawIndexedIndirectCount
• The VkCommandPool that commandBuffer was allocated from, in vkCmdBeginRenderPass2
• The VkCommandPool that commandBuffer was allocated from, in vkCmdNextSubpass2
• The VkCommandPool that commandBuffer was allocated from, in vkCmdEndRenderPass2
• The VkCommandPool that commandBuffer was allocated from, in vkCmdSetEvent2

3.7. Valid Usage

Valid usage defines a set of conditions which must be met in order to achieve well-defined runtime behavior in an application. These conditions depend only on Vulkan state, and the parameters or objects whose usage is constrained by the condition.

The core layer assumes applications are using the API correctly. Except as documented elsewhere in the Specification, the behavior of the core layer to an application using the API incorrectly is undefined, and may include program termination. However, implementations must ensure that incorrect usage by an application does not affect the integrity of the operating system, the Vulkan implementation, or other Vulkan client applications in the system. In particular, any guarantees made by an operating system about whether memory from one process can be visible to another process or not must not be violated by a Vulkan implementation for any memory allocation. Vulkan implementations are not required to make additional security or integrity guarantees beyond those provided by the OS unless explicitly directed by the application's use of a particular feature or extension.

Note

For instance, if an operating system guarantees that data in all its memory allocations are set to zero when newly allocated, the Vulkan implementation must make the same guarantees for any allocations it controls (e.g. VkDeviceMemory).

Similarly, if an operating system guarantees that use-after-free of host allocations will not result in values written by another process becoming visible, the same guarantees must be made by the Vulkan implementation for device memory.

If the protectedMemory feature is supported, the implementation provides additional guarantees when invalid usage occurs to prevent values in protected memory from being accessed or inferred outside of protected operations, as described in Protected Memory Access Rules.

Some valid usage conditions have dependencies on runtime limits or feature availability. It is possible to validate these conditions against Vulkan's minimum supported values for these limits and features, or some subset of other known values.

Valid usage conditions do not cover conditions where well-defined behavior (including returning an error code) exists.

Valid usage conditions should apply to the command or structure where complete information about the condition would be known during execution of an application. This is such that a validation layer or linter can be written directly against these statements at the point they are specified.

Note

This does lead to some non-obvious places for valid usage statements. For instance, the valid values for a structure might depend on a separate value in the calling command. In this case, the structure itself will not reference this valid usage as it is impossible to determine validity from the structure that it is invalid - instead this valid usage would be attached to the calling command.
Another example is draw state - the state setters are independent, and can cause a legitimately invalid state configuration between draw calls; so the valid usage statements are attached to the place where all state needs to be valid - at the drawing command.

Valid usage conditions are described in a block labelled “Valid Usage” following each command or structure they apply to.

3.7.1. Usage Validation

Vulkan is a layered API. The lowest layer is the core Vulkan layer, as defined by this Specification. The application can use additional layers above the core for debugging, validation, and other purposes.

One of the core principles of Vulkan is that building and submitting command buffers should be highly efficient. Thus error checking and validation of state in the core layer is minimal, although more rigorous validation can be enabled through the use of layers.

Validation of correct API usage is left to validation layers. Applications should be developed with validation layers enabled, to help catch and eliminate errors. Once validated, released applications should not enable validation layers by default.

3.7.2. Implicit Valid Usage

Some valid usage conditions apply to all commands and structures in the API, unless explicitly denoted otherwise for a specific command or structure. These conditions are considered implicit, and are described in a block labelled “Valid Usage (Implicit)” following each command or structure they apply to. Implicit valid usage conditions are described in detail below.

Valid Usage for Object Handles

Any input parameter to a command that is an object handle must be a valid object handle, unless otherwise specified. An object handle is valid if:

- It has been created or allocated by a previous, successful call to the API. Such calls are noted in the Specification.
- It has not been deleted or freed by a previous call to the API. Such calls are noted in the Specification.
- Any objects used by that object, either as part of creation or execution, must also be valid.

The reserved values VK_NULL_HANDLE and NULL can be used in place of valid non-dispatchable handles and dispatchable handles, respectively, when explicitly called out in the Specification. Any command that creates an object successfully must not return these values. It is valid to pass these values to vkDestroy* or vkFree* commands, which will silently ignore these values.

Valid Usage for Pointers

Any parameter that is a pointer must be a valid pointer only if it is explicitly called out by a Valid Usage statement.
A pointer is “valid” if it points at memory containing values of the number and type(s) expected by
the command, and all fundamental types accessed through the pointer (e.g. as elements of an array
or as members of a structure) satisfy the alignment requirements of the host processor.

Valid Usage for Strings

Any parameter that is a pointer to char must be a finite sequence of values terminated by a null
character, or if explicitly called out in the Specification, can be NULL.

Valid Usage for Enumerated Types

Any parameter of an enumerated type must be a valid enumerant for that type. A enumerant is
valid if:

- The enumerant is defined as part of the enumerated type.
- The enumerant is not the special value (suffixed with \_MAX\_ENUM) defined for the enumerated
type.

This special value exists only to ensure that C enum types are 32 bits in size. It is not part of the
API, and should not be used by applications.

Any enumerated type returned from a query command or otherwise output from Vulkan to the
application must not have a reserved value. Reserved values are values not defined by any
extension for that enumerated type.

Note
This language is intended to accommodate cases such as “hidden” extensions
known only to driver internals, or layers enabling extensions without knowledge
of the application, without allowing return of values not defined by any extension.

Note
Application developers are encouraged to be careful when using switch statements
with Vulkan API enums. This is because new extensions can add new values to
existing enums. Using a default: statement within a switch may avoid future
compilation issues.

This is particularly true for enums such as VkDriverId, which may have values
added that do not belong to a corresponding new extension.

Valid Usage for Flags

A collection of flags is represented by a bitmask using the type VkFlags:

```
// Provided by VK_VERSION_1_0
typedef uint32_t VkFlags;
```
Bitmasks are passed to many commands and structures to compactly represent options, but \texttt{VkFlags} is not used directly in the API. Instead, a \texttt{Vk*Flags} type which is an alias of \texttt{VkFlags}, and whose name matches the corresponding \texttt{Vk*FlagBits} that are valid for that type, is used.

Any \texttt{Vk*Flags} member or parameter used in the API as an input \textbf{must} be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags. A bit flag is valid if:

- The bit flag is defined as part of the \texttt{Vk*FlagBits} type, where the bits type is obtained by taking the flag type and replacing the trailing \texttt{Flags} with \texttt{FlagBits}. For example, a flag value of type \texttt{VkColorComponentFlags} \textbf{must} contain only bit flags defined by \texttt{VkColorComponentFlagBits}.
- The flag is allowed in the context in which it is being used. For example, in some cases, certain bit flags or combinations of bit flags are mutually exclusive.

Any \texttt{Vk*Flags} member or parameter returned from a query command or otherwise output from Vulkan to the application \textbf{may} contain bit flags undefined in its corresponding \texttt{Vk*FlagBits} type. An application \textbf{cannot} rely on the state of these unspecified bits.

Only the low-order 31 bits (bit positions zero through 30) are available for use as flag bits.

\begin{itemize}
  \item This restriction is due to poorly defined behavior by C compilers given a C enumerant value of \texttt{0x80000000}. In some cases adding this enumerant value may increase the size of the underlying \texttt{Vk*FlagBits} type, breaking the ABI.
\end{itemize}

A collection of 64-bit flags is represented by a bitmask using the type \texttt{VkFlags64}:

\begin{verbatim}
// Provided by VK_VERSION_1_3, VK_KHR_synchronization2
typedef uint64_t VkFlags64;
\end{verbatim}

When the 31 bits available in \texttt{VkFlags} are insufficient, the \texttt{VkFlags64} type can be passed to commands and structures to represent up to 64 options. \texttt{VkFlags64} is not used directly in the API. Instead, a \texttt{Vk*Flags2} type which is an alias of \texttt{VkFlags64}, and whose name matches the corresponding \texttt{Vk*FlagBits2} that are valid for that type, is used.

Any \texttt{Vk*Flags2} member or parameter used in the API as an input \textbf{must} be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags. A bit flag is valid if:

- The bit flag is defined as part of the \texttt{Vk*FlagBits2} type, where the bits type is obtained by taking the flag type and replacing the trailing \texttt{Flags2} with \texttt{FlagBits2}. For example, a flag value of type \texttt{VkAccessFlags2KHR} \textbf{must} contain only bit flags defined by \texttt{VkAccessFlagBits2KHR}.
- The flag is allowed in the context in which it is being used. For example, in some cases, certain bit flags or combinations of bit flags are mutually exclusive.

Any \texttt{Vk*Flags2} member or parameter returned from a query command or otherwise output from Vulkan to the application \textbf{may} contain bit flags undefined in its corresponding \texttt{Vk*FlagBits2} type. An application \textbf{cannot} rely on the state of these unspecified bits.
Both the `Vk*FlagBits2` type, and the individual bits defined for that type, are defined as `uint64_t` integers in the C API. This is in contrast to the 32-bit types, where the `Vk*FlagBits` type is defined as a C `enum` and the individual bits as enumerants belonging to that `enum`. As a result, there is less compile-time type checking possible for the 64-bit types. This is unavoidable since there is no sufficiently portable way to define a 64-bit `enum` type in C99.

Valid Usage for Structure Types

Any parameter that is a structure containing a `sType` member must have a value of `sType` which is a valid `VkStructureType` value matching the type of the structure.

Valid Usage for Structure Pointer Chains

Any parameter that is a structure containing a `void*` `pNext` member must have a value of `pNext` that is either `NULL`, or is a pointer to a valid extending structure, containing `sType` and `pNext` members as described in the Vulkan Documentation and Extensions document in the section “Extending Structures”. The set of structures connected by `pNext` pointers is referred to as a `pNext` chain.

Each structure included in the `pNext` chain must be defined at runtime by either:

- a core version which is supported
- an extension which is enabled
- a supported device extension in the case of physical-device-level functionality added by the device extension

Each type of extending structure must not appear more than once in a `pNext` chain, including any aliases. This general rule may be explicitly overridden for specific structures.

Any component of the implementation (the loader, any enabled layers, and drivers) must skip over, without processing (other than reading the `sType` and `pNext` members) any extending structures in the chain not defined by core versions or extensions supported by that component.

As a convenience to implementations and layers needing to iterate through a structure pointer chain, the Vulkan API provides two base structures. These structures allow for some type safety, and can be used by Vulkan API functions that operate on generic inputs and outputs.

The `VkBaseInStructure` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBaseInStructure {
    VkStructureType sType;
    const struct VkBaseInStructure* pNext;
} VkBaseInStructure;
```

- `sType` is the structure type of the structure being iterated through.
• **pNext** is **NULL** or a pointer to the next structure in a structure chain.

**VkBaseInStructure** can be used to facilitate iterating through a read-only structure pointer chain.

The **VkBaseOutStructure** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBaseOutStructure {
    VkStructureType sType;
    struct VkBaseOutStructure* pNext;
} VkBaseOutStructure;
```

• **sType** is the structure type of the structure being iterated through.

• **pNext** is **NULL** or a pointer to the next structure in a structure chain.

**VkBaseOutStructure** can be used to facilitate iterating through a structure pointer chain that returns data back to the application.

**Valid Usage for Nested Structures**

The above conditions also apply recursively to members of structures provided as input to a command, either as a direct argument to the command, or themselves a member of another structure.

Specifics on valid usage of each command are covered in their individual sections.

**Valid Usage for Extensions**

Instance-level functionality or behavior added by an instance extension to the API must not be used unless that extension is supported by the instance as determined by `vkEnumerateInstanceExtensionProperties`, and that extension is enabled in `VkInstanceCreateInfo`.

Physical-device-level functionality or behavior added by an instance extension to the API must not be used unless that extension is supported by the instance as determined by `vkEnumerateInstanceExtensionProperties`, and that extension is enabled in `VkInstanceCreateInfo`.

Physical-device-level functionality or behavior added by a device extension to the API must not be used unless the conditions described in Extending Physical Device Core Functionality are met.

Device functionality or behavior added by a device extension to the API must not be used unless that extension is supported by the device as determined by `vkEnumerateDeviceExtensionProperties`, and that extension is enabled in `VkDeviceCreateInfo`.

**Valid Usage for Newer Core Versions**

Instance-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the instance as determined by `vkEnumerateInstanceVersion` and the specified version of `VkApplicationInfo::apiVersion`.

Physical-device-level functionality or behavior added by a new core version of the API must not be
used unless it is supported by the physical device as determined by `VkPhysicalDeviceProperties::apiVersion` and the specified version of `VkApplicationInfo::apiVersion`.

Device-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the device as determined by `VkPhysicalDeviceProperties::apiVersion` and the specified version of `VkApplicationInfo::apiVersion`.

### 3.8. `VkResult` Return Codes

While the core Vulkan API is not designed to capture incorrect usage, some circumstances still require return codes. Commands in Vulkan return their status via return codes that are in one of two categories:

- **Successful completion codes** are returned when a command needs to communicate success or status information. All successful completion codes are non-negative values.
- **Run time error codes** are returned when a command needs to communicate a failure that could only be detected at runtime. All runtime error codes are negative values.

All return codes in Vulkan are reported via `VkResult` return values. The possible codes are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkResult {
    VK_SUCCESS = 0,
    VK_NOT_READY = 1,
    VK_TIMEOUT = 2,
    VK_EVENT_SET = 3,
    VK_EVENT_RESET = 4,
    VK_INCOMPLETE = 5,
    VK_ERROR_OUT_OF_HOST_MEMORY = -1,
    VK_ERROR_OUT_OF_DEVICE_MEMORY = -2,
    VK_ERROR_INITIALIZATION_FAILED = -3,
    VK_ERROR_DEVICE_LOST = -4,
    VK_ERROR_MEMORY_MAP_FAILED = -5,
    VK_ERROR_LAYER_NOT_PRESENT = -6,
    VK_ERROR_EXTENSION_NOT_PRESENT = -7,
    VK_ERROR_FEATURE_NOT_PRESENT = -8,
    VK_ERROR_INCOMPATIBLE_DRIVER = -9,
    VK_ERROR_TOO_MANY_OBJECTS = -10,
    VK_ERROR_FORMAT_NOT_SUPPORTED = -11,
    VK_ERROR_FRAGMENTED_POOL = -12,
    VK_ERROR_UNKNOWN = -13,
    // Provided by VK_VERSION_1_1
    VK_ERROR_OUT_OF_POOL_MEMORY = -1000069000,
    // Provided by VK_VERSION_1_1
    VK_ERROR_INVALID_EXTERNAL_HANDLE = -1000072003,
    // Provided by VK_VERSION_1_2

} VkResult;

Success Codes

- **VK_SUCCESS** Command successfully completed
- **VK_NOT_READY** A fence or query has not yet completed
- **VK_TIMEOUT** A wait operation has not completed in the specified time
- **VK_EVENT_SET** An event is signaled
- **VK_EVENT_RESET** An event is unsignaled
- **VK_INCOMPLETE** A return array was too small for the result
- **VK_SUBOPTIMAL_KHR** A swapchain no longer matches the surface properties exactly, but can still be used to present to the surface successfully.
- **VK_THREAD_IDLE_KHR** A deferred operation is not complete but there is currently no work for this thread to do at the time of this call.
- **VK_THREAD_DONE_KHR** A deferred operation is not complete but there is no work remaining to assign to additional threads.
- **VK_OPERATION_DEFERRED_KHR** A deferred operation was requested and at least some of the work was deferred.
- **VK_OPERATION_NOT_DEFERRED_KHR** A deferred operation was requested and no operations were deferred.
- **VK_PIPELINE_COMPILE_REQUIRED** A requested pipeline creation would have required compilation, but the application requested compilation to not be performed.

Error codes
• VK_ERROR_OUT_OF_HOST_MEMORY  A host memory allocation has failed.
• VK_ERROR_OUT_OF_DEVICE_MEMORY  A device memory allocation has failed.
• VK_ERROR_INITIALIZATION_FAILED  Initialization of an object could not be completed for implementation-specific reasons.
• VK_ERROR_DEVICE_LOST  The logical or physical device has been lost. See Lost Device
• VK_ERROR_MEMORY_MAP_FAILED  Mapping of a memory object has failed.
• VK_ERROR_LAYER_NOT_PRESENT  A requested layer is not present or could not be loaded.
• VK_ERROR_EXTENSION_NOT_PRESENT  A requested extension is not supported.
• VK_ERROR_FEATURE_NOT_PRESENT  A requested feature is not supported.
• VK_ERROR_INCOMPATIBLE_DRIVER  The requested version of Vulkan is not supported by the driver or is otherwise incompatible for implementation-specific reasons.
• VK_ERROR_TOO_MANY_OBJECTS  Too many objects of the type have already been created.
• VK_ERROR_FORMAT_NOT_SUPPORTED  A requested format is not supported on this device.
• VK_ERROR_FRAGMENTED_POOL  A pool allocation has failed due to fragmentation of the pool’s memory. This must only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. This should be returned in preference to VK_ERROR_OUT_OF_POOL_MEMORY, but only if the implementation is certain that the pool allocation failure was due to fragmentation.
• VK_ERROR_SURFACE_LOST_KHR  A surface is no longer available.
• VK_ERROR_NATIVE_WINDOW_IN_USE_KHR  The requested window is already in use by Vulkan or another API in a manner which prevents it from being used again.
• VK_ERROR_OUT_OF_DATE_KHR  A surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications must query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.
• VK_ERROR_INCOMPATIBLE_DISPLAY_KHR  The display used by a swapchain does not use the same presentable image layout, or is incompatible in a way that prevents sharing an image.
• VK_ERROR_INVALID_SHADER_NV  One or more shaders failed to compile or link. More details are reported back to the application via VK_EXT_debug_report if enabled.
• VK_ERROR_OUT_OF_POOL_MEMORY  A pool memory allocation has failed. This must only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. If the failure was definitely due to fragmentation of the pool, VK_ERROR_FRAGMENTED_POOL should be returned instead.
• VK_ERROR_INVALID_EXTERNAL_HANDLE  An external handle is not a valid handle of the specified type.
• VK_ERROR_FRAGMENTATION  A descriptor pool creation has failed due to fragmentation.
• VK_ERROR_INVALID_DEVICE_ADDRESS_EXT  A buffer creation failed because the requested address is not available.
• VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS  A buffer creation or memory allocation failed because the requested address is not available. A shader group handle assignment failed because the requested shader group handle information is no longer valid.
• **VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT** An operation on a swapchain created with **VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT** failed as it did not have exclusive full-screen access. This **may** occur due to implementation-dependent reasons, outside of the application's control.

• **VK_ERROR_COMPRESSION_EXHAUSTED_EXT** An image creation failed because internal resources required for compression are exhausted. This **must** only be returned when fixed-rate compression is requested.

• **VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR** The requested **VkImageUsageFlags** are not supported.

• **VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR** The requested video picture layout is not supported.

• **VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR** A video profile operation specified via **VkVideoProfileInfoKHR::videoCodecOperation** is not supported.

• **VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR** Format parameters in a requested **VkVideoProfileInfoKHR** chain are not supported.

• **VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR** Codec-specific parameters in a requested **VkVideoProfileInfoKHR** chain are not supported.

• **VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR** The specified video Std header version is not supported.

• **VK_ERROR_UNKNOWN** An unknown error has occurred; either the application has provided invalid input, or an implementation failure has occurred.

If a command returns a runtime error, unless otherwise specified any output parameters will have undefined contents, except that if the output parameter is a structure with **sType** and **pNext** fields, those fields will be unmodified. Any structures chained from **pNext** will also have undefined contents, except that **sType** and **pNext** will be unmodified.

**VK_ERROR_OUT_OF_*_MEMORY** errors do not modify any currently existing Vulkan objects. Objects that have already been successfully created **can** still be used by the application.

---

**Note**

As a general rule, **Free**, **Release**, and **Reset** commands do not return **VK_ERROR_OUT_OF_HOST_MEMORY**, while any other command with a return code **may** return it. Any exceptions from this rule are described for those commands.

**VK_ERROR_UNKNOWN** will be returned by an implementation when an unexpected error occurs that cannot be attributed to valid behavior of the application and implementation. Under these conditions, it **may** be returned from any command returning a **VkResult**.

---

**Note**

**VK_ERROR_UNKNOWN** is not expected to ever be returned if the application behavior is valid, and if the implementation is bug-free. If **VK_ERROR_UNKNOWN** is received, the application should be checked against the latest validation layers to verify correct behavior as much as possible. If no issues are identified it could be an implementation issue, and the implementor should be contacted for support.
Performance-critical commands generally do not have return codes. If a runtime error occurs in such commands, the implementation will defer reporting the error until a specified point. For commands that record into command buffers (vkCmd*) runtime errors are reported by **vkEndCommandBuffer**.

### 3.9. Numeric Representation and Computation

Implementations normally perform computations in floating-point, and **must** meet the range and precision requirements defined under “Floating-Point Computation” below.

These requirements only apply to computations performed in Vulkan operations outside of shader execution, such as texture image specification and sampling, and per-fragment operations. Range and precision requirements during shader execution differ and are specified by the **Precision and Operation of SPIR-V Instructions** section.

In some cases, the representation and/or precision of operations is implicitly limited by the specified format of vertex or texel data consumed by Vulkan. Specific floating-point formats are described later in this section.

#### 3.9.1. Floating-Point Computation

Most floating-point computation is performed in SPIR-V shader modules. The properties of computation within shaders are constrained as defined by the **Precision and Operation of SPIR-V Instructions** section.

Some floating-point computation is performed outside of shaders, such as viewport and depth range calculations. For these computations, we do not specify how floating-point numbers are to be represented, or the details of how operations on them are performed, but only place minimal requirements on representation and precision as described in the remainder of this section.

We require simply that numbers’ floating-point parts contain enough bits and that their exponent fields are large enough so that individual results of floating-point operations are accurate to about 1 part in $10^5$. The maximum representable magnitude for all floating-point values **must** be at least $2^{32}$.

\[
x \times 0 = 0 \times x = 0 \text{ for any non-infinite and non-NaN } x.
\]

\[
1 \times x = x \times 1 = x.
\]

\[
x + 0 = 0 + x = x.
\]

\[
0^0 = 1.
\]

Occasionally, further requirements will be specified. Most single-precision floating-point formats meet these requirements.
The special values \( \text{Inf} \) and \(-\text{Inf}\) encode values with magnitudes too large to be represented; the special value \( \text{NaN} \) encodes “Not A Number” values resulting from undefined arithmetic operations such as \( 0 / 0 \). Implementations may support \( \text{Inf} \) and \( \text{NaN} \) in their floating-point computations. Any computation which does not support either \( \text{Inf} \) or \( \text{NaN} \), for which that value is an input or output will yield an undefined value.

3.9.2. Floating-Point Format Conversions

When a value is converted to a defined floating-point representation, finite values falling between two representable finite values are rounded to one or the other. The rounding mode is not defined. Finite values whose magnitude is larger than that of any representable finite value may be rounded either to the closest representable finite value or to the appropriately signed infinity. For unsigned destination formats any negative values are converted to zero. Positive infinity is converted to positive infinity; negative infinity is converted to negative infinity in signed formats and to zero in unsigned formats; and any NaN is converted to a NaN.

3.9.3. 16-Bit Floating-Point Numbers

16-bit floating point numbers are defined in the “16-bit floating point numbers” section of the Khronos Data Format Specification.

3.9.4. Unsigned 11-Bit Floating-Point Numbers

Unsigned 11-bit floating point numbers are defined in the “Unsigned 11-bit floating point numbers” section of the Khronos Data Format Specification.

3.9.5. Unsigned 10-Bit Floating-Point Numbers

Unsigned 10-bit floating point numbers are defined in the “Unsigned 10-bit floating point numbers” section of the Khronos Data Format Specification.

3.9.6. General Requirements

Any representable floating-point value in the appropriate format is legal as input to a Vulkan command that requires floating-point data. The result of providing a value that is not a floating-point number to such a command is unspecified, but must not lead to Vulkan interruption or termination. For example, providing a negative zero (where applicable) or a denormalized number to a Vulkan command must yield deterministic results, while providing a NaN or \( \text{Inf} \) yields unspecified results.

Some calculations require division. In such cases (including implied divisions performed by vector normalization), division by zero produces an unspecified result but must not lead to Vulkan interruption or termination.

3.10. Fixed-Point Data Conversions

When generic vertex attributes and pixel color or depth components are represented as integers, they are often (but not always) considered to be normalized. Normalized integer values are treated
specially when being converted to and from floating-point values, and are usually referred to as normalized fixed-point.

In the remainder of this section, \( b \) denotes the bit width of the fixed-point integer representation. When the integer is one of the types defined by the API, \( b \) is the bit width of that type. When the integer comes from an image containing color or depth component texels, \( b \) is the number of bits allocated to that component in its specified image format.

The signed and unsigned fixed-point representations are assumed to be \( b \)-bit binary two’s-complement integers and binary unsigned integers, respectively.

### 3.10.1. Conversion from Normalized Fixed-Point to Floating-Point

Unsigned normalized fixed-point integers represent numbers in the range \([0,1]\). The conversion from an unsigned normalized fixed-point value \( c \) to the corresponding floating-point value \( f \) is defined as

\[
f = \frac{c}{2^b - 1}
\]

Signed normalized fixed-point integers represent numbers in the range \([-1,1]\). The conversion from a signed normalized fixed-point value \( c \) to the corresponding floating-point value \( f \) is performed using

\[
f = \max\left(\frac{c}{2^b - 1}, -1.0\right)
\]

Only the range \([-2^{b-1} + 1, 2^{b-1} - 1]\) is used to represent signed fixed-point values in the range \([-1,1]\). For example, if \( b = 8 \), then the integer value -127 corresponds to -1.0 and the value 127 corresponds to 1.0. This equation is used everywhere that signed normalized fixed-point values are converted to floating-point.

Note that while zero is exactly expressible in this representation, one value (-128 in the example) is outside the representable range, and implementations must clamp it to -1.0. Where the value is subject to further processing by the implementation, e.g. during texture filtering, values less than -1.0 may be used but the result must be clamped before the value is returned to shaders.

### 3.10.2. Conversion from Floating-Point to Normalized Fixed-Point

The conversion from a floating-point value \( f \) to the corresponding unsigned normalized fixed-point value \( c \) is defined by first clamping \( f \) to the range \([0,1]\), then computing

\[
c = \text{convertFloatToUint}(f \times (2^b - 1), b)
\]

where \( \text{convertFloatToUint}(r, b) \) returns one of the two unsigned binary integer values with exactly \( b \) bits which are closest to the floating-point value \( r \). Implementations should round to nearest. If \( r \) is equal to an integer, then that integer value must be returned. In particular, if \( f \) is equal to 0.0 or 1.0, then \( c \) must be assigned 0 or \( 2^b - 1 \), respectively.

The conversion from a floating-point value \( f \) to the corresponding signed normalized fixed-point
value $c$ is performed by clamping $f$ to the range $[-1,1]$, then computing

$$c = \text{convertFloatToInt}(f \times (2^{b-1} - 1), b)$$

where \text{convertFloatToInt}(r,b) returns one of the two signed two's-complement binary integer values with exactly $b$ bits which are closest to the floating-point value $r$. Implementations should round to nearest. If $r$ is equal to an integer, then that integer value must be returned. In particular, if $f$ is equal to -1.0, 0.0, or 1.0, then $c$ must be assigned $-(2^{b-1} - 1)$, 0, or $2^{b-1} - 1$, respectively.

This equation is used everywhere that floating-point values are converted to signed normalized fixed-point.

### 3.11. Common Object Types

Some types of Vulkan objects are used in many different structures and command parameters, and are described here. These types include offsets, extents, and rectangles.

#### 3.11.1. Offsets

Offsets are used to describe a pixel location within an image or framebuffer, as an $(x,y)$ location for two-dimensional images, or an $(x,y,z)$ location for three-dimensional images.

A two-dimensional offset is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkOffset2D {
    int32_t x;
    int32_t y;
} VkOffset2D;
```

- $x$ is the x offset.
- $y$ is the y offset.

A three-dimensional offset is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkOffset3D {
    int32_t x;
    int32_t y;
    int32_t z;
} VkOffset3D;
```

- $x$ is the x offset.
- $y$ is the y offset.
- $z$ is the z offset.
3.11.2. Extents

Extents are used to describe the size of a rectangular region of pixels within an image or framebuffer, as (width,height) for two-dimensional images, or as (width,height,depth) for three-dimensional images.

A two-dimensional extent is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtent2D {
    uint32_t width;
    uint32_t height;
} VkExtent2D;
```

- **width** is the width of the extent.
- **height** is the height of the extent.

A three-dimensional extent is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtent3D {
    uint32_t width;
    uint32_t height;
    uint32_t depth;
} VkExtent3D;
```

- **width** is the width of the extent.
- **height** is the height of the extent.
- **depth** is the depth of the extent.

3.11.3. Rectangles

Rectangles are used to describe a specified rectangular region of pixels within an image or framebuffer. Rectangles include both an offset and an extent of the same dimensionality, as described above. Two-dimensional rectangles are defined by the structure

```c
// Provided by VK_VERSION_1_0
typedef struct VkRect2D {
    VkOffset2D offset;
    VkExtent2D extent;
} VkRect2D;
```

- **offset** is a **VkOffset2D** specifying the rectangle offset.
- **extent** is a **VkExtent2D** specifying the rectangle extent.
3.11.4. Structure Types

Each value corresponds to a particular structure with a sType member with a matching name. As a general rule, the name of each VkStructureType value is obtained by taking the name of the structure, stripping the leading Vk, prefixing each capital letter with _, converting the entire resulting string to upper case, and prefixing it with VK_STRUCTURE_TYPE_. For example, structures of type VkImageCreateInfo correspond to a VkStructureType value of VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO, and thus a structure of this type must have its sType member set to this value before it is passed to the API.

The values VK_STRUCTURE_TYPE_LOADER_INSTANCE_CREATE_INFO and VK_STRUCTURE_TYPE_LOADER_DEVICE_CREATE_INFO are reserved for internal use by the loader, and do not have corresponding Vulkan structures in this Specification.

Structure types supported by the Vulkan API include:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStructureType {
    VK_STRUCTURE_TYPE_APPLICATION_INFO = 0,
    VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO = 1,
    VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO = 2,
    VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO = 3,
    VK_STRUCTURE_TYPE_SUBMIT_INFO = 4,
    VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO = 5,
    VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE = 6,
    VK_STRUCTURE_TYPE_BIND_SPARSE_INFO = 7,
    VK_STRUCTURE_TYPE_FENCE_CREATE_INFO = 8,
    VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO = 9,
    VK_STRUCTURE_TYPE_EVENT_CREATE_INFO = 10,
    VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO = 11,
    VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO = 12,
    VK_STRUCTURE_TYPE_BUFFER_VIEW_CREATE_INFO = 13,
    VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO = 14,
    VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO = 15,
    VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO = 16,
    VK_STRUCTURE_TYPE_PIPELINE_CACHE_CREATE_INFO = 17,
    VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO = 18,
    VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO = 19,
    VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO = 20,
    VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO = 21,
    VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO = 22,
    VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO = 23,
    VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO = 24,
    VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO = 25,
    VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO = 26,
    VK_STRUCTURE_TYPE_PIPELINE_DYNAMIC_STATE_CREATE_INFO = 27,
    VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO = 28,
    VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_CREATE_INFO = 29,
    VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO = 30,
    VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO = 31,
};
```
VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO = 32,
VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_CREATE_INFO = 33,
VK_STRUCTURE_TYPE_DESCRIPTOR_SET_ALLOCATE_INFO = 34,
VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET = 35,
VK_STRUCTURE_TYPE_COPY_DESCRIPTOR_SET = 36,
VK_STRUCTURE_TYPE_FRAMEBUFFER_CREATE_INFO = 37,
VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO = 38,
VK_STRUCTURE_TYPE_COMMAND_POOL_CREATE_INFO = 39,
VK_STRUCTURE_TYPE_COMMAND_BUFFER_ALLOCATE_INFO = 40,
VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_INFO = 41,
VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO = 42,
VK_STRUCTURE_TYPE_RENDER_PASS_BEGIN_INFO = 43,

3.12. API Name Aliases

A small number of APIs did not follow the naming conventions when initially defined. For consistency, when we discover an API name that violates the naming conventions, we rename it in the Specification, XML, and header files. For backwards compatibility, the original (incorrect) name is retained as a “typo alias”. The alias is deprecated and should not be used, but will be retained indefinitely.

Note

VK_STENCIL_FRONT_AND_BACK is an example of a typo alias. It was initially defined as part of VkStencilFaceFlagBits. Once the naming inconsistency was noticed, it was renamed to VK_STENCIL_FACE_FRONT_AND_BACK, and the old name was aliased to the correct name.
Chapter 4. Initialization

Before using Vulkan, an application must initialize it by loading the Vulkan commands, and creating a VkInstance object.

4.1. Command Function Pointers

Vulkan commands are not necessarily exposed by static linking on a platform. Commands to query function pointers for Vulkan commands are described below.

Note
When extensions are promoted or otherwise incorporated into another extension or Vulkan core version, command aliases may be included. Whilst the behavior of each command alias is identical, the behavior of retrieving each alias's function pointer is not. A function pointer for a given alias can only be retrieved if the extension or version that introduced that alias is supported and enabled, irrespective of whether any other alias is available.

Function pointers for all Vulkan commands can be obtained with the command:

```c
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetInstanceProcAddr(
    VkInstance instance,
    const char* pName);
```

- instance is the instance that the function pointer will be compatible with, or NULL for commands not dependent on any instance.
- pName is the name of the command to obtain.

vkGetInstanceProcAddr itself is obtained in a platform- and loader- specific manner. Typically, the loader library will export this command as a function symbol, so applications can link against the loader library, or load it dynamically and look up the symbol using platform-specific APIs.

The table below defines the various use cases for vkGetInstanceProcAddr and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) must not be NULL.

The returned function pointer is of type PFN_vkVoidFunction, and must be cast to the type of the command being queried before use.

### Table 1. vkGetInstanceProcAddr behavior

<table>
<thead>
<tr>
<th>instance</th>
<th>pName</th>
<th>return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>*1</td>
<td>NULL</td>
<td>undefined</td>
</tr>
<tr>
<td>invalid non-NULL instance</td>
<td>*1</td>
<td>undefined</td>
</tr>
<tr>
<td>NULL</td>
<td>global command^2</td>
<td>fp</td>
</tr>
<tr>
<td>instance</td>
<td>pName</td>
<td>return value</td>
</tr>
<tr>
<td>----------</td>
<td>------------------------------</td>
<td>--------------</td>
</tr>
<tr>
<td>NULL</td>
<td>vkGetInstanceProcAddr</td>
<td>fp&lt;sup&gt;5&lt;/sup&gt;</td>
</tr>
<tr>
<td>instance</td>
<td>vkGetInstanceProcAddr</td>
<td>fp</td>
</tr>
<tr>
<td>instance</td>
<td>core dispatchable command</td>
<td>fp&lt;sup&gt;3&lt;/sup&gt;</td>
</tr>
<tr>
<td>instance</td>
<td>enabled instance extension dispatchable command for instance</td>
<td>fp&lt;sup&gt;3&lt;/sup&gt;</td>
</tr>
<tr>
<td>instance</td>
<td>available device extension&lt;sup&gt;4&lt;/sup&gt; dispatchable command for instance</td>
<td>fp&lt;sup&gt;3&lt;/sup&gt;</td>
</tr>
<tr>
<td>any other case, not covered above</td>
<td>NULL</td>
<td></td>
</tr>
</tbody>
</table>

1

"*" means any representable value for the parameter (including valid values, invalid values, and NULL).

2

The global commands are: vkEnumerateInstanceVersion, vkEnumerateInstanceExtensionProperties, vkEnumerateInstanceLayerProperties, and vkCreateInstance. Dispatchable commands are all other commands which are not global.

3

The returned function pointer must only be called with a dispatchable object (the first parameter) that is instance or a child of instance, e.g. VkInstance, VkPhysicalDevice, VkDevice, VkQueue, or VkCommandBuffer.

4

An “available device extension” is a device extension supported by any physical device enumerated by instance.

5

Starting with Vulkan 1.2, vkGetInstanceProcAddr can resolve itself with a NULL instance pointer.

Valid Usage (Implicit)

- VUID-vkGetInstanceProcAddr-instance-parameter
  If instance is not NULL, instance must be a valid VkInstance handle

- VUID-vkGetInstanceProcAddr-pName-parameter
  pName must be a null-terminated UTF-8 string

In order to support systems with multiple Vulkan implementations, the function pointers returned by vkGetInstanceProcAddr may point to dispatch code that calls a different real implementation for different VkDevice objects or their child objects. The overhead of the internal dispatch for VkDevice
objects can be avoided by obtaining device-specific function pointers for any commands that use a
device or device-child object as their dispatchable object. Such function pointers can be obtained with the command:

```c
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetDeviceProcAddr(
    VkDevice device,
    const char* pName);
```

The table below defines the various use cases for `vkGetDeviceProcAddr` and expected return value ("fp" is "function pointer") for each case. A valid returned function pointer ("fp") must not be `NULL`.

The returned function pointer is of type `PFN_vkVoidFunction`, and must be cast to the type of the command being queried before use. The function pointer must only be called with a dispatchable object (the first parameter) that is `device` or a child of `device`.

<table>
<thead>
<tr>
<th>device</th>
<th>pName</th>
<th>return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>*1</td>
<td>undefined</td>
</tr>
<tr>
<td>invalid device</td>
<td>*1</td>
<td>undefined</td>
</tr>
<tr>
<td>device</td>
<td>NULL</td>
<td>undefined</td>
</tr>
<tr>
<td>device</td>
<td>requested core version^2</td>
<td>fp^4</td>
</tr>
<tr>
<td></td>
<td>device-level dispatchable command^3</td>
<td></td>
</tr>
<tr>
<td>device</td>
<td>enabled extension</td>
<td>fp^4</td>
</tr>
<tr>
<td></td>
<td>device-level dispatchable command^3</td>
<td></td>
</tr>
<tr>
<td>any other case, not covered above</td>
<td></td>
<td>NULL</td>
</tr>
</tbody>
</table>

1 "*" means any representable value for the parameter (including valid values, invalid values, and `NULL`).

2 Device-level commands which are part of the core version specified by `VkApplicationInfo::apiVersion` when creating the instance will always return a valid function pointer. Core commands beyond that version which are supported by the implementation may either return `NULL` or a function pointer, though the function pointer must not be called.

3 In this function, device-level excludes all physical-device-level commands.

4 The returned function pointer must only be called with a dispatchable object (the first parameter) that is `device` or a child of `device` e.g. `VkDevice`, `VkQueue`, or `VkCommandBuffer`. 
4.1.1. Extending Physical Device Core Functionality

New core physical-device-level functionality can be used when the physical-device version is greater than or equal to the version of Vulkan that added the new functionality. The Vulkan version supported by a physical device can be obtained by calling `vkGetPhysicalDeviceProperties`.

4.1.2. Extending Physical Device From Device Extensions

When the `VK_KHR_get_physical_device_properties2` extension is enabled, or when both the instance and the physical-device versions are at least 1.1, physical-device-level functionality of a device extension can be used with a physical device if the corresponding extension is enumerated by `vkEnumerateDeviceExtensionProperties` for that physical device, even before a logical device has been created.

To obtain a function pointer for a physical-device-level command from a device extension, an application can use `vkGetInstanceProcAddr`. This function pointer may point to dispatch code, which calls a different real implementation for different `VkPhysicalDevice` objects. Applications must not use a `VkPhysicalDevice` in any command added by an extension or core version that is not supported by that physical device.

Device extensions may define structures that can be added to the `pNext` chain of physical-device-level commands.

4.2. Instances

There is no global state in Vulkan and all per-application state is stored in a `VkInstance` object. Creating a `VkInstance` object initializes the Vulkan library and allows the application to pass information about itself to the implementation.

Instances are represented by `VkInstance` handles:

The definition of `PFN_vkVoidFunction` is:

```c
// Provided by VK_VERSION_1_0
typedef void (VKAPI_PTR *PFN_vkVoidFunction)(void);
```

This type is returned from command function pointer queries, and must be cast to an actual command function pointer before use.
To query the version of instance-level functionality supported by the implementation, call:

```c
VkResult vkEnumerateInstanceVersion(
    uint32_t* pApiVersion);
```

- `pApiVersion` is a pointer to a `uint32_t`, which is the version of Vulkan supported by instance-level functionality, encoded as described in Version Numbers.

**Note**
The intended behaviour of `vkEnumerateInstanceVersion` is that an implementation **should** not need to perform memory allocations and **should** unconditionally return `VK_SUCCESS`. The loader, and any enabled layers, **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` in the case of a failed memory allocation.

### Valid Usage (Implicit)

- **VUID-vkEnumerateInstanceVersion-pApiVersion-parameter**
  
  `pApiVersion` must be a valid pointer to a `uint32_t` value

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`

To create an instance object, call:

```c
VkResult vkCreateInstance(
    const VkInstanceCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkInstance* pInstance);
```

- `pCreateInfo` is a pointer to a `VkInstanceCreateInfo` structure controlling creation of the instance.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pInstance` points a `VkInstance` handle in which the resulting instance is returned.
vkCreateInstance verifies that the requested layers exist. If not, vkCreateInstance will return VK_ERROR_LAYER_NOT_PRESENT. Next vkCreateInstance verifies that the requested extensions are supported (e.g. in the implementation or in any enabled instance layer) and if any requested extension is not supported, vkCreateInstance must return VK_ERROR_EXTENSION_NOT_PRESENT. After verifying and enabling the instance layers and extensions the VkInstance object is created and returned to the application. If a requested extension is only supported by a layer, both the layer and the extension need to be specified at vkCreateInstance time for the creation to succeed.

Valid Usage

- VUID-vkCreateInstance-ppEnabledExtensionNames-01388
  All required extensions for each extension in the VkInstanceCreateInfo::ppEnabledExtensionNames list must also be present in that list

Valid Usage (Implicit)

- VUID-vkCreateInstance-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkInstanceCreateInfo structure
- VUID-vkCreateInstance-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateInstance-pInstance-parameter
  pInstance must be a valid pointer to a VkInstance handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_LAYER_NOT_PRESENT
- VK_ERROR_EXTENSION_NOT_PRESENT
- VK_ERROR_INCOMPATIBLE_DRIVER

The VkInstanceCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkInstanceCreateInfo {
    VkStructureType sType;
```
```c
const void* pNext;
VkInstanceCreateInfo flags;
const VkApplicationInfo* pApplicationInfo;
uint32_t enabledLayerCount;
const char* const* ppEnabledLayerNames;
uint32_t enabledExtensionCount;
const char* const* ppEnabledExtensionNames;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkInstanceCreateFlagBits` indicating the behavior of the instance.
- **pApplicationInfo** is NULL or a pointer to a `VkApplicationInfo` structure. If not NULL, this information helps implementations recognize behavior inherent to classes of applications. `VkApplicationInfo` is defined in detail below.
- **enabledLayerCount** is the number of global layers to enable.
- **ppEnabledLayerNames** is a pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings containing the names of layers to enable for the created instance. The layers are loaded in the order they are listed in this array, with the first array element being the closest to the application, and the last array element being the closest to the driver. See the Layers section for further details.
- **enabledExtensionCount** is the number of global extensions to enable.
- **ppEnabledExtensionNames** is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable.

To capture events that occur while creating or destroying an instance, an application can link a `VkDebugReportCallbackCreateInfoEXT` structure or a `VkDebugUtilsMessengerCreateInfoEXT` structure to the `pNext` element of the `VkInstanceCreateInfo` structure given to `vkCreateInstance`. This callback is only valid for the duration of the `vkCreateInstance` and the `vkDestroyInstance` call. Use `vkCreateDebugReportCallbackEXT` or `vkCreateDebugUtilsMessengerEXT` to create persistent callback objects.

### Valid Usage

- **VUID-VkInstanceCreateInfo-pNext-04925**
  If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkDebugReportCallbackCreateInfoEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` must contain `VK_EXT_debug_report`

- **VUID-VkInstanceCreateInfo-pNext-04926**
  If the `pNext` chain of `VkInstanceCreateInfo` includes a `VkDebugUtilsMessengerCreateInfoEXT` structure, the list of enabled extensions in `ppEnabledExtensionNames` must contain `VK_EXT_debug_utils`

- **VUID-VkInstanceCreateInfo-pNext-06779**
  If the `pNext` chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its
The `exportObjectType` member must be either `VK.ExportMetalObject.Type.Metal.DeviceBit` or `VK.ExportMetalObject.Type.Metal.CommandQueueBit`.

- **VUID-VkInstanceCreateInfo-flags-06559**
  If `flags` has the `VK.InstanceCreateInfo.Flags.VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR` bit set, the list of enabled extensions in `ppEnabledExtensionNames` must contain `VK_KHR.portability.enumeration`.

### Valid Usage (Implicit)

- **VUID-VkInstanceCreateInfo-sType-sType**
  `sType` must be `VK.Structure.Type.VK_INSTANCE_CREATE_INFO`.

- **VUID-VkInstanceCreateInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDebugReportCallbackCreateInfo`, `VkDebugUtilsMessengerCreateInfo`, `VkExportMetalObjectCreateInfo`, `VkValidationFeatures`, or `VkValidationFlags`.

- **VUID-VkInstanceCreateInfo-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkDebugUtilsMessengerCreateInfo` or `VkExportMetalObjectCreateInfo`.

- **VUID-VkInstanceCreateInfo-flags-parameter**
  `flags` must be a valid combination of `VkInstanceCreateFlagBits` values.

- **VUID-VkInstanceCreateInfo-pApplicationInfo-parameter**
  If `pApplicationInfo` is not `NULL`, `pApplicationInfo` must be a valid pointer to a valid `VkApplicationInfo` structure.

- **VUID-VkInstanceCreateInfo-ppEnabledLayerNames-parameter**
  If `enabledLayerCount` is not 0, `ppEnabledLayerNames` must be a valid pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings.

- **VUID-VkInstanceCreateInfo-ppEnabledExtensionNames-parameter**
  If `enabledExtensionCount` is not 0, `ppEnabledExtensionNames` must be a valid pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings.

```c
// Provided by VK_VERSION_1_0
typedef enum VkInstanceCreateFlagBits {
    // Provided by VK_KHR.portability.enumeration
    VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR = 0x00000001,
} VkInstanceCreateFlagBits;
```

- `VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR` specifies that the instance will enumerate available Vulkan Portability-compliant physical devices and groups in addition to the Vulkan physical devices and groups that are enumerated by default.
typedef VkFlags VkInstanceCreateFlags;

VkInstanceCreateFlags is a bitmask type for setting a mask of zero or more 
VkInstanceCreateFlagBits.

When creating a Vulkan instance for which you wish to disable validation checks, add a 
VkValidationFlagsEXT structure to the pNext chain of the VkInstanceCreateInfo structure, specifying 
the checks to be disabled.

typedef struct VkValidationFlagsEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t disabledValidationCheckCount;
    const VkValidationCheckEXT* pDisabledValidationChecks;
} VkValidationFlagsEXT;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• disabledValidationCheckCount is the number of checks to disable.
• pDisabledValidationChecks is a pointer to an array of VkValidationCheckEXT values specifying 
the validation checks to be disabled.

Valid Usage (Implicit)

• VUID-VkValidationFlagsEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VALIDATION_FLAGS_EXT

• VUID-VkValidationFlagsEXT-pDisabledValidationChecks-parameter
  pDisabledValidationChecks must be a valid pointer to an array of 
disabledValidationCheckCount valid VkValidationCheckEXT values

• VUID-VkValidationFlagsEXT-disabledValidationCheckCount-arraylength
  disabledValidationCheckCount must be greater than 0

Possible values of elements of the VkValidationFlagsEXT::pDisabledValidationChecks array, 
specifying validation checks to be disabled, are:

typedef enum VkValidationCheckEXT {
    VK_VALIDATION_CHECK_ALL_EXT = 0,
    VK_VALIDATION_CHECK_SHADERS_EXT = 1,
} VkValidationCheckEXT;
• VK_VALIDATION_CHECK_ALL_EXT specifies that all validation checks are disabled.
• VK_VALIDATION_CHECK_SHADERS_EXT specifies that shader validation is disabled.

When creating a Vulkan instance for which you wish to enable or disable specific validation features, add a VkValidationFeaturesEXT structure to the pNext chain of the VkInstanceCreateInfo structure, specifying the features to be enabled or disabled.

```c
// Provided by VK_EXT_validation_features
typedef struct VkValidationFeaturesEXT {
    VkStructureType sType;       // Type of this structure.
    const void* pNext;           // NULL or a pointer to a structure extending this structure.
    uint32_t enabledValidationFeatureCount;   // Number of features to enable.
    const VkValidationFeatureEnableEXT* pEnabledValidationFeatures;  // Pointer to an array of VkValidationFeatureEnableEXT values.
    uint32_t disabledValidationFeatureCount;   // Number of features to disable.
    const VkValidationFeatureDisableEXT* pDisabledValidationFeatures; // Pointer to an array of VkValidationFeatureDisableEXT values.
} VkValidationFeaturesEXT;
```

Valid Usage

• VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-02967
  If the pEnabledValidationFeatures array contains VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT, then it must also contain VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT

• VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-02968
  If the pEnabledValidationFeatures array contains VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT, then it must not contain VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT

Valid Usage (Implicit)

• VUID-VkValidationFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VALIDATION_FEATURES_EXT

• VUID-VkValidationFeaturesEXT-pEnabledValidationFeatures-parameter
  If enabledValidationFeatureCount is not 0, pEnabledValidationFeatures must be a valid
Possible values of elements of the `VkValidationFeaturesEXT::pEnabledValidationFeatures` array, specifying validation features to be enabled, are:

```c
// Provided by VK_EXT_validation_features
typedef enum VkValidationFeatureEnableEXT {
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT = 0,
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT = 1,
    VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT = 2,
    VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT = 3,
    VK_VALIDATION_FEATURE_ENABLE_SYNCHRONIZATION_VALIDATION_EXT = 4
} VkValidationFeatureEnableEXT;
```

- **VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT** specifies that GPU-assisted validation is enabled. Activating this feature instruments shader programs to generate additional diagnostic data. This feature is disabled by default.
- **VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT** specifies that the validation layers reserve a descriptor set binding slot for their own use. The layer reports a value for `VkPhysicalDeviceLimits::maxBoundDescriptorSets` that is one less than the value reported by the device. If the device supports the binding of only one descriptor set, the validation layer does not perform GPU-assisted validation. This feature is disabled by default.
- **VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT** specifies that Vulkan best-practices validation is enabled. Activating this feature enables the output of warnings related to common misuse of the API, but which are not explicitly prohibited by the specification. This feature is disabled by default.
- **VK_VALIDATION_FEATURE_ENABLE_DEBUG_PRINTF_EXT** specifies that the layers will process `debugPrintfEXT` operations in shaders and send the resulting output to the debug callback. This feature is disabled by default.
- **VK_VALIDATION_FEATURE_ENABLE_SYNCHRONIZATION_VALIDATION_EXT** specifies that Vulkan synchronization validation is enabled. This feature reports resource access conflicts due to missing or incorrect synchronization operations between actions (Draw, Copy, Dispatch, Blit) reading or writing the same regions of memory. This feature is disabled by default.

Possible values of elements of the `VkValidationFeaturesEXT::pDisabledValidationFeatures` array, specifying validation features to be disabled, are:

```c
// Provided by VK_EXT_validation_features
typedef enum VkValidationFeatureDisableEXT {
    VK_VALIDATION_FEATURE_DISABLE_ALL_EXT = 0,
}
```

- **VK_VALIDATION_FEATURE_DISABLE_ALL_EXT** specifies that all validation features are disabled.
VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT = 1,
VK_VALIDATION_FEATURE_DISABLE_THREAD_SAFETY_EXT = 2,
VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT = 3,
VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT = 4,
VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT = 5,
VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT = 6,
VK_VALIDATION_FEATURE_DISABLE_SHADER_VALIDATION_CACHE_EXT = 7,
} VkValidationFeatureDisableEXT;

- **VK_VALIDATION_FEATURE_DISABLE_ALL_EXT** specifies that all validation checks are disabled.
- **VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT** specifies that shader validation is disabled. This feature is enabled by default.
- **VK_VALIDATION_FEATURE_DISABLE_Thread_SAFETY_EXT** specifies that thread safety validation is disabled. This feature is enabled by default.
- **VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT** specifies that stateless parameter validation is disabled. This feature is enabled by default.
- **VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT** specifies that object lifetime validation is disabled. This feature is enabled by default.
- **VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT** specifies that core validation checks are disabled. This feature is enabled by default. If this feature is disabled, the shader validation and GPU-assisted validation features are also disabled.
- **VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT** specifies that protection against duplicate non-dispatchable object handles is disabled. This feature is enabled by default.
- **VK_VALIDATION_FEATURE_DISABLE_SHADER_VALIDATION_CACHE_EXT** specifies that there will be no caching of shader validation results and every shader will be validated on every application execution. Shader validation caching is enabled by default.

**Note**
Disabling checks such as parameter validation and object lifetime validation prevents the reporting of error conditions that can cause other validation checks to behave incorrectly or crash. Some validation checks assume that their inputs are already valid and do not always revalidate them.

**Note**
The **VK_EXT_validation_features** extension subsumes all the functionality provided in the **VK_EXT_validation_flags** extension.

The **VkApplicationInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkApplicationInfo {
    VkStructureType     sType;
    const void*          pNext;
    const char*          pApplicationName;
} VkApplicationInfo;
```
uint32_t applicationVersion;
const char* pEngineName;
uint32_t engineVersion;
uint32_t apiVersion;
} VkApplicationInfo;

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pApplicationName is NULL or is a pointer to a null-terminated UTF-8 string containing the name of the application.
- applicationVersion is an unsigned integer variable containing the developer-supplied version number of the application.
- pEngineName is NULL or is a pointer to a null-terminated UTF-8 string containing the name of the engine (if any) used to create the application.
- engineVersion is an unsigned integer variable containing the developer-supplied version number of the engine used to create the application.
- apiVersion must be the highest version of Vulkan that the application is designed to use, encoded as described in Version Numbers. The patch version number specified in apiVersion is ignored when creating an instance object. Only the major and minor versions of the instance must match those requested in apiVersion.

Vulkan 1.0 implementations were required to return VK_ERROR_INCOMPATIBLE_DRIVER if apiVersion was larger than 1.0. Implementations that support Vulkan 1.1 or later must not return VK_ERROR_INCOMPATIBLE_DRIVER for any value of apiVersion.

Note
Because Vulkan 1.0 implementations may fail with VK_ERROR_INCOMPATIBLE_DRIVER, applications should determine the version of Vulkan available before calling vkCreateInstance. If the vkGetInstanceProcAddr returns NULL for vkEnumerateInstanceVersion, it is a Vulkan 1.0 implementation. Otherwise, the application can call vkEnumerateInstanceVersion to determine the version of Vulkan.

As long as the instance supports at least Vulkan 1.1, an application can use different versions of Vulkan with an instance than it does with a device or physical device.

Note
The Khronos validation layers will treat apiVersion as the highest API version the application targets, and will validate API usage against the minimum of that version and the implementation version (instance or device, depending on context). If an application tries to use functionality from a greater version than this, a validation error will be triggered.

For example, if the instance supports Vulkan 1.1 and three physical devices support Vulkan 1.0, Vulkan 1.1, and Vulkan 1.2, respectively, and if the application
sets `apiVersion` to 1.2, the application **can** use the following versions of Vulkan:

- **Vulkan 1.0** can be used with the instance and with all physical devices.
- **Vulkan 1.1** can be used with the instance and with the physical devices that support Vulkan 1.1 and Vulkan 1.2.
- **Vulkan 1.2** can be used with the physical device that supports Vulkan 1.2.

If we modify the above example so that the application sets `apiVersion` to 1.1, then the application **must** not use Vulkan 1.2 functionality on the physical device that supports Vulkan 1.2.

**Note**

Providing a `NULL` `VkInstanceCreateInfo::pApplicationInfo` or providing an `apiVersion` of 0 is equivalent to providing an `apiVersion` of `VK_MAKE_API_VERSION(0,1,0,0)`.

### Valid Usage

- **VUID-VkApplicationInfo-apiVersion-04010**
  If `apiVersion` is not 0, then it **must** be greater than or equal to `VK_API_VERSION_1_0`

### Valid Usage (Implicit)

- **VUID-VkApplicationInfo-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_APPLICATION_INFO`

- **VUID-VkApplicationInfo-pNext-pNext**
  `pNext` **must** be `NULL`

- **VUID-VkApplicationInfo-pApplicationName-parameter**
  If `pApplicationName` is not `NULL`, `pApplicationName` **must** be a null-terminated UTF-8 string

- **VUID-VkApplicationInfo-pEngineName-parameter**
  If `pEngineName` is not `NULL`, `pEngineName` **must** be a null-terminated UTF-8 string

To destroy an instance, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyInstance(
    VkInstance instance,
    const VkAllocationCallbacks* pAllocator);
```

- `instance` is the handle of the instance to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage

- VUID-vkDestroyInstance-instance-00629
  All child objects created using instance must have been destroyed prior to destroying instance

- VUID-vkDestroyInstance-instance-00630
  If VkAllocationCallbacks were provided when instance was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyInstance-instance-00631
  If no VkAllocationCallbacks were provided when instance was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyInstance-instance-parameter
  If instance is not NULL, instance must be a valid VkInstance handle

- VUID-vkDestroyInstance-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

Host Synchronization

- Host access to instance must be externally synchronized

- Host access to all VkPhysicalDevice objects enumerated from instance must be externally synchronized
Chapter 5. Devices and Queues

Once Vulkan is initialized, devices and queues are the primary objects used to interact with a Vulkan implementation.

Vulkan separates the concept of *physical* and *logical* devices. A physical device usually represents a single complete implementation of Vulkan (excluding instance-level functionality) available to the host, of which there are a finite number. A logical device represents an instance of that implementation with its own state and resources independent of other logical devices.

Physical devices are represented by `VkPhysicalDevice` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkPhysicalDevice)
```

5.1. Physical Devices

To retrieve a list of physical device objects representing the physical devices installed in the system, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumeratePhysicalDevices(
    VkInstance instance,
    uint32_t* pPhysicalDeviceCount,
    VkPhysicalDevice* pPhysicalDevices);
```

- `instance` is a handle to a Vulkan instance previously created with `vkCreateInstance`.
- `pPhysicalDeviceCount` is a pointer to an integer related to the number of physical devices available or queried, as described below.
- `pPhysicalDevices` is either `NULL` or a pointer to an array of `VkPhysicalDevice` handles.

If `pPhysicalDevices` is `NULL`, then the number of physical devices available is returned in `pPhysicalDeviceCount`. Otherwise, `pPhysicalDeviceCount` must point to a variable set by the user to the number of elements in the `pPhysicalDevices` array, and on return the variable is overwritten with the number of handles actually written to `pPhysicalDevices`. If `pPhysicalDeviceCount` is less than the number of physical devices available, at most `pPhysicalDeviceCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available physical devices were returned.

Valid Usage (Implicit)

- `VUID-vkEnumeratePhysicalDevices-instance-parameter` instance must be a valid `VkInstance` handle
- `VUID-vkEnumeratePhysicalDevices-pPhysicalDeviceCount-parameter`
\textbf{pPhysicalDeviceCount} must be a valid pointer to a \texttt{uint32_t} value

- VUID-vkEnumeratePhysicalDevices-pPhysicalDevices-parameter

  If the value referenced by \texttt{pPhysicalDeviceCount} is not 0, and \texttt{pPhysicalDevices} is not NULL, \texttt{pPhysicalDevices} must be a valid pointer to an array of \texttt{pPhysicalDeviceCount} \texttt{VkPhysicalDevice} handles.

---

**Return Codes**

**Success**
- VK\_SUCCESS
- VK\_INCOMPLETE

**Failure**
- VK\_ERROR\_OUT\_OF\_HOST\_MEMORY
- VK\_ERROR\_OUT\_OF\_DEVICE\_MEMORY
- VK\_ERROR\_INITIALIZATION\_FAILED

To query general properties of physical devices once enumerated, call:

```c
// Provided by VK\_VERSION\_1\_0
void vkGetPhysicalDeviceProperties(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceProperties* pProperties);
```

- \texttt{physicalDevice} is the handle to the physical device whose properties will be queried.
- \texttt{pProperties} is a pointer to a \texttt{VkPhysicalDeviceProperties} structure in which properties are returned.

---

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceProperties-physicalDevice-parameter
  \texttt{physicalDevice} must be a valid \texttt{VkPhysicalDevice} handle
- VUID-vkGetPhysicalDeviceProperties-pProperties-parameter
  \texttt{pProperties} must be a valid pointer to a \texttt{VkPhysicalDeviceProperties} structure

The \texttt{VkPhysicalDeviceProperties} structure is defined as:

```c
// Provided by VK\_VERSION\_1\_0
typedef struct VkPhysicalDeviceProperties {
    uint32_t apiVersion;
    uint32_t driverVersion;
    uint32_t vendorID;
} VkPhysicalDeviceProperties;
```
# VkPhysicalDeviceProperties

- **apiVersion** is the version of Vulkan supported by the device, encoded as described in [Version Numbers](#).
- **driverVersion** is the vendor-specified version of the driver.
- **vendorID** is a unique identifier for the vendor (see below) of the physical device.
- **deviceID** is a unique identifier for the physical device among devices available from the vendor.
- **deviceType** is a [VkPhysicalDeviceType](#) specifying the type of device.
- **deviceName** is an array of [VK_MAX_PHYSICAL_DEVICE_NAME_SIZE](#) `char` containing a null-terminated UTF-8 string which is the name of the device.
- **pipelineCacheUUID** is an array of [VK_UUID_SIZE](#) `uint8_t` values representing a universally unique identifier for the device.
- **limits** is the [VkPhysicalDeviceLimits](#) structure specifying device-specific limits of the physical device. See [Limits](#) for details.
- **sparseProperties** is the [VkPhysicalDeviceSparseProperties](#) structure specifying various sparse related properties of the physical device. See [Sparse Properties](#) for details.

**Note**

The value of `apiVersion` may be different than the version returned by `vkEnumerateInstanceVersion`; either higher or lower. In such cases, the application must not use functionality that exceeds the version of Vulkan associated with a given object. The `pApiVersion` parameter returned by `vkEnumerateInstanceVersion` is the version associated with a `VkInstance` and its children, except for a `VkPhysicalDevice` and its children. `VkPhysicalDeviceProperties::apiVersion` is the version associated with a `VkPhysicalDevice` and its children.

**Note**

The encoding of `driverVersion` is implementation-defined. It may not use the same encoding as `apiVersion`. Applications should follow information from the vendor on how to extract the version information from `driverVersion`.

On implementations that claim support for the [Roadmap 2022](#) profile, the major and minor version expressed by `apiVersion` must be at least Vulkan 1.3.

The **vendorID** and **deviceID** fields are provided to allow applications to adapt to device characteristics that are not adequately exposed by other Vulkan queries.
These **may** include performance profiles, hardware errata, or other characteristics.

The **vendor** identified by **vendor ID** is the entity responsible for the most salient characteristics of the underlying implementation of the **VkPhysicalDevice** being queried.

For example, in the case of a discrete GPU implementation, this **should** be the GPU chipset vendor. In the case of a hardware accelerator integrated into a system-on-chip (SoC), this **should** be the supplier of the silicon IP used to create the accelerator.

If the vendor has a **PCI vendor ID**, the low 16 bits of **vendor ID** **must** contain that PCI vendor ID, and the remaining bits **must** be set to zero. Otherwise, the value returned **must** be a valid Khronos vendor ID, obtained as described in the **Vulkan Documentation and Extensions: Procedures and Conventions** document in the section “Registering a Vendor ID with Khronos”. Khronos vendor IDs are allocated starting at 0x10000, to distinguish them from the PCI vendor ID namespace. Khronos vendor IDs are symbolically defined in the **VkVendorId** type.

The vendor is also responsible for the value returned in **device ID**. If the implementation is driven primarily by a **PCI device** with a **PCI device ID**, the low 16 bits of **device ID** **must** contain that PCI device ID, and the remaining bits **must** be set to zero. Otherwise, the choice of what values to return **may** be dictated by operating system or platform policies - but **should** uniquely identify both the device version and any major configuration options (for example, core count in the case of multicore devices).

The same **device ID** **should** be used for all physical implementations of that device version and configuration. For example, all uses of a specific silicon IP GPU version and configuration **should** use the same device ID, even if those uses occur in different SoCs.

Khronos vendor IDs which **may** be returned in **VkPhysicalDeviceProperties::vendor ID** are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkVendorId {
    VK_VENDOR_ID_VIV = 0x10001,
    VK_VENDOR_ID_VSI = 0x10002,
    VK_VENDOR_ID_KAZAN = 0x10003,
    VK_VENDOR_ID_CODEPLAY = 0x10004,
    VK_VENDOR_ID_MESA = 0x10005,
    VK_VENDOR_ID_POCL = 0x10006,
} VkVendorId;
```
Khronos vendor IDs may be allocated by vendors at any time. Only the latest canonical versions of this Specification, of the corresponding `vk.xml` API Registry, and of the corresponding `vulkan_core.h` header file must contain all reserved Khronos vendor IDs.

Only Khronos vendor IDs are given symbolic names at present. PCI vendor IDs returned by the implementation can be looked up in the PCI-SIG database.

`VK_MAX_PHYSICAL_DEVICE_NAME_SIZE` is the length in char values of an array containing a physical device name string, as returned in `VkPhysicalDeviceProperties::deviceName`.

```c
#define VK_MAX_PHYSICAL_DEVICE_NAME_SIZE 256
```

The physical device types which may be returned in `VkPhysicalDeviceProperties::deviceType` are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPhysicalDeviceType {
    VK_PHYSICAL_DEVICE_TYPE_OTHER = 0,
    VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU = 1,
    VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU = 2,
    VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU = 3,
    VK_PHYSICAL_DEVICE_TYPE_CPU = 4,
} VkPhysicalDeviceType;
```

• `VK_PHYSICAL_DEVICE_TYPE_OTHER` - the device does not match any other available types.
• `VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU` - the device is typically one embedded in or tightly coupled with the host.
• `VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU` - the device is typically a separate processor connected to the host via an interlink.
• `VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU` - the device is typically a virtual node in a virtualization environment.
• `VK_PHYSICAL_DEVICE_TYPE_CPU` - the device is typically running on the same processors as the host.

The physical device type is advertised for informational purposes only, and does not directly affect the operation of the system. However, the device type may correlate with other advertised properties or capabilities of the system, such as how many memory heaps there are.

To query general properties of physical devices once enumerated, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceProperties2(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);
```

or the equivalent command
void vkGetPhysicalDeviceProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pProperties` is a pointer to a `VkPhysicalDeviceProperties2` structure in which properties are returned.

Each structure in `pProperties` and its `pNext` chain contains members corresponding to implementation-dependent properties, behaviors, or limits. `vkGetPhysicalDeviceProperties2` fills in each member to specify the corresponding value for the implementation.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceProperties2-physicalDevice-parameter
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceProperties2-pProperties-parameter
  - `pProperties` must be a valid pointer to a `VkPhysicalDeviceProperties2` structure

The `VkPhysicalDeviceProperties2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProperties2 {
    VkStructureType sType;
    void* pNext;
    VkPhysicalDeviceProperties properties;
} VkPhysicalDeviceProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceProperties2 VkPhysicalDeviceProperties2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `properties` is a `VkPhysicalDeviceProperties` structure describing properties of the physical device. This structure is written with the same values as if it were written by `vkGetPhysicalDeviceProperties`.

The `pNext` chain of this structure is used to extend the structure with properties defined by extensions.
Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceProperties2-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROPERTIES_2`

- **VUID-VkPhysicalDeviceProperties2-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of

  - `VkPhysicalDeviceAccelerationStructurePropertiesKHR`
  - `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT`
  - `VkPhysicalDeviceConservativeRasterizationPropertiesEXT`
  - `VkPhysicalDeviceCooperativeMatrixPropertiesNV`
  - `VkPhysicalDeviceCustomBorderColorPropertiesEXT`
  - `VkPhysicalDeviceDepthStencilResolveProperties`
  - `VkPhysicalDeviceDescriptorIndexingProperties`
  - `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV`
  - `VkPhysicalDeviceDiscardRectanglePropertiesEXT`
  - `VkPhysicalDeviceDriverProperties`
  - `VkPhysicalDeviceDrmPropertiesEXT`
  - `VkPhysicalDeviceExtendedDynamicState3PropertiesEXT`
  - `VkPhysicalDeviceExternalMemoryHostPropertiesEXT`
  - `VkPhysicalDeviceFloatControlsProperties`
  - `VkPhysicalDeviceFragmentDensityMap2PropertiesEXT`
  - `VkPhysicalDeviceFragmentDensityMapOffsetPropertiesQCOM`
  - `VkPhysicalDeviceFragmentDensityMapPropertiesEXT`
  - `VkPhysicalDeviceFragmentShaderBarycentricPropertiesKHR`
  - `VkPhysicalDeviceFragmentShadingRateEnumsPropertiesNV`
  - `VkPhysicalDeviceFragmentShadingRatePropertiesKHR`
  - `VkPhysicalDeviceGraphicsPipelineLibraryPropertiesEXT`
  - `VkPhysicalDeviceIDProperties`
  - `VkPhysicalDeviceImageProcessingPropertiesQCOM`
  - `VkPhysicalDeviceInlineUniformBlockProperties`
  - `VkPhysicalDeviceLineRasterizationPropertiesEXT`
  - `VkPhysicalDeviceMaintenance3Properties`
  - `VkPhysicalDeviceMeshShaderPropertiesEXT`
  - `VkPhysicalDeviceMeshShaderPropertiesNV`
  - `VkPhysicalDeviceMultiDrawPropertiesEXT`
  - `VkPhysicalDeviceMultiviewPerViewAttributesPropertiesNVX`
  - `VkPhysicalDeviceMultiviewProperties`
  - `VkPhysicalDeviceOpacityMicromapPropertiesEXT`
  - `VkPhysicalDeviceOpticalFlowPropertiesNV`
  - `VkPhysicalDevicePCIBusInfoPropertiesEXT`
  - `VkPhysicalDevicePerformanceQueryPropertiesKHR`
  - `VkPhysicalDevicePipelineRobustnessPropertiesEXT`
  - `VkPhysicalDevicePointClippingProperties`
  - `VkPhysicalDevicePortabilitySubsetPropertiesKHR`
  - `VkPhysicalDeviceProtectedMemoryProperties`
  - `VkPhysicalDeviceProvokingVertexPropertiesEXT`
  - `VkPhysicalDevicePushDescriptorPropertiesKHR`
  - `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`
  - `VkPhysicalDeviceRayTracingPropertiesNV`
  - `VkPhysicalDeviceRobustness2PropertiesEXT`
  - `VkPhysicalDeviceSampleLocationsPropertiesEXT`
  - `VkPhysicalDeviceSamplerFilterMinmaxProperties`
The `VkPhysicalDeviceVulkan11Properties` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan11Properties {
    VkStructureType sType;
    void* pNext;
    uint8_t deviceUUID[VK_UUID_SIZE];
    uint8_t driverUUID[VK_UUID_SIZE];
    uint8_t deviceLUID[VK_LUID_SIZE];
    uint32_t deviceNodeMask;
    VkBool32 deviceLUIDValid;
    uint32_t subgroupSize;
    VkShaderStageFlags subgroupSupportedStages;
    VkSubgroupFeatureFlags subgroupSupportedOperations;
    VkBool32 subgroupQuadOperationsInAllStages;
    VkPointClippingBehavior pointClippingBehavior;
    uint32_t maxMultiviewViewCount;
    uint32_t maxMultiviewInstanceIndex;
    VkBool32 protectedNoFault;
    uint32_t maxPerSetDescriptors;
    VkDeviceSize maxMemoryAllocationSize;
} VkPhysicalDeviceVulkan11Properties;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the device.
- `driverUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique
identifier for the driver build in use by the device.

- **deviceLUID** is an array of `VK_LUID_SIZE uint8_t` values representing a locally unique identifier for the device.
- **deviceNodeMask** is a `uint32_t` bitfield identifying the node within a linked device adapter corresponding to the device.
- **deviceLUIDValid** is a boolean value that will be `VK_TRUE` if `deviceLUID` contains a valid LUID and `deviceNodeMask` contains a valid node mask, and `VK_FALSE` if they do not.
- **subgroupSize** is the default number of invocations in each subgroup. `subgroupSize` is at least 1 if any of the physical device’s queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `subgroupSize` is a power-of-two.
- **subgroupSupportedStages** is a bitfield of `VkShaderStageFlagBits` describing the shader stages that group operations with subgroup scope are supported in. `subgroupSupportedStages` will have the `VK_SHADER_STAGE_COMPUTE_BIT` bit set if any of the physical device’s queues support `VK_QUEUE_COMPUTE_BIT`.
- **subgroupSupportedOperations** is a bitmask of `VkSubgroupFeatureFlagBits` specifying the sets of group operations with subgroup scope supported on this device. `subgroupSupportedOperations` will have the `VK_SUBGROUP_FEATURE_BASIC_BIT` bit set if any of the physical device’s queues support `VK_QUEUE_COMPUTE_BIT`.
- **subgroupQuadOperationsInAllStages** is a boolean specifying whether quad group operations are available in all stages, or are restricted to fragment and compute stages.
- **pointClippingBehavior** is a `VkPointClippingBehavior` value specifying the point clipping behavior supported by the implementation.
- **maxMultiviewViewCount** is one greater than the maximum view index that can be used in a subpass.
- **maxMultiviewInstanceIndex** is the maximum valid value of instance index allowed to be generated by a drawing command recorded within a subpass of a multiview render pass instance.
- **protectedNoFault** specifies how an implementation behaves when an application attempts to write to unprotected memory in a protected queue operation, read from protected memory in an unprotected queue operation, or perform a query in a protected queue operation. If this limit is `VK_TRUE`, such writes will be discarded or have undefined values written, reads and queries will return undefined values. If this limit is `VK_FALSE`, applications must not perform these operations. See Protected Memory Access Rules for more information.
- **maxPerSetDescriptors** is a maximum number of descriptors (summed over all descriptor types) in a single descriptor set that is guaranteed to satisfy any implementation-dependent constraints on the size of a descriptor set itself. Applications can query whether a descriptor set that goes beyond this limit is supported using `vkGetDescriptorSetLayoutSupport`.
- **maxMemoryAllocationSize** is the maximum size of a memory allocation that can be created, even if there is more space available in the heap.

If the `VkPhysicalDeviceVulkan11Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.
These properties correspond to Vulkan 1.1 functionality.

The members of `VkPhysicalDeviceVulkan11Properties` have the same values as the corresponding members of `VkPhysicalDeviceIDProperties`, `VkPhysicalDeviceSubgroupProperties`, `VkPhysicalDevicePointClippingProperties`, `VkPhysicalDeviceMultiviewProperties`, `VkPhysicalDeviceProtectedMemoryProperties`, and `VkPhysicalDeviceMaintenance3Properties`.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceVulkan11Properties-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_1_PROPERTIES`

The `VkPhysicalDeviceVulkan12Properties` structure is defined as:

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• driverID is a unique identifier for the driver of the physical device.
• driverName is an array of VK_MAX_DRIVER_NAME_SIZE char containing a null-terminated UTF-8 string which is the name of the driver.
• driverInfo is an array of VK_MAX_DRIVER_INFO_SIZE char containing a null-terminated UTF-8 string with additional information about the driver.
• conformanceVersion is the version of the Vulkan conformance test this driver is conformant against (see VkConformanceVersion).
• **denormBehaviorIndependence** is a **VkShaderFloatControlsIndependence** value indicating whether, and how, denorm behavior can be set independently for different bit widths.

• **roundingModeIndependence** is a **VkShaderFloatControlsIndependence** value indicating whether, and how, rounding modes can be set independently for different bit widths.

• **shaderSignedZeroInfNanPreserveFloat16** is a boolean value indicating whether sign of a zero, Nans and \( \pm \infty \) can be preserved in 16-bit floating-point computations. It also indicates whether the **SignedZeroInfNanPreserve** execution mode can be used for 16-bit floating-point types.

• **shaderSignedZeroInfNanPreserveFloat32** is a boolean value indicating whether sign of a zero, Nans and \( \pm \infty \) can be preserved in 32-bit floating-point computations. It also indicates whether the **SignedZeroInfNanPreserve** execution mode can be used for 32-bit floating-point types.

• **shaderSignedZeroInfNanPreserveFloat64** is a boolean value indicating whether sign of a zero, Nans and \( \pm \infty \) can be preserved in 64-bit floating-point computations. It also indicates whether the **SignedZeroInfNanPreserve** execution mode can be used for 64-bit floating-point types.

• **shaderDenormPreserveFloat16** is a boolean value indicating whether denormals can be preserved in 16-bit floating-point computations. It also indicates whether the **DenormPreserve** execution mode can be used for 16-bit floating-point types.

• **shaderDenormPreserveFloat32** is a boolean value indicating whether denormals can be preserved in 32-bit floating-point computations. It also indicates whether the **DenormPreserve** execution mode can be used for 32-bit floating-point types.

• **shaderDenormPreserveFloat64** is a boolean value indicating whether denormals can be preserved in 64-bit floating-point computations. It also indicates whether the **DenormPreserve** execution mode can be used for 64-bit floating-point types.

• **shaderDenormFlushToZeroFloat16** is a boolean value indicating whether denormals can be flushed to zero in 16-bit floating-point computations. It also indicates whether the **DenormFlushToZero** execution mode can be used for 16-bit floating-point types.

• **shaderDenormFlushToZeroFloat32** is a boolean value indicating whether denormals can be flushed to zero in 32-bit floating-point computations. It also indicates whether the **DenormFlushToZero** execution mode can be used for 32-bit floating-point types.

• **shaderDenormFlushToZeroFloat64** is a boolean value indicating whether denormals can be flushed to zero in 64-bit floating-point computations. It also indicates whether the **DenormFlushToZero** execution mode can be used for 64-bit floating-point types.

• **shaderRoundingModeRTEFloat16** is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the **RoundingModeRTE** execution mode can be used for 16-bit floating-point types.

• **shaderRoundingModeRTEFloat32** is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the **RoundingModeRTE** execution mode can be used for 32-bit floating-point types.

• **shaderRoundingModeRTEFloat64** is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the **RoundingModeRTE** execution mode can be used for 64-bit floating-point types.
• `shaderRoundingModeRTZFloat16` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode can be used for 16-bit floating-point types.

• `shaderRoundingModeRTZFloat32` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode can be used for 32-bit floating-point types.

• `shaderRoundingModeRTZFloat64` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode can be used for 64-bit floating-point types.

• `maxUpdateAfterBindDescriptorsInAllPools` is the maximum number of descriptors (summed over all descriptor types) that can be created across all pools that are created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set. Pool creation may fail when this limit is exceeded, or when the space this limit represents is unable to satisfy a pool creation due to fragmentation.

• `shaderUniformBufferArrayNonUniformIndexingNative` is a boolean value indicating whether uniform buffer descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of uniform buffers may execute multiple times in order to access all the descriptors.

• `shaderSampledImageArrayNonUniformIndexingNative` is a boolean value indicating whether sampler and image descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of samplers or images may execute multiple times in order to access all the descriptors.

• `shaderStorageBufferArrayNonUniformIndexingNative` is a boolean value indicating whether storage buffer descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage buffers may execute multiple times in order to access all the descriptors.

• `shaderStorageImageArrayNonUniformIndexingNative` is a boolean value indicating whether storage image descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage images may execute multiple times in order to access all the descriptors.

• `shaderInputAttachmentArrayNonUniformIndexingNative` is a boolean value indicating whether input attachment descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a single dynamic instance of an instruction that nonuniformly indexes an array of input attachments may execute multiple times in order to access all the descriptors.

• `robustBufferAccessUpdateAfterBind` is a boolean value indicating whether `robustBufferAccess` can be enabled on a device simultaneously with `descriptorBindingUniformBufferUpdateAfterBind`, `descriptorBindingStorageBufferUpdateAfterBind`, `descriptorBindingUniformTexelBufferUpdateAfterBind`, and/or `descriptorBindingStorageTexelBufferUpdateAfterBind`. If this is `VK_FALSE`, then either `robustBufferAccess` must be disabled or all of these update-after-bind features must be disabled.

• `quadDivergentImplicitLod` is a boolean value indicating whether implicit level of detail
calculations for image operations have well-defined results when the image and/or sampler objects used for the instruction are not uniform within a quad. See Derivative Image Operations.

- \texttt{maxPerStageDescriptorUpdateAfterBindSamplers} is similar to \texttt{maxPerStageDescriptorSamplers} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxPerStageDescriptorUpdateAfterBindUniformBuffers} is similar to \texttt{maxPerStageDescriptorUniformBuffers} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxPerStageDescriptorUpdateAfterBindStorageBuffers} is similar to \texttt{maxPerStageDescriptorStorageBuffers} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxPerStageDescriptorUpdateAfterBindSampledImages} is similar to \texttt{maxPerStageDescriptorSampledImages} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxPerStageDescriptorUpdateAfterBindStorageImages} is similar to \texttt{maxPerStageDescriptorStorageImages} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxPerStageDescriptorUpdateAfterBindInputAttachments} is similar to \texttt{maxPerStageDescriptorInputAttachments} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxPerStageUpdateAfterBindResources} is similar to \texttt{maxPerStageResources} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxDescriptorSetUpdateAfterBindSamplers} is similar to \texttt{maxDescriptorSetSamplers} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxDescriptorSetUpdateAfterBindUniformBuffers} is similar to \texttt{maxDescriptorSetUniformBuffers} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxDescriptorSetUpdateAfterBindUniformBuffersDynamic} is similar to \texttt{maxDescriptorSetUniformBuffersDynamic} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set. While an application \texttt{can} allocate dynamic uniform buffer descriptors from a pool created with the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT}, bindings for these descriptors \texttt{must} not be present in any descriptor set layout that includes bindings created with \texttt{VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT}.

- \texttt{maxDescriptorSetUpdateAfterBindStorageBuffers} is similar to \texttt{maxDescriptorSetStorageBuffers} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

- \texttt{maxDescriptorSetUpdateAfterBindStorageBuffersDynamic} is similar to \texttt{maxDescriptorSetStorageBuffersDynamic} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.
application can allocate dynamic storage buffer descriptors from a pool created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

- `maxDescriptorSetUpdateAfterBindSampledImages` is similar to `maxDescriptorSetSampledImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- `maxDescriptorSetUpdateAfterBindStorageImages` is similar to `maxDescriptorSetStorageImages` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- `maxDescriptorSetUpdateAfterBindInputAttachments` is similar to `maxDescriptorSetInputAttachments` but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- `supportedDepthResolveModes` is a bitmask of `VkResolveModeFlagBits` indicating the set of supported depth resolve modes. `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` must be included in the set but implementations may support additional modes.

- `supportedStencilResolveModes` is a bitmask of `VkResolveModeFlagBits` indicating the set of supported stencil resolve modes. `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` must be included in the set but implementations may support additional modes. `VK_RESOLVE_MODE_AVERAGE_BIT` must not be included in the set.

- `independentResolveNone` is `VK_TRUE` if the implementation supports setting the depth and stencil resolve modes to different values when one of those modes is `VK_RESOLVE_MODE_NONE`. Otherwise the implementation only supports setting both modes to the same value.

- `independentResolve` is `VK_TRUE` if the implementation supports all combinations of the supported depth and stencil resolve modes, including setting either depth or stencil resolve mode to `VK_RESOLVE_MODE_NONE`. An implementation that supports `independentResolve` must also support `independentResolveNone`.

- `filterMinmaxSingleComponentFormats` is a boolean value indicating whether a minimum set of required formats support min/max filtering.

- `filterMinmaxImageComponentMapping` is a boolean value indicating whether the implementation supports non-identity component mapping of the image when doing min/max filtering.

- `maxTimelineSemaphoreValueDifference` indicates the maximum difference allowed by the implementation between the current value of a timeline semaphore and any pending signal or wait operations.

- `framebufferIntegerColorSampleCounts` is a bitmask of `VkSampleCountFlagBits` indicating the color sample counts that are supported for all framebuffer color attachments with integer formats.

If the `VkPhysicalDeviceVulkan12Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.2 functionality.

The members of `VkPhysicalDeviceVulkan12Properties` must have the same values as the
corresponding members of VkPhysicalDeviceDriverProperties, 
VkPhysicalDeviceFloatControlsProperties, 
VkPhysicalDeviceDepthStencilResolveProperties, 
VkPhysicalDeviceSamplerFilterMinmaxProperties, and 
VkPhysicalDeviceTimelineSemaphoreProperties.

Valid Usage (Implicit)

VkBool32 uniformTexelBufferOffsetSingleTexelAlignment;
VkDeviceSize maxBufferSize;
}

sType is the type of this structure.

pNext is NULL or a pointer to a structure extending this structure.

minSubgroupSize is the minimum subgroup size supported by this device. minSubgroupSize is at least one if any of the physical device’s queues support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT. minSubgroupSize is a power-of-two. minSubgroupSize is less than or equal to maxSubgroupSize. minSubgroupSize is less than or equal to subgroupSize.

maxSubgroupSize is the maximum subgroup size supported by this device. maxSubgroupSize is at least one if any of the physical device’s queues support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT. maxSubgroupSize is a power-of-two. maxSubgroupSize is greater than or equal to minSubgroupSize. maxSubgroupSize is greater than or equal to subgroupSize.

maxComputeWorkgroupSubgroups is the maximum number of subgroups supported by the implementation within a workgroup.

requiredSubgroupSizeStages is a bitfield of what shader stages support having a required subgroup size specified.

maxInlineUniformBlockSize is the maximum size in bytes of an inline uniform block binding.

maxPerStageDescriptorInlineUniformBlock is the maximum number of inline uniform block
bindings that can be accessible to a single shader stage in a pipeline layout. Descriptor bindings with a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK count against this limit. Only descriptor bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit.

- maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks is similar to maxPerStageDescriptorInlineUniformBlocks but counts descriptor bindings from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- maxDescriptorSetInlineUniformBlocks is the maximum number of inline uniform block bindings that can be included in descriptor bindings in a pipeline layout across all pipeline shader stages and descriptor set numbers. Descriptor bindings with a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK count against this limit. Only descriptor bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit.

- maxDescriptorSetUpdateAfterBindInlineUniformBlocks is similar to maxDescriptorSetInlineUniformBlocks but counts descriptor bindings from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- maxInlineUniformTotalSize is the maximum total size in bytes of all inline uniform block bindings, across all pipeline shader stages and descriptor set numbers, that can be included in a pipeline layout. Descriptor bindings with a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK count against this limit.

- integerDotProduct8BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit unsigned dot product operations using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct8BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit signed dot product operations using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct8BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 8-bit mixed signedness dot product operations using the OpSUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct4x8BitPackedUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit unsigned dot product operations from operands packed into 32-bit integers using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct4x8BitPackedSignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit signed dot product operations from operands packed into 32-bit integers using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct4x8BitPackedMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 8-bit mixed signedness dot product operations from operands packed into 32-bit integers using the OpSUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct16BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 16-bit unsigned dot product operations using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct16BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 16-bit signed dot product operations using the OpSDotKHR SPIR-V instruction is accelerated as defined below.
• `integerDotProduct16BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProduct32BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProduct32BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProduct32BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProduct64BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProduct64BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProduct64BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating8BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating8BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.
• `integerDotProductAccumulatingSaturating16BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating16BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating32BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating32BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating64BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating64BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• `storageTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a storage texel buffer of any format. The value must be a power of two.

• `storageTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a storage texel buffer of any format.

• `uniformTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a uniform texel buffer of any format. The value must be a power of two.

• `uniformTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a uniform texel buffer of any format.

• `maxBufferSize` is the maximum size `VkBuffer` that can be created.

If the `VkPhysicalDeviceVulkan13Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.3 functionality.
The members of `VkPhysicalDeviceVulkan13Properties` must have the same values as the corresponding members of `VkPhysicalDeviceInlineUniformBlockProperties` and `VkPhysicalDeviceSubgroupSizeControlProperties`.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceVulkan13Properties-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_3_PROPERTIES`

The `VkPhysicalDeviceIDProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceIDProperties {
    VkStructureType sType;
    void* pNext;
    uint8_t deviceUUID[VK_UUID_SIZE];
    uint8_t driverUUID[VK_UUID_SIZE];
    uint8_t deviceLUID[VK_LUID_SIZE];
    uint32_t deviceNodeMask;
    VkBool32 deviceLUIDValid;
} VkPhysicalDeviceIDProperties;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence_capabilities,
// VK_KHR_external_memory_capabilities, VK_KHR_external_semaphore_capabilities
typedef VkPhysicalDeviceIDProperties VkPhysicalDeviceIDPropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceUUID` is an array of `VK_UUID_SIZE uint8_t` values representing a universally unique identifier for the device.
- `driverUUID` is an array of `VK_UUID_SIZE uint8_t` values representing a universally unique identifier for the driver build in use by the device.
- `deviceLUID` is an array of `VK_LUID_SIZE uint8_t` values representing a locally unique identifier for the device.
- `deviceNodeMask` is a `uint32_t` bitfield identifying the node within a linked device adapter corresponding to the device.
- `deviceLUIDValid` is a boolean value that will be `VK_TRUE` if `deviceLUID` contains a valid LUID and `deviceNodeMask` contains a valid node mask, and `VK_FALSE` if they do not.

If the `VkPhysicalDeviceIDProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with
each corresponding implementation-dependent property.

**deviceUUID** must be immutable for a given device across instances, processes, driver APIs, driver versions, and system reboots.

Applications can compare the **driverUUID** value across instance and process boundaries, and can make similar queries in external APIs to determine whether they are capable of sharing memory objects and resources using them with the device.

**deviceUUID** and/or **driverUUID** must be used to determine whether a particular external object can be shared between driver components, where such a restriction exists as defined in the compatibility table for the particular object type:

- External memory handle types compatibility
- External semaphore handle types compatibility
- External fence handle types compatibility

If **deviceLUIDValid** is **VK_FALSE**, the values of **deviceLUID** and **deviceNodeMask** are undefined. If **deviceLUIDValid** is **VK_TRUE** and Vulkan is running on the Windows operating system, the contents of **deviceLUID** can be cast to an LUID object and must be equal to the locally unique identifier of a IDXGIAdapter1 object that corresponds to **physicalDevice**. If **deviceLUIDValid** is **VK_TRUE**, **deviceNodeMask** must contain exactly one bit. If Vulkan is running on an operating system that supports the Direct3D 12 API and **physicalDevice** corresponds to an individual device in a linked device adapter, **deviceNodeMask** identifies the Direct3D 12 node corresponding to **physicalDevice**. Otherwise, **deviceNodeMask** must be 1.

**Note**

Although they have identical descriptions, VkPhysicalDeviceIDProperties::deviceUUID may differ from VkPhysicalDeviceProperties2::pipelineCacheUUID. The former is intended to identify and correlate devices across API and driver boundaries, while the latter is used to identify a compatible device and driver combination to use when serializing and de-serializing pipeline state.

Implementations should return deviceUUID values which are likely to be unique even in the presence of multiple Vulkan implementations (such as a GPU driver and a software renderer; two drivers for different GPUs; or the same Vulkan driver running on two logically different devices).

Khronos' conformance testing is unable to guarantee that deviceUUID values are actually unique, so implementors should make their own best efforts to ensure this. In particular, hard-coded deviceUUID values, especially all-0 bits, should never be used.

A combination of values unique to the vendor, the driver, and the hardware environment can be used to provide a deviceUUID which is unique to a high degree of certainty. Some possible inputs to such a computation are:

- Information reported by vkGetPhysicalDeviceProperties
• PCI device ID (if defined)
• PCI bus ID, or similar system configuration information.
• Driver binary checksums.

**Note**
While `VkPhysicalDeviceIDProperties::deviceUUID` is specified to remain consistent across driver versions and system reboots, it is not intended to be usable as a serializable persistent identifier for a device. It may change when a device is physically added to, removed from, or moved to a different connector in a system while that system is powered down. Further, there is no reasonable way to verify with conformance testing that a given device retains the same UUID in a given system across all driver versions supported in that system. While implementations should make every effort to report consistent device UUIDs across driver versions, applications should avoid relying on the persistence of this value for uses other than identifying compatible devices for external object sharing purposes.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceIDProperties-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ID_PROPERTIES`

**VK_UUID_SIZE** is the length in `uint8_t` values of an array containing a universally unique device or driver build identifier, as returned in `VkPhysicalDeviceIDProperties::deviceUUID` and `VkPhysicalDeviceIDProperties::driverUUID`.

```c
#define VK_UUID_SIZE 16U
```

**VK_LUID_SIZE** is the length in `uint8_t` values of an array containing a locally unique device identifier, as returned in `VkPhysicalDeviceIDProperties::deviceLUID`.

```c
#define VK_LUID_SIZE 8U
```

or the equivalent

```c
#define VK_LUID_SIZE_KHR VK_LUID_SIZE
```

The `VkPhysicalDeviceDriverProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDriverProperties {
    VkStructureType      sType;
    void*                 pNext;
    VkDriverId            driverID;
} VkPhysicalDeviceDriverProperties;
```
or the equivalent

```c
// Provided by VK_KHR_driver_properties
typedef VkPhysicalDeviceDriverPropertiesKHR VkPhysicalDeviceDriverProperties;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `driverID` is a unique identifier for the driver of the physical device.
- `driverName` is an array of `VK_MAX_DRIVER_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the driver.
- `driverInfo` is an array of `VK_MAX_DRIVER_INFO_SIZE` `char` containing a null-terminated UTF-8 string with additional information about the driver.
- `conformanceVersion` is the version of the Vulkan conformance test this driver is conformant against (see `VkConformanceVersion`).

If the `VkPhysicalDeviceDriverProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the driver corresponding to a physical device.

`driverID` must be immutable for a given driver across instances, processes, driver versions, and system reboots.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceDriverProperties-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DRIVER_PROPERTIES`

Khronos driver IDs which **may** be returned in `VkPhysicalDeviceDriverProperties::driverID` are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkDriverId {
    VK_DRIVER_ID_AMD_PROPRIETARY = 1,
    VK_DRIVER_ID_AMD_OPEN_SOURCE = 2,
    VK_DRIVER_ID_MESA_RADV = 3,
    VK_DRIVER_ID_NVIDIA_PROPRIETARY = 4,
    VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS = 5,
    VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA = 6,
};
```
VK_DRIVER_ID_IMAGINATION_PROPRIETARY = 7,
VK_DRIVER_ID_QUALCOMM_PROPRIETARY = 8,
VK_DRIVER_ID_ARM_PROPRIETARY = 9,
VK_DRIVER_ID_GOOGLE_SWIFTSHADER = 10,
VK_DRIVER_ID_GGP_PROPRIETARY = 11,
VK_DRIVER_ID_BROADCOM_PROPRIETARY = 12,
VK_DRIVER_ID_MESA_LLVMPIPE = 13,
VK_DRIVER_ID_MOLTENVK = 14,
VK_DRIVER_ID_COREAVI_PROPRIETARY = 15,
VK_DRIVER_ID_JUICE_PROPRIETARY = 16,
VK_DRIVER_ID_VERISILICON_PROPRIETARY = 17,
VK_DRIVER_ID_MESA_TURNIP = 18,
VK_DRIVER_ID_MESA_V3DV = 19,
VK_DRIVER_ID_MESA_PANVK = 20,
VK_DRIVER_ID_SAMSUNG_PROPRIETARY = 21,
VK_DRIVER_ID_MESA_VENUS = 22,
VK_DRIVER_ID_MESA_DOZEN = 23,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_AMD_PROPRIETARY_KHR = VK_DRIVER_ID_AMD_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_AMD_OPEN_SOURCE_KHR = VK_DRIVER_ID_AMD_OPEN_SOURCE,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_MESA_RADV_KHR = VK_DRIVER_ID_MESA_RADV,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_NVIDIA_PROPRIETARY_KHR = VK_DRIVER_ID_NVIDIA_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS_KHR =
VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA_KHR = VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_IMAGINATION_PROPRIETARY_KHR = VK_DRIVER_ID_IMAGINATION_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_QUALCOMM_PROPRIETARY_KHR = VK_DRIVER_ID_QUALCOMM_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_ARM_PROPRIETARY_KHR = VK_DRIVER_ID_ARM_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_GOOGLE_SWIFTSHADER_KHR = VK_DRIVER_ID_GOOGLE_SWIFTSHADER,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_GGP_PROPRIETARY_KHR = VK_DRIVER_ID_GGP_PROPRIETARY,
// Provided by VK_KHR_driver_properties
VK_DRIVER_ID_BROADCOM_PROPRIETARY_KHR = VK_DRIVER_ID_BROADCOM_PROPRIETARY,
} VkDriverId;

or the equivalent

// Provided by VK_KHR_driver_properties
typedef VkDriverId VkDriverIdKHR;
Note
Khronos driver IDs may be allocated by vendors at any time. There may be multiple driver IDs for the same vendor, representing different drivers (for e.g. different platforms, proprietary or open source, etc.). Only the latest canonical versions of this Specification, of the corresponding *vk.xml* API Registry, and of the corresponding *vulkan_core.h* header file must contain all reserved Khronos driver IDs.

Only driver IDs registered with Khronos are given symbolic names. There may be unregistered driver IDs returned.

### VK_MAX_DRIVER_NAME_SIZE

is the length in char values of an array containing a driver name string, as returned in `VkPhysicalDeviceDriverProperties::driverName`.

```c
#define VK_MAX_DRIVER_NAME_SIZE           256U
```

or the equivalent

```c
#define VK_MAX_DRIVER_NAME_SIZE_KHR       VK_MAX_DRIVER_NAME_SIZE
```

### VK_MAX_DRIVER_INFO_SIZE

is the length in char values of an array containing a driver information string, as returned in `VkPhysicalDeviceDriverProperties::driverInfo`.

```c
#define VK_MAX_DRIVER_INFO_SIZE           256U
```

or the equivalent

```c
#define VK_MAX_DRIVER_INFO_SIZE_KHR       VK_MAX_DRIVER_INFO_SIZE
```

The conformance test suite version an implementation is compliant with is described with the `VkConformanceVersion` structure:

```c
// Provided by VK_VERSION_1_2
typedef struct VkConformanceVersion {
    uint8_t major;
    uint8_t minor;
    uint8_t subminor;
    uint8_t patch;
} VkConformanceVersion;
```

or the equivalent

```c
// Provided by VK_KHR_driver_properties
```
typedef VkConformanceVersion VkConformanceVersionKHR;

- major is the major version number of the conformance test suite.
- minor is the minor version number of the conformance test suite.
- subminor is the subminor version number of the conformance test suite.
- patch is the patch version number of the conformance test suite.

The VkPhysicalDevicePCIBusInfoPropertiesEXT structure is defined as:

```c
typedef struct VkPhysicalDevicePCIBusInfoPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t pciDomain;
    uint32_t pciBus;
    uint32_t pciDevice;
    uint32_t pciFunction;
} VkPhysicalDevicePCIBusInfoPropertiesEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pciDomain is the PCI bus domain.
- pciBus is the PCI bus identifier.
- pciDevice is the PCI device identifier.
- pciFunction is the PCI device function identifier.

If the VkPhysicalDevicePCIBusInfoPropertiesEXT structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

These are properties of the PCI bus information of a physical device.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePCIBusInfoPropertiesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PCI_BUS_INFO_PROPERTIES_EXT

The VkPhysicalDeviceDrmPropertiesEXT structure is defined as:

```c
// Provided by VK_EXT_physical_device_drm
typedef struct VkPhysicalDeviceDrmPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 hasPrimary;
} VkPhysicalDeviceDrmPropertiesEXT;
```
VkBool32 hasRender;
int64_t primaryMajor;
int64_t primaryMinor;
int64_t renderMajor;
int64_t renderMinor;
} VkPhysicalDeviceDrmPropertiesEXT;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **hasPrimary** is a boolean indicating whether the physical device has a DRM primary node.
- **hasRender** is a boolean indicating whether the physical device has a DRM render node.
- **primaryMajor** is the DRM primary node major number, if any.
- **primaryMinor** is the DRM primary node minor number, if any.
- **renderMajor** is the DRM render node major number, if any.
- **renderMinor** is the DRM render node minor number, if any.

If the **VkPhysicalDeviceDrmPropertiesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

These are properties of the DRM information of a physical device.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDrmPropertiesEXT-sType-sType
  
  *sType* must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DRM_PROPERTIES_EXT**

The **VkPhysicalDeviceShaderIntegerDotProductProperties** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceShaderIntegerDotProductProperties {
    VkStructureType sType;
    void* pNext;
    VkBool32 integerDotProduct8BitUnsignedAccelerated;
    VkBool32 integerDotProduct8BitSignedAccelerated;
    VkBool32 integerDotProduct8BitMixedSignednessAccelerated;
    VkBool32 integerDotProduct4x8BitPackedUnsignedAccelerated;
    VkBool32 integerDotProduct4x8BitPackedSignedAccelerated;
    VkBool32 integerDotProduct4x8BitPackedMixedSignednessAccelerated;
    VkBool32 integerDotProduct16BitUnsignedAccelerated;
    VkBool32 integerDotProduct16BitSignedAccelerated;
    VkBool32 integerDotProduct16BitMixedSignednessAccelerated;
    VkBool32 integerDotProduct32BitUnsignedAccelerated;
    VkBool32 integerDotProduct32BitSignedAccelerated;
    VkBool32 integerDotProduct32BitMixedSignednessAccelerated;
} VkPhysicalDeviceShaderIntegerDotProductProperties;
```
or the equivalent

```c
// Provided by VK_KHR_shader_integer_dot_product
typedef VkPhysicalDeviceShaderIntegerDotProductProperties
    VkPhysicalDeviceShaderIntegerDotProductPropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `-integerDotProduct8BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.
- `-integerDotProduct8BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.
- `-integerDotProduct8BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.
accelerated as defined below.

- `integerDotProduct4x8BitPackedUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned dot product operations from operands packed into 32-bit integers using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct4x8BitPackedSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed dot product operations from operands packed into 32-bit integers using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct4x8BitPackedMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness dot product operations from operands packed into 32-bit integers using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct16BitUnsigned Accelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct16BitSigned Accelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct16BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct32BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct32BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct32BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct64BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct64BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct64BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating8BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating8BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations using the
OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated` is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit mixed signedness accumulating saturating dot product operations using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated` is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated` is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated` is a boolean that will be \texttt{VK_TRUE} if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating16BitUnsignedAccelerated` is a boolean that will be \texttt{VK_TRUE} if the support for 16-bit unsigned accumulating saturating dot product operations using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating16BitSignedAccelerated` is a boolean that will be \texttt{VK_TRUE} if the support for 16-bit signed accumulating saturating dot product operations using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated` is a boolean that will be \texttt{VK_TRUE} if the support for 16-bit mixed signedness accumulating saturating dot product operations using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating32BitUnsignedAccelerated` is a boolean that will be \texttt{VK_TRUE} if the support for 32-bit unsigned accumulating saturating dot product operations using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating32BitSignedAccelerated` is a boolean that will be \texttt{VK_TRUE} if the support for 32-bit signed accumulating saturating dot product operations using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated` is a boolean that will be \texttt{VK_TRUE} if the support for 32-bit mixed signedness accumulating saturating dot product operations using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating64BitUnsignedAccelerated` is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit unsigned accumulating saturating dot product operations using the \texttt{OpUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating64BitSignedAccelerated` is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit signed accumulating saturating dot product operations using the \texttt{OpSDotAccSatKHR} SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated` is a boolean that will be \texttt{VK_TRUE} if the support for 64-bit mixed signedness accumulating saturating dot product operations using the \texttt{OpSUDotAccSatKHR} SPIR-V instruction is accelerated as defined below.
If the VkPhysicalDeviceShaderIntegerDotProductProperties structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

These are properties of the integer dot product acceleration information of a physical device.

Note
A dot product operation is deemed accelerated if its implementation provides a performance advantage over application-provided code composed from elementary instructions and/or other dot product instructions, either because the implementation uses optimized machine code sequences whose generation from application-provided code cannot be guaranteed or because it uses hardware features that cannot otherwise be targeted from application-provided code.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderIntegerDotProductProperties-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_DOT_PRODUCT_PROPERTIES

The VkPhysicalDeviceImageProcessingPropertiesQCOM structure is defined as:

```c
// Provided by VK_QCOM_image_processing
typedef struct VkPhysicalDeviceImageProcessingPropertiesQCOM {
    VkStructureType sType;
    void* pNext;
    uint32_t maxWeightFilterPhases;
    VkExtent2D maxWeightFilterDimension;
    VkExtent2D maxBlockMatchRegion;
    VkExtent2D maxBoxFilterBlockSize;
} VkPhysicalDeviceImageProcessingPropertiesQCOM;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxWeightFilterPhases is the maximum value that can be specified for VkImageViewSampleWeightCreateInfoQCOM::numPhases in weight image sampling operations.
- maxWeightFilterDimension is a VkExtent2D describing the largest dimensions (width and height) that can be specified for VkImageViewSampleWeightCreateInfoQCOM::filterSize.
- maxBlockMatchRegion is a VkExtent2D describing the largest dimensions (width and height) that can be specified for blockSize in block matching operations.
- maxBoxFilterBlockSize is a VkExtent2D describing the maximum dimensions (width and height) that can be specified for blockSize in box filter sampling operations.

If the VkPhysicalDeviceImageProcessingPropertiesQCOM structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with
each corresponding implementation-dependent property.

These are properties of the image processing information of a physical device.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageProcessingPropertiesQCOM-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_PROCESSING_PROPERTIES_QCOM

To query properties of queues available on a physical device, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceQueueFamilyProperties(
    VkPhysicalDevice physicalDevice,
    uint32_t* pQueueFamilyPropertyCount,
    VkQueueFamilyProperties* pQueueFamilyProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pQueueFamilyPropertyCount` is a pointer to an integer related to the number of queue families available or queried, as described below.
- `pQueueFamilyProperties` is either `NULL` or a pointer to an array of `VkQueueFamilyProperties` structures.

If `pQueueFamilyProperties` is `NULL`, then the number of queue families available is returned in `pQueueFamilyPropertyCount`. Implementations must support at least one queue family. Otherwise, `pQueueFamilyPropertyCount` must point to a variable set by the user to the number of elements in the `pQueueFamilyProperties` array, and on return the variable is overwritten with the number of structures actually written to `pQueueFamilyProperties`. If `pQueueFamilyPropertyCount` is less than the number of queue families available, at most `pQueueFamilyPropertyCount` structures will be written.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceQueueFamilyProperties-physicalDevice-parameter
  physicalDevice must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyPropertyCount-parameter
  pQueueFamilyPropertyCount must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyProperties-parameter
  If the value referenced by `pQueueFamilyPropertyCount` is not 0, and `pQueueFamilyProperties` is not `NULL`, `pQueueFamilyProperties` must be a valid pointer to an array of `pQueueFamilyPropertyCount` `VkQueueFamilyProperties` structures

The `VkQueueFamilyProperties` structure is defined as:
typedef struct VkQueueFamilyProperties {
    VkQueueFlags queueFlags;
    uint32_t queueCount;
    uint32_t timestampValidBits;
    VkExtent3D minImageTransferGranularity;
} VkQueueFamilyProperties;

• queueFlags is a bitmask of VkQueueFlagBits indicating capabilities of the queues in this queue family.

• queueCount is the unsigned integer count of queues in this queue family. Each queue family must support at least one queue.

• timestampValidBits is the unsigned integer count of meaningful bits in the timestamps written via vkCmdWriteTimestamp2 or vkCmdWriteTimestamp. The valid range for the count is 36 to 64 bits, or a value of 0, indicating no support for timestamps. Bits outside the valid range are guaranteed to be zeros.

• minImageTransferGranularity is the minimum granularity supported for image transfer operations on the queues in this queue family.

The value returned in minImageTransferGranularity has a unit of compressed texel blocks for images having a block-compressed format, and a unit of texels otherwise.

Possible values of minImageTransferGranularity are:

• (0,0,0) specifies that only whole mip levels must be transferred using the image transfer operations on the corresponding queues. In this case, the following restrictions apply to all offset and extent parameters of image transfer operations:
  ◦ The x, y, and z members of a VkOffset3D parameter must always be zero.
  ◦ The width, height, and depth members of a VkExtent3D parameter must always match the width, height, and depth of the image subresource corresponding to the parameter, respectively.

• (A_x, A_y, A_z) where A_x, A_y, and A_z are all integer powers of two. In this case the following restrictions apply to all image transfer operations:
  ◦ x, y, and z of a VkOffset3D parameter must be integer multiples of A_x, A_y, and A_z, respectively.
  ◦ width of a VkExtent3D parameter must be an integer multiple of A_x, or else x + width must equal the width of the image subresource corresponding to the parameter.
  ◦ height of a VkExtent3D parameter must be an integer multiple of A_y, or else y + height must equal the height of the image subresource corresponding to the parameter.
  ◦ depth of a VkExtent3D parameter must be an integer multiple of A_z, or else z + depth must equal the depth of the image subresource corresponding to the parameter.
  ◦ If the format of the image corresponding to the parameters is one of the block-compressed formats then for the purposes of the above calculations the granularity must be scaled up
Queues supporting graphics and/or compute operations must report \((1,1,1)\) in `minImageTransferGranularity`, meaning that there are no additional restrictions on the granularity of image transfer operations for these queues. Other queues supporting image transfer operations are only required to support whole mip level transfers, thus `minImageTransferGranularity` for queues belonging to such queue families may be \((0,0,0)\).

The **Device Memory** section describes memory properties queried from the physical device.

For physical device feature queries see the **Features** chapter.

Bits which may be set in `VkQueueFamilyProperties::queueFlags`, indicating capabilities of queues in a queue family are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueueFlagBits {
    VK_QUEUE_GRAPHICS_BIT = 0x00000001,
    VK_QUEUE_COMPUTE_BIT = 0x00000002,
    VK_QUEUE_TRANSFER_BIT = 0x00000004,
    VK_QUEUE_SPARSE_BINDING_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_QUEUE_PROTECTED_BIT = 0x00000010,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_decode_queue
    VK_QUEUE_VIDEO_DECODING_BIT_KHR = 0x00000020,
    #endif
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_encode_queue
    VK_QUEUE_VIDEO_ENCODING_BIT_KHR = 0x00000040,
    #endif
    // Provided by VK_NV_optical_flow
    VK_QUEUE_OPTICAL_FLOW_BIT_NV = 0x00000100,
} VkQueueFlagBits;
```

- **VK_QUEUE_GRAPHICS_BIT** specifies that queues in this queue family support graphics operations.
- **VK_QUEUE_COMPUTE_BIT** specifies that queues in this queue family support compute operations.
- **VK_QUEUE_TRANSFER_BIT** specifies that queues in this queue family support transfer operations.
- **VK_QUEUE_SPARSE_BINDING_BIT** specifies that queues in this queue family support sparse memory management operations (see **Sparse Resources**). If any of the sparse resource features are enabled, then at least one queue family must support this bit.
- **VK_QUEUE_VIDEO_DECODING_BIT_KHR** specifies that queues in this queue family support Video Decode operations.
- **VK_QUEUE_VIDEO_ENCODING_BIT_KHR** specifies that queues in this queue family support Video Encode operations.
- **VK_QUEUE_OPTICAL_FLOW_BIT_NV** specifies that queues in this queue family support optical flow operations.
• VK_QUEUE_PROTECTED_BIT specifies that queues in this queue family support the VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT bit. (see Protected Memory). If the physical device supports the protectedMemory feature, at least one of its queue families must support this bit.

If an implementation exposes any queue family that supports graphics operations, at least one queue family of at least one physical device exposed by the implementation must support both graphics and compute operations.

Furthermore, if the protectedMemory physical device feature is supported, then at least one queue family of at least one physical device exposed by the implementation must support graphics operations, compute operations, and protected memory operations.

Note

All commands that are allowed on a queue that supports transfer operations are also allowed on a queue that supports either graphics or compute operations. Thus, if the capabilities of a queue family include VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT, then reporting the VK_QUEUE_TRANSFER_BIT capability separately for that queue family is optional.

For further details see Queues.

// Provided by VK_VERSION_1_0
typedef VkFlags VkQueueFlags;

VkQueueFlags is a bitmask type for setting a mask of zero or more VkQueueFlagBits.

To query properties of queues available on a physical device, call:

// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceQueueFamilyProperties2(
    VkPhysicalDevice physicalDevice,
    uint32_t* pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2* pQueueFamilyProperties);

or the equivalent command

// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceQueueFamilyProperties2KHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2* pQueueFamilyProperties);

• physicalDevice is the handle to the physical device whose properties will be queried.

• pQueueFamilyPropertyCount is a pointer to an integer related to the number of queue families available or queried, as described in vkGetPhysicalDeviceQueueFamilyProperties.
• \texttt{pQueueFamilyProperties} is either \texttt{NULL} or a pointer to an array of \texttt{VkQueueFamilyProperties2} structures.

\texttt{vkGetPhysicalDeviceQueueFamilyProperties2} behaves similarly to \texttt{vkGetPhysicalDeviceQueueFamilyProperties}, with the ability to return extended information in a \texttt{pNext} chain of output structures.

### Valid Usage (Implicit)

- \textit{VUID-vkGetPhysicalDeviceQueueFamilyProperties2-physicalDevice-parameter} \texttt{physicalDevice} must be a valid \texttt{VkPhysicalDevice} handle
- \textit{VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyPropertyCount-parameter} \texttt{pQueueFamilyPropertyCount} must be a valid pointer to a \texttt{uint32_t} value
- \textit{VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyProperties-parameter} If the value referenced by \texttt{pQueueFamilyPropertyCount} is not 0, and \texttt{pQueueFamilyProperties} is not \texttt{NULL}, \texttt{pQueueFamilyProperties} must be a valid pointer to an array of \texttt{pQueueFamilyPropertyCount} \texttt{VkQueueFamilyProperties2} structures

The \texttt{VkQueueFamilyProperties2} structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkQueueFamilyProperties2 {
    VkStructureType sType;
    void* pNext;
    VkQueueFamilyProperties queueFamilyProperties;
} VkQueueFamilyProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkQueueFamilyProperties2 VkQueueFamilyProperties2KHR;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{queueFamilyProperties} is a \texttt{VkQueueFamilyProperties} structure which is populated with the same values as in \texttt{vkGetPhysicalDeviceQueueFamilyProperties}.

### Valid Usage (Implicit)

- \textit{VUID-VkQueueFamilyProperties2-sType-sType} \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_QUEUE_FAMILY_PROPERTIES_2}
- \textit{VUID-VkQueueFamilyProperties2-pNext-pNext}
Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkQueueFamilyCheckpointProperties2NV`, `VkQueueFamilyCheckpointPropertiesNV`, `VkQueueFamilyGlobalPriorityPropertiesKHR`, `VkQueueFamilyQueryResultStatusPropertiesKHR`, or `VkQueueFamilyVideoPropertiesKHR`.

- `VUID-VkQueueFamilyProperties2-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

The definition of `VkQueueFamilyGlobalPriorityPropertiesKHR` is:

```c
// Provided by VK_KHR_global_priority
typedef struct VkQueueFamilyGlobalPriorityPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t priorityCount;
    VkQueueGlobalPriorityKHR priorities[VK_MAX_GLOBAL_PRIORITY_SIZE_KHR];
} VkQueueFamilyGlobalPriorityPropertiesKHR;
```

or the equivalent

```c
// Provided by VK_EXT_global_priority_query
typedef VkQueueFamilyGlobalPriorityPropertiesKHR
    VkQueueFamilyGlobalPriorityPropertiesEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `priorityCount` is the number of supported global queue priorities in this queue family, and it must be greater than 0.
- `priorities` is an array of `VK_MAX_GLOBAL_PRIORITY_SIZE_EXT` `VkQueueGlobalPriorityEXT` enums representing all supported global queue priorities in this queue family. The first `priorityCount` elements of the array will be valid.

If the `VkQueueFamilyGlobalPriorityPropertiesKHR` structure is included in the `pNext` chain of the `VkQueueFamilyProperties2` structure passed to `vkGetPhysicalDeviceQueueFamilyProperties2`, it is filled in with the list of supported global queue priorities for the indicated family.

The valid elements of `priorities` must not contain any duplicate values.

The valid elements of `priorities` must be a continuous sequence of `VkQueueGlobalPriorityKHR` enums in the ascending order.

```
Note
For example, returning `priorityCount` as 3 with supported `priorities` as `VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR`, `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR` and `VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR` is not allowed.
```
Valid Usage (Implicit)

- VUID-VkQueueFamilyGlobalPriorityPropertiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUEUE_FAMILY_GLOBAL_PRIORITY_PROPERTIES_KHR

- VUID-VkQueueFamilyGlobalPriorityPropertiesKHR-priorities-parameter
  Any given element of priorities must be a valid VkQueueGlobalPriorityKHR value

VK_MAX_GLOBAL_PRIORITY_SIZE_KHR is the length of an array of VkQueueGlobalPriorityKHR enumerants representing supported queue priorities, as returned in VkQueueFamilyGlobalPriorityPropertiesKHR::priorities.

```c
#define VK_MAX_GLOBAL_PRIORITY_SIZE_KHR 16U
```

or the equivalent

```c
#define VK_MAX_GLOBAL_PRIORITY_SIZE_EXT VK_MAX_GLOBAL_PRIORITY_SIZE_KHR
```

The VkQueueFamilyCheckpointProperties2NV structure is defined as:

```c
// Provided by VK_KHR_synchronization2 with VK_NV_device_diagnostic_checkpoints
typedef struct VkQueueFamilyCheckpointProperties2NV {
    VkStructureType sType;
    void* pNext;
    VkPipelineStageFlags2 checkpointExecutionStageMask;
} VkQueueFamilyCheckpointProperties2NV;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- checkpointExecutionStageMask is a mask indicating which pipeline stages the implementation can execute checkpoint markers in.

Additional queue family information can be queried by setting VkQueueFamilyProperties2::pNext to point to a VkQueueFamilyCheckpointProperties2NV structure.

Valid Usage (Implicit)

- VUID-VkQueueFamilyCheckpointProperties2NV-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUEUE_FAMILY_CHECKPOINT_PROPERTIES_2_NV

The VkQueueFamilyCheckpointPropertiesNV structure is defined as:

```c
// Provided by VK_NV_device_diagnostic_checkpoints
```
typedef struct VkQueueFamilyCheckpointPropertiesNV {
    VkStructureType sType;
    void* pNext;
    VkPipelineStageFlags checkpointExecutionStageMask;
} VkQueueFamilyCheckpointPropertiesNV;

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `checkpointExecutionStageMask` is a mask indicating which pipeline stages the implementation can execute checkpoint markers in.

Additional queue family information can be queried by setting `VkQueueFamilyProperties2::pNext` to point to a `VkQueueFamilyCheckpointPropertiesNV` structure.

## Valid Usage (Implicit)

- VUID-VkQueueFamilyCheckpointPropertiesNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_CHECKPOINT_PROPERTIES_NV`

To enumerate the performance query counters available on a queue family of a physical device, call:

```c
// Provided by VK_KHR_performance_query
VkResult vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    uint32_t* pCounterCount,
    VkPerformanceCounterKHR* pCounters,
    VkPerformanceCounterDescriptionKHR* pCounterDescriptions);
```

- `physicalDevice` is the handle to the physical device whose queue family performance query counter properties will be queried.
- `queueFamilyIndex` is the index into the queue family of the physical device we want to get properties for.
- `pCounterCount` is a pointer to an integer related to the number of counters available or queried, as described below.
- `pCounters` is either `NULL` or a pointer to an array of `VkPerformanceCounterKHR` structures.
- `pCounterDescriptions` is either `NULL` or a pointer to an array of `VkPerformanceCounterDescriptionKHR` structures.

If `pCounters` is `NULL` and `pCounterDescriptions` is `NULL`, then the number of counters available is returned in `pCounterCount`. Otherwise, `pCounterCount` must point to a variable set by the user to the number of elements in the `pCounters`, `pCounterDescriptions`, or both arrays and on return the variable is overwritten with the number of structures actually written out. If `pCounterCount` is less
than the number of counters available, at most \texttt{pCounterCount} structures will be written, and \texttt{VK_INCOMPLETE} will be returned instead of \texttt{VK_SUCCESS}, to indicate that not all the available counters were returned.

### Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-physicalDevice-parameter
  \texttt{physicalDevice} must be a valid \texttt{VkPhysicalDevice} handle

- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterCount-parameter
  \texttt{pCounterCount} must be a valid pointer to a \texttt{uint32_t} value

- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounters-parameter
  If the value referenced by \texttt{pCounterCount} is not 0, and \texttt{pCounters} is not \texttt{NULL}, \texttt{pCounters} must be a valid pointer to an array of \texttt{pCounterCount} \texttt{VkPerformanceCounterKHR} structures

- VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterDescriptions-parameter
  If the value referenced by \texttt{pCounterCount} is not 0, and \texttt{pCounterDescriptions} is not \texttt{NULL}, \texttt{pCounterDescriptions} must be a valid pointer to an array of \texttt{pCounterCount} \texttt{VkPerformanceCounterDescriptionKHR} structures

### Return Codes

**Success**

- \texttt{VK_SUCCESS}
- \texttt{VK_INCOMPLETE}

**Failure**

- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}
- \texttt{VK_ERROR_INITIALIZATION_FAILED}

The \texttt{VkPerformanceCounterKHR} structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterKHR {
    VkStructureType          sType;
    void*                    pNext;
    VkPerformanceCounterUnitKHR unit;
    VkPerformanceCounterScopeKHR scope;
    VkPerformanceCounterStorageKHR storage;
    uint8_t               uuid[VK_UUID_SIZE];
} VkPerformanceCounterKHR;
```
• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **unit** is a **VkPerformanceCounterUnitKHR** specifying the unit that the counter data will record.
• **scope** is a **VkPerformanceCounterScopeKHR** specifying the scope that the counter belongs to.
• **storage** is a **VkPerformanceCounterStorageKHR** specifying the storage type that the counter’s data uses.
• **uuid** is an array of size **VK_UUID_SIZE**, containing 8-bit values that represent a universally unique identifier for the counter of the physical device.

### Valid Usage (Implicit)

- **VUID-VkPerformanceCounterKHR-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_KHR**
- **VUID-VkPerformanceCounterKHR-pNext-pNext**
  - **pNext** must be **NULL**

Performance counters have an associated unit. This unit describes how to interpret the performance counter result.

The performance counter unit types which **may** be returned in **VkPerformanceCounterKHR::unit** are:

```cpp
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterUnitKHR {
    VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR = 0,
    VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR = 1,
    VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR = 2,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR = 3,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR = 4,
    VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR = 5,
    VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR = 6,
    VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR = 7,
    VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR = 8,
    VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR = 9,
    VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR = 10,
} VkPerformanceCounterUnitKHR;
```

- **VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR** - the performance counter unit is a generic data point.
- **VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR** - the performance counter unit is a percentage (%).
- **VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR** - the performance counter unit is a value of nanoseconds (ns).
- VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR - the performance counter unit is a value of bytes.
- VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR - the performance counter unit is a value of bytes/s.
- VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR - the performance counter unit is a temperature reported in Kelvin.
- VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR - the performance counter unit is a value of watts (W).
- VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR - the performance counter unit is a value of volts (V).
- VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR - the performance counter unit is a value of amps (A).
- VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR - the performance counter unit is a value of hertz (Hz).
- VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR - the performance counter unit is a value of cycles.

Performance counters have an associated scope. This scope describes the granularity of a performance counter.

The performance counter scope types which may be returned in VkPerformanceCounterKHR::scope are:

```cpp
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterScopeKHR {
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR = 0,
    VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR = 1,
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR = 2,
    VK_QUERY_SCOPE_COMMAND_BUFFER_KHR = VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR,
    VK_QUERY_SCOPE_RENDER_PASS_KHR = VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR,
    VK_QUERY_SCOPE_COMMAND_KHR = VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR,
} VkPerformanceCounterScopeKHR;
```

- VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR - the performance counter scope is a single complete command buffer.
- VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR - the performance counter scope is zero or more complete render passes. The performance query containing the performance counter must begin and end outside a render pass instance.
- VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR - the performance counter scope is zero or more commands.

Performance counters have an associated storage. This storage describes the payload of a counter result.

The performance counter storage types which may be returned in VkPerformanceCounterKHR::storage are:

```cpp
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterStorageKHR {
    VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR = 0,
};
```
VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR = 1,
VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR = 2,
VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR = 3,
VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR = 4,
VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR = 5,
} VkPerformanceCounterStorageKHR;

- **VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR** - the performance counter storage is a 32-bit signed integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR** - the performance counter storage is a 64-bit signed integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR** - the performance counter storage is a 32-bit unsigned integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR** - the performance counter storage is a 64-bit unsigned integer.
- **VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR** - the performance counter storage is a 32-bit floating-point.
- **VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR** - the performance counter storage is a 64-bit floating-point.

The `VkPerformanceCounterDescriptionKHR` structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterDescriptionKHR {
    VkStructureType sType;
    void* pNext;
    VkPerformanceCounterDescriptionFlagsKHR flags;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char category[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
} VkPerformanceCounterDescriptionKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkPerformanceCounterDescriptionFlagBitsKHR` indicating the usage behavior for the counter.
- **name** is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the name of the counter.
- **category** is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the category of the counter.
- **description** is an array of size `VK_MAX_DESCRIPTION_SIZE`, containing a null-terminated UTF-8 string specifying the description of the counter.
Valid Usage (Implicit)

- VUID-VkPerformanceCounterDescriptionKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR

- VUID-VkPerformanceCounterDescriptionKHR-pNext-pNext
  pNext must be NULL

Bits which can be set in VkPerformanceCounterDescriptionKHR::flags, specifying usage behavior of a performance counter, are:

```c
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterDescriptionFlagBitsKHR {
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR = 0x00000001,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR = 0x00000002,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_KHR =
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_KHR =
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR,
} VkPerformanceCounterDescriptionFlagBitsKHR;
```

- VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR specifies that recording the counter may have a noticeable performance impact.
- VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR specifies that concurrently recording the counter while other submitted command buffers are running may impact the accuracy of the recording.

```c
// Provided by VK_KHR_performance_query
typedef VkFlags VkPerformanceCounterDescriptionFlagsKHR;
```

VkPerformanceCounterDescriptionFlagsKHR is a bitmask type for setting a mask of zero or more VkPerformanceCounterDescriptionFlagBitsKHR.

### 5.2. Devices

Device objects represent logical connections to physical devices. Each device exposes a number of queue families each having one or more queues. All queues in a queue family support the same operations.

As described in Physical Devices, a Vulkan application will first query for all physical devices in a system. Each physical device can then be queried for its capabilities, including its queue and queue family properties. Once an acceptable physical device is identified, an application will create a corresponding logical device. The created logical device is then the primary interface to the physical device.

How to enumerate the physical devices in a system and query those physical devices for their
queue family properties is described in the [Physical Device Enumeration](#) section above.

A single logical device can be created from multiple physical devices, if those physical devices belong to the same device group. A *device group* is a set of physical devices that support accessing each other’s memory and recording a single command buffer that can be executed on all the physical devices. Device groups are enumerated by calling `vkEnumeratePhysicalDeviceGroups`, and a logical device is created from a subset of the physical devices in a device group by passing the physical devices through `VkDeviceGroupDeviceCreateInfo`. For two physical devices to be in the same device group, they must support identical extensions, features, and properties.

**Note**

Physical devices in the same device group must be so similar because there are no rules for how different features/properties would interact. They must return the same values for nearly every invariant `vkGetPhysicalDevice*` feature, property, capability, etc., but could potentially differ for certain queries based on things like having a different display connected, or a different compositor. The specification does not attempt to enumerate which state is in each category, because such a list would quickly become out of date.

To retrieve a list of the device groups present in the system, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkEnumeratePhysicalDeviceGroups(
    VkInstance instance,
    uint32_t* pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

or the equivalent command

```c
// Provided by VK_KHR_device_group_creation
VkResult vkEnumeratePhysicalDeviceGroupsKHR(
    VkInstance instance,
    uint32_t* pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

- `instance` is a handle to a Vulkan instance previously created with `vkCreateInstance`.
- `pPhysicalDeviceGroupCount` is a pointer to an integer related to the number of device groups available or queried, as described below.
- `pPhysicalDeviceGroupProperties` is either `NULL` or a pointer to an array of `VkPhysicalDeviceGroupProperties` structures.

If `pPhysicalDeviceGroupProperties` is `NULL`, then the number of device groups available is returned in `pPhysicalDeviceGroupCount`. Otherwise, `pPhysicalDeviceGroupCount` must point to a variable set by the user to the number of elements in the `pPhysicalDeviceGroupProperties` array, and on return the variable is overwritten with the number of structures actually written to `pPhysicalDeviceGroupProperties`. If `pPhysicalDeviceGroupCount` is less than the number of device
groups available, at most \texttt{pPhysicalDeviceGroupCount} structures will be written, and \texttt{VK_INCOMPLETE} will be returned instead of \texttt{VK_SUCCESS}, to indicate that not all the available device groups were returned.

Every physical device \textbf{must} be in exactly one device group.

### Valid Usage (Implicit)

- \textbf{VUID-vkEnumeratePhysicalDeviceGroups-instance-parameter} \textit{instance} \textbf{must} be a valid \texttt{VkInstance} handle
- \textbf{VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupCount-parameter} \textit{pPhysicalDeviceGroupCount} \textbf{must} be a valid pointer to a \texttt{uint32_t} value
- \textbf{VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupProperties-parameter} If the value referenced by \textit{pPhysicalDeviceGroupCount} is not 0, and \textit{pPhysicalDeviceGroupProperties} is not \texttt{NULL}, \textit{pPhysicalDeviceGroupProperties} \textbf{must} be a valid pointer to an array of \textit{pPhysicalDeviceGroupCount} \texttt{VkPhysicalDeviceGroupProperties} structures

### Return Codes

**Success**

- \texttt{VK_SUCCESS}
- \texttt{VK_INCOMPLETE}

**Failure**

- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}
- \texttt{VK_ERROR_INITIALIZATION_FAILED}

The \texttt{VkPhysicalDeviceGroupProperties} structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceGroupProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t physicalDeviceCount;
    VkPhysicalDevice physicalDevices[VK_MAX_DEVICE_GROUP_SIZE];
    VkBool32 subsetAllocation;
} VkPhysicalDeviceGroupProperties;
```

or the equivalent

```c
// Provided by VK_KHR_device_group_creation
```
typedef VkPhysicalDeviceGroupProperties VkPhysicalDeviceGroupPropertiesKHR;

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **physicalDeviceCount** is the number of physical devices in the group.
- **physicalDevices** is an array of `VK_MAX_DEVICE_GROUP_SIZE` `VkPhysicalDevice` handles representing all physical devices in the group. The first `physicalDeviceCount` elements of the array will be valid.
- **subsetAllocation** specifies whether logical devices created from the group support allocating device memory on a subset of devices, via the `deviceMask` member of the `VkMemoryAllocateFlagsInfo`. If this is `VK_FALSE`, then all device memory allocations are made across all physical devices in the group. If `physicalDeviceCount` is 1, then `subsetAllocation` must be `VK_FALSE`.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceGroupProperties-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES`
- `VUID-VkPhysicalDeviceGroupProperties-pNext-pNext`  
  `pNext` must be `NULL`

`VK_MAX_DEVICE_GROUP_SIZE` is the length of an array containing `VkPhysicalDevice` handle values representing all physical devices in a group, as returned in `VkPhysicalDeviceGroupProperties::physicalDevices`.

```c
#define VK_MAX_DEVICE_GROUP_SIZE          32U
```

or the equivalent

```c
#define VK_MAX_DEVICE_GROUP_SIZE_KHR      VK_MAX_DEVICE_GROUP_SIZE
```

### 5.2.1. Device Creation

Logical devices are represented by `VkDevice` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkDevice)
```

A logical device is created as a *connection* to a physical device. To create a logical device, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateDevice(  
```
vkCreateDevice(physicalDevice, pCreateInfo, pAllocator, pDevice);

- **physicalDevice** must be one of the device handles returned from a call to `vkEnumeratePhysicalDevices` (see Physical Device Enumeration).

- **pCreateInfo** is a pointer to a `VkDeviceCreateInfo` structure containing information about how to create the device.

- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

- **pDevice** is a pointer to a handle in which the created `VkDevice` is returned.

`vkCreateDevice` verifies that extensions and features requested in the `ppEnabledExtensionNames` and `pEnabledFeatures` members of `pCreateInfo`, respectively, are supported by the implementation. If any requested extension is not supported, `vkCreateDevice` must return `VK_ERROR_EXTENSION_NOT_PRESENT`. If any requested feature is not supported, `vkCreateDevice` must return `VK_ERROR_FEATURE_NOT_PRESENT`. Support for extensions can be checked before creating a device by querying `vkEnumerateDeviceExtensionProperties`. Support for features can similarly be checked by querying `vkGetPhysicalDeviceFeatures`.

After verifying and enabling the extensions the `VkDevice` object is created and returned to the application.

Multiple logical devices can be created from the same physical device. Logical device creation may fail due to lack of device-specific resources (in addition to other errors). If that occurs, `vkCreateDevice` will return `VK_ERROR_TOO_MANY_OBJECTS`.

### Valid Usage

- VUID-vkCreateDevice-ppEnabledExtensionNames-01387
  All required device extensions for each extension in the `VkDeviceCreateInfo`::`ppEnabledExtensionNames` list must also be present in that list

### Valid Usage (Implicit)

- VUID-vkCreateDevice-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkCreateDevice-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkDeviceCreateInfo` structure

- VUID-vkCreateDevice-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateDevice-pDevice-parameter
  `pDevice` must be a valid pointer to a `VkDevice` handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INITIALIZATION_FAILED
• VK_ERROR_EXTENSION_NOT_PRESENT
• VK_ERROR_FEATURE_NOT_PRESENT
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_DEVICE_LOST

The `VkDeviceCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDeviceCreateInfo {
    VkStructureType     sType;
    const void*         pNext;
    VkDeviceCreateFlags flags;
    uint32_t            queueCreateInfoCount;
    const VkDeviceQueueCreateInfo* pQueueCreateInfos;
    const char* const*  ppEnabledLayerNames;
    const char* const*  ppEnabledExtensionNames;
    const VkPhysicalDeviceFeatures* pEnabledFeatures;
} VkDeviceCreateInfo;
```

• `sType` is the type of this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `queueCreateInfoCount` is the unsigned integer size of the `pQueueCreateInfos` array. Refer to the Queue Creation section below for further details.
• `pQueueCreateInfos` is a pointer to an array of `VkDeviceQueueCreateInfo` structures describing the queues that are requested to be created along with the logical device. Refer to the Queue Creation section below for further details.
• `enabledLayerCount` is deprecated and ignored.
• `ppEnabledLayerNames` is deprecated and ignored. See Device Layer Deprecation.
• `enabledExtensionCount` is the number of device extensions to enable.
- `ppEnabledExtensionNames` is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable for the created device. See the Extensions section for further details.

- `pEnabledFeatures` is NULL or a pointer to a `VkPhysicalDeviceFeatures` structure containing boolean indicators of all the features to be enabled. Refer to the Features section for further details.

---

### Valid Usage

- **VUID-VkDeviceCreateInfo-queueFamilyIndex-02802**
  The `queueFamilyIndex` member of each element of `pQueueCreateInfos` must be unique within `pQueueCreateInfos`, except that two members can share the same `queueFamilyIndex` if one describes protected-capable queues and one describes queues that are not protected-capable.

- **VUID-VkDeviceCreateInfo-pQueueCreateInfos-06755**
  If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, the sum of their `queueCount` members must be less than or equal to the `queueCount` member of the `VkQueueFamilyProperties` structure, as returned by `vkGetPhysicalDeviceQueueFamilyProperties` in the `pQueueFamilyProperties[queueFamilyIndex]`.

- **VUID-VkDeviceCreateInfo-pQueueCreateInfos-06654**
  If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, then all of such elements must have the same global priority level, which can be specified explicitly by the including a `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure in the `pNext` chain, or by the implicit default value.

- **VUID-VkDeviceCreateInfo-pNext-00373**
  If the `pNext` chain includes a `VkPhysicalDeviceFeatures2` structure, then `pEnabledFeatures` must be NULL.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-01840**
  `ppEnabledExtensionNames` must not contain `VK_AMD_negative_viewport_height`.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-03328**
  `ppEnabledExtensionNames` must not contain both `VK_KHR_buffer_device_address` and `VK_EXT_buffer_device_address`.

- **VUID-VkDeviceCreateInfo-pNext-04748**
  If the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure and `VkPhysicalDeviceVulkan12Features::bufferDeviceAddress` is `VK_TRUE`, `ppEnabledExtensionNames` must not contain `VK_EXT_buffer_device_address`.

- **VUID-VkDeviceCreateInfo-pNext-02829**
  If the `pNext` chain includes a `VkPhysicalDeviceVulkan11Features` structure, then it must not include a `VkPhysicalDevice16BitStorageFeatures`, `VkPhysicalDeviceMultiviewFeatures`, `VkPhysicalDeviceVariablePointersFeatures`, `VkPhysicalDeviceProtectedMemoryFeatures`, `VkPhysicalDeviceSamplerYcbcrConversionFeatures`, or `VkPhysicalDeviceShaderDrawParametersFeatures` structure.
• VUID-VkDeviceCreateInfo-pNext-02830
   If the *pNext* chain includes a *VkPhysicalDeviceVulkan12Features* structure, then it **must**
   not include a
   *VkPhysicalDevice8BitStorageFeatures,
   VkPhysicalDeviceShaderAtomicInt64Features,
   VkPhysicalDeviceShaderFloat16Int8Features,
   VkPhysicalDeviceDescriptorIndexingFeatures,
   VkPhysicalDeviceScalarBlockLayoutFeatures,
   VkPhysicalDeviceImagelessFramebufferFeatures,
   VkPhysicalDeviceUniformBufferStandardLayoutFeatures,
   VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures,
   VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures,
   VkPhysicalDeviceHostQueryResetFeatures,
   VkPhysicalDeviceTimelineSemaphoreFeatures,
   VkPhysicalDeviceBufferDeviceAddressFeatures,
   or
   *VkPhysicalDeviceVulkanMemoryModelFeatures* structure

• VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-04476
   If *ppEnabledExtensionNames* contains "VK_KHR_shader_draw_parameters" and the *pNext* chain
   includes a *VkPhysicalDeviceVulkan11Features* structure, then
   *VkPhysicalDeviceVulkan11Features::shaderDrawParameters must be VK_TRUE

• VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02831
   If *ppEnabledExtensionNames* contains "VK_KHR_draw_indirect_count" and the *pNext* chain
   includes a *VkPhysicalDeviceVulkan12Features* structure, then
   *VkPhysicalDeviceVulkan12Features::drawIndirectCount must be VK_TRUE

• VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02832
   If *ppEnabledExtensionNames* contains "VK_KHR_sampler_mirror_clamp_to_edge" and the *pNext* chain
   includes a *VkPhysicalDeviceVulkan12Features* structure, then
   *VkPhysicalDeviceVulkan12Features::samplerMirrorClampToEdge must be VK_TRUE

• VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02833
   If *ppEnabledExtensionNames* contains "VK_EXT_descriptor_indexing" and the *pNext* chain
   includes a *VkPhysicalDeviceVulkan12Features* structure, then
   *VkPhysicalDeviceVulkan12Features::descriptorIndexing must be VK_TRUE

• VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02834
   If *ppEnabledExtensionNames* contains "VK_EXT_sampler_filter_minmax" and the *pNext* chain
   includes a *VkPhysicalDeviceVulkan12Features* structure, then
   *VkPhysicalDeviceVulkan12Features::samplerFilterMinmax must be VK_TRUE

• VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02835
   If *ppEnabledExtensionNames* contains "VK_EXT_shader_viewport_index_layer" and the *pNext* chain
   includes a *VkPhysicalDeviceVulkan12Features* structure, then
   *VkPhysicalDeviceVulkan12Features::shaderOutputViewportIndex and
   VkPhysicalDeviceVulkan12Features::shaderOutputLayer must both be VK_TRUE

• VUID-VkDeviceCreateInfo-pNext-06532
   If the *pNext* chain includes a *VkPhysicalDeviceVulkan13Features* structure, then it **must**
   not include a
   *VkPhysicalDeviceDynamicRenderingFeatures,
   VkPhysicalDeviceImageRobustnessFeatures,
   VkPhysicalDeviceInlineUniformBlockFeatures,
   VkPhysicalDeviceMaintenance4Features,
VkPhysicalDevicePipelineCreationCacheControlFeatures,
VkPhysicalDevicePrivateDataFeatures,
VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures,
VkPhysicalDeviceShaderIntegerDotProductFeatures,
VkPhysicalDeviceShaderTerminateInvocationFeatures,
VkPhysicalDeviceSubgroupSizeControlFeatures,
VkPhysicalDeviceSynchronization2Features,
VkPhysicalDeviceTextureCompressionASTCHDRFeatures, or
VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures structure

- VUID-VkDeviceCreateInfo-pProperties-04451
  If the VK_KHR_portability_subset extension is included in pProperties of
  vkEnumerateDeviceExtensionProperties, ppEnabledExtensionNames must include
  "VK_KHR_portability_subset"

- VUID-VkDeviceCreateInfo-shadingRateImage-04478
  If the shadingRateImage feature is enabled, the pipelineFragmentShadingRate feature must
  not be enabled

- VUID-VkDeviceCreateInfo-shadingRateImage-04479
  If the shadingRateImage feature is enabled, the primitiveFragmentShadingRate feature must
  not be enabled

- VUID-VkDeviceCreateInfo-shadingRateImage-04480
  If the shadingRateImage feature is enabled, the attachmentFragmentShadingRate feature must
  not be enabled

- VUID-VkDeviceCreateInfo-fragmentDensityMap-04481
  If the fragmentDensityMap feature is enabled, the pipelineFragmentShadingRate feature must
  not be enabled

- VUID-VkDeviceCreateInfo-fragmentDensityMap-04482
  If the fragmentDensityMap feature is enabled, the primitiveFragmentShadingRate feature must
  not be enabled

- VUID-VkDeviceCreateInfo-fragmentDensityMap-04483
  If the fragmentDensityMap feature is enabled, the attachmentFragmentShadingRate feature must
  not be enabled

- VUID-VkDeviceCreateInfo-None-04896
  If sparseImageInt64Atomics is enabled, shaderImageInt64Atomics must be enabled

- VUID-VkDeviceCreateInfo-None-04897
  If sparseImageFloat32Atomics is enabled, shaderImageFloat32Atomics must be enabled

- VUID-VkDeviceCreateInfo-None-04898
  If sparseImageFloat32AtomicAdd is enabled, shaderImageFloat32AtomicAdd must be enabled

- VUID-VkDeviceCreateInfo-sparseImageFloat32AtomicMinMax-04975
  If sparseImageFloat32AtomicMinMax is enabled, shaderImageFloat32AtomicMinMax must be
  enabled
Valid Usage (Implicit)

- VUID-VkDeviceCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO

- VUID-VkDeviceCreateInfo-pNext-pNext

VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures

• VUID-VkDeviceCreateInfo-sType-unique
The sType value of each struct in the pNext chain must be unique, with the exception of structures of type VkDeviceDeviceMemoryReportCreateInfoEXT or VkDevicePrivateDataCreateInfo
• VUID-VkDeviceCreateInfo-flags-zerobitmask
  \textit{flags} \textbf{must} be 0

• VUID-VkDeviceCreateInfo-pQueueCreateInfos-parameter
  \textit{pQueueCreateInfos} \textbf{must} be a valid pointer to an array of \textit{queueCreateInfoCount} valid
  \textit{VkDeviceQueueCreateInfo} structures

• VUID-VkDeviceCreateInfo-ppEnabledLayerNames-parameter
  If \textit{enabledLayerCount} is not 0, \textit{ppEnabledLayerNames} \textbf{must} be a valid pointer to an array of
  \textit{enabledLayerCount} null-terminated UTF-8 strings

• VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-parameter
  If \textit{enabledExtensionCount} is not 0, \textit{ppEnabledExtensionNames} \textbf{must} be a valid pointer to an
  array of \textit{enabledExtensionCount} null-terminated UTF-8 strings

• VUID-VkDeviceCreateInfo-pEnabledFeatures-parameter
  If \textit{pEnabledFeatures} is not NULL, \textit{pEnabledFeatures} \textbf{must} be a valid pointer to a valid
  \textit{VkPhysicalDeviceFeatures} structure

• VUID-VkDeviceCreateInfo-queueCreateInfoCount-arraylength
  \textit{queueCreateInfoCount} \textbf{must} be greater than 0

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceCreateFlags;
```

\textit{VkDeviceCreateFlags} is a bitmask type for setting a mask, but is currently reserved for future use.

A logical device \textbf{can} be created that connects to one or more physical devices by adding a
\textit{VkDeviceGroupDeviceCreateInfo} structure to the \textit{pNext} chain of \textit{VkDeviceCreateInfo}. The
\textit{VkDeviceGroupDeviceCreateInfo} structure is defined as:

```cpp
// Provided by VK_VERSION_1_1
typedef struct VK_VERSION_1_1
#endif

typedef struct VkDeviceGroupDeviceCreateInfo {
  VkStructureType sType;
  const void* pNext;
  uint32_t physicalDeviceCount;
  const VkPhysicalDevice* pPhysicalDevices;
} VkDeviceGroupDeviceCreateInfo;
```

or the equivalent

```cpp
// Provided by VK_KHR_device_group_creation
typedef VkDeviceGroupDeviceCreateInfo VkDeviceGroupDeviceCreateInfoKHR;
```

• \textit{sType} is the type of this structure.

• \textit{pNext} is NULL or a pointer to a structure extending this structure.

• \textit{physicalDeviceCount} is the number of elements in the \textit{pPhysicalDevices} array.
• **pPhysicalDevices** is a pointer to an array of physical device handles belonging to the same device group.

The elements of the **pPhysicalDevices** array are an ordered list of the physical devices that the logical device represents. These must be a subset of a single device group, and need not be in the same order as they were enumerated. The order of the physical devices in the **pPhysicalDevices** array determines the *device index* of each physical device, with element *i* being assigned a device index of *i*. Certain commands and structures refer to one or more physical devices by using device indices or *device masks* formed using device indices.

A logical device created without using **VkDeviceGroupDeviceCreateInfo**, or with **physicalDeviceCount** equal to zero, is equivalent to a **physicalDeviceCount** of one and **pPhysicalDevices** pointing to the **physicalDevice** parameter to **vkCreateDevice**. In particular, the device index of that physical device is zero.

Valid Usage

- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00375
  Each element of **pPhysicalDevices** must be unique

- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00376
  All elements of **pPhysicalDevices** must be in the same device group as enumerated by **vkEnumeratePhysicalDeviceGroups**

- VUID-VkDeviceGroupDeviceCreateInfo-physicalDeviceCount-00377
  If **physicalDeviceCount** is not 0, the **physicalDevice** parameter of **vkCreateDevice** must be an element of **pPhysicalDevices**

Valid Usage (Implicit)

- VUID-VkDeviceGroupDeviceCreateInfo-sType-sType
  *sType* must be **VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO**

- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-parameter
  If **physicalDeviceCount** is not 0, **pPhysicalDevices** must be a valid pointer to an array of **physicalDeviceCount** valid **VkPhysicalDevice** handles

To specify whether device memory allocation is allowed beyond the size reported by **VkPhysicalDeviceMemoryProperties**, add a **VkDeviceMemoryOverallocationCreateInfoAMD** structure to the **pNext** chain of the **VkDeviceCreateInfo** structure. If this structure is not specified, it is as if the **VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD** value is used.

```c
// Provided by VK_AMD_memory_overallocation_behavior
typedef struct VkDeviceMemoryOverallocationCreateInfoAMD {
    VkStructureType sType;
    const void* pNext;
    VkMemoryOverallocationBehaviorAMD overallocationBehavior;
};
```
• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **overallocationBehavior** is the desired overallocation behavior.

### Valid Usage (Implicit)

- **VUID-VkDeviceMemoryOverallocationCreateInfoAMD-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_DEVICE_MEMORY_OVERALLOCATION_CREATE_INFO_AMD**

- **VUID-VkDeviceMemoryOverallocationCreateInfoAMD-overallocationBehavior-parameter**
  
  **overallocationBehavior** must be a valid **VkMemoryOverallocationBehaviorAMD** value

Possible values for **VkDeviceMemoryOverallocationCreateInfoAMD::overallocationBehavior** include:

// Provided by VK_AMD_memory_overallocation_behavior
typedef enum VkMemoryOverallocationBehaviorAMD {
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD = 0,
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_ALLOWED_AMD = 1,
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_DISALLOWED_AMD = 2,
} VkMemoryOverallocationBehaviorAMD;

- **VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD** lets the implementation decide if overallocation is allowed.
- **VK_MEMORY_OVERALLOCATION_BEHAVIOR_ALLOWED_AMD** specifies overallocation is allowed if platform permits.
- **VK_MEMORY_OVERALLOCATION_BEHAVIOR_DISALLOWED_AMD** specifies the application is not allowed to allocate device memory beyond the heap sizes reported by **VkPhysicalDeviceMemoryProperties**. Allocations that are not explicitly made by the application within the scope of the Vulkan instance are not accounted for.

When using the Nsight™ Aftermath SDK, to configure how device crash dumps are created, add a **VkDeviceDiagnosticsConfigCreateInfoNV** structure to the **pNext** chain of the **VkDeviceCreateInfo** structure.

// Provided by VK_NV_device_diagnostics_config
typedef struct VkDeviceDiagnosticsConfigCreateInfoNV {
    VkStructureType           sType;
    const void*               pNext;
    VkDeviceDiagnosticsConfigFlagsNV flags;
} VkDeviceDiagnosticsConfigCreateInfoNV;

• **sType** is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `flags` is a bitmask of `VkDeviceDiagnosticsConfigFlagBitsNV` specifying additional parameters for configuring diagnostic tools.

---

**Valid Usage (Implicit)**

- VUID-VkDeviceDiagnosticsConfigCreateInfoNV-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_DEVICE_DIAGNOSTICS_CONFIG_CREATE_INFO_NV`
- VUID-VkDeviceDiagnosticsConfigCreateInfoNV-flags-parameter
  - `flags` must be a valid combination of `VkDeviceDiagnosticsConfigFlagBitsNV` values

Bits which can be set in `VkDeviceDiagnosticsConfigCreateInfoNV::flags` include:

```c
// Provided by VK_NV_device_diagnostics_config
typedef enum VkDeviceDiagnosticsConfigFlagBitsNV {
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_DEBUG_INFO_BIT_NV = 0x00000001,
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_RESOURCE_TRACKING_BIT_NV = 0x00000002,
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_AUTOMATIC_CHECKPOINTS_BIT_NV = 0x00000004,
    VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_ERROR_REPORTING_BIT_NV = 0x00000008,
} VkDeviceDiagnosticsConfigFlagBitsNV;
```

- `VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_DEBUG_INFO_BIT_NV` enables the generation of debug information for shaders.
- `VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_RESOURCE_TRACKING_BIT_NV` enables driver side tracking of resources (images, buffers, etc.) used to augment the device fault information.
- `VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_AUTOMATIC_CHECKPOINTS_BIT_NV` enables automatic insertion of diagnostic checkpoints for draw calls, dispatches, trace rays, and copies. The CPU call stack at the time of the command will be associated as the marker data for the automatically inserted checkpoints.
- `VK_DEVICE_DIAGNOSTICS_CONFIG_ENABLE_SHADER_ERROR_REPORTING_BIT_NV` enables shader error reporting.

```c
// Provided by VK_NV_device_diagnostics_config
typedef VkFlags VkDeviceDiagnosticsConfigFlagsNV;
```

`VkDeviceDiagnosticsConfigFlagsNV` is a bitmask type for setting a mask of zero or more `VkDeviceDiagnosticsConfigFlagBitsNV`.

To register callbacks for underlying device memory events of type `VkDeviceMemoryReportEventTypeEXT`, add one or multiple `VkDeviceDeviceMemoryReportCreateInfoEXT` structures to the `pNext` chain of the `VkDeviceCreateInfo` structure.
typedef struct VkDeviceDeviceMemoryReportCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemoryReportFlagsEXT flags;
    PFN_vkDeviceMemoryReportCallbackEXT pfnUserCallback;
    void* pUserData;
} VkDeviceDeviceMemoryReportCreateInfoEXT;

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is 0 and reserved for future use.
- pfnUserCallback is the application callback function to call.
- pUserData is user data to be passed to the callback.

The callback may be called from multiple threads simultaneously.

The callback must be called only once by the implementation when a VkDeviceMemoryReportEventTypeEXT event occurs.

Note
The callback could be called from a background thread other than the thread calling the Vulkan commands.

Valid Usage (Implicit)

- VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_DEVICE_MEMORY_REPORT_CREATE_INFO_EXT
- VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-flags-zerobitmask
  flags must be 0
- VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-pfnUserCallback-parameter
  pfnUserCallback must be a valid PFN_vkDeviceMemoryReportCallbackEXT value
- VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-pUserData-parameter
  pUserData must be a pointer value

The prototype for the VkDeviceDeviceMemoryReportCreateInfoEXT::pfnUserCallback function implemented by the application is:

// Provided by VK_EXT_device_memory_report
typedef void (VKAPI_PTR *PFN_vkDeviceMemoryReportCallbackEXT)(
    const VkDeviceMemoryReportCallbackDataEXT* pCallbackData,
    void* pUser);
• **pCallbackData** contains all the callback related data in the `VkDeviceMemoryReportCallbackDataEXT` structure.

• **pUserData** is the user data provided when the `VkDeviceDeviceMemoryReportCreateInfoEXT` was created.

The callback **must** not make calls to any Vulkan commands.

The definition of `VkDeviceMemoryReportCallbackDataEXT` is:

```c
// Provided by VK_EXT_device_memory_report
typedef struct VkDeviceMemoryReportCallbackDataEXT {
    VkStructureType          sType;
    void*                    pNext;
    VkDeviceMemoryReportFlagsEXT flags;
    VkDeviceMemoryReportEventTypeEXT type;
    uint64_t                 memoryObjectId;
    VkDeviceSize             size;
    VkObjectType             objectType;
    uint64_t                 objectHandle;
    uint32_t                 heapIndex;
} VkDeviceMemoryReportCallbackDataEXT;
```

• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **flags** is 0 and reserved for future use.

• **type** is a `VkDeviceMemoryReportEventTypeEXT` type specifying the type of event reported in this `VkDeviceMemoryReportCallbackDataEXT` structure.

• **memoryObjectId** is the unique id for the underlying memory object as described below.

• **size** is the size of the memory object in bytes. If **type** is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT`, or `VK DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT`, **size** is a valid `VkDeviceSize` value. Otherwise, **size** is undefined.

• **objectType** is a `VkObjectType` value specifying the type of the object associated with this device memory report event. If **type** is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT`, or `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT`, **objectType** is a valid `VkObjectType` enum. Otherwise, **objectType** is undefined.

• **objectHandle** is the object this device memory report event is attributed to. If **type** is `VK DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT`, `VK DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT`, `VK DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT`, or `VK DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT`, **objectHandle** is a valid Vulkan handle of the type associated with **objectType** as defined in the `VkObjectType` and Vulkan Handle Relationship table. Otherwise, **objectHandle** is undefined.
• **heapIndex** describes which memory heap this device memory allocation is made from. If **type** is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT` or `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT`, **heapIndex** corresponds to one of the valid heaps from the `VkPhysicalDeviceMemoryProperties` structure. Otherwise, **heapIndex** is undefined.

**memoryObjectId** is used to avoid double-counting on the same memory object.

If an internally-allocated device memory object or a `VkDeviceMemory` cannot be exported, **memoryObjectId** must be unique in the `VkDevice`.

If an internally-allocated device memory object or a `VkDeviceMemory` supports being exported, **memoryObjectId** must be unique system wide.

If an internal device memory object or a `VkDeviceMemory` is backed by an imported external memory object, **memoryObjectId** must be unique system wide.

---

**Implementor’s Note**

If the heap backing an internally-allocated device memory cannot be used to back `VkDeviceMemory`, implementations can advertise that heap with no types.

---

**Note**

This structure should only be considered valid during the lifetime of the triggered callback.

For `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT` and `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT` events, **objectHandle** usually will not yet exist when the application or tool receives the callback. **objectHandle** will only exist when the create or allocate call that triggered the event returns, and if the allocation or import ends up failing **objectHandle** will not ever exist.

---

**Valid Usage (Implicit)**

• **VUID-VkDeviceMemoryReportCallbackDataEXT-sType-sType**
  **sType** must be `VK_STRUCTURE_TYPE_DEVICE_MEMORY_REPORT_CALLBACK_DATA_EXT`

• **VUID-VkDeviceMemoryReportCallbackDataEXT-pNext-pNext**
  **pNext** must be NULL

---

```c
// Provided by VK_EXT_device_memory_report
typedef VkFlags VkDeviceMemoryReportFlagsEXT;
```

`VkDeviceMemoryReportFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.
Possible values of `VkDeviceMemoryReportCallbackDataEXT::type`, specifying event types which cause the device driver to call the callback, are:

```c
// Provided by VK_EXT_device_memory_report
typedef enum VkDeviceMemoryReportEventTypeEXT {
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT = 0,
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT = 1,
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT = 2,
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT = 3,
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT = 4,
} VkDeviceMemoryReportEventTypeEXT;
```

- `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT` specifies this event corresponds to the allocation of an internal device memory object or a `VkDeviceMemory`.
- `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT` specifies this event corresponds to the deallocation of an internally-allocated device memory object or a `VkDeviceMemory`.
- `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT` specifies this event corresponds to the import of an external memory object.
- `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT` specifies this event is the release of an imported external memory object.
- `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT` specifies this event corresponds to the failed allocation of an internal device memory object or a `VkDeviceMemory`.

To reserve private data storage slots, add a `VkDevicePrivateDataCreateInfo` structure to the `pNext` chain of the `VkDeviceCreateInfo` structure. Reserving slots in this manner is not strictly necessary, but doing so may improve performance.

```c
// Provided by VK_VERSION_1_3
typedef struct VkDevicePrivateDataCreateInfo {
    VkStructureType      sType;
    const void*           pNext;
    uint32_t              privateDataSlotRequestCount;
} VkDevicePrivateDataCreateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_private_data
typedef VkDevicePrivateDataCreateInfo VkDevicePrivateDataCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `privateDataSlotRequestCount` is the amount of slots to reserve.
5.2.2. Device Use

The following is a high-level list of VkDevice uses along with references on where to find more information:

- Creation of queues. See the Queues section below for further details.
- Creation and tracking of various synchronization constructs. See Synchronization and Cache Control for further details.
- Allocating, freeing, and managing memory. See Memory Allocation and Resource Creation for further details.
- Creation and destruction of command buffers and command buffer pools. See Command Buffers for further details.
- Creation, destruction, and management of graphics state. See Pipelines and Resource Descriptors, among others, for further details.

5.2.3. Lost Device

A logical device may become lost for a number of implementation-specific reasons, indicating that pending and future command execution may fail and cause resources and backing memory to become undefined.

Note

Typical reasons for device loss will include things like execution timing out (to prevent denial of service), power management events, platform resource management, implementation errors.

Applications not adhering to valid usage may also result in device loss being reported, however this is not guaranteed. Even if device loss is reported, the system may be in an unrecoverable state, and further usage of the API is still considered invalid.

When this happens, certain commands will return VK_ERROR_DEVICE_LOST. After any such event, the logical device is considered lost. It is not possible to reset the logical device to a non-lost state, however the lost state is specific to a logical device (VkDevice), and the corresponding physical device (VkPhysicalDevice) may be otherwise unaffected.

In some cases, the physical device may also be lost, and attempting to create a new logical device will fail, returning VK_ERROR_DEVICE_LOST. This is usually indicative of a problem with the underlying implementation, or its connection to the host. If the physical device has not been lost, and a new logical device is successfully created from that physical device, it must be in the non-lost state.
Whilst logical device loss may be recoverable, in the case of physical device loss, it is unlikely that an application will be able to recover unless additional, unaffected physical devices exist on the system. The error is largely informational and intended only to inform the user that a platform issue has occurred, and should be investigated further. For example, underlying hardware may have developed a fault or become physically disconnected from the rest of the system. In many cases, physical device loss may cause other more serious issues such as the operating system crashing; in which case it may not be reported via the Vulkan API.

When a device is lost, its child objects are not implicitly destroyed and their handles are still valid. Those objects must still be destroyed before their parents or the device can be destroyed (see the Object Lifetime section). The host address space corresponding to device memory mapped using vkMapMemory is still valid, and host memory accesses to these mapped regions are still valid, but the contents are undefined. It is still legal to call any API command on the device and child objects.

Once a device is lost, command execution may fail, and commands that return a VkResult may return VK_ERROR_DEVICE_LOST. Commands that do not allow runtime errors must still operate correctly for valid usage and, if applicable, return valid data.

Commands that wait indefinitely for device execution (namely vkDeviceWaitIdle, vkQueueWaitIdle, vkWaitForFences or vkAcquireNextImageKHR with a maximum timeout, and vkGetQueryPoolResults with the VK_QUERY_RESULT_WAIT_BIT bit set in flags) must return in finite time even in the case of a lost device, and return either VK_SUCCESS or VK_ERROR_DEVICE_LOST. For any command that may return VK_ERROR_DEVICE_LOST, for the purpose of determining whether a command buffer is in the pending state, or whether resources are considered in-use by the device, a return value of VK_ERROR_DEVICE_LOST is equivalent to VK_SUCCESS.

The content of any external memory objects that have been exported from or imported to a lost device become undefined. Objects on other logical devices or in other APIs which are associated with the same underlying memory resource as the external memory objects on the lost device are unaffected other than their content becoming undefined. The layout of subresources of images on other logical devices that are bound to VkDeviceMemory objects associated with the same underlying memory resources as external memory objects on the lost device becomes VK_IMAGE_LAYOUT_UNDEFINED.

The state of VkSemaphore objects on other logical devices created by importing a semaphore payload with temporary permanence which was exported from the lost device is undefined. The state of VkSemaphore objects on other logical devices that permanently share a semaphore payload with a VkSemaphore object on the lost device is undefined, and remains undefined following any subsequent signal operations. Implementations must ensure pending and subsequently submitted wait operations on such semaphores behave as defined in Semaphore State Requirements For Wait Operations for external semaphores not in a valid state for a wait operation.

5.2.4. Device Destruction

To destroy a device, call:
// Provided by VK_VERSION_1_0

```c
void vkDestroyDevice(
    VkDevice device,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

To ensure that no work is active on the device, **vkDeviceWaitIdle** can be used to gate the destruction of the device. Prior to destroying a device, an application is responsible for destroying/freeing any Vulkan objects that were created using that device as the first parameter of the corresponding **vkCreate* or vkAllocate* command.

**Note**

The lifetime of each of these objects is bound by the lifetime of the **VkDevice** object. Therefore, to avoid resource leaks, it is critical that an application explicitly free all of these resources prior to calling **vkDestroyDevice**.

**Valid Usage**

- VUID-vkDestroyDevice-device-00378
  All child objects created on **device** must have been destroyed prior to destroying **device**

- VUID-vkDestroyDevice-device-00379
  If **VkAllocationCallbacks** were provided when **device** was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyDevice-device-00380
  If no **VkAllocationCallbacks** were provided when **device** was created, **pAllocator** must be **NULL**

**Valid Usage (Implicit)**

- VUID-vkDestroyDevice-device-parameter
  If **device** is not **NULL**, **device** must be a valid **VkDevice** handle

- VUID-vkDestroyDevice-pAllocator-parameter
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

**Host Synchronization**

- Host access to **device** must be externally synchronized
- Host access to all **VkQueue** objects created from **device** must be externally synchronized
5.3. Queues

5.3.1. Queue Family Properties

As discussed in the Physical Device Enumeration section above, the `vkGetPhysicalDeviceQueueFamilyProperties` command is used to retrieve details about the queue families and queues supported by a device.

Each index in the `pQueueFamilyProperties` array returned by `vkGetPhysicalDeviceQueueFamilyProperties` describes a unique queue family on that physical device. These indices are used when creating queues, and they correspond directly with the `queueFamilyIndex` that is passed to the `vkCreateDevice` command via the `VkDeviceQueueCreateInfo` structure as described in the Queue Creation section below.

Grouping of queue families within a physical device is implementation-dependent.

---

**Note**

The general expectation is that a physical device groups all queues of matching capabilities into a single family. However, while implementations should do this, it is possible that a physical device may return two separate queue families with the same capabilities.

---

Once an application has identified a physical device with the queue(s) that it desires to use, it will create those queues in conjunction with a logical device. This is described in the following section.

5.3.2. Queue Creation

Creating a logical device also creates the queues associated with that device. The queues to create are described by a set of `VkDeviceQueueCreateInfo` structures that are passed to `vkCreateDevice` in `pQueueCreateInfos`.

Queues are represented by `VkQueue` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkQueue)
```

The `VkDeviceQueueCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDeviceQueueCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t queueFamilyIndex;
    uint32_t queueCount;
    const float* pQueuePriorities;
} VkDeviceQueueCreateInfo;
```
• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is a bitmask indicating behavior of the queues.

• **queueFamilyIndex** is an unsigned integer indicating the index of the queue family in which to create the queues on this device. This index corresponds to the index of an element of the **pQueueFamilyProperties** array that was returned by **vkGetPhysicalDeviceQueueFamilyProperties**.

• **queueCount** is an unsigned integer specifying the number of queues to create in the queue family indicated by **queueFamilyIndex**, and with the behavior specified by **flags**.

• **pQueuePriorities** is a pointer to an array of **queueCount** normalized floating point values, specifying priorities of work that will be submitted to each created queue. See [Queue Priority](#) for more information.

## Valid Usage

- VUID-VkDeviceQueueCreateInfo-queueFamilyIndex-00381
  **queueFamilyIndex** must be less than **pQueueFamilyPropertyCount** returned by **vkGetPhysicalDeviceQueueFamilyProperties**

- VUID-VkDeviceQueueCreateInfo-queueCount-00382
  **queueCount** must be less than or equal to the **queueCount** member of the **VkQueueFamilyProperties** structure, as returned by **vkGetPhysicalDeviceQueueFamilyProperties** in the **pQueueFamilyProperties[queueFamilyIndex]**

- VUID-VkDeviceQueueCreateInfo-pQueuePriorities-00383
  Each element of **pQueuePriorities** must be between 0.0 and 1.0 inclusive

- VUID-VkDeviceQueueCreateInfo-flags-02861
  If the protectedMemory feature is not enabled, the **VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT** bit of **flags** must not be set

- VUID-VkDeviceQueueCreateInfo-flags-06449
  If **flags** includes **VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT**, **queueFamilyIndex** must be the index of a queue family that includes the **VK_QUEUE_PROTECTED_BIT** capability

## Valid Usage (Implicit)

- VUID-VkDeviceQueueCreateInfo-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO**

- VUID-VkDeviceQueueCreateInfo-pNext-pNext
  **pNext** must be NULL or a pointer to a valid instance of **VkDeviceQueueGlobalPriorityCreateInfoKHR**

- VUID-VkDeviceQueueCreateInfo-sType-unique
  The **sType** value of each struct in the **pNext** chain must be unique

- VUID-VkDeviceQueueCreateInfo-flags-parameter
  **flags** must be a valid combination of **VkDeviceQueueCreateFlagBits** values
• **VUID-VkDeviceQueueCreateInfo-pQueuePriorities-parameter**
  
  `pQueuePriorities` must be a valid pointer to an array of `queueCount` float values.

• **VUID-VkDeviceQueueCreateInfo-queueCount-arraylength**
  
  `queueCount` must be greater than 0.

Bits which can be set in `VkDeviceQueueCreateInfo::flags`, specifying usage behavior of a queue, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkDeviceQueueCreateFlagBits {
    // Provided by VK_VERSION_1_1
    VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT = 0x00000001,
} VkDeviceQueueCreateFlagBits;
```

- **VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT** specifies that the device queue is a protected-capable queue.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceQueueCreateFlags;
```

`VkDeviceQueueCreateFlags` is a bitmask type for setting a mask of zero or more `VkDeviceQueueCreateFlagBits`.

Queues can be created with a system-wide priority by adding a `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure to the `pNext` chain of `VkDeviceQueueCreateInfo`.

The `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_global_priority
typedef struct VkDeviceQueueGlobalPriorityCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkQueueGlobalPriorityKHR globalPriority;
} VkDeviceQueueGlobalPriorityCreateInfoKHR;
```

or the equivalent

```c
// Provided by VK_EXT_global_priority
typedef VkDeviceQueueGlobalPriorityCreateInfoKHR
VkDeviceQueueGlobalPriorityCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is **NULL** or a pointer to a structure extending this structure.
• **globalPriority** is the system-wide priority associated to these queues as specified by `VkQueueGlobalPriorityEXT`.

Queues created without specifying `VkDeviceQueueGlobalPriorityCreateInfoKHR` will default to `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR`.

### Valid Usage (Implicit)

- **VUID-VkDeviceQueueGlobalPriorityCreateInfoKHR-sType-sType**
  
  *sType* **must** be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_GLOBAL_PRIORITY_CREATE_INFO_KHR`.

- **VUID-VkDeviceQueueGlobalPriorityCreateInfoKHR-globalPriority-parameter**
  
  *globalPriority* **must** be a valid `VkQueueGlobalPriorityKHR` value.

Possible values of `VkDeviceQueueGlobalPriorityCreateInfoKHR::globalPriority`, specifying a system-wide priority level are:

```c
// Provided by VK_KHR_global_priority
typedef enum VkQueueGlobalPriorityKHR {
    VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR = 128,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR = 256,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR = 512,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR = 1024,
    VK_QUEUE_GLOBAL_PRIORITY_LOW_EXT = VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT = VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_EXT = VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_EXT = VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR,
} VkQueueGlobalPriorityKHR;
```

or the equivalent

```c
// Provided by VK_EXT_global_priority
typedef VkQueueGlobalPriorityKHR VkQueueGlobalPriorityEXT;
```

Priority values are sorted in ascending order. A comparison operation on the enum values can be used to determine the priority order.

- **VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR** is below the system default. Useful for non-interactive tasks.
- **VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR** is the system default priority.
- **VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR** is above the system default.
- **VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR** is the highest priority. Useful for critical tasks.

Queues with higher system priority **may** be allotted more processing time than queues with lower priority. An implementation **may** allow a higher-priority queue to starve a lower-priority queue until the higher-priority queue has no further commands to execute.
Priorities imply no ordering or scheduling constraints.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

The global priority level of a queue takes precedence over the per-process queue priority (VkDeviceQueueCreateInfo::pQueuePriorities).

Abuse of this feature may result in starving the rest of the system of implementation resources. Therefore, the driver implementation may deny requests to acquire a priority above the default priority (VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR) if the caller does not have sufficient privileges. In this scenario VK_ERROR_NOT_PERMITTED_KHR is returned.

The driver implementation may fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this scenario VK_ERROR_INITIALIZATION_FAILED is returned.

If the globalPriorityQuery feature is enabled and the requested global priority is not reported via VkQueueFamilyGlobalPriorityPropertiesKHR, the driver implementation must fail the queue creation. In this scenario, VK_ERROR_INITIALIZATION_FAILED is returned.

To retrieve a handle to a VkQueue object, call:

```c
// Provided by VK_VERSION_1_0
void vkGetDeviceQueue(VkDevice device, uint32_t queueFamilyIndex, uint32_t queueIndex, VkQueue* pQueue);
```

- `device` is the logical device that owns the queue.
- `queueFamilyIndex` is the index of the queue family to which the queue belongs.
- `queueIndex` is the index within this queue family of the queue to retrieve.
- `pQueue` is a pointer to a VkQueue object that will be filled with the handle for the requested queue.

vkGetDeviceQueue must only be used to get queues that were created with the flags parameter of VkDeviceQueueCreateInfo set to zero. To get queues that were created with a non-zero flags parameter use vkGetDeviceQueue2.

### Valid Usage

- VUID-vkGetDeviceQueue-queueFamilyIndex-00384
  queueFamilyIndex must be one of the queue family indices specified when device was created, via the VkDeviceQueueCreateInfo structure

- VUID-vkGetDeviceQueue-queueIndex-00385
  queueIndex must be less than the value of VkDeviceQueueCreateInfo::queueCount for the
queue family indicated by `queueFamilyIndex` when `device` was created

- VUID-vkGetDeviceQueue-flags-01841
  
  `VkDeviceQueueCreateInfo::flags` must have been set to zero when `device` was created

### Valid Usage (Implicit)

- VUID-vkGetDeviceQueue-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkGetDeviceQueue-pQueue-parameter
  
  `pQueue` must be a valid pointer to a `VkQueue` handle

To retrieve a handle to a `VkQueue` object with specific `VkDeviceQueueCreateFlags` creation flags, call:

```c
// Provided by VK_VERSION_1_1
void vkGetDeviceQueue2(
    VkDevice device,
    const VkDeviceQueueInfo2* pQueueInfo,
    VkQueue* pQueue);
```

- `device` is the logical device that owns the queue.
- `pQueueInfo` is a pointer to a `VkDeviceQueueInfo2` structure, describing parameters of the device queue to be retrieved.
- `pQueue` is a pointer to a `VkQueue` object that will be filled with the handle for the requested queue.

### Valid Usage (Implicit)

- VUID-vkGetDeviceQueue2-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkGetDeviceQueue2-pQueueInfo-parameter
  
  `pQueueInfo` must be a valid pointer to a valid `VkDeviceQueueInfo2` structure

- VUID-vkGetDeviceQueue2-pQueue-parameter
  
  `pQueue` must be a valid pointer to a `VkQueue` handle

The `VkDeviceQueueInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceQueueInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkDeviceQueueCreateFlags flags;
} VkDeviceQueueInfo2;
```
uint32_t queueFamilyIndex;
uint32_t queueIndex;
} VkDeviceQueueInfo2;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure. The **pNext** chain of **VkDeviceQueueInfo2** can be used to provide additional device queue parameters to **vkGetDeviceQueue2**.
- **flags** is a **VkDeviceQueueCreateFlags** value indicating the flags used to create the device queue.
- **queueFamilyIndex** is the index of the queue family to which the queue belongs.
- **queueIndex** is the index of the queue to retrieve from within the set of queues that share both the queue family and flags specified.

The queue returned by **vkGetDeviceQueue2** must have the same **flags** value from this structure as that used at device creation time in a **VkDeviceQueueCreateInfo** structure.

**Note**

Normally, if you create both protected-capable and non-protected-capable queues with the same family, they are treated as separate lists of queues and **queueIndex** is relative to the start of the list of queues specified by both **queueFamilyIndex** and **flags**. However, for historical reasons, some implementations may exhibit different behavior. These divergent implementations instead concatenate the lists of queues and treat **queueIndex** as relative to the start of the first list of queues with the given **queueFamilyIndex**. This only matters in cases where an application has created both protected-capable and non-protected-capable queues from the same queue family.

For such divergent implementations, the maximum value of **queueIndex** is equal to the sum of **VkDeviceQueueCreateInfo::queueCount** minus one, for all **VkDeviceQueueCreateInfo** structures that share a common **queueFamilyIndex**.

Such implementations will return **NULL** for either the protected or unprotected queues when calling **vkGetDeviceQueue2** with **queueIndex** in the range zero to **VkDeviceQueueCreateInfo::queueCount** minus one. In cases where these implementations returned **NULL**, the corresponding queues are instead located in the extended range described in the preceding two paragraphs.

This behaviour will not be observed on any driver that has passed Vulkan conformance test suite version 1.3.3.0, or any subsequent version. This information can be found by querying **VkPhysicalDeviceDriverProperties::conformanceVersion**.

**Valid Usage**

- **VUID-VkDeviceQueueInfo2-queueFamilyIndex-01842**
  queueFamilyIndex **must** be one of the queue family indices specified when **device** was
5.3.3. Queue Family Index

The queue family index is used in multiple places in Vulkan in order to tie operations to a specific family of queues.

When retrieving a handle to the queue via `vkGetDeviceQueue`, the queue family index is used to select which queue family to retrieve the `VkQueue` handle from as described in the previous section.

When creating a `VkCommandPool` object (see Command Pools), a queue family index is specified in the `VkCommandPoolCreateInfo` structure. Command buffers from this pool can only be submitted on queues corresponding to this queue family.

When creating `VkImage` (see Images) and `VkBuffer` (see Buffers) resources, a set of queue families is included in the `VkImageCreateInfo` and `VkBufferCreateInfo` structures to specify the queue families that can access the resource.

When inserting a `VkBufferMemoryBarrier` or `VkImageMemoryBarrier` (see Pipeline Barriers), a source and destination queue family index is specified to allow the ownership of a buffer or image to be transferred from one queue family to another. See the Resource Sharing section for details.

5.3.4. Queue Priority

Each queue is assigned a priority, as set in the `VkDeviceQueueCreateInfo` structures when creating the device. The priority of each queue is a normalized floating point value between 0.0 and 1.0, which is then translated to a discrete priority level by the implementation. Higher values indicate a higher priority, with 0.0 being the lowest priority and 1.0 being the highest.

Within the same device, queues with higher priority may be allotted more processing time than queues with lower priority. The implementation makes no guarantees with regards to ordering or
scheduling among queues with the same priority, other than the constraints defined by any explicit synchronization primitives. The implementation makes no guarantees with regards to queues across different devices.

An implementation may allow a higher-priority queue to starve a lower-priority queue on the same VkDevice until the higher-priority queue has no further commands to execute. The relationship of queue priorities must not cause queues on one VkDevice to starve queues on another VkDevice.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

5.3.5. Queue Submission

Work is submitted to a queue via queue submission commands such as vkQueueSubmit2 or vkQueueSubmit. Queue submission commands define a set of queue operations to be executed by the underlying physical device, including synchronization with semaphores and fences.

Submission commands take as parameters a target queue, zero or more batches of work, and an optional fence to signal upon completion. Each batch consists of three distinct parts:

1. Zero or more semaphores to wait on before execution of the rest of the batch.
   ◦ If present, these describe a semaphore wait operation.
2. Zero or more work items to execute.
   ◦ If present, these describe a queue operation matching the work described.
3. Zero or more semaphores to signal upon completion of the work items.
   ◦ If present, these describe a semaphore signal operation.

If a fence is present in a queue submission, it describes a fence signal operation.

All work described by a queue submission command must be submitted to the queue before the command returns.

Sparse Memory Binding

In Vulkan it is possible to sparsely bind memory to buffers and images as described in the Sparse Resource chapter. Sparse memory binding is a queue operation. A queue whose flags include the VK_QUEUE_SPARSE_BINDING_BIT must be able to support the mapping of a virtual address to a physical address on the device. This causes an update to the page table mappings on the device. This update must be synchronized on a queue to avoid corrupting page table mappings during execution of graphics commands. By binding the sparse memory resources on queues, all commands that are dependent on the updated bindings are synchronized to only execute after the binding is updated. See the Synchronization and Cache Control chapter for how this synchronization is accomplished.

5.3.6. Queue Destruction

Queues are created along with a logical device during vkCreateDevice. All queues associated with a logical device are destroyed when vkDestroyDevice is called on that device.
Chapter 6. Command Buffers

Command buffers are objects used to record commands which can be subsequently submitted to a device queue for execution. There are two levels of command buffers - primary command buffers, which can execute secondary command buffers, and which are submitted to queues, and secondary command buffers, which can be executed by primary command buffers, and which are not directly submitted to queues.

Command buffers are represented by VkCommandBuffer handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkCommandBuffer)
```

Recorded commands include commands to bind pipelines and descriptor sets to the command buffer, commands to modify dynamic state, commands to draw (for graphics rendering), commands to dispatch (for compute), commands to execute secondary command buffers (for primary command buffers only), commands to copy buffers and images, and other commands.

Each command buffer manages state independently of other command buffers. There is no inheritance of state across primary and secondary command buffers, or between secondary command buffers. When a command buffer begins recording, all state in that command buffer is undefined. When secondary command buffer(s) are recorded to execute on a primary command buffer, the secondary command buffer inherits no state from the primary command buffer, and all state of the primary command buffer is undefined after an execute secondary command buffer command is recorded. There is one exception to this rule - if the primary command buffer is inside a render pass instance, then the render pass and subpass state is not disturbed by executing secondary command buffers. For state dependent commands (such as draws and dispatches), any state consumed by those commands must not be undefined.

VkCommandBufferInheritanceViewportScissorInfoNV defines an exception allowing limited inheritance of dynamic viewport and scissor state.

Unless otherwise specified, and without explicit synchronization, the various commands submitted to a queue via command buffers may execute in arbitrary order relative to each other, and/or concurrently. Also, the memory side effects of those commands may not be directly visible to other commands without explicit memory dependencies. This is true within a command buffer, and across command buffers submitted to a given queue. See the synchronization chapter for information on implicit and explicit synchronization between commands.

6.1. Command Buffer Lifecycle

Each command buffer is always in one of the following states:

**Initial**

When a command buffer is allocated, it is in the initial state. Some commands are able to reset a command buffer (or a set of command buffers) back to this state from any of the executable, recording or invalid state. Command buffers in the initial state can only be moved to the
recording state, or freed.

**Recording**

vkBeginCommandBuffer changes the state of a command buffer from the initial state to the *recording state*. Once a command buffer is in the recording state, vkCmd* commands can be used to record to the command buffer.

**Executable**

vkEndCommandBuffer ends the recording of a command buffer, and moves it from the recording state to the *executable state*. Executable command buffers can be submitted, reset, or recorded to another command buffer.

**Pending**

Queue submission of a command buffer changes the state of a command buffer from the executable state to the *pending state*. Whilst in the pending state, applications must not attempt to modify the command buffer in any way - as the device may be processing the commands recorded to it. Once execution of a command buffer completes, the command buffer either reverts back to the *executable state*, or if it was recorded with VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT, it moves to the *invalid state*. A synchronization command should be used to detect when this occurs.

**Invalid**

Some operations, such as modifying or deleting a resource that was used in a command recorded to a command buffer, will transition the state of that command buffer into the *invalid state*. Command buffers in the invalid state can only be reset or freed.

---

![Figure 1. Lifecycle of a command buffer](image)

Any given command that operates on a command buffer has its own requirements on what state a command buffer must be in, which are detailed in the valid usage constraints for that command.

Resetting a command buffer is an operation that discards any previously recorded commands and puts a command buffer in the *initial state*. Resetting occurs as a result of vkResetCommandBuffer or vkResetCommandPool, or as part of vkBeginCommandBuffer (which additionally puts the command buffer in the *recording state*).
Secondary command buffers can be recorded to a primary command buffer via `vkCmdExecuteCommands`. This partially ties the lifecycle of the two command buffers together - if the primary is submitted to a queue, both the primary and any secondaries recorded to it move to the pending state. Once execution of the primary completes, so it does for any secondary recorded within it. After all executions of each command buffer complete, they each move to their appropriate completion state (either to the executable state or the invalid state, as specified above).

If a secondary moves to the invalid state or the initial state, then all primary buffers it is recorded in move to the invalid state. A primary moving to any other state does not affect the state of a secondary recorded in it.

**Note**
Resetting or freeing a primary command buffer removes the lifecycle linkage to all secondary command buffers that were recorded into it.

### 6.2. Command Pools

Command pools are opaque objects that command buffer memory is allocated from, and which allow the implementation to amortize the cost of resource creation across multiple command buffers. Command pools are externally synchronized, meaning that a command pool must not be used concurrently in multiple threads. That includes use via recording commands on any command buffers allocated from the pool, as well as operations that allocate, free, and reset command buffers or the pool itself.

Command pools are represented by `VkCommandPool` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCommandPool)
```

To create a command pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateCommandPool(
    VkDevice device,
    const VkCommandPoolCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkCommandPool* pCommandPool);
```

- **device** is the logical device that creates the command pool.
- **pCreateInfo** is a pointer to a `VkCommandPoolCreateInfo` structure specifying the state of the command pool object.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pCommandPool** is a pointer to a `VkCommandPool` handle in which the created pool is returned.
Valid Usage

- VUID-vkCreateCommandPool-queueFamilyIndex-01937
  
pCreateInfo->queueFamilyIndex must be the index of a queue family available in the logical device device

Valid Usage (Implicit)

- VUID-vkCreateCommandPool-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateCommandPool-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkCommandPoolCreateInfo structure

- VUID-vkCreateCommandPool-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateCommandPool-pCommandPool-parameter
  pCommandPool must be a valid pointer to a VkCommandPool handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkCommandPoolCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandPoolCreateFlags flags;
    uint32_t queueFamilyIndex;
} VkCommandPoolCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkCommandPoolCreateFlagBits indicating usage behavior for the pool and command buffers allocated from it.
• `queueFamilyIndex` designates a queue family as described in section Queue Family Properties. All command buffers allocated from this command pool must be submitted on queues from the same queue family.

### Valid Usage

- VUID-VkCommandPoolCreateInfo-flags-02860
  If the protectedMemory feature is not enabled, the VK_COMMAND_POOL_CREATE_PROTECTED_BIT bit of flags must not be set

### Valid Usage (Implicit)

- VUID-VkCommandPoolCreateInfo-sType-sType
  *sType* must be VK_STRUCTURE_TYPE_COMMAND_POOL_CREATE_INFO

- VUID-VkCommandPoolCreateInfo-pNext-pNext
  *pNext* must be NULL

- VUID-VkCommandPoolCreateInfo-flags-parameter
  *flags* must be a valid combination of VkCommandPoolCreateFlagBits values

Bits which can be set in VkCommandPoolCreateInfo::flags, specifying usage behavior for a command pool, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolCreateFlagBits {
    VK_COMMAND_POOL_CREATE_TRANSIENT_BIT = 0x00000001,
    VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT = 0x00000002,
// Provided by VK_VERSION_1_1
    VK_COMMAND_POOL_CREATE_PROTECTED_BIT = 0x00000004,
} VkCommandPoolCreateFlagBits;
```

- **VK_COMMAND_POOL_CREATE_TRANSIENT_BIT** specifies that command buffers allocated from the pool will be short-lived, meaning that they will be reset or freed in a relatively short timeframe. This flag may be used by the implementation to control memory allocation behavior within the pool.

- **VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT** allows any command buffer allocated from a pool to be individually reset to the initial state; either by calling `vkResetCommandBuffer`, or via the implicit reset when calling `vkBeginCommandBuffer`. If this flag is not set on a pool, then `vkResetCommandBuffer` must not be called for any command buffer allocated from that pool.

- **VK_COMMAND_POOL_CREATE_PROTECTED_BIT** specifies that command buffers allocated from the pool are protected command buffers.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolCreateFlags;
```
VkCommandPoolCreateFlags is a bitmask type for setting a mask of zero or more VkCommandPoolCreateFlagBits.

To trim a command pool, call:

```c
// Provided by VK_VERSION_1_1
void vkTrimCommandPool(
    VkDevice device,
    VkCommandPool commandPool,
    VkCommandPoolTrimFlags flags);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance1
void vkTrimCommandPoolKHR(
    VkDevice device,
    VkCommandPool commandPool,
    VkCommandPoolTrimFlags flags);
```

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool to trim.
- `flags` is reserved for future use.

Trimming a command pool recycles unused memory from the command pool back to the system. Command buffers allocated from the pool are not affected by the command.

**Note**
This command provides applications with some control over the internal memory allocations used by command pools.

Unused memory normally arises from command buffers that have been recorded and later reset, such that they are no longer using the memory. On reset, a command buffer can return memory to its command pool, but the only way to release memory from a command pool to the system requires calling `vkResetCommandPool`, which cannot be executed while any command buffers from that pool are still in use. Subsequent recording operations into command buffers will re-use this memory but since total memory requirements fluctuate over time, unused memory can accumulate.

In this situation, trimming a command pool **may** be useful to return unused memory back to the system, returning the total outstanding memory allocated by the pool back to a more “average” value.

Implementations utilize many internal allocation strategies that make it impossible to guarantee that all unused memory is released back to the system. For instance, an implementation of a command pool **may** involve allocating memory in bulk from the system and sub-allocating from that memory. In such an
implementation any live command buffer that holds a reference to a bulk allocation would prevent that allocation from being freed, even if only a small proportion of the bulk allocation is in use.

In most cases trimming will result in a reduction in allocated but unused memory, but it does not guarantee the “ideal” behavior.

Trimming may be an expensive operation, and should not be called frequently. Trimming should be treated as a way to relieve memory pressure after application-known points when there exists enough unused memory that the cost of trimming is “worth” it.

### Valid Usage (Implicit)

- **VUID-vkTrimCommandPool-device-parameter**
  device must be a valid VkDevice handle

- **VUID-vkTrimCommandPool-commandPool-parameter**
  commandPool must be a valid VkCommandPool handle

- **VUID-vkTrimCommandPool-flags-zerobitmask**
  flags must be 0

- **VUID-vkTrimCommandPool-commandPool-parent**
  commandPool must have been created, allocated, or retrieved from device

### Host Synchronization

- Host access to commandPool must be externally synchronized

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkCommandPoolTrimFlags;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance1
typedef VkCommandPoolTrimFlags VkCommandPoolTrimFlagsKHR;
```

**VkCommandPoolTrimFlags** is a bitmask type for setting a mask, but is currently reserved for future use.

To reset a command pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetCommandPool(
    VkDevice device,
    VkCommandPool commandPool,
```
VkCommandPoolResetFlags flags);

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool to reset.
- `flags` is a bitmask of `VkCommandPoolResetFlagBits` controlling the reset operation.

Resetting a command pool recycles all of the resources from all of the command buffers allocated from the command pool back to the command pool. All command buffers that have been allocated from the command pool are put in the initial state.

Any primary command buffer allocated from another `VkCommandPool` that is in the recording or executable state and has a secondary command buffer allocated from `commandPool` recorded into it, becomes invalid.

**Valid Usage**

- VUID-vkResetCommandPool-commandPool-00040
  All `VkCommandBuffer` objects allocated from `commandPool` must not be in the pending state

**Valid Usage (Implicit)**

- VUID-vkResetCommandPool-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkResetCommandPool-commandPool-parameter
  `commandPool` must be a valid `VkCommandPool` handle
- VUID-vkResetCommandPool-flags-parameter
  `flags` must be a valid combination of `VkCommandPoolResetFlagBits` values
- VUID-vkResetCommandPool-commandPool-parent
  `commandPool` must have been created, allocated, or retrieved from `device`

**Host Synchronization**

- Host access to `commandPool` must be externally synchronized

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
Bits which can be set in `vkResetCommandPool::flags`, controlling the reset operation, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolResetFlagBits {
    VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandPoolResetFlagBits;
```

- `VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT` specifies that resetting a command pool recycles all of the resources from the command pool back to the system.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolResetFlags;
```

`VkCommandPoolResetFlags` is a bitmask type for setting a mask of zero or more `VkCommandPoolResetFlagBits`.

To destroy a command pool, call:

```cpp
// Provided by VK_VERSION_1_0
void vkDestroyCommandPool(
    VkDevice device,        // logical device that destroys the command pool.
    VkCommandPool commandPool,    // handle of the command pool to destroy.
    const VkAllocationCallbacks* pAllocator);    // controls host memory allocation as described in the Memory Allocation chapter.
```

- `device` is the logical device that destroys the command pool.
- `commandPool` is the handle of the command pool to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

When a pool is destroyed, all command buffers allocated from the pool are freed.

Any primary command buffer allocated from another `VkCommandPool` that is in the recording or executable state and has a secondary command buffer allocated from `commandPool` recorded into it, becomes invalid.

---

**Valid Usage**

- VUID-vkDestroyCommandPool-commandPool-00041
  All `VkCommandBuffer` objects allocated from `commandPool` must not be in the pending state

- VUID-vkDestroyCommandPool-commandPool-00042
  If `VkAllocationCallbacks` were provided when `commandPool` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyCommandPool-commandPool-00043
  If no `VkAllocationCallbacks` were provided when `commandPool` was created, `pAllocator` must be NULL
Valid Usage (Implicit)

- VUID-vkDestroyCommandPool-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyCommandPool-commandPool-parameter
  If commandPool is not VK_NULL_HANDLE, commandPool must be a valid VkCommandPool handle

- VUID-vkDestroyCommandPool-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyCommandPool-commandPool-parent
  If commandPool is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to commandPool must be externally synchronized

6.3. Command Buffer Allocation and Management

To allocate command buffers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateCommandBuffers(
    VkDevice device,
    const VkCommandBufferAllocateInfo* pAllocateInfo,
    VkCommandBuffer* pCommandBuffers);
```

- device is the logical device that owns the command pool.
- pAllocateInfo is a pointer to a VkCommandBufferAllocateInfo structure describing parameters of the allocation.
- pCommandBuffers is a pointer to an array of VkCommandBuffer handles in which the resulting command buffer objects are returned. The array must be at least the length specified by the commandBufferCount member of pAllocateInfo. Each allocated command buffer begins in the initial state.

vkAllocateCommandBuffers can be used to allocate multiple command buffers. If the allocation of any of those command buffers fails, the implementation must free all successfully allocated command buffer objects from this command, set all entries of the pCommandBuffers array to NULL and return the error.

Note
Filling `pCommandBuffers` with NULL values on failure is an exception to the default error behavior that output parameters will have undefined contents.

When command buffers are first allocated, they are in the initial state.

### Valid Usage (Implicit)

- VUID-vkAllocateCommandBuffers-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkAllocateCommandBuffers-pAllocateInfo-parameter
  
  `pAllocateInfo` must be a valid pointer to a valid `VkCommandBufferAllocateInfo` structure

- VUID-vkAllocateCommandBuffers-pCommandBuffers-parameter
  
  `pCommandBuffers` must be a valid pointer to an array of `pAllocateInfo->commandBufferCount` `VkCommandBuffer` handles

- VUID-vkAllocateCommandBuffers-pAllocateInfo::commandBufferCount-arraylength
  
  `pAllocateInfo->commandBufferCount` must be greater than 0

### Host Synchronization

- Host access to `pAllocateInfo->commandPool` must be externally synchronized

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCommandBufferAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandPool commandPool;
    VkCommandBufferLevel level;
    uint32_t commandBufferCount;
} VkCommandBufferAllocateInfo;
```

- `sType` is the type of this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `commandPool` is the command pool from which the command buffers are allocated.
• `level` is a `VkCommandBufferLevel` value specifying the command buffer level.
• `commandBufferCount` is the number of command buffers to allocate from the pool.

**Valid Usage (Implicit)**

- `VUID-VkCommandBufferAllocateInfo-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_ALLOCATE_INFO`
- `VUID-VkCommandBufferAllocateInfo-pNext-pNext`  
  `pNext` must be NULL
- `VUID-VkCommandBufferAllocateInfo-commandPool-parameter`  
  `commandPool` must be a valid `VkCommandPool` handle
- `VUID-VkCommandBufferAllocateInfo-level-parameter`  
  `level` must be a valid `VkCommandBufferLevel` value

Possible values of `VkCommandBufferAllocateInfo::level`, specifying the command buffer level, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferLevel {
    VK_COMMAND_BUFFER_LEVEL_PRIMARY = 0,
    VK_COMMAND_BUFFER_LEVEL_SECONDARY = 1,
} VkCommandBufferLevel;
```

- `VK_COMMAND_BUFFER_LEVEL_PRIMARY` specifies a primary command buffer.
- `VK_COMMAND_BUFFER_LEVEL_SECONDARY` specifies a secondary command buffer.

To reset a command buffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetCommandBuffer(
    VkCommandBuffer commandBuffer,
    VkCommandBufferResetFlags flags);
```

- `commandBuffer` is the command buffer to reset. The command buffer can be in any state other than pending, and is moved into the initial state.
- `flags` is a bitmask of `VkCommandBufferResetFlagBits` controlling the reset operation.

Any primary command buffer that is in the recording or executable state and has `commandBuffer` recorded into it, becomes invalid.
Valid Usage

- VUID-vkResetCommandBuffer-commandBuffer-00045
  commandBuffer must not be in the pending state

- VUID-vkResetCommandBuffer-commandBuffer-00046
  commandBuffer must have been allocated from a pool that was created with the VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT

Valid Usage (Implicit)

- VUID-vkResetCommandBuffer-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkResetCommandBuffer-flags-parameter
  flags must be a valid combination of VkCommandBufferResetFlagBits values

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_DEVICE_MEMORY

Bits which can be set in vkResetCommandBuffer::flags, controlling the reset operation, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferResetFlagBits {
    VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandBufferResetFlagBits;
```

- VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT specifies that most or all memory resources currently owned by the command buffer should be returned to the parent command pool. If this flag is not set, then the command buffer may hold onto memory resources and reuse them when recording commands. commandBuffer is moved to the initial state.
VkCommandBufferResetFlags is a bitmask type for setting a mask of zero or more VkCommandBufferResetFlagBits. To free command buffers, call:

```c
void vkFreeCommandBuffers(
    VkDevice device,
    VkCommandPool commandPool,
    uint32_t commandBufferCount,
    const VkCommandBuffer* pCommandBuffers);
```

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool from which the command buffers were allocated.
- `commandBufferCount` is the length of the `pCommandBuffers` array.
- `pCommandBuffers` is a pointer to an array of handles of command buffers to free.

Any primary command buffer that is in the recording or executable state and has any element of `pCommandBuffers` recorded into it, becomes invalid.

### Valid Usage

- VUID-vkFreeCommandBuffers-pCommandBuffers-00047
  All elements of `pCommandBuffers` must not be in the pending state

- VUID-vkFreeCommandBuffers-pCommandBuffers-00048
  `pCommandBuffers` must be a valid pointer to an array of `commandBufferCount` `VkCommandBuffer` handles, each element of which must either be a valid handle or NULL

### Valid Usage (Implicit)

- VUID-vkFreeCommandBuffers-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkFreeCommandBuffers-commandPool-parameter
  `commandPool` must be a valid `VkCommandPool` handle

- VUID-vkFreeCommandBuffers-commandBufferCount-arraylength
  `commandBufferCount` must be greater than 0

- VUID-vkFreeCommandBuffers-commandPool-parent
  `commandPool` must have been created, allocated, or retrieved from `device`

- VUID-vkFreeCommandBuffers-pCommandBuffers-parent
Each element of `pCommandBuffers` that is a valid handle must have been created, allocated, or retrieved from `commandPool`.

### Host Synchronization

- Host access to `commandPool` must be externally synchronized.
- Host access to each member of `pCommandBuffers` must be externally synchronized.

## 6.4. Command Buffer Recording

To begin recording a command buffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBeginCommandBuffer(
    VkCommandBuffer commandBuffer,
    const VkCommandBufferBeginInfo* pBeginInfo);
```

- `commandBuffer` is the handle of the command buffer which is to be put in the recording state.
- `pBeginInfo` is a pointer to a `VkCommandBufferBeginInfo` structure defining additional information about how the command buffer begins recording.

### Valid Usage

- VUID-vkBeginCommandBuffer-commandBuffer-00049
  `commandBuffer` must not be in the recording or pending state.

- VUID-vkBeginCommandBuffer-commandBuffer-00050
  If `commandBuffer` was allocated from a `VkCommandPool` which did not have the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, `commandBuffer` must be in the initial state.

- VUID-vkBeginCommandBuffer-commandBuffer-00051
  If `commandBuffer` is a secondary command buffer, the `pInheritanceInfo` member of `pBeginInfo` must be a valid `VkCommandBufferInheritanceInfo` structure.

- VUID-vkBeginCommandBuffer-commandBuffer-00052
  If `commandBuffer` is a secondary command buffer and either the `occlusionQueryEnable` member of the `pInheritanceInfo` member of `pBeginInfo` is `VK_FALSE`, or the `occlusionQueryPrecise` feature is not enabled, then `pBeginInfo->pInheritanceInfo->queryFlags` must not contain `VK_QUERY_CONTROL_PRECISE_BIT`.

- VUID-vkBeginCommandBuffer-commandBuffer-02840
  If `commandBuffer` is a primary command buffer, then `pBeginInfo->flags` must not set both the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` and the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flags.
Valid Usage (Implicit)

- VUID-vkBeginCommandBuffer-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkBeginCommandBuffer-pBeginInfo-parameter
  `pBeginInfo` must be a valid pointer to a valid `VkCommandBufferBeginInfo` structure

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCommandBufferBeginInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferBeginInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkCommandBufferUsageFlags flags;
    const VkCommandBufferInheritanceInfo* pInheritanceInfo;
} VkCommandBufferBeginInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkCommandBufferUsageFlagBits` specifying usage behavior for the command buffer.
- `pInheritanceInfo` is a pointer to a `VkCommandBufferInheritanceInfo` structure, used if `commandBuffer` is a secondary command buffer. If this is a primary command buffer, then this value is ignored.
Valid Usage

- VUID-VkCommandBufferBeginInfo-flags-00055
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT, the framebuffer member of pInheritanceInfo must be either VK_NULL_HANDLE, or a valid VkFramebuffer that is compatible with the renderPass member of pInheritanceInfo

- VUID-VkCommandBufferBeginInfo-flags-06000
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT and the renderPass member of pInheritanceInfo is not VK_NULL_HANDLE, renderPass must be a valid VkRenderPass

- VUID-VkCommandBufferBeginInfo-flags-06001
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT and the renderPass member of pInheritanceInfo is not VK_NULL_HANDLE, the subpass member of pInheritanceInfo must be a valid subpass index within the renderPass member of pInheritanceInfo

- VUID-VkCommandBufferBeginInfo-flags-06002
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT and the renderPass member of pInheritanceInfo is VK_NULL_HANDLE, the pNext chain of pInheritanceInfo must include a VkCommandBufferInheritanceRenderingInfo structure

- VUID-VkCommandBufferBeginInfo-flags-06003
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT, the renderPass member of pInheritanceInfo is VK_NULL_HANDLE, and the pNext chain of pInheritanceInfo includes a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, the colorAttachmentCount member of that structure must be equal to the value of VkCommandBufferInheritanceRenderingInfo::colorAttachmentCount

Valid Usage (Implicit)

- VUID-VkCommandBufferBeginInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO

- VUID-VkCommandBufferBeginInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkDeviceGroupCommandBufferBeginInfo

- VUID-VkCommandBufferBeginInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkCommandBufferBeginInfo-flags-parameter
  flags must be a valid combination of VkCommandBufferUsageFlagBits values

Bits which can be set in VkCommandBufferBeginInfo::flags, specifying usage behavior for a command buffer, are:
typedef enum VkCommandBufferUsageFlagBits {
    VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT = 0x00000001,
    VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT = 0x00000002,
    VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT = 0x00000004,
} VkCommandBufferUsageFlagBits;

• VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT specifies that each recording of the command buffer will only be submitted once, and the command buffer will be reset and recorded again between each submission.

• VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT specifies that a secondary command buffer is considered to be entirely inside a render pass. If this is a primary command buffer, then this bit is ignored.

• VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT specifies that a command buffer can be resubmitted to a queue while it is in the pending state, and recorded into multiple primary command buffers.

typedef VkFlags VkCommandBufferUsageFlags;

VkCommandBufferUsageFlags is a bitmask type for setting a mask of zero or more VkCommandBufferUsageFlagBits.

If the command buffer is a secondary command buffer, then the VkCommandBufferInheritanceInfo structure defines any state that will be inherited from the primary command buffer:

typedef struct VkCommandBufferInheritanceInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderPass renderPass;
    uint32_t subpass;
    VkFramebuffer framebuffer;
    VkBool32 occlusionQueryEnable;
    VkQueryControlFlags queryFlags;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkCommandBufferInheritanceInfo;

• sType is the type of this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• renderPass is a VkRenderPass object defining which render passes the VkCommandBuffer will be compatible with and can be executed within.

• subpass is the index of the subpass within the render pass instance that the VkCommandBuffer will be executed within.
framebuffer can refer to the VkFramebuffer object that the VkCommandBuffer will be rendering to if it is executed within a render pass instance. It can be VK_NULL_HANDLE if the framebuffer is not known.

Note
Specifying the exact framebuffer that the secondary command buffer will be executed with may result in better performance at command buffer execution time.

occlusionQueryEnable specifies whether the command buffer can be executed while an occlusion query is active in the primary command buffer. If this is VK_TRUE, then this command buffer can be executed whether the primary command buffer has an occlusion query active or not. If this is VK_FALSE, then the primary command buffer must not have an occlusion query active.

queryFlags specifies the query flags that can be used by an active occlusion query in the primary command buffer when this secondary command buffer is executed. If this value includes the VK_QUERY_CONTROL_PRECISE_BIT bit, then the active query can return boolean results or actual sample counts. If this bit is not set, then the active query must not use the VK_QUERY_CONTROL_PRECISE_BIT bit.

pipelineStatistics is a bitmask of VkQueryPipelineStatisticFlagBits specifying the set of pipeline statistics that can be counted by an active query in the primary command buffer when this secondary command buffer is executed. If this value includes a given bit, then this command buffer can be executed whether the primary command buffer has a pipeline statistics query active that includes this bit or not. If this value excludes a given bit, then the active pipeline statistics query must not be from a query pool that counts that statistic.

If the VkCommandBuffer will not be executed within a render pass instance, or if the render pass instance was begun with vkCmdBeginRendering, renderPass, subpass, and framebuffer are ignored.

Valid Usage

- VUID-VkCommandBufferInheritanceInfo-occlusionQueryEnable-00056
  If the inheritedQueries feature is not enabled, occlusionQueryEnable must be VK_FALSE

- VUID-VkCommandBufferInheritanceInfo-queryFlags-00057
  If the inheritedQueries feature is enabled, queryFlags must be a valid combination of VkQueryControlFlagBits values

- VUID-VkCommandBufferInheritanceInfo-queryFlags-02788
  If the inheritedQueries feature is not enabled, queryFlags must be 0

- VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-02789
  If the pipelineStatisticsQuery feature is enabled, pipelineStatistics must be a valid combination of VkQueryPipelineStatisticFlagBits values

- VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-00058
  If the pipelineStatisticsQuery feature is not enabled, pipelineStatistics must be 0
Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceInfo-sType-sType
  
  The `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_INFO`.

- VUID-VkCommandBufferInheritanceInfo-pNext-pNext
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkAttachmentSampleCountInfoAMD`, `VkCommandBufferInheritanceConditionalRenderingInfoEXT`, `VkCommandBufferInheritanceRenderPassTransformInfoQCOM`, `VkCommandBufferInheritanceRenderingInfo`, `VkCommandBufferInheritanceViewportScissorInfoNV`, or `VkMultiviewPerViewAttributesInfoNVX`.

- VUID-VkCommandBufferInheritanceInfo-sType-unique
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- VUID-VkCommandBufferInheritanceInfo-commonparent
  
  Both of `framebuffer`, and `renderPass` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

Note

On some implementations, not using the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` bit enables command buffers to be patched in-place if needed, rather than creating a copy of the command buffer.

If a command buffer is in the invalid, or executable state, and the command buffer was allocated from a command pool with the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, then `vkBeginCommandBuffer` implicitly resets the command buffer, behaving as if `vkResetCommandBuffer` had been called with `VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT` not set. After the implicit reset, `commandBuffer` is moved to the recording state.

If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceConditionalRenderingInfoEXT` structure, then that structure controls whether a command buffer can be executed while conditional rendering is active in the primary command buffer.

The `VkCommandBufferInheritanceConditionalRenderingInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_conditional_rendering
typedef struct VkCommandBufferInheritanceConditionalRenderingInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 conditionalRenderingEnable;
} VkCommandBufferInheritanceConditionalRenderingInfoEXT;
```

- `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `conditionalRenderingEnable` specifies whether the command buffer can be executed while conditional rendering is active in the primary command buffer. If this is `VK_TRUE`, then this command buffer can be executed whether the primary command buffer has active conditional rendering or not. If this is `VK_FALSE`, then the primary command buffer must not have conditional rendering active.

If this structure is not present, the behavior is as if `conditionalRenderingEnable` is `VK_FALSE`.

### Valid Usage

- **VUID-VkCommandBufferInheritanceConditionalRenderingInfoEXT-conditionalRenderingEnable-01977**
  
  If the `inheritedConditionalRendering` feature is not enabled, `conditionalRenderingEnable` must be `VK_FALSE`.

### Valid Usage (Implicit)

- **VUID-VkCommandBufferInheritanceConditionalRenderingInfoEXT-sType-sType**

  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_CONDITIONAL_RENDERING_INFO_EXT`.

To begin recording a secondary command buffer compatible with execution inside a render pass using render pass transform, add the `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` to the `pNext` chain of `VkCommandBufferInheritanceInfo` structure passed to the `vkBeginCommandBuffer` command specifying the parameters for transformed rasterization.

The `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` structure is defined as:

```c
// Provided by VK_QCOM_render_pass_transform
typedef struct VkCommandBufferInheritanceRenderPassTransformInfoQCOM {
    VkStructureType sType;
    void* pNext;
    VkSurfaceTransformFlagBitsKHR transform;
    VkRect2D renderArea;
} VkCommandBufferInheritanceRenderPassTransformInfoQCOM;
```

• `sType` is the type of this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `transform` is a `VkSurfaceTransformFlagBitsKHR` value describing the transform to be applied to the render pass.

• `renderArea` is the render area that is affected by the command buffer.
When the secondary is recorded to execute within a render pass instance using `vkCmdExecuteCommands`, the render pass transform parameters of the secondary command buffer must be consistent with the render pass transform parameters specified for the render pass instance. In particular, the transform and renderArea for command buffer must be identical to the transform and renderArea of the render pass instance.

### Valid Usage

- **VUID-VkCommandBufferInheritanceRenderPassTransformInfoQCOM-transform-02864**
  
  transform must be 
  
  \[ 
  \begin{align*}
  &\text{VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR,} \\
  &\text{VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR,} \\
  &\text{VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR,} \\
  &\text{or} \\
  &\text{VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR} 
  \end{align*}
  \]

### Valid Usage (Implicit)

- **VUID-VkCommandBufferInheritanceRenderPassTransformInfoQCOM-sType-sType**
  
  sType must be 
  
  \[ 
  \text{VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDER_PASS_TRANSFORM_INFO_QCOM} 
  \]

The `VkCommandBufferInheritanceViewportScissorInfoNV` structure is defined as:

```c
typedef struct VkCommandBufferInheritanceViewportScissorInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 viewportScissor2D;
    uint32_t viewportDepthCount;
    const VkViewport* pViewportDepths;
} VkCommandBufferInheritanceViewportScissorInfoNV;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **viewportScissor2D** specifies whether the listed dynamic state is inherited.
- **viewportDepthCount** specifies the maximum number of viewports to inherit. When `viewportScissor2D` is `VK_FALSE`, the behavior is as if this value is zero.
- **pViewportDepths** is a pointer to a `VkViewport` structure specifying the expected depth range for each inherited viewport.

If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceViewportScissorInfoNV` structure, then that structure controls whether a command buffer can inherit the following state from other command buffers:

- **VK_DYNAMIC_STATE_SCISSOR**
- **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT**
as well as the following state, with restrictions on inherited depth values and viewport count:

- VK_DYNAMIC_STATE_VIEWPORT
- VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT

If viewportScissor2D is VK_FALSE, then the command buffer does not inherit the listed dynamic state, and should set this state itself. If this structure is not present, the behavior is as if viewportScissor2D is VK_FALSE.

If viewportScissor2D is VK_TRUE, then the listed dynamic state is inherited, and the command buffer must not set this state, except that the viewport and scissor count may be set by binding a graphics pipeline that does not specify this state as dynamic.

Note
Due to this restriction, applications should ensure either all or none of the graphics pipelines bound in this secondary command buffer use dynamic viewport/scissor counts.

When the command buffer is executed as part of the execution of a vkCmdExecuteCommands command, the inherited state (if enabled) is determined by the following procedure, performed separately for each dynamic state, and separately for each value for dynamic state that consists of multiple values (e.g. multiple viewports).

- With i being the index of the executed command buffer in the pCommandBuffers array of vkCmdExecuteCommands, if i > 0 and any secondary command buffer from index 0 to i-1 modifies the state, the inherited state is provisionally set to the final value set by the last such secondary command buffer. Binding a graphics pipeline defining the state statically is equivalent to setting the state to an undefined value.
- Otherwise, the tentative inherited state is that of the primary command buffer at the point the vkCmdExecuteCommands command was recorded; if the state is undefined, then so is the provisional inherited state.
- If the provisional inherited state is an undefined value, then the state is not inherited.
- If the provisional inherited state is a viewport, with n being its viewport index, then if n ≥ viewportDepthCount, or if either VkViewport::minDepth or VkViewport::maxDepth are not equal to the respective values of the n\text{th} element of pViewportDepths, then the state is not inherited.
- If the provisional inherited state passes both checks, then it becomes the actual inherited state.

Note
There is no support for inheriting dynamic state from a secondary command buffer executed as part of a different vkCmdExecuteCommands command.

Valid Usage
- VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04782
If the `inheritedViewportScissor2D` feature is not enabled, `viewportScissor2D` must be `VK_FALSE`.

- `VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04783`
  If the `multiViewport` feature is not enabled and `viewportScissor2D` is `VK_TRUE`, then `viewportDepthCount` must be `1`.

- `VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04784`
  If `viewportScissor2D` is `VK_TRUE`, then `viewportDepthCount` must be greater than `0`.

- `VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04785`
  If `viewportScissor2D` is `VK_TRUE`, then `pViewportDepths` must be a valid pointer to an array of `viewportDepthCount` valid `VkViewport` structures, except any requirements on `x`, `y`, `width`, and `height` do not apply.

- `VUID-VkCommandBufferInheritanceViewportScissorInfoNV-viewportScissor2D-04786`
  If `viewportScissor2D` is `VK_TRUE`, then the command buffer must be recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`.

**Valid Usage (Implicit)**

- `VUID-VkCommandBufferInheritanceViewportScissorInfoNV-sType-sType`
  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_VIEWPORT_SCISSOR_INFO_NV`.

The `VkCommandBufferInheritanceRenderingInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferInheritanceRenderingInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderingFlags flags;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkFormat* pColorAttachmentFormats;
    VkFormat depthAttachmentFormat;
    VkFormat stencilAttachmentFormat;
    VkSampleCountFlagBits rasterizationSamples;
} VkCommandBufferInheritanceRenderingInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkCommandBufferInheritanceRenderingInfo
VkCommandBufferInheritanceRenderingInfoKHR;
```

- `sType` is the type of this structure
- `pNext` is `NULL` or a pointer to a structure extending this structure
• **flags** is a bitmask of *VkRenderingFlagBits* used by the render pass instance.
• **viewMask** is the view mask used for rendering.
• **colorAttachmentCount** is the number of color attachments specified in the render pass instance.
• **pColorAttachmentFormats** is a pointer to an array of *VkFormat* values defining the format of color attachments.
• **depthAttachmentFormat** is a *VkFormat* value defining the format of the depth attachment.
• **stencilAttachmentFormat** is a *VkFormat* value defining the format of the stencil attachment.
• **rasterizationSamples** is a *VkSampleCountFlagBits* specifying the number of samples used in rasterization.

If the *pNext* chain of *VkCommandBufferInheritanceInfo* includes a *VkCommandBufferInheritanceRenderingInfo* structure, then that structure controls parameters of dynamic render pass instances that the *VkCommandBuffer* can be executed within. If *VkCommandBufferInheritanceInfo::*renderPass* is not *VK_NULL_HANDLE*, or *VK_COMMAND BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT* is not specified in *VkCommandBufferBeginInfo::*flags*, parameters of this structure are ignored.

If **colorAttachmentCount** is 0 and the **variableMultisampleRate** feature is enabled, **rasterizationSamples** is ignored.

If **depthAttachmentFormat**, **stencilAttachmentFormat**, or any element of **pColorAttachmentFormats** is **VK_FORMAT_UNDEFINED**, it indicates that the corresponding attachment is unused within the render pass.

### Valid Usage

- **VUID-VkCommandBufferInheritanceRenderingInfo-colorAttachmentCount-06004**
  If **colorAttachmentCount** is not 0, **rasterizationSamples** must be a valid *VkSampleCountFlagBits* value
- **VUID-VkCommandBufferInheritanceRenderingInfo-variableMultisampleRate-06005**
  If the **variableMultisampleRate** feature is not enabled, **rasterizationSamples** must be a valid *VkSampleCountFlagBits* value
- **VUID-VkCommandBufferInheritanceRenderingInfo-pColorAttachmentFormats-06006**
  If any element of **pColorAttachmentFormats** is not **VK_FORMAT_UNDEFINED**, it must be a format with potential format features that include **VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT**
- **VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06540**
  If **depthAttachmentFormat** is not **VK_FORMAT_UNDEFINED**, it must be a format that includes a depth aspect
- **VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06007**
  If **depthAttachmentFormat** is not **VK_FORMAT_UNDEFINED**, it must be a format with potential format features that include **VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT**
- **VUID-VkCommandBufferInheritanceRenderingInfoKHR-pColorAttachmentFormats-06492**
  When rendering to a Linear Color attachment, if any element of **pColorAttachmentFormats** is not **VK_FORMAT_UNDEFINED**, it must be a format with potential format features that include
If \texttt{stencilAttachmentFormat} is not \texttt{VK_FORMAT_UNDEFINED}, it \textbf{must} be a format that includes a stencil aspect.

If \texttt{stencilAttachmentFormat} is not \texttt{VK_FORMAT_UNDEFINED}, it \textbf{must} be a format with potential format features that include \texttt{VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT}.

If \texttt{depthAttachmentFormat} is not \texttt{VK_FORMAT_UNDEFINED} and \texttt{stencilAttachmentFormat} is not \texttt{VK_FORMAT_UNDEFINED}, \texttt{depthAttachmentFormat} \textbf{must} equal \texttt{stencilAttachmentFormat}.

If the \texttt{multiview} feature is not enabled, \texttt{viewMask} \textbf{must} be 0.

The index of the most significant bit in \texttt{viewMask} \textbf{must} be less than \texttt{maxMultiviewViewCount}.

---

**Valid Usage (Implicit)**

- \textbf{must} be \texttt{VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDERING_INFO}.
- If \texttt{colorAttachmentCount} is not 0, \texttt{pColorAttachmentFormats} must be a valid pointer to an array of \texttt{colorAttachmentCount} valid \texttt{VkFormat} values.
- \texttt{depthAttachmentFormat} must be a valid \texttt{VkFormat} value.
- \texttt{stencilAttachmentFormat} must be a valid \texttt{VkFormat} value.
- \texttt{rasterizationSamples} must be a valid \texttt{VkSampleCountFlagBits} value.

The \texttt{VkAttachmentSampleCountInfoAMD} or \texttt{VkAttachmentSampleCountInfoNV} structure is defined as:

```c
typedef struct VkAttachmentSampleCountInfoAMD {
    VkStructureType sType;
    const void* pNext;
    uint32_t colorAttachmentCount;
    const VkSampleCountFlagBits* pColorAttachmentSamples;
    VkSampleCountFlagBits depthStencilAttachmentSamples;
} VkAttachmentSampleCountInfoAMD;
```
or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering with VK_NV_framebuffer_mixed_samples
typedef VkAttachmentSampleCountInfoAMD VkAttachmentSampleCountInfoNV;
```

- **sType** is the type of this structure
- **pNext** is NULL or a pointer to a structure extending this structure
- **colorAttachmentCount** is the number of color attachments specified in a render pass instance.
- **pColorAttachmentSamples** is a pointer to an array of `VkSampleCountFlagBits` values defining the sample count of color attachments.
- **depthStencilAttachmentSamples** is a `VkSampleCountFlagBits` value defining the sample count of a depth/stencil attachment.

If `VkCommandBufferInheritanceInfo::renderPass` is `VK_NULL_HANDLE`, `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` is specified in `VkCommandBufferBeginInfo::flags`, and the `pNext` chain of `VkCommandBufferInheritanceInfo` includes `VkAttachmentSampleCountInfoAMD`, then this structure defines the sample counts of each attachment within the render pass instance. If `VkAttachmentSampleCountInfoAMD` is not included, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` is used as the sample count for each attachment. If `VkCommandBufferInheritanceInfo::renderPass` is not `VK_NULL_HANDLE`, or `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` is not specified in `VkCommandBufferBeginInfo::flags`, parameters of this structure are ignored.

`VkAttachmentSampleCountInfoAMD` can also be included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`. When a graphics pipeline is created without a `VkRenderPass`, if this structure is present in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it specifies the sample count of attachments used for rendering. If this structure is not specified, and the pipeline does not include a `VkRenderPass`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` is used as the sample count for each attachment. If a graphics pipeline is created with a valid `VkRenderPass`, parameters of this structure are ignored.

### Valid Usage (Implicit)

- **VUID-VkAttachmentSampleCountInfoAMD-sType-sType**
  - **sType** must be `VK_STRUCTURE_TYPE_ATTACHMENT_SAMPLE_COUNT_INFO_AMD`

Once recording starts, an application records a sequence of commands (`vkCmd*`) to set state in the command buffer, draw, dispatch, and other commands.

Several commands can also be recorded indirectly from `VkBuffer` content, see Device-Generated Commands.

To complete recording of a command buffer, call:

```c
// Provided by VK_VERSION_1_0
```
VkResult vkEndCommandBuffer(
    VkCommandBuffer commandBuffer);  

- `commandBuffer` is the command buffer to complete recording.

If there was an error during recording, the application will be notified by an unsuccessful return code returned by `vkEndCommandBuffer`. If the application wishes to further use the command buffer, the command buffer **must** be reset.

The command buffer **must** have been in the **recording state**, and is moved to the **executable state**.

### Valid Usage

- VUID-vkEndCommandBuffer-commandBuffer-00059
  `commandBuffer` must be in the **recording state**

- VUID-vkEndCommandBuffer-commandBuffer-00060
  If `commandBuffer` is a primary command buffer, there **must** not be an active render pass instance

- VUID-vkEndCommandBuffer-commandBuffer-00061
  All queries made **active** during the recording of `commandBuffer` **must** have been made inactive

- VUID-vkEndCommandBuffer-None-01978
  Conditional rendering **must** not be **active**

- VUID-vkEndCommandBuffer-None-06991
  There **must** be no video session object bound

- VUID-vkEndCommandBuffer-commandBuffer-01815
  If `commandBuffer` is a secondary command buffer, there **must** not be an outstanding `vkCmdBeginDebugUtilsLabelEXT` command recorded to `commandBuffer` that has not previously been ended by a call to `vkCmdEndDebugUtilsLabelEXT`

- VUID-vkEndCommandBuffer-commandBuffer-00062
  If `commandBuffer` is a secondary command buffer, there **must** not be an outstanding `vkCmdDebugMarkerBeginEXT` command recorded to `commandBuffer` that has not previously been ended by a call to `vkCmdDebugMarkerEndEXT`

### Valid Usage (Implicit)

- VUID-vkEndCommandBuffer-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally
### Return Codes

<table>
<thead>
<tr>
<th><strong>Success</strong></th>
<th><strong>Failure</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SUCCESS</td>
<td>VK_ERROR_OUT_OF_HOST_MEMORY</td>
</tr>
<tr>
<td></td>
<td>VK_ERROR_OUT_OF_DEVICE_MEMORY</td>
</tr>
</tbody>
</table>

When a command buffer is in the executable state, it **can** be submitted to a queue for execution.

### 6.5. Command Buffer Submission

**Note**

Submission can be a high overhead operation, and applications **should** attempt to batch work together into as few calls to `vkQueueSubmit` or `vkQueueSubmit2` as possible.

To submit command buffers to a queue, call:

```c
// Provided by VK_VERSION_1_3
VkResult vkQueueSubmit2(
    VkQueue queue,
    uint32_t submitCount,
    const VkSubmitInfo2* pSubmits,
    VkFence fence);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
VkResult vkQueueSubmit2KHR(
    VkQueue queue,
    uint32_t submitCount,
    const VkSubmitInfo2* pSubmits,
    VkFence fence);
```

- **queue** is the queue that the command buffers will be submitted to.
- **submitCount** is the number of elements in the **pSubmits** array.
- **pSubmits** is a pointer to an array of **VkSubmitInfo2** structures, each specifying a command buffer submission batch.
- **fence** is an **optional** handle to a fence to be signaled once all submitted command buffers have
completed execution. If `fence` is not `VK_NULL_HANDLE`, it defines a fence signal operation.

`vkQueueSubmit2` is a queue submission command, with each batch defined by an element of `pSubmits`.

Semaphore operations submitted with `vkQueueSubmit2` have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the semaphore section of the synchronization chapter.

If any command buffer submitted to this queue is in the executable state, it is moved to the pending state. Once execution of all submissions of a command buffer complete, it moves from the pending state, back to the executable state. If a command buffer was recorded with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` flag, it instead moves back to the invalid state.

If `vkQueueSubmit2` fails, it may return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by `pSubmits` is unaffected by the call or its failure. If `vkQueueSubmit2` fails in such a way that the implementation is unable to make that guarantee, the implementation must return `VK_ERROR_DEVICE_LOST`. See Lost Device.

**Valid Usage**

- VUID-vkQueueSubmit2-fence-04894
  - If `fence` is not `VK_NULL_HANDLE`, `fence` must be unsignaled

- VUID-vkQueueSubmit2-fence-04895
  - If `fence` is not `VK_NULL_HANDLE`, `fence` must not be associated with any other queue command that has not yet completed execution on that queue

- VUID-vkQueueSubmit2-synchronization2-03866
  - The synchronization2 feature must be enabled

- VUID-vkQueueSubmit2-commandBuffer-03867
  - If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` referenced a `VkEvent`, that event must not be referenced by a command that has been submitted to another queue and is still in the pending state

- VUID-vkQueueSubmit2-semaphore-03868
  - The semaphore member of any binary semaphore element of the `pSignalSemaphoreInfos` member of any element of `pSubmits` must be unsignaled when the semaphore signal operation it defines is executed on the device

- VUID-vkQueueSubmit2-stageMask-03869
  - The stageMask member of any element of the `pSignalSemaphoreInfos` member of any element of `pSubmits` must only include pipeline stages that are supported by the queue family which `queue` belongs to

- VUID-vkQueueSubmit2-stageMask-03870
  - The stageMask member of any element of the `pWaitSemaphoreInfos` member of any element of `pSubmits` must only include pipeline stages that are supported by the queue family
which `queue` belongs to

- **VUID-vkQueueSubmit2-semaphore-03871**
  When a semaphore wait operation for a binary semaphore is executed, as defined by the `semaphore` member of any element of the `pWaitSemaphoreInfos` member of any element of `pSubmits`, there **must** be no other queues waiting on the same semaphore.

- **VUID-vkQueueSubmit2-semaphore-03872**
  The `semaphore` member of any element of the `pWaitSemaphoreInfos` member of any element of `pSubmits` **must** be semaphores that are signaled, or have semaphore signal operations previously submitted for execution.

- **VUID-vkQueueSubmit2-semaphore-03873**
  Any `semaphore` member of any element of the `pWaitSemaphoreInfos` member of any element of `pSubmits` that was created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_BINARY_KHR` **must** reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) **must** have also been submitted for execution.

- **VUID-vkQueueSubmit2-commandBuffer-03874**
  The `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` **must** be in the pending or executable state.

- **VUID-vkQueueSubmit2-commandBuffer-03875**
  If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it **must** not be in the pending state.

- **VUID-vkQueueSubmit2-commandBuffer-03876**
  Any secondary command buffers recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` **must** be in the pending or executable state.

- **VUID-vkQueueSubmit2-commandBuffer-03877**
  If any secondary command buffers recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it **must** not be in the pending state.

- **VUID-vkQueueSubmit2-commandBuffer-03878**
  The `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` **must** have been allocated from a `VkCommandPool` that was created for the same queue family `queue` belongs to.

- **VUID-vkQueueSubmit2-commandBuffer-03879**
  If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` includes a `Queue Family Transfer Acquire Operation`, there **must** exist a previously submitted `Queue Family Transfer Release Operation` on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such acquire operations, and which happens before the acquire operation.

- **VUID-vkQueueSubmit2-commandBuffer-03880**
  If a command recorded into the `commandBuffer` member of any element of the
The `pCommandBufferInfos` member of any element of `pSubmits` was a `vkCmdBeginQuery` whose `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the profiling lock must have been held continuously on the `VkDevice` that `queue` was retrieved from, throughout recording of those command buffers.

- VUID-vkQueueSubmit2-queue-06447
  If `queue` was not created with `VKDEVICE_QUEUE_CREATE_PROTECTED_BIT`, the flags member of any element of `pSubmits` must not include `VK_SUBMIT_PROTECTED_BIT_KHR`.

**Valid Usage (Implicit)**

- VUID-vkQueueSubmit2-queue-parameter
  `queue` must be a valid `VkQueue` handle

- VUID-vkQueueSubmit2-pSubmits-parameter
  If `submitCount` is not 0, `pSubmits` must be a valid pointer to an array of `submitCount` valid `VkSubmitInfo2` structures

- VUID-vkQueueSubmit2-fence-parameter
  If `fence` is not `VK_NULL_HANDLE`, `fence` must be a valid `VkFence` handle

- VUID-vkQueueSubmit2-commonparent
  Both of `fence`, and `queue` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

**Host Synchronization**

- Host access to `queue` must be externally synchronized
- Host access to `fence` must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
</table>

**Return Codes**

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
The `VkSubmitInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkSubmitInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkSubmitFlags flags;
    uint32_t waitSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pWaitSemaphoreInfos;
    uint32_t commandBufferInfoCount;
    const VkCommandBufferSubmitInfo* pCommandBufferInfos;
    uint32_t signalSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pSignalSemaphoreInfos;
} VkSubmitInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkSubmitInfo2 VkSubmitInfo2KHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkSubmitFlagBits`.
- **waitSemaphoreInfoCount** is the number of elements in `pWaitSemaphoreInfos`.
- **pWaitSemaphoreInfos** is a pointer to an array of `VkSemaphoreSubmitInfo` structures defining semaphore wait operations.
- **commandBufferInfoCount** is the number of elements in `pCommandBufferInfos` and the number of command buffers to execute in the batch.
- **pCommandBufferInfos** is a pointer to an array of `VkCommandBufferSubmitInfo` structures describing command buffers to execute in the batch.
- **signalSemaphoreInfoCount** is the number of elements in `pSignalSemaphoreInfos`.
- **pSignalSemaphoreInfos** is a pointer to an array of `VkSemaphoreSubmitInfo` describing semaphore signal operations.

### Valid Usage

- **VUID-VkSubmitInfo2-semaphore-03881**
  If the same semaphore is used as the `semaphore` member of both an element of `pSignalSemaphoreInfos` and `pWaitSemaphoreInfos`, and that semaphore is a timeline semaphore, the `value` member of the `pSignalSemaphoreInfos` element **must** be greater than the `value` member of the `pWaitSemaphoreInfos` element.

- **VUID-VkSubmitInfo2-semaphore-03882**
  If the `semaphore` member of any element of `pSignalSemaphoreInfos` is a timeline semaphore,
the value member of that element must have a value greater than the current value of the semaphore when the semaphore signal operation is executed

• VUID-VkSubmitInfo2-semaphore-03883
If the semaphore member of any element of pSignalSemaphoreInfos is a timeline semaphore, the value member of that element must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than maxTimelineSemaphoreValueDifference

• VUID-VkSubmitInfo2-semaphore-03884
If the semaphore member of any element of pWaitSemaphoreInfos is a timeline semaphore, the value member of that element must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than maxTimelineSemaphoreValueDifference

• VUID-VkSubmitInfo2-flags-03886
If flags includes VK_SUBMIT_PROTECTED_BIT, all elements of pCommandBuffers must be protected command buffers

• VUID-VkSubmitInfo2-flags-03887
If flags does not include VK_SUBMIT_PROTECTED_BIT, each element of pCommandBuffers must not be a protected command buffer

• VUID-VkSubmitInfo2KHR-commandBuffer-06192
If any commandBuffer member of an element of pCommandBufferInfos contains any resumed render pass instances, they must be suspended by a render pass instance earlier in submission order within pCommandBufferInfos

• VUID-VkSubmitInfo2KHR-commandBuffer-06010
If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, they must be resumed by a render pass instance later in submission order within pCommandBufferInfos

• VUID-VkSubmitInfo2KHR-commandBuffer-06011
If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, there must be no action or synchronization commands between that render pass instance and the render pass instance that resumes it

• VUID-VkSubmitInfo2KHR-commandBuffer-06012
If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, there must be no render pass instances between that render pass instance and the render pass instance that resumes it

• VUID-VkSubmitInfo2KHR-variableSampleLocations-06013
If the variableSampleLocations limit is not supported, and any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, must use the same sample locations
Valid Usage (Implicit)

- VUID-VkSubmitInfo2-sType-sType
  sType must be `VK_STRUCTURE_TYPE_SUBMIT_INFO_2`

- VUID-VkSubmitInfo2-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPerformanceQuerySubmitInfoKHR`, `VkWin32KeyedMutexAcquireReleaseInfoKHR`, or `VkWin32KeyedMutexAcquireReleaseInfoNV`

- VUID-VkSubmitInfo2-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkSubmitInfo2-flags-parameter
  flags must be a valid combination of `VkSubmitFlagBits` values

- VUID-VkSubmitInfo2-pWaitSemaphoreInfos-parameter
  If `waitSemaphoreInfoCount` is not 0, `pWaitSemaphoreInfos` must be a valid pointer to an array of `waitSemaphoreInfoCount` valid `VkSemaphoreSubmitInfo` structures

- VUID-VkSubmitInfo2-pCommandBufferInfos-parameter
  If `commandBufferInfoCount` is not 0, `pCommandBufferInfos` must be a valid pointer to an array of `commandBufferInfoCount` valid `VkCommandBufferSubmitInfo` structures

- VUID-VkSubmitInfo2-pSignalSemaphoreInfos-parameter
  If `signalSemaphoreInfoCount` is not 0, `pSignalSemaphoreInfos` must be a valid pointer to an array of `signalSemaphoreInfoCount` valid `VkSemaphoreSubmitInfo` structures

Bits which can be set in `VkSubmitInfo2::flags`, specifying submission behavior, are:

```c
// Provided by VK_VERSION_1_3
typedef enum VkSubmitFlagBits {
    VK_SUBMIT_PROTECTED_BIT = 0x00000001,
    VK_SUBMIT_PROTECTED_BIT_KHR = VK_SUBMIT_PROTECTED_BIT,
} VkSubmitFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkSubmitFlagBits VkSubmitFlagBitsKHR;
```

- `VK_SUBMIT_PROTECTED_BIT` specifies that this batch is a protected submission.
**VkSubmitFlags** is a bitmask type for setting a mask of zero or more **VkSubmitFlagBits**.

The **VkSemaphoreSubmitInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkSemaphoreSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    uint64_t value;
    VkPipelineStageFlags2 stageMask;
    uint32_t deviceIndex;
} VkSemaphoreSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkSemaphoreSubmitInfo VkSemaphoreSubmitInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **semaphore** is a **VkSemaphore** affected by this operation.
- **value** is either the value used to signal **semaphore** or the value waited on by **semaphore**, if **semaphore** is a timeline semaphore. Otherwise it is ignored.
- **stageMask** is a **VkPipelineStageFlags2** mask of pipeline stages which limit the first synchronization scope of a semaphore signal operation, or second synchronization scope of a semaphore wait operation as described in the semaphore wait operation and semaphore signal operation sections of the synchronization chapter.
- **deviceIndex** is the index of the device within a device group that executes the semaphore wait or signal operation.

Whether this structure defines a semaphore wait or signal operation is defined by how it is used.

### Valid Usage

- **VUID-VkSemaphoreSubmitInfo-stageMask-03929**
  If the geometryShader feature is not enabled, **stageMask** must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- **VUID-VkSemaphoreSubmitInfo-stageMask-03930**
  If the tessellationShader feature is not enabled, **stageMask** must not contain...
• VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT

• VUID-VkSemaphoreSubmitInfo-stageMask-03931
  If the conditionalRendering feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT

• VUID-VkSemaphoreSubmitInfo-stageMask-03932
  If the fragmentDensityMap feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT

• VUID-VkSemaphoreSubmitInfo-stageMask-03933
  If the transformFeedback feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT

• VUID-VkSemaphoreSubmitInfo-stageMask-03934
  If the meshShader feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT

• VUID-VkSemaphoreSubmitInfo-stageMask-03935
  If the taskShader feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT

• VUID-VkSemaphoreSubmitInfo-shadingRateImage-07316
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, stageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-VkSemaphoreSubmitInfo-stageMask-04957
  If the subpassShading feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI

• VUID-VkSemaphoreSubmitInfo-stageMask-04995
  If the invocationMask feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI

• VUID-VkSemaphoreSubmitInfo-device-03888
  If the device that semaphore was created on is not a device group, deviceIndex must be 0

• VUID-VkSemaphoreSubmitInfo-device-03889
  If the device that semaphore was created on is a device group, deviceIndex must be a valid device index

Valid Usage (Implicit)

• VUID-VkSemaphoreSubmitInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SEMAPHORE_SUBMIT_INFO

• VUID-VkSemaphoreSubmitInfo-pNext-pNext
  pNext must be NULL

• VUID-VkSemaphoreSubmitInfo-semaphore-parameter
  semaphore must be a valid VkSemaphore handle

• VUID-VkSemaphoreSubmitInfo-stageMask-parameter
  stageMask must be a valid combination of VkPipelineStageFlagBits2 values
The `VkCommandBufferSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandBuffer commandBuffer;
    uint32_t deviceMask;
} VkCommandBufferSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkCommandBufferSubmitInfo VkCommandBufferSubmitInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `commandBuffer` is a `VkCommandBuffer` to be submitted for execution.
- `deviceMask` is a bitmask indicating which devices in a device group execute the command buffer. A `deviceMask` of 0 is equivalent to setting all bits corresponding to valid devices in the group to 1.

### Valid Usage

- VUID-VkCommandBufferSubmitInfo-commandBuffer-03890
  `commandBuffer` must not have been allocated with `VK_COMMAND_BUFFER_LEVEL_SECONDARY`

- VUID-VkCommandBufferSubmitInfo-deviceMask-03891
  If `deviceMask` is not 0, it must be a valid device mask

### Valid Usage (Implicit)

- VUID-VkCommandBufferSubmitInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_SUBMIT_INFO`

- VUID-VkCommandBufferSubmitInfo-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkCommandBufferSubmitInfo-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

To submit command buffers to a queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueSubmit(
    VkQueue queue,
```
uint32_t submitCount, const VkSubmitInfo* pSubmits, VkFence fence);

• *queue* is the queue that the command buffers will be submitted to.
• *submitCount* is the number of elements in the *pSubmits* array.
• *pSubmits* is a pointer to an array of *VkSubmitInfo* structures, each specifying a command buffer submission batch.
• *fence* is an optional handle to a fence to be signaled once all submitted command buffers have completed execution. If *fence* is not *VK_NULL_HANDLE*, it defines a fence signal operation.

*vkQueueSubmit* is a queue submission command, with each batch defined by an element of *pSubmits*. Batches begin execution in the order they appear in *pSubmits*, but may complete out of order.

Fence and semaphore operations submitted with *vkQueueSubmit* have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the semaphore and fence sections of the synchronization chapter.

Details on the interaction of *pWaitDstStageMask* with synchronization are described in the semaphore wait operation section of the synchronization chapter.

The order that batches appear in *pSubmits* is used to determine submission order, and thus all the implicit ordering guarantees that respect it. Other than these implicit ordering guarantees and any explicit synchronization primitives, these batches may overlap or otherwise execute out of order.

If any command buffer submitted to this queue is in the executable state, it is moved to the pending state. Once execution of all submissions of a command buffer complete, it moves from the pending state, back to the executable state. If a command buffer was recorded with the *VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT* flag, it instead moves to the invalid state.

If *vkQueueSubmit* fails, it may return *VK_ERROR_OUT_OF_HOST_MEMORY* or *VK_ERROR_OUT_OF_DEVICE_MEMORY*. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by *pSubmits* is unaffected by the call or its failure. If *vkQueueSubmit* fails in such a way that the implementation is unable to make that guarantee, the implementation must return *VK_ERROR_DEVICE_LOST*. See Lost Device.

### Valid Usage

- **VUID-vkQueueSubmit-fence-00063**
  If *fence* is not *VK_NULL_HANDLE*, *fence* must be unsigned

- **VUID-vkQueueSubmit-fence-00064**
  If *fence* is not *VK_NULL_HANDLE*, *fence* must not be associated with any other queue command that has not yet completed execution on that queue

- **VUID-vkQueueSubmit-pCommandBuffers-00065**
  Any calls to *vkCmdSetEvent*, *vkCmdResetEvent* or *vkCmdWaitEvents* that have been
recorded into any of the command buffer elements of the `pCommandBuffers` member of any element of `pSubmits`, must not reference any `VkEvent` that is referenced by any of those commands in a command buffer that has been submitted to another queue and is still in the `pending` state

- **VUID-vkQueueSubmit-pWaitDstStageMask-00066**
  Any stage flag included in any element of the `pWaitDstStageMask` member of any element of `pSubmits` must be a pipeline stage supported by one of the capabilities of `queue`, as specified in the table of supported pipeline stages

- **VUID-vkQueueSubmit-pSignalSemaphores-00067**
  Each binary semaphore element of the `pSignalSemaphores` member of any element of `pSubmits` must be unsignaled when the semaphore signal operation it defines is executed on the device

- **VUID-vkQueueSubmit-pWaitSemaphores-00068**
  When a semaphore wait operation referring to a binary semaphore defined by any element of the `pWaitSemaphores` member of any element of `pSubmits` executes on `queue`, there must be no other queues waiting on the same semaphore

- **VUID-vkQueueSubmit-pWaitSemaphores-03238**
  All elements of the `pWaitSemaphores` member of all elements of `pSubmits` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) must have also been submitted for execution

- **VUID-vkQueueSubmit-pCommandBuffers-00070**
  Each element of the `pCommandBuffers` member of each element of `pSubmits` must be in the `pending` or `executable` state

- **VUID-vkQueueSubmit-pCommandBuffers-00071**
  If any element of the `pCommandBuffers` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it must not be in the `pending` state

- **VUID-vkQueueSubmit-pCommandBuffers-00072**
  Any secondary command buffers recorded into any element of the `pCommandBuffers` member of any element of `pSubmits` must be in the `pending` or `executable` state

- **VUID-vkQueueSubmit-pCommandBuffers-00073**
  If any secondary command buffers recorded into any element of the `pCommandBuffers` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it must not be in the `pending` state

- **VUID-vkQueueSubmit-pCommandBuffers-00074**
  Each element of the `pCommandBuffers` member of each element of `pSubmits` must have been allocated from a `VkCommandPool` that was created for the same queue family `queue` belongs to

- **VUID-vkQueueSubmit-pSubmits-02207**
  If any element of `pSubmits->pCommandBuffers` includes a `Queue Family Transfer Acquire Operation`, there must exist a previously submitted `Queue Family Transfer Release Operation` on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such acquire
operations, and which happens-before the acquire operation

- **VID-vkQueueSubmit-pCommandBuffers-03220**
  If a command recorded into any element of `pCommandBuffers` was a `vkCmdBeginQuery` whose `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the profiling lock must have been held continuously on the `VkDevice` that `queue` was retrieved from, throughout recording of those command buffers

- **VID-vkQueueSubmit-pSubmits-02808**
  Any resource created with `VK_SHARING_MODE_EXCLUSIVE` that is read by an operation specified by `pSubmits` must not be owned by any queue family other than the one which `queue` belongs to, at the time it is executed

- **VID-vkQueueSubmit-pSubmits-04626**
  Any resource created with `VK_SHARING_MODE_CONCURRENT` that is accessed by an operation specified by `pSubmits` must have included the queue family of `queue` at resource creation time

- **VID-vkQueueSubmit-queue-06448**
  If `queue` was not created with `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT`, there must be no element of `pSubmits` that includes an `VkProtectedSubmitInfo` structure in its `pNext` chain with `protectedSubmit` equal to `VK_TRUE`

---

**Valid Usage (Implicit)**

- **VID-vkQueueSubmit-queue-parameter**
  `queue` must be a valid `VkQueue` handle

- **VID-vkQueueSubmit-pSubmits-parameter**
  If `submitCount` is not 0, `pSubmits` must be a valid pointer to an array of `submitCount` valid `VkSubmitInfo` structures

- **VID-vkQueueSubmit-fence-parameter**
  If `fence` is not `VK_NULL_HANDLE`, `fence` must be a valid `VkFence` handle

- **VID-vkQueueSubmit-commonparent**
  Both of `fence`, and `queue` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

---

**Host Synchronization**

- Host access to `queue` must be externally synchronized
- Host access to `fence` must be externally synchronized

---

The `VkSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    const VkPipelineStageFlags* pWaitDstStageMask;
    uint32_t commandBufferCount;
    const VkCommandBuffer* pCommandBuffers;
    uint32_t signalSemaphoreCount;
    const VkSemaphore* pSignalSemaphores;
} VkSubmitInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores upon which to wait before executing the command buffers for the batch.
- `pWaitSemaphores` is a pointer to an array of `VkSemaphore` handles upon which to wait before the command buffers for this batch begin execution. If semaphores to wait on are provided, they define a semaphore wait operation.
- `pWaitDstStageMask` is a pointer to an array of pipeline stages at which each corresponding semaphore wait will occur.
- `commandBufferCount` is the number of command buffers to execute in the batch.
- `pCommandBuffers` is a pointer to an array of `VkCommandBuffer` handles to execute in the batch.
- `signalSemaphoreCount` is the number of semaphores to be signaled once the commands specified in `pCommandBuffers` have completed execution.
- `pSignalSemaphores` is a pointer to an array of `VkSemaphore` handles which will be signaled when the command buffers for this batch have completed execution. If semaphores to be signaled are provided, they define a semaphore signal operation.

The order that command buffers appear in `pCommandBuffers` is used to determine submission order,
and thus all the implicit ordering guarantees that respect it. Other than these implicit ordering guarantees and any explicit synchronization primitives, these command buffers may overlap or otherwise execute out of order.

**Valid Usage**

- **VUID-VkSubmitInfo-pWaitDstStageMask-04090**
  If the geometryShader feature is not enabled, pWaitDstStageMask must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- **VUID-VkSubmitInfo-pWaitDstStageMask-04091**
  If the tessellationShader feature is not enabled, pWaitDstStageMask must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-VkSubmitInfo-pWaitDstStageMask-04092**
  If the conditionalRendering feature is not enabled, pWaitDstStageMask must not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-VkSubmitInfo-pWaitDstStageMask-04093**
  If the fragmentDensityMap feature is not enabled, pWaitDstStageMask must not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-VkSubmitInfo-pWaitDstStageMask-04094**
  If the transformFeedback feature is not enabled, pWaitDstStageMask must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-VkSubmitInfo-pWaitDstStageMask-04095**
  If the meshShader feature is not enabled, pWaitDstStageMask must not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- **VUID-VkSubmitInfo-pWaitDstStageMask-04096**
  If the taskShader feature is not enabled, pWaitDstStageMask must not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- **VUID-VkSubmitInfo-shadingRateImage-07318**
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, pWaitDstStageMask must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-VkSubmitInfo-pWaitDstStageMask-03937**
  If the synchronization2 feature is not enabled, pWaitDstStageMask must not be 0

- **VUID-VkSubmitInfo-pCommandBuffers-00075**
  Each element of pCommandBuffers must not have been allocated with `VK_COMMAND_BUFFER_LEVEL_SECONDARY`

- **VUID-VkSubmitInfo-pWaitDstStageMask-00078**
  Each element of pWaitDstStageMask must not include `VK_PIPELINE_STAGE_HOST_BIT`

- **VUID-VkSubmitInfo-pWaitSemaphores-03239**
  If any element of pWaitSemaphores or pSignalSemaphores was created with a VkSemaphoreType of `VK_SEMAPHORE_TYPE_TIMELINE`, then the pNext chain must include a VkTimelineSemaphoreSubmitInfo structure
If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pWaitSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, then its `waitSemaphoreValueCount` member must equal the current value of the semaphore when the semaphore signal operation is executed.

For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value greater than the current value of the semaphore.

For each element of `pWaitSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, the corresponding element of `VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues` must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.

If the `pNext` chain of this structure does not include a `VkProtectedSubmitInfo` structure with `protectedSubmit` set to `VK_TRUE`, then each element of the `pCommandBuffers` array must be an unprotected command buffer.

If the `pNext` chain of this structure includes a `VkProtectedSubmitInfo` structure with `protectedSubmit` set to `VK_TRUE`, then each element of the `pCommandBuffers` array must be a protected command buffer.

If `pCommandBuffers` contains any resumed render pass instances, they must be suspended by a render pass instance earlier in submission order within `pCommandBuffers`.

If `pCommandBuffers` contains any suspended render pass instances, they must be resumed by a render pass instance later in submission order within `pCommandBuffers`.
• VUID-VkSubmitInfo-pCommandBuffers-06015
If pCommandBuffers contains any suspended render pass instances, there must be no action or synchronization commands executed in a primary or secondary command buffer between that render pass instance and the render pass instance that resumes it.

• VUID-VkSubmitInfo-pCommandBuffers-06016
If pCommandBuffers contains any suspended render pass instances, there must be no render pass instances between that render pass instance and the render pass instance that resumes it.

• VUID-VkSubmitInfo-variableSampleLocations-06017
If the variableSampleLocations limit is not supported, and any element of pCommandBuffers contains any suspended render pass instance, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, must use the same sample locations.

Valid Usage (Implicit)

• VUID-VkSubmitInfo-sType-sType
sType must be VK_STRUCTURE_TYPE_SUBMIT_INFO.

• VUID-VkSubmitInfo-pNext-pNext
Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkAmigoProfilingSubmitInfoSEC, VkD3D12FenceSubmitInfoKHR, VkDeviceGroupSubmitInfo, VkPerformanceQuerySubmitInfoKHR, VkProtectedSubmitInfo, VkTimelineSemaphoreSubmitInfo, VkWin32KeyedMutexAcquireReleaseInfoKHR, or VkWin32KeyedMutexAcquireReleaseInfoNV.

• VUID-VkSubmitInfo-sType-unique
The sType value of each struct in the pNext chain must be unique.

• VUID-VkSubmitInfo-pWaitSemaphores-parameter
If waitSemaphoreCount is not 0, pWaitSemaphores must be a valid pointer to an array of waitSemaphoreCount valid VkSemaphore handles.

• VUID-VkSubmitInfo-pWaitDstStageMask-parameter
If waitSemaphoreCount is not 0, pWaitDstStageMask must be a valid pointer to an array of waitSemaphoreCount valid combinations of VkPipelineStageFlagBits values.

• VUID-VkSubmitInfo-pCommandBuffers-parameter
If commandBufferCount is not 0, pCommandBuffers must be a valid pointer to an array of commandBufferCount valid VkCommandBuffer handles.

• VUID-VkSubmitInfo-pSignalSemaphores-parameter
If signalSemaphoreCount is not 0, pSignalSemaphores must be a valid pointer to an array of signalSemaphoreCount valid VkSemaphore handles.

• VUID-VkSubmitInfo-commonparent
Each of the elements of pCommandBuffers, the elements of pSignalSemaphores, and the elements of pWaitSemaphores that are valid handles of non-ignored parameters must have
To specify the values to use when waiting for and signaling semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, add a `VkTimelineSemaphoreSubmitInfo` structure to the `pNext` chain of the `VkSubmitInfo` structure when using `vkQueueSubmit` or the `VkBindSparseInfo` structure when using `vkQueueBindSparse`. The `VkTimelineSemaphoreSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkTimelineSemaphoreSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreValueCount;
    const uint64_t* pWaitSemaphoreValues;
    uint32_t signalSemaphoreValueCount;
    const uint64_t* pSignalSemaphoreValues;
} VkTimelineSemaphoreSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkTimelineSemaphoreSubmitInfo VkTimelineSemaphoreSubmitInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreValueCount` is the number of semaphore wait values specified in `pWaitSemaphoreValues`.
- `pWaitSemaphoreValues` is a pointer to an array of `waitSemaphoreValueCount` values for the corresponding semaphores in `VkSubmitInfo::pWaitSemaphores` to wait for.
- `signalSemaphoreValueCount` is the number of semaphore signal values specified in `pSignalSemaphoreValues`.
- `pSignalSemaphoreValues` is a pointer to an array `signalSemaphoreValueCount` values for the corresponding semaphores in `VkSubmitInfo::pSignalSemaphores` to set when signaled.

If the semaphore in `VkSubmitInfo::pWaitSemaphores` or `VkSubmitInfo::pSignalSemaphores` corresponding to an entry in `pWaitSemaphoreValues` or `pSignalSemaphoreValues` respectively was not created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, the implementation must ignore the value in the `pWaitSemaphoreValues` or `pSignalSemaphoreValues` entry.

**Valid Usage (Implicit)**

- `VUID-VkTimelineSemaphoreSubmitInfo-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_TIMELINE_SEMAPHORE_SUBMIT_INFO`
- `VUID-VkTimelineSemaphoreSubmitInfo-pWaitSemaphoreValues-parameter`
If `waitSemaphoreValueCount` is not 0, and `pWaitSemaphoreValues` is not NULL, `pWaitSemaphoreValues` must be a valid pointer to an array of `waitSemaphoreValueCount uint64_t` values

- VUID-VkTimelineSemaphoreSubmitInfo-pSignalSemaphoreValues-parameter
  If `signalSemaphoreValueCount` is not 0, and `pSignalSemaphoreValues` is not NULL, `pSignalSemaphoreValues` must be a valid pointer to an array of `signalSemaphoreValueCount uint64_t` values

To specify the values to use when waiting for and signaling semaphores whose current payload refers to a Direct3D 12 fence, add a `VkD3D12FenceSubmitInfoKHR` structure to the `pNext` chain of the `VkSubmitInfo` structure. The `VkD3D12FenceSubmitInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkD3D12FenceSubmitInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreValuesCount;
    const uint64_t* pWaitSemaphoreValues;
    uint32_t signalSemaphoreValuesCount;
    const uint64_t* pSignalSemaphoreValues;
} VkD3D12FenceSubmitInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `waitSemaphoreValuesCount` is the number of semaphore wait values specified in `pWaitSemaphoreValues`.
- `pWaitSemaphoreValues` is a pointer to an array of `waitSemaphoreValuesCount` values for the corresponding semaphores in `VkSubmitInfo::pWaitSemaphores` to wait for.
- `signalSemaphoreValuesCount` is the number of semaphore signal values specified in `pSignalSemaphoreValues`.
- `pSignalSemaphoreValues` is a pointer to an array of `signalSemaphoreValuesCount` values for the corresponding semaphores in `VkSubmitInfo::pSignalSemaphores` to set when signaled.

If the semaphore in `VkSubmitInfo::pWaitSemaphores` or `VkSubmitInfo::pSignalSemaphores` corresponding to an entry in `pWaitSemaphoreValues` or `pSignalSemaphoreValues` respectively does not currently have a payload referring to a Direct3D 12 fence, the implementation must ignore the value in the `pWaitSemaphoreValues` or `pSignalSemaphoreValues` entry.

**Note**

As the introduction of the external semaphore handle type `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` is preserved for backwards
compatibility. However, applications should prefer importing such handle types into semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, and use the VkTimelineSemaphoreSubmitInfo structure instead of the VkD3D12FenceSubmitInfoKHR structure to specify the values to use when waiting for and signaling such semaphores.

**Valid Usage**

- VUID-VkD3D12FenceSubmitInfoKHR-waitSemaphoreValuesCount-00079
  
  `waitSemaphoreValuesCount` must be the same value as `VkSubmitInfo::waitSemaphoreCount`, where `VkSubmitInfo` is in the `pNext` chain of this `VkD3D12FenceSubmitInfoKHR` structure

- VUID-VkD3D12FenceSubmitInfoKHR-signalSemaphoreValuesCount-00080
  
  `signalSemaphoreValuesCount` must be the same value as `VkSubmitInfo::signalSemaphoreCount`, where `VkSubmitInfo` is in the `pNext` chain of this `VkD3D12FenceSubmitInfoKHR` structure

**Valid Usage (Implicit)**

- VUID-VkD3D12FenceSubmitInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_D3D12_FENCE_SUBMIT_INFO_KHR`

- VUID-VkD3D12FenceSubmitInfoKHR-pWaitSemaphoreValues-parameter
  
  If `waitSemaphoreValuesCount` is not 0, and `pWaitSemaphoreValues` is not NULL, `pWaitSemaphoreValues` must be a valid pointer to an array of `waitSemaphoreValuesCount` uint64_t values

- VUID-VkD3D12FenceSubmitInfoKHR-pSignalSemaphoreValues-parameter
  
  If `signalSemaphoreValuesCount` is not 0, and `pSignalSemaphoreValues` is not NULL, `pSignalSemaphoreValues` must be a valid pointer to an array of `signalSemaphoreValuesCount` uint64_t values

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism may be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They can only be used if the imported resource was created with the `D3D11_RESOURCE_MISC_SHARED_KEYEDMUTEX` flag.

To acquire keyed mutexes before submitted work and/or release them after, add a VkWin32KeyedMutexAcquireReleaseInfoKHR structure to the `pNext` chain of the VkSubmitInfo structure.

The `VkWin32KeyedMutexAcquireReleaseInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_win32_keyed_mutex
typedef struct VkWin32KeyedMutexAcquireReleaseInfoKHR {
    VkStructureType sType;
    const void* pNext;
} VkWin32KeyedMutexAcquireReleaseInfoKHR;
```
```c
uint32_t acquireCount;
const VkDeviceMemory* pAcquireSyncs;
const uint64_t* pAcquireKeys;
const uint32_t* pAcquireTimeouts;
uint32_t releaseCount;
const VkDeviceMemory* pReleaseSyncs;
const uint64_t* pReleaseKeys;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `acquireCount` is the number of entries in the `pAcquireSyncs`, `pAcquireKeys`, and `pAcquireTimeouts` arrays.
- `pAcquireSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pAcquireKeys` is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in `pAcquireSyncs`.
- `pAcquireTimeouts` is a pointer to an array of timeout values, in millisecond units, for each acquire specified in `pAcquireKeys`.
- `releaseCount` is the number of entries in the `pReleaseSyncs` and `pReleaseKeys` arrays.
- `pReleaseSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pReleaseKeys` is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in `pReleaseSyncs`.

### Valid Usage

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-00081**
  Each member of `pAcquireSyncs` and `pReleaseSyncs` must be a device memory object imported by setting `VkImportMemoryWin32HandleInfoKHR::handleType` to `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`

### Valid Usage (Implicit)

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_KHR`

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-parameter**
  If `acquireCount` is not 0, `pAcquireSyncs` must be a valid pointer to an array of `acquireCount` valid `VkDeviceMemory` handles
When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism may be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They can only be used if the imported resource was created with the D3D11_RESOURCE_MISC_SHARED_KEYEDMUTEX flag.

To acquire keyed mutexes before submitted work and/or release them after, add a VkWin32KeyedMutexAcquireReleaseInfoNV structure to the pNext chain of the VkSubmitInfo structure.

The VkWin32KeyedMutexAcquireReleaseInfoNV structure is defined as:

```c
// Provided by VK_NV_win32_keyed_mutex
typedef struct VkWin32KeyedMutexAcquireReleaseInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t acquireCount;
    const VkDeviceMemory* pAcquireSyncs;
    const uint64_t* pAcquireKeys;
    const uint32_t* pAcquireTimeoutMilliseconds;
    uint32_t releaseCount;
    const VkDeviceMemory* pReleaseSyncs;
    const uint64_t* pReleaseKeys;
} VkWin32KeyedMutexAcquireReleaseInfoNV;
```

- acquireCount is the number of entries in the pAcquireSyncs, pAcquireKeys, and pAcquireTimeoutMilliseconds arrays.
- pAcquireSyncs is a pointer to an array of VkDeviceMemory objects which were imported from the same VkDevice.
Direct3D 11 resources.

- **pAcquireKeys** is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in **pAcquireSyncs**.
- **pAcquireTimeoutMilliseconds** is a pointer to an array of timeout values, in millisecond units, for each acquire specified in **pAcquireKeys**.
- **releaseCount** is the number of entries in the **pReleaseSyncs** and **pReleaseKeys** arrays.
- **pReleaseSyncs** is a pointer to an array of **VkDeviceMemory** objects which were imported from Direct3D 11 resources.
- **pReleaseKeys** is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in **pReleaseSyncs**.

### Valid Usage (Implicit)

- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_Acquire_Release_INFO_NV**
- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireSyncs-parameter**
  - If **acquireCount** is not 0, **pAcquireSyncs** must be a valid pointer to an array of **acquireCount** valid **VkDeviceMemory** handles
- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireKeys-parameter**
  - If **acquireCount** is not 0, **pAcquireKeys** must be a valid pointer to an array of **acquireCount** **uint64_t** values
- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pAcquireTimeoutMilliseconds-parameter**
  - If **acquireCount** is not 0, **pAcquireTimeoutMilliseconds** must be a valid pointer to an array of **acquireCount** **uint32_t** values
- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pReleaseSyncs-parameter**
  - If **releaseCount** is not 0, **pReleaseSyncs** must be a valid pointer to an array of **releaseCount** valid **VkDeviceMemory** handles
- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-pReleaseKeys-parameter**
  - If **releaseCount** is not 0, **pReleaseKeys** must be a valid pointer to an array of **releaseCount** **uint64_t** values
- **VUID-VkWin32KeyedMutexAcquireReleaseInfoNV-commonparent**
  - Both of the elements of **pAcquireSyncs**, and the elements of **pReleaseSyncs** that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same **VkDevice**

If the **pNext** chain of **VkSubmitInfo** includes a **VkProtectedSubmitInfo** structure, then the structure indicates whether the batch is protected. The **VkProtectedSubmitInfo** structure is defined as:

```
// Provided by VK_VERSION_1_1
```
typedef struct VkProtectedSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    VkBool32 protectedSubmit;
} VkProtectedSubmitInfo;

- protectedSubmit specifies whether the batch is protected. If protectedSubmit is VK_TRUE, the batch is protected. If protectedSubmit is VK_FALSE, the batch is unprotected. If the VkSubmitInfo::pNext chain does not include this structure, the batch is unprotected.

Valid Usage (Implicit)

- VUID-VkProtectedSubmitInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PROTECTED_SUBMIT_INFO

If the pNext chain of VkSubmitInfo includes a VkDeviceGroupSubmitInfo structure, then that structure includes device indices and masks specifying which physical devices execute semaphore operations and command buffers.

The VkDeviceGroupSubmitInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const uint32_t* pWaitSemaphoreDeviceIndices;
    uint32_t commandBufferCount;
    const uint32_t* pCommandBufferDeviceMasks;
    uint32_t signalSemaphoreCount;
    const uint32_t* pSignalSemaphoreDeviceIndices;
} VkDeviceGroupSubmitInfo;
```

or the equivalent

```
// Provided by VK_KHR_device_group
typedef VkDeviceGroupSubmitInfo VkDeviceGroupSubmitInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- waitSemaphoreCount is the number of elements in the pWaitSemaphoreDeviceIndices array.
- pWaitSemaphoreDeviceIndices is a pointer to an array of waitSemaphoreCount device indices indicating which physical device executes the semaphore wait operation in the corresponding element of VkSubmitInfo::pWaitSemaphores.
• `commandBufferCount` is the number of elements in the `pCommandBufferDeviceMasks` array.

• `pCommandBufferDeviceMasks` is a pointer to an array of `commandBufferCount` device masks indicating which physical devices execute the command buffer in the corresponding element of `VkSubmitInfo::pCommandBuffers`. A physical device executes the command buffer if the corresponding bit is set in the mask.

• `signalSemaphoreCount` is the number of elements in the `pSignalSemaphoreDeviceIndices` array.

• `pSignalSemaphoreDeviceIndices` is a pointer to an array of `signalSemaphoreCount` device indices indicating which physical device executes the semaphore signal operation in the corresponding element of `VkSubmitInfo::pSignalSemaphores`.

If this structure is not present, semaphore operations and command buffers execute on device index zero.

### Valid Usage

- **VUID-VkDeviceGroupSubmitInfo-waitSemaphoreCount-00082**
  - `waitSemaphoreCount` must equal `VkSubmitInfo::waitSemaphoreCount`

- **VUID-VkDeviceGroupSubmitInfo-commandBufferCount-00083**
  - `commandBufferCount` must equal `VkSubmitInfo::commandBufferCount`

- **VUID-VkDeviceGroupSubmitInfo-signalSemaphoreCount-00084**
  - `signalSemaphoreCount` must equal `VkSubmitInfo::signalSemaphoreCount`

- **VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-00085**
  - All elements of `pWaitSemaphoreDeviceIndices` and `pSignalSemaphoreDeviceIndices` must be valid device indices

- **VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-00086**
  - All elements of `pCommandBufferDeviceMasks` must be valid device masks

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupSubmitInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_SUBMIT_INFO`

- **VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-parameter**
  - If `waitSemaphoreCount` is not 0, `pWaitSemaphoreDeviceIndices` must be a valid pointer to an array of `waitSemaphoreCount uint32_t` values

- **VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-parameter**
  - If `commandBufferCount` is not 0, `pCommandBufferDeviceMasks` must be a valid pointer to an array of `commandBufferCount uint32_t` values

- **VUID-VkDeviceGroupSubmitInfo-pSignalSemaphoreDeviceIndices-parameter**
  - If `signalSemaphoreCount` is not 0, `pSignalSemaphoreDeviceIndices` must be a valid pointer to an array of `signalSemaphoreCount uint32_t` values

If the `pNext` chain of `VkSubmitInfo` includes a `VkPerformanceQuerySubmitInfoKHR` structure, then
the structure indicates which counter pass is active for the batch in that submit.

The `VkPerformanceQuerySubmitInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceQuerySubmitInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t counterPassIndex;
} VkPerformanceQuerySubmitInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `counterPassIndex` specifies which counter pass index is active.

If the `VkSubmitInfo::pNext` chain does not include this structure, the batch defaults to use counter pass index 0.

### Valid Usage

- VUID-VkPerformanceQuerySubmitInfoKHR-counterPassIndex-03221
  
  `counterPassIndex` must be less than the number of counter passes required by any queries within the batch. The required number of counter passes for a performance query is obtained by calling `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

### Valid Usage (Implicit)

- VUID-VkPerformanceQuerySubmitInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR`.

## 6.6. Queue Forward Progress

When using binary semaphores, the application must ensure that command buffer submissions will be able to complete without any subsequent operations by the application on any queue. After any call to `vkQueueSubmit` (or other queue operation), for every queued wait on a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` there must be a prior signal of that semaphore that will not be consumed by a different wait on the semaphore.

When using timeline semaphores, wait-before-signal behavior is well-defined and applications can submit work via `vkQueueSubmit` defining a timeline semaphore wait operation before submitting a corresponding semaphore signal operation. For each timeline semaphore wait operation defined by a call to `vkQueueSubmit`, the application must ensure that a corresponding semaphore signal operation is executed before forward progress can be made.

If a command buffer submission waits for any events to be signaled, the application must ensure
that command buffer submissions will be able to complete without any subsequent operations by
the application. Events signaled by the host **must** be signaled before the command buffer waits on
those events.

**Note**
The ability for commands to wait on the host to set an events was originally added
to allow low-latency updates to resources between host and device. However, to
ensure quality of service, implementations would necessarily detect extended
stalls in execution and timeout after a short period. As this period is not defined in
the Vulkan specification, it is impossible to correctly validate any application with
any wait period. Since the original users of this functionality were highly limited
and platform-specific, this functionality is now considered defunct and should not
be used.

6.7. Secondary Command Buffer Execution

A secondary command buffer **must** not be directly submitted to a queue. Instead, secondary
command buffers are recorded to execute as part of a primary command buffer with the
command:

```
// Provided by VK_VERSION_1_0
void vkCmdExecuteCommands(
    VkCommandBuffer commandBuffer,
    uint32_t commandBufferCount,
    const VkCommandBuffer* pCommandBuffers);
```

- **commandBuffer** is a handle to a primary command buffer that the secondary command buffers
  are executed in.
- **commandBufferCount** is the length of the **pCommandBuffers** array.
- **pCommandBuffers** is a pointer to an array of **commandBufferCount** secondary command buffer
  handles, which are recorded to execute in the primary command buffer in the order they are
  listed in the array.

If any element of **pCommandBuffers** was not recorded with the
**VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT** flag, and it was recorded into any other primary
command buffer which is currently in the **executable or recording state**, that primary command
buffer becomes **invalid**.

**Valid Usage**

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00088**
  Each element of **pCommandBuffers** **must** have been allocated with a **level** of
  **VK_COMMAND_BUFFER_LEVEL_SECONDARY**
- **VUID-vkCmdExecuteCommands-pCommandBuffers-00089**
  Each element of **pCommandBuffers** **must** be in the **pending or executable state**
If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not be in the pending state.

If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not have already been recorded to `commandBuffer`.

If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not appear more than once in `pCommandBuffers`.

Each element of `pCommandBuffers` **must** have been allocated from a `VkCommandPool` that was created for the same queue family as the `VkCommandPool` from which `commandBuffer` was allocated.

If `vkCmdExecuteCommands` is being called within a render pass instance, each element of `pCommandBuffers` **must** have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`.

If `vkCmdExecuteCommands` is being called within a render pass instance, and any element of `pCommandBuffers` was recorded with `VkCommandBufferInheritanceInfo::framebuffer` not equal to `VK_NULL_HANDLE`, that `VkFramebuffer` **must** match the `VkFramebuffer` used in the current render pass instance.

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, its `contents` parameter **must** have been set to `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS`.

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo::subpass` set to the index of the subpass which the given command buffer will be executed in.

If `vkCmdExecuteCommands` is being called within a render pass instance that included `VkRenderPassTransformBeginInfoQCOM` in the `pNext` chain of `VkRenderPassBeginInfo`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` in the `pNext` chain of `VkCommandBufferBeginInfo`.
If `vkCmdExecuteCommands` is being called within a render pass instance that included `VkRenderPassTransformBeginInfoQCOM` in the `pNext` chain of `VkRenderPassBeginInfo`, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceRenderPassTransformInfoQCOM::transform` identical to `VkRenderPassTransformBeginInfoQCOM::transform`.

If `vkCmdExecuteCommands` is being called within a render pass instance that included `VkRenderPassTransformBeginInfoQCOM` in the `pNext` chain of `VkRenderPassBeginInfo`, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceRenderPassTransformInfoQCOM::renderArea` identical to `VkRenderPassBeginInfo::renderArea`.

If `vkCmdExecuteCommands` is not being called within a render pass instance, each element of `pCommandBuffers` must not have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`.

If the `inheritedQueries` feature is not enabled, `commandBuffer` must not have any queries active.

If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::occlusionQueryEnable` set to `VK_TRUE`.

If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::queryFlags` having all bits set that are set for the query.

If `commandBuffer` has a `VK_QUERY_TYPE_PIPELINE_STATISTICS` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::pipelineStatistics` having all bits set that are set in the `VkQueryPool` the query uses.

Each element of `pCommandBuffers` must not begin any query types that are active in `commandBuffer`.

`commandBuffer` must not have any queries other than `VKQUERY_TYPE_OCCLUSION` and `VKQUERY_TYPE_PIPELINE_STATISTICS` active.

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, each element of `pCommandBuffers` must be a protected command buffer.

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, each element of `pCommandBuffers` must be an unprotected command buffer.
• VUID-vkCmdExecuteCommands-None-02286
  This command must not be recorded when transform feedback is active

• VUID-vkCmdExecuteCommands-commandBuffer-06533
  If vkCmdExecuteCommands is being called within a render pass instance and any recorded command in commandBuffer in the current subpass will write to an image subresource as an attachment, commands recorded in elements of pCommandBuffers must not read from the memory backing that image subresource in any other way

• VUID-vkCmdExecuteCommands-commandBuffer-06534
  If vkCmdExecuteCommands is being called within a render pass instance and any recorded command in commandBuffer in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of pCommandBuffers must not write to that image subresource as an attachment

• VUID-vkCmdExecuteCommands-pCommandBuffers-06535
  If vkCmdExecuteCommands is being called within a render pass instance and any recorded command in a given element of pCommandBuffers will write to an image subresource as an attachment, commands recorded in elements of pCommandBuffers at a higher index must not read from the memory backing that image subresource in any other way

• VUID-vkCmdExecuteCommands-pCommandBuffers-06536
  If vkCmdExecuteCommands is being called within a render pass instance and any recorded command in a given element of pCommandBuffers will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of pCommandBuffers at a higher index must not write to that image subresource as an attachment

• VUID-vkCmdExecuteCommands-pCommandBuffers-06021
  If pCommandBuffers contains any suspended render pass instances, there must be no action or synchronization commands between that render pass instance and any render pass instance that resumes it

• VUID-vkCmdExecuteCommands-pCommandBuffers-06022
  If pCommandBuffers contains any suspended render pass instances, there must be no render pass instances between that render pass instance and any render pass instance that resumes it

• VUID-vkCmdExecuteCommands-variableSampleLocations-06023
  If the variableSampleLocations limit is not supported, and any element of pCommandBuffers contains any suspended render pass instances, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, must use the same sample locations

• VUID-vkCmdExecuteCommands-flags-06024
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, its VkRenderingInfo::flags parameter must have included VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT

• VUID-vkCmdExecuteCommands-pBeginInfo-06025
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, the render passes specified in the pBeginInfo->pInheritanceInfo-
>renderPass members of the `vkBeginCommandBuffer` commands used to begin recording each element of `pCommandBuffers` must be VK_NULL_HANDLE

- **VUID-vkCmdExecuteCommands-flags-06026**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the `flags` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the `VkRenderingInfo::flags` parameter to `vkCmdBeginRendering`, excluding `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`

- **VUID-vkCmdExecuteCommands-colorAttachmentCount-06027**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the `colorAttachmentCount` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the `VkRenderingInfo::colorAttachmentCount` parameter to `vkCmdBeginRendering`

- **VUID-vkCmdExecuteCommands-imageView-06028**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `imageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is not VK_NULL_HANDLE, the corresponding element of the `pColorAttachmentFormats` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of ` VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the format used to create that image view

- **VUID-vkCmdExecuteCommands-pDepthAttachment-06029**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `VkRenderingInfo::pDepthAttachment->imageView` parameter to `vkCmdBeginRendering` is not VK_NULL_HANDLE, the value of the `depthAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the format used to create that image view

- **VUID-vkCmdExecuteCommands-pStencilAttachment-06030**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `VkRenderingInfo::pStencilAttachment->imageView` parameter to `vkCmdBeginRendering` is not VK_NULL_HANDLE, the value of the `stencilAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the format used to create that image view

- **VUID-vkCmdExecuteCommands-pDepthAttachment-06774**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `VkRenderingInfo::pDepthAttachment->imageView` parameter to `vkCmdBeginRendering` was VK_NULL_HANDLE, the value of the `depthAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the
pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be VK_FORMAT_UNDEFINED

- VUID-vkCmdExecuteCommands-pStencilAttachment-06775
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering and the VkRenderingInfo::pStencilAttachment->imageView parameter to vkCmdBeginRendering was VK_NULL_HANDLE, the value of the stencilAttachmentFormat member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be VK_FORMAT_UNDEFINED

- VUID-vkCmdExecuteCommands-viewMask-06031
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, the viewMask member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the VkRenderingInfo::viewMask parameter to vkCmdBeginRendering

- VUID-vkCmdExecuteCommands-pNext-06032
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering and the pNext chain of VkCommandBufferInheritanceInfo includes a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, if the imageView member of an element of the VkRenderingInfo::pColorAttachments parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the corresponding element of the pColorAttachmentSamples member of the VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-06033
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering and the pNext chain of VkCommandBufferInheritanceInfo includes a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, if the VkRenderingInfo::pDepthAttachment->imageView parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of the VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the sample count used to create that image view

- VUID-vkCmdExecuteCommands-pNext-06034
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering and the pNext chain of VkCommandBufferInheritanceInfo includes a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, if the VkRenderingInfo::pStencilAttachment->imageView parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of the VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the sample count used to create that image view
to create that image view

- **VUID-vkCmdExecuteCommands-pNext-06035**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` does not include a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, if the `imageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` must be equal to the sample count used to create that image view.

- **VUID-vkCmdExecuteCommands-pNext-06036**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` does not include a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, if the `VkRenderingInfo::pDepthAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` must be equal to the sample count used to create that image view.

- **VUID-vkCmdExecuteCommands-pNext-06037**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `pNext` chain of `VkCommandBufferInheritanceInfo` does not include a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, if the `VkRenderingInfo::pStencilAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of `VkCommandBufferInheritanceRenderingInfo::rasterizationSamples` must be equal to the sample count used to create that image view.

---

**Valid Usage (Implicit)**

- **VUID-vkCmdExecuteCommands-commandBuffer-parameter**
  The `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdExecuteCommands-pCommandBuffers-parameter**
  The `pCommandBuffers` must be a valid pointer to an array of `commandBufferCount` valid `VkCommandBuffer` handles.

- **VUID-vkCmdExecuteCommands-commandBuffer-recording**
  The `commandBuffer` must be in the recording state.

- **VUID-vkCmdExecuteCommands-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations.

- **VUID-vkCmdExecuteCommands-videocoding**
  This command must only be called outside of a video coding scope.

- **VUID-vkCmdExecuteCommands-bufferlevel**
  The `commandBuffer` must be a primary `VkCommandBuffer`.

- **VUID-vkCmdExecuteCommands-commandBufferCount-arraylength**
  The `commandBufferCount` must be equal to the length of the `pCommandBuffers` array.
commandBufferCount must be greater than 0

- VUID-vkCmdExecuteCommands-commonparent
  Both of commandBuffer, and the elements of pCommandBuffers must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### 6.8. Command Buffer Device Mask

Each command buffer has a piece of state storing the current device mask of the command buffer. This mask controls which physical devices within the logical device all subsequent commands will execute on, including state-setting commands, action commands, and synchronization commands.

Scissor, exclusive scissor, and viewport state (excluding the count of each) can be set to different values on each physical device (only when set as dynamic state), and each physical device will render using its local copy of the state. Other state is shared between physical devices, such that all physical devices use the most recently set values for the state. However, when recording an action command that uses a piece of state, the most recent command that set that state must have included all physical devices that execute the action command in its current device mask.

The command buffer's device mask is orthogonal to the pCommandBufferDeviceMasks member of VkDeviceGroupSubmitInfo. Commands only execute on a physical device if the device index is set in both device masks.

If the pNext chain of VkCommandBufferBeginInfo includes a VkDeviceGroupCommandBufferBeginInfo structure, then that structure includes an initial device mask for the command buffer.

The VkDeviceGroupCommandBufferBeginInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupCommandBufferBeginInfo {
    VkStructureType  sType;
} VkDeviceGroupCommandBufferBeginInfo;
```
const void* pNext;
uint32_t deviceMask;
} VkDeviceGroupCommandBufferBeginInfo;

or the equivalent

// Provided by VK_KHR_device_group
typedef VkDeviceGroupCommandBufferBeginInfo VkDeviceGroupCommandBufferBeginInfoKHR;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• deviceMask is the initial value of the command buffer's device mask.

The initial device mask also acts as an upper bound on the set of devices that can ever be in the device mask in the command buffer.

If this structure is not present, the initial value of a command buffer's device mask is set to include all physical devices in the logical device when the command buffer begins recording.

Valid Usage
• VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00106
deviceMask must be a valid device mask value
• VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00107
deviceMask must not be zero

Valid Usage (Implicit)
• VUID-VkDeviceGroupCommandBufferBeginInfo-sType-sType
sType must be VK_STRUCTURE_TYPEDEVICE_GROUP_COMMAND_BUFFER_BEGIN_INFO

To update the current device mask of a command buffer, call:

// Provided by VK_VERSION_1_1
void vkCmdSetDeviceMask(
    VkCommandBuffer commandBuffer,
    uint32_t deviceMask);

or the equivalent command

// Provided by VK_KHR_device_group
void vkCmdSetDeviceMaskKHR(
    VkCommandBuffer commandBuffer,
• `commandBuffer` is command buffer whose current device mask is modified.
• `deviceMask` is the new value of the current device mask.

`deviceMask` is used to filter out subsequent commands from executing on all physical devices whose bit indices are not set in the mask, except commands beginning a render pass instance, commands transitioning to the next subpass in the render pass instance, and commands ending a render pass instance, which always execute on the set of physical devices whose bit indices are included in the `deviceMask` member of the `VkDeviceGroupRenderPassBeginInfo` structure passed to the command beginning the corresponding render pass instance.

**Valid Usage**

- VUID-vkCmdSetDeviceMask-deviceMask-00108  
  `deviceMask` must be a valid device mask value
- VUID-vkCmdSetDeviceMask-deviceMask-00109  
  `deviceMask` must not be zero
- VUID-vkCmdSetDeviceMask-deviceMask-00110  
  `deviceMask` must not include any set bits that were not in the `VkDeviceGroupCommandBufferBeginInfo::deviceMask` value when the command buffer began recording
- VUID-vkCmdSetDeviceMask-deviceMask-00111  
  If `vkCmdSetDeviceMask` is called inside a render pass instance, `deviceMask` must not include any set bits that were not in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` value when the render pass instance began recording

**Valid Usage (Implicit)**

- VUID-vkCmdSetDeviceMask-commandBuffer-parameter  
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDeviceMask-commandBuffer-recording  
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetDeviceMask-commandBuffer-cmdpool  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, or transfer operations

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Chapter 7. Synchronization and Cache Control

Synchronization of access to resources is primarily the responsibility of the application in Vulkan. The order of execution of commands with respect to the host and other commands on the device has few implicit guarantees, and needs to be explicitly specified. Memory caches and other optimizations are also explicitly managed, requiring that the flow of data through the system is largely under application control.

Whilst some implicit guarantees exist between commands, five explicit synchronization mechanisms are exposed by Vulkan:

Fences
Fences can be used to communicate to the host that execution of some task on the device has completed.

Semaphores
Semaphores can be used to control resource access across multiple queues.

Events
Events provide a fine-grained synchronization primitive which can be signaled either within a command buffer or by the host, and can be waited upon within a command buffer or queried on the host.

Pipeline Barriers
Pipeline barriers also provide synchronization control within a command buffer, but at a single point, rather than with separate signal and wait operations.

Render Passes
Render passes provide a useful synchronization framework for most rendering tasks, built upon the concepts in this chapter. Many cases that would otherwise need an application to use other synchronization primitives can be expressed more efficiently as part of a render pass.

7.1. Execution and Memory Dependencies

An operation is an arbitrary amount of work to be executed on the host, a device, or an external entity such as a presentation engine. Synchronization commands introduce explicit execution dependencies, and memory dependencies between two sets of operations defined by the command’s two synchronization scopes.

The synchronization scopes define which other operations a synchronization command is able to create execution dependencies with. Any type of operation that is not in a synchronization command’s synchronization scopes will not be included in the resulting dependency. For example, for many synchronization commands, the synchronization scopes can be limited to just operations executing in specific pipeline stages, which allows other pipeline stages to be excluded from a dependency. Other scoping options are possible, depending on the particular command.
An execution dependency is a guarantee that for two sets of operations, the first set must happen-before the second set. If an operation happens-before another operation, then the first operation must complete before the second operation is initiated. More precisely:

- Let $\text{Ops}_1$ and $\text{Ops}_2$ be separate sets of operations.
- Let $\text{Sync}$ be a synchronization command.
- Let $\text{Scope}_{1st}$ and $\text{Scope}_{2nd}$ be the synchronization scopes of $\text{Sync}$.
- Let $\text{ScopedOps}_1$ be the intersection of sets $\text{Ops}_1$ and $\text{Scope}_{1st}$.
- Let $\text{ScopedOps}_2$ be the intersection of sets $\text{Ops}_2$ and $\text{Scope}_{2nd}$.
- Submitting $\text{Ops}_1$, $\text{Sync}$ and $\text{Ops}_2$ for execution, in that order, will result in execution dependency $\text{ExeDep}$ between $\text{ScopedOps}_1$ and $\text{ScopedOps}_2$.
- Execution dependency $\text{ExeDep}$ guarantees that $\text{ScopedOps}_1$ happen-before $\text{ScopedOps}_2$.

An execution dependency chain is a sequence of execution dependencies that form a happens-before relation between the first dependency’s $\text{ScopedOps}_1$ and the final dependency’s $\text{ScopedOps}_2$. For each consecutive pair of execution dependencies, a chain exists if the intersection of $\text{Scope}_{2nd}$ in the first dependency and $\text{Scope}_{1st}$ in the second dependency is not an empty set. The formation of a single execution dependency from an execution dependency chain can be described by substituting the following in the description of execution dependencies:

- Let $\text{Sync}$ be a set of synchronization commands that generate an execution dependency chain.
- Let $\text{Scope}_{1st}$ be the first synchronization scope of the first command in $\text{Sync}$.
- Let $\text{Scope}_{2nd}$ be the second synchronization scope of the last command in $\text{Sync}$.

Execution dependencies alone are not sufficient to guarantee that values resulting from writes in one set of operations can be read from another set of operations.

Three additional types of operations are used to control memory access. Availability operations cause the values generated by specified memory write accesses to become available to a memory domain for future access. Any available value remains available until a subsequent write to the same memory location occurs (whether it is made available or not) or the memory is freed. Memory domain operations cause writes that are available to a source memory domain to become available to a destination memory domain (an example of this is making writes available to the host domain available to the device domain). Visibility operations cause values available to a memory domain to become visible to specified memory accesses.

Availability, visibility, memory domains, and memory domain operations are formally defined in the Availability and Visibility section of the Memory Model chapter. Which API operations perform each of these operations is defined in Availability, Visibility, and Domain Operations.

A memory dependency is an execution dependency which includes availability and visibility operations such that:

- The first set of operations happens-before the availability operation.
- The availability operation happens-before the visibility operation.
- The visibility operation happens-before the second set of operations.
Once written values are made visible to a particular type of memory access, they can be read or written by that type of memory access. Most synchronization commands in Vulkan define a memory dependency.

The specific memory accesses that are made available and visible are defined by the access scopes of a memory dependency. Any type of access that is in a memory dependency’s first access scope and occurs in \texttt{ScopedOps}_1 is made available. Any type of access that is in a memory dependency’s second access scope and occurs in \texttt{ScopedOps}_2 has any available writes made visible to it. Any type of operation that is not in a synchronization command’s access scopes will not be included in the resulting dependency.

A memory dependency enforces availability and visibility of memory accesses and execution order between two sets of operations. Adding to the description of execution dependency chains:

- Let \( \text{MemOps}_1 \) be the set of memory accesses performed by \( \text{ScopedOps}_1 \).
- Let \( \text{MemOps}_2 \) be the set of memory accesses performed by \( \text{ScopedOps}_2 \).
- Let \( \text{AccessScope}_{1st} \) be the first access scope of the first command in the \texttt{Sync} chain.
- Let \( \text{AccessScope}_{2nd} \) be the second access scope of the last command in the \texttt{Sync} chain.
- Let \( \text{ScopedMemOps}_1 \) be the intersection of sets \( \text{MemOps}_1 \) and \( \text{AccessScope}_{1st} \).
- Let \( \text{ScopedMemOps}_2 \) be the intersection of sets \( \text{MemOps}_2 \) and \( \text{AccessScope}_{2nd} \).
- Submitting \( \text{Ops}_1 \), \texttt{Sync}, and \( \text{Ops}_2 \) for execution, in that order, will result in a memory dependency \( \text{MemDep} \) between \( \text{ScopedOps}_1 \) and \( \text{ScopedOps}_2 \).
- Memory dependency \( \text{MemDep} \) guarantees that:
  - Memory writes in \( \text{ScopedMemOps}_1 \) are made available.
  - Available memory writes, including those from \( \text{ScopedMemOps}_1 \), are made visible to \( \text{ScopedMemOps}_2 \).

Note

Execution and memory dependencies are used to solve data hazards, i.e. to ensure that read and write operations occur in a well-defined order. Write-after-read hazards can be solved with just an execution dependency, but read-after-write and write-after-write hazards need appropriate memory dependencies to be included between them. If an application does not include dependencies to solve these hazards, the results and execution orders of memory accesses are undefined.

### 7.1.1. Image Layout Transitions

Image subresources can be transitioned from one layout to another as part of a memory dependency (e.g. by using an image memory barrier). When a layout transition is specified in a memory dependency, it happens-after the availability operations in the memory dependency, and happens-before the visibility operations. Image layout transitions may perform read and write accesses on all memory bound to the image subresource range, so applications must ensure that all memory writes have been made available before a layout transition is executed. Available memory is automatically made visible to a layout transition, and writes performed by a layout transition are automatically made available.
Layout transitions always apply to a particular image subresource range, and specify both an old layout and new layout. The old layout must either be `VK_IMAGE_LAYOUT_UNDEFINED`, or match the current layout of the image subresource range. If the old layout matches the current layout of the image subresource range, the transition preserves the contents of that range. If the old layout is `VK_IMAGE_LAYOUT_UNDEFINED`, the contents of that range may be discarded.

As image layout transitions may perform read and write accesses on the memory bound to the image, if the image subresource affected by the layout transition is bound to peer memory for any device in the current device mask then the memory heap the bound memory comes from must support the `VK_PEER_MEMORY_FEATURE GENERIC_SRC_BIT` and `VK_PEER_MEMORY_FEATURE GENERIC_DST_BIT` capabilities as returned by `vkGetDeviceGroupPeerMemoryFeatures`.

Note

Applications must ensure that layout transitions happen-after all operations accessing the image with the old layout, and happen-before any operations that will access the image with the new layout. Layout transitions are potentially read/write operations, so not defining appropriate memory dependencies to guarantee this will result in a data race.

Image layout transitions interact with memory aliasing.

Layout transitions that are performed via image memory barriers execute in their entirety in submission order, relative to other image layout transitions submitted to the same queue, including those performed by render passes. In effect there is an implicit execution dependency from each such layout transition to all layout transitions previously submitted to the same queue.

The image layout of each image subresource of a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus when the image member of an image memory barrier is an image created with this flag the application can chain a `VkSampleLocationsInfoEXT` structure to the `pNext` chain of `VkImageMemoryBarrier2` or `VkImageMemoryBarrier` to specify the sample locations to use during any image layout transition.

If the `VkSampleLocationsInfoEXT` structure does not match the sample location state last used to render to the image subresource range specified by `subresourceRange`, or if no `VkSampleLocationsInfoEXT` structure is present, then the contents of the given image subresource range becomes undefined as if `oldLayout` would equal `VK_IMAGE_LAYOUT_UNDEFINED`.

7.1.2. Pipeline Stages

The work performed by an action or synchronization command consists of multiple operations, which are performed as a sequence of logically independent steps known as pipeline stages. The exact pipeline stages executed depend on the particular command that is used, and current command buffer state when the command was recorded. Drawing commands, dispatching commands, copy commands, clear commands, and synchronization commands all execute in different sets of pipeline stages. Synchronization commands do not execute in a defined pipeline stage.
Operations performed by synchronization commands (e.g. availability and visibility operations) are not executed by a defined pipeline stage. However other commands can still synchronize with them by using the synchronization scopes to create a dependency chain.

Execution of operations across pipeline stages must adhere to implicit ordering guarantees, particularly including pipeline stage order. Otherwise, execution across pipeline stages may overlap or execute out of order with regards to other stages, unless otherwise enforced by an execution dependency.

Several of the synchronization commands include pipeline stage parameters, restricting the synchronization scopes for that command to just those stages. This allows fine grained control over the exact execution dependencies and accesses performed by action commands. Implementations should use these pipeline stages to avoid unnecessary stalls or cache flushing.

Bits which can be set in a VkPipelineStageFlags2 mask, specifying stages of execution, are:

```c
// Provided by VK_VERSION_1_3
// Flag bits for VkPipelineStageFlagBits2
typedef VkFlags64 VkPipelineStageFlagBits2;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE = 0ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE_KHR = 0ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT = 0x00000001ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT_KHR = 0x00000001ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT = 0x00000002ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT_KHR = 0x00000002ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT = 0x00000004ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT_KHR = 0x00000004ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT = 0x00000008ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT_KHR = 0x00000008ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT_KHR = 0x00000010ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT_KHR = 0x00000020ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT = 0x00000040ULL;
```
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR = 0x00000040ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT_KHR = 0x00000080ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT_KHR = 0x00000100ULL;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkPipelineStageFlagBits2 VkPipelineStageFlagBits2KHR;

- **VK_PIPELINE_STAGE_2_NONE** specifies no stages of execution.
- **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT** specifies the stage of the pipeline where indirect command parameters are consumed. This stage also includes reading commands written by *vkCmdPreprocessGeneratedCommandsNV*.
- **VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT** specifies the task shader stage.
- **VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT** specifies the mesh shader stage.
• **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT** specifies the stage of the pipeline where index buffers are consumed.

• **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT** specifies the stage of the pipeline where vertex buffers are consumed.

• **VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT** is equivalent to the logical OR of:
  - **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT**
  - **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT**

• **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT** specifies the vertex shader stage.

• **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT** specifies the tessellation control shader stage.

• **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT** specifies the tessellation evaluation shader stage.

• **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT** specifies the geometry shader stage.

• **VK_PIPELINE_STAGE_2_PRE_RASTERIZATION_SHADERS_BIT** is equivalent to specifying all supported pre-rasterization shader stages:
  - **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT**
  - **VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT**

• **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT** specifies the fragment shader stage.

• **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes **subpass load operations** for framebuffer attachments with a depth/stencil format.

• **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes **subpass store operations** for framebuffer attachments with a depth/stencil format.

• **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT** specifies the stage of the pipeline after blending where the final color values are output from the pipeline. This stage also includes **subpass load and store operations**, multisample resolve operations for framebuffer attachments with a color or depth/stencil format, and **vkCmdClearAttachments**.

• **VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT** specifies the compute shader stage.

• **VK_PIPELINE_STAGE_2_HOST_BIT** specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.

• **VK_PIPELINE_STAGE_2_COPY_BIT** specifies the execution of all **copy commands**, including **vkCmdCopyQueryPoolResults**.

• **VK_PIPELINE_STAGE_2_BLIT_BIT** specifies the execution of **vkCmdBlitImage**.
• **VK_PIPELINE_STAGE_2_RESOLVE_BIT** specifies the execution of `vkCmdResolveImage`.

• **VK_PIPELINE_STAGE_2_CLEAR_BIT** specifies the execution of clear commands, with the exception of `vkCmdClearAttachments`.

• **VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT** is equivalent to specifying all of:
  - VK_PIPELINE_STAGE_2_COPY_BIT
  - VK_PIPELINE_STAGE_2_BLIT_BIT
  - VK_PIPELINE_STAGE_2_RESOLVE_BIT
  - VK_PIPELINE_STAGE_2_CLEAR_BIT
  - VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR

• **VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR** specifies the execution of the ray tracing shader stages.

• **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** specifies the execution of acceleration structure commands.

• **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR** specifies the execution of acceleration structure copy commands.

• **VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT** specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
  - VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT
  - VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT
  - VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT
  - VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT
  - VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT
  - VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT
  - VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT
  - VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT
  - VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT
  - VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT
  - VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT
  - VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT
  - VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT
  - VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT
  - VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV
  - VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT
  - VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI

• **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT** specifies all operations performed by all commands supported on the queue it is used with.
• **VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT** specifies the stage of the pipeline where the predicate of conditional rendering is consumed.

• **VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT** specifies the stage of the pipeline where vertex attribute output values are written to the transform feedback buffers.

• **VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV** specifies the stage of the pipeline where device-side generation of commands via `vkCmdPreprocessGeneratedCommandsNV` is handled.

• **VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies the stage of the pipeline where the fragment shading rate attachment or shading rate image is read to determine the fragment shading rate for portions of a rasterized primitive.

• **VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT** specifies the stage of the pipeline where the fragment density map is read to generate the fragment areas.

• **VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI** specifies the stage of the pipeline where the invocation mask image is read by the implementation to optimize the ray dispatch.

• **VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR** specifies the stage of the pipeline where video decode operation are performed.

• **VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR** specifies the stage of the pipeline where video encode operation are performed.

• **VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV** specifies the stage of the pipeline where optical flow operation are performed.

• **VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI** specifies the subpass shading shader stage.

• **VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT** is equivalent to `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` with `VkAccessFlags2` set to 0 when specified in the second synchronization scope, but equivalent to `VK_PIPELINE_STAGE_2_NONE` in the first scope.

• **VK_PIPELINE_STAGE_2_BOTTOM_OF_PIPE_BIT** is equivalent to `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` with `VkAccessFlags2` set to 0 when specified in the first synchronization scope, but equivalent to `VK_PIPELINE_STAGE_2_NONE` in the second scope.

**Note**
The `TOP` and `BOTTOM` pipeline stages are deprecated, and applications should prefer `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` and `VK_PIPELINE_STAGE_2_NONE`.

**Note**
The `VkPipelineStageFlags2` bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how `VkPipelineStageFlagBits` is defined. The first 31 values are common to both, and are interchangeable.

`VkPipelineStageFlags2` is a bitmask type for setting a mask of zero or more `VkPipelineStageFlagBits2` flags:

```c
// Provided by VK_VERSION_1_3
typedef VkFlags64 VkPipelineStageFlags2;
```
or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkPipelineStageFlags2 VkPipelineStageFlags2KHR;
```

Bits which **can** be set in a `VkPipelineStageFlags` mask, specifying stages of execution, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineStageFlagBits {
    VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT = 0x00000001,
    VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT = 0x00000002,
    VK_PIPELINE_STAGE_VERTEX_INPUT_BIT = 0x00000004,
    VK_PIPELINE_STAGE_VERTEX_SHADER_BIT = 0x00000008,
    VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010,
    VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020,
    VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT = 0x00000040,
    VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT = 0x00000080,
    VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT = 0x00000100,
    VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT = 0x00000200,
    VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT = 0x00000400,
    VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT = 0x00000800,
    VK_PIPELINE_STAGE_TRANSFER_BIT = 0x00001000,
    VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT = 0x00002000,
    VK_PIPELINE_STAGE_HOST_BIT = 0x00004000,

```

260
These values all have the same meaning as the equivalently named values for

VkPipelineStageFlags2.

- **VK_PIPELINE_STAGE_NONE** specifies no stages of execution.
- **VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT** specifies the stage of the pipeline where VkDrawIndirect* / VkDispatchIndirect* / VkTraceRaysIndirect* data structures are consumed. This stage also includes reading commands written by vkCmdExecuteGeneratedCommandsNV.
- **VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT** specifies the task shader stage.
- **VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT** specifies the mesh shader stage.
- **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT** specifies the stage of the pipeline where vertex and index buffers are consumed.
- **VK_PIPELINE_STAGE_VERTEX_SHADER_BIT** specifies the vertex shader stage.
- **VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT** specifies the tessellation control shader stage.
- **VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT** specifies the tessellation evaluation shader stage.
- **VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT** specifies the geometry shader stage.
- **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** specifies the fragment shader stage.
- **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes subpass load operations for framebuffer attachments with a depth/stencil format.
- **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes subpass store operations for framebuffer attachments with a depth/stencil format.
- **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** specifies the stage of the pipeline after blending where the final color values are output from the pipeline. This stage also includes subpass load and store operations, multisample resolve operations for framebuffer attachments with a color or depth/stencil format, and vkCmdClearAttachments.
- **VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT** specifies the execution of a compute shader.
• **VK_PIPELINE_STAGE_TRANSFER_BIT** specifies the following commands:
  ◦ All copy commands, including **vkCmdCopyQueryPoolResults**
  ◦ **vkCmdBlitImage2** and **vkCmdBlitImage**
  ◦ **vkCmdResolveImage2** and **vkCmdResolveImage**
  ◦ All clear commands, with the exception of **vkCmdClearAttachments**

• **VK_PIPELINE_STAGE_HOST_BIT** specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.

• **VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** specifies the execution of
  ◦ **vkCmdBuildAccelerationStructureNV**
  ◦ **vkCmdCopyAccelerationStructureNV**
  ◦ **vkCmdWriteAccelerationStructuresPropertiesNV**
  ◦ **vkCmdBuildAccelerationStructuresIndirectKHR**
  ◦ **vkCmdCopyAccelerationStructureKHR**
  ◦ **vkCmdCopyMemoryToAccelerationStructureKHR**
  ◦ **vkCmdCopyAccelerationStructureToMemoryKHR**
  ◦ **vkCmdWriteAccelerationStructuresPropertiesKHR**

• **VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR** specifies the execution of the ray tracing shader stages, via **vkCmdTraceRaysNV**, **vkCmdTraceRaysKHR**, or **vkCmdTraceRaysIndirectKHR**

• **VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT** specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
  ◦ **VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT**
  ◦ **VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT**
  ◦ **VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT**
  ◦ **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT**
  ◦ **VK_PIPELINE_STAGE_VERTEX_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT**
  ◦ **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT**
  ◦ **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT**
  ◦ **VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT**
  ◦ **VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT**
  ◦ **VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**
  ◦ **VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT**

• **VK_PIPELINE_STAGE_ALL_COMMANDS_BIT** specifies all operations performed by all commands supported on the queue it is used with.

• **VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT** specifies the stage of the pipeline where the
predicate of conditional rendering is consumed.

- **VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT** specifies the stage of the pipeline where vertex attribute output values are written to the transform feedback buffers.

- **VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV** specifies the stage of the pipeline where device-side preprocessing for generated commands via `vkCmdPreprocessGeneratedCommandsNV` is handled.

- **VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies the stage of the pipeline where the fragment shading rate attachment or shading rate image is read to determine the fragment shading rate for portions of a rasterized primitive.

- **VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT** specifies the stage of the pipeline where the fragment density map is read to generate the fragment areas.

- **VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT** is equivalent to **VK_PIPELINE_STAGE_ALL_COMMANDS_BIT** with `VkAccessFlags` set to 0 when specified in the second synchronization scope, but specifies no stage of execution when specified in the first scope.

- **VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT** is equivalent to **VK_PIPELINE_STAGE_ALL_COMMANDS_BIT** with `VkAccessFlags` set to 0 when specified in the first synchronization scope, but specifies no stage of execution when specified in the second scope.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineStageFlags;
```

**VkPipelineStageFlags** is a bitmask type for setting a mask of zero or more **VkPipelineStageFlagBits**.

If a synchronization command includes a source stage mask, its first synchronization scope only includes execution of the pipeline stages specified in that mask, and its first access scope only includes memory accesses performed by pipeline stages specified in that mask.

If a synchronization command includes a destination stage mask, its second synchronization scope only includes execution of the pipeline stages specified in that mask, and its second access scope only includes memory access performed by pipeline stages specified in that mask.

**Note**

Including a particular pipeline stage in the first synchronization scope of a command implicitly includes logically earlier pipeline stages in the synchronization scope. Similarly, the second synchronization scope includes logically later pipeline stages.

However, note that access scopes are not affected in this way - only the precise stages specified are considered part of each access scope.

Certain pipeline stages are only available on queues that support a particular set of operations. The following table lists, for each pipeline stage flag, which queue capability flag must be supported by the queue. When multiple flags are enumerated in the second column of the table, it means that the pipeline stage is supported on the queue if it supports any of the listed capability flags. For further details on queue capabilities see Physical Device Enumeration and Queues.
Table 3. Supported pipeline stage flags

</tbody>
</table>

Pipeline stages that execute as a result of a command logically complete execution in a specific order, such that completion of a logically later pipeline stage must not happen-before completion of
a logically earlier stage. This means that including any stage in the source stage mask for a particular synchronization command also implies that any logically earlier stages are included in \textbf{Scope}_{1st} for that command.

Similarly, initiation of a logically earlier pipeline stage \textbf{must} not happen after initiation of a logically later pipeline stage. Including any given stage in the destination stage mask for a particular synchronization command also implies that any logically later stages are included in \textbf{Scope}_{2nd} for that command.

\begin{note}

Implementations \textbf{may} not support synchronization at every pipeline stage for every synchronization operation. If a pipeline stage that an implementation does not support synchronization for appears in a source stage mask, it \textbf{may} substitute any logically later stage in its place for the first synchronization scope. If a pipeline stage that an implementation does not support synchronization for appears in a destination stage mask, it \textbf{may} substitute any logically earlier stage in its place for the second synchronization scope.

For example, if an implementation is unable to signal an event immediately after vertex shader execution is complete, it \textbf{may} instead signal the event after color attachment output has completed.

If an implementation makes such a substitution, it \textbf{must} not affect the semantics of execution or memory dependencies or image and buffer memory barriers.

\end{note}

\textbf{Graphics pipelines} are executable on queues supporting \texttt{VK\_QUEUE\_GRAPHICS\_BIT}. Stages executed by graphics pipelines \textbf{can} only be specified in commands recorded for queues supporting \texttt{VK\_QUEUE\_GRAPHICS\_BIT}.

The graphics primitive pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:

- \texttt{VK\_PIPELINE\_STAGE\_DRAW\_INDIRECT\_BIT}
- \texttt{VK\_PIPELINE\_STAGE\_2\_INDEX\_INPUT\_BIT}
- \texttt{VK\_PIPELINE\_STAGE\_2\_VERTEX\_ATTRIBUTE\_INPUT\_BIT}
- \texttt{VK\_PIPELINE\_STAGE\_VERTEX\_SHADER\_BIT}
- \texttt{VK\_PIPELINE\_STAGE\_TESSELLATION\_CONTROL\_SHADER\_BIT}
- \texttt{VK\_PIPELINE\_STAGE\_TESSELLATION\_EVALUATION\_SHADER\_BIT}
- \texttt{VK\_PIPELINE\_STAGE\_GEOMETRY\_SHADER\_BIT}
- \texttt{VK\_PIPELINE\_STAGE\_TRANSFORM\_FEEDBACK\_BIT\_EXT}
- \texttt{VK\_PIPELINE\_STAGE\_FRAGMENT\_SHADING\_RATE\_ATTACHMENT\_BIT\_KHR}
- \texttt{VK\_PIPELINE\_STAGE\_EARLY\_FRAGMENT\_TESTS\_BIT}
- \texttt{VK\_PIPELINE\_STAGE\_FRAGMENT\_SHADER\_BIT}
- \texttt{VK\_PIPELINE\_STAGE\_LATE\_FRAGMENT\_TESTS\_BIT}
The graphics mesh pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:

- VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT
- VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT
- VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT
- VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
- VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT
- VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT

For the compute pipeline, the following stages occur in this order:

- VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT
- VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT

For the subpass shading pipeline, the following stages occur in this order:

- VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI

For graphics pipeline commands executing in a render pass with a fragment density map attachment, the following pipeline stage where the fragment density map read happens has no particular order relative to the other stages, except that it is logically earlier than VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT:

- VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT
- VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT

The conditional rendering stage is formally part of both the graphics, and the compute pipeline. The pipeline stage where the predicate read happens has unspecified order relative to other stages of these pipelines:

- VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

For the transfer pipeline, the following stages occur in this order:

- VK_PIPELINE_STAGE_TRANSFER_BIT

For host operations, only one pipeline stage occurs, so no order is guaranteed:

- VK_PIPELINE_STAGE_HOST_BIT

For the command preprocessing pipeline, the following stages occur in this order:

- VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV
For acceleration structure operations, only one pipeline stage occurs, so no order is guaranteed:

- VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR

For the ray tracing pipeline, the following stages occur in this order:

- VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT
- VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

### 7.1.3. Access Types

Memory in Vulkan can be accessed from within shader invocations and via some fixed-function stages of the pipeline. The *access type* is a function of the *descriptor type* used, or how a fixed-function stage accesses memory.

Some synchronization commands take sets of access types as parameters to define the *access scopes* of a memory dependency. If a synchronization command includes a *source access mask*, its first *access scope* only includes accesses via the access types specified in that mask. Similarly, if a synchronization command includes a *destination access mask*, its second *access scope* only includes accesses via the access types specified in that mask.

Bits which can be set in the `srcAccessMask` and `dstAccessMask` members of `VkMemoryBarrier2KHR`, `VkImageMemoryBarrier2KHR`, and `VkBufferMemoryBarrier2KHR`, specifying access behavior, are:

```c
// Provided by VK_VERSION_1_3
// Flag bits for VkAccessFlagBits2
typedef VkFlags64 VkAccessFlagBits2;
static const VkAccessFlagBits2 VK_ACCESS_2_NONE = 0ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_NONE_KHR = 0ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT = 0x00000001ULL;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkAccessFlagBits2 VkAccessFlagBits2KHR;

- **VK_ACCESS_2_NONE** specifies no accesses.
- **VK_ACCESS_2_MEMORY_READ_BIT** specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all READ access flags that are valid where it is used.
- **VK_ACCESS_2_MEMORY_WRITE_BIT** specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all WRITE access flags that are valid where it is used.
- **VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT** specifies read access to command data read from indirect buffers as part of an indirect build, trace, drawing or dispatch command. Such access occurs in the **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT** pipeline stage.
- **VK_ACCESS_2_INDEX_READ_BIT** specifies read access to an index buffer as part of an indexed drawing command, bound by `vkCmdBindIndexBuffer`. Such access occurs in the **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT** pipeline stage.
- **VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT** specifies read access to a vertex buffer as part of a drawing command, bound by `vkCmdBindVertexBuffer`. Such access occurs in the **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT** pipeline stage.
- **VK_ACCESS_2_UNIFORM_READ_BIT** specifies read access to a **uniform buffer** in any shader pipeline stage.
- **VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT** specifies read access to an **input attachment** within a render pass during subpass shading or fragment shading. Such access occurs in the **VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI** or **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT** pipeline stage.
- **VK_ACCESS_2_SHADER_SAMPLED_READ_BIT** specifies read access to a **uniform texel buffer** or **sampled image** in any shader pipeline stage.
- **VK_ACCESS_2_SHADER_STORAGE_READ_BIT** specifies read access to a **storage buffer**, **physical storage buffer**, **storage texel buffer**, or **storage image** in any shader pipeline stage.
- **VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR** specifies read access to a **shader binding table** in any shader pipeline stage.
- **VK_ACCESS_2_SHADER_READ_BIT** is equivalent to the logical OR of:
  - **VK_ACCESS_2_UNIFORM_READ_BIT**
  - **VK_ACCESS_2_SHADER_SAMPLED_READ_BIT**
• **VK_ACCESS_2_SHADER_STORAGE_READ_BIT**
• **VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR**

• **VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT** specifies write access to a storage buffer, physical storage buffer, storage texel buffer, or storage image in any shader pipeline stage.

• **VK_ACCESS_2_SHADER_WRITE_BIT** is equivalent to **VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT**.

• **VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT** specifies read access to a color attachment, such as via blending, logic operations, or via certain subpass load operations. It does not include advanced blend operations. Such access occurs in the **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage.

• **VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT** specifies write access to a color, resolve, or depth/stencil resolve attachment during a render pass or via certain subpass load and store operations. Such access occurs in the **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage.

• **VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT** specifies read access to a depth/stencil attachment, via depth or stencil operations or via certain subpass load operations. Such access occurs in the **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT** or **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT** pipeline stages.

• **VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT** specifies write access to a depth/stencil attachment, via depth or stencil operations or via certain subpass load and store operations. Such access occurs in the **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT** or **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT** pipeline stages.

• **VK_ACCESS_2_TRANSFER_READ_BIT** specifies read access to an image or buffer in a copy operation. Such access occurs in the **VK_PIPELINE_STAGE_2_COPY_BIT**, **VK_PIPELINE_STAGE_2_BLIT_BIT**, or **VK_PIPELINE_STAGE_2_RESOLVE_BIT** pipeline stages.

• **VK_ACCESS_2_TRANSFER_WRITE_BIT** specifies write access to an image or buffer in a clear or copy operation. Such access occurs in the **VK_PIPELINE_STAGE_2_COPY_BIT**, **VK_PIPELINE_STAGE_2_BLIT_BIT**, or **VK_PIPELINE_STAGE_2_RESOLVE_BIT** pipeline stages.

• **VK_ACCESS_2_HOST_READ_BIT** specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the **VK_PIPELINE_STAGE_2_HOST_BIT** pipeline stage.

• **VK_ACCESS_2_HOST_WRITE_BIT** specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the **VK_PIPELINE_STAGE_2_HOST_BIT** pipeline stage.

• **VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT** specifies read access to a predicate as part of conditional rendering. Such access occurs in the **VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT** pipeline stage.

• **VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT** specifies write access to a transform feedback buffer made when transform feedback is active. Such access occurs in the **VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT** pipeline stage.

• **VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT** specifies read access to a transform feedback counter buffer which is read when **vkCmdBeginTransformFeedbackEXT** executes.
Such access occurs in the VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT pipeline stage.

- **VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT** specifies write access to a transform feedback counter buffer which is written when `vkCmdEndTransformFeedbackEXT` executes. Such access occurs in the VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT pipeline stage.

- **VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV** specifies reads from buffer inputs to `vkCmdPreprocessGeneratedCommandsNV`. Such access occurs in the VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV pipeline stage.

- **VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV** specifies writes to the target command buffer preprocess outputs. Such access occurs in the VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV pipeline stage.

- **VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT** specifies read access to color attachments, including advanced blend operations. Such access occurs in the VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage.

- **VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI** specifies read access to an invocation mask image in the VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI pipeline stage.

- **VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR** specifies read access to an acceleration structure as part of a trace, build, or copy command, or to an acceleration structure scratch buffer as part of a build command. Such access occurs in the VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR pipeline stage or VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage.

- **VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR** specifies write access to an acceleration structure or acceleration structure scratch buffer as part of a build or copy command. Such access occurs in the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage.

- **VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT** specifies read access to a fragment density map attachment during dynamic fragment density map operations. Such access occurs in the VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT pipeline stage.

- **VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR** specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR pipeline stage.

- **VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV** specifies read access to a shading rate image during rasterization. Such access occurs in the VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV pipeline stage. It is equivalent to `VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR`.

- **VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR** specifies read access to an image or buffer resource as part of a video decode operation. Such access occurs in the VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR pipeline stage.

- **VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR** specifies write access to an image or buffer resource as part of a video decode operation. Such access occurs in the VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR pipeline stage.

- **VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR** specifies read access to an image or buffer resource as part of a video encode operation. Such access occurs in the VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR pipeline stage.

- **VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR** specifies write access to an image or buffer resource as part of a video encode operation. Such access occurs in the VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR pipeline stage.
part of a video encode operation. Such access occurs in the
VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR pipeline stage.

- VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV specifies read access to an image or buffer resource as part of a optical flow operation. Such access occurs in the VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR pipeline stage.

- VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV specifies write access to an image or buffer resource as part of a optical flow operation. Such access occurs in the VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR pipeline stage.

- VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT specifies write access to a micromap object. Such access occurs in the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage.

- VK_ACCESS_2_MICROMAP_READ_BIT_EXT specifies read access to a micromap object. Such access occurs in the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT and VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stages.

Note

In situations where an application wishes to select all access types for a given set of pipeline stages, VK_ACCESS_2_MEMORY_READ_BIT or VK_ACCESS_2_MEMORY_WRITE_BIT can be used. This is particularly useful when specifying stages that only have a single access type.

Note

The VkAccessFlags2 bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how VkAccessFlagBits is defined. The first 31 values are common to both, and are interchangeable.

VkAccessFlags2 is a bitmask type for setting a mask of zero or more VkAccessFlagBits:

```c
// Provided by VK_VERSION_1_3
typedef VkFlags64 VkAccessFlags2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkAccessFlags2 VkAccessFlags2KHR;
```

Bits which can be set in the srcAccessMask and dstAccessMask members of VkSubpassDependency, VkSubpassDependency2, VkMemoryBarrier, VkBufferMemoryBarrier, and VkImageMemoryBarrier, specifying access behavior, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAccessFlagBits {
    VK_ACCESS_INDIRECT_COMMAND_READ_BIT = 0x00000001,
    VK_ACCESS_INDEX_READ_BIT = 0x00000002,
    VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT = 0x00000004,
    // and so on...
};
```
VK_ACCESS_UNIFORM_READ_BIT = 0x00000008,
VK_ACCESS_INPUT_ATTACHMENT_READ_BIT = 0x00000010,
VK_ACCESS_SHADER_READ_BIT = 0x00000020,
VK_ACCESS_SHADER_WRITE_BIT = 0x00000040,
VK_ACCESS_COLOR_ATTACHMENT_READ_BIT = 0x00000080,
VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT = 0x00000100,
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT = 0x00000200,
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT = 0x00000400,
VK_ACCESS_TRANSFER_READ_BIT = 0x00000800,
VK_ACCESS_TRANSFER_WRITE_BIT = 0x00001000,
VK_ACCESS_HOST_READ_BIT = 0x00002000,
VK_ACCESS_HOST_WRITE_BIT = 0x00004000,
VK_ACCESS_MEMORY_READ_BIT = 0x00008000,
VK_ACCESS_MEMORY_WRITE_BIT = 0x00010000,
// Provided by VK_VERSION_1_3
VK_ACCESS_NONE = 0,
// Provided by VK_EXT_transform_feedback
VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT = 0x02000000,
// Provided by VK_KHR_acceleration_structure
VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR = 0x00200000,
VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR = 0x00400000,
// Provided by VK_EXT_fragment_density_map
VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT = 0x01000000,
// Provided by VK_KHR_synchronization2
VK_ACCESS_NONE_KHR = VK_ACCESS_NONE,
These values all have the same meaning as the equivalently named values for `VkAccessFlags2`.

- **VK_ACCESS_NONE** specifies no accesses.
- **VK_ACCESS_MEMORY_READ_BIT** specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all **READ** access flags that are valid where it is used.
- **VK_ACCESS_MEMORY_WRITE_BIT** specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all **WRITE** access flags that are valid where it is used.
- **VK_ACCESS_INDIRECT_COMMAND_READ_BIT** specifies read access to indirect command data read as part of an indirect build, trace, drawing or dispatching command. Such access occurs in the **VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT** pipeline stage.
- **VK_ACCESS_INDEX_READ_BIT** specifies read access to an index buffer as part of an indexed drawing command, bound by `vkCmdBindIndexBuffer`. Such access occurs in the **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT** pipeline stage.
- **VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT** specifies read access to a vertex buffer as part of a drawing command, bound by `vkCmdBindVertexBuffers`. Such access occurs in the **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT** pipeline stage.
- **VK_ACCESS_UNIFORM_READ_BIT** specifies read access to a uniform buffer in any shader pipeline stage.
- **VK_ACCESS_INPUT_ATTACHMENT_READ_BIT** specifies read access to an input attachment within a render pass during subpass shading or fragment shading. Such access occurs in the **VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI** or **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** pipeline stage.
- **VK_ACCESS_SHADER_READ_BIT** specifies read access to a uniform buffer, uniform texel buffer, sampled image, storage buffer, physical storage buffer, shader binding table, storage texel buffer, or storage image in any shader pipeline stage.
- **VK_ACCESS_SHADER_WRITE_BIT** specifies write access to a storage buffer, physical storage buffer, storage texel buffer, or storage image in any shader pipeline stage.
- **VK_ACCESS_COLOR_ATTACHMENT_READ_BIT** specifies read access to a color attachment, such as via blending, logic operations, or via certain subpass load operations. It does not include advanced blend operations. Such access occurs in the **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage.
- **VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT** specifies write access to a color, resolve, or depth/stencil resolve attachment during a render pass or via certain subpass load and store operations. Such access occurs in the **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage.
- **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT** specifies read access to a depth/stencil attachment, via depth or stencil operations or via certain subpass load operations. Such access occurs in the **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT** or **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** pipeline stages.
- **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT** specifies write access to a depth/stencil attachment, via depth or stencil operations or via certain subpass load and store operations. Such access occurs in the **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT** or **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** pipeline stages.
• **VK_ACCESS_TRANSFER_READ_BIT** specifies read access to an image or buffer in a **copy** operation. Such access occurs in the **VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT** pipeline stage.

• **VK_ACCESS_TRANSFER_WRITE_BIT** specifies write access to an image or buffer in a **clear** or **copy** operation. Such access occurs in the **VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT** pipeline stage.

• **VK_ACCESS_HOST_READ_BIT** specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the **VK_PIPELINE_STAGE_HOST_BIT** pipeline stage.

• **VK_ACCESS_HOST_WRITE_BIT** specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the **VK_PIPELINE_STAGE_HOST_BIT** pipeline stage.

• **VK_ACCESS_CONDITIONAL_RENDERING_READ_BIT_EXT** specifies read access to a predicate as part of conditional rendering. Such access occurs in the **VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT** pipeline stage.

• **VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT** specifies write access to a transform feedback buffer made when transform feedback is active. Such access occurs in the **VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT** pipeline stage.

• **VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT** specifies read access to a transform feedback counter buffer which is read when `vkCmdBeginTransformFeedbackEXT` executes. Such access occurs in the **VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT** pipeline stage.

• **VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT** specifies write access to a transform feedback counter buffer which is written when `vkCmdEndTransformFeedbackEXT` executes. Such access occurs in the **VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT** pipeline stage.

• **VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV** specifies reads from buffer inputs to `vkCmdPreprocessGeneratedCommandsNV`. Such access occurs in the **VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV** pipeline stage.

• **VK_ACCESS_COMMAND_PREPROCESS_WRITE_BIT_NV** specifies writes to the target command buffer: `VkBuffer` preprocess outputs in `vkCmdPreprocessGeneratedCommandsNV`. Such access occurs in the **VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV** pipeline stage.

• **VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT** specifies read access to color attachments, including **advanced blend operations**. Such access occurs in the **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage.

• **VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI** specifies read access to a invocation mask image in the **VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI** pipeline stage.

• **VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR** specifies read access to an acceleration structure as part of a trace, build, or copy command, or to an acceleration structure scratch buffer as part of a build command. Such access occurs in the **VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR** pipeline stage or **VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** pipeline stage.

• **VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR** specifies write access to an acceleration structure or acceleration structure scratch buffer as part of a build or copy command. Such access occurs in the **VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** pipeline stage.

• **VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT** specifies read access to a **fragment density map**
attachment during dynamic fragment density map operations. Such access occurs in the
VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT pipeline stage.

- **VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR** specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the
  VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR pipeline stage.

- **VK_ACCESS_SHADING_RATE_IMAGE_READ_BIT_NV** specifies read access to a shading rate image during rasterization. Such access occurs in the
  VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV pipeline stage. It is equivalent to
  VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR.

Certain access types are only performed by a subset of pipeline stages. Any synchronization command that takes both stage masks and access masks uses both to define the access scopes - only the specified access types performed by the specified stages are included in the access scope. An application must not specify an access flag in a synchronization command if it does not include a pipeline stage in the corresponding stage mask that is able to perform accesses of that type. The following table lists, for each access flag, which pipeline stages can perform that type of access.

*Table 4. Supported access types*

<table>
<thead>
<tr>
<th>Access flag</th>

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkAccessFlags;
```

**VkAccessFlags** is a bitmask type for setting a mask of zero or more VkAccessFlagBits.

If a memory object does not have the **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** property, then **vkFlushMappedMemoryRanges** **must** be called in order to guarantee that writes to the memory object from the host are made available to the host domain, where they **can** be further made available to the device domain via a domain operation. Similarly, **vkInvalidateMappedMemoryRanges** **must** be called to guarantee that writes which are available to the host domain are made visible to host operations.

If the memory object does have the **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** property flag, writes to the memory object from the host are automatically made available to the host domain. Similarly, writes made available to the host domain are automatically made visible to the host.

**Note**

Queue submission commands automatically perform a domain operation from host to device for all writes performed before the command executes, so in most cases an explicit memory barrier is not needed for this case. In the few circumstances where a submit does not occur between the host write and the device read access, writes **can** be made available by using an explicit memory barrier.

### 7.1.4. Framebuffer Region Dependencies

**Pipeline stages** that operate on, or with respect to, the framebuffer are collectively the framebuffer-space pipeline stages. These stages are:
For these pipeline stages, an execution or memory dependency from the first set of operations to the second set can either be a single framebuffer-global dependency, or split into multiple framebuffer-local dependencies. A dependency with non-framebuffer-space pipeline stages is neither framebuffer-global nor framebuffer-local.

A framebuffer region is a subset of the entire framebuffer, and can either be:

- A sample region, which is set of sample (x, y, layer, sample) coordinates that is a subset of the entire framebuffer, or
- A fragment region, which is a set of fragment (x, y, layer) coordinates that is a subset of the entire framebuffer.

Both synchronization scopes of a framebuffer-local dependency include only the operations performed within corresponding framebuffer regions (as defined below). No ordering guarantees are made between different framebuffer regions for a framebuffer-local dependency.

Both synchronization scopes of a framebuffer-global dependency include operations on all framebuffer-regions.

If the first synchronization scope includes operations on pixels/fragments with N samples and the second synchronization scope includes operations on pixels/fragments with M samples, where N does not equal M, then a framebuffer region containing all samples at a given (x, y, layer) coordinate in the first synchronization scope corresponds to a region containing all samples at the same coordinate in the second synchronization scope. In other words, the framebuffer region is a fragment region and it is a pixel granularity dependency. If N equals M, and if the VkSubpassDescription::flags does not specify the VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM flag, then a framebuffer region containing a single (x, y, layer, sample) coordinate in the first synchronization scope corresponds to a region containing the same sample at the same coordinate in the second synchronization scope. In other words, the framebuffer region is a sample region and it is a sample granularity dependency.

If the pipeline performing the operation was created with VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT, VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT, or VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT, the framebuffer region is a fragment region and it is a pixel granularity dependency.

Note
Since fragment shader invocations are not specified to run in any particular groupings, the size of a framebuffer region is implementation-dependent, not known to the application, and must be assumed to be no larger than specified above.
Practically, the pixel vs. sample granularity dependency means that if an input attachment has a different number of samples than the pipeline's `rasterizationSamples`, then a fragment can access any sample in the input attachment's pixel even if it only uses framebuffer-local dependencies. If the input attachment has the same number of samples, then the fragment can only access the covered samples in its input `SampleMask` (i.e. the fragment operations happen-after a framebuffer-local dependency for each sample the fragment covers). To access samples that are not covered, either the `VkSubpassDescription::flags` `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM` flag is required, or a framebuffer-global dependency is required.

If a synchronization command includes a `dependencyFlags` parameter, and specifies the `VK_DEPENDENCY_BY_REGION_BIT` flag, then it defines framebuffer-local dependencies for the framebuffer-space pipeline stages in that synchronization command, for all framebuffer regions. If no `dependencyFlags` parameter is included, or the `VK_DEPENDENCY_BY_REGION_BIT` flag is not specified, then a framebuffer-global dependency is specified for those stages. The `VK_DEPENDENCY_BY_REGION_BIT` flag does not affect the dependencies between non-framebuffer-space pipeline stages, nor does it affect the dependencies between framebuffer-space and non-framebuffer-space pipeline stages.

Framebuffer-local dependencies are more efficient for most architectures; particularly tile-based architectures - which can keep framebuffer-regions entirely in on-chip registers and thus avoid external bandwidth across such a dependency. Including a framebuffer-global dependency in your rendering will usually force all implementations to flush data to memory, or to a higher level cache, breaking any potential locality optimizations.

7.1.5. View-Local Dependencies

In a render pass instance that has `multiview` enabled, dependencies can be either view-local or view-global.

A view-local dependency only includes operations from a single `source view` from the source subpass in the first synchronization scope, and only includes operations from a single `destination view` from the destination subpass in the second synchronization scope. A view-global dependency includes all views in the view mask of the source and destination subpasses in the corresponding synchronization scopes.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag, then it defines view-local dependencies for that synchronization command, for all views. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag is not specified, then a view-global dependency is specified.
7.1.6. Device-Local Dependencies

Dependencies can be either device-local or non-device-local. A device-local dependency acts as multiple separate dependencies, one for each physical device that executes the synchronization command, where each dependency only includes operations from that physical device in both synchronization scopes. A non-device-local dependency is a single dependency where both synchronization scopes include operations from all physical devices that participate in the synchronization command. For subpass dependencies, all physical devices in the VkDeviceGroupRenderPassBeginInfo::deviceMask participate in the dependency, and for pipeline barriers all physical devices that are set in the command buffer's current device mask participate in the dependency.

If a synchronization command includes a dependencyFlags parameter and specifies the VK_DEPENDENCY_DEVICE_GROUP_BIT flag, then it defines a non-device-local dependency for that synchronization command. If no dependencyFlags parameter is included or the VK_DEPENDENCY_DEVICE_GROUP_BIT flag is not specified, then it defines device-local dependencies for that synchronization command, for all participating physical devices.

Semaphore and event dependencies are device-local and only execute on the one physical device that performs the dependency.

7.2. Implicit Synchronization Guarantees

A small number of implicit ordering guarantees are provided by Vulkan, ensuring that the order in which commands are submitted is meaningful, and avoiding unnecessary complexity in common operations.

Submission order is a fundamental ordering in Vulkan, giving meaning to the order in which action and synchronization commands are recorded and submitted to a single queue. Explicit and implicit ordering guarantees between commands in Vulkan all work on the premise that this ordering is meaningful. This order does not itself define any execution or memory dependencies; synchronization commands and other orderings within the API use this ordering to define their scopes.

Submission order for any given set of commands is based on the order in which they were recorded to command buffers and then submitted. This order is determined as follows:

1. The initial order is determined by the order in which vkQueueSubmit and vkQueueSubmit2 commands are executed on the host, for a single queue, from first to last.
2. The order in which VkSubmitInfo structures are specified in the pSubmits parameter of vkQueueSubmit, or in which VkSubmitInfo2 structures are specified in the pSubmits parameter of vkQueueSubmit2, from lowest index to highest.
3. The order in which command buffers are specified in the pCommandBuffers member of VkSubmitInfo or VkSubmitInfo2 from lowest index to highest.
4. The order in which commands were recorded to a command buffer on the host, from first to last:
   - For commands recorded outside a render pass, this includes all other commands recorded
outside a render pass, including `vkCmdBeginRenderPass` and `vkCmdEndRenderPass` commands; it does not directly include commands inside a render pass.

- For commands recorded inside a render pass, this includes all other commands recorded inside the same subpass, including the `vkCmdBeginRenderPass` and `vkCmdEndRenderPass` commands that delimit the same render pass instance; it does not include commands recorded to other subpasses. **State commands** do not execute any operations on the device, instead they set the state of the command buffer when they execute on the host, in the order that they are recorded. **Action commands** consume the current state of the command buffer when they are recorded, and will execute state changes on the device as required to match the recorded state.

The order of primitives passing through the graphics pipeline and image layout transitions as part of an image memory barrier provide additional guarantees based on submission order.

Execution of **pipeline stages** within a given command also has a loose ordering, dependent only on a single command.

**Signal operation order** is a fundamental ordering in Vulkan, giving meaning to the order in which semaphore and fence signal operations occur when submitted to a single queue. The signal operation order for queue operations is determined as follows:

1. The initial order is determined by the order in which `vkQueueSubmit` and `vkQueueSubmit2` commands are executed on the host, for a single queue, from first to last.
2. The order in which `VkSubmitInfo` structures are specified in the `pSubmits` parameter of `vkQueueSubmit`, or in which `VkSubmitInfo2` structures are specified in the `pSubmits` parameter of `vkQueueSubmit2`, from lowest index to highest.
3. The fence signal operation defined by the `fence` parameter of a `vkQueueSubmit`, `vkQueueSubmit2`, or `vkQueueBindSparse` command is ordered after all semaphore signal operations defined by that command.

Semaphore signal operations defined by a single `VkSubmitInfo`, `VkSubmitInfo2`, or `VkBindSparseInfo` structure are unordered with respect to other semaphore signal operations defined within the same structure.

The `vkSignalSemaphore` command does not execute on a queue but instead performs the signal operation from the host. The semaphore signal operation defined by executing a `vkSignalSemaphore` command happens-after the `vkSignalSemaphore` command is invoked and happens-before the command returns.

**Note**

When signaling timeline semaphores, it is the responsibility of the application to ensure that they are ordered such that the semaphore value is strictly increasing. Because the first synchronization scope for a semaphore signal operation contains all semaphore signal operations which occur earlier in submission order, all semaphore signal operations contained in any given batch are guaranteed to happen-after all semaphore signal operations contained in any previous batches. However, no ordering guarantee is provided between the semaphore signal operations defined within a single batch. This, combined with the requirement...
that timeline semaphore values strictly increase, means that it is invalid to signal
the same timeline semaphore twice within a single batch.

If an application wishes to ensure that some semaphore signal operation happens-
after some other semaphore signal operation, it can submit a separate batch
containing only semaphore signal operations, which will happen-after the
semaphore signal operations in any earlier batches.

When signaling a semaphore from the host, the only ordering guarantee is that the
signal operation happens-after when `vkSignalSemaphore` is called and happen-
before it returns. Therefore, it is invalid to call `vkSignalSemaphore` while there are
any outstanding signal operations on that semaphore from any queue submissions
unless those queue submissions have some dependency which ensures that they
happen-after the host signal operation. One example of this would be if the
pending signal operation is, itself, waiting on the same semaphore at a lower value
and the call to `vkSignalSemaphore` signals that lower value. Furthermore, if there
are two or more processes or threads signaling the same timeline semaphore from
the host, the application must ensure that the `vkSignalSemaphore` with the lower
semaphore value returns before `vkSignalSemaphore` is called with the higher value.

7.3. Fences

Fences are a synchronization primitive that can be used to insert a dependency from a queue to the
host. Fences have two states - signaled and unsignaled. A fence can be signaled as part of the
execution of a queue submission command. Fences can be unsignaled on the host with
`vkResetFences`. Fences can be waited on by the host with the `vkWaitForFences` command, and the
current state can be queried with `vkGetFenceStatus`.

The internal data of a fence may include a reference to any resources and pending work associated
with signal or unsignal operations performed on that fence object, collectively referred to as the
defense's payload. Mechanisms to import and export that internal data to and from fences are
provided below. These mechanisms indirectly enable applications to share fence state between two
or more fences and other synchronization primitives across process and API boundaries.

Fences are represented by `VkFence` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFence)
```

To create a fence, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateFence(
    VkDevice
    const VkFenceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFence* pFence
)
```
• **device** is the logical device that creates the fence.

• **pCreateInfo** is a pointer to a `VkFenceCreateInfo` structure containing information about how the fence is to be created.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

• **pFence** is a pointer to a handle in which the resulting fence object is returned.

---

**Valid Usage (Implicit)**

- **VUID-vkCreateFence-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkCreateFence-pCreateInfo-parameter**
  `pCreateInfo` must be a valid pointer to a valid `VkFenceCreateInfo` structure

- **VUID-vkCreateFence-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateFence-pFence-parameter**
  `pFence` must be a valid pointer to a `VkFence` handle

---

**Return Codes**

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

---

The `VkFenceCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkFenceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFenceCreateFlags flags;
} VkFenceCreateInfo;
```

- **sType** is the type of this structure.

- **pNext** is `NULL` or a pointer to a structure extending this structure.

- **flags** is a bitmask of `VkFenceCreateFlagBits` specifying the initial state and behavior of the fence.
### Valid Usage (Implicit)

- **VUID-VkFenceCreateInfo-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_FENCE_CREATE_INFO`

- **VUID-VkFenceCreateInfo-pNext-pNext**
  - Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkExportFenceCreateInfo` or `VkExportFenceWin32HandleInfoKHR`

- **VUID-VkFenceCreateInfo-sType-unique**
  - The `sType` value of each struct in the `pNext` chain **must** be unique

- **VUID-VkFenceCreateInfo-flags-parameter**
  - `flags` **must** be a valid combination of `VkFenceCreateFlagBits` values

```c
// Provided by VK_VERSION_1_0
typedef enum VkFenceCreateFlagBits {
    VK_FENCE_CREATE_SIGNALED_BIT = 0x00000001,
} VkFenceCreateFlagBits;
```

- **`VK_FENCE_CREATE_SIGNALED_BIT`** specifies that the fence object is created in the signaled state. Otherwise, it is created in the unsignaled state.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkFenceCreateFlags;
```

`VkFenceCreateFlags` is a bitmask type for setting a mask of zero or more `VkFenceCreateFlagBits`.

To create a fence whose payload **can** be exported to external handles, add a `VkExportFenceCreateInfo` structure to the `pNext` chain of the `VkFenceCreateInfo` structure. The `VkExportFenceCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExportFenceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalFenceHandleTypeFlags handleTypes;
} VkExportFenceCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence
typedef VkExportFenceCreateInfo VkExportFenceCreateInfoKHR;
```

- **`sType`** is the type of this structure.

---

286
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `handleTypes` is a bitmask of `VkExternalFenceHandleTypeFlagBits` specifying one or more fence handle types the application can export from the resulting fence. The application can request multiple handle types for the same fence.

### Valid Usage

- **VUID-VkExportFenceCreateInfo-handleTypes-01446**
  The bits in `handleTypes` must be supported and compatible, as reported by `VkExternalFenceProperties`

### Valid Usage (Implicit)

- **VUID-VkExportFenceCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_FENCE_CREATE_INFO`

- **VUID-VkExportFenceCreateInfo-handleTypes-parameter**
  `handleTypes` must be a valid combination of `VkExternalFenceHandleTypeFlagBits` values

To specify additional attributes of NT handles exported from a fence, add a `VkExportFenceWin32HandleInfoKHR` structure to the `pNext` chain of the `VkFenceCreateInfo` structure. The `VkExportFenceWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_fence_win32
typedef struct VkExportFenceWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD dwAccess;
    LPCWSTR name;
} VkExportFenceWin32HandleInfoKHR;
```

- `sType` is the type of this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.

- `dwAccess` is a `DWORD` specifying access rights of the handle.

- `name` is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created fence.

If `VkExportFenceCreateInfo` is not included in the same `pNext` chain, this structure is ignored.

If `VkExportFenceCreateInfo` is included in the `pNext` chain of `VkFenceCreateInfo` with a Windows `handleType`, but either `VkExportFenceWin32HandleInfoKHR` is not included in the `pNext` chain, or if it is
but `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights will be

```
DXGI_SHARED_RESOURCE_READ | DXGI_SHARED_RESOURCE_WRITE
```

for handles of the following types:

```
VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT
```

1

**Valid Usage**

- **VUID-VkExportFenceWin32HandleInfoKHR-handleTypes-01447**
  If `VkExportFenceCreateInfo::handleTypes` does not include `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT`, a `VkExportFenceWin32HandleInfoKHR` structure must not be included in the `pNext` chain of `VkFenceCreateInfo`

**Valid Usage (Implicit)**

- **VUID-VkExportFenceWin32HandleInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_FENCE_WIN32_HANDLE_INFO_KHR`

- **VUID-VkExportFenceWin32HandleInfoKHR-pAttributes-parameter**
  If `pAttributes` is not `NULL`, `pAttributes` must be a valid pointer to a valid `SECURITY_ATTRIBUTES` value

To export a Windows handle representing the state of a fence, call:

```c
// Provided by VK_KHR_external_fence_win32
VkResult vkGetFenceWin32HandleKHR(
    VkDevice device,                      // device
    const VkFenceGetWin32HandleInfoKHR* pGetWin32HandleInfo,  // pGetWin32HandleInfo
    HANDLE* pHandle);                     // pHandle
```

- `device` is the logical device that created the fence being exported.
- `pGetWin32HandleInfo` is a pointer to a `VkFenceGetWin32HandleInfoKHR` structure containing parameters of the export operation.
- `pHandle` will return the Windows handle representing the fence state.

For handle types defined as NT handles, the handles returned by `vkGetFenceWin32HandleKHR` are owned by the application. To avoid leaking resources, the application must release ownership of
them using the `CloseHandle` system call when they are no longer needed.

Exporting a Windows handle from a fence may have side effects depending on the transference of the specified handle type, as described in Importing Fence Payloads.

### Valid Usage (Implicit)

- VUID-vkGetFenceWin32HandleKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetFenceWin32HandleKHR-pGetWin32HandleInfo-parameter
  - `pGetWin32HandleInfo` must be a valid pointer to a valid `VkFenceGetWin32HandleInfoKHR` structure
- VUID-vkGetFenceWin32HandleKHR-pHandle-parameter
  - `pHandle` must be a valid pointer to a `HANDLE` value

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkFenceGetWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_fence_win32
typedef struct VkFenceGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetWin32HandleInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fence` is the fence from which state will be exported.
- `handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalFenceHandleTypeFlagBits` for a description of the properties of the defined external fence handle types.
Valid Usage

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01448**
  handleType **must** have been included in VkExportFenceCreateInfo::handleTypes when the fence's current payload was created.

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01449**
  If handleType is defined as an NT handle, vkGetFenceWin32HandleKHR **must** be called no more than once for each valid unique combination of fence and handleType.

- **VUID-VkFenceGetWin32HandleInfoKHR-fence-01450**
  fence **must** not currently have its payload replaced by an imported payload as described below in Importing Fence Payloads unless that imported payload's handle type was included in VkExternalFenceProperties::exportFromImportedHandleTypes for handleType.

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01451**
  If handleType refers to a handle type with copy payload transference semantics, fence **must** be signaled, or have an associated fence signal operation pending execution.

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01452**
  handleType **must** be defined as an NT handle or a global share handle.

Valid Usage (Implicit)

- **VUID-VkFenceGetWin32HandleInfoKHR-sType-sType**
  sType **must** be VK_STRUCTURE_TYPE_FENCE_GET_WIN32_HANDLE_INFO_KHR.

- **VUID-VkFenceGetWin32HandleInfoKHR-pNext-pNext**
  pNext **must** be NULL.

- **VUID-VkFenceGetWin32HandleInfoKHR-fence-parameter**
  fence **must** be a valid VkFence handle.

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-parameter**
  handleType **must** be a valid VkExternalFenceHandleTypeFlagBits value.

To export a POSIX file descriptor representing the payload of a fence, call:

```c
// Provided by VK_KHR_external_fence_fd
VkResult vkGetFenceFdKHR(VkDevice device,
                           const VkFenceGetFdInfoKHR* pGetFdInfo,
                           int* pFd);  
```

- **device** is the logical device that created the fence being exported.
- **pGetFdInfo** is a pointer to a VkFenceGetFdInfoKHR structure containing parameters of the export operation.
- **pFd** will return the file descriptor representing the fence payload.
Each call to `vkGetFenceFdKHR` must create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application must release ownership of the file descriptor when it is no longer needed.

**Note**
Ownership can be released in many ways. For example, the application can call `close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a fence payload.

If `pGetFdInfo->handleType` is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` and the fence is signaled at the time `vkGetFenceFdKHR` is called, `pFd` may return the value `-1` instead of a valid file descriptor.

Where supported by the operating system, the implementation must set the file descriptor to be closed automatically when an `execve` system call is made.

Exporting a file descriptor from a fence may have side effects depending on the transference of the specified handle type, as described in Importing Fence State.

### Valid Usage (Implicit)
- VUID-vkGetFenceFdKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetFenceFdKHR-pGetFdInfo-parameter
  - `pGetFdInfo` must be a valid pointer to a valid `VkFenceGetFdInfoKHR` structure
- VUID-vkGetFenceFdKHR-pFd-parameter
  - `pFd` must be a valid pointer to an `int` value

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkFenceGetFdInfoKHR` structure is defined as:

```c
typedef struct VkFenceGetFdInfoKHR {
    VkStructureType                     sType;
    const void*                          pNext;
    VkFence                               fence;
    VkExternalFenceHandleTypeFlagBits    handleType;
} VkFenceGetFdInfoKHR;
```
• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **fence** is the fence from which state will be exported.
• **handleType** is a **VkExternalFenceHandleTypeFlagBits** value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of **handleType**. See **VkExternalFenceHandleTypeFlagBits** for a description of the properties of the defined external fence handle types.

### Valid Usage

- **VUID-VkFenceGetFdInfoKHR-handleType-01453**
  
  **handleType must** have been included in **VkExportFenceCreateInfo::handleTypes** when **fence**’s current payload was created

- **VUID-VkFenceGetFdInfoKHR-handleType-01454**
  
  If **handleType** refers to a handle type with copy payload transference semantics, **fence must** be signaled, or have an associated **fence signal operation pending execution**

- **VUID-VkFenceGetFdInfoKHR-fence-01455**
  
  **fence must** not currently have its payload replaced by an imported payload as described below in **Importing Fence Payloads** unless that imported payload’s handle type was included in **VkExternalFenceProperties::exportFromImportedHandleTypes** for **handleType**

- **VUID-VkFenceGetFdInfoKHR-handleType-01456**
  
  **handleType must** be defined as a POSIX file descriptor handle

### Valid Usage (Implicit)

- **VUID-VkFenceGetFdInfoKHR-sType-sType**
  
  **sType must** be **VK_STRUCTURE_TYPE_FENCE_GET_FD_INFO_KHR**

- **VUID-VkFenceGetFdInfoKHR-pNext-pNext**
  
  **pNext must** be **NULL**

- **VUID-VkFenceGetFdInfoKHR-fence-parameter**
  
  **fence must** be a valid **VkFence** handle

- **VUID-VkFenceGetFdInfoKHR-handleType-parameter**
  
  **handleType must** be a valid **VkExternalFenceHandleTypeFlagBits** value

To destroy a fence, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyFence()
```
VkDevice 
VkFence 
const VkAllocationCallbacks* 

- **device** is the logical device that destroys the fence.
- **fence** is the handle of the fence to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- VUID-vkDestroyFence-fence-01120
  All queue submission commands that refer to fence must have completed execution
- VUID-vkDestroyFence-fence-01121
  If VkAllocationCallbacks were provided when fence was created, a compatible set of callbacks must be provided here
- VUID-vkDestroyFence-fence-01122
  If no VkAllocationCallbacks were provided when fence was created, pAllocator must be NULL

**Valid Usage (Implicit)**

- VUID-vkDestroyFence-device-parameter
  device must be a valid VkDevice handle
- VUID-vkDestroyFence-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle
- VUID-vkDestroyFence-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyFence-fence-parent
  If fence is a valid handle, it must have been created, allocated, or retrieved from device

**Host Synchronization**

- Host access to fence must be externally synchronized

To query the status of a fence from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetFenceStatus(
    VkDevice device,
    VkFence fence);
```
• `device` is the logical device that owns the fence.

• `fence` is the handle of the fence to query.

Upon success, `vkGetFenceStatus` returns the status of the fence object, with the following return codes:

### Table 5. Fence Object Status Codes

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SUCCESS</td>
<td>The fence specified by <code>fence</code> is signaled.</td>
</tr>
<tr>
<td>VK_NOT_READY</td>
<td>The fence specified by <code>fence</code> is unsignaled.</td>
</tr>
<tr>
<td>VK_ERROR_DEVICE_LOST</td>
<td>The device has been lost. See Lost Device.</td>
</tr>
</tbody>
</table>

If a `queue submission` command is pending execution, then the value returned by this command may immediately be out of date.

If the device has been lost (see Lost Device), `vkGetFenceStatus` may return any of the above status codes. If the device has been lost and `vkGetFenceStatus` is called repeatedly, it will eventually return either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

### Valid Usage (Implicit)

- `VUID-vkGetFenceStatus-device-parameter`
  - `device` must be a valid `VkDevice` handle
- `VUID-vkGetFenceStatus-fence-parameter`
  - `fence` must be a valid `VkFence` handle
- `VUID-vkGetFenceStatus-fence-parent`
  - `fence` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_NOT_READY`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

To set the state of fences to unsignaled from the host, call:
VkResult vkResetFences(
    VkDevice device,
    uint32_t fenceCount,
    const VkFence* pFences);

• device is the logical device that owns the fences.
• fenceCount is the number of fences to reset.
• pFences is a pointer to an array of fence handles to reset.

If any member of pFences currently has its payload imported with temporary permanence, that fence’s prior permanent payload is first restored. The remaining operations described therefore operate on the restored payload.

When vkResetFences is executed on the host, it defines a fence unsignal operation for each fence, which resets the fence to the unsignaled state.

If any member of pFences is already in the unsignaled state when vkResetFences is executed, then vkResetFences has no effect on that fence.

---

Valid Usage

• VUID-vkResetFences-pFences-01123
  Each element of pFences must not be currently associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

• VUID-vkResetFences-device-parameter
device must be a valid VkDevice handle
• VUID-vkResetFences-pFences-parameter
  pFences must be a valid pointer to an array of fenceCount valid VkFence handles
• VUID-vkResetFences-fenceCount-arraylength
  fenceCount must be greater than 0
• VUID-vkResetFences-pFences-parent
  Each element of pFences must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to each member of pFences must be externally synchronized
Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

When a fence is submitted to a queue as part of a queue submission command, it defines a memory dependency on the batches that were submitted as part of that command, and defines a fence signal operation which sets the fence to the signaled state.

The first synchronization scope includes every batch submitted in the same queue submission command. Fence signal operations that are defined by vkQueueSubmit or vkQueueSubmit2 additionally include in the first synchronization scope all commands that occur earlier in submission order. Fence signal operations that are defined by vkQueueSubmit, vkQueueSubmit2 or vkQueueBindSparse additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in signal operation order.

The second synchronization scope only includes the fence signal operation.

The first access scope includes all memory access performed by the device.

The second access scope is empty.

To wait for one or more fences to enter the signaled state on the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkWaitForFences(
    VkDevice device,
    uint32_t fenceCount,
    const VkFence* pFences,
    VkBool32 waitAll,
    uint64_t timeout);
```

- `device` is the logical device that owns the fences.
- `fenceCount` is the number of fences to wait on.
- `pFences` is a pointer to an array of `fenceCount` fence handles.
- `waitAll` is the condition that must be satisfied to successfully unblock the wait. If `waitAll` is VK_TRUE, then the condition is that all fences in `pFences` are signaled. Otherwise, the condition is that at least one fence in `pFences` is signaled.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which may be substantially longer than one nanosecond, and may be longer than the requested period.

If the condition is satisfied when `vkWaitForFences` is called, then `vkWaitForFences` returns
immediately. If the condition is not satisfied at the time `vkWaitForFences` is called, then `vkWaitForFences` will block and wait until the condition is satisfied or the `timeout` has expired, whichever is sooner.

If `timeout` is zero, then `vkWaitForFences` does not wait, but simply returns the current state of the fences. `VK_TIMEOUT` will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the `timeout` has expired, `vkWaitForFences` returns `VK_SUCCESS`. Otherwise, `vkWaitForFences` returns `VK_TIMEOUT` after the `timeout` has expired.

If device loss occurs (see Lost Device) before the timeout has expired, `vkWaitForFences` must return in finite time with either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

Note

While we guarantee that `vkWaitForFences` must return in finite time, no guarantees are made that it returns immediately upon device loss. However, the client can reasonably expect that the delay will be on the order of seconds and that calling `vkWaitForFences` will not result in a permanently (or seemingly permanently) dead process.

Valid Usage (Implicit)

• VUID-vkWaitForFences-device-parameter
device must be a valid VkDevice handle

• VUID-vkWaitForFences-pFences-parameter
pFences must be a valid pointer to an array of fenceCount valid VkFence handles

• VUID-vkWaitForFences-fenceCount-arraylength
fenceCount must be greater than 0

• VUID-vkWaitForFences-pFences-parent
Each element of pFences must have been created, allocated, or retrieved from device

Return Codes

Success

• VK_SUCCESS
• VK_TIMEOUT

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_DEVICE_LOST

An execution dependency is defined by waiting for a fence to become signaled, either via
The first synchronization scope includes only the fence signal operation.

The second synchronization scope includes the host operations of `vkWaitForFences` or `vkGetFenceStatus` indicating that the fence has become signaled.

Note
Signaling a fence and waiting on the host does not guarantee that the results of memory accesses will be visible to the host, as the access scope of a memory dependency defined by a fence only includes device access. A memory barrier or other memory dependency must be used to guarantee this. See the description of host access types for more information.

7.3.1. Alternate Methods to Signal Fences

Besides submitting a fence to a queue as part of a queue submission command, a fence may also be signaled when a particular event occurs on a device or display.

To create a fence that will be signaled when an event occurs on a device, call:

```c
// Provided by VK_EXT_display_control
VkResult vkRegisterDeviceEventEXT(
    VkDevice device, const VkDeviceEventInfoEXT* pDeviceEventInfo,
    const VkAllocationCallbacks* pAllocator, VkFence* pFence);
```

- `device` is a logical device on which the event may occur.
- `pDeviceEventInfo` is a pointer to a `VkDeviceEventInfoEXT` structure describing the event of interest to the application.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pFence` is a pointer to a handle in which the resulting fence object is returned.

Valid Usage (Implicit)

- `VUID-vkRegisterDeviceEventEXT-device-parameter` device must be a valid `VkDevice` handle
- `VUID-vkRegisterDeviceEventEXT-pDeviceEventInfo-parameter` `pDeviceEventInfo` must be a valid pointer to a valid `VkDeviceEventInfoEXT` structure
- `VUID-vkRegisterDeviceEventEXT-pAllocator-parameter` If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- `VUID-vkRegisterDeviceEventEXT-pFence-parameter` `pFence` must be a valid pointer to a `VkFence` handle
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkDeviceEventInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkDeviceEventInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceEventTypeEXT deviceEvent;
} VkDeviceEventInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `device` is a `VkDeviceEventTypeEXT` value specifying when the fence will be signaled.

**Valid Usage (Implicit)**

- VUID-VkDeviceEventInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_EVENT_INFO_EXT`
- VUID-VkDeviceEventInfoEXT-pNext-pNext
  `pNext` must be `NULL`
- VUID-VkDeviceEventInfoEXT-deviceEvent-parameter
  `deviceEvent` must be a valid `VkDeviceEventTypeEXT` value

Possible values of `VkDeviceEventInfoEXT::device`, specifying when a fence will be signaled, are:

```c
// Provided by VK_EXT_display_control
typedef enum VkDeviceEventTypeEXT {
    VK_DEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT = 0,
} VkDeviceEventTypeEXT;
```

- `VK_DEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT` specifies that the fence is signaled when a display is plugged into or unplugged from the specified device. Applications can use this notification to determine when they need to re-enumerate the available displays on a device.

To create a fence that will be signaled when an event occurs on a `VkDisplayKHR` object, call:
// Provided by VK_EXT_display_control

VkResult vkRegisterDisplayEventEXT(
    VkDevice device,
    VkDisplayKHR display,
    const VkDisplayEventInfoEXT* pDisplayEventInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFence* pFence);

- **device** is a logical device associated with **display**
- **display** is the display on which the event **may** occur.
- **pDisplayEventInfo** is a pointer to a **VkDisplayEventInfoEXT** structure describing the event of interest to the application.
- **pAllocator** controls host memory allocation as described in the **Memory Allocation** chapter.
- **pFence** is a pointer to a handle in which the resulting fence object is returned.

### Valid Usage (Implicit)

- VUID-vkRegisterDisplayEventEXT-device-parameter
  - **device** **must** be a valid **VkDevice** handle
- VUID-vkRegisterDisplayEventEXT-display-parameter
  - **display** **must** be a valid **VkDisplayKHR** handle
- VUID-vkRegisterDisplayEventEXT-pDisplayEventInfo-parameter
  - **pDisplayEventInfo** **must** be a valid pointer to a valid **VkDisplayEventInfoEXT** structure
- VUID-vkRegisterDisplayEventEXT-pAllocator-parameter
  - If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid **VkAllocationCallbacks** structure
- VUID-vkRegisterDisplayEventEXT-pFence-parameter
  - **pFence** **must** be a valid pointer to a **VkFence** handle
- VUID-vkRegisterDisplayEventEXT-commonparent
  - Both of **device**, and **display** **must** have been created, allocated, or retrieved from the same **VkPhysicalDevice**

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**

The **VkDisplayEventInfoEXT** structure is defined as:
// Provided by VK_EXT_display_control
typedef struct VkDisplayEventInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkDisplayEventTypeEXT    displayEvent;
} VkDisplayEventInfoEXT;

- *sType* is the type of this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- *displayEvent* is a VkDisplayEventTypeEXT specifying when the fence will be signaled.

Valid Usage (Implicit)

- VUID-VkDisplayEventInfoEXT-sType-sType
  *sType* must be VK_STRUCTURE_TYPE_DISPLAY_EVENT_INFO_EXT
- VUID-VkDisplayEventInfoEXT-pNext-pNext
  *pNext* must be NULL
- VUID-VkDisplayEventInfoEXT-displayEvent-parameter
  *displayEvent* must be a valid VkDisplayEventTypeEXT value

Possible values of VkDisplayEventInfoEXT::displayEvent, specifying when a fence will be signaled, are:

// Provided by VK_EXT_display_control
typedef enum VkDisplayEventTypeEXT {
    VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT = 0,
} VkDisplayEventTypeEXT;

- VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT specifies that the fence is signaled when the first pixel of the next display refresh cycle leaves the display engine for the display.

7.3.2. Importing Fence Payloads

Applications can import a fence payload into an existing fence using an external fence handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the fence will be restored to its permanent state the next time that fence is passed to vkResetFences.

**Note**

Restoring a fence to its prior permanent payload is a distinct operation from resetting a fence payload. See vkResetFences for more detail.

Performing a subsequent temporary import on a fence before resetting it has no effect on this requirement; the next unsignal of the fence must still restore its last permanent state. A permanent
payload import behaves as if the target fence was destroyed, and a new fence was created with the same handle but the imported payload. Because importing a fence payload temporarily or permanently detaches the existing payload from a fence, similar usage restrictions to those applied to vkDestroyFence are applied to any command that imports a fence payload. Which of these import types is used is referred to as the import operation’s permanence. Each handle type supports either one or both types of permanence.

The implementation must perform the import operation by either referencing or copying the payload referred to by the specified external fence handle, depending on the handle’s type. The import method used is referred to as the handle type’s transference. When using handle types with reference transference, importing a payload to a fence adds the fence to the set of all fences sharing that payload. This set includes the fence from which the payload was exported. Fence signaling, waiting, and resetting operations performed on any fence in the set must behave as if the set were a single fence. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Fence signaling, waiting, and resetting operations performed on the target of copy imports must not affect any other fence or payload.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a fence payload to a handle with copy transference has the same side effects on the source fence’s payload as executing a fence reset operation. If the fence was using a temporarily imported payload, the fence’s prior permanent payload will be restored.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a fence payload to a handle with copy transference has the same side effects on the source fence’s payload as executing a fence reset operation. If the fence was using a temporarily imported payload, the fence’s prior permanent payload will be restored.

The tables Handle Types Supported by VkImportFenceWin32HandleInfoKHR and Handle Types Supported by VkImportFenceFdInfoKHR define the permanence and transference of each handle type.

External synchronization allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for fences sharing a payload across processes, satisfying the external synchronization requirements of VkFence parameters as if all fences in the set were the same object is sometimes infeasible. Satisfying valid usage constraints on the state of a fence would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific fence handle, not to its payload. For distinct fence objects which share a payload:

- If multiple commands which queue a signal operation, or which unsignal a fence, are called concurrently, behavior will be as if the commands were called in an arbitrary sequential order.
- If a queue submission command is called with a fence that is sharing a payload, and the payload is already associated with another queue command that has not yet completed execution, either one or both of the commands will cause the fence to become signaled when they complete execution.
- If a fence payload is reset while it is associated with a queue command that has not yet completed execution, the payload will become unsignaled, but may become signaled again when the command completes execution.
- In the preceding cases, any of the devices associated with the fences sharing the payload may be lost, or any of the queue submission or fence reset commands may return
Other than these non-deterministic results, behavior is well defined. In particular:

- The implementation **must** not crash or enter an internally inconsistent state where future valid Vulkan commands might cause undefined results,
- Timeouts on future wait commands on fences sharing the payload **must** be effective.

**Note**

These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared fence for more than synchronizing access to the shared memory. For example, a process should not use a fence with shared payload to tell when commands it submitted to a queue have completed and objects used by those commands may be destroyed, since the other process can accidentally or maliciously cause the fence to signal before the commands actually complete.

When a fence is using an imported payload, its `VkExportFenceCreateInfo::handleTypes` value is specified when creating the fence from which the payload was exported, rather than specified when creating the fence. Additionally, `VkExternalFenceProperties::exportFromImportedHandleTypes` restricts which handle types **can** be exported from such a fence based on the specific handle type used to import the current payload. Passing a fence to `vkAcquireNextImageKHR` is equivalent to temporarily importing a fence payload to that fence.

**Note**

Because the exportable handle types of an imported fence correspond to its current imported payload, and `vkAcquireNextImageKHR` behaves the same as a temporary import operation for which the source fence is opaque to the application, applications have no way of determining whether any external handle types **can** be exported from a fence in this state. Therefore, applications **must** not attempt to export handles from fences using a temporarily imported payload from `vkAcquireNextImageKHR`.

When importing a fence payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations **must** perform sufficient validation of external handles to ensure that the operation results in a valid fence which will not cause program termination, device loss, queue stalls, host thread stalls, or corruption of other resources when used as allowed according to its import parameters. If the external handle provided does not meet these requirements, the implementation **must** fail the fence payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

To import a fence payload from a Windows handle, call:

```c
// Provided by VK_KHR_external_fence_win32
VkResult vkImportFenceWin32HandleKHR(VkDevice device, const VkImportFenceWin32HandleInfoKHR* pImportFenceWin32HandleInfo);
```
• `device` is the logical device that created the fence.

• `pImportFenceWin32HandleInfo` is a pointer to a `VkImportFenceWin32HandleInfoKHR` structure specifying the fence and import parameters.

Importing a fence payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application **must** release ownership using the `CloseHandle` system call when the handle is no longer needed.

Applications **can** import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

**Valid Usage**

- VUID-vkImportFenceWin32HandleKHR-fence-04448
  - `fence` **must** not be associated with any queue command that has not yet completed execution on that queue

**Valid Usage (Implicit)**

- VUID-vkImportFenceWin32HandleKHR-device-parameter
  - `device` **must** be a valid `VkDevice` handle

- VUID-vkImportFenceWin32HandleKHR-pImportFenceWin32HandleInfo-parameter
  - `pImportFenceWin32HandleInfo` **must** be a valid pointer to a valid `VkImportFenceWin32HandleInfoKHR` structure

**Return Codes**

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportFenceWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_fence_win32
typedef struct VkImportFenceWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkFenceImportFlags flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    HANDLE handle;
} VkImportFenceWin32HandleInfoKHR;
```
LPCWSTR name;
} VkImportFenceWin32HandleInfoKHR;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **fence** is the fence into which the state will be imported.
• **flags** is a bitmask of VkFenceImportFlagBits specifying additional parameters for the fence payload import operation.
• **handleType** is a VkExternalFenceHandleTypeFlagBits value specifying the type of handle.
• **handle** is NULL or the external handle to import.
• **name** is NULL or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.

The handle types supported by **handleType** are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
</tbody>
</table>

Valid Usage

• VUID-VkImportFenceWin32HandleInfoKHR-handleType-01457
  **handleType** **must** be a value included in the **Handle Types Supported by VkImportFenceWin32HandleInfoKHR** table

• VUID-VkImportFenceWin32HandleInfoKHR-handleType-01459
  If **handleType** is not **VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT**, **name** **must** be NULL

• VUID-VkImportFenceWin32HandleInfoKHR-handleType-01460
  If **handle** is NULL, **name** **must** name a valid synchronization primitive of the type specified by **handleType**

• VUID-VkImportFenceWin32HandleInfoKHR-handleType-01461
  If **name** is NULL, **handle** **must** be a valid handle of the type specified by **handleType**

• VUID-VkImportFenceWin32HandleInfoKHR-handleType-01462
  If **handle** is not NULL, **name** **must** be NULL

• VUID-VkImportFenceWin32HandleInfoKHR-handle-01539
  If **handle** is not NULL, it **must** obey any requirements listed for **handleType** in **external fence handle types compatibility**

• VUID-VkImportFenceWin32HandleInfoKHR-name-01540
  If **name** is not NULL, it **must** obey any requirements listed for **handleType** in **external fence**
Valid Usage (Implicit)

- VUID-VkImportFenceWin32HandleInfoKHR-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_IMPORT_FENCE_WIN32_HANDLE_INFO_KHR

- VUID-VkImportFenceWin32HandleInfoKHR-pNext-pNext
  
  pNext must be NULL

- VUID-VkImportFenceWin32HandleInfoKHR-fence-parameter
  
  fence must be a valid VkFence handle

- VUID-VkImportFenceWin32HandleInfoKHR-flags-parameter
  
  flags must be a valid combination of VkFenceImportFlagBits values

Host Synchronization

- Host access to fence must be externally synchronized

To import a fence payload from a POSIX file descriptor, call:

```c
// Provided by VK_KHR_external_fence_fd
VkResult vkImportFenceFdKHR(
    VkDevice device,
    const VkImportFenceFdInfoKHR* pImportFenceFdInfo);
```

- device is the logical device that created the fence.

- pImportFenceFdInfo is a pointer to a VkImportFenceFdInfoKHR structure specifying the fence and import parameters.

Importing a fence payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application must not perform any operations on the file descriptor after a successful import.

Applications can import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage

- VUID-vkImportFenceFdKHR-fence-01463
  
  fence must not be associated with any queue command that has not yet completed execution on that queue
Valid Usage (Implicit)

- VUID-vkImportFenceFdKHR-device-parameter
  *device* must be a valid *VkDevice* handle

- VUID-vkImportFenceFdKHR-pImportFenceFdInfo-parameter
  *pImportFenceFdInfo* must be a valid pointer to a valid *VkImportFenceFdInfoKHR* structure

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The *VkImportFenceFdInfoKHR* structure is defined as:

```c
// Provided by VK_KHR_external_fence_fd
typedef struct VkImportFenceFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkFenceImportFlags flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    int fd;
} VkImportFenceFdInfoKHR;
```

- *sType* is the type of this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- *fence* is the fence into which the payload will be imported.
- *flags* is a bitmask of *VkFenceImportFlagBits* specifying additional parameters for the fence payload import operation.
- *handleType* is a *VkExternalFenceHandleTypeFlagBits* value specifying the type of *fd*.
- *fd* is the external handle to import.

The handle types supported by *handleType* are:

**Table 7. Handle Types Supported by *VkImportFenceFdInfoKHR***

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>Handle Type</td>
<td>Transference</td>
<td>Permanence Supported</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>--------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT</td>
<td>Copy</td>
<td>Temporary</td>
</tr>
</tbody>
</table>

**Valid Usage**

- **VUID-VkImportFenceFdInfoKHR-handleType-01464**
  handleType must be a value included in the Handle Types Supported by VkImportFenceFdInfoKHR table

- **VUID-VkImportFenceFdInfoKHR-fd-01541**
  fd must obey any requirements listed for handleType in external fence handle types compatibility

- **VUID-VkImportFenceFdInfoKHR-handleType-07306**
  If handleType refers to a handle type with copy payload transference semantics, flags must contain VK_FENCE_IMPORT_TEMPORARY_BIT

If handleType is VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT, the special value -1 for fd is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the VkFence will have a temporarily imported payload as if a valid file descriptor had been provided.

**Note**

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a -1 file descriptor when exporting a VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT from a VkFence which is signaled.

**Valid Usage (Implicit)**

- **VUID-VkImportFenceFdInfoKHR-sType-sType**
  sType must be VK_STRUCTURE_TYPE_IMPORT_FENCE_FD_INFO_KHR

- **VUID-VkImportFenceFdInfoKHR-pNext-pNext**
  pNext must be NULL

- **VUID-VkImportFenceFdInfoKHR-fence-parameter**
  fence must be a valid VkFence handle

- **VUID-VkImportFenceFdInfoKHR-flags-parameter**
  flags must be a valid combination of VkFenceImportFlagBits values

- **VUID-VkImportFenceFdInfoKHR-handleType-parameter**
  handleType must be a valid VkExternalFenceHandleTypeFlagBits value
Host Synchronization

- Host access to fence must be externally synchronized

Bits which can be set in

- VkImportFenceWin32HandleInfoKHR::flags
- VkImportFenceFdInfoKHR::flags

specifying additional parameters of a fence import operation are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkFenceImportFlagBits {
    VK_FENCE_IMPORT_TEMPORARY_BIT = 0x00000001,
    // Provided by VK_KHR_external_fence
    VK_FENCE_IMPORT_TEMPORARY_BIT_KHR = VK_FENCE_IMPORT_TEMPORARY_BIT,
} VkFenceImportFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence
typedef VkFenceImportFlagBitsKHR VkFenceImportFlagBits;
```

- VK_FENCE_IMPORT_TEMPORARY_BIT specifies that the fence payload will be imported only temporarily, as described in Importing Fence Payloads, regardless of the permanence of handleType.

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkFenceImportFlags;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence
typedef VkFenceImportFlagsKHR VkFenceImportFlags;
```

VkFenceImportFlags is a bitmask type for setting a mask of zero or more VkFenceImportFlagBits.

7.4. Semaphores

Semaphores are a synchronization primitive that can be used to insert a dependency between queue operations or between a queue operation and the host. Binary semaphores have two states - signaled and unsignaled. Timeline semaphores have a strictly increasing 64-bit unsigned integer payload and are signaled with respect to a particular reference value. A semaphore can be signaled
after execution of a queue operation is completed, and a queue operation can wait for a semaphore to become signaled before it begins execution. A timeline semaphore can additionally be signaled from the host with the `vkSignalSemaphore` command and waited on from the host with the `vkWaitSemaphores` command.

The internal data of a semaphore may include a reference to any resources and pending work associated with signal or unsignal operations performed on that semaphore object, collectively referred to as the semaphore's payload. Mechanisms to import and export that internal data to and from semaphores are provided below. These mechanisms indirectly enable applications to share semaphore state between two or more semaphores and other synchronization primitives across process and API boundaries.

Semaphores are represented by `VkSemaphore` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSemaphore)
```

To create a semaphore, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateSemaphore(VkDevice device, const VkSemaphoreCreateInfo* pCreateInfo, const VkAllocationCallbacks* pAllocator, VkSemaphore* pSemaphore);
```

- `device` is the logical device that creates the semaphore.
- `pCreateInfo` is a pointer to a `VkSemaphoreCreateInfo` structure containing information about how the semaphore is to be created.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pSemaphore` is a pointer to a handle in which the resulting semaphore object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateSemaphore-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkCreateSemaphore-pCreateInfo-parameter `pCreateInfo` must be a valid pointer to a valid `VkSemaphoreCreateInfo` structure
- VUID-vkCreateSemaphore-pAllocator-parameter If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateSemaphore-pSemaphore-parameter `pSemaphore` must be a valid pointer to a `VkSemaphore` handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkSemaphoreCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSemaphoreCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphoreCreateFlags flags;
} VkSemaphoreCreateInfo;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.

Valid Usage

• VUID-VkSemaphoreCreateInfo-pNext-06789
If the pNext chain includes a VkExportMetalObjectCreateInfoEXT structure, its exportObjectType member must be VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT.

Valid Usage (Implicit)

• VUID-VkSemaphoreCreateInfo-sType-sType
sType must be VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO

• VUID-VkSemaphoreCreateInfo-pNext-pNext
Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkExportMetalObjectCreateInfoEXT, VkExportSemaphoreCreateInfo, VkImportMetalSharedEventCreateInfoEXT, or VkSemaphoreTypeInfo.

• VUID-VkSemaphoreCreateInfo-sType-unique
The sType value of each struct in the pNext chain must be unique, with the exception of structures of type VkExportMetalObjectCreateInfoEXT

• VUID-VkSemaphoreCreateInfo-flags-zerobitmask
flags must be 0
`VkSemaphoreCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkSemaphoreTypeCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreTypeCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphoreType semaphoreType;
    uint64_t initialValue;
} VkSemaphoreTypeCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreTypeCreateInfo VkSemaphoreTypeCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphoreType` is a `VkSemaphoreType` value specifying the type of the semaphore.
- `initialValue` is the initial payload value if `semaphoreType` is `VK_SEMAPHORE_TYPE_TIMELINE`.

To create a semaphore of a specific type, add a `VkSemaphoreTypeCreateInfo` structure to the `VkSemaphoreCreateInfo`::`pNext` chain.

If no `VkSemaphoreTypeCreateInfo` structure is included in the `pNext` chain of `VkSemaphoreCreateInfo`, then the created semaphore will have a default `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`.

### Valid Usage

- **VUID-VkSemaphoreTypeCreateInfo-timelineSemaphore-03252**
  If the `timelineSemaphore` feature is not enabled, `semaphoreType` must not equal `VK_SEMAPHORE_TYPE_TIMELINE`

- **VUID-VkSemaphoreTypeCreateInfo-semaphoreType-03279**
  If `semaphoreType` is `VK_SEMAPHORE_TYPE_BINARY`, `initialValue` must be zero

### Valid Usage (Implicit)

- **VUID-VkSemaphoreTypeCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_TYPE_CREATE_INFO`
semaphoreType must be a valid VkSemaphoreType value

Possible values of VkSemaphoreTypeCreateInfo::semaphoreType, specifying the type of a semaphore, are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreType {
    VK_SEMAPHORE_TYPE_BINARY = 0,
    VK_SEMAPHORE_TYPE_TIMELINE = 1,
} VkSemaphoreType;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreType VkSemaphoreTypeKHR;
```

- **VK_SEMAPHORE_TYPE_BINARY** specifies a binary semaphore type that has a boolean payload indicating whether the semaphore is currently signaled or unsignaled. When created, the semaphore is in the unsignaled state.

- **VK_SEMAPHORE_TYPE_TIMELINE** specifies a timeline semaphore type that has a strictly increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. When created, the semaphore payload has the value given by the initialValue field of VkSemaphoreTypeCreateInfo.

To create a semaphore whose payload can be exported to external handles, add a VkExportSemaphoreCreateInfo structure to thepNext chain of the VkSemaphoreCreateInfo structure. The VkExportSemaphoreCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VK_VERSION_1_1
    VkExportSemaphoreCreateInfo {
        VkStructureType sType;
        const void* pNext;
        VkExternalSemaphoreHandleTypeFlags handleTypes;
} VkExportSemaphoreCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_semaphore
typedef VkExportSemaphoreCreateInfo VkExportSemaphoreCreateInfoKHR;
```
• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `handleTypes` is a bitmask of `VkExternalSemaphoreHandleTypeFlagBits` specifying one or more semaphore handle types the application can export from the resulting semaphore. The application can request multiple handle types for the same semaphore.

### Valid Usage

- **VUID-VkExportSemaphoreCreateInfo-handleTypes-01124**
  The bits in `handleTypes` must be supported and compatible, as reported by `VkExternalSemaphoreProperties`.

### Valid Usage (Implicit)

- **VUID-VkExportSemaphoreCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_CREATE_INFO`.
- **VUID-VkExportSemaphoreCreateInfo-handleTypes-parameter**
  `handleTypes` must be a valid combination of `VkExternalSemaphoreHandleTypeFlagBits` values.

To specify additional attributes of NT handles exported from a semaphore, add a `VkExportSemaphoreWin32HandleInfoKHR` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkExportSemaphoreWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkExportSemaphoreWin32HandleInfoKHR {
    VkStructureType         sType;
    const void*             pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD                    dwAccess;
    LPCWSTR                  name;
} VkExportSemaphoreWin32HandleInfoKHR;
```

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
• `dwAccess` is a `DWORD` specifying access rights of the handle.
• `name` is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created semaphore.

If `VkExportSemaphoreCreateInfo` is not included in the same `pNext` chain, this structure is ignored.
If `VkExportSemaphoreCreateInfo` is included in the `pNext` chain of `VkSemaphoreCreateInfo` with a Windows `handleType`, but either `VkExportSemaphoreWin32HandleInfoKHR` is not included in the `pNext` chain, or if it is but `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights used depend on the handle type.

For handles of the following types:

**VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT**

The implementation **must** ensure the access rights allow both signal and wait operations on the semaphore.

For handles of the following types:

**VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT**

The access rights **must** be:

`GENERIC_ALL`

### Valid Usage

- **VUID-VkExportSemaphoreWin32HandleInfoKHR-handleTypes-01125**
  
  If `VkExportSemaphoreCreateInfo::handleTypes` does not include `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`, `VkExportSemaphoreWin32HandleInfoKHR` must not be included in the `pNext` chain of `VkSemaphoreCreateInfo`.

### Valid Usage (Implicit)

- **VUID-VkExportSemaphoreWin32HandleInfoKHR-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR`.

- **VUID-VkExportSemaphoreWin32HandleInfoKHR-pAttributes-parameter**
  
  If `pAttributes` is not `NULL`, `pAttributes` **must** be a valid pointer to a valid `SECURITY_ATTRIBUTES` value.

To export a Windows handle representing the payload of a semaphore, call:

```c
// Provided by VK_KHR_external_semaphore_win32
VkResult vkGetSemaphoreWin32HandleKHR(  
    VkDevice device,  
    const VkSemaphoreGetWin32HandleInfoKHR* pGetWin32HandleInfo,  
    ...);
```
HANDLE* pHandle);

- **device** is the logical device that created the semaphore being exported.
- **pGetWin32HandleInfo** is a pointer to a VkSemaphoreGetWin32HandleInfoKHR structure containing parameters of the export operation.
- **pHandle** will return the Windows handle representing the semaphore state.

For handle types defined as NT handles, the handles returned by vkGetSemaphoreWin32Handle_KHR are owned by the application. To avoid leaking resources, the application **must** release ownership of them using the CloseHandle system call when they are no longer needed.

Exporting a Windows handle from a semaphore **may** have side effects depending on the transference of the specified handle type, as described in Importing Semaphore Payloads.

## Valid Usage (Implicit)

- VUID-vkGetSemaphoreWin32HandleKHR-device-parameter
  - **device** must be a valid VkDevice handle
- VUID-vkGetSemaphoreWin32HandleKHR-pGetWin32HandleInfo-parameter
  - **pGetWin32HandleInfo** must be a valid pointer to a valid VkSemaphoreGetWin32HandleInfoKHR structure
- VUID-vkGetSemaphoreWin32HandleKHR-pHandle-parameter
  - **pHandle** must be a valid pointer to a HANDLE value

## Return Codes

### Success
- VK_SUCCESS

### Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkSemaphoreGetWin32HandleInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkSemaphoreGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetWin32HandleInfoKHR;
```

- **sType** is the type of this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `semaphore` is the semaphore from which state will be exported.
• `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.

### Valid Usage

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01126**
  
  `handleType` must have been included in `VkExportSemaphoreCreateInfo::handleTypes` when the `semaphore`'s current payload was created.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01127**
  
  If `handleType` is defined as an NT handle, `vkGetSemaphoreWin32HandleKHR` must be called no more than once for each valid unique combination of `semaphore` and `handleType`.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-01128**
  
  `semaphore` must not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload's handle type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for `handleType`.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01129**
  
  If `handleType` refers to a handle type with copy payload transference semantics, as defined below in Importing Semaphore Payloads, there must be no queue waiting on `semaphore`.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01130**
  
  If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` must be signaled, or have an associated semaphore signal operation pending execution.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01131**
  
  `handleType` must be defined as an NT handle or a global share handle.

### Valid Usage (Implicit)

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_WIN32_HANDLE_INFO_KHR`.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-pNext-pNext**
  
  `pNext` must be `NULL`.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-parameter**
  
  `semaphore` must be a valid `VkSemaphore` handle.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-parameter**
  
  `handleType` must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value.
To export a POSIX file descriptor representing the payload of a semaphore, call:

```c
// Provided by VK_KHR_external_semaphore_fd
VkResult vkGetSemaphoreFdKHR(
    VkDevice device,
    const VkSemaphoreGetFdInfoKHR* pGetFdInfo,
    int* pFd);
```

- `device` is the logical device that created the semaphore being exported.
- `pGetFdInfo` is a pointer to a `VkSemaphoreGetFdInfoKHR` structure containing parameters of the export operation.
- `pFd` will return the file descriptor representing the semaphore payload.

Each call to `vkGetSemaphoreFdKHR` must create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application must release ownership of the file descriptor when it is no longer needed.

```
Note
Ownership can be released in many ways. For example, the application can call `close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.
```

Where supported by the operating system, the implementation must set the file descriptor to be closed automatically when an `execve` system call is made.

Exporting a file descriptor from a semaphore may have side effects depending on the transference of the specified handle type, as described in Importing Semaphore State.

**Valid Usage (Implicit)**

- VUID-vkGetSemaphoreFdKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetSemaphoreFdKHR-pGetFdInfo-parameter
  `pGetFdInfo` must be a valid pointer to a valid `VkSemaphoreGetFdInfoKHR` structure

- VUID-vkGetSemaphoreFdKHR-pFd-parameter
  `pFd` must be a valid pointer to an `int` value

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_TOO_MANY_OBJECTS`
The `VkSemaphoreGetFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkSemaphoreGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetFdInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of `handleType`. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.

### Valid Usage

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01132**
  `handleType` must have been included in `VkExportSemaphoreCreateInfo::handleTypes` when `semaphore`'s current payload was created.

- **VUID-VkSemaphoreGetFdInfoKHR-semaphore-01133**
  `semaphore` must not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload's handle type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for `handleType`.

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01134**
  If `handleType` refers to a handle type with copy payload transference semantics, as defined below in Importing Semaphore Payloads, there must be no queue waiting on `semaphore`.

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01135**
  If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` must be signaled, or have an associated semaphore signal operation pending execution.

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01136**
  `handleType` must be defined as a POSIX file descriptor handle.

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-03253**
  If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` must have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`.
If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` must have an associated semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) must have also been submitted for execution.

### Valid Usage (Implicit)

- **VUID-VkSemaphoreGetFdInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_FD_INFO_KHR`

- **VUID-VkSemaphoreGetFdInfoKHR-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkSemaphoreGetFdInfoKHR-semaphore-parameter**
  
  `semaphore` must be a valid `VkSemaphore` handle

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-parameter**
  
  `handleType` must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

To export a Zircon event handle representing the payload of a semaphore, call:

```c
// Provided by VK_FUCHSIA_external_semaphore
VkResult vkGetSemaphoreZirconHandleFUCHSIA(
    VkDevice device,
    const VkSemaphoreGetZirconHandleInfoFUCHSIA* pGetZirconHandleInfo,
    zx_handle_t* pZirconHandle);
```

- `device` is the logical device that created the semaphore being exported.

- `pGetZirconHandleInfo` is a pointer to a `VkSemaphoreGetZirconHandleInfoFUCHSIA` structure containing parameters of the export operation.

- `pZirconHandle` will return the Zircon event handle representing the semaphore payload.

Each call to `vkGetSemaphoreZirconHandleFUCHSIA` must create a Zircon event handle and transfer ownership of it to the application. To avoid leaking resources, the application must release ownership of the Zircon event handle when it is no longer needed.

### Note

Ownership can be released in many ways. For example, the application can call `zx_handle_close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.

Exporting a Zircon event handle from a semaphore may have side effects depending on the transference of the specified handle type, as described in Importing Semaphore State.
Valid Usage (Implicit)

- VUID-vkGetSemaphoreZirconHandleFUCHSIA-device-parameter  
  `device` must be a valid `VkDevice` handle

- VUID-vkGetSemaphoreZirconHandleFUCHSIA-pGetZirconHandleInfo-parameter  
  `pGetZirconHandleInfo` must be a valid pointer to a valid `VkSemaphoreGetZirconHandleInfoFUCHSIA` structure

- VUID-vkGetSemaphoreZirconHandleFUCHSIA-pZirconHandle-parameter  
  `pZirconHandle` must be a valid pointer to a `zx_handle_t` value

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkSemaphoreGetZirconHandleInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_external_semaphore
typedef struct VkSemaphoreGetZirconHandleInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetZirconHandleInfoFUCHSIA;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the Zircon event handle returned depend on the value of `handleType`. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.

Valid Usage

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04758  
  `handleType` must have been included in `VkExportSemaphoreCreateInfo::handleTypes` when
semaphore's current payload was created

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-04759
  *semaphore must* not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload's handle type was included in VkExternalSemaphoreProperties::exportFromImportedHandleTypes for handleType

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04760
  If `handleType` refers to a handle type with copy payload transference semantics, as defined below in Importing Semaphore Payloads, there *must* be no queue waiting on *semaphore*

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04761
  If `handleType` refers to a handle type with copy payload transference semantics, *semaphore* *must* be signaled, or have an associated *semaphore signal operation* pending execution

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-04762
  `handleType must` be defined as a Zircon event handle

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-04763
  *semaphore must* have been created with a *VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY*

**Valid Usage (Implicit)**

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-sType-sType
  `sType must` be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_ZIRCON_HANDLE_INFO_FUCHSIA`

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-pNext-pNext
  `pNext must` be `NULL`

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-semaphore-parameter
  `semaphore must` be a valid *VkSemaphore* handle

- VUID-VkSemaphoreGetZirconHandleInfoFUCHSIA-handleType-parameter
  `handleType must` be a valid *VkExternalSemaphoreHandleTypeFlagBits* value

To destroy a semaphore, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroySemaphore(
  VkDevice device,            // Provided by VK_VERSION_1_0
  VkSemaphore semaphore,      // Provided by VK_VERSION_1_0
  const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the semaphore.
- `semaphore` is the handle of the semaphore to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
7.4.1. Semaphore Signaling

When a batch is submitted to a queue via a queue submission, and it includes semaphores to be signaled, it defines a memory dependency on the batch, and defines semaphore signal operations which set the semaphores to the signaled state.

In case of semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE the semaphore is considered signaled with respect to the counter value set to be signaled as specified in VkTimelineSemaphoreSubmitInfo or VkSemaphoreSignalInfo.

The first synchronization scope includes every command submitted in the same batch. In the case of vkQueueSubmit2, the first synchronization scope is limited to the pipeline stage specified by VkSemaphoreSubmitInfo::stageMask. Semaphore signal operations that are defined by vkQueueSubmit or vkQueueSubmit2 additionally include all commands that occur earlier in submission order. Semaphore signal operations that are defined by vkQueueSubmit,
vkQueueSubmit2 or vkQueueBindSparse additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in signal operation order.

The second synchronization scope includes only the semaphore signal operation.

The first access scope includes all memory access performed by the device.

The second access scope is empty.

### 7.4.2. Semaphore Waiting

When a batch is submitted to a queue via a queue submission, and it includes semaphores to be waited on, it defines a memory dependency between prior semaphore signal operations and the batch, and defines semaphore wait operations.

Such semaphore wait operations set the semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY to the unsignaled state. In case of semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE a prior semaphore signal operation defines a memory dependency with a semaphore wait operation if the value the semaphore is signaled with is greater than or equal to the value the semaphore is waited with, thus the semaphore will continue to be considered signaled with respect to the counter value waited on as specified in VkTimelineSemaphoreSubmitInfo.

The first synchronization scope includes all semaphore signal operations that operate on semaphores waited on in the same batch, and that happen-before the wait completes.

The second synchronization scope includes every command submitted in the same batch. In the case of vkQueueSubmit, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by the corresponding element of pWaitDstStageMask. In the case of vkQueueSubmit2, the second synchronization scope is limited to the pipeline stage specified by VkSemaphoreSubmitInfo::stageMask. Also, in the case of either vkQueueSubmit2 or vkQueueSubmit, the second synchronization scope additionally includes all commands that occur later in submission order.

The first access scope is empty.

The second access scope includes all memory access performed by the device.

The semaphore wait operation happens-after the first set of operations in the execution dependency, and happens-before the second set of operations in the execution dependency.

---

**Note**

Unlike timeline semaphores, fences or events, the act of waiting for a binary semaphore also unsignals that semaphore. Applications must ensure that between two such wait operations, the semaphore is signaled again, with execution dependencies used to ensure these occur in order. Binary semaphore waits and signals should thus occur in discrete 1:1 pairs.

---

**Note**
A common scenario for using `pWaitDstStageMask` with values other than `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` is when synchronizing a window system presentation operation against subsequent command buffers which render the next frame. In this case, a presentation image **must** not be overwritten until the presentation operation completes, but other pipeline stages **can** execute without waiting. A mask of `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` prevents subsequent color attachment writes from executing until the semaphore signals. Some implementations **may** be able to execute transfer operations and/or pre-rasterization work before the semaphore is signaled.

If an image layout transition needs to be performed on a presentable image before it is used in a framebuffer, that **can** be performed as the first operation submitted to the queue after acquiring the image, and **should** not prevent other work from overlapping with the presentation operation. For example, a `VkImageMemoryBarrier` could use:

- `srcStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `srcAccessMask = 0`
- `dstStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `dstAccessMask = VK_ACCESS_COLOR_ATTACHMENT_READ_BIT | VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`
- `oldLayout = VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`
- `newLayout = VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

Alternatively, `oldLayout` **can** be `VK_IMAGE_LAYOUT_UNDEFINED`, if the image's contents need not be preserved.

This barrier accomplishes a dependency chain between previous presentation operations and subsequent color attachment output operations, with the layout transition performed in between, and does not introduce a dependency between previous work and any pre-rasterization shader stages. More precisely, the semaphore signals after the presentation operation completes, the semaphore wait stalls the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` stage, and there is a dependency from that same stage to itself with the layout transition performed in between.

### 7.4.3. Semaphore State Requirements For Wait Operations

Before waiting on a semaphore, the application **must** ensure the semaphore is in a valid state for a wait operation. Specifically, when a **semaphore wait operation** is submitted to a queue:

- A binary semaphore **must** be signaled, or have an associated **semaphore signal operation** that is pending execution.
- Any **semaphore signal operations** on which the pending binary semaphore signal operation depends **must** also be completed or pending execution.
- There **must** be no other queue waiting on the same binary semaphore when the operation
7.4.4. Host Operations on Semaphores

In addition to semaphore signal operations and semaphore wait operations submitted to device queues, timeline semaphores support the following host operations:

- Query the current counter value of the semaphore using the `vkGetSemaphoreCounterValue` command.
- Wait for a set of semaphores to reach particular counter values using the `vkWaitSemaphores` command.
- Signal the semaphore with a particular counter value from the host using the `vkSignalSemaphore` command.

To query the current counter value of a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` from the host, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkGetSemaphoreCounterValue(
    VkDevice device,
    VkSemaphore semaphore,
    uint64_t* pValue);
```

or the equivalent command

```c
// Provided by VK_KHR_timeline_semaphore
VkResult vkGetSemaphoreCounterValueKHR(
    VkDevice device,
    VkSemaphore semaphore,
    uint64_t* pValue);
```

- `device` is the logical device that owns the semaphore.
- `semaphore` is the handle of the semaphore to query.
- `pValue` is a pointer to a 64-bit integer value in which the current counter value of the semaphore is returned.

**Note**

If a queue submission command is pending execution, then the value returned by this command may immediately be out of date.

**Valid Usage**

- VUID-vkGetSemaphoreCounterValue-semaphore-03255
  `semaphore` must have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`
Valid Usage (Implicit)

- VUID-vkGetSemaphoreCounterValue-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkGetSemaphoreCounterValue-semaphore-parameter
  
  semaphore must be a valid VkSemaphore handle

- VUID-vkGetSemaphoreCounterValue-pValue-parameter
  
  pValue must be a valid pointer to a uint64_t value

- VUID-vkGetSemaphoreCounterValue-semaphore-parent
  
  semaphore must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

To wait for a set of semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE to reach particular counter values on the host, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkWaitSemaphores(
    VkDevice device,
    const VkSemaphoreWaitInfo* pWaitInfo,
    uint64_t timeout);
```

or the equivalent command

```c
// Provided by VK_KHR_timeline_semaphore
VkResult vkWaitSemaphoresKHR(
    VkDevice device,
    const VkSemaphoreWaitInfo* pWaitInfo,
    uint64_t timeout);
```

- device is the logical device that owns the semaphores.
- pWaitInfo is a pointer to a VkSemaphoreWaitInfo structure containing information about the wait condition.
- timeout is the timeout period in units of nanoseconds. timeout is adjusted to the closest value
allowed by the implementation-dependent timeout accuracy, which may be substantially longer than one nanosecond, and may be longer than the requested period.

If the condition is satisfied when `vkWaitSemaphores` is called, then `vkWaitSemaphores` returns immediately. If the condition is not satisfied at the time `vkWaitSemaphores` is called, then `vkWaitSemaphores` will block and wait until the condition is satisfied or the timeout has expired, whichever is sooner.

If `timeout` is zero, then `vkWaitSemaphores` does not wait, but simply returns information about the current state of the semaphores. `VK_TIMEOUT` will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the `timeout` has expired, `vkWaitSemaphores` returns `VK_SUCCESS`. Otherwise, `vkWaitSemaphores` returns `VK_TIMEOUT` after the `timeout` has expired.

If device loss occurs (see Lost Device) before the timeout has expired, `vkWaitSemaphores` must return in finite time with either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

### Valid Usage (Implicit)

- VUID-vkWaitSemaphores-device-parameter  
  `device` must be a valid `VkDevice` handle
- VUID-vkWaitSemaphores-pWaitInfo-parameter  
  `pWaitInfo` must be a valid pointer to a valid `VkSemaphoreWaitInfo` structure

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_TIMEOUT`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

The `VkSemaphoreWaitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreWaitInfo {
  VkStructureType sType;
  const void* pNext;
  VkSemaphoreWaitFlags flags;
  uint32_t semaphoreCount;
  const VkSemaphore* pSemaphores;
} VkSemaphoreWaitInfo;
```
```c
const uint64_t* pValues;
} VkSemaphoreWaitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitInfo VKSemaphoreWaitInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkSemaphoreWaitFlagBits` specifying additional parameters for the semaphore wait operation.
- `semaphoreCount` is the number of semaphores to wait on.
- `pSemaphores` is a pointer to an array of `semaphoreCount` semaphore handles to wait on.
- `pValues` is a pointer to an array of `semaphoreCount` timeline semaphore values.

### Valid Usage

- VUID-VkSemaphoreWaitInfo-pSemaphores-03256
  
  All of the elements of `pSemaphores` must reference a semaphore that was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`

### Valid Usage (Implicit)

- VUID-VkSemaphoreWaitInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_WAIT_INFO`

- VUID-VkSemaphoreWaitInfo-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkSemaphoreWaitInfo-flags-parameter
  
  `flags` must be a valid combination of `VkSemaphoreWaitFlagBits` values

- VUID-VkSemaphoreWaitInfo-pSemaphores-parameter
  
  `pSemaphores` must be a valid pointer to an array of `semaphoreCount` valid `VkSemaphore` handles

- VUID-VkSemaphoreWaitInfo-pValues-parameter
  
  `pValues` must be a valid pointer to an array of `semaphoreCount uint64_t` values

- VUID-VkSemaphoreWaitInfo-semaphoreCount-arraylength
  
  `semaphoreCount` must be greater than `0`

Bits which can be set in `VkSemaphoreWaitInfo::flags`, specifying additional parameters of a semaphore wait operation, are:
typedef enum VkSemaphoreWaitFlagBits {
    VK_SEMAPHORE_WAIT_ANY_BIT = 0x00000001,
} VkSemaphoreWaitFlagBits;

• VK_SEMAPHORE_WAIT_ANY_BIT specifies that the semaphore wait condition is that at least one of the
  semaphores in VkSemaphoreWaitInfo::pSemaphores has reached the value specified by the
  corresponding element of VkSemaphoreWaitInfo::pValues. If VK_SEMAPHORE_WAIT_ANY_BIT is not set,
  the semaphore wait condition is that all of the semaphores in VkSemaphoreWaitInfo::pSemaphores
  have reached the value specified by the corresponding element of VkSemaphoreWaitInfo::pValues.

typedef VkSemaphoreWaitFlags VkSemaphoreWaitFlagsKHR;

VkSemaphoreWaitFlags is a bitmask type for setting a mask of zero or more
VkSemaphoreWaitFlagBits.

To signal a semaphore created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE with a
particular counter value, on the host, call:

VkResult vkSignalSemaphore(VkDevice device,
const VkSemaphoreSignalInfo* pSignalInfo);

or the equivalent command

VkResult vkSignalSemaphoreKHR(VkDevice device,
const VkSemaphoreSignalInfo* pSignalInfo);
• **device** is the logical device that owns the semaphore.

• **pSignalInfo** is a pointer to a `VkSemaphoreSignalInfo` structure containing information about the signal operation.

When `vkSignalSemaphore` is executed on the host, it defines and immediately executes a *semaphore signal operation* which sets the timeline semaphore to the given value.

The first synchronization scope is defined by the host execution model, but includes execution of `vkSignalSemaphore` on the host and anything that happened-before it.

The second synchronization scope is empty.

### Valid Usage (Implicit)

- **VUID-vkSignalSemaphore-device-parameter**
  
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkSignalSemaphore-pSignalInfo-parameter**
  
  `pSignalInfo` **must** be a valid pointer to a valid `VkSemaphoreSignalInfo` structure

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkSemaphoreSignalInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreSignalInfo {
    VkStructureType     sType;
    const void*         pNext;
    VkSemaphore         semaphore;
    uint64_t             value;
} VkSemaphoreSignalInfo;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreSignalInfo VkSemaphoreSignalInfoKHR;
```

- **sType** is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- semaphore is the handle of the semaphore to signal.
- value is the value to signal.

**Valid Usage**

- VUID-VkSemaphoreSignalInfo-semaphore-03257
  semaphore must have been created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE
- VUID-VkSemaphoreSignalInfo-value-03258
  value must have a value greater than the current value of the semaphore
- VUID-VkSemaphoreSignalInfo-value-03259
  value must be less than the value of any pending semaphore signal operations
- VUID-VkSemaphoreSignalInfo-value-03260
  value must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on semaphore by more than maxTimelineSemaphoreValueDifference

**Valid Usage (Implicit)**

- VUID-VkSemaphoreSignalInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SEMAPHORE_SIGNAL_INFO
- VUID-VkSemaphoreSignalInfo-pNext-pNext
  pNext must be NULL
- VUID-VkSemaphoreSignalInfo-semaphore-parameter
  semaphore must be a valid VkSemaphore handle

**7.4.5. Importing Semaphore Payloads**

Applications can import a semaphore payload into an existing semaphore using an external semaphore handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the implementation must restore the semaphore to its prior permanent state after submitting the next semaphore wait operation. Performing a subsequent temporary import on a semaphore before performing a semaphore wait has no effect on this requirement; the next wait submitted on the semaphore must still restore its last permanent state. A permanent payload import behaves as if the target semaphore was destroyed, and a new semaphore was created with the same handle but the imported payload. Because importing a semaphore payload temporarily or permanently detaches the existing payload from a semaphore, similar usage restrictions to those applied to vkDestroySemaphore are applied to any command that imports a semaphore payload. Which of these import types is used is referred to as the import operation's permanence. Each handle type supports either one or both types of permanence.
The implementation must perform the import operation by either referencing or copying the payload referred to by the specified external semaphore handle, depending on the handle's type. The import method used is referred to as the handle type's transference. When using handle types with reference transference, importing a payload to a semaphore adds the semaphore to the set of all semaphores sharing that payload. This set includes the semaphore from which the payload was exported. Semaphore signaling and waiting operations performed on any semaphore in the set must behave as if the set were a single semaphore. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Semaphore signaling and waiting operations performed on the target of copy imports must not affect any other semaphore or payload.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a semaphore payload to a handle with copy transference has the same side effects on the source semaphore's payload as executing a semaphore wait operation. If the semaphore was using a temporarily imported payload, the semaphore's prior permanent payload will be restored.

Note

The permanence and transference of handle types can be found in:

- Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR`
- Handle Types Supported by `VkImportSemaphoreFdInfoKHR`
- Handle Types Supported by `VkImportSemaphoreZirconHandleInfoFUCHSIA`

External synchronization allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for semaphores sharing a payload across processes, satisfying the external synchronization requirements of `VkSemaphore` parameters as if all semaphores in the set were the same object is sometimes infeasible. Satisfying the wait operation state requirements would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific semaphore handle, not to its payload. For distinct semaphore objects which share a payload, if the semaphores are passed to separate queue submission commands concurrently, behavior will be as if the commands were called in an arbitrary sequential order. If the wait operation state requirements are violated for the shared payload by a queue submission command, or if a signal operation is queued for a shared payload that is already signaled or has a pending signal operation, effects must be limited to one or more of the following:

- Returning `VK_ERROR_INITIALIZATION_FAILED` from the command which resulted in the violation.
- Losing the logical device on which the violation occurred immediately or at a future time, resulting in a `VK_ERROR_DEVICE_LOST` error from subsequent commands, including the one causing the violation.
- Continuing execution of the violating command or operation as if the semaphore wait completed successfully after an implementation-dependent timeout. In this case, the state of the payload becomes undefined, and future operations on semaphores sharing the payload will be subject to these same rules. The semaphore must be destroyed or have its payload replaced by an import operation to again have a well-defined state.
These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared semaphore for more than synchronizing access to the shared memory. For example, a process should not use a shared semaphore as part of an execution dependency chain that, when complete, leads to objects being destroyed, if it does not trust other processes sharing the semaphore payload.

When a semaphore is using an imported payload, its `VkExportSemaphoreCreateInfo::handleTypes` value is specified when creating the semaphore from which the payload was exported, rather than specified when creating the semaphore. Additionally, `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` restricts which handle types can be exported from such a semaphore based on the specific handle type used to import the current payload. Passing a semaphore to `vkAcquireNextImageKHR` is equivalent to temporarily importing a semaphore payload to that semaphore.

Because the exportable handle types of an imported semaphore correspond to its current imported payload, and `vkAcquireNextImageKHR` behaves the same as a temporary import operation for which the source semaphore is opaque to the application, applications have no way of determining whether any external handle types can be exported from a semaphore in this state. Therefore, applications must not attempt to export external handles from semaphores using a temporarily imported payload from `vkAcquireNextImageKHR`.

When importing a semaphore payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations must perform sufficient validation of external handles to ensure that the operation results in a valid semaphore which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its import parameters, and excepting those side effects allowed for violations of the valid semaphore state for wait operations rules. If the external handle provided does not meet these requirements, the implementation must fail the semaphore payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

In addition, when importing a semaphore payload that is not compatible with the payload type corresponding to the `VkSemaphoreType` the semaphore was created with, the implementation may fail the semaphore payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

As the introduction of the external semaphore handle type `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` is preserved for backwards compatibility. However, applications should prefer importing such handle types into semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`. 
To import a semaphore payload from a Windows handle, call:

```c
// Provided by VK_KHR_external_semaphore_win32
VkResult vkImportSemaphoreWin32HandleKHR(
    VkDevice device,
    const VkImportSemaphoreWin32HandleInfoKHR* pImportSemaphoreWin32HandleInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreWin32HandleInfo` is a pointer to a `VkImportSemaphoreWin32HandleInfoKHR` structure specifying the semaphore and import parameters.

Importing a semaphore payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release ownership using the `CloseHandle` system call when the handle is no longer needed.

Applications can import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

### Valid Usage (Implicit)

- VUID-vkImportSemaphoreWin32HandleKHR-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkImportSemaphoreWin32HandleKHR-pImportSemaphoreWin32HandleInfo-parameter
  
  `pImportSemaphoreWin32HandleInfo` must be a valid pointer to a valid `VkImportSemaphoreWin32HandleInfoKHR` structure

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportSemaphoreWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkImportSemaphoreWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkImportSemaphoreWin32HandleInfoKHR;
```
HANDLE
LPCWSTR
} VkImportSemaphoreWin32HandleInfoKHR;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **semaphore** is the semaphore into which the payload will be imported.
• **flags** is a bitmask of VkSemaphoreImportFlagBits specifying additional parameters for the semaphore payload import operation.
• **handleType** is a VkExternalSemaphoreHandleTypeFlagBits value specifying the type of **handle**.
• **handle** is NULL or the external handle to import.
• **name** is NULL or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.

The handle types supported by **handleType** are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
</tbody>
</table>

**Valid Usage**

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01140
  handleType must be a value included in the Handle Types Supported by VkImportSemaphoreWin32HandleInfoKHR table
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01466
  If handleType is not VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT or VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT, name must be NULL
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01467
  If handle is NULL, name must name a valid synchronization primitive of the type specified by handleType
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01468
  If name is NULL, handle must be a valid handle of the type specified by handleType
- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01469
  If handle is not NULL, name must be NULL
• VUID-VkImportSemaphoreWin32HandleInfoKHR-handle-01542
If handle is not NULL, it must obey any requirements listed for handleType in external semaphore handle types compatibility.

• VUID-VkImportSemaphoreWin32HandleInfoKHR-name-01543
If name is not NULL, it must obey any requirements listed for handleType in external semaphore handle types compatibility.

• VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-03261
If handleType is VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT or VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, the VkSemaphoreCreateInfo::flags field must match that of the semaphore from which handle or name was exported.

• VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-03262
If handleType is VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT or VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, the VkSemaphoreTypeCreateInfo::semaphoreType field must match that of the semaphore from which handle or name was exported.

• VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-03322
If flags contains VK_SEMAPHORE_IMPORT_TEMPORARY_BIT, the VkSemaphoreTypeCreateInfo::semaphoreType field of the semaphore from which handle or name was exported must not be VK_SEMAPHORE_TYPE_TIMELINE.

Valid Usage (Implicit)

• VUID-VkImportSemaphoreWin32HandleInfoKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR.

• VUID-VkImportSemaphoreWin32HandleInfoKHR-pNext-pNext
pNext must be NULL.

• VUID-VkImportSemaphoreWin32HandleInfoKHR-semaphore-parameter
semaphore must be a valid VkSemaphore handle.

• VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-parameter
flags must be a valid combination of VkSemaphoreImportFlagBits values.

Host Synchronization

• Host access to semaphore must be externally synchronized.

To import a semaphore payload from a POSIX file descriptor, call:

```c
// Provided by VK_KHR_external_semaphore_fd
VkResult vkImportSemaphoreFdKHR(
    VkDevice device,
    const VkImportSemaphoreFdInfoKHR* pImportSemaphoreFdInfo);
```
• **device** is the logical device that created the semaphore.

• **pImportSemaphoreFdInfo** is a pointer to a `VkImportSemaphoreFdInfoKHR` structure specifying the semaphore and import parameters.

Importing a semaphore payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import.

Applications **can** import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

### Valid Usage

- VUID-vkImportSemaphoreFdKHR-semaphore-01142
  
  semaphore **must** not be associated with any queue command that has not yet completed execution on that queue

### Valid Usage (Implicit)

- VUID-vkImportSemaphoreFdKHR-device-parameter
  
  device **must** be a valid `VkDevice` handle

- VUID-vkImportSemaphoreFdKHR-pImportSemaphoreFdInfo-parameter
  
  `pImportSemaphoreFdInfo` **must** be a valid pointer to a valid `VkImportSemaphoreFdInfoKHR` structure

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportSemaphoreFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkImportSemaphoreFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    int fd;
} VkImportSemaphoreFdInfoKHR;
```
VkImportSemaphoreFdInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **semaphore** is the semaphore into which the payload will be imported.
- **flags** is a bitmask of VkSemaphoreImportFlagBits specifying additional parameters for the semaphore payload import operation.
- **handleType** is a VkExternalSemaphoreHandleTypeFlagBits value specifying the type of fd.
- **fd** is the external handle to import.

The handle types supported by **handleType** are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT</td>
<td>Copy</td>
<td>Temporary</td>
</tr>
</tbody>
</table>

### Valid Usage

- **VUID-VkImportSemaphoreFdInfoKHR-handleType-01143**
  - **handleType** must be a value included in the Handle Types Supported by VkImportSemaphoreFdInfoKHR table
- **VUID-VkImportSemaphoreFdInfoKHR-fd-01544**
  - **fd** must obey any requirements listed for **handleType** in external semaphore handle types compatibility
- **VUID-VkImportSemaphoreFdInfoKHR-handleType-03263**
  - If **handleType** is VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT, the VkSemaphoreCreateInfo::flags field must match that of the semaphore from which fd was exported
- **VUID-VkImportSemaphoreFdInfoKHR-handleType-07307**
  - If **handleType** refers to a handle type with copy payload transference semantics, **flags** must contain VK_SEMAPHORE_IMPORT_TEMPORARY_BIT
- **VUID-VkImportSemaphoreFdInfoKHR-handleType-03264**
  - If **handleType** is VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT, the VkSemaphoreTypeCreateInfo::semaphoreType field must match that of the semaphore from which fd was exported
- **VUID-VkImportSemaphoreFdInfoKHR-flgs-03323**
  - If **flags** contains VK_SEMAPHORE_IMPORT_TEMPORARY_BIT, the VkSemaphoreTypeCreateInfo::semaphoreType field of the semaphore from which fd was exported must not be VK_SEMAPHORE_TYPE_TIMELINE
If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT`, the special value `-1` for `fd` is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the `VkSemaphore` will have a temporarily imported payload as if a valid file descriptor had been provided.

**Note**

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a `-1` file descriptor when exporting a `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT` from a `VkSemaphore` which is signaled.

### Valid Usage (Implicit)

- **VUID-VkImportSemaphoreFdInfoKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_FD_INFO_KHR`
- **VUID-VkImportSemaphoreFdInfoKHR-pNext-pNext**
  - `pNext` must be NULL
- **VUID-VkImportSemaphoreFdInfoKHR-semaphore-parameter**
  - `semaphore` must be a valid `VkSemaphore` handle
- **VUID-VkImportSemaphoreFdInfoKHR-flags-parameter**
  - `flags` must be a valid combination of `VkSemaphoreImportFlagBits` values
- **VUID-VkImportSemaphoreFdInfoKHR-handleType-parameter**
  - `handleType` must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

### Host Synchronization

- Host access to `semaphore` must be externally synchronized

To import a semaphore payload from a Zircon event handle, call:

```c
// Provided by VK_FUCHSIA_external_semaphore
VkResult vkImportSemaphoreZirconHandleFUCHSIA(
    VkDevice device,
    const VkImportSemaphoreZirconHandleInfoFUCHSIA* pImportSemaphoreZirconHandleInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreZirconHandleInfo` is a pointer to a `VkImportSemaphoreZirconHandleInfoFUCHSIA` structure specifying the semaphore and import parameters.

Importing a semaphore payload from a Zircon event handle transfers ownership of the handle
from the application to the Vulkan implementation. The application must not perform any operations on the handle after a successful import.

Applications can import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

### Valid Usage

- VUID-vkImportSemaphoreZirconHandleFUCHSIA-semaphore-04764

  semaphore must not be associated with any queue command that has not yet completed execution on that queue

### Valid Usage (Implicit)

- VUID-vkImportSemaphoreZirconHandleFUCHSIA-device-parameter

  device must be a valid VkDevice handle

- VUID-vkImportSemaphoreZirconHandleFUCHSIA-pImportSemaphoreZirconHandleInfo-parameter

  pImportSemaphoreZirconHandleInfo must be a valid pointer to a valid VkImportSemaphoreZirconHandleInfoFUCHSIA structure

### Return Codes

#### Success

- VK_SUCCESS

#### Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkImportSemaphoreZirconHandleInfoFUCHSIA structure is defined as:

```c
// Provided by VK_FUCHSIA_external_semaphore
typedef struct VkImportSemaphoreZirconHandleInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    zx_handle_t zirconHandle;
} VkImportSemaphoreZirconHandleInfoFUCHSIA;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
• **semaphore** is the semaphore into which the payload will be imported.

• **flags** is a bitmask of **VkSemaphoreImportFlagBits** specifying additional parameters for the semaphore payload import operation.

• **handleType** is a **VkExternalSemaphoreHandleTypeFlagBits** value specifying the type of zirconHandle.

• **zirconHandle** is the external handle to import.

The handle types supported by **handleType** are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA</td>
<td>Reference</td>
<td>Temporary, Permanent</td>
</tr>
</tbody>
</table>

**Valid Usage**

- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-handleType-04765
  - **handleType** must be a value included in the Handle Types Supported by VkImportSemaphoreZirconHandleInfoFUCHSIA table

- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-zirconHandle-04766
  - **zirconHandle** must obey any requirements listed for **handleType** in external semaphore handle types compatibility

- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-zirconHandle-04767
  - **zirconHandle** must have ZX_RIGHTS_BASIC and ZX_RIGHTS_SIGNAL rights

- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-sType-04768
  - The **VkSemaphoreTypeCreateInfo::semaphoreType** field must not be VK_SEMAPHORE_TYPE_TIMELINE

**Valid Usage (Implicit)**

- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-sType-sType
  - **sType** must be VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_ZIRCON_HANDLE_INFO_FUCHSIA

- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-pNext-pNext
  - **pNext** must be NULL

- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-semaphore-parameter
  - **semaphore** must be a valid **VkSemaphore** handle

- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-flags-parameter
  - **flags** must be a valid combination of **VkSemaphoreImportFlagBits** values

- VUID-VkImportSemaphoreZirconHandleInfoFUCHSIA-handleType-parameter
  - **handleType** must be a valid **VkExternalSemaphoreHandleTypeFlagBits** value
Host Synchronization

- Host access to semaphore must be externally synchronized

Bits which can be set in

- `VkImportSemaphoreWin32HandleInfoKHR::flags`
- `VkImportSemaphoreFdInfoKHR::flags`
- `VkImportSemaphoreZirconHandleInfoFUCHSIA::flags`

specifying additional parameters of a semaphore import operation are:

```cpp
// Provided by VK_VERSION_1_1
typedef enum VkSemaphoreImportFlagBits {
    VK_SEMAPHORE_IMPORT_TEMPORARY_BIT = 0x00000001,
    // Provided by VK_KHR_external_semaphore
    VK_SEMAPHORE_IMPORT_TEMPORARY_BIT_KHR = VK_SEMAPHORE_IMPORT_TEMPORARY_BIT,
} VkSemaphoreImportFlagBits;
```

or the equivalent

```cpp
// Provided by VK_KHR_external_semaphore
typedef VkSemaphoreImportFlagBits VkSemaphoreImportFlagBitsKHR;
```

These bits have the following meanings:

- `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT` specifies that the semaphore payload will be imported only temporarily, as described in Importing Semaphore Payloads, regardless of the permanence of `handleType`.

```cpp
// Provided by VK_VERSION_1_1
typedef VkFlags VkSemaphoreImportFlags;
```

or the equivalent

```cpp
// Provided by VK_KHR_external_semaphore
typedef VkSemaphoreImportFlags VkSemaphoreImportFlagsKHR;
```

`VkSemaphoreImportFlags` is a bitmask type for setting a mask of zero or more `VkSemaphoreImportFlagBits`. 
7.5. Events

Events are a synchronization primitive that can be used to insert a fine-grained dependency between commands submitted to the same queue, or between the host and a queue. Events must not be used to insert a dependency between commands submitted to different queues. Events have two states - signaled and unsignaled. An application can signal or unsignal an event either on the host or on the device. A device can be made to wait for an event to become signaled before executing further operations. No command exists to wait for an event to become signaled on the host, but the current state of an event can be queried.

Events are represented by VkEvent handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkEvent)
```

To create an event, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateEvent(
    VkDevice device,
    const VkEventCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkEvent* pEvent);
```

- `device` is the logical device that creates the event.
- `pCreateInfo` is a pointer to a VkEventCreateInfo structure containing information about how the event is to be created.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pEvent` is a pointer to a handle in which the resulting event object is returned.

When created, the event object is in the unsignaled state.

**Valid Usage**

- VUID-vkCreateEvent-events-04468
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::events is VK_FALSE, then the implementation does not support events, and vkCreateEvent must not be used

**Valid Usage (Implicit)**

- VUID-vkCreateEvent-device-parameter
  `device` must be a valid VkDevice handle
- VUID-vkCreateEvent-pCreateInfo-parameter
**pCreateInfo** must be a valid pointer to a valid **VkEventCreateInfo** structure

- **VUID-vkCreateEvent-pAllocator-parameter**
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- **VUID-vkCreateEvent-pEvent-parameter**
  **pEvent** must be a valid pointer to a **VkEvent** handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The **VkEventCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkEventCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkEventCreateFlags flags;
} VkEventCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkEventCreateFlagBits** defining additional creation parameters.

### Valid Usage

- **VUID-VkEventCreateInfo-pNext-06790**
  If the **pNext** chain includes a **VkExportMetalObjectCreateInfoEXT** structure, its **exportObjectType** member must be **VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT**.

### Valid Usage (Implicit)

- **VUID-VkEventCreateInfo-sType-sType**
  **sType** must be **VK_STRUCTURE_TYPE_EVENT_CREATE_INFO**

- **VUID-VkEventCreateInfo-pNext-pNext**
  Each **pNext** member of any structure (including this one) in the **pNext** chain must be either
or a pointer to a valid instance of `VkExportMetalObjectCreateInfoEXT` or `VkImportMetalSharedEventInfoEXT`

- **VUID-VkEventCreateInfo-sType-unique**
  The `sType` value of each struct in the `pNext` chain **must** be unique, with the exception of structures of type `VkExportMetalObjectCreateInfoEXT`

- **VUID-VkEventCreateInfo-flags-parameter**
  `flags` **must** be a valid combination of `VkEventCreateFlagBits` values

```c
// Provided by VK_VERSION_1_0
typedef enum VkEventCreateFlagBits {
    // Provided by VK_VERSION_1_3
    VK_EVENT_CREATE_DEVICE_ONLY_BIT = 0x00000001,
    // Provided by VK_KHR_synchronization2
    VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR = VK_EVENT_CREATE_DEVICE_ONLY_BIT,
} VkEventCreateFlagBits;
```

- **`VK_EVENT_CREATE_DEVICE_ONLY_BIT`** specifies that host event commands will not be used with this event.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkEventCreateFlags;
```

`VkEventCreateFlags` is a bitmask type for setting a mask of `VkEventCreateFlagBits`.

To destroy an event, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyEvent(
    VkDevice device,  // The logical device that destroys the event.
    VkEvent event,    // The handle of the event to destroy.
    const VkAllocationCallbacks* pAllocator);  // Controls host memory allocation as described in the Memory Allocation chapter.
```

- **`device`** is the logical device that destroys the event.
- **`event`** is the handle of the event to destroy.
- **`pAllocator`** controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- **VUID-vkDestroyEvent-event-01145**
  All submitted commands that refer to `event` **must** have completed execution

- **VUID-vkDestroyEvent-event-01146**
  If `VkAllocationCallbacks` were provided when `event` was created, a compatible set of callbacks **must** be provided here
• VUID-vkDestroyEvent-event-01147
  If no VkAllocationCallbacks were provided when event was created, pAllocator must be NULL.

Valid Usage (Implicit)

• VUID-vkDestroyEvent-device-parameter
device must be a valid VkDevice handle

• VUID-vkDestroyEvent-event-parameter
If event is not VK_NULL_HANDLE, event must be a valid VkEvent handle

• VUID-vkDestroyEvent-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkDestroyEvent-event-parent
If event is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to event must be externally synchronized

To query the state of an event from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetEventStatus(
    VkDevice device,
    VkEvent event);
```

• device is the logical device that owns the event.

• event is the handle of the event to query.

Upon success, vkGetEventStatus returns the state of the event object with the following return codes:

Table 11. Event Object Status Codes

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EVENT_SET</td>
<td>The event specified by event is signaled.</td>
</tr>
<tr>
<td>VK_EVENT_RESET</td>
<td>The event specified by event is unsignaled.</td>
</tr>
</tbody>
</table>

If a vkCmdSetEvent or vkCmdResetEvent command is in a command buffer that is in the pending state, then the value returned by this command may immediately be out of date.
The state of an event can be updated by the host. The state of the event is immediately changed, and subsequent calls to `vkGetEventStatus` will return the new state. If an event is already in the requested state, then updating it to the same state has no effect.

Valid Usage

- VUID-vkGetEventStatus-event-03940
  event must not have been created with `VKEVENTCREATEDEVICEONLY_BIT`

Valid Usage (Implicit)

- VUID-vkGetEventStatus-device-parameter
device must be a valid `VkDevice` handle
- VUID-vkGetEventStatus-event-parameter
event must be a valid `VkEvent` handle
- VUID-vkGetEventStatus-event-parent
event must have been created, allocated, or retrieved from device

Return Codes

Success

- `VK_EVENT_SET`
- `VK_EVENT_RESET`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

To set the state of an event to signaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkSetEvent(
  VkDevice device,
  VkEvent event);
```

- `device` is the logical device that owns the event.
- `event` is the event to set.

When `vkSetEvent` is executed on the host, it defines an event signal operation which sets the event to the signaled state.
If event is already in the signaled state when vkSetEvent is executed, then vkSetEvent has no effect, and no event signal operation occurs.

Valid Usage

- VUID-vkSetEvent-event-03941
  event must not have been created with VK_EVENT_CREATE_DEVICE_ONLY_BIT

Valid Usage (Implicit)

- VUID-vkSetEvent-device-parameter
device must be a valid VkDevice handle

- VUID-vkSetEvent-event-parameter
event must be a valid VkEvent handle

- VUID-vkSetEvent-event-parent
event must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to event must be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To set the state of an event to unsignaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetEvent(
    VkDevice device,
    VkEvent event);
```

- device is the logical device that owns the event.
- event is the event to reset.

When vkResetEvent is executed on the host, it defines an event unsignal operation which resets the event to the unsignaled state.
If \textit{event} is already in the unsignaled state when \texttt{vkResetEvent} is executed, then \texttt{vkResetEvent} has no effect, and no event unsignal operation occurs.

### Valid Usage

- VUID-vkResetEvent-event-03821
  There \textbf{must} be an execution dependency between \texttt{vkResetEvent} and the execution of any \texttt{vkCmdWaitEvents} that includes \texttt{event} in its \texttt{pEvents} parameter

- VUID-vkResetEvent-event-03822
  There \textbf{must} be an execution dependency between \texttt{vkResetEvent} and the execution of any \texttt{vkCmdWaitEvents2} that includes \texttt{event} in its \texttt{pEvents} parameter

- VUID-vkResetEvent-event-03823
  \texttt{event} \textbf{must} not have been created with \texttt{VK_EVENT_CREATE_DEVICE_ONLY_BIT}

### Valid Usage (Implicit)

- VUID-vkResetEvent-device-parameter
  \texttt{device} \textbf{must} be a valid \texttt{VkDevice} handle

- VUID-vkResetEvent-event-parameter
  \texttt{event} \textbf{must} be a valid \texttt{VkEvent} handle

- VUID-vkResetEvent-event-parent
  \texttt{event} \textbf{must} have been created, allocated, or retrieved from \texttt{device}

### Host Synchronization

- Host access to \texttt{event} \textbf{must} be externally synchronized

### Return Codes

**Success**
- \texttt{VK_SUCCESS}

**Failure**
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}

The state of an event \textbf{can} also be updated on the device by commands inserted in command buffers.

To signal an event from a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetEvent2(
```
or the equivalent command

```c
void vkCmdSetEvent2KHR(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    const VkDependencyInfo* pDependencyInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be signaled.
- `pDependencyInfo` is a pointer to a `VkDependencyInfo` structure defining the first scopes of this operation.

When `vkCmdSetEvent2` is submitted to a queue, it defines the first half of memory dependencies defined by `pDependencyInfo`, as well as an event signal operation which sets the event to the signaled state. A memory dependency is defined between the event signal operation and commands that occur earlier in submission order.

The first synchronization scope and access scope are defined by the union of all the memory dependencies defined by `pDependencyInfo`, and are applied to all operations that occur earlier in submission order. Queue family ownership transfers and image layout transitions defined by `pDependencyInfo` are also included in the first scopes.

The second synchronization scope includes only the event signal operation, and any queue family ownership transfers and image layout transitions defined by `pDependencyInfo`.

The second access scope includes only queue family ownership transfers and image layout transitions.

Future `vkCmdWaitEvents2` commands rely on all values of each element in `pDependencyInfo` matching exactly with those used to signal the corresponding event. `vkCmdWaitEvents` must not be used to wait on the result of a signal operation defined by `vkCmdSetEvent2`.

---

**Note**

The extra information provided by `vkCmdSetEvent2` compared to `vkCmdSetEvent` allows implementations to more efficiently schedule the operations required to satisfy the requested dependencies. With `vkCmdSetEvent`, the full dependency information is not known until `vkCmdWaitEvents` is recorded, forcing implementations to insert the required operations at that point and not before.

If `event` is already in the signaled state when `vkCmdSetEvent2` is executed on the device, then `vkCmdSetEvent2` has no effect, no event signal operation occurs, and no dependency is generated.
Valid Usage

- VUID-vkCmdSetEvent2-synchronization2-03824
  The synchronization2 feature must be enabled

- VUID-vkCmdSetEvent2-dependencyFlags-03825
  The dependencyFlags member of pDependencyInfo must be 0

- VUID-vkCmdSetEvent2-commandBuffer-03826
  The current device mask of commandBuffer must include exactly one physical device

- VUID-vkCmdSetEvent2-srcStageMask-03827
  The srcStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfo must only include pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from

- VUID-vkCmdSetEvent2-dstStageMask-03828
  The dstStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfo must only include pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from

Valid Usage (Implicit)

- VUID-vkCmdSetEvent2-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetEvent2-event-parameter
  event must be a valid VkEvent handle

- VUID-vkCmdSetEvent2-pDependencyInfo-parameter
  pDependencyInfo must be a valid pointer to a valid VkDependencyInfo structure

- VUID-vkCmdSetEvent2-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetEvent2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdSetEvent2-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdSetEvent2-commonparent
  Both of commandBuffer, and event must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Both</td>
<td>Graphics</td>
<td>Synchronization</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Decode</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Encode</td>
<td></td>
</tr>
</tbody>
</table>

The `VkDependencyInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDependencyInfo {
    VkStructureType sType;
    const void* pNext;
    VkDependencyFlags dependencyFlags;
    uint32_t memoryBarrierCount;
    const VkMemoryBarrier2* pMemoryBarriers;
    uint32_t pBufferMemoryBarrierCount;
    const VkBufferMemoryBarrier2* pBufferMemoryBarriers;
    uint32_t imageMemoryBarrierCount;
    const VkImageMemoryBarrier2* pImageMemoryBarriers;
} VkDependencyInfo;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkDependencyInfo VkDependencyInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier2` structures defining memory dependencies between any memory accesses.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier2` structures defining memory dependencies between buffer ranges.
• `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.

• `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier2` structures defining memory dependencies between image subresources.

This structure defines a set of memory dependencies, as well as queue family transfer operations and image layout transitions.

Each member of `pMemoryBarriers`, `pBufferMemoryBarriers`, and `pImageMemoryBarriers` defines a separate memory dependency.

### Valid Usage (Implicit)

- VUID-VkDependencyInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_DEPENDENCY_INFO`

- VUID-VkDependencyInfo-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkDependencyInfo-dependencyFlags-parameter
  
  `dependencyFlags` must be a valid combination of `VkDependencyFlagBits` values

- VUID-VkDependencyInfo-pMemoryBarriers-parameter
  
  If `memoryBarrierCount` is not 0, `pMemoryBarriers` must be a valid pointer to an array of `VkMemoryBarrier2` structures

- VUID-VkDependencyInfo-pBufferMemoryBarriers-parameter
  
  If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` must be a valid pointer to an array of `VkBufferMemoryBarrier2` structures

- VUID-VkDependencyInfo-pImageMemoryBarriers-parameter
  
  If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` must be a valid pointer to an array of `VkImageMemoryBarrier2` structures

To set the state of an event to signaled from a device, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetEvent(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be signaled.
- `stageMask` specifies the source stage mask used to determine the first synchronization scope.

`vkCmdSetEvent` behaves identically to `vkCmdSetEvent2`, except that it does not define an access scope, and must only be used with `vkCmdWaitEvents`, not `vkCmdWaitEvents2`. 
Valid Usage

- VUID-vkCmdSetEvent-stageMask-04090
  If the geometryShader feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- VUID-vkCmdSetEvent-stageMask-04091
  If the tessellationShader feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or
  VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-vkCmdSetEvent-stageMask-04092
  If the conditionalRendering feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

- VUID-vkCmdSetEvent-stageMask-04093
  If the fragmentDensityMap feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

- VUID-vkCmdSetEvent-stageMask-04094
  If the transformFeedback feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

- VUID-vkCmdSetEvent-stageMask-04095
  If the meshShader feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT

- VUID-vkCmdSetEvent-stageMask-04096
  If the taskShader feature is not enabled, stageMask must not contain
  VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

- VUID-vkCmdSetEvent-shadingRateImage-07318
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, stageMask
  must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdSetEvent-stageMask-03937
  stageMask must not include VK_PIPELINE_STAGE_HOST_BIT

- VUID-vkCmdSetEvent-commandBuffer-01152
  commandBuffer’s current device mask must include exactly one physical device

Valid Usage (Implicit)

- VUID-vkCmdSetEvent-commandBuffer-parameter
**commandBuffer** must be a valid VkCommandBuffer handle

- VUID-vkCmdSetEvent-event-parameter
  event must be a valid VkEvent handle

- VUID-vkCmdSetEvent-stageMask-parameter
  stageMask must be a valid combination of VkPipelineStageFlagBits values

- VUID-vkCmdSetEvent-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetEvent-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdSetEvent-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdSetEvent-commonparent
  Both of commandBuffer, and event must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Both</td>
<td>Graphics, Compute, Decode, Encode</td>
<td>Synchronization</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To unsignal the event from a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdResetEvent2(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags2 stageMask);
```
// Provided by VK_KHR_synchronization2
void vkCmdResetEvent2KHR(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags2 stageMask);

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be unsignaled.
- `stageMask` is a `VkPipelineStageFlags2` mask of pipeline stages used to determine the first synchronization scope.

When `vkCmdResetEvent2` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and defines an event unsignal operation which resets the event to the unsignaled state.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations by `stageMask` or stages that are logically earlier than `stageMask`.

The second synchronization scope includes only the event unsignal operation.

If `event` is already in the unsignaled state when `vkCmdResetEvent2` is executed on the device, then this command has no effect, no event unsignal operation occurs, and no execution dependency is generated.

### Valid Usage

- **VUID-vkCmdResetEvent2-stageMask-03929**
  If the `geometryShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- **VUID-vkCmdResetEvent2-stageMask-03930**
  If the `tessellationShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-vkCmdResetEvent2-stageMask-03931**
  If the `conditionalRendering` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-vkCmdResetEvent2-stageMask-03932**
  If the `fragmentDensityMap` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-vkCmdResetEvent2-stageMask-03933**
  If the `transformFeedback` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-vkCmdResetEvent2-stageMask-03934**
  If the `meshShader` feature is not enabled, `stageMask` must not contain
VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT

- VUID-vkCmdResetEvent2-stageMask-03935
  If the taskShader feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT

- VUID-vkCmdResetEvent2-shadingRateImage-07316
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, stageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdResetEvent2-stageMask-04957
  If the subpassShading feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI

- VUID-vkCmdResetEvent2-stageMask-04995
  If the invocationMask feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI

- VUID-vkCmdResetEvent2-synchronization2-03829
  The synchronization2 feature must be enabled

- VUID-vkCmdResetEvent2-stageMask-03830
  stageMask must not include VK_PIPELINE_STAGE_2_HOST_BIT

- VUID-vkCmdResetEvent2-event-03831
  There must be an execution dependency between vkCmdResetEvent2 and the execution of any vkCmdWaitEvents that includes event in its pEvents parameter

- VUID-vkCmdResetEvent2-event-03832
  There must be an execution dependency between vkCmdResetEvent2 and the execution of any vkCmdWaitEvents2 that includes event in its pEvents parameter

- VUID-vkCmdResetEvent2-commandBuffer-03833
  commandBuffer’s current device mask must include exactly one physical device

Valid Usage (Implicit)

- VUID-vkCmdResetEvent2-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdResetEvent2-event-parameter
  event must be a valid VkEvent handle

- VUID-vkCmdResetEvent2-stageMask-parameter
  stageMask must be a valid combination of VkPipelineStageFlagBits2 values

- VUID-vkCmdResetEvent2-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdResetEvent2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdResetEvent2-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdResetEvent2-commonparent
  Both of commandBuffer, and event must have been created, allocated, or retrieved from the same VkDevice

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Both</td>
<td>Graphics, Compute, Decode, Encode</td>
<td>Synchronization</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To set the state of an event to unsignaled from a device, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdResetEvent(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags stageMask);
```

- commandBuffer is the command buffer into which the command is recorded.
- event is the event that will be unsignaled.
- stageMask is a bitmask of VkPipelineStageFlagBits specifying the source stage mask used to determine when the event is unsignaled.

vkCmdResetEvent behaves identically to vkCmdResetEvent2.

**Valid Usage**

- VUID-vkCmdResetEvent-stageMask-04090
  If the geometryShader feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-vkCmdResetEvent-stageMask-04091
  If the tessellationShader feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or
If the conditionalRendering feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT.

If the fragmentDensityMap feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT.

If the transformFeedback feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT.

If the meshShader feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT.

If the taskShader feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT.

If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, stageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR.

If the synchronization2 feature is not enabled, stageMask must not be 0.

Any pipeline stage included in stageMask must be supported by the capabilities of the queue family specified by the queueFamilyIndex member of the VkCommandPoolCreateInfo structure that was used to create the VkCommandPool that commandBuffer was allocated from, as specified in the table of supported pipeline stages.

stageMask must not include VK_PIPELINE_STAGE_HOST_BIT.

There must be an execution dependency between vkCmdResetEvent and the execution of any vkCmdWaitEvents that includes event in its pEvents parameter.

There must be an execution dependency between vkCmdResetEvent and the execution of any vkCmdWaitEvents2 that includes event in its pEvents parameter.

commandBuffer’s current device mask must include exactly one physical device.

Valid Usage (Implicit)

commandBuffer must be a valid VkCommandBuffer handle.
**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Outside</td>
<td>Both</td>
<td>Graphics Compute</td>
<td>Synchronization</td>
</tr>
</tbody>
</table>

To wait for one or more events to enter the signaled state on a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdWaitEvents2(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    const VkDependencyInfo* pDependencyInfos);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
```
void vkCmdWaitEvents2KHR(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    const VkDependencyInfo* pDependencyInfos);

- `commandBuffer` is the command buffer into which the command is recorded.
- `eventCount` is the length of the `pEvents` array.
- `pEvents` is a pointer to an array of `eventCount` events to wait on.
- `pDependencyInfos` is a pointer to an array of `eventCount` `VkDependencyInfo` structures, defining the second synchronization scope.

When `vkCmdWaitEvents2` is submitted to a queue, it inserts memory dependencies according to the elements of `pDependencyInfos` and each corresponding element of `pEvents`. `vkCmdWaitEvents2` must not be used to wait on event signal operations occurring on other queues, or signal operations executed by `vkCmdSetEvent`.

The first synchronization scope and access scope of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred earlier in submission order than the last event signal operation on element `i` of `pEvents`.

Signal operations for an event at index `i` are only included if:

- The event was signaled by a `vkCmdSetEvent2` command that occurred earlier in submission order with a `dependencyInfo` parameter exactly equal to the element of `pDependencyInfos` at index `i`; or
- The event was created without `VK_EVENT_CREATE_DEVICE_ONLY_BIT`, and the first synchronization scope defined by the element of `pDependencyInfos` at index `i` only includes host operations (`VK_PIPELINE_STAGE_2_HOST_BIT`).

The second synchronization scope and access scope of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred later in submission order than `vkCmdWaitEvents2`.

**Note**
`vkCmdWaitEvents2` is used with `vkCmdSetEvent2` to define a memory dependency between two sets of action commands, roughly in the same way as pipeline barriers, but split into two commands such that work between the two may execute unhindered.

**Note**
Applications should be careful to avoid race conditions when using events. There is no direct ordering guarantee between `vkCmdSetEvent2` and `vkCmdResetEvent2`, `vkCmdResetEvent`, or `vkCmdSetEvent`. Another execution dependency (e.g. a pipeline barrier or semaphore with `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`) is needed to prevent such a race condition.
Valid Usage

- VUID-vkCmdWaitEvents2-synchronization2-03836
  The synchronization2 feature must be enabled

- VUID-vkCmdWaitEvents2-pEvents-03837
  Members of pEvents must not have been signaled by vkCmdSetEvent

- VUID-vkCmdWaitEvents2-pEvents-03838
  For any element i of pEvents, if that event is signaled by vkCmdSetEvent2, that command's dependencyInfo parameter must be exactly equal to the ith element of pDependencyInfos

- VUID-vkCmdWaitEvents2-pEvents-03839
  For any element i of pEvents, if that event is signaled by vkSetEvent, barriers in the ith element of pDependencyInfos must include only host operations in their first synchronization scope

- VUID-vkCmdWaitEvents2-pEvents-03840
  For any element i of pEvents, if barriers in the ith element of pDependencyInfos include only host operations, the ith element of pEvents must be signaled before vkCmdWaitEvents2 is executed

- VUID-vkCmdWaitEvents2-pEvents-03841
  For any element i of pEvents, if barriers in the ith element of pDependencyInfos do not include host operations, the ith element of pEvents must be signaled by a corresponding vkCmdSetEvent2 that occurred earlier in submission order

- VUID-vkCmdWaitEvents2-srcStageMask-03842
  The srcStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfos must either include only pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from, or include only VK_PIPELINE_STAGE_2_HOST_BIT

- VUID-vkCmdWaitEvents2-dstStageMask-03843
  The dstStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfos must only include pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from

- VUID-vkCmdWaitEvents2-dependencyFlags-03844
  If vkCmdWaitEvents2 is being called inside a render pass instance, the srcStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfos must not include VK_PIPELINE_STAGE_2_HOST_BIT

- VUID-vkCmdWaitEvents2-commandBuffer-03846
  commandBuffer's current device mask must include exactly one physical device

Valid Usage (Implicit)

- VUID-vkCmdWaitEvents2-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
• VUID-vkCmdWaitEvents2-pEvents-parameter
  \texttt{pEvents} must be a valid pointer to an array of \texttt{eventCount} valid \texttt{VkEvent} handles

• VUID-vkCmdWaitEvents2-pDependencyInfos-parameter
  \texttt{pDependencyInfos} must be a valid pointer to an array of \texttt{eventCount} valid \texttt{VkDependencyInfo} structures

• VUID-vkCmdWaitEvents2-commandBuffer-recording
  \texttt{commandBuffer} must be in the \texttt{recording} state

• VUID-vkCmdWaitEvents2-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics, compute, decode, or encode operations

• VUID-vkCmdWaitEvents2-eventCount-arraylength
  \texttt{eventCount} must be greater than 0

• VUID-vkCmdWaitEvents2-commonparent
  Both of \texttt{commandBuffer}, and the elements of \texttt{pEvents} must have been created, allocated, or retrieved from the same \texttt{VkDevice}

---

**Host Synchronization**

• Host access to \texttt{commandBuffer} must be externally synchronized

• Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Both</td>
<td>Graphics, Compute, Decode, Encode</td>
<td>Synchronization</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To wait for one or more events to enter the signaled state on a device, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdWaitEvents(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    VkPipelineStageFlags srcStageMask,
    VkPipelineStageFlags dstStageMask,
    uint32_t memoryBarrierCount,
    const VkMemoryBarrier* pMemoryBarriers,
```
• `commandBuffer` is the command buffer into which the command is recorded.
• `eventCount` is the length of the `pEvents` array.
• `pEvents` is a pointer to an array of event object handles to wait on.
• `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the source stage mask.
• `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the destination stage mask.
• `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
• `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier` structures.
• `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
• `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier` structures.
• `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
• `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier` structures.

`vkCmdWaitEvents` is largely similar to `vkCmdWaitEvents2`, but can only wait on signal operations defined by `vkCmdSetEvent`. As `vkCmdSetEvent` does not define any access scopes, `vkCmdWaitEvents` defines the first access scope for each event signal operation in addition to its own access scopes.

**Note**
Since `vkCmdSetEvent` does not have any dependency information beyond a stage mask, implementations do not have the same opportunity to perform availability and visibility operations or image layout transitions in advance as they do with `vkCmdSetEvent2` and `vkCmdWaitEvents2`.

When `vkCmdWaitEvents` is submitted to a queue, it defines a memory dependency between prior event signal operations on the same queue or the host, and subsequent commands. `vkCmdWaitEvents` must not be used to wait on event signal operations occurring on other queues.

The first synchronization scope only includes event signal operations that operate on members of `pEvents`, and the operations that happened-before the event signal operations. Event signal operations performed by `vkCmdSetEvent` that occur earlier in submission order are included in the first synchronization scope, if the logically latest pipeline stage in their `stageMask` parameter is logically earlier than or equal to the logically latest pipeline stage in `srcStageMask`. Event signal operations performed by `vkSetEvent` are only included in the first synchronization scope if `VK_PIPELINE_STAGE_HOST_BIT` is included in `srcStageMask`.

The second synchronization scope includes all commands that occur later in submission order. The second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by `dstStageMask`.

The first access scope is limited to accesses in the pipeline stages determined by the source stage mask.
mask specified by srcStageMask. Within that, the first access scope only includes the first access scopes defined by elements of the pMemoryBarriers, pBufferMemoryBarriers and pImageMemoryBarriers arrays, which each define a set of memory barriers. If no memory barriers are specified, then the first access scope includes no accesses.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by dstStageMask. Within that, the second access scope only includes the second access scopes defined by elements of the pMemoryBarriers, pBufferMemoryBarriers and pImageMemoryBarriers arrays, which each define a set of memory barriers. If no memory barriers are specified, then the second access scope includes no accesses.

### Valid Usage

- **VUID-vkCmdWaitEvents-srcStageMask-04090**
  If the geometryShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- **VUID-vkCmdWaitEvents-srcStageMask-04091**
  If the tessellationShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- **VUID-vkCmdWaitEvents-srcStageMask-04092**
  If the conditionalRendering feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

- **VUID-vkCmdWaitEvents-srcStageMask-04093**
  If the fragmentDensityMap feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

- **VUID-vkCmdWaitEvents-srcStageMask-04094**
  If the transformFeedback feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

- **VUID-vkCmdWaitEvents-srcStageMask-04095**
  If the meshShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT

- **VUID-vkCmdWaitEvents-srcStageMask-04096**
  If the taskShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

- **VUID-vkCmdWaitEvents-shadingRateImage-07318**
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, srcStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- **VUID-vkCmdWaitEvents-srcStageMask-03937**
  If the synchronization2 feature is not enabled, srcStageMask must not be 0

- **VUID-vkCmdWaitEvents-dstStageMask-04090**
  If the geometryShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT
If the tessellationShader feature is not enabled, dstStageMask must not contain
VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or
VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

If the conditionalRendering feature is not enabled, dstStageMask must not contain
VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

If the fragmentDensityMap feature is not enabled, dstStageMask must not contain
VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

If the transformFeedback feature is not enabled, dstStageMask must not contain
VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

If the meshShader feature is not enabled, dstStageMask must not contain
VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT

If the taskShader feature is not enabled, dstStageMask must not contain
VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

If neither the shadingRateImage or attachmentFragmentShadingRate are enabled,
dstStageMask must not contain
VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

If the synchronization2 feature is not enabled, dstStageMask must not be 0

The srcAccessMask member of each element of pMemoryBarriers must only include access
flags that are supported by one or more of the pipeline stages in srcStageMask, as specified
in the table of supported access types

The dstAccessMask member of each element of pMemoryBarriers must only include access
flags that are supported by one or more of the pipeline stages in dstStageMask, as specified
in the table of supported access types

For any element of pBufferMemoryBarriers, if its srcQueueFamilyIndex and
dstQueueFamilyIndex members are equal, or if its srcQueueFamilyIndex is the queue family
index that was used to create the command pool that commandBuffer was allocated from,
then its srcAccessMask member must only contain access flags that are supported by one
or more of the pipeline stages in srcStageMask, as specified in the table of supported access
types

For any element of pBufferMemoryBarriers, if its srcQueueFamilyIndex and
dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family
index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

- **VUID-vkCmdWaitEvents-pImageMemoryBarriers-02819**
  For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the table of supported access types.

- **VUID-vkCmdWaitEvents-pImageMemoryBarriers-02820**
  For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

- **VUID-vkCmdWaitEvents-srcStageMask-06459**
  Any pipeline stage included in `srcStageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages.

- **VUID-vkCmdWaitEvents-dstStageMask-06460**
  Any pipeline stage included in `dstStageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages.

- **VUID-vkCmdWaitEvents-srcStageMask-01158**
  `srcStageMask` must be the bitwise OR of the `stageMask` parameter used in previous calls to `vkCmdSetEvent` with any of the elements of `pEvents` and `VK_PIPELINE_STAGE_HOST_BIT` if any of the elements of `pEvents` was set using `vkSetEvent`.

- **VUID-vkCmdWaitEvents-srcQueueFamilyIndex-02803**
  The `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any element of `pBufferMemoryBarriers` or `pImageMemoryBarriers` must be equal.

- **VUID-vkCmdWaitEvents-commandBuffer-01167**
  `commandBuffer`'s current device mask must include exactly one physical device.

- **VUID-vkCmdWaitEvents-pEvents-03847**
  Elements of `pEvents` must not have been signaled by `vkCmdSetEvent2`.
Valid Usage (Implicit)

- VUID-vkCmdWaitEvents-commandBuffer-parameter
  
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdWaitEvents-pEvents-parameter
  
  pEvents must be a valid pointer to an array of eventCount valid VkEvent handles

- VUID-vkCmdWaitEvents-srcStageMask-parameter
  
  srcStageMask must be a valid combination of VkPipelineStageFlagBits values

- VUID-vkCmdWaitEvents-dstStageMask-parameter
  
  dstStageMask must be a valid combination of VkPipelineStageFlagBits values

- VUID-vkCmdWaitEvents-pMemoryBarriers-parameter
  
  If memoryBarrierCount is not 0, pMemoryBarriers must be a valid pointer to an array of memoryBarrierCount valid VkMemoryBarrier structures

- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-parameter
  
  If bufferMemoryBarrierCount is not 0, pBufferMemoryBarriers must be a valid pointer to an array of bufferMemoryBarrierCount valid VkBufferMemoryBarrier structures

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-parameter
  
  If imageMemoryBarrierCount is not 0, pImageMemoryBarriers must be a valid pointer to an array of imageMemoryBarrierCount valid VkImageMemoryBarrier structures

- VUID-vkCmdWaitEvents-commandBuffer-recording
  
  commandBuffer must be in the recording state

- VUID-vkCmdWaitEvents-commandBuffer-cmdpool
  
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdWaitEvents-eventCount-arraylength
  
  eventCount must be greater than 0

- VUID-vkCmdWaitEvents-commonparent
  
  Both of commandBuffer, and the elements of pEvents must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
7.6. Pipeline Barriers

To record a pipeline barrier, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdPipelineBarrier2(
    VkCommandBuffer commandBuffer,
    const VkDependencyInfo* pDependencyInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdPipelineBarrier2KHR(
    VkCommandBuffer commandBuffer,
    const VkDependencyInfo* pDependencyInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pDependencyInfo` is a pointer to a `VkDependencyInfo` structure defining the scopes of this operation.

When `vkCmdPipelineBarrier2` is submitted to a queue, it defines memory dependencies between commands that were submitted before it, and those submitted after it.

The first synchronization scope and access scope of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred earlier in submission order.

The second synchronization scope and access scope of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred later in submission order.

If `vkCmdPipelineBarrier2` is recorded within a render pass instance, the synchronization scopes are limited to operations within the same subpass.

### Valid Usage

- VUID-vkCmdPipelineBarrier2-pDependencies-02285
If `vkCmdPipelineBarrier2` is called within a render pass instance, the render pass **must** have been created with at least one `VkSubpassDependency` instance in `VkRenderPassCreateInfo::pDependencies` that expresses a dependency from the current subpass to itself, with synchronization scopes and access scopes that are all supersets of the scopes defined in this command

- **VUID-vkCmdPipelineBarrier2-bufferMemoryBarrierCount-01178**
  If `vkCmdPipelineBarrier2` is called within a render pass instance, it **must** not include any buffer memory barriers

- **VUID-vkCmdPipelineBarrier2-image-04073**
  If `vkCmdPipelineBarrier2` is called within a render pass instance, the `image` member of any image memory barrier included in this command **must** be an attachment used in the current subpass both as an input attachment, and as either a color or depth/stencil attachment

- **VUID-vkCmdPipelineBarrier2-oldLayout-01181**
  If `vkCmdPipelineBarrier2` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command **must** be equal

- **VUID-vkCmdPipelineBarrier2-srcQueueFamilyIndex-01182**
  If `vkCmdPipelineBarrier2` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any image memory barrier included in this command **must** be equal

- **VUID-vkCmdPipelineBarrier2-dependencyFlags-01186**
  If `vkCmdPipelineBarrier2` is called outside of a render pass instance, `VK_DEPENDENCY_VIEW_LOCAL_BIT` **must** not be included in the dependency flags

- **VUID-vkCmdPipelineBarrier2-None-06191**
  If `vkCmdPipelineBarrier2` is called within a render pass instance, the render pass **must** not have been started with `vkCmdBeginRendering`

- **VUID-vkCmdPipelineBarrier2-synchronization2-03848**
  The `synchronization2` feature **must** be enabled

- **VUID-vkCmdPipelineBarrier2-srcStageMask-03849**
  The `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- **VUID-vkCmdPipelineBarrier2-dstStageMask-03850**
  The `dstStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` **must** only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

---

**Valid Usage (Implicit)**

- **VUID-vkCmdPipelineBarrier2-commandBuffer-parameter**
commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdPipelineBarrier2-pDependencyInfo-parameter
  pDependencyInfo must be a valid pointer to a valid VkDependencyInfo structure

- VUID-vkCmdPipelineBarrier2-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdPipelineBarrier2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, compute, decode, or encode operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

</tbody>
</table>

To record a pipeline barrier, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdPipelineBarrier(
    VkCommandBuffer
    VkPipelineStageFlags srcStageMask,
    VkPipelineStageFlags dstStageMask,
    VkDependencyFlags dependencyFlags,
    memoryBarrierCount,
    pBufferMemoryBarriers, pImageMemoryBarriers)
```

- commandBuffer is the command buffer into which the command is recorded.
- srcStageMask is a bitmask of VkPipelineStageFlagBits specifying the source stages.
• **dstStageMask** is a bitmask of `VkPipelineStageFlagBits` specifying the destination stages.

• **dependencyFlags** is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.

• **memoryBarrierCount** is the length of the `pMemoryBarriers` array.

• **pMemoryBarriers** is a pointer to an array of `VkMemoryBarrier` structures.

• **bufferMemoryBarrierCount** is the length of the `pBufferMemoryBarriers` array.

• **pBufferMemoryBarriers** is a pointer to an array of `VkBufferMemoryBarrier` structures.

• **imageMemoryBarrierCount** is the length of the `pImageMemoryBarriers` array.

• **pImageMemoryBarriers** is a pointer to an array of `VkImageMemoryBarrier` structures.

`vkCmdPipelineBarrier` operates almost identically to `vkCmdPipelineBarrier2`, except that the scopes and barriers are defined as direct parameters rather than being defined by an `VkDependencyInfo`.

When `vkCmdPipelineBarrier` is submitted to a queue, it defines a memory dependency between commands that were submitted before it, and those submitted after it.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the first synchronization scope includes all commands that occur earlier in submission order. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the first synchronization scope includes only commands that occur earlier in submission order within the same subpass. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the source stage mask specified by `srcStageMask`.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the second synchronization scope includes all commands that occur later in submission order. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the second synchronization scope includes only commands that occur later in submission order within the same subpass. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by `dstStageMask`.

The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by `srcStageMask`. Within that, the first access scope only includes the first access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the first access scope includes no accesses.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by `dstStageMask`. Within that, the second access scope only includes the second access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the second access scope includes no accesses.

If `dependencyFlags` includes `VK_DEPENDENCY_BY_REGION_BIT`, then any dependency between framebuffer-space pipeline stages is framebuffer-local - otherwise it is framebuffer-global.
Valid Usage

- VUID-vkCmdPipelineBarrier-srcStageMask-04090
  If the geometryShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- VUID-vkCmdPipelineBarrier-srcStageMask-04091
  If the tessellationShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-vkCmdPipelineBarrier-srcStageMask-04092
  If the conditionalRendering feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

- VUID-vkCmdPipelineBarrier-srcStageMask-04093
  If the fragmentDensityMap feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

- VUID-vkCmdPipelineBarrier-srcStageMask-04094
  If the transformFeedback feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

- VUID-vkCmdPipelineBarrier-srcStageMask-04095
  If the meshShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT

- VUID-vkCmdPipelineBarrier-srcStageMask-04096
  If the taskShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT

- VUID-vkCmdPipelineBarrier-shadingRateImage-07318
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, srcStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdPipelineBarrier-srcStageMask-03937
  If the synchronization2 feature is not enabled, srcStageMask must not be \( \emptyset \)

- VUID-vkCmdPipelineBarrier-dstStageMask-04090
  If the geometryShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- VUID-vkCmdPipelineBarrier-dstStageMask-04091
  If the tessellationShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-vkCmdPipelineBarrier-dstStageMask-04092
  If the conditionalRendering feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT

- VUID-vkCmdPipelineBarrier-dstStageMask-04093
  If the fragmentDensityMap feature is not enabled, dstStageMask must not contain
If the transformFeedback feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT.

If the meshShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT.

If the taskShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT.

If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, dstStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR.

If the synchronization2 feature is not enabled, dstStageMask must not be 0.

The srcAccessMask member of each element of pMemoryBarriers must only include access flags that are supported by one or more of the pipeline stages in srcStageMask, as specified in the table of supported access types.

The dstAccessMask member of each element of pMemoryBarriers must only include access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types.

For any element of pBufferMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its srcQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its srcAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in srcStageMask, as specified in the table of supported access types.

For any element of pBufferMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its dstAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types.

For any element of pImageMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its srcQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its srcAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in srcStageMask, as specified in the table of supported access types.
or more of the pipeline stages in `srcStageMask`, as specified in the table of supported access types

- **UUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02820**
  For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types

- **UUID-vkCmdPipelineBarrier-pDependencies-02285**
  If `vkCmdPipelineBarrier` is called within a render pass instance, the render pass must have been created with at least one `VkSubpassDependency` instance in `VkRenderPassCreateInfo::pDependencies` that expresses a dependency from the current subpass to itself, with synchronization scopes and access scopes that are all supersets of the scopes defined in this command

- **UUID-vkCmdPipelineBarrier-bufferMemoryBarrierCount-01178**
  If `vkCmdPipelineBarrier` is called within a render pass instance, it must not include any buffer memory barriers

- **UUID-vkCmdPipelineBarrier-image-04073**
  If `vkCmdPipelineBarrier` is called within a render pass instance, the `image` member of any image memory barrier included in this command must be an attachment used in the current subpass both as an input attachment, and as either a color or depth/stencil attachment

- **UUID-vkCmdPipelineBarrier-oldLayout-01181**
  If `vkCmdPipelineBarrier` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command must be equal

- **UUID-vkCmdPipelineBarrier-srcQueueFamilyIndex-01182**
  If `vkCmdPipelineBarrier` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any image memory barrier included in this command must be equal

- **UUID-vkCmdPipelineBarrier-dependencyFlags-01186**
  If `vkCmdPipelineBarrier` is called outside of a render pass instance, `VK_DEPENDENCY_VIEW_LOCAL_BIT` must not be included in the dependency flags

- **UUID-vkCmdPipelineBarrier-None-06191**
  If `vkCmdPipelineBarrier` is called within a render pass instance, the render pass must not have been started with `vkCmdBeginRendering`

- **UUID-vkCmdPipelineBarrier-srcStageMask-06461**
  Any pipeline stage included in `srcStageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages

- **UUID-vkCmdPipelineBarrier-dstStageMask-06462**
Any pipeline stage included in `dstStageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages.

### Valid Usage (Implicit)

- **VUID-vkCmdPipelineBarrier-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdPipelineBarrier-srcStageMask-parameter**
  
  `srcStageMask` must be a valid combination of `VkPipelineStageFlagBits` values.

- **VUID-vkCmdPipelineBarrier-dstStageMask-parameter**
  
  `dstStageMask` must be a valid combination of `VkPipelineStageFlagBits` values.

- **VUID-vkCmdPipelineBarrier-dependencyFlags-parameter**
  
  `dependencyFlags` must be a valid combination of `VkDependencyFlagBits` values.

- **VUID-vkCmdPipelineBarrier-pMemoryBarriers-parameter**
  
  If `memoryBarrierCount` is not 0, `pMemoryBarriers` must be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier` structures.

- **VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-parameter**
  
  If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` must be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier` structures.

- **VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-parameter**
  
  If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` must be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier` structures.

- **VUID-vkCmdPipelineBarrier-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdPipelineBarrier-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, compute, decode, or encode operations.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.
Bits which can be set in `vkCmdPipelineBarrier::dependencyFlags`, specifying how execution and memory dependencies are formed, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDependencyFlagBits {
    VK_DEPENDENCY_BY_REGION_BIT = 0x00000001,

    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_DEVICE_GROUP_BIT = 0x00000004,

    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_VIEW_LOCAL_BIT = 0x00000002,

    // Provided by VK_EXT_attachment_feedback_loop_layout
    VK_DEPENDENCY_FEEDBACK_LOOP_BIT_EXT = 0x00000008,

    // Provided by VK_KHR_multiview
    VK_DEPENDENCY_VIEW_LOCAL_BIT_KHR = VK_DEPENDENCY_VIEW_LOCAL_BIT,

    // Provided by VK_KHR_device_group
    VK_DEPENDENCY_DEVICE_GROUP_BIT_KHR = VK_DEPENDENCY_DEVICE_GROUP_BIT,
}
VkDependencyFlagBits;
```

- `VK_DEPENDENCY_BY_REGION_BIT` specifies that dependencies will be framebuffer-local.
- `VK_DEPENDENCY_VIEW_LOCAL_BIT` specifies that a subpass has more than one view.
- `VK_DEPENDENCY_DEVICE_GROUP_BIT` specifies that dependencies are non-device-local.
- `VK_DEPENDENCY_FEEDBACK_LOOP_BIT_EXT` specifies that the render pass will write to and read from the same image using the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` layout.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDependencyFlags;
```

`VkDependencyFlags` is a bitmask type for setting a mask of zero or more `VkDependencyFlagBits`.

### 7.6.1. Subpass Self-dependency

`vkCmdPipelineBarrier` or `vkCmdPipelineBarrier2` must not be called within a render pass instance started with `vkCmdBeginRendering`. 
If `vkCmdPipelineBarrier` or `vkCmdPipelineBarrier2` is called inside a render pass instance, the following restrictions apply. For a given subpass to allow a pipeline barrier, the render pass must declare a self-dependency from that subpass to itself. That is, there must exist a subpass dependency with `srcSubpass` and `dstSubpass` both equal to that subpass index. More than one self-dependency can be declared for each subpass.

Self-dependencies must only include pipeline stage bits that are graphics stages. If any of the stages in `srcStageMask` are framebuffer-space stages, `dstStageMask` must only contain framebuffer-space stages. This means that pseudo-stages like `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` which include the execution of both framebuffer-space stages and non-framebuffer-space stages must not be used.

If the source and destination stage masks both include framebuffer-space stages, then `dependencyFlags` must include `VK_DEPENDENCY_BY_REGION_BIT`. If the subpass has more than one view, then `dependencyFlags` must include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

Each of the synchronization scopes and access scopes of a `vkCmdPipelineBarrier2` or `vkCmdPipelineBarrier` command inside a render pass instance must be a subset of the scopes of one of the self-dependencies for the current subpass.

If the self-dependency has `VK_DEPENDENCY_BY_REGION_BIT` or `VK_DEPENDENCY_VIEW_LOCAL_BIT` set, then so must the pipeline barrier. Pipeline barriers within a render pass instance must not include buffer memory barriers. Image memory barriers must only specify image subresources that are used as attachments within the subpass, and must not define an image layout transition or queue family ownership transfer.

### 7.7. Memory Barriers

Memory barriers are used to explicitly control access to buffer and image subresource ranges. Memory barriers are used to transfer ownership between queue families, change image layouts, and define availability and visibility operations. They explicitly define the access types and buffer and image subresource ranges that are included in the access scopes of a memory dependency that is created by a synchronization command that includes them.

#### 7.7.1. Global Memory Barriers

Global memory barriers apply to memory accesses involving all memory objects that exist at the time of its execution.

The `VkMemoryBarrier2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2 srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2 dstAccessMask;
} VkMemoryBarrier2;
```
or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkMemoryBarrier2 VkMemoryBarrier2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the first synchronization scope.
- `srcAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the first access scope.
- `dstStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the second synchronization scope.
- `dstAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the second access scope.

This structure defines a memory dependency affecting all device memory.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by `srcStageMask` and `srcAccessMask`.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by `dstStageMask` and `dstAccessMask`.

### Valid Usage

- **VUID-VkMemoryBarrier2-srcStageMask-03929**
  If the `geometryShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- **VUID-VkMemoryBarrier2-srcStageMask-03930**
  If the `tessellationShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-VkMemoryBarrier2-srcStageMask-03931**
  If the `conditionalRendering` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-VkMemoryBarrier2-srcStageMask-03932**
  If the `fragmentDensityMap` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-VkMemoryBarrier2-srcStageMask-03933**
  If the `transformFeedback` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-VkMemoryBarrier2-srcStageMask-03934**
If the meshShader feature is not enabled, srcStageMask must not contain
VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT

• VUID-VkMemoryBarrier2-srcStageMask-03935
If the taskShader feature is not enabled, srcStageMask must not contain
VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT

• VUID-VkMemoryBarrier2-shadingRateImage-07316
If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, srcStageMask must not contain
VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-VkMemoryBarrier2-srcStageMask-04957
If the subpassShading feature is not enabled, srcStageMask must not contain
VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI

• VUID-VkMemoryBarrier2-srcStageMask-04995
If the invocationMask feature is not enabled, srcStageMask must not contain
VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI

• VUID-VkMemoryBarrier2-srcAccessMask-03900
If srcAccessMask includes VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT, srcStageMask must include
VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03901
If srcAccessMask includes VK_ACCESS_2_INDEX_READ_BIT, srcStageMask must include
VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03902
If srcAccessMask includes VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT, srcStageMask must include
VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03903
If srcAccessMask includes VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT, srcStageMask must include
VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03904
If srcAccessMask includes VK_ACCESS_2_UNIFORM_READ_BIT, srcStageMask must include
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkMemoryBarrier2-srcAccessMask-03905
If srcAccessMask includes VK_ACCESS_2_SHADER_SAMPLED_READ_BIT, srcStageMask must include
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkMemoryBarrier2-srcAccessMask-03906
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkMemoryBarrier2-srcAccessMask-03907**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkMemoryBarrier2-srcAccessMask-07454**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkMemoryBarrier2-srcAccessMask-03909**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkMemoryBarrier2-srcAccessMask-03910**
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkMemoryBarrier2-srcAccessMask-03911**
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkMemoryBarrier2-srcAccessMask-03912**
  If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkMemoryBarrier2-srcAccessMask-03913**
  If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkMemoryBarrier2-srcAccessMask-03914**
  If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkMemoryBarrier2-srcAccessMask-03915**
  If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`
VK_PIPELINE_STAGE_2_RESOLVE_BIT,       VK_PIPELINE_STAGE_2_CLEAR_BIT,
VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT,
VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
        or
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03916
  If `srcAccessMask` includes VK_ACCESS_2_HOST_READ_BIT, `srcStageMask` must include
  VK_PIPELINE_STAGE_2_HOST_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03917
  If `srcAccessMask` includes VK_ACCESS_2_HOST_WRITE_BIT, `srcStageMask` must include
  VK_PIPELINE_STAGE_2_HOST_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03918
  If `srcAccessMask` includes VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT, `srcStageMask`
  must include VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03919
  If `srcAccessMask` includes VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT, `srcStageMask`
  must include VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03920
  If `srcAccessMask` includes VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT, `srcStageMask`
  must include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03922
  If `srcAccessMask` includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT,
  `srcStageMask` must include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT,
  VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT,
  or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-03923
  If `srcAccessMask` includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT,
  `srcStageMask` must include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkMemoryBarrier2-srcAccessMask-04994
  If `srcAccessMask` includes VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI, `srcStageMask` must
  include VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI

• VUID-VkMemoryBarrier2-srcAccessMask-03924
  If `srcAccessMask` includes VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV, `srcStageMask` must
  include VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV

• VUID-VkMemoryBarrier2-srcAccessMask-03925
If `srcAccessMask` includes `VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkMemoryBarrier2-srcAccessMask-03926**
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkMemoryBarrier2-srcAccessMask-03927**
  If `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_2_*_SHADER_BIT` stages

- **VUID-VkMemoryBarrier2-srcAccessMask-03928**
  If `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkMemoryBarrier2-srcAccessMask-06256**
  If the `rayQuery` feature is not enabled and `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` must not include any of the `VK_PIPELINE_STAGE_2_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- **VUID-VkMemoryBarrier2-srcAccessMask-07272**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- **VUID-VkMemoryBarrier2-srcAccessMask-04858**
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`

- **VUID-VkMemoryBarrier2-srcAccessMask-04859**

  If dstAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT, dstStageMask
must include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-04747
  If dstAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT, dstStageMask must include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03922
  If dstAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT, dstStageMask must include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03923
  If dstAccessMask includes VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV, dstStageMask must include VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03924
  If dstAccessMask includes VK_ACCESS_2_COMMAND_PREPROCESS_READ_BIT_NV, dstStageMask must include VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03925
  If dstAccessMask includes VK_ACCESS_2_COMMAND_PREPROCESS_WRITE_BIT_NV, dstStageMask must include VK_PIPELINE_STAGE_2_COMMAND_PREPROCESS_BIT_NV or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03926
  If dstAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT, dstStageMask must include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-03927
  If dstAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkMemoryBarrier2-dstAccessMask-03928
  If dstAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-dstAccessMask-06256
  If the rayQuery feature is not enabled and dstAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, dstStageMask must not include any of the VK_PIPELINE_STAGE_*_SHADER_BIT stages except VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR
If `dstAccessMask` includes `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`.

If `dstAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`.

If `dstAccessMask` includes `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`.

Valid Usage (Implicit)

- **VUID-VkMemoryBarrier2-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_BARRIER_2`.

- **VUID-VkMemoryBarrier2-srcStageMask-parameter**
  `srcStageMask` must be a valid combination of `VkPipelineStageFlagBits2` values.

- **VUID-VkMemoryBarrier2-srcAccessMask-parameter**
  `srcAccessMask` must be a valid combination of `VkAccessFlagBits2` values.

- **VUID-VkMemoryBarrier2-dstStageMask-parameter**
  `dstStageMask` must be a valid combination of `VkPipelineStageFlagBits2` values.

- **VUID-VkMemoryBarrier2-dstAccessMask-parameter**
  `dstAccessMask` must be a valid combination of `VkAccessFlagBits2` values.
The `VkMemoryBarrier` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryBarrier {
    VkStructureType sType;
    const void* pNext;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
} VkMemoryBarrier;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a source access mask.
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a destination access mask.

The first **access scope** is limited to access types in the source access mask specified by `srcAccessMask`.

The second **access scope** is limited to access types in the destination access mask specified by `dstAccessMask`.

### Valid Usage (Implicit)

- VUID-VkMemoryBarrier-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_BARRIER`

- VUID-VkMemoryBarrier-pNext-pNext
  `pNext` **must** be `NULL`

- VUID-VkMemoryBarrier-srcAccessMask-parameter
  `srcAccessMask` **must** be a valid combination of `VkAccessFlagBits` values

- VUID-VkMemoryBarrier-dstAccessMask-parameter
  `dstAccessMask` **must** be a valid combination of `VkAccessFlagBits` values

### 7.7.2. Buffer Memory Barriers

Buffer memory barriers only apply to memory accesses involving a specific buffer range. That is, a memory dependency formed from a buffer memory barrier is **scoped** to access via the specified buffer range. Buffer memory barriers **can** also be used to define a **queue family ownership transfer** for the specified buffer range.

The `VkBufferMemoryBarrier2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBufferMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
} VkBufferMemoryBarrier2;
```
or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkBufferMemoryBarrier2 VkBufferMemoryBarrier2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the first synchronization scope.
- `srcAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the first access scope.
- `dstStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the second synchronization scope.
- `dstAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the second access scope.
- `srcQueueFamilyIndex` is the source queue family for a queue family ownership transfer.
- `dstQueueFamilyIndex` is the destination queue family for a queue family ownership transfer.
- `buffer` is a handle to the buffer whose backing memory is affected by the barrier.
- `offset` is an offset in bytes into the backing memory for `buffer`; this is relative to the base offset as bound to the buffer (see `vkBindBufferMemory`).
- `size` is a size in bytes of the affected area of backing memory for `buffer`, or `VK_WHOLE_SIZE` to use the range from `offset` to the end of the buffer.

This structure defines a memory dependency limited to a range of a buffer, and can define a queue family transfer operation for that range.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by `srcStageMask` and `srcAccessMask`.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by `dstStageMask` and `dstAccessMask`.

Both access scopes are limited to only memory accesses to `buffer` in the range defined by `offset` and size.

If `buffer` was created with `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` is not equal to
dstQueueFamilyIndex, this memory barrier defines a queue family transfer operation. When executed on a queue in the family identified by srcQueueFamilyIndex, this barrier defines a queue family release operation for the specified buffer range, and the second synchronization and access scopes do not synchronize operations on that queue. When executed on a queue in the family identified by dstQueueFamilyIndex, this barrier defines a queue family acquire operation for the specified buffer range, and the first synchronization and access scopes do not synchronize operations on that queue.

A queue family transfer operation is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer. A queue family release operation is defined when dstQueueFamilyIndex is one of those values, and a queue family acquire operation is defined when srcQueueFamilyIndex is one of those values.

Valid Usage

- VUID-VkBufferMemoryBarrier2-srcStageMask-03929
  If the geometryShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT

- VUID-VkBufferMemoryBarrier2-srcStageMask-03930
  If the tessellationShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-VkBufferMemoryBarrier2-srcStageMask-03931
  If the conditionalRendering feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT

- VUID-VkBufferMemoryBarrier2-srcStageMask-03932
  If the fragmentDensityMap feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT

- VUID-VkBufferMemoryBarrier2-srcStageMask-03933
  If the transformFeedback feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT

- VUID-VkBufferMemoryBarrier2-srcStageMask-03934
  If the meshShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT

- VUID-VkBufferMemoryBarrier2-srcStageMask-03935
  If the taskShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT

- VUID-VkBufferMemoryBarrier2-shadingRateImage-07316
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkBufferMemoryBarrier2-srcStageMask-04957
  If the subpassShading feature is not enabled, srcStageMask must not contain...
If the `invocationMask` feature is not enabled, `srcStageMask` must not contain VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI.

If `srcAccessMask` includes VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT, `srcStageMask` must include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

If `srcAccessMask` includes VK_ACCESS_2_INDEX_READ_BIT, `srcStageMask` must include VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

If `srcAccessMask` includes VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT, `srcStageMask` must include VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

If `srcAccessMask` includes VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT, `srcStageMask` must include VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

If `srcAccessMask` includes VK_ACCESS_2_UNIFORM_READ_BIT, `srcStageMask` must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages.

If `srcAccessMask` includes VK_ACCESS_2_SHADER_SAMPLED_READ_BIT, `srcStageMask` must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages.

If `srcAccessMask` includes VK_ACCESS_2_SHADER_STORAGE_READ_BIT, `srcStageMask` must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages.

If `srcAccessMask` includes VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT, `srcStageMask` must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages.
stages

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03909
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- VUID-VkBufferMemoryBarrier2-srcAccessMask-03910
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-offset-01187
  offset must be less than the size of buffer

- VUID-VkBufferMemoryBarrier2-size-01188
  If size is not equal to VK_WHOLE_SIZE, size must be greater than 0

- VUID-VkBufferMemoryBarrier2-size-01189
  If size is not equal to VK_WHOLE_SIZE, size must be less than or equal to the size of buffer minus offset

- VUID-VkBufferMemoryBarrier2-buffer-01931
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkBufferMemoryBarrier2-srcQueueFamilyIndex-04087
  If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one must not be a special queue family reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer

- VUID-VkBufferMemoryBarrier2-buffer-04088
  If buffer was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, and one of srcQueueFamilyIndex and dstQueueFamilyIndex is one of the special queue family values reserved for external memory transfers, the other must be VK_QUEUE_FAMILY_IGNORED

- VUID-VkBufferMemoryBarrier2-buffer-04089
  If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex and dstQueueFamilyIndex must both be valid queue families, or one of the special queue family values reserved for external memory transfers, as described in Queue Family Ownership Transfer
If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_2_HOST_BIT`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` must be equal.

**Valid Usage (Implicit)**

- VUID-VkBufferMemoryBarrier2-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER_2`

- VUID-VkBufferMemoryBarrier2-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkBufferMemoryBarrier2-srcStageMask-parameter
  
  `srcStageMask` must be a valid combination of `VkPipelineStageFlagBits2` values

- VUID-VkBufferMemoryBarrier2-srcAccessMask-parameter
  
  `srcAccessMask` must be a valid combination of `VkAccessFlagBits2` values

- VUID-VkBufferMemoryBarrier2-dstStageMask-parameter
  
  `dstStageMask` must be a valid combination of `VkPipelineStageFlagBits2` values

- VUID-VkBufferMemoryBarrier2-dstAccessMask-parameter
  
  `dstAccessMask` must be a valid combination of `VkAccessFlagBits2` values

- VUID-VkBufferMemoryBarrier2-buffer-parameter
  
  `buffer` must be a valid `VkBuffer` handle

The `VkBufferMemoryBarrier` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferMemoryBarrier {  
    VkStructureType sType;
    const void* pNext;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkBufferMemoryBarrier;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a source access mask.
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a destination access mask.
- `srcQueueFamilyIndex` is the source queue family for a queue family ownership transfer.
- `dstQueueFamilyIndex` is the destination queue family for a queue family ownership transfer.
• **buffer** is a handle to the buffer whose backing memory is affected by the barrier.

• **offset** is an offset in bytes into the backing memory for **buffer**; this is relative to the base offset as bound to the buffer (see `vkBindBufferMemory`).

• **size** is a size in bytes of the affected area of backing memory for **buffer**, or `VK_WHOLE_SIZE` to use the range from **offset** to the end of the buffer.

The first **access scope** is limited to access to memory through the specified buffer range, via access types in the **source access mask** specified by `srcAccessMask`. If `srcAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT`, a memory domain operation is performed where available memory in the host domain is also made available to the device domain.

The second **access scope** is limited to access to memory through the specified buffer range, via access types in the **destination access mask** specified by `dstAccessMask`. If `dstAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT` or `VK_ACCESS_HOST_READ_BIT`, a memory domain operation is performed where available memory in the device domain is also made available to the host domain.

**Note**

When `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` is used, available memory in host domain is automatically made visible to host domain, and any host write is automatically made available to host domain.

If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, and `srcQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a queue family release operation for the specified buffer range, and the second access scope includes no access, as if `dstAccessMask` was `0`.

If `dstQueueFamilyIndex` is not equal to `srcQueueFamilyIndex`, and `dstQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a queue family acquire operation for the specified buffer range, and the first access scope includes no access, as if `srcAccessMask` was `0`.

**Valid Usage**

- **VUID-VkBufferMemoryBarrier-offset-01187**
  
  **offset** must be less than the size of **buffer**

- **VUID-VkBufferMemoryBarrier-size-01188**
  
  If `size` is not equal to `VK_WHOLE_SIZE`, `size` must be greater than `0`

- **VUID-VkBufferMemoryBarrier-size-01189**
  
  If `size` is not equal to `VK_WHOLE_SIZE`, `size` must be less than or equal to than the size of **buffer** minus **offset**

- **VUID-VkBufferMemoryBarrier-buffer-01931**
  
  If **buffer** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-VkBufferMemoryBarrier-srcQueueFamilyIndex-04087**
  
  If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, at least one must not be a special queue family reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer
If buffer was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, and one of srcQueueFamilyIndex and dstQueueFamilyIndex is one of the special queue family values reserved for external memory transfers, the other must be VK_QUEUE_FAMILY_IGNORED.

If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex and dstQueueFamilyIndex must both be valid queue families, or one of the special queue family values reserved for external memory transfers, as described in Queue Family Ownership Transfer.

If the synchronization2 feature is not enabled, and buffer was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, at least one of srcQueueFamilyIndex and dstQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED.

Valid Usage (Implicit)

- **sType** must be VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER
- **pNext** must be NULL
- **buffer** must be a valid VkBuffer handle

VK_WHOLE_SIZE is a special value indicating that the entire remaining length of a buffer following a given offset should be used. It can be specified for VkBufferMemoryBarrier::size and other structures.

```c
#define VK_WHOLE_SIZE (~-0ULL)
```

### 7.7.3. Image Memory Barriers

Image memory barriers only apply to memory accesses involving a specific image subresource range. That is, a memory dependency formed from an image memory barrier is scoped to access via the specified image subresource range. Image memory barriers can also be used to define image layout transitions or a queue family ownership transfer for the specified image subresource range.

The VkImageMemoryBarrier2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageMemoryBarrier2 {
```
VkStructureType sType;

const void* pNext;

VkPipelineStageFlags2 srcStageMask;
VkAccessFlags2 srcAccessMask;

VkPipelineStageFlags2 dstStageMask;
VkAccessFlags2 dstAccessMask;

VkImageLayout oldLayout;
VkImageLayout newLayout;

uint32_t srcQueueFamilyIndex;
uint32_t dstQueueFamilyIndex;

VkImage image;

VkImageSubresourceRange subresourceRange;

} VkImageMemoryBarrier2;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkImageMemoryBarrier2 VkImageMemoryBarrier2KHR;

• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **srcStageMask** is a VkPipelineStageFlags2 mask of pipeline stages to be included in the first synchronization scope.

• **srcAccessMask** is a VkAccessFlags2 mask of access flags to be included in the first access scope.

• **dstStageMask** is a VkPipelineStageFlags2 mask of pipeline stages to be included in the second synchronization scope.

• **dstAccessMask** is a VkAccessFlags2 mask of access flags to be included in the second access scope.

• **oldLayout** is the old layout in an image layout transition.

• **newLayout** is the new layout in an image layout transition.

• **srcQueueFamilyIndex** is the source queue family for a queue family ownership transfer.

• **dstQueueFamilyIndex** is the destination queue family for a queue family ownership transfer.

• **image** is a handle to the image affected by this barrier.

• **subresourceRange** describes the image subresource range within image that is affected by this barrier.

This structure defines a memory dependency limited to an image subresource range, and can define a queue family transfer operation and image layout transition for that subresource range.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by **srcStageMask** and **srcAccessMask**.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by **dstStageMask** and **dstAccessMask**.
Both access scopes are limited to only memory accesses to image in the subresource range defined by subresourceRange.

If image was created with VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, this memory barrier defines a queue family transfer operation. When executed on a queue in the family identified by srcQueueFamilyIndex, this barrier defines a queue family release operation for the specified image subresource range, and the second synchronization and access scopes do not synchronize operations on that queue. When executed on a queue in the family identified by dstQueueFamilyIndex, this barrier defines a queue family acquire operation for the specified image subresource range, and the first synchronization and access scopes do not synchronize operations on that queue.

A queue family transfer operation is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer. A queue family release operation is defined when dstQueueFamilyIndex is one of those values, and a queue family acquire operation is defined when srcQueueFamilyIndex is one of those values.

If oldLayout is not equal to newLayout, then the memory barrier defines an image layout transition for the specified image subresource range. If this memory barrier defines a queue family transfer operation, the layout transition is only executed once between the queues.

Note
When the old and new layout are equal, the layout values are ignored - data is preserved no matter what values are specified, or what layout the image is currently in.

If image has a multi-planar format and the image is disjoint, then including VK_IMAGE_ASPECT_COLOR_BIT in the aspectMask member of subresourceRange is equivalent to including VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, and (for three-plane formats only) VK_IMAGE_ASPECT_PLANE_2_BIT.

Valid Usage

- VUID-VkImageMemoryBarrier2-srcStageMask-03929
  If the geometryShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT

- VUID-VkImageMemoryBarrier2-srcStageMask-03930
  If the tessellationShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-VkImageMemoryBarrier2-srcStageMask-03931
  If the conditionalRendering feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT

- VUID-VkImageMemoryBarrier2-srcStageMask-03932
  If the fragmentDensityMap feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT
If the `transformFeedback` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`.

If the `meshShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`.

If the `taskShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`.

If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the `subpassShading` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI`.

If the `invocationMask` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`.

If `srcAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`, `VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.
If `srcAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03906**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03907**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkImageMemoryBarrier2-srcAccessMask-07454**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03909**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03910**
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03911**
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03912**
  If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03913**
  If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03914**
  If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, or
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03915
  If srcAccessMask includes VK_ACCESS_2_TRANSFER_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT,
  VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_CLEAR_BIT,
  VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT,
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  or
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03916
  If srcAccessMask includes VK_ACCESS_2_HOST_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_HOST_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03917
  If srcAccessMask includes VK_ACCESS_2_HOST_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_HOST_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03918
  If srcAccessMask includes VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT, srcStageMask
  must include VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03919
  If srcAccessMask includes VK_ACCESS_2_FRAGMENT_DENSITY_MAP_READ_BIT_EXT, srcStageMask
  must include VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03920
  If srcAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT, srcStageMask
  must include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-04747
  If srcAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT,
  srcStageMask must include
  VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03922
  If srcAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT,
  srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-03923
  If srcAccessMask includes VK_ACCESS_2_SHADING_RATE_IMAGE_READ_BIT_NV, srcStageMask must
  include VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkImageMemoryBarrier2-srcAccessMask-04994
  If srcAccessMask includes VK_ACCESS_2_INVOCATION_MASK_READ_BIT_HUAWEI, srcStageMask must
  include
  VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI
If \texttt{srcAccessMask} includes \texttt{VK\_ACCESS\_2\_COMMAND\_PREPROCESS\_READ\_BIT\_NV}, \texttt{srcStageMask} must include either \texttt{VK\_PIPELINE\_STAGE\_2\_COMMAND\_PREPROCESS\_BIT\_NV} or \texttt{VK\_PIPELINE\_STAGE\_2\_ALL\_COMMANDS\_BIT}

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03925**
  If \texttt{srcAccessMask} includes \texttt{VK\_ACCESS\_2\_COMMAND\_PREPROCESS\_WRITE\_BIT\_NV}, \texttt{srcStageMask} must include \texttt{VK\_PIPELINE\_STAGE\_2\_COMMAND\_PREPROCESS\_BIT\_NV} or \texttt{VK\_PIPELINE\_STAGE\_2\_ALL\_COMMANDS\_BIT}

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03926**
  If \texttt{srcAccessMask} includes \texttt{VK\_ACCESS\_2\_COLOR\_ATTACHMENT\_READ\_NONCOHERENT\_BIT\_EXT}, \texttt{srcStageMask} must include \texttt{VK\_PIPELINE\_STAGE\_2\_COLOR\_ATTACHMENT\_OUTPUT\_BIT}, \texttt{VK\_PIPELINE\_STAGE\_2\_ALL\_GRAPHICS\_BIT}, or \texttt{VK\_PIPELINE\_STAGE\_2\_ALL\_COMMANDS\_BIT}

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03927**
  If \texttt{srcAccessMask} includes \texttt{VK\_ACCESS\_2\_ACCELERATION\_STRUCTURE\_READ\_BIT\_KHR}, \texttt{srcStageMask} must include \texttt{VK\_PIPELINE\_STAGE\_2\_ACCELERATION\_STRUCTURE\_BUILD\_BIT\_KHR}, \texttt{VK\_PIPELINE\_STAGE\_2\_ALL\_COMMANDS\_BIT}, or one of the \texttt{VK\_PIPELINE\_STAGE\_*_SHADER\_BIT} stages

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03928**
  If \texttt{srcAccessMask} includes \texttt{VK\_ACCESS\_2\_ACCELERATION\_STRUCTURE\_WRITE\_BIT\_KHR}, \texttt{srcStageMask} must include \texttt{VK\_PIPELINE\_STAGE\_2\_ACCELERATION\_STRUCTURE\_BUILD\_BIT\_KHR} or \texttt{VK\_PIPELINE\_STAGE\_2\_ALL\_COMMANDS\_BIT}

- **VUID-VkImageMemoryBarrier2-srcAccessMask-06256**
  If the \texttt{rayQuery} feature is not enabled and \texttt{srcAccessMask} includes \texttt{VK\_ACCESS\_2\_ACCELERATION\_STRUCTURE\_READ\_BIT\_KHR}, \texttt{srcStageMask} must not include any of the \texttt{VK\_PIPELINE\_STAGE\_*_SHADER\_BIT} stages except \texttt{VK\_PIPELINE\_STAGE\_2\_RAY\_TRACING\_SHADER\_BIT\_KHR}

- **VUID-VkImageMemoryBarrier2-srcAccessMask-07272**
  If \texttt{srcAccessMask} includes \texttt{VK\_ACCESS\_2\_SHADER\_BINDING\_TABLE\_READ\_BIT\_KHR}, \texttt{srcStageMask} must include \texttt{VK\_PIPELINE\_STAGE\_2\_SHADER\_BUILD\_BIT\_KHR}

- **VUID-VkImageMemoryBarrier2-srcAccessMask-04858**
  If \texttt{srcAccessMask} includes \texttt{VK\_ACCESS\_2\_VIDEO\_DECODE\_READ\_BIT\_KHR}, \texttt{srcStageMask} must include \texttt{VK\_PIPELINE\_STAGE\_2\_VIDEO\_DECODE\_BIT\_KHR}

- **VUID-VkImageMemoryBarrier2-srcAccessMask-04859**
  If \texttt{srcAccessMask} includes \texttt{VK\_ACCESS\_2\_VIDEO\_DECODE\_WRITE\_BIT\_KHR}, \texttt{srcStageMask} must include \texttt{VK\_PIPELINE\_STAGE\_2\_VIDEO\_DECODE\_BIT\_KHR}

- **VUID-VkImageMemoryBarrier2-srcAccessMask-04860**
  If \texttt{srcAccessMask} includes \texttt{VK\_ACCESS\_2\_VIDEO\_ENCODE\_READ\_BIT\_KHR}, \texttt{srcStageMask} must include \texttt{VK\_PIPELINE\_STAGE\_2\_VIDEO\_ENCODE\_BIT\_KHR}

- **VUID-VkImageMemoryBarrier2-srcAccessMask-04861**
  If \texttt{srcAccessMask} includes \texttt{VK\_ACCESS\_2\_VIDEO\_ENCODE\_WRITE\_BIT\_KHR}, \texttt{srcStageMask} must include \texttt{VK\_PIPELINE\_STAGE\_2\_VIDEO\_ENCODE\_BIT\_KHR}

- **VUID-VkImageMemoryBarrier2-srcAccessMask-07455**
  If \texttt{srcAccessMask} includes \texttt{VK\_ACCESS\_2\_OPTICAL\_FLOW\_READ\_BIT\_NV}, \texttt{srcStageMask} must
include VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV

• VUID-VkImageMemoryBarrier2-srcAccessMask-07456
  If `srcAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`

• VUID-VkImageMemoryBarrier2-srcAccessMask-07457
  If `srcAccessMask` includes `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`

• VUID-VkImageMemoryBarrier2-srcAccessMask-07458
  If `srcAccessMask` includes `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`

• VUID-VkImageMemoryBarrier2-dstStageMask-03929
  If the `geometryShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

• VUID-VkImageMemoryBarrier2-dstStageMask-03930
  If the `tessellationShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

• VUID-VkImageMemoryBarrier2-dstStageMask-03931
  If the `conditionalRendering` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

• VUID-VkImageMemoryBarrier2-dstStageMask-03932
  If the `fragmentDensityMap` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

• VUID-VkImageMemoryBarrier2-dstStageMask-03933
  If the `transformFeedback` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

• VUID-VkImageMemoryBarrier2-dstStageMask-03934
  If the `meshShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`

• VUID-VkImageMemoryBarrier2-dstStageMask-03935
  If the `taskShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`

• VUID-VkImageMemoryBarrier2-shadingRateImage-07316
  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

• VUID-VkImageMemoryBarrier2-dstStageMask-04957
  If the `subpassShading` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI`

• VUID-VkImageMemoryBarrier2-dstStageMask-04995
  If the `invocationMask` feature is not enabled, `dstStageMask` must not contain
• VUID-VkImageMemoryBarrier2-dstAccessMask-03900
  If dstAccessMask includes VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT, dstStageMask must include
  VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-03901
  If dstAccessMask includes VK_ACCESS_2_INDEX_READ_BIT, dstStageMask must include
  VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-03902
  If dstAccessMask includes VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT, dstStageMask must include
  VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-03903
  If dstAccessMask includes VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT, dstStageMask must include
  VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_KHR,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkImageMemoryBarrier2-dstAccessMask-03904
  If dstAccessMask includes VK_ACCESS_2_UNIFORM_READ_BIT, dstStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkImageMemoryBarrier2-dstAccessMask-03905
  If dstAccessMask includes VK_ACCESS_2_SHADER_SAMPLED_READ_BIT, dstStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkImageMemoryBarrier2-dstAccessMask-03906
  If dstAccessMask includes VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT, dstStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkImageMemoryBarrier2-dstAccessMask-03907
  If dstAccessMask includes VK_ACCESS_2_SHADER_WRITE_BIT, dstStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkImageMemoryBarrier2-dstAccessMask-03910
  If dstAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-03911
  If dstAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-03912
  If dstAccessMask includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-03913
  If dstAccessMask includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-03914
  If dstAccessMask includes VK_ACCESS_2_TRANSFER_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-03915
  If dstAccessMask includes VK_ACCESS_2_TRANSFER_WRITE_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_CLEAR_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-03916
  If dstAccessMask includes VK_ACCESS_2_HOST_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_HOST_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-03917
  If dstAccessMask includes VK_ACCESS_2_HOST_WRITE_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_HOST_BIT

• VUID-VkImageMemoryBarrier2-dstAccessMask-03918
  If dstAccessMask includes VK_ACCESS_2_CONDITIONAL_RENDERING_READ_BIT_EXT, dstStageMask must include VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT
If \( \text{dstAccessMask} \) includes \( \text{VK} \_ \text{ACCESS}\_2\_\text{FRAGMENT}\_\text{DENSITY}\_\text{MAP}\_\text{READ}\_\text{BIT}\_\text{EXT} \), \( \text{dstStageMask} \) must include \( \text{VK} \_ \text{PIPELINE} \_ \text{STAGE}\_2\_\text{FRAGMENT}\_\text{DENSITY}\_\text{PROCESS}\_\text{BIT}\_\text{EXT} \), \( \text{VK} \_ \text{PIPELINE} \_ \text{STAGE}\_2\_\text{ALL}\_\text{GRAPHICS}\_\text{BIT} \), or \( \text{VK} \_ \text{PIPELINE} \_ \text{STAGE}\_2\_\text{ALL}\_\text{COMMANDS}\_\text{BIT} \)

- \text{VUID-VkImageMemoryBarrier2-dstAccessMask-03928}
  If \( \text{dstAccessMask} \) includes \( \text{VK} \_ \text{ACCESS}\_2\_\text{ACCELERATION}\_\text{STRUCTURE}\_\text{WRITE}\_\text{BIT}\_\text{KHR} \), \( \text{dstStageMask} \) must include \( \text{VK} \_ \text{PIPELINE} \_ \text{STAGE}\_2\_\text{ACCELERATION}\_\text{STRUCTURE}\_\text{BUILD}\_\text{BIT}\_\text{KHR} \) or \( \text{VK} \_ \text{PIPELINE} \_ \text{STAGE}\_2\_\text{ALL}\_\text{COMMANDS}\_\text{BIT} \)
If the `rayQuery` feature is not enabled and `dstAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `dstStageMask` must not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`.

If `dstAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_READ_BIT_NV`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`.

If `dstAccessMask` includes `VK_ACCESS_2_OPTICAL_FLOW_WRITE_BIT_NV`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_OPTICAL_FLOW_BIT_NV`.

If `dstAccessMask` includes `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`.

If `dstAccessMask` includes `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`.

If `subresourceRange.baseMipLevel` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` must be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

If `subresourceRange.baseArrayLayer` must be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.
VkImageCreateInfo when image was created

- VUID-VkImageMemoryBarrier2-subresourceRange-01725
  If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the arrayLayers specified in VkImageCreateInfo when image was created.

- VUID-VkImageMemoryBarrier2-image-01932
  If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- VUID-VkImageMemoryBarrier2-oldLayout-01208
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT.

- VUID-VkImageMemoryBarrier2-oldLayout-01209
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

- VUID-VkImageMemoryBarrier2-oldLayout-01210
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

- VUID-VkImageMemoryBarrier2-oldLayout-01211
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL then image must have been created with VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT.

- VUID-VkImageMemoryBarrier2-oldLayout-01212
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL then image must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT.

- VUID-VkImageMemoryBarrier2-oldLayout-01213
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL then image must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT.

- VUID-VkImageMemoryBarrier2-newLayout-01197
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, oldLayout must be VK_IMAGE_LAYOUT_UNDEFINED or the current layout of the image subresources affected by the barrier.

- VUID-VkImageMemoryBarrier2-newLayout-01198
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, `newLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

- **VUID-VkImageMemoryBarrier2-oldLayout-01658**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` then `image` must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkImageMemoryBarrier2-oldLayout-01659**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then `image` must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04065**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_OPTIMAL` then `image` must have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

- **VUID-VkImageMemoryBarrier2-synchronization2-06911**
  If the synchronization2 feature is not enabled, layout must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.

- **VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-03938**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL`, image must have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-03939**
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL`, image must have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- **VUID-VkImageMemoryBarrier2-oldLayout-02088**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR` then image must have been created with `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` set

- **VUID-VkImageMemoryBarrier2-image-01671**
  If `image` has a single-plane color format or is not disjoint, then the `aspectMask` member of `subresourceRange` must be `VK_IMAGE_ASPECT_COLOR_BIT`

- **VUID-VkImageMemoryBarrier2-image-01672**
  If `image` has a multi-planar format and the image is disjoint, then the `aspectMask` member of `subresourceRange` must include either at least one of `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, and `VK_IMAGE_ASPECT_PLANE_2_BIT`; or must include `VK_IMAGE_ASPECT_COLOR_BIT`

- **VUID-VkImageMemoryBarrier2-image-01673**
  If `image` has a multi-planar format with only two planes, then the `aspectMask` member of `subresourceRange` must not include `VK_IMAGE_ASPECT_PLANE_2_BIT`

- **VUID-VkImageMemoryBarrier2-image-03319**
  If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is enabled, then the `aspectMask` member of `subresourceRange` must include either or both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`

- **VUID-VkImageMemoryBarrier2-image-03320**
  If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is not enabled, then the `aspectMask` member of `subresourceRange` must include both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`

- **VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04070**
  If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, at least one must not be a special queue family reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer

- **VUID-VkImageMemoryBarrier2-image-04071**
  If `image` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, and one of `srcQueueFamilyIndex` and `dstQueueFamilyIndex` is one of the special queue family values reserved for external memory transfers, the other must be `VK_QUEUE_FAMILY_IGNORED`

- **VUID-VkImageMemoryBarrier2-image-04072**
  If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` must both be valid queue families, or one of the special queue family
values reserved for external memory transfers, as described in Queue Family Ownership Transfer

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07006
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT then image must have been created with either the VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT usage bits, and the VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT or VK_IMAGE_USAGE_SAMPLED_BIT usage bits, and the VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT usage bit.

- VUID-VkImageMemoryBarrier2-attachmentFeedbackLoopLayout-07313
  If the attachmentFeedbackLoopLayout feature is not enabled, newLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

- VUID-VkImageMemoryBarrier2-srcStageMask-03854
  If either srcStageMask or dstStageMask includes VK_PIPELINE_STAGE_2_HOST_BIT, srcQueueFamilyIndex and dstQueueFamilyIndex must be equal

- VUID-VkImageMemoryBarrier2-srcStageMask-03855
  If srcStageMask includes VK_PIPELINE_STAGE_2_HOST_BIT, and srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, oldLayout must be one of VK_IMAGE_LAYOUT_PREINITIALIZED, VK_IMAGE_LAYOUT_UNDEFINED, or VK_IMAGE_LAYOUT_GENERAL

Valid Usage (Implicit)

- VUID-VkImageMemoryBarrier2-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER_2

- VUID-VkImageMemoryBarrier2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkSampleLocationsInfoEXT

- VUID-VkImageMemoryBarrier2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkImageMemoryBarrier2-srcStageMask-parameter
  srcStageMask must be a valid combination of VkPipelineStageFlagBits2 values

- VUID-VkImageMemoryBarrier2-srcAccessMask-parameter
  srcAccessMask must be a valid combination of VkAccessFlagBits2 values

- VUID-VkImageMemoryBarrier2-dstStageMask-parameter
  dstStageMask must be a valid combination of VkPipelineStageFlagBits2 values

- VUID-VkImageMemoryBarrier2-dstAccessMask-parameter
  dstAccessMask must be a valid combination of VkAccessFlagBits2 values

- VUID-VkImageMemoryBarrier2-oldLayout-parameter
  oldLayout must be a valid VkImageLayout value

- VUID-VkImageMemoryBarrier2-newLayout-parameter
  newLayout must be a valid VkImageLayout value
The `VkImageMemoryBarrier` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageMemoryBarrier {
    VkStructureType      sType;
    const void*          pNext;
    VkAccessFlags        srcAccessMask;
    VkAccessFlags        dstAccessMask;
    VkImageLayout        oldLayout;
    VkImageLayout        newLayout;
    uint32_t             srcQueueFamilyIndex;
    uint32_t             dstQueueFamilyIndex;
    VkImage              image;
    VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **srcAccessMask** is a bitmask of `VkAccessFlagBits` specifying a source access mask.
- **dstAccessMask** is a bitmask of `VkAccessFlagBits` specifying a destination access mask.
- **oldLayout** is the old layout in an image layout transition.
- **newLayout** is the new layout in an image layout transition.
- **srcQueueFamilyIndex** is the source queue family for a queue family ownership transfer.
- **dstQueueFamilyIndex** is the destination queue family for a queue family ownership transfer.
- **image** is a handle to the image affected by this barrier.
- **subresourceRange** describes the image subresource range within image that is affected by this barrier.

The first access scope is limited to access to memory through the specified image subresource range, via access types in the source access mask specified by `srcAccessMask`. If `srcAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT`, memory writes performed by that access type are also made visible, as that access type is not performed through a resource.

The second access scope is limited to access to memory through the specified image subresource range, via access types in the destination access mask specified by `dstAccessMask`. If `dstAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT` or `VK_ACCESS_HOST_READ_BIT`, available memory writes are also made visible to accesses of those types, as those access types are not performed through a resource.

If **srcQueueFamilyIndex** is not equal to **dstQueueFamilyIndex**, and **srcQueueFamilyIndex** is equal to the
current queue family, then the memory barrier defines a queue family release operation for the specified image subresource range, and the second access scope includes no access, as if dstAccessMask was 0.

If dstQueueFamilyIndex is not equal to srcQueueFamilyIndex, and dstQueueFamilyIndex is equal to the current queue family, then the memory barrier defines a queue family acquire operation for the specified image subresource range, and the first access scope includes no access, as if srcAccessMask was 0.

If the synchronization2 feature is not enabled or oldLayout is not equal to newLayout, oldLayout and newLayout define an image layout transition for the specified image subresource range.

\[\text{Note}\]
If the synchronization2 feature is enabled, when the old and new layout are equal, the layout values are ignored - data is preserved no matter what values are specified, or what layout the image is currently in.

If image has a multi-planar format and the image is disjoint, then including VK_IMAGE_ASPECT_COLOR_BIT in the aspectMask member of subresourceRange is equivalent to including VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, and (for three-plane formats only) VK_IMAGE_ASPECT_PLANE_2_BIT.

### Valid Usage

- **VUID-VkImageMemoryBarrier-subresourceRange-01486**
  subresourceRange.baseMipLevel must be less than the mipLevels specified in VkImageCreateInfo when image was created

- **VUID-VkImageMemoryBarrier-subresourceRange-01724**
  If subresourceRange.levelCount is not VK_REMAINING_MIP_LEVELS, subresourceRange.baseMipLevel + subresourceRange.levelCount must be less than or equal to the mipLevels specified in VkImageCreateInfo when image was created

- **VUID-VkImageMemoryBarrier-subresourceRange-01488**
  subresourceRange.baseArrayLayer must be less than the arrayLayers specified in VkImageCreateInfo when image was created

- **VUID-VkImageMemoryBarrier-subresourceRange-01725**
  If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the arrayLayers specified in VkImageCreateInfo when image was created

- **VUID-VkImageMemoryBarrier-image-01932**
  If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-VkImageMemoryBarrier-oldLayout-01208**
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT
• VUID-VkImageMemoryBarrier-oldLayout-01209
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

• VUID-VkImageMemoryBarrier-oldLayout-01210
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

• VUID-VkImageMemoryBarrier-oldLayout-01211
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

• VUID-VkImageMemoryBarrier-oldLayout-01212
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`.

• VUID-VkImageMemoryBarrier-oldLayout-01213
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT`.

• VUID-VkImageMemoryBarrier-newLayout-01198
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` then image must have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then image must have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set.

If the `synchronization2` feature is not enabled, layout must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and `oldLayout` or newLayout is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

If image has a single-plane color format or is not disjoint, then the aspectMask member of subresourceRange must be `VK_IMAGE_ASPECT_COLOR_BIT`.
If image has a multi-planar format and the image is disjoint, then the aspectMask member of subresourceRange must include either at least one of VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, and VK_IMAGE_ASPECT_PLANE_2_BIT; or must include VK_IMAGE_ASPECT_COLOR_BIT.

If image has a multi-planar format with only two planes, then the aspectMask member of subresourceRange must not include VK_IMAGE_ASPECT_PLANE_2_BIT.

If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is enabled, then the aspectMask member of subresourceRange must include either or both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT.

If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is not enabled, then the aspectMask member of subresourceRange must include both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT.

If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one must not be a special queue family reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer.

If image was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, and one of srcQueueFamilyIndex and dstQueueFamilyIndex is one of the special queue family values reserved for external memory transfers, the other must be VK_QUEUE_FAMILY_IGNORED.

If image was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex and dstQueueFamilyIndex must both be valid queue families, or one of the special queue family values reserved for external memory transfers, as described in Queue Family Ownership Transfer.

If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT then image must have been created with either the VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT usage bits, and the VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT or VK_IMAGE_USAGE_SAMPLED_BIT usage bits, and the VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT usage bit.

If the attachmentFeedbackLoopLayout feature is not enabled, newLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT.
If the synchronization2 feature is not enabled, and image was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, at least one of srcQueueFamilyIndex and dstQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED.

Valid Usage (Implicit)

- **VUID-VkImageMemoryBarrier-sType-sType**
  - sType must be VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER
- **VUID-VkImageMemoryBarrier-pNext-pNext**
  - pNext must be NULL or a pointer to a valid instance of VkSampleLocationsInfoEXT
- **VUID-VkImageMemoryBarrier-sType-unique**
  - The sType value of each struct in the pNext chain must be unique
- **VUID-VkImageMemoryBarrier-oldLayout-parameter**
  - oldLayout must be a valid VkImageLayout value
- **VUID-VkImageMemoryBarrier-newLayout-parameter**
  - newLayout must be a valid VkImageLayout value
- **VUID-VkImageMemoryBarrier-image-parameter**
  - image must be a valid VkImage handle
- **VUID-VkImageMemoryBarrier-subresourceRange-parameter**
  - subresourceRange must be a valid VkImageSubresourceRange structure

7.7.4. Queue Family Ownership Transfer

Resources created with a VkSharingMode of VK_SHARING_MODE_EXCLUSIVE must have their ownership explicitly transferred from one queue family to another in order to access their content in a well-defined manner on a queue in a different queue family.

The special queue family index VK_QUEUE_FAMILY_IGNORED indicates that a queue family parameter or member is ignored.

```c
#define VK_QUEUE_FAMILY_IGNORED  (-0U)
```

Resources shared with external APIs or instances using external memory must also explicitly manage ownership transfers between local and external queues (or equivalent constructs in external APIs) regardless of the VkSharingMode specified when creating them.

The special queue family index VK_QUEUE_FAMILY_EXTERNAL represents any queue external to the resource's current Vulkan instance, as long as the queue uses the same underlying device group or physical device, and the same driver version as the resource's VkDevice, as indicated by VkPhysicalDeviceIDProperties::deviceUUID and VkPhysicalDeviceIDProperties::driverUUID.
```
#define VK_QUEUE_FAMILY_EXTERNAL (~1U)
```

or the equivalent

```
#define VK_QUEUE_FAMILY_EXTERNAL_KHR VK_QUEUE_FAMILY_EXTERNAL
```

The special queue family index `VK_QUEUE_FAMILY_FOREIGN_EXT` represents any queue external to the resource's current Vulkan instance, regardless of the queue's underlying physical device or driver version. This includes, for example, queues for fixed-function image processing devices, media codec devices, and display devices, as well as all queues that use the same underlying device group or physical device, and the same driver version as the resource's `VkDevice`.

```
#define VK_QUEUE_FAMILY_FOREIGN_EXT (~2U)
```

If memory dependencies are correctly expressed between uses of such a resource between two queues in different families, but no ownership transfer is defined, the contents of that resource are undefined for any read accesses performed by the second queue family.

**Note**

If an application does not need the contents of a resource to remain valid when transferring from one queue family to another, then the ownership transfer should be skipped.

**Note**

Applications should expect transfers to/from `VK_QUEUE_FAMILY_FOREIGN_EXT` to be more expensive than transfers to/from `VK_QUEUE_FAMILY_EXTERNAL_KHR`.

A queue family ownership transfer consists of two distinct parts:

1. Release exclusive ownership from the source queue family
2. Acquire exclusive ownership for the destination queue family

An application must ensure that these operations occur in the correct order by defining an execution dependency between them, e.g. using a semaphore.

A release operation is used to release exclusive ownership of a range of a buffer or image subresource range. A release operation is defined by executing a buffer memory barrier (for a buffer range) or an image memory barrier (for an image subresource range) using a pipeline barrier command, on a queue from the source queue family. The `srcQueueFamilyIndex` parameter of the barrier must be set to the source queue family index, and the `dstQueueFamilyIndex` parameter to the destination queue family index. `dstAccessMask` is ignored for such a barrier, such that no visibility operation is executed - the value of this mask does not affect the validity of the barrier. The release operation happens-after the availability operation, and happens-before operations specified in the second synchronization scope of the calling command.
An *acquire operation* is used to acquire exclusive ownership of a range of a buffer or image subresource range. An acquire operation is defined by executing a *buffer memory barrier* (for a buffer range) or an *image memory barrier* (for an image subresource range) using a pipeline barrier command, on a queue from the destination queue family. The buffer range or image subresource range specified in an acquire operation *must* match exactly that of a previous release operation. The *srcQueueFamilyIndex* parameter of the barrier *must* be set to the source queue family index, and the *dstQueueFamilyIndex* parameter to the destination queue family index. *srcAccessMask* is ignored for such a barrier, such that no availability operation is executed - the value of this mask does not affect the validity of the barrier. The acquire operation happens-after operations in the first synchronization scope of the calling command, and happens-before the visibility operation.

**Note**

Whilst it is not invalid to provide destination or source access masks for memory barriers used for release or acquire operations, respectively, they have no practical effect. Access after a release operation has undefined results, and so visibility for those accesses has no practical effect. Similarly, write access before an acquire operation will produce undefined results for future access, so availability of those writes has no practical use. In an earlier version of the specification, these were required to match on both sides - but this was subsequently relaxed. These masks *should* be set to 0.

If the transfer is via an image memory barrier, and an *image layout transition* is desired, then the values of *oldLayout* and *newLayout* in the *release operation*'s memory barrier *must* be equal to values of *oldLayout* and *newLayout* in the *acquire operation*'s memory barrier. Although the image layout transition is submitted twice, it will only be executed once. A layout transition specified in this way happens-after the *release operation* and happens-before the *acquire operation*.

If the values of *srcQueueFamilyIndex* and *dstQueueFamilyIndex* are equal, no ownership transfer is performed, and the barrier operates as if they were both set to *VK_QUEUE_FAMILY_IGNORED*.

Queue family ownership transfers *may* perform read and write accesses on all memory bound to the image subresource or buffer range, so applications *must* ensure that all memory writes have been made *available* before a queue family ownership transfer is executed. Available memory is automatically made visible to queue family release and acquire operations, and writes performed by those operations are automatically made available.

Once a queue family has acquired ownership of a buffer range or image subresource range of a *VK_SHARING_MODE_EXCLUSIVE* resource, its contents are undefined to other queue families unless ownership is transferred. The contents of any portion of another resource which aliases memory that is bound to the transferred buffer or image subresource range are undefined after a release or acquire operation.

**Note**

Because *events cannot* be used directly for inter-queue synchronization, and because *vkCmdSetEvent* does not have the queue family index or memory barrier parameters needed by a *release operation*, the release and acquire operations of a queue family ownership transfer can only be performed using *vkCmdPipelineBarrier*. 
7.8. Wait Idle Operations

To wait on the host for the completion of outstanding queue operations for a given queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueWaitIdle(
    VkQueue queue);
```

- `queue` is the queue on which to wait.

`vkQueueWaitIdle` is equivalent to having submitted a valid fence to every previously executed queue submission command that accepts a fence, then waiting for all of those fences to signal using `vkWaitForFences` with an infinite timeout and `waitAll` set to `VK_TRUE`.

### Valid Usage (Implicit)

- VUID-vkQueueWaitIdle-queue-parameter `queue` must be a valid `VkQueue` handle

### Host Synchronization

- Host access to `queue` must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
</table>

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

To wait on the host for the completion of outstanding queue operations for all queues on a given logical device, call:
 VkResult vkDeviceWaitIdle( VkDevice device);

- `device` is the logical device to idle.

`vkDeviceWaitIdle` is equivalent to calling `vkQueueWaitIdle` for all queues owned by `device`.

**Valid Usage (Implicit)**

- `VUID-vkDeviceWaitIdle-device-parameter`
  
  `device` must be a valid `VkDevice` handle

**Host Synchronization**

- Host access to all `VkQueue` objects created from `device` must be externally synchronized

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

### 7.9. Host Write Ordering Guarantees

When batches of command buffers are submitted to a queue via a `queue submission command`, it defines a memory dependency with prior host operations, and execution of command buffers submitted to the queue.

The first **synchronization scope** is defined by the host execution model, but includes execution of `vkQueueSubmit` on the host and anything that happened-before it.

The second **synchronization scope** includes all commands submitted in the same `queue submission`, and all commands that occur later in `submission order`.

The first **access scope** includes all host writes to mappable device memory that are available to the host memory domain.

The second **access scope** includes all memory access performed by the device.
7.10. Synchronization and Multiple Physical Devices

If a logical device includes more than one physical device, then fences, semaphores, and events all still have a single instance of the signaled state.

A fence becomes signaled when all physical devices complete the necessary queue operations.

Semaphore wait and signal operations all include a device index that is the sole physical device that performs the operation. These indices are provided in the `VkDeviceGroupSubmitInfo` and `VkDeviceGroupBindSparseInfo` structures. Semaphores are not exclusively owned by any physical device. For example, a semaphore can be signaled by one physical device and then waited on by a different physical device.

An event can only be waited on by the same physical device that signaled it (or the host).

7.11. Calibrated timestamps

In order to be able to correlate the time a particular operation took place at on timelines of different time domains (e.g. a device operation vs. a host operation), Vulkan allows querying calibrated timestamps from multiple time domains.

To query calibrated timestamps from a set of time domains, call:

```c
// Provided by VK_EXT_calibrated_timestamps
VkResult vkGetCalibratedTimestampsEXT(
    VkDevice device,
    uint32_t timestampCount,
    const VkCalibratedTimestampInfoEXT* pTimestampInfos,
    uint64_t* pTimestamps,
    uint64_t* pMaxDeviation);
```

- `device` is the logical device used to perform the query.
- `timestampCount` is the number of timestamps to query.
- `pTimestampInfos` is a pointer to an array of `timestampCount` `VkCalibratedTimestampInfoEXT` structures, describing the time domains the calibrated timestamps should be captured from.
- `pTimestamps` is a pointer to an array of `timestampCount` 64-bit unsigned integer values in which the requested calibrated timestamp values are returned.
- `pMaxDeviation` is a pointer to a 64-bit unsigned integer value in which the strictly positive maximum deviation, in nanoseconds, of the calibrated timestamp values is returned.

Note

The maximum deviation may vary between calls to `vkGetCalibratedTimestampsEXT` even for the same set of time domains due to implementation and platform specific reasons. It is the application’s responsibility to assess whether the returned maximum deviation makes the timestamp values suitable for any particular purpose and can choose to re-issue the timestamp calibration call.
pursuing a lower deviation value.

Calibrated timestamp values can be extrapolated to estimate future coinciding timestamp values, however, depending on the nature of the time domains and other properties of the platform extrapolating values over a sufficiently long period of time may no longer be accurate enough to fit any particular purpose, so applications are expected to re-calibrate the timestamps on a regular basis.

### Valid Usage (Implicit)

- VUID-vkGetCalibratedTimestampsEXT-device-parameter  
  `device` must be a valid `VkDevice` handle

- VUID-vkGetCalibratedTimestampsEXT-pTimestampInfos-parameter  
  `pTimestampInfos` must be a valid pointer to an array of `timestampCount` valid `VkCalibratedTimestampInfoEXT` structures

- VUID-vkGetCalibratedTimestampsEXT-pTimestamps-parameter  
  `pTimestamps` must be a valid pointer to an array of `timestampCount` `uint64_t` values

- VUID-vkGetCalibratedTimestampsEXT-pMaxDeviation-parameter  
  `pMaxDeviation` must be a valid pointer to a `uint64_t` value

- VUID-vkGetCalibratedTimestampsEXT-timestampCount-arraylength  
  `timestampCount` must be greater than 0

### Return Codes

#### Success
- VK_SUCCESS

#### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OFDEVICE_MEMORY

The `VkCalibratedTimestampInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_calibrated_timestamps
typedef struct VkCalibratedTimestampInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkTimeDomainEXT timeDomain;
} VkCalibratedTimestampInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `timeDomain` is a `VkTimeDomainEXT` value specifying the time domain from which the calibrated
timestamp value should be returned.

### Valid Usage

- VUID-VkCalibratedTimestampInfoEXT-timeDomain-02354
tIME DomaIn must be one of the VkTimeDomainEXT values returned by vkGetPhysicalDeviceCalibrateableTimeDomainsEXT

### Valid Usage (Implicit)

- VUID-VkCalibratedTimestampInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_CALIBRATED_TIMESTAMP_INFO_EXT
- VUID-VkCalibratedTimestampInfoEXT-pNext-pNext
  pNext must be NULL
- VUID-VkCalibratedTimestampInfoEXT-timeDomain-parameter
  timeDomain must be a valid VkTimeDomainEXT value

The set of supported time domains consists of:

```c
// Provided by VK_EXT_calibrated_timestamps
typedef enum VkTimeDomainEXT {
    VK_TIME_DOMAIN_DEVICE_EXT = 0,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_EXT = 1,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_EXT = 2,
    VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_EXT = 3,
} VkTimeDomainEXT;
```

- **VK_TIME_DOMAIN_DEVICE_EXT** specifies the device time domain. Timestamp values in this time domain use the same units and are comparable with device timestamp values captured using vkCmdWriteTimestamp or vkCmdWriteTimestamp2 and are defined to be incrementing according to the timestampPeriod of the device.

- **VK_TIME_DOMAIN_CLOCK_MONOTONIC_EXT** specifies the CLOCK_MONOTONIC time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX clock_gettime API as computed by this example:

```c
Note
An implementation supporting VK_EXT_calibrated_timestamps will use the same time domain for all its VkQueue so that timestamp values reported for VK_TIME_DOMAIN_DEVICE_EXT can be matched to any timestamp captured through vkCmdWriteTimestamp or vkCmdWriteTimestamp2.
```

```c
struct timespec tv;
```
clock_gettime(CLOCK_MONOTONIC, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;

• **VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_EXT** specifies the CLOCK_MONOTONIC_RAW time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX clock_gettime API as computed by this example:

```c
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC_RAW, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

• **VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_EXT** specifies the performance counter (QPC) time domain available on Windows. Timestamp values in this time domain are in the same units as those provided by the Windows QueryPerformanceCounter API and are comparable with platform timestamp values captured using that API as computed by this example:

```c
LARGE_INTEGER counter;
QueryPerformanceCounter(&counter);
return counter.QuadPart;
```
Chapter 8. Render Pass

**Draw commands** must be recorded within a *render pass instance*. Each render pass instance defines a set of image resources, referred to as *attachments*, used during rendering.

To begin a render pass instance, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBeginRendering(
    VkCommandBuffer commandBuffer,
    const VkRenderingInfo* pRenderingInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_dynamic_rendering
void vkCmdBeginRenderingKHR(
    VkCommandBuffer commandBuffer,
    const VkRenderingInfo* pRenderingInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderingInfo` is a pointer to a `VkRenderingInfo` structure specifying details of the render pass instance to begin.

After beginning a render pass instance, the command buffer is ready to record *draw commands*.

If `pRenderingInfo->flags` includes `VK_RENDERING_RESUMING_BIT` then this render pass is resumed from a render pass instance that has been suspended earlier in submission order.

### Valid Usage

- VUID-vkCmdBeginRendering-dynamicRendering-06446: The *dynamicRendering* feature must be enabled
- VUID-vkCmdBeginRendering-commandBuffer-06068: If `commandBuffer` is a secondary command buffer, `pRenderingInfo->flags` must not include `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`

### Valid Usage (Implicit)

- VUID-vkCmdBeginRendering-commandBuffer-parameter: `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdBeginRendering-pRenderingInfo-parameter: `pRenderingInfo` must be a valid pointer to a valid `VkRenderingInfo` structure
- VUID-vkCmdBeginRendering-commandBuffer-recording

434
commandBuffer must be in the recording state

- VUID-vkCmdBeginRendering-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBeginRendering-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBeginRendering-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>

The VkRenderingInfo structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkRenderingInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderingFlags flags;
    VkRect2D renderArea;
    uint32_t layerCount;
    uint32_t viewMask;
    const VkRenderingAttachmentInfo* pColorAttachments;
    const VkRenderingAttachmentInfo* pDepthAttachment;
    const VkRenderingAttachmentInfo* pStencilAttachment;
} VkRenderingInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering, VK_QCOM_tile_properties
typedef VkRenderingInfo VkRenderingInfoKHR;
```
- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkRenderingFlagBits**.
- **renderArea** is the render area that is affected by the render pass instance.
- **layerCount** is the number of layers rendered to in each attachment when **viewMask** is 0.
- **viewMask** is the view mask indicating the indices of attachment layers that will be rendered when it is not 0.
- **colorAttachmentCount** is the number of elements in **pColorAttachments**.
- **pColorAttachments** is a pointer to an array of **colorAttachmentCount** **VkRenderingAttachmentInfo** structures describing any color attachments used.
- **pDepthAttachment** is a pointer to a **VkRenderingAttachmentInfo** structure describing a depth attachment.
- **pStencilAttachment** is a pointer to a **VkRenderingAttachmentInfo** structure describing a stencil attachment.

If **viewMask** is not 0, multiview is enabled.

If there is an instance of **VkDeviceGroupRenderPassBeginInfo** included in the **pNext** chain and its **deviceCount** member is not 0, then **renderArea** is ignored, and the render area is defined per-device by that structure.

Each element of the **pColorAttachments** array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a **Location** value of X, then it uses the attachment provided in **pColorAttachments[X]**. If the **imageView** member of any element of **pColorAttachments** that are not **VK_NULL_HANDLE** must have been created with the same **sampleCount**.

---

**Valid Usage**

- **VUID-VkRenderingInfo-viewMask-06069**
  If **viewMask** is 0, **layerCount** must not be 0

- **VUID-VkRenderingInfo-multisampledRenderToSingleSampled-06857**
  If none of the **VK_AMD_mixed_attachment_samples** extension, the **VK_NV_framebuffer_mixed_samples** extension, or the **multisampledRenderToSingleSampled** feature are enabled, **imageView** members of **pDepthAttachment**, **pStencilAttachment**, and elements of **pColorAttachments** that are not **VK_NULL_HANDLE** must have been created with the same **sampleCount**.

- **VUID-VkRenderingInfo-imageView-06858**
  If **multisampled-render-to-single-sampled** is enabled, then all attachments referenced by **imageView** members of **pDepthAttachment**, **pStencilAttachment**, and elements of **pColorAttachments** that are not **VK_NULL_HANDLE** must have a sample count that is either **VK_SAMPLE_COUNT_1_BIT** or equal to **VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples**.
If `multisampled-render-to-single-sampled` is enabled, then all attachments referenced by `imageView` members of `pDepthAttachment`, `pStencilAttachment`, and elements of `pColorAttachments` that are not `VK_NULL_HANDLE` and have a sample count of `VK_SAMPLE_COUNT_1_BIT` must have been created with `VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT` in their `VkImageCreateInfo::flags`.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` must be greater than or equal to 0.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` must be greater than or equal to 0.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the width of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` must be greater than or equal to `renderArea.offset.x + renderArea.extent.width`.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the height of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` must be greater than or equal to `renderArea.offset.y + renderArea.extent.height`.

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, the width of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` must be greater than or equal to the sum of the `offset.x` and `extent.width` members of each element of `pDeviceRenderAreas`.

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, the height of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` must be greater than or equal to the sum of the `offset.y` and `extent.height` members of each element of `pDeviceRenderAreas`.

If neither `pDepthAttachment` or `pStencilAttachment` are NULL and the `imageView` member of either structure is not `VK_NULL_HANDLE`, the `imageView` member of each structure must be the same.

If neither `pDepthAttachment` or `pStencilAttachment` are NULL, and the `resolveMode` member of each is not `VK_RESOLVE_MODE_NONE`, the `resolveImageView` member of each structure must be the same.
• VUID-VkRenderingInfo-colorAttachmentCount-06087
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, that imageView must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

• VUID-VkRenderingInfo-pDepthAttachment-06547
  If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->imageView must have been created with a format that includes a depth aspect

• VUID-VkRenderingInfo-pDepthAttachment-06088
  If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->imageView must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkRenderingInfo-pStencilAttachment-06548
  If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->imageView must have been created with a format that includes a stencil aspect

• VUID-VkRenderingInfo-pStencilAttachment-06089
  If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->imageView must have been created with a stencil usage including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkRenderingInfo-colorAttachmentCount-06090
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, the layout member of that element of pColorAttachments must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkRenderingInfo-colorAttachmentCount-06091
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, if the resolveMode member of that element of pColorAttachments is not VK_RESOLVE_MODE_NONE, its resolveImageLayout member must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkRenderingInfo-pDepthAttachment-06092
  If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->layout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

• VUID-VkRenderingInfo-pDepthAttachment-06093
  If pDepthAttachment is not NULL, pDepthAttachment->imageView is not VK_NULL_HANDLE, and pDepthAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pDepthAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

• VUID-VkRenderingInfo-pStencilAttachment-06094
  If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->layout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

• VUID-VkRenderingInfo-pStencilAttachment-06095
  If pStencilAttachment is not NULL, pStencilAttachment->imageView is not VK_NULL_HANDLE,
and pStencilAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pStencilAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

- VUID-VkRenderingInfo-colorAttachmentCount-06096
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, the layout member of that element of pColorAttachments must not be VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderingInfo-colorAttachmentCount-06097
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, if the resolveMode member of that element of pColorAttachments is not VK_RESOLVE_MODE_NONE, its resolveImageLayout member must not be VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderingInfo-pDepthAttachment-06098
  If pDepthAttachment is not NULL, pDepthAttachment->imageView is not VK_NULL_HANDLE, and pDepthAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pDepthAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkRenderingInfo-pStencilAttachment-06099
  If pStencilAttachment is not NULL, pStencilAttachment->imageView is not VK_NULL_HANDLE, and pStencilAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pStencilAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderingInfo-colorAttachmentCount-06100
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, the layout member of that element of pColorAttachments must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderingInfo-colorAttachmentCount-06101
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, if the resolveMode member of that element of pColorAttachments is not VK_RESOLVE_MODE_NONE, its resolveImageLayout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderingInfo-pDepthAttachment-06102
  If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->resolveMode must be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes

- VUID-VkRenderingInfo-pStencilAttachment-06103
  If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->resolveMode must be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes
If \texttt{pDepthAttachment} or \texttt{pStencilAttachment} are both not \texttt{NULL}, \texttt{pDepthAttachment->imageView} and \texttt{pStencilAttachment->imageView} are both not \texttt{VK_NULL_HANDLE}, and \texttt{VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone} is \texttt{VK_FALSE}, the \texttt{resolveMode} of both structures \textbf{must} be the same value.

If \texttt{pDepthAttachment} or \texttt{pStencilAttachment} are both not \texttt{NULL}, \texttt{pDepthAttachment->imageView} and \texttt{pStencilAttachment->imageView} are both not \texttt{VK_NULL_HANDLE}, \texttt{VkPhysicalDeviceDepthStencilResolveProperties::independentResolve} is \texttt{VK_FALSE}, and the \texttt{resolveMode} of neither structure is \texttt{VK_RESOLVE_MODE_NONE}, the \texttt{resolveMode} of both structures \textbf{must} be the same value.

\texttt{colorAttachmentCount} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceLimits::maxColorAttachments}.

If the \texttt{imageView} member of a \texttt{VkRenderingFragmentDensityMapAttachmentInfoEXT} structure included in the \texttt{pNext} chain is not \texttt{VK_NULL_HANDLE}, and the \texttt{fragmentDensityMapNonSubsampledImages} feature is not enabled, valid \texttt{imageView} and \texttt{resolveImageView} members of \texttt{pDepthAttachment}, \texttt{pStencilAttachment}, and each element of \texttt{pColorAttachments} \textbf{must} be a \texttt{VkImageView} created with \texttt{VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT}.

If the \texttt{imageView} member of a \texttt{VkRenderingFragmentDensityMapAttachmentInfoEXT} structure included in the \texttt{pNext} chain is not \texttt{VK_NULL_HANDLE}, and \texttt{viewMask} is not \texttt{0}, \texttt{imageView} \textbf{must} have a \texttt{layerCount} greater than or equal to the index of the most significant bit in \texttt{viewMask}.

If the \texttt{imageView} member of a \texttt{VkRenderingFragmentDensityMapAttachmentInfoEXT} structure included in the \texttt{pNext} chain is not \texttt{VK_NULL_HANDLE}, and \texttt{viewMask} is \texttt{0}, \texttt{imageView} \textbf{must} have a \texttt{layerCount} equal to \texttt{1}.

If the \texttt{pNext} chain does not contain \texttt{VkDeviceGroupRenderPassBeginInfo} or its \texttt{deviceRenderAreaCount} member is equal to \texttt{0} and the \texttt{imageView} member of a \texttt{VkRenderingFragmentDensityMapAttachmentInfoEXT} structure included in the \texttt{pNext} chain is not \texttt{VK_NULL_HANDLE}, \texttt{imageView} \textbf{must} have a width greater than or equal to \[
\left\lceil \frac{\text{renderArea}_{\text{width}}}{\text{maxFragmentDensityTexImageSize}_{\text{width}}} \right\rceil
\]

If the \texttt{pNext} chain contains a \texttt{VkDeviceGroupRenderPassBeginInfo} structure, its \texttt{deviceRenderAreaCount} member is not \texttt{0}, and the \texttt{imageView} member of a \texttt{VkRenderingFragmentDensityMapAttachmentInfoEXT} structure included in the \texttt{pNext} chain is not \texttt{VK_NULL_HANDLE}, \texttt{imageView} \textbf{must} have a width greater than or equal to \[
\left\lceil \frac{\text{deviceRenderArea}_{\text{width}}}{\text{maxFragmentDensityTexImageSize}_{\text{width}}} \right\rceil
\]

For each element of \texttt{pDeviceRenderAreas}, \texttt{imageView} \textbf{must} have a width greater than or equal to \[
\left\lceil \frac{\text{deviceRenderArea}_{\text{width}}}{\text{maxFragmentDensityTexImageSize}_{\text{width}}} \right\rceil
\]
VkRenderingFragmentDensityMapAttachmentInfoEXT structure included in the pNext chain is not VK_NULL_HANDLE, imageView must have a height greater than or equal to:

\[
max_{\text{FragmentDensityTexelSize}} \times \frac{\text{imageView}}{\text{deviceRenderAreaSizeY}} + \frac{\text{imageView}}{\text{deviceRenderAreaSizeHeight}}
\]

• VUID-VkRenderingInfo-pNext-06115
If the pNext chain contains a VkDeviceGroupRenderPassBeginInfo structure, its deviceRenderAreaCount member is not 0, and the imageView member of a VkRenderingFragmentDensityMapAttachmentInfoEXT structure included in the pNext chain is not VK_NULL_HANDLE, imageView must have a height greater than or equal to:

\[
max_{\text{FragmentDensityTexelSize}} \times \frac{\text{imageView}}{\text{deviceRenderAreaSizeY}} + \frac{\text{imageView}}{\text{deviceRenderAreaSizeHeight}}
\]

• VUID-VkRenderingInfo-imageView-06116
If the imageView member of a VkRenderingFragmentDensityMapAttachmentInfoEXT structure included in the pNext chain is not VK_NULL_HANDLE, it must not be equal to the imageView or resolveImageView member of pDepthAttachment, pStencilAttachment, or any element of pColorAttachments.

• VUID-VkRenderingInfo-pNext-06119
If the pNext chain does not contain VkDeviceGroupRenderPassBeginInfo or its deviceRenderAreaCount member is equal to 0 and the imageView member of a VkRenderingFragmentShadingRateAttachmentInfoKHR structure included in the pNext chain is not VK_NULL_HANDLE, imageView must have a width greater than or equal to:

\[
\text{deviceRenderAreaSizeX} + \frac{\text{imageView}}{\text{deviceRenderAreaSizeWidth}}
\]

• VUID-VkRenderingInfo-pNext-06120
If the pNext chain contains a VkDeviceGroupRenderPassBeginInfo structure, its deviceRenderAreaCount member is not 0, and the imageView member of a VkRenderingFragmentShadingRateAttachmentInfoKHR structure included in the pNext chain is not VK_NULL_HANDLE, imageView must have a width greater than or equal to:

\[
\text{deviceRenderAreaSizeX} + \frac{\text{imageView}}{\text{deviceRenderAreaSizeWidth}}
\]

• VUID-VkRenderingInfo-pNext-06121
If the pNext chain does not contain VkDeviceGroupRenderPassBeginInfo or its deviceRenderAreaCount member is equal to 0 and the imageView member of a VkRenderingFragmentShadingRateAttachmentInfoKHR structure included in the pNext chain is not VK_NULL_HANDLE, imageView must have a height greater than or equal to:

\[
\text{deviceRenderAreaSizeY} + \frac{\text{imageView}}{\text{deviceRenderAreaSizeHeight}}
\]

• VUID-VkRenderingInfo-pNext-06122
If the pNext chain contains a VkDeviceGroupRenderPassBeginInfo structure, its deviceRenderAreaCount member is not 0, and the imageView member of a VkRenderingFragmentShadingRateAttachmentInfoKHR structure included in the pNext chain is not VK_NULL_HANDLE, imageView must have a height greater than or equal to:

\[
\text{deviceRenderAreaSizeY} + \frac{\text{imageView}}{\text{deviceRenderAreaSizeHeight}}
\]

• VUID-VkRenderingInfo-imageView-06123
If the imageView member of a VkRenderingFragmentShadingRateAttachmentInfoKHR structure included in the pNext chain is not VK_NULL_HANDLE, and viewMask is 0, imageView must have a layerCount that is either equal to 1 or greater than or equal to layerCount.

• VUID-VkRenderingInfo-imageView-06124
If the imageView member of a VkRenderingFragmentShadingRateAttachmentInfoKHR structure included in the pNext chain is not VK_NULL_HANDLE, imageView must have a layerCount that is either equal to 1 or greater than or equal to layerCount.
structure included in the pNext chain is not VK_NULL_HANDLE, and viewMask is not 0, imageView must have a layerCount that either equal to 1 or greater than or equal to the index of the most significant bit in viewMask

- **VUID-VkRenderingInfo-imageView-06125**
  If the imageView member of a VkRenderingFragmentShadingRateAttachmentInfoKHR structure included in the pNext chain is not VK_NULL_HANDLE, it must not be equal to the imageView or resolveImageView member of pDepthAttachment, pStencilAttachment, or any element of pColorAttachments

- **VUID-VkRenderingInfo-imageView-06126**
  If the imageView member of a VkRenderingFragmentShadingRateAttachmentInfoKHR structure included in the pNext chain is not VK_NULL_HANDLE, it must not be equal to the imageView member of a VkRenderingFragmentDensityMapAttachmentInfoEXT structure included in the pNext chain

- **VUID-VkRenderingInfo-multiview-06127**
  If the multiview feature is not enabled, viewMask must be 0

- **VUID-VkRenderingInfo-viewMask-06128**
  The index of the most significant bit in viewMask must be less than maxMultiviewViewCount

---

**Valid Usage (Implicit)**

- **VUID-VkRenderingInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_RENDERING_INFO

- **VUID-VkRenderingInfo-pNext-pNext**
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceGroupRenderPassBeginInfo, VkMultisampledRenderToSingleSampledInfoEXT, VkMultiviewPerViewAttributesInfoNVX, VkRenderingFragmentDensityMapAttachmentInfoEXT, or VkRenderingFragmentShadingRateAttachmentInfoKHR

- **VUID-VkRenderingInfo-sType-unique**
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkRenderingInfo-flags-parameter**
  flags must be a valid combination of VkRenderingFlagBits values

- **VUID-VkRenderingInfo-pColorAttachments-parameter**
  If colorAttachmentCount is not 0, pColorAttachments must be a valid pointer to an array of colorAttachmentCount valid VkRenderingAttachmentInfo structures

- **VUID-VkRenderingInfo-pDepthAttachment-parameter**
  If pDepthAttachment is not NULL, pDepthAttachment must be a valid pointer to a valid VkRenderingAttachmentInfo structure

- **VUID-VkRenderingInfo-pStencilAttachment-parameter**
  If pStencilAttachment is not NULL, pStencilAttachment must be a valid pointer to a valid VkRenderingAttachmentInfo structure
Bits which can be set in `VkRenderingInfo::flags` describing additional properties of the render pass are:

```c
// Provided by VK_VERSION_1_3
typedef enum VkRenderingFlagBits {
    VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT = 0x00000001,
    VK_RENDERING_SUSPENDING_BIT = 0x00000002,
    VK_RENDERING_RESUMING_BIT = 0x00000004,
} VkRenderingFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingFlagBits VkRenderingFlagBitsKHR;
```

- `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT` specifies that draw calls for the render pass instance will be recorded in secondary command buffers.
- `VK_RENDERING_RESUMING_BIT` specifies that the render pass instance is resuming an earlier suspended render pass instance.
- `VK_RENDERING_SUSPENDING_BIT` specifies that the render pass instance will be suspended.
- `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT` specifies that Legacy Dithering is enabled for the render pass instance.

The contents of `pRenderingInfo` must match between suspended render pass instances and the render pass instances that resume them, other than the presence or absence of the `VK_RENDERING_RESUMING_BIT`, `VK_RENDERING_SUSPENDING_BIT`, and `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT` flags. No action or synchronization commands, or other render pass instances, are allowed between suspending and resuming render pass instances.

```c
// Provided by VK_VERSION_1_3
typedef VkFlags VkRenderingFlags;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingFlags VkRenderingFlagsKHR;
```
**VkRenderingFlags** is a bitmask type for setting a mask of zero or more **VkRenderingFlagBits**.

The **VkRenderingAttachmentInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkRenderingAttachmentInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageView imageView;
    VkImageLayout imageLayout;
    VkResolveModeFlagBits resolveMode;
    VkImageView resolveImageView;
    VkImageLayout resolveImageLayout;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkClearValue clearValue;
} VkRenderingAttachmentInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingAttachmentInfo VkRenderingAttachmentInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **imageView** is the image view that will be used for rendering.
- **imageLayout** is the layout that **imageView** will be in during rendering.
- **resolveMode** is a **VkResolveModeFlagBits** value defining how multisampled data written to **imageView** will be resolved.
- **resolveImageView** is an image view used to write resolved multisample data at the end of rendering.
- **resolveImageLayout** is the layout that **resolveImageView** will be in during rendering.
- **loadOp** is a **VkAttachmentLoadOp** value specifying how the contents of **imageView** are treated at the start of the render pass instance.
- **storeOp** is a **VkAttachmentStoreOp** value specifying how the contents of **imageView** are treated at the end of the render pass instance.
- **clearValue** is a **VkClearValue** structure defining values used to clear **imageView** when **loadOp** is **VK_ATTACHMENT_LOAD_OP_CLEAR**.

Values in **imageView** are loaded and stored according to the values of **loadOp** and **storeOp**, within the render area for each device specified in **VkRenderingInfo**. If **imageView** is **VK_NULL_HANDLE**, other members of this structure are ignored; writes to this attachment will be discarded, and no load, store, or resolve operations will be performed.
If `resolveMode` is `VK_RESOLVE_MODE_NONE`, then `resolveImageView` is ignored. If `resolveMode` is not `VK_RESOLVE_MODE_NONE`, and `resolveImageView` is not `VK_NULL_HANDLE`, values in `resolveImageView` within the render area become undefined once rendering begins. At the end of rendering, the color values written to each pixel location in `imageView` will be resolved according to `resolveMode` and stored into the the same location in `resolveImageView`.

**Note**
The resolve mode and store operation are independent; it is valid to write both resolved and unresolved values, and equally valid to discard the unresolved values while writing the resolved ones.

Store and resolve operations are only performed at the end of a render pass instance that does not specify the `VK_RENDERING_SUSPENDING_BIT_KHR` flag.

Load operations are only performed at the beginning of a render pass instance that does not specify the `VK_RENDERING_RESUMING_BIT_KHR` flag.

Image contents at the end of a suspended render pass instance remain defined for access by a resuming render pass instance.

**Valid Usage**

- **VUID-VkRenderingAttachmentInfo-imageView-06129**
  If `imageView` is not `VK_NULL_HANDLE` and has a non-integer color format, `resolveMode` **must** be `VK_RESOLVE_MODE_NONE` or `VK_RESOLVE_MODE_AVERAGE_BIT`

- **VUID-VkRenderingAttachmentInfo-imageView-06130**
  If `imageView` is not `VK_NULL_HANDLE` and has an integer color format, `resolveMode` **must** be `VK_RESOLVE_MODE_NONE` or `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT`

- **VUID-VkRenderingAttachmentInfo-imageView-06861**
  If `imageView` is not `VK_NULL_HANDLE`, `resolveMode` is not `VK_RESOLVE_MODE_NONE`, and the `pNext` chain of `VkRenderingInfo` does not includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the `multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`, `imageView` **must** not have a sample count of `VK_SAMPLE_COUNT_1_BIT`

- **VUID-VkRenderingAttachmentInfo-imageView-06862**
  If `imageView` is not `VK_NULL_HANDLE`, `resolveMode` is not `VK_RESOLVE_MODE_NONE`, and the `pNext` chain of `VkRenderingInfo` does not includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the `multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`, `resolveImageView` **must** not be `VK_NULL_HANDLE`

- **VUID-VkRenderingAttachmentInfo-imageView-06863**
  If `imageView` is not `VK_NULL_HANDLE`, `resolveMode` is not `VK_RESOLVE_MODE_NONE`, the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the `multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`, and `imageView` has a sample count of `VK_SAMPLE_COUNT_1_BIT`, `resolveImageView` **must** be `VK_NULL_HANDLE`
If imageView is not VK_NULL_HANDLE, resolveImageView is not VK_NULL_HANDLE, and resolveMode is not VK_RESOLVE_MODE_NONE, resolveImageView must have a sample count of VK_SAMPLE_COUNT_1_BIT.

If imageView is not VK_NULL_HANDLE, resolveImageView is not VK_NULL_HANDLE, and resolveMode is not VK_RESOLVE_MODE_NONE, imageView and resolveImageView must have the same VkFormat.

If imageView is not VK_NULL_HANDLE, imageLayout must not be VK_IMAGE_LAYOUT_UNDEFINED, VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, or VK_IMAGE_LAYOUT_PREINITIALIZED.

If imageView is not VK_NULL_HANDLE and resolveMode is not VK_RESOLVE_MODE_NONE, resolveImageLayout must not be VK_IMAGE_LAYOUT_UNDEFINED, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, or VK_IMAGE_LAYOUT_PREINITIALIZED.

If imageView is not VK_NULL_HANDLE and resolveMode is not VK_RESOLVE_MODE_NONE, resolveImageLayout must not be VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

If imageView is not VK_NULL_HANDLE, imageLayout must not be VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV.

If imageView is not VK_NULL_HANDLE and resolveMode is not VK_RESOLVE_MODE_NONE, resolveImageLayout must not be VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT.

If imageView is not VK_NULL_HANDLE and resolveMode is not VK_RESOLVE_MODE_NONE, resolveImageLayout must not be VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT.

If imageView is not VK_NULL_HANDLE and resolveMode is not VK_RESOLVE_MODE_NONE, resolveImageLayout must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR.

If imageView is not VK_NULL_HANDLE and resolveMode is not VK_RESOLVE_MODE_NONE, resolveImageLayout must not be VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR.
VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR

- VUID-VkRenderingAttachmentInfo-imageView-06145
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

- VUID-VkRenderingAttachmentInfo-imageView-06146
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

Valid Usage (Implicit)

- VUID-VkRenderingAttachmentInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_RENDERING_ATTACHMENT_INFO`

- VUID-VkRenderingAttachmentInfo-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkRenderingAttachmentInfo-imageView-parameter
  If `imageView` is not `VK_NULL_HANDLE`, `imageView` must be a valid `VkImageView` handle

- VUID-VkRenderingAttachmentInfo-imageLayout-parameter
  `imageLayout` must be a valid `VkImageLayout` value

- VUID-VkRenderingAttachmentInfo-resolveMode-parameter
  If `resolveMode` is not `0`, `resolveMode` must be a valid `VkResolveModeFlagBits` value

- VUID-VkRenderingAttachmentInfo-resolveImageView-parameter
  If `resolveImageView` is not `VK_NULL_HANDLE`, `resolveImageView` must be a valid `VkImageView` handle

- VUID-VkRenderingAttachmentInfo-resolveImageLayout-parameter
  `resolveImageLayout` must be a valid `VkImageLayout` value

- VUID-VkRenderingAttachmentInfo-loadOp-parameter
  `loadOp` must be a valid `VkAttachmentLoadOp` value

- VUID-VkRenderingAttachmentInfo-storeOp-parameter
  `storeOp` must be a valid `VkAttachmentStoreOp` value

- VUID-VkRenderingAttachmentInfo-clearValue-parameter
  `clearValue` must be a valid `VkClearValue` union

- VUID-VkRenderingAttachmentInfo-commonparent
  Both of `imageView` and `resolveImageView` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

The `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure is defined as:

```c
typedef struct VkRenderingFragmentShadingRateAttachmentInfoKHR {
    VkStructureType         sType;
    const void*             pNext;
} VkRenderingFragmentShadingRateAttachmentInfoKHR;
```
VkImageView  imageView;
VkImageLayout  imageLayout;
VkExtent2D  shadingRateAttachmentTexelSize;
} VkRenderingFragmentShadingRateAttachmentInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **imageView** is the image view that will be used as a fragment shading rate attachment.
- **imageLayout** is the layout that **imageView** will be in during rendering.
- **shadingRateAttachmentTexelSize** specifies the number of pixels corresponding to each texel in **imageView**.

This structure can be included in the **pNext** chain of **VkRenderingInfo** to define a fragment shading rate attachment. If **imageView** is **VK_NULL_HANDLE**, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

### Valid Usage

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06147**
  If **imageView** is not **VK_NULL_HANDLE**, layout **must** be **VK_IMAGE_LAYOUT_GENERAL** or **VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR**

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06148**
  If **imageView** is not **VK_NULL_HANDLE**, it **must** have been created with **VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06149**
  If **imageView** is not **VK_NULL_HANDLE**, **shadingRateAttachmentTexelSize.width** **must** be a power of two value

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06150**
  If **imageView** is not **VK_NULL_HANDLE**, **shadingRateAttachmentTexelSize.width** **must** be less than or equal to **maxFragmentShadingRateAttachmentTexelSize.width**

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06151**
  If **imageView** is not **VK_NULL_HANDLE**, **shadingRateAttachmentTexelSize.width** **must** be greater than or equal to **minFragmentShadingRateAttachmentTexelSize.width**

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06152**
  If **imageView** is not **VK_NULL_HANDLE**, **shadingRateAttachmentTexelSize.height** **must** be a power of two value

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06153**
  If **imageView** is not **VK_NULL_HANDLE**, **shadingRateAttachmentTexelSize.height** **must** be less than or equal to **maxFragmentShadingRateAttachmentTexelSize.height**

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06154**
  If **imageView** is not **VK_NULL_HANDLE**, **shadingRateAttachmentTexelSize.height** **must** be greater than or equal to **minFragmentShadingRateAttachmentTexelSize.height**
If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.width` and `shadingRateAttachmentTexelSize.height` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`.

If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.height` and `shadingRateAttachmentTexelSize.width` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR`
- `imageView` must be a valid `VkImageView` handle
- `imageLayout` must be a valid `VkImageLayout` value

The `VkRenderingFragmentDensityMapAttachmentInfoEXT` structure is defined as:

```c
// Provided by VK_KHR_dynamic_rendering with VK_EXT_fragment_density_map
typedef struct VkRenderingFragmentDensityMapAttachmentInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkImageView imageView;
    VkImageLayout imageLayout;
} VkRenderingFragmentDensityMapAttachmentInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imageView` is the image view that will be used as a fragment density map attachment.
- `imageLayout` is the layout that `imageView` will be in during rendering.

This structure can be included in the `pNext` chain of `VkRenderingInfo` to define a fragment density map. If this structure is not included in the `pNext` chain, `imageView` is treated as `VK_NULL_HANDLE`.

Valid Usage

- `layout` must be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`.
- It must have been created with.
VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT

- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-06159
  If `imageView` is not `VK_NULL_HANDLE`, it must not have been created with `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`

Valid Usage (Implicit)

- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_INFO_EXT`
- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageView-parameter
  `imageView` must be a valid `VkImageView` handle
- VUID-VkRenderingFragmentDensityMapAttachmentInfoEXT-imageLayout-parameter
  `imageLayout` must be a valid `VkImageLayout` value

To end a render pass instance, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdEndRendering(
    VkCommandBuffer commandBuffer);
```

or the equivalent command

```c
// Provided by VK_KHR_dynamic_rendering
void vkCmdEndRenderingKHR(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer in which to record the command.

If the value of `pRenderingInfo->flags` used to begin this render pass instance included `VK_RENDERING_SUSPENDING_BIT`, then this render pass is suspended and will be resumed later in submission order.

Valid Usage

- VUID-vkCmdEndRendering-None-06161
  The current render pass instance must have been begun with `vkCmdBeginRendering`
- VUID-vkCmdEndRendering-commandBuffer-06162
  The current render pass instance must have been begun in `commandBuffer`
- VUID-vkCmdEndRendering-None-06781
  This command must not be recorded when transform feedback is active
- VUID-vkCmdEndRendering-None-06999
  If `vkCmdBeginQuery*` was called within the render pass, the corresponding `vkCmdEndQuery*`
must have been called subsequently within the same subpass.

Valid Usage (Implicit)

- VUID-vkCmdEndRendering-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdEndRendering-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdEndRendering-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdEndRendering-renderpass
  This command must only be called inside of a render pass instance
- VUID-vkCmdEndRendering-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Note**

For more complex rendering graphs, it is possible to pre-define a static render pass object, which as well as allowing draw commands, allows the definition of framebuffer-local dependencies between multiple subpasses. These objects have a lot of setup cost compared to vkCmdBeginRendering, but use of subpass dependencies can confer important performance benefits on some devices.

The VkTilePropertiesQCOM structure is defined as:

```c
// Provided by VK_QCOM_tile_properties
typedef struct VkTilePropertiesQCOM {
```
• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **tileSize** is the dimensions of a tile, with width and height describing the width and height of a tile in pixels, and depth corresponding to the number of slices the tile spans.
• **apronSize** is the dimension of the apron.
• **origin** is the top-left corner of the first tile in attachment space.

All tiles will be tightly packed around the first tile, with edges being multiples of tile width and/or height from the origin.

**Note**

Reported value for **apronSize** will be zero and its functionality will be described in a future extension.

**Valid Usage (Implicit)**

- VUID-VkTilePropertiesQCOM-sType-sType
  - **sType** must be **VK_STRUCTURE_TYPE_TILE_PROPERTIES_QCOM**
- VUID-VkTilePropertiesQCOM-pNext-pNext
  - **pNext** must be **NULL**

To query the tile properties when using dynamic rendering, call:

```c
// Provided by VK_QCOM_tile_properties
VkResult vkGetDynamicRenderingTilePropertiesQCOM(  
  VkDevice device,  
  const VkRenderingInfo* pRenderingInfo,  
  VkTilePropertiesQCOM* pProperties);
```

• **device** is a logical device associated with the render pass.
• **pRenderingInfo** is a pointer to the **VkRenderingInfo** structure specifying details of the render pass instance in dynamic rendering.
• **pProperties** is a pointer to a **VkTilePropertiesQCOM** structure in which the properties are returned.
Valid Usage (Implicit)

- VUID-vkGetDynamicRenderingTilePropertiesQCOM-device-parameter device must be a valid VkDevice handle
- VUID-vkGetDynamicRenderingTilePropertiesQCOM-pRenderingInfo-parameter pRenderingInfo must be a valid pointer to a valid VkRenderingInfo structure
- VUID-vkGetDynamicRenderingTilePropertiesQCOM-pProperties-parameter pProperties must be a valid pointer to a VkTilePropertiesQCOM structure

Return Codes

Success
- VK_SUCCESS

A render pass object represents a collection of attachments, subpasses, and dependencies between the subpasses, and describes how the attachments are used over the course of the subpasses.

Render passes are represented by VkRenderPass handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkRenderPass)
```

An attachment description describes the properties of an attachment including its format, sample count, and how its contents are treated at the beginning and end of each render pass instance.

A subpass represents a phase of rendering that reads and writes a subset of the attachments in a render pass. Rendering commands are recorded into a particular subpass of a render pass instance.

A subpass description describes the subset of attachments that is involved in the execution of a subpass. Each subpass can read from some attachments as input attachments, write to some as color attachments or depth/stencil attachments, perform shader resolve operations to color_attachments or depth/stencil_attachments, and perform multisample resolve operations to resolve attachments. A subpass description can also include a set of preserve attachments, which are attachments that are not read or written by the subpass but whose contents must be preserved throughout the subpass.

A subpass uses an attachment if the attachment is a color, depth/stencil, resolve, depth/stencil resolve, fragment shading rate, or input attachment for that subpass (as determined by the pColorAttachments, pDepthStencilAttachment, pResolveAttachments, VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment, VkFragmentShadingRateAttachmentInfoKHR::pFragmentShadingRateAttachment->attachment, and pInputAttachments members of VkSubpassDescription, respectively). A subpass does not use an attachment if that attachment is preserved by the subpass. The first use of an attachment is in the lowest numbered subpass that uses that attachment. Similarly, the last use of an attachment is in the highest numbered subpass that uses that attachment.
The subpasses in a render pass all render to the same dimensions, and fragments for pixel (x,y,layer) in one subpass can only read attachment contents written by previous subpasses at that same (x,y,layer) location. For multi-pixel fragments, the pixel read from an input attachment is selected from the pixels covered by that fragment in an implementation-dependent manner. However, this selection must be made consistently for any fragment with the same shading rate for the lifetime of the VkDevice.

Note
By describing a complete set of subpasses in advance, render passes provide the implementation an opportunity to optimize the storage and transfer of attachment data between subpasses.

In practice, this means that subpasses with a simple framebuffer-space dependency may be merged into a single tiled rendering pass, keeping the attachment data on-chip for the duration of a render pass instance. However, it is also quite common for a render pass to only contain a single subpass.

Subpass dependencies describe execution and memory dependencies between subpasses.

A subpass dependency chain is a sequence of subpass dependencies in a render pass, where the source subpass of each subpass dependency (after the first) equals the destination subpass of the previous dependency.

Execution of subpasses may overlap or execute out of order with regards to other subpasses, unless otherwise enforced by an execution dependency. Each subpass only respects submission order for commands recorded in the same subpass, and the vkCmdBeginRenderPass and vkCmdEndRenderPass commands that delimit the render pass - commands within other subpasses are not included. This affects most other implicit ordering guarantees.

A render pass describes the structure of subpasses and attachments independent of any specific image views for the attachments. The specific image views that will be used for the attachments, and their dimensions, are specified in VkFramebuffer objects. Framebuffers are created with respect to a specific render pass that the framebuffer is compatible with (see Render Pass Compatibility). Collectively, a render pass and a framebuffer define the complete render target state for one or more subpasses as well as the algorithmic dependencies between the subpasses.

The various pipeline stages of the drawing commands for a given subpass may execute concurrently and/or out of order, both within and across drawing commands, whilst still respecting pipeline order. However for a given (x,y,layer,sample) sample location, certain per-sample operations are performed in rasterization order.

VK_ATTACHMENT_UNUSED is a constant indicating that a render pass attachment is not used.

#define VK_ATTACHMENT_UNUSED (-0U)
8.1. Render Pass Creation

To create a render pass, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateRenderPass(
    VkDevice device,
    const VkRenderPassCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkRenderPass* pRenderPass);
```

- **device** is the logical device that creates the render pass.
- **pCreateInfo** is a pointer to a `VkRenderPassCreateInfo` structure describing the parameters of the render pass.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pRenderPass** is a pointer to a `VkRenderPass` handle in which the resulting render pass object is returned.

**Valid Usage (Implicit)**

- VUID-vkCreateRenderPass-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkCreateRenderPass-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkRenderPassCreateInfo` structure
- VUID-vkCreateRenderPass-pAllocate-parameter
  - If `pAllocator` is not `NULL`, `pAllocate` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateRenderPass-pRenderPass-parameter
  - `pRenderPass` must be a valid pointer to a `VkRenderer` handle

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkRenderPassCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
```
typedef struct VkRenderPassCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkRenderPassCreateFlags   flags;
    uint32_t                  attachmentCount;
    const VkAttachmentDescription* pAttachments;
    uint32_t                  subpassCount;
    const VkSubpassDescription* pSubpasses;
    uint32_t                  dependencyCount;
    const VkSubpassDependency* pDependencies;
} VkRenderPassCreateInfo;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkRenderPassCreateFlagBits.
- **attachmentCount** is the number of attachments used by this render pass.
- **pAttachments** is a pointer to an array of attachmentCount VkAttachmentDescription structures describing the attachments used by the render pass.
- **subpassCount** is the number of subpasses to create.
- **pSubpasses** is a pointer to an array of subpassCount VkSubpassDescription structures describing each subpass.
- **dependencyCount** is the number of memory dependencies between pairs of subpasses.
- **pDependencies** is a pointer to an array of dependencyCount VkSubpassDependency structures describing dependencies between pairs of subpasses.

**Note**

Care should be taken to avoid a data race here; if any subpasses access attachments with overlapping memory locations, and one of those accesses is a write, a subpass dependency needs to be included between them.

**Valid Usage**

- **VUID-VkRenderPassCreateInfo-attachment-00834**
  If the attachment member of any element of pInputAttachments, pColorAttachments, pResolveAttachments or pDepthStencilAttachment, or any element of pPreserveAttachments in any element of pSubpasses is not VK_ATTACHMENT_UNUSED, then it must be less than attachmentCount.

- **VUID-VkRenderPassCreateInfo-fragmentDensityMapAttachment-06471**
  If the pNext chain includes a VkRenderPassFragmentDensityMapCreateInfoEXT structure and the fragmentDensityMapAttachment member is not VK_ATTACHMENT_UNUSED, then attachment must be less than attachmentCount.

- **VUID-VkRenderPassCreateInfo-pAttachments-00836**
  For any member of pAttachments with a loadOp equal to VK_ATTACHMENT_LOAD_OP_CLEAR, the
first use of that attachment must not specify a layout equal to
VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
or
VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkRenderPassCreateInfo-pAttachments-02511
For any member of pAttachments with a stencilLoadOp equal to
VK_ATTACHMENT_LOAD_OP_CLEAR, the first use of that attachment must not specify a layout
equal to VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL or
VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkRenderPassCreateInfo-pAttachments-01566
For any member of pAttachments with a loadOp equal to VK_ATTACHMENT_LOAD_OP_CLEAR, the
first use of that attachment must not specify a layout equal to
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkRenderPassCreateInfo-pAttachments-01567
For any member of pAttachments with a stencilLoadOp equal to
VK_ATTACHMENT_LOAD_OP_CLEAR, the first use of that attachment must not specify a layout
equal to VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkRenderPassCreateInfo-pNext-01926
If the pNext chain includes a VkRenderPassInputAttachmentAspectCreateInfo structure, the
subpass member of each element of its pAspectReferences member must be less than subpassCount

• VUID-VkRenderPassCreateInfo-pNext-01927
If the pNext chain includes a VkRenderPassInputAttachmentAspectCreateInfo structure, the
inputAttachmentIndex member of each element of its pAspectReferences member must be less than the value of inputAttachmentCount in the element of pSubpasses identified by its subpass member

• VUID-VkRenderPassCreateInfo-pNext-01963
If the pNext chain includes a VkRenderPassInputAttachmentAspectCreateInfo structure, for any element of the pInputAttachments member of any element of pSubpasses where the attachment member is not VK_ATTACHMENT_UNUSED, the aspectMask member of the corresponding element of VkRenderPassInputAttachmentAspectCreateInfo:::pAspectReferences must only include aspects that are present in images of the format specified by the element of pAttachments at attachment

• VUID-VkRenderPassCreateInfo-pNext-01928
If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, and its
subpassCount member is not zero, that member must be equal to the value of subpassCount

• VUID-VkRenderPassCreateInfo-pNext-01929
If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, if its
dependencyCount member is not zero, it must be equal to dependencyCount

• VUID-VkRenderPassCreateInfo-pNext-01930
If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, for each non-
zero element of pViewOffsets, the srcSubpass and dstSubpass members of pDependencies at the same index must not be equal

• VUID-VkRenderPassCreateInfo-pNext-02512
If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, for any element
of pDependencies with a dependencyFlags member that does not include VK_DEPENDENCY_VIEW_LOCAL_BIT, the corresponding element of the pViewOffsets member of that VkRenderPassMultiviewCreateInfo instance must be 0

- VUID-VkRenderPassCreateInfo-pNext-02513
  If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, elements of its pViewMasks member must either all be 0, or all not be 0

- VUID-VkRenderPassCreateInfo-pNext-02514
  If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, and each element of its pViewMasks member is 0, the dependencyFlags member of each element of pDependencies must not include VK_DEPENDENCY_VIEW_LOCAL_BIT

- VUID-VkRenderPassCreateInfo-pNext-02515
  If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, and each element of its pViewMasks member is 0, its correlationMaskCount member must be 0

• VUID-VkRenderPassCreateInfo-pDependencies-00837
  For any element of pDependencies, if the srcSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the srcStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the source subpass

- VUID-VkRenderPassCreateInfo-pDependencies-00838
  For any element of pDependencies, if the dstSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the dstStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the destination subpass

- VUID-VkRenderPassCreateInfo-pDependencies-06866
  For any element of pDependencies, if its srcSubpass is not VK_SUBPASS_EXTERNAL, it must be less than subpassCount

- VUID-VkRenderPassCreateInfo-pDependencies-06867
  For any element of pDependencies, if its dstSubpass is not VK_SUBPASS_EXTERNAL, it must be less than subpassCount

Valid Usage (Implicit)

- VUID-VkRenderPassCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO

- VUID-VkRenderPassCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkRenderPassFragmentDensityMapCreateInfoEXT, VkRenderPassInputAttachmentAspectCreateInfo, or VkRenderPassMultiviewCreateInfo

- VUID-VkRenderPassCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkRenderPassCreateInfo-flags-parameter
  flags must be a valid combination of VkRenderPassCreateFlagBits values
• VUID-VkRenderPassCreateInfo-pAttachments-parameter
If attachmentCount is not 0, pAttachments must be a valid pointer to an array of attachmentCount valid VkAttachmentDescription structures

• VUID-VkRenderPassCreateInfo-pSubpasses-parameter
pSubpasses must be a valid pointer to an array of subpassCount valid VkSubpassDescription structures

• VUID-VkRenderPassCreateInfo-pDependencies-parameter
If dependencyCount is not 0, pDependencies must be a valid pointer to an array of dependencyCount valid VkSubpassDependency structures

• VUID-VkRenderPassCreateInfo-subpassCount-arraylength
subpassCount must be greater than 0

Bits which can be set in VkRenderPassCreateInfo::flags, describing additional properties of the render pass, are:

```c
definition
typedef enum VkRenderPassCreateFlagBits {
    # Provided by VK_QCOM_render_pass_transform
    VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM = 0x00000002,
} VkRenderPassCreateFlagBits;
```

- VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM specifies that the created render pass is compatible with render pass transform.

```c
definition
typedef VkFlags VkRenderPassCreateFlags;
```

VkRenderPassCreateFlags is a bitmask type for setting a mask of zero or more VkRenderPassCreateFlagBits.

If the VkRenderPassCreateInfo::pNext chain includes a VkRenderPassMultiviewCreateInfo structure, then that structure includes an array of view masks, view offsets, and correlation masks for the render pass.

The VkRenderPassMultiviewCreateInfo structure is defined as:

```c
definition
typedef struct VkRenderPassMultiviewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t subpassCount;
    const uint32_t* pViewMasks;
    uint32_t dependencyCount;
    const int32_t* pViewOffsets;
    uint32_t correlationMaskCount;
} VkRenderPassMultiviewCreateInfo;
```
const uint32_t* pCorrelationMasks;
} VkRenderPassMultiviewCreateInfo;

or the equivalent

// Provided by VK_KHR_multiview
typedef VkRenderPassMultiviewCreateInfo VkRenderPassMultiviewCreateInfoKHR;

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `subpassCount` is zero or the number of subpasses in the render pass.
- `pViewMasks` is a pointer to an array of `subpassCount` view masks, where each mask is a bitfield of view indices describing which views rendering is broadcast to in each subpass, when multiview is enabled. If `subpassCount` is zero, each view mask is treated as zero.
- `dependencyCount` is zero or the number of dependencies in the render pass.
- `pViewOffsets` is a pointer to an array of `dependencyCount` view offsets, one for each dependency. If `dependencyCount` is zero, each dependency’s view offset is treated as zero. Each view offset controls which views in the source subpass the views in the destination subpass depend on.
- `correlationMaskCount` is zero or the number of correlation masks.
- `pCorrelationMasks` is a pointer to an array of `correlationMaskCount` view masks indicating sets of views that may be more efficient to render concurrently.

When a subpass uses a non-zero view mask, multiview functionality is considered to be enabled. Multiview is all-or-nothing for a render pass - that is, either all subpasses must have a non-zero view mask (though some subpasses may have only one view) or all must be zero. Multiview causes all drawing and clear commands in the subpass to behave as if they were broadcast to each view, where a view is represented by one layer of the framebuffer attachments. All draws and clears are broadcast to each view index whose bit is set in the view mask. The view index is provided in the `ViewIndex` shader input variable, and color, depth/stencil, and input attachments all read/write the layer of the framebuffer corresponding to the view index.

If the view mask is zero for all subpasses, multiview is considered to be disabled and all drawing commands execute normally, without this additional broadcasting.

Some implementations may not support multiview in conjunction with mesh shaders, geometry shaders or tessellation shaders.

When multiview is enabled, the `VK_DEPENDENCY_VIEW_LOCAL_BIT` bit in a dependency can be used to express a view-local dependency, meaning that each view in the destination subpass depends on a single view in the source subpass. Unlike pipeline barriers, a subpass dependency can potentially have a different view mask in the source subpass and the destination subpass. If the dependency is view-local, then each view (dstView) in the destination subpass depends on the view dstView + `pViewOffsets[dependency]` in the source subpass. If there is not such a view in the source subpass, then this dependency does not affect that view in the destination subpass. If the dependency is not view-local, then all views in the destination subpass depend on all views in the source subpass, and
the view offset is ignored. A non-zero view offset is not allowed in a self-dependency.

The elements of \texttt{pCorrelationMasks} are a set of masks of views indicating that views in the same mask \textbf{may} exhibit spatial coherency between the views, making it more efficient to render them concurrently. Correlation masks \textbf{must} not have a functional effect on the results of the multiview rendering.

When multiview is enabled, at the beginning of each subpass all non-render pass state is undefined. In particular, each time \texttt{vkCmdBeginRenderPass} or \texttt{vkCmdNextSubpass} is called the graphics pipeline \textbf{must} be bound, any relevant descriptor sets or vertex/index buffers \textbf{must} be bound, and any relevant dynamic state or push constants \textbf{must} be set before they are used.

A multiview subpass \textbf{can} declare that its shaders will write per-view attributes for all views in a single invocation, by setting the \texttt{VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX} bit in the subpass description. The only supported per-view attributes are position and viewport mask, and per-view position and viewport masks are written to output array variables decorated with \texttt{PositionPerViewNV} and \texttt{ViewportMaskPerViewNV}, respectively. If \texttt{VK_NV_viewport_array2} is not supported and enabled, \texttt{ViewportMaskPerViewNV} \textbf{must} not be used. Values written to elements of \texttt{PositionPerViewNV} and \texttt{ViewportMaskPerViewNV} \textbf{must} not depend on the \texttt{ViewIndex}. The shader \textbf{must} also write to an output variable decorated with \texttt{Position}, and the value written to \texttt{Position} \textbf{must} equal the value written to \texttt{PositionPerViewNV[ViewIndex]}. Similarly, if \texttt{ViewportMaskPerViewNV} is written to then the shader \textbf{must} also write to an output variable decorated with \texttt{ViewportMaskNV}, and the value written to \texttt{ViewportMaskNV} \textbf{must} equal the value written to \texttt{ViewportMaskPerViewNV[ViewIndex]}. Implementations will either use values taken from \texttt{Position} and \texttt{ViewportMaskNV} and invoke the shader once for each view, or will use values taken from \texttt{PositionPerViewNV} and \texttt{ViewportMaskPerViewNV} and invoke the shader fewer times. The values written to \texttt{Position} and \texttt{ViewportMaskNV} \textbf{must} not depend on the values written to \texttt{PositionPerViewNV} and \texttt{ViewportMaskPerViewNV}, or vice versa (to allow compilers to eliminate the unused outputs). All attributes that do not have \texttt{*PerViewNV} counterparts \textbf{must} not depend on \texttt{ViewIndex}.

Per-view attributes are all-or-nothing for a subpass. That is, all pipelines compiled against a subpass that includes the \texttt{VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX} bit \textbf{must} write per-view attributes to the \texttt{*PerViewNV[]} shader outputs, in addition to the non-per-view (e.g. \texttt{Position}) outputs. Pipelines compiled against a subpass that does not include this bit \textbf{must} not include the \texttt{*PerViewNV[]} outputs in their interfaces.

### Valid Usage

- VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-00841
  Each view index \textbf{must} not be set in more than one element of \texttt{pCorrelationMasks}

- VUID-VkRenderPassMultiviewCreateInfo-multiview-06555
  If the \texttt{multiview} feature is not enabled, each element of \texttt{pViewMasks} \textbf{must} be \texttt{0}

- VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-06697
  The index of the most significant bit in each element of \texttt{pViewMasks} \textbf{must} be less than \texttt{maxMultiviewViewCount}
Valid Usage (Implicit)

- **VUID-VkRenderPassMultiviewCreateInfo-sType-sType**
  
sType **must** be VK_STRUCTURE_TYPE_RENDER_PASS_MULTIVIEW_CREATE_INFO

- **VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-parameter**
  
  If subpassCount is not 0, pViewMasks **must** be a valid pointer to an array of subpassCount uint32_t values

- **VUID-VkRenderPassMultiviewCreateInfo-pViewOffsets-parameter**
  
  If dependencyCount is not 0, pViewOffsets **must** be a valid pointer to an array of dependencyCount int32_t values

- **VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-parameter**
  
  If correlationMaskCount is not 0, pCorrelationMasks **must** be a valid pointer to an array of correlationMaskCount uint32_t values

The `VkMultiviewPerViewAttributesInfoNVX` structure is defined as:

```c
// Provided by VK_KHR_dynamic_rendering with VK_NVX_multiview_per_view_attributes
typedef struct VkMultiviewPerViewAttributesInfoNVX {
    VkStructureType sType;
    const void* pNext;
    VkBool32 perViewAttributes;
    VkBool32 perViewAttributesPositionXOnly;
} VkMultiviewPerViewAttributesInfoNVX;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **perViewAttributes** specifies that shaders compiled for this pipeline write the attributes for all views in a single invocation of each vertex processing stage. All pipelines executed within a render pass instance that includes this bit **must** write per-view attributes to the *PerViewNV[]* shader outputs, in addition to the non-per-view (e.g. Position) outputs.
- **perViewAttributesPositionXOnly** specifies that shaders compiled for this pipeline use per-view positions which only differ in value in the x component. Per-view viewport mask can also be used.

When dynamic render pass instances are being used, instead of specifying `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX` or `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX` in the subpass description flags, the per-attribute properties of the render pass instance **must** be specified by the `VkMultiviewPerViewAttributesInfoNVX` structure. Include the `VkMultiviewPerViewAttributesInfoNVX` structure in the pNext chain of `VkGraphicsPipelineCreateInfo` when creating a graphics pipeline for dynamic rendering, `VkRenderingInfo` when starting a dynamic render pass instance, and `VkCommandBufferInheritanceInfo` when specifying the dynamic render pass instance parameters for secondary command buffers.
Valid Usage (Implicit)

- **VUID-VkMultiviewPerViewAttributesInfoNVX-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_MULTIVIEW_PER_VIEW_ATTRIBUTES_INFO_NVX`

If the `VkRenderPassCreateInfo::pNext` chain includes a `VkRenderPassFragmentDensityMapCreateInfoEXT` structure, then that structure includes a fragment density map attachment for the render pass.

The `VkRenderPassFragmentDensityMapCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_fragment_density_map
typedef struct VkRenderPassFragmentDensityMapCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkAttachmentReference fragmentDensityMapAttachment;
} VkRenderPassFragmentDensityMapCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentDensityMapAttachment` is the fragment density map to use for the render pass.

The fragment density map is read at an implementation-dependent time with the following constraints determined by the attachment’s image view flags:

- `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT` specifies that the fragment density map will be read by the device during `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT` specifies that the fragment density map will be read by the host during `vkEndCommandBuffer` of the primary command buffer that the render pass is recorded into
- Otherwise the fragment density map will be read by the host during `vkCmdBeginRenderPass`

The fragment density map may additionally be read by the device during `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT` for any mode.

If this structure is not present, it is as if `fragmentDensityMapAttachment` was given as `VK_ATTACHMENT_UNUSED`.

Valid Usage

- **VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02548**
  - If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` must not be an element of `VkSubpassDescription::pInputAttachments`, `VkSubpassDescription::pColorAttachments`, `VkSubpassDescription::pResolveAttachments`, `VkSubpassDescription::pDepthStencilAttachment`, or `VkSubpassDescription`
PreserveAttachments for any subpass

- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02549
  If fragmentDensityMapAttachment is not VK_ATTACHMENT_UNUSED, layout must be equal to VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT, or VK_IMAGE_LAYOUT_GENERAL

- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02550
  If fragmentDensityMapAttachment is not VK_ATTACHMENT_UNUSED, fragmentDensityMapAttachment must reference an attachment with a loadOp equal to VK_ATTACHMENT_LOAD_OP_LOAD or VK_ATTACHMENT_LOAD_OP_DONT_CARE

- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-02551
  If fragmentDensityMapAttachment is not VK_ATTACHMENT_UNUSED, fragmentDensityMapAttachment must reference an attachment with a storeOp equal to VK_ATTACHMENT_STORE_OP_DONT_CARE

**Valid Usage (Implicit)**

- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_FRAGMENT_DENSITY_MAP_CREATE_INFO_EXT

- VUID-VkRenderPassFragmentDensityMapCreateInfoEXT-fragmentDensityMapAttachment-parameter
  fragmentDensityMapAttachment must be a valid VkAttachmentReference structure

The VkAttachmentDescription structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkAttachmentDescription {
    VkAttachmentDescriptionFlags flags;
    VkFormat format;
    VkSampleCountFlagBits samples;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkAttachmentLoadOp stencilLoadOp;
    VkAttachmentStoreOp stencilStoreOp;
    VkImageLayout initialLayout;
    VkImageLayout finallayout;
} VkAttachmentDescription;
```

- flags is a bitmask of VkAttachmentDescriptionFlagBits specifying additional properties of the attachment.
- format is a VkFormat value specifying the format of the image view that will be used for the attachment.
- samples is a VkSampleCountFlagBits value specifying the number of samples of the image.
• **loadOp** is a `VkAttachmentLoadOp` value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.

• **storeOp** is a `VkAttachmentStoreOp` value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.

• **stencilLoadOp** is a `VkAttachmentLoadOp` value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.

• **stencilStoreOp** is a `VkAttachmentStoreOp` value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.

• **initialLayout** is the layout the attachment image subresource will be in when a render pass instance begins.

• **finalLayout** is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

If the attachment uses a color format, then `loadOp` and `storeOp` are used, and `stencilLoadOp` and `stencilStoreOp` are ignored. If the format has depth and/or stencil components, `loadOp` and `storeOp` apply only to the depth data, while `stencilLoadOp` and `stencilStoreOp` define how the stencil data is handled. `loadOp` and `stencilLoadOp` define the *load operations* that execute as part of the first subpass that uses the attachment. `storeOp` and `stencilStoreOp` define the *store operations* that execute as part of the last subpass that uses the attachment.

The load operation for each sample in an attachment happens-before any recorded command which accesses the sample in the first subpass where the attachment is used. Load operations for attachments with a depth/stencil format execute in the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` pipeline stage. Load operations for attachments with a color format execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.

The store operation for each sample in an attachment happens-after any recorded command which accesses the sample in the last subpass where the attachment is used. Store operations for attachments with a depth/stencil format execute in the `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stage. Store operations for attachments with a color format execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.

If an attachment is not used by any subpass, `loadOp`, `storeOp`, `stencilStoreOp`, and `stencilLoadOp` will be ignored for that attachment, and no load or store ops will be performed. However, any transition specified by `initialLayout` and `finalLayout` will still be executed.

The load and store operations apply on the first and last use of each view in the render pass, respectively. If a view index of an attachment is not included in the view mask in any subpass that uses it, then the load and store operations are ignored, and the attachment's memory contents will not be modified by execution of a render pass instance.

During a render pass instance, input/color attachments with color formats that have a component size of 8, 16, or 32 bits *must* be represented in the attachment's format throughout the instance. Attachments with other floating- or fixed-point color formats, or with depth components *may* be represented in a format with a precision higher than the attachment format, but *must* be represented with the same range. When such a component is loaded via the `loadOp`, it will be converted into an implementation-dependent format used by the render pass. Such components
must be converted from the render pass format, to the format of the attachment, before they are resolved or stored at the end of a render pass instance via `storeOp`. Conversions occur as described in Numeric Representation and Computation and Fixed-Point Data Conversions.

If `flags` includes `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, then the attachment is treated as if it shares physical memory with another attachment in the same render pass. This information limits the ability of the implementation to reorder certain operations (like layout transitions and the `loadOp`) such that it is not improperly reordered against other uses of the same physical memory via a different attachment. This is described in more detail below.

If a render pass uses multiple attachments that alias the same device memory, those attachments must each include the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` bit in their attachment description flags. Attachments aliasing the same memory occurs in multiple ways:

- Multiple attachments being assigned the same image view as part of framebuffer creation.
- Attachments using distinct image views that correspond to the same image subresource of an image.
- Attachments using views of distinct image subresources which are bound to overlapping memory ranges.

Note

 Render passes must include subpass dependencies (either directly or via a subpass dependency chain) between any two subpasses that operate on the same attachment or aliasing attachments and those subpass dependencies must include execution and memory dependencies separating uses of the aliases, if at least one of those subpasses writes to one of the aliases. These dependencies must not include the `VK_DEPENDENCY_BY_REGION_BIT` if the aliases are views of distinct image subresources which overlap in memory.

Multiple attachments that alias the same memory must not be used in a single subpass. A given attachment index must not be used multiple times in a single subpass, with one exception: two subpass attachments can use the same attachment index if at least one use is as an input attachment and neither use is as a resolve or preserve attachment. In other words, the same view can be used simultaneously as an input and color or depth/stencil attachment, but must not be used as multiple color or depth/stencil attachments nor as resolve or preserve attachments. The precise set of valid scenarios is described in more detail below.

If a set of attachments alias each other, then all except the first to be used in the render pass must use an `initialLayout` of `VK_IMAGE_LAYOUT_UNDEFINED`, since the earlier uses of the other aliases make their contents undefined. Once an alias has been used and a different alias has been used after it, the first alias must not be used in any later subpasses. However, an application can assign the same image view to multiple aliasing attachment indices, which allows that image view to be used multiple times even if other aliases are used in between.

Note

 Once an attachment needs the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` bit, there should be no additional cost of introducing additional aliases, and using these
additional aliases may allow more efficient clearing of the attachments on multiple uses via `VK_ATTACHMENT_LOAD_OP_CLEAR`.

Valid Usage

- `VUID-VkAttachmentDescription-format-06698`  
  format must not be `VK_FORMAT_UNDEFINED`

- `VUID-VkAttachmentDescription-format-06699`  
  If format includes a color or depth aspect and loadOp is `VK_ATTACHMENT_LOAD_OP_LOAD`, then initialLayout must not be `VK_IMAGE_LAYOUT_UNDEFINED`

- `VUID-VkAttachmentDescription-finalLayout-00843`  
  finalLayout must not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- `VUID-VkAttachmentDescription-format-03280`  
  If format is a color format, initialLayout must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- `VUID-VkAttachmentDescription-format-03281`  
  If format is a color format, initialLayout must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- `VUID-VkAttachmentDescription-format-03282`  
  If format is a color format, finalLayout must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- `VUID-VkAttachmentDescription-format-03283`  
  If format is a depth/stencil format, finalLayout must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- `VUID-VkAttachmentDescription-format-06487`  
  If format is a color format, initialLayout must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- `VUID-VkAttachmentDescription-format-06488`  
  If format is a color format, finalLayout must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- `VUID-VkAttachmentDescription-separateDepthStencilLayouts-03284`  
  If the separateDepthStencilLayouts feature is not enabled, initialLayout must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- `VUID-VkAttachmentDescription-separateDepthStencilLayouts-03285`  
  If the separateDepthStencilLayouts feature is not enabled, finalLayout must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.
• VUID-VkAttachmentDescription-format-03286
If format is a color format, initialLayout must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-03287
If format is a color format, finalLayout must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-06906
If format is a depth/stencil format which includes both depth and stencil aspects,
initialLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-06907
If format is a depth/stencil format which includes both depth and stencil aspects,
finalLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-03290
If format is a depth/stencil format which includes only the depth aspect, initialLayout
must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-03291
If format is a depth/stencil format which includes only the depth aspect, finalLayout must
not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-synchronization2-06908
If the synchronization2 feature is not enabled, initialLayout must not be
VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkAttachmentDescription-synchronization2-06909
If the synchronization2 feature is not enabled, finalLayout must not be
VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkAttachmentDescription-attachmentFeedbackLoopLayout-07309
If the attachmentFeedbackLoopLayout feature is not enabled, initialLayout must not be
VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

• VUID-VkAttachmentDescription-attachmentFeedbackLoopLayout-07310
If the attachmentFeedbackLoopLayout feature is not enabled, finalLayout must not be
VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

• VUID-VkAttachmentDescription-format-06700
If format includes a stencil aspect and stencilLoadOp is VK_ATTACHMENT_LOAD_OP_LOAD, then
initialLayout must not be VK_IMAGE_LAYOUT_UNDEFINED

• VUID-VkAttachmentDescription-format-03292
If `format` is a depth/stencil format which includes only the stencil aspect, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- VUID-VkAttachmentDescription-format-03293
  If `format` is a depth/stencil format which includes only the stencil aspect, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- VUID-VkAttachmentDescription-format-06242
  If `format` is a depth/stencil format which includes both depth and stencil aspects, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- VUID-VkAttachmentDescription-format-06243
  If `format` is a depth/stencil format which includes both depth and stencil aspects, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

Valid Usage (Implicit)

- VUID-VkAttachmentDescription-flags-parameter
  `flags` must be a valid combination of `VkAttachmentDescriptionFlagBits` values.

- VUID-VkAttachmentDescription-format-parameter
  `format` must be a valid `VkFormat` value.

- VUID-VkAttachmentDescription-samples-parameter
  `samples` must be a valid `VkSampleCountFlagBits` value.

- VUID-VkAttachmentDescription-loadOp-parameter
  `loadOp` must be a valid `VkAttachmentLoadOp` value.

- VUID-VkAttachmentDescription-storeOp-parameter
  `storeOp` must be a valid `VkAttachmentStoreOp` value.

- VUID-VkAttachmentDescription-stencilLoadOp-parameter
  `stencilLoadOp` must be a valid `VkAttachmentLoadOp` value.

- VUID-VkAttachmentDescription-stencilStoreOp-parameter
  `stencilStoreOp` must be a valid `VkAttachmentStoreOp` value.

- VUID-VkAttachmentDescription-initialLayout-parameter
  `initialLayout` must be a valid `VkImageLayout` value.

- VUID-VkAttachmentDescription-finalLayout-parameter
  `finalLayout` must be a valid `VkImageLayout` value.

Bits which can be set in `VkAttachmentDescription::flags`, describing additional properties of the attachment, are:

```cpp
// Provided by VK_VERSION_1_0
```
typedef enum VkAttachmentDescriptionFlagBits {
    VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT = 0x00000001,
} VkAttachmentDescriptionFlagBits;

- **VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT** specifies that the attachment aliases the same device memory as other attachments.

// Provided by VK_VERSION_1_0
typedef VkFlags VkAttachmentDescriptionFlags;

**VkAttachmentDescriptionFlags** is a bitmask type for setting a mask of zero or more **VkAttachmentDescriptionFlagBits**.

Possible values of **VkAttachmentDescription::loadOp** and **stencilLoadOp**, specifying how the contents of the attachment are treated, are:

// Provided by VK_VERSION_1_0
typedef enum VkAttachmentLoadOp {
    VK_ATTACHMENT_LOAD_OP_LOAD = 0,
    VK_ATTACHMENT_LOAD_OP_CLEAR = 1,
    VK_ATTACHMENT_LOAD_OP_DONT_CARE = 2,
    // Provided by VK_EXT_load_store_op_none
    VK_ATTACHMENT_LOAD_OP_NONE_EXT = 1000400000,
} VkAttachmentLoadOp;

- **VK_ATTACHMENT_LOAD_OP_LOAD** specifies that the previous contents of the image within the render area will be preserved. For attachments with a depth/stencil format, this uses the access type **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT**. For attachments with a color format, this uses the access type **VK_ACCESS_COLOR_ATTACHMENT_READ_BIT**.

- **VK_ATTACHMENT_LOAD_OP_CLEAR** specifies that the contents within the render area will be cleared to a uniform value, which is specified when a render pass instance is begun. For attachments with a depth/stencil format, this uses the access type **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT**. For attachments with a color format, this uses the access type **VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT**.

- **VK_ATTACHMENT_LOAD_OP_DONT_CARE** specifies that the previous contents within the area need not be preserved; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT**. For attachments with a color format, this uses the access type **VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT**.

- **VK_ATTACHMENT_LOAD_OP_NONE_EXT** specifies that the previous contents of the image within the render area will be preserved, but the contents of the attachment will be undefined inside the render pass. No access type is used as the image is not accessed.

Possible values of **VkAttachmentDescription::storeOp** and **stencilStoreOp**, specifying how the contents of the attachment are treated, are:
typedef enum VkAttachmentStoreOp {
    VK_ATTACHMENT_STORE_OP_STORE = 0,
    VK_ATTACHMENT_STORE_OP_DONT_CARE = 1,
    // Provided by VK_VERSION_1_3
    VK_ATTACHMENT_STORE_OP_NONE = 1000301000,
    // Provided by VK_KHR_dynamic_rendering
    VK_ATTACHMENT_STORE_OP_NONE_KHR = VK_ATTACHMENT_STORE_OP_NONE,
    // Provided by VK_QCOM_render_pass_store_ops
    VK_ATTACHMENT_STORE_OP_NONE_QCOM = VK_ATTACHMENT_STORE_OP_NONE,
    // Provided by VK_EXT_load_store_op_none
    VK_ATTACHMENT_STORE_OP_NONE_EXT = VK_ATTACHMENT_STORE_OP_NONE,
} VkAttachmentStoreOp;

- VK_ATTACHMENT_STORE_OP_STORE specifies the contents generated during the render pass and within the render area are written to memory. For attachments with a depth/stencil format, this uses the access type VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT. For attachments with a color format, this uses the access type VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT.

- VK_ATTACHMENT_STORE_OP_DONT_CARE specifies the contents within the render area are not needed after rendering, and may be discarded; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT. For attachments with a color format, this uses the access type VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT.

- VK_ATTACHMENT_STORE_OP_NONE specifies the contents within the render area are not accessed by the store operation. However, if the attachment was written to during the render pass, the contents of the attachment will be undefined inside the render area.

Note

VK_ATTACHMENT_STORE_OP_DONT_CARE can cause contents generated during previous render passes to be discarded before reaching memory, even if no write to the attachment occurs during the current render pass.

The VkRenderPassInputAttachmentAspectCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassInputAttachmentAspectCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t aspectReferenceCount;
    const VkInputAttachmentAspectReference* pAspectReferences;
} VkRenderPassInputAttachmentAspectCreateInfo;
```

or the equivalent

```
// Provided by VK_KHR_maintenance2
typedef VkRenderPassInputAttachmentAspectCreateInfo
```
VkRenderPassInputAttachmentAspectCreateInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **aspectReferenceCount** is the number of elements in the **pAspectReferences** array.
- **pAspectReferences** is a pointer to an array of **aspectReferenceCount** **VkInputAttachmentAspectReference** structures containing a mask describing which aspect(s) can be accessed for a given input attachment within a given subpass.

To specify which aspects of an input attachment can be read, add a **VkRenderPassInputAttachmentAspectCreateInfo** structure to the **pNext** chain of the **VkRenderPassCreateInfo** structure:

An application can access any aspect of an input attachment that does not have a specified aspect mask in the **pAspectReferences** array. Otherwise, an application must not access aspect(s) of an input attachment other than those in its specified aspect mask.

**Valid Usage (Implicit)**

- VUID-VkRenderPassInputAttachmentAspectCreateInfo-sType-sType
  
  - **sType** must be `VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO`

- VUID-VkRenderPassInputAttachmentAspectCreateInfo-pAspectReferences-parameter
  
  - **pAspectReferences** must be a valid pointer to an array of **aspectReferenceCount** valid **VkInputAttachmentAspectReference** structures

- VUID-VkRenderPassInputAttachmentAspectCreateInfo-aspectReferenceCount-arraylength
  
  - **aspectReferenceCount** must be greater than 0

The **VkInputAttachmentAspectReference** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkInputAttachmentAspectReference {
    uint32_t subpass;
    uint32_t inputAttachmentIndex;
    VkImageAspectFlags aspectMask;
} VkInputAttachmentAspectReference;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkInputAttachmentAspectReference VkInputAttachmentAspectReferenceKHR;
```

- **subpass** is an index into the **pSubpasses** array of the parent **VkRenderPassCreateInfo** structure.
- **inputAttachmentIndex** is an index into the **pInputAttachments** of the specified subpass.
• `aspectMask` is a mask of which aspect(s) can be accessed within the specified subpass.

This structure specifies an aspect mask for a specific input attachment of a specific subpass in the render pass.

`subpass` and `inputAttachmentIndex` index into the render pass as:

```c
pCreateInfo->pSubpasses[subpass].pInputAttachments[inputAttachmentIndex]
```

### Valid Usage

- VUID-VkInputAttachmentAspectReference-aspectMask-01964
  `aspectMask` must not include `VK_IMAGE_ASPECT_METADATA_BIT`

- VUID-VkInputAttachmentAspectReference-aspectMask-02250
  `aspectMask` must not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index `i`

### Valid Usage (Implicit)

- VUID-VkInputAttachmentAspectReference-aspectMask-parameter
  `aspectMask` must be a valid combination of `VkImageAspectFlagBits` values

- VUID-VkInputAttachmentAspectReference-aspectMask-requiredbitmap
  `aspectMask` must not be `0`

The `VkSubpassDescription` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDescription {
    VkSubpassDescriptionFlags flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t inputAttachmentCount;
    const VkAttachmentReference* pInputAttachments;
    uint32_t colorAttachmentCount;
    const VkAttachmentReference* pColorAttachments;
    const VkAttachmentReference* pResolveAttachments;
    const VkAttachmentReference* pDepthStencilAttachment;
    uint32_t preserveAttachmentCount;
    const uint32_t* pPreserveAttachments;
} VkSubpassDescription;
```

- `flags` is a bitmask of `VkSubpassDescriptionFlagBits` specifying usage of the subpass.

- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying the pipeline type supported for this subpass.

- `inputAttachmentCount` is the number of input attachments.
• **pInputAttachments** is a pointer to an array of *VkAttachmentReference* structures defining the input attachments for this subpass and their layouts.

• **colorAttachmentCount** is the number of color attachments.

• **pColorAttachments** is a pointer to an array of *colorAttachmentCount* *VkAttachmentReference* structures defining the color attachments for this subpass and their layouts.

• **pResolveAttachments** is NULL or a pointer to an array of *colorAttachmentCount* *VkAttachmentReference* structures defining the resolve attachments for this subpass and their layouts.

• **pDepthStencilAttachment** is a pointer to a *VkAttachmentReference* structure specifying the depth/stencil attachment for this subpass and its layout.

• **preserveAttachmentCount** is the number of preserved attachments.

• **pPreserveAttachments** is a pointer to an array of *preserveAttachmentCount* render pass attachment indices identifying attachments that are not used by this subpass, but whose contents must be preserved throughout the subpass.

Each element of the **pInputAttachments** array corresponds to an input attachment index in a fragment shader, i.e. if a shader declares an image variable decorated with a *InputAttachmentIndex* value of X, then it uses the attachment provided in **pInputAttachments[X]**. Input attachments must also be bound to the pipeline in a descriptor set. If the **attachment** member of any element of **pInputAttachments** is **VK_ATTACHMENT_UNUSED**, the application must not read from the corresponding input attachment index. Fragment shaders can use input variables to access the contents of an input attachment at the fragment’s (x, y, layer) framebuffer coordinates. Input attachments must not be used by any subpasses within a render pass that enables render pass transform.

Each element of the **pColorAttachments** array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a *Location* value of X, then it uses the attachment provided in **pColorAttachments[X]**. If the **attachment** member of any element of **pColorAttachments** is **VK_ATTACHMENT_UNUSED**, or if Color Write Enable has been disabled for the corresponding attachment index, then writes to the corresponding location by a fragment shader are discarded.

If **flags** does not include **VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM**, and if **pResolveAttachments** is not NULL, each of its elements corresponds to a color attachment (the element in **pColorAttachments** at the same index), and a multisample resolve operation is defined for each attachment. At the end of each subpass, multisample resolve operations read the subpass’s color attachments, and resolve the samples for each pixel within the render area to the same pixel location in the corresponding resolve attachments, unless the resolve attachment index is **VK_ATTACHMENT_UNUSED**.

Similarly, if **flags** does not include **VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM**, and **VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment** is not NULL and does not have the value **VK_ATTACHMENT_UNUSED**, it corresponds to the depth/stencil attachment in **pDepthStencilAttachment**, and multisample resolve operations for depth and stencil are defined by **VkSubpassDescriptionDepthStencilResolve::depthResolveMode** and **VkSubpassDescriptionDepthStencilResolve::stencilResolveMode**, respectively. At the end of each subpass, multisample resolve operations read the subpass’s depth/stencil attachment, and resolve
the samples for each pixel to the same pixel location in the corresponding resolve attachment. If `VkSubpassDescriptionDepthStencilResolve::depthResolveMode` is `VK_RESOLVE_MODE_NONE`, then the depth component of the resolve attachment is not written to and its contents are preserved. Similarly, if `VkSubpassDescriptionDepthStencilResolve::stencilResolveMode` is `VK_RESOLVE_MODE_NONE`, then the stencil component of the resolve attachment is not written to and its contents are preserved. `VkSubpassDescriptionDepthStencilResolve::depthResolveMode` is ignored if the `VkFormat` of the `pDepthStencilResolveAttachment` does not have a depth component. Similarly, `VkSubpassDescriptionDepthStencilResolve::stencilResolveMode` is ignored if the `VkFormat` of the `pDepthStencilResolveAttachment` does not have a stencil component.

If the image subresource range referenced by the depth/stencil attachment is created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT`, then the multisample resolve operation uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pPostSubpassSampleLocations` for the subpass.

If `pDepthStencilAttachment` is `NULL`, or if its attachment index is `VK_ATTACHMENT_UNUSED`, it indicates that no depth/stencil attachment will be used in the subpass.

The contents of an attachment within the render area become undefined at the start of a subpass `S` if all of the following conditions are true:

- The attachment is used as a color, depth/stencil, or resolve attachment in any subpass in the render pass.
- There is a subpass `S_i` that uses or preserves the attachment, and a subpass dependency from `S_i` to `S`.
- The attachment is not used or preserved in subpass `S`.

In addition, the contents of an attachment within the render area become undefined at the start of a subpass `S` if all of the following conditions are true:

- `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM` is set.
- The attachment is used as a color or depth/stencil in the subpass.

Once the contents of an attachment become undefined in subpass `S`, they remain undefined for subpasses in subpass dependency chains starting with subpass `S` until they are written again. However, they remain valid for subpasses in other subpass dependency chains starting with subpass `S_i` if those subpasses use or preserve the attachment.

---

**Valid Usage**

- **VUID-VkSubpassDescription-attachment-06912**
  If the attachment member of an element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, its layout member must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkSubpassDescription-attachment-06913**
  If the attachment member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`,
If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be
VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription-attachment-06914
  If the attachment member of an element of pResolveAttachments is not
  VK_ATTACHMENT_UNUSED, its layout member must not be
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription-attachment-06915
  If the attachment member of pDepthStencilAttachment is not VK_ATTACHMENT_UNUSED, its layout
  member must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription-attachment-06916
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its
  layout member must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkSubpassDescription-attachment-06917
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its
  layout member must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkSubpassDescription-attachment-06918
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its
  layout member must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkSubpassDescription-attachment-06919
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its
  layout member must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, or
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkSubpassDescription-attachment-06920
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its
  layout member must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, or
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkSubpassDescription-attachment-06921
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its
  layout member must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR

- VUID-VkSubpassDescription-attachment-06922
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its
  layout member must not be
  VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkSubpassDescription-attachment-06923
  If the attachment member of an element of pResolveAttachments is not
VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkSubpassDescription-pipelineBindPoint-04952
  pipelineBindPoint must be VK_PIPELINE_BIND_POINT_GRAPHICS or VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI

- VUID-VkSubpassDescription-colorAttachmentCount-00845
  colorAttachmentCount must be less than or equal to VkPhysicalDeviceLimits::maxColorAttachments

- VUID-VkSubpassDescription-loadOp-00846
  If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then loadOp must not be VK_ATTACHMENT_LOAD_OP_CLEAR

- VUID-VkSubpassDescription-pResolveAttachments-00847
  If pResolveAttachments is not NULL, for each resolve attachment that is not VK_ATTACHMENT_UNUSED, the corresponding color attachment must not be VK_ATTACHMENT_UNUSED

- VUID-VkSubpassDescription-pResolveAttachments-00848
  If pResolveAttachments is not NULL, for each resolve attachment that is not VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have a sample count of VK_SAMPLE_COUNT_1_BIT

- VUID-VkSubpassDescription-pResolveAttachments-00849
  If pResolveAttachments is not NULL, each resolve attachment that is not VK_ATTACHMENT_UNUSED must have a sample count of VK_SAMPLE_COUNT_1_BIT

- VUID-VkSubpassDescription-pResolveAttachments-00850
  If pResolveAttachments is not NULL, each resolve attachment that is not VK_ATTACHMENT_UNUSED must have the same VkFormat as its corresponding color attachment

- VUID-VkSubpassDescription-pColorAttachments-06868
  If neither the VK_AMD_mixed_attachment_samples extension nor the VK_NV_framebuffer_mixed_samples extension is enabled, all attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have the same sample count

- VUID-VkSubpassDescription-pInputAttachments-02647
  All attachments in pInputAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain at least VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkSubpassDescription-pColorAttachments-02648
  All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-VkSubpassDescription-pResolveAttachments-02649
  All attachments in pResolveAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT
• VUID-VkSubpassDescription-pDepthStencilAttachment-02650
  If \( p\text{DepthStencilAttachment} \) is not NULL and the attachment is not \( \text{VK\_ATTACHMENT\_UNUSED} \) then it must have an image format whose potential format features contain \( \text{VK\_FORMAT\_FEATURE\_DEPTH\_STENCIL\_ATTACHMENT\_BIT} \)

• VUID-VkSubpassDescription-linearColorAttachment-06496
  If the linearColorAttachment feature is enabled and the image is created with \( \text{VK\_IMAGE\_TILING\_LINEAR} \), all attachments in \( p\text{InputAttachments} \) that are not \( \text{VK\_ATTACHMENT\_UNUSED} \) must have image formats whose potential format features must contain \( \text{VK\_FORMAT\_FEATURE\_2\_LINEAR\_COLOR\_ATTACHMENT\_BIT\_NV} \)

• VUID-VkSubpassDescription-linearColorAttachment-06497
  If the linearColorAttachment feature is enabled and the image is created with \( \text{VK\_IMAGE\_TILING\_LINEAR} \), all attachments in \( p\text{ColorAttachments} \) that are not \( \text{VK\_ATTACHMENT\_UNUSED} \) must have image formats whose potential format features must contain \( \text{VK\_FORMAT\_FEATURE\_2\_LINEAR\_COLOR\_ATTACHMENT\_BIT\_NV} \)

• VUID-VkSubpassDescription-linearColorAttachment-06498
  If the linearColorAttachment feature is enabled and the image is created with \( \text{VK\_IMAGE\_TILING\_LINEAR} \), all attachments in \( p\text{ResolveAttachments} \) that are not \( \text{VK\_ATTACHMENT\_UNUSED} \) must have image formats whose potential format features must contain \( \text{VK\_FORMAT\_FEATURE\_2\_LINEAR\_COLOR\_ATTACHMENT\_BIT\_NV} \)

• VUID-VkSubpassDescription-pColorAttachments-01506
  If the \( \text{VK\_AMD\_mixed\_attachment\_samples} \) extension is enabled, all attachments in \( p\text{ColorAttachments} \) that are not \( \text{VK\_ATTACHMENT\_UNUSED} \) must have a sample count that is smaller than or equal to the sample count of \( p\text{DepthStencilAttachment} \) if it is not \( \text{VK\_ATTACHMENT\_UNUSED} \)

• VUID-VkSubpassDescription-pDepthStencilAttachment-01418
  If neither the \( \text{VK\_AMD\_mixed\_attachment\_samples} \) nor the \( \text{VK\_NV\_framebuffer\_mixed\_samples} \) extensions are enabled, and if \( p\text{DepthStencilAttachment} \) is not \( \text{VK\_ATTACHMENT\_UNUSED} \) and any attachments in \( p\text{ColorAttachments} \) are not \( \text{VK\_ATTACHMENT\_UNUSED} \), they must have the same sample count

• VUID-VkSubpassDescription-attachment-00853
  Each element of \( p\text{PreserveAttachments} \) must not be \( \text{VK\_ATTACHMENT\_UNUSED} \)

• VUID-VkSubpassDescription-pPreserveAttachments-00854
  Each element of \( p\text{PreserveAttachments} \) must not also be an element of any other member of the subpass description

• VUID-VkSubpassDescription-layout-02519
  If any attachment is used by more than one \( \text{VkAttachmentReference} \) member, then each use must use the same layout

• VUID-VkSubpassDescription-flags-00856
  If flags includes \( \text{VK\_SUBPASS\_DESCRIPTION\_PER\_VIEW\_POSITION\_X\_ONLY\_BIT\_NVX} \), it must also include \( \text{VK\_SUBPASS\_DESCRIPTION\_PER\_VIEW\_ATTRIBUTES\_BIT\_NVX} \)

• VUID-VkSubpassDescription-flags-03341
  If flags includes \( \text{VK\_SUBPASS\_DESCRIPTION\_SHADER\_RESOLVE\_BIT\_QCOM} \), and if \( p\text{ResolveAttachments} \) is not NULL, then each resolve attachment must be \( \text{VK\_ATTACHMENT\_UNUSED} \)
• VUID-VkSubpassDescription-flags-03343
  If flags includes VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM, then the subpass must be the last subpass in a subpass dependency chain.

• VUID-VkSubpassDescription-pInputAttachments-02868
  If the render pass is created with VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM each of the elements of pInputAttachments must be VK_ATTACHMENT_UNUSED.

• VUID-VkSubpassDescription-pDepthStencilAttachment-04438
  pDepthStencilAttachment and pColorAttachments must not contain references to the same attachment.

Valid Usage (Implicit)

• VUID-VkSubpassDescription-flags-parameter
  flags must be a valid combination of VkSubpassDescriptionFlagBits values.

• VUID-VkSubpassDescription-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value.

• VUID-VkSubpassDescription-pInputAttachments-parameter
  If inputAttachmentCount is not 0, pInputAttachments must be a valid pointer to an array of inputAttachmentCount valid VkAttachmentReference structures.

• VUID-VkSubpassDescription-pColorAttachments-parameter
  If colorAttachmentCount is not 0, pColorAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference structures.

• VUID-VkSubpassDescription-pResolveAttachments-parameter
  If colorAttachmentCount is not 0, and pResolveAttachments is not NULL, pResolveAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference structures.

• VUID-VkSubpassDescription-pDepthStencilAttachment-parameter
  If pDepthStencilAttachment is not NULL, pDepthStencilAttachment must be a valid pointer to a valid VkAttachmentReference structure.

• VUID-VkSubpassDescription-pPreserveAttachments-parameter
  If preserveAttachmentCount is not 0, pPreserveAttachments must be a valid pointer to an array of preserveAttachmentCount uint32_t values.

Bits which can be set in VkSubpassDescription::flags, specifying usage of the subpass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSubpassDescriptionFlagBits {
  // Provided by VK_NVX_multiview_per_view_attributes
  VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX = 0x00000001,
  // Provided by VK_NVX_multiview_per_view_attributes
  VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX = 0x00000002,
  // Provided by VK_QCOM_render_pass_shader_resolve
  VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM = 0x00000004,
```
• **VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX** specifies that shaders compiled for this subpass write the attributes for all views in a single invocation of each pre-rasterization shader stage. All pipelines compiled against a subpass that includes this bit must write per-view attributes to the *PerViewNV[]* shader outputs, in addition to the non-per-view (e.g. Position) outputs.

• **VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX** specifies that shaders compiled for this subpass use per-view positions which only differ in value in the x component. Per-view viewport mask can also be used.

• **VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM** specifies that the framebuffer region is the fragment region, that is, the minimum region dependencies are by pixel rather than by sample, such that any fragment shader invocation can access any sample associated with that fragment shader invocation.

• **VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM** specifies that the subpass performs shader resolve operations.

• **VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT** specifies that this subpass supports pipelines created with `VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT`.

• **VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT** specifies that this subpass supports pipelines created with `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT`.

• **VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT** specifies that this subpass supports pipelines created with
VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT.

- **VK_SUBPASS_DESCRIPTION_ENABLE_LEGACY_DITHERING_BIT_EXT** specifies that **Legacy Dithering** is enabled for this subpass.

Note

Shader resolve operations allow for custom resolve operations, but overdrawing pixels may have a performance and/or power cost. Furthermore, since the content of any depth stencil attachment or color attachment is undefined at the beginning of a shader resolve subpass, any depth testing, stencil testing, or blending operation which sources these undefined values also has undefined result value.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkSubpassDescriptionFlags;
```

**VkSubpassDescriptionFlags** is a bitmask type for setting a mask of zero or more **VkSubpassDescriptionFlagBits**.

The **VkAttachmentReference** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkAttachmentReference {
    uint32_t attachment;
    VkImageLayout layout;
} VkAttachmentReference;
```

- **attachment** is either an integer value identifying an attachment at the corresponding index in **VkRenderPassCreateInfo::pAttachments**, or **VK_ATTACHMENT_UNUSED** to signify that this attachment is not used.
- **layout** is a **VkImageLayout** value specifying the layout the attachment uses during the subpass.

### Valid Usage

- **VUID-VkAttachmentReference-layout-03077**
  If **attachment** is not **VK_ATTACHMENT_UNUSED**, **layout** must not be **VK_IMAGE_LAYOUT_UNDEFINED**, **VK_IMAGE_LAYOUT_PREINITIALIZED**, or **VK_IMAGE_LAYOUT_PRESENT_SRC_KHR**

- **VUID-VkAttachmentReference-separateDepthStencilLayouts-03313**
  If the **separateDepthStencilLayouts** feature is not enabled, and **attachment** is not **VK_ATTACHMENT_UNUSED**, **layout** must not be **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL**, **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**, **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL**, or **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**

- **VUID-VkAttachmentReference-synchronization2-06910**
  If the **synchronization2** feature is not enabled, **layout** must not be **VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR** or **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR**
If the attachmentFeedbackLoopLayout feature is not enabled, layout must not be VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT.

Valid Usage (Implicit)

- VUID-VkAttachmentReference-layout-parameter
  layout must be a valid VkImageLayout value

VK_SUBPASS_EXTERNAL is a special subpass index value expanding synchronization scope outside a subpass. It is described in more detail by VkSubpassDependency.

```
#define VK_SUBPASS_EXTERNAL (~0U)
```

The VkSubpassDependency structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDependency {
    uint32_t srcSubpass;
    uint32_t dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkDependencyFlags dependencyFlags;
} VkSubpassDependency;
```

- srcSubpass is the subpass index of the first subpass in the dependency, or VK_SUBPASS_EXTERNAL.
- dstSubpass is the subpass index of the second subpass in the dependency, or VK_SUBPASS_EXTERNAL.
- srcStageMask is a bitmask of VkPipelineStageFlagBits specifying the source stage mask.
- dstStageMask is a bitmask of VkPipelineStageFlagBits specifying the destination stage mask.
- srcAccessMask is a bitmask of VkAccessFlagBits specifying a source access mask.
- dstAccessMask is a bitmask of VkAccessFlagBits specifying a destination access mask.
- dependencyFlags is a bitmask of VkDependencyFlagBits.

If srcSubpass is equal to dstSubpass then the VkSubpassDependency describes a subpass self-dependency, and only constrains the pipeline barriers allowed within a subpass instance. Otherwise, when a render pass instance which includes a subpass dependency is submitted to a queue, it defines a memory dependency between the subpasses identified by srcSubpass and dstSubpass.

If srcSubpass is equal to VK_SUBPASS_EXTERNAL, the first synchronization scope includes commands
that occur earlier in submission order than the `vkCmdBeginRenderPass` used to begin the render pass instance. Otherwise, the first set of commands includes all commands submitted as part of the subpass instance identified by `srcSubpass` and any load, store or multisample resolve operations on attachments used in `srcSubpass`. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the source stage mask specified by `srcStageMask`.

If `dstSubpass` is equal to `VK_SUBPASS_EXTERNAL`, the second synchronization scope includes commands that occur later in submission order than the `vkCmdEndRenderPass` used to end the render pass instance. Otherwise, the second set of commands includes all commands submitted as part of the subpass instance identified by `dstSubpass` and any load, store or multisample resolve operations on attachments used in `dstSubpass`. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by `dstStageMask`.

The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by `srcStageMask`. It is also limited to access types in the source access mask specified by `srcAccessMask`.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by `dstStageMask`. It is also limited to access types in the destination access mask specified by `dstAccessMask`.

The availability and visibility operations defined by a subpass dependency affect the execution of image layout transitions within the render pass.

**Note**

For non-attachment resources, the memory dependency expressed by subpass dependency is nearly identical to that of a `VkMemoryBarrier` (with matching `srcAccessMask` and `dstAccessMask` parameters) submitted as a part of a `vkCmdPipelineBarrier` (with matching `srcStageMask` and `dstStageMask` parameters). The only difference being that its scopes are limited to the identified subpasses rather than potentially affecting everything before and after.

For attachments however, subpass dependencies work more like a `VkImageMemoryBarrier` defined similarly to the `VkMemoryBarrier` above, the queue family indices set to `VK_QUEUE_FAMILY_IGNORED`, and layouts as follows:

- The equivalent to `oldLayout` is the attachment's layout according to the subpass description for `srcSubpass`.
- The equivalent to `newLayout` is the attachment's layout according to the subpass description for `dstSubpass`.

**Valid Usage**

- VUID-VkSubpassDependency-srcStageMask-04090

  If the `geometryShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
If the `tessellationShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

If the `conditionalRendering` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`.

If the `fragmentDensityMap` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.

If the `transformFeedback` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

If the `meshShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`.

If the `taskShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`.

If the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the `synchronization2` feature is not enabled, `srcStageMask` must not be 0.

If the `geometryShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

If the `tessellationShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

If the `conditionalRendering` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`.

If the `fragmentDensityMap` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.

If the `transformFeedback` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

If the `geometryShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.
If the meshShader feature is not enabled, \( \text{dstStageMask} \) must not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`.

- **VUID-VkSubpassDependency-dstStageMask-04096**
  If the taskShader feature is not enabled, \( \text{dstStageMask} \) must not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`.

- **VUID-VkSubpassDependency-shadingRateImage-07318**
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, \( \text{dstStageMask} \) must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-VkSubpassDependency-dstStageMask-03937**
  If the synchronization2 feature is not enabled, \( \text{dstStageMask} \) must not be 0.

**srcSubpass** must be less than or equal to `VK_SUBPASS_EXTERNAL`, to avoid cyclic dependencies and ensure a valid execution order.

**srcSubpass** and **dstSubpass** must not both be equal to `VK_SUBPASS_EXTERNAL`.

If **srcSubpass** is equal to **dstSubpass** and **srcStageMask** includes a framebuffer-space stage, **dstStageMask** must only contain framebuffer-space stages.

Any access flag included in **srcAccessMask** must be supported by one of the pipeline stages in **srcStageMask**, as specified in the table of supported access types.

Any access flag included in **dstAccessMask** must be supported by one of the pipeline stages in **dstStageMask**, as specified in the table of supported access types.

If **srcSubpass** equals **dstSubpass**, and **srcStageMask** and **dstStageMask** both include a framebuffer-space stage, then **dependencyFlags** must include `VK_DEPENDENCY_BY_REGION_BIT`.

If **dependencyFlags** includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, **srcSubpass** must not be equal to `VK_SUBPASS_EXTERNAL`.

If **dependencyFlags** includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, **dstSubpass** must not be equal to `VK_SUBPASS_EXTERNAL`.

If **srcSubpass** equals **dstSubpass** and that subpass has more than one bit set in the view mask, then **dependencyFlags** must include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

---

**Valid Usage (Implicit)**

- **VUID-VkSubpassDependency-srcStageMask-parameter**
  \( \text{srcStageMask} \) must be a valid combination of `VkPipelineStageFlagBits` values.
When multiview is enabled, the execution of the multiple views of one subpass may not occur simultaneously or even back-to-back, and rather may be interleaved with the execution of other subpasses. The load and store operations apply to attachments on a per-view basis. For example, an attachment using VK_ATTACHMENT_LOAD_OP_CLEAR will have each view cleared on first use, but the first use of one view may be temporally distant from the first use of another view.

Note
A good mental model for multiview is to think of a multiview subpass as if it were a collection of individual (per-view) subpasses that are logically grouped together and described as a single multiview subpass in the API. Similarly, a multiview attachment can be thought of like several individual attachments that happen to be layers in a single image. A view-local dependency between two multiview subpasses acts like a set of one-to-one dependencies between corresponding pairs of per-view subpasses. A view-global dependency between two multiview subpasses acts like a set of \( N \times M \) dependencies between all pairs of per-view subpasses in the source and destination. Thus, it is a more compact representation which also makes clear the commonality and reuse that is present between views in a subpass. This interpretation motivates the answers to questions like “when does the load op apply” - it is on the first use of each view of an attachment, as if each view was a separate attachment.

The content of each view follows the description in attachment content behavior. In particular, if an attachment is preserved, all views within the attachment are preserved.

If any two subpasses of a render pass activate transform feedback to the same bound transform feedback buffers, a subpass dependency must be included (either directly or via some intermediate subpasses) between them.

If there is no subpass dependency from VK_SUBPASS_EXTERNAL to the first subpass that uses an attachment, then an implicit subpass dependency exists from VK_SUBPASS_EXTERNAL to the first subpass it is used in. The implicit subpass dependency only exists if there exists an automatic layout transition away from initialLayout. The subpass dependency operates as if defined with the following parameters:

```cpp
VkSubpassDependency implicitDependency = {
    .srcSubpass = VK_SUBPASS_EXTERNAL;
};
```
Similarly, if there is no subpass dependency from the last subpass that uses an attachment to `VK_SUBPASS_EXTERNAL`, then an implicit subpass dependency exists from the last subpass it is used in to `VK_SUBPASS_EXTERNAL`. The implicit subpass dependency only exists if there exists an automatic layout transition into `finalLayout`. The subpass dependency operates as if defined with the following parameters:

```c
VkSubpassDependency implicitDependency = {
    .srcSubpass = lastSubpass; // Last subpass attachment is used in
    .dstSubpass = VK_SUBPASS_EXTERNAL;
    .srcStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT;
    .dstStageMask = VK_PIPELINE_STAGE_NONE;
    .srcAccessMask = VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
                     VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT;
    .dstAccessMask = 0;
    .dependencyFlags = 0;
};
```

As subpasses **may** overlap or execute out of order with regards to other subpasses unless a subpass dependency chain describes otherwise, the layout transitions required between subpasses **cannot** be known to an application. Instead, an application provides the layout that each attachment **must** be in at the start and end of a render pass, and the layout it **must** be in during each subpass it is used in. The implementation then **must** execute layout transitions between subpasses in order to guarantee that the images are in the layouts required by each subpass, and in the final layout at the end of the render pass.

Automatic layout transitions apply to the entire image subresource attached to the framebuffer. If multiview is not enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the number of layers specified by `VkFramebufferCreateInfo::layers`. If multiview is enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the layers corresponding to views which are used by some subpass in the render pass, even if that subpass does not reference the given attachment. If the attachment view is a 2D or 2D array view of a 3D image, even if the attachment view only refers to a subset of the slices of the selected mip level of the 3D image, automatic layout transitions apply to the entire subresource referenced which is the entire mip level in this case.

Automatic layout transitions away from the layout used in a subpass happen-after the availability
operations for all dependencies with that subpass as the \texttt{srcSubpass}.

Automatic layout transitions into the layout used in a subpass happen-before the visibility operations for all dependencies with that subpass as the \texttt{dstSubpass}.

Automatic layout transitions away from \texttt{initialLayout} happen-after the availability operations for all dependencies with a \texttt{srcSubpass} equal to \texttt{VK_SUBPASS_EXTERNAL}, where \texttt{dstSubpass} uses the attachment that will be transitioned. For attachments created with \texttt{VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT}, automatic layout transitions away from \texttt{initialLayout} happen-after the availability operations for all dependencies with a \texttt{srcSubpass} equal to \texttt{VK_SUBPASS_EXTERNAL}, where \texttt{dstSubpass} uses any aliased attachment.

Automatic layout transitions into \texttt{finalLayout} happen-before the visibility operations for all dependencies with a \texttt{dstSubpass} equal to \texttt{VK_SUBPASS_EXTERNAL}, where \texttt{srcSubpass} uses the attachment that will be transitioned. For attachments created with \texttt{VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT}, automatic layout transitions into \texttt{finalLayout} happen-before the visibility operations for all dependencies with a \texttt{dstSubpass} equal to \texttt{VK_SUBPASS_EXTERNAL}, where \texttt{srcSubpass} uses any aliased attachment.

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with \texttt{VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT} is dependent on the last sample locations used to render to the attachment, thus automatic layout transitions use the sample locations state specified in \texttt{VkRenderPassSampleLocationsBeginInfoEXT}.

Automatic layout transitions of an attachment referring to a depth/stencil image created with \texttt{VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT} use the sample locations the image subresource range referenced by the attachment was last rendered with. If the current render pass does not use the attachment as a depth/stencil attachment in any subpass that happens-before, the automatic layout transition uses the sample locations state specified in the \texttt{sampleLocationsInfo} member of the element of the \texttt{VkRenderPassSampleLocationsBeginInfoEXT}::pAttachmentInitialSampleLocations array for which the \texttt{attachmentIndex} member equals the attachment index of the attachment, if one is specified. Otherwise, the automatic layout transition uses the sample locations state specified in the \texttt{sampleLocationsInfo} member of the element of the \texttt{VkRenderPassSampleLocationsBeginInfoEXT}::pPostSubpassSampleLocations array for which the \texttt{subpassIndex} member equals the index of the subpass that last used the attachment as a depth/stencil attachment, if one is specified.

If no sample locations state has been specified for an automatic layout transition performed on an attachment referring to a depth/stencil image created with \texttt{VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT} the contents of the depth aspect of the depth/stencil attachment become undefined as if the layout of the attachment was transitioned from the \texttt{VK_IMAGE_LAYOUT_UNDEFINED} layout.

If two subpasses use the same attachment, and both subpasses use the attachment in a read-only layout, no subpass dependency needs to be specified between those subpasses. If an implementation treats those layouts separately, it \textbf{must} insert an implicit subpass dependency between those subpasses to separate the uses in each layout. The subpass dependency operates as if defined with the following parameters:
A subpass may access the same subresource for both a color or depth/stencil attachment and as an input resource in one of the following ways:

- As an input attachment
- As a sampled image or image resource in *VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT* layout in a pipeline with either the *VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT* or *VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT* bits set in a render pass that contains dependencies with the *VK_DEPENDENCY_FEEDBACK_LOOP_BIT_EXT* bit set.

In these situations, writes via the color or depth/stencil attachment are not automatically made visible to reads via the input resource, causing a feedback loop, except in any of the following conditions:

- If the color components or depth/stencil components read are mutually exclusive with the components written by the color or depth/stencil attachments, then there is no feedback loop. This requires the graphics pipelines used by the subpass to disable writes to color components that are read as inputs via the *colorWriteEnable* or *colorWriteMask*, and to disable writes to depth/stencil components that are read as inputs via *depthWriteEnable* or *stencilTestEnable*.
- If the attachment is used as an input attachment and depth/stencil attachment only, and the depth/stencil attachment is not written to.

Rendering within a subpass containing a feedback loop creates a data race, except in the following cases:

- If a memory dependency is inserted between when the attachment is written and when it is subsequently read by later fragments. Pipeline barriers expressing a subpass self-dependency.
are the only way to achieve this, and one **must** be inserted every time a fragment will read values at a particular sample \((x, y, \text{layer}, \text{sample})\) coordinate, if those values have been written since the most recent pipeline barrier; or since the start of the subpass, if there have been no pipeline barriers since the start of the subpass.

- If the attachment is used as color and input attachment, and the pipeline performing the read was created with `VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT` included in the `flags` member of the `pColorBlendState` member of its `VkGraphicsPipelineCreateInfo`. This creates a framebuffer-local memory dependency for each fragment generated by draw commands using this pipeline with the following properties:
  - The first **synchronization scope** includes the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage executed by all previous fragments (as defined by **primitive order**) in the corresponding **framebuffer regions** including those generated by the same draw command.
  - The second **synchronization scope** includes the `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` pipeline stage executed by the generated fragment.
  - The first **access scope** includes all writes to color attachments.
  - The second **access scope** includes all reads from input attachments.

- If the attachment is used as depth/stencil and input attachment, and the pipeline performs a read of the depth aspect and was created with `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT` included in the `flags` member of the `pDepthStencilState` member of its `VkGraphicsPipelineCreateInfo`. This creates a memory dependency for each fragment generated by draw commands using this pipeline with the following properties:
  - The first **synchronization scope** includes `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` and `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stages executed by all previous fragments (as defined by **primitive order**) in the corresponding **framebuffer regions** including those generated by the same draw command.
  - The second **synchronization scope** includes `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` and `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stages executed by the generated fragment.
  - The first **access scope** includes all writes to the depth aspect of depth/stencil attachments.
  - The second **access scope** includes all reads from the depth aspect of input attachments.

- If the attachment is used as depth/stencil and input attachment, and the pipeline performs a read of the stencil aspect and was created with `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT` included in the `flags` member of the `pDepthStencilState` member of its `VkGraphicsPipelineCreateInfo`. This creates a memory dependency for each fragment generated by draw commands using this pipeline with the following properties:
  - The first **synchronization scope** includes `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` and `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stages executed by all previous fragments (as defined by **primitive order**) in the corresponding **framebuffer regions** including those generated by the same draw command.
  - The second **synchronization scope** includes `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` and
VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT pipeline stages executed by the generated fragment.

- The first access scope includes all writes to the stencil aspect of depth/stencil attachments.
- The second access scope includes all reads from the stencil aspect of input attachments.

An attachment must not be used as both a depth/stencil attachment and a color attachment.

**Note**
Writes inside of a feedback loop for images in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout only avoid a data race in the following conditions:

- The fragment (p,q) is sampling the texel at (p,q), with a subpass self-dependency.
- Reading/sampling from a region not currently being written to the image as a color or depth/stencil attachment in the current subpass (disjoint read/write regions).

A more extensible version of render pass creation is also defined below.

To create a render pass, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkCreateRenderPass2(
    VkDevice device,
    const VkRenderPassCreateInfo2* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkRenderPass* pRenderPass);
```

or the equivalent command

```c
// Provided by VK_KHR_create_renderpass2
VkResult vkCreateRenderPass2KHR(
    VkDevice device,
    const VkRenderPassCreateInfo2* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkRenderPass* pRenderPass);
```

- `device` is the logical device that creates the render pass.
- `pCreateInfo` is a pointer to a `VkRenderPassCreateInfo2` structure describing the parameters of the render pass.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pRenderPass` is a pointer to a `VkRenderPass` handle in which the resulting render pass object is returned.
This command is functionally identical to `vkCreateRenderPass`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

**Valid Usage (Implicit)**

- **VUID-vkCreateRenderPass2-device-parameter**
  `device` *must* be a valid `VkDevice` handle

- **VUID-vkCreateRenderPass2-pCreateInfo-parameter**
  `pCreateInfo` *must* be a valid pointer to a valid `VkRenderPassCreateInfo2` structure

- **VUID-vkCreateRenderPass2-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` *must* be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateRenderPass2-pRenderPass-parameter**
  `pRenderPass` *must* be a valid pointer to a `VkRenderPass` handle

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkRenderPassCreateInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassCreateInfo2 {
    VkStructureType    sType;
    const void*        pNext;
    VkRenderPassCreateFlags flags;
    uint32_t            attachmentCount;
    const VkAttachmentDescription2* pAttachments;
    uint32_t            subpassCount;
    const VkSubpassDescription2* pSubpasses;
    uint32_t            dependencyCount;
    const VkSubpassDependency2* pDependencies;
    uint32_t            correlatedViewMaskCount;
    const uint32_t*     pCorrelatedViewMasks;
} VkRenderPassCreateInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
```
typedef VkRenderPassCreateInfo2 VkRenderPassCreateInfo2KHR;

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `attachmentCount` is the number of attachments used by this render pass.
- `pAttachments` is a pointer to an array of `attachmentCount` `VkAttachmentDescription2` structures describing the attachments used by the render pass.
- `subpassCount` is the number of subpasses to create.
- `pSubpasses` is a pointer to an array of `subpassCount` `VkSubpassDescription2` structures describing each subpass.
- `dependencyCount` is the number of dependencies between pairs of subpasses.
- `pDependencies` is a pointer to an array of `dependencyCount` `VkSubpassDependency2` structures describing dependencies between pairs of subpasses.
- `correlatedViewMaskCount` is the number of correlation masks.
- `pCorrelatedViewMasks` is a pointer to an array of view masks indicating sets of views that may be more efficient to render concurrently.

Parameters defined by this structure with the same name as those in `VkRenderPassCreateInfo` have the identical effect to those parameters; the child structures are variants of those used in `VkRenderPassCreateInfo` which add `sType` and `pNext` parameters, allowing them to be extended.

If the `VkSubpassDescription2::viewMask` member of any element of `pSubpasses` is not zero, multiview functionality is considered to be enabled for this render pass.

correlatedViewMaskCount and `pCorrelatedViewMasks` have the same effect as `VkRenderPassMultiviewCreateInfo::correlationMaskCount` and `VkRenderPassMultiviewCreateInfo::pCorrelationMasks`, respectively.

### Valid Usage

- **VUID-VkRenderPassCreateInfo2-None-03049**
  If any two subpasses operate on attachments with overlapping ranges of the same `VkDeviceMemory` object, and at least one subpass writes to that area of `VkDeviceMemory`, a subpass dependency must be included (either directly or via some intermediate subpasses) between them.

- **VUID-VkRenderPassCreateInfo2-attachment-03050**
  If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or the attachment indexed by any element of `pPreserveAttachments` in any given element of `pSubpasses` is bound to a range of a `VkDeviceMemory` object that overlaps with any other attachment in any subpass (including the same subpass), the `VkAttachmentDescription2` structures describing them must include `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` in `flags`.

493
If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any given element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, then it must be less than `attachmentCount`.

If the `pNext` chain includes a `VkRenderPassFragmentDensityMapCreateInfoEXT` structure and the `fragmentDensityMapAttachment` member is not `VK_ATTACHMENT_UNUSED`, then attachment must be less than `attachmentCount`.

If the `pNext` chain includes a `VkSubpassDescriptionDepthStencilResolve` structure and the `pDepthStencilResolveAttachment` member is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, then attachment must be less than `attachmentCount`.

For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment must not specify a layout equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment must not specify a layout equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.

For any element of `pDependencies`, if the `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `srcStageMask` member of that dependency must be a pipeline stage supported by the pipeline identified by the `pipelineBindPoint` member of the source subpass.

For any element of `pDependencies`, if the `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `dstStageMask` member of that dependency must be a pipeline stage supported by the pipeline identified by the `pipelineBindPoint` member of the destination subpass.

The set of bits included in any element of `pCorrelatedViewMasks` must not overlap with the set of bits included in any other element of `pCorrelatedViewMasks`.

If the `VkSubpassDescription2::viewMask` member of all elements of `pSubpasses` is 0, `correlatedViewMaskCount` must be 0.

The `VkSubpassDescription2::viewMask` member of all elements of `pSubpasses` must either all be 0, or all not be 0.
- **VUID-VkRenderPassCreateInfo2-viewMask-03059**
  If the `VkSubpassDescription2::viewMask` member of all elements of `pSubpasses` is 0, the `dependencyFlags` member of any element of `pDependencies` must not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

- **VUID-VkRenderPassCreateInfo2-pDependencies-03060**
  For any element of `pDependencies` where its `srcSubpass` member equals its `dstSubpass` member, if the `viewMask` member of the corresponding element of `pSubpasses` includes more than one bit, its `dependencyFlags` member must include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

- **VUID-VkRenderPassCreateInfo2-attachment-02525**
  If the `attachment` member of any element of the `pInputAttachments` member of any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, the `aspectMask` member of that element of `pInputAttachments` only include aspects that are present in images of the format specified by the element of `pAttachments` specified by `attachment`.

- **VUID-VkRenderPassCreateInfo2-srcSubpass-02526**
  The `srcSubpass` member of each element of `pDependencies` must be less than `subpassCount`.

- **VUID-VkRenderPassCreateInfo2-dstSubpass-02527**
  The `dstSubpass` member of each element of `pDependencies` must be less than `subpassCount`.

- **VUID-VkRenderPassCreateInfo2-pAttachments-04585**
  If any element of `pAttachments` is used as a fragment shading rate attachment in any subpass, it must not be used as any other attachment in the render pass.

- **VUID-VkRenderPassCreateInfo2-flags-04521**
  If `flags` includes `VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM`, an element of `pSubpasses` includes an instance of `VkFragmentShadingRateAttachmentInfoKHR` in its `pNext` chain, and the `pFragmentShadingRateAttachment` member of that structure is not equal to `NULL`, the attachment member of `pFragmentShadingRateAttachment` must be `VK_ATTACHMENT_UNUSED`.

- **VUID-VkRenderPassCreateInfo2-pAttachments-04586**
  If any element of `pAttachments` is used as a fragment shading rate attachment in any subpass, it must have an image format whose potential format features contain `VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-VkRenderPassCreateInfo2-rasterizationSamples-04905**
  If the pipeline is being created with fragment shader state, and the `VK_QCOM_render_pass_shader_resolve` extension is enabled, and if subpass has any input attachments, and if the subpass description contains `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM`, then the sample count of the input attachments must equal `rasterizationSamples`.

- **VUID-VkRenderPassCreateInfo2-sampleShadingEnable-04906**
  If the pipeline is being created with fragment shader state, and the `VK_QCOM_render_pass_shader_resolve` extension is enabled, and if the subpass description contains `VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM`, then `sampleShadingEnable` must be `false`.

- **VUID-VkRenderPassCreateInfo2-flags-04907**
  If `flags` includes `VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM`, and if `pResolveAttachments` is not `NULL`, then each resolve attachment must be
VK_ATTACHMENT_UNUSED

- VUID-VkRenderPassCreateInfo2-flags-04908
  If flags includes VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM, and if pDepthStencilResolveAttachment is not NULL, then the depth/stencil resolve attachment must be VK_ATTACHMENT_UNUSED

- VUID-VkRenderPassCreateInfo2-flags-04909
  If flags includes VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM, then the subpass must be the last subpass in a subpass dependency chain

- VUID-VkRenderPassCreateInfo2-attachment-06244
  If the attachment member of the pDepthStencilAttachment member of an element of pSubpasses is not VK_ATTACHMENT_UNUSED, the layout member of that same structure is either VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, and thepNext chain of that structure does not include a VkAttachmentReferenceStencilLayout structure, then the element of pAttachments with an index equal to attachment must not have a format that includes both depth and stencil aspects

- VUID-VkRenderPassCreateInfo2-attachment-06245
  If the attachment member of the pDepthStencilAttachment member of an element of pSubpasses is not VK_ATTACHMENT_UNUSED and the layout member of that same structure is either VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, then the element of pAttachments with an index equal to attachment must have a format that includes only a stencil aspect

- VUID-VkRenderPassCreateInfo2-attachment-06246
  If the attachment member of the pDepthStencilAttachment member of an element of pSubpasses is not VK_ATTACHMENT_UNUSED and the layout member of that same structure is either VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, then the element of pAttachments with an index equal to attachment must not have a format that includes only a stencil aspect

Valid Usage (Implicit)

- VUID-VkRenderPassCreateInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO_2

- VUID-VkRenderPassCreateInfo2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkRenderPassCreationControlEXT, VkRenderPassCreationFeedbackCreateInfoEXT, or VkRenderPassFragmentDensityMapCreateInfoEXT

- VUID-VkRenderPassCreateInfo2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkRenderPassCreateInfo2-flags-parameter
  flags must be a valid combination of VkRenderPassCreateFlagBits values

- VUID-VkRenderPassCreateInfo2-pAttachments-parameter
If `attachmentCount` is not 0, `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkAttachmentDescription2` structures.

- VUID-VkRenderPassCreateInfo2-pSubpasses-parameter
  - `pSubpasses` must be a valid pointer to an array of `subpassCount` valid `VkSubpassDescription2` structures

- VUID-VkRenderPassCreateInfo2-pDependencies-parameter
  If `dependencyCount` is not 0, `pDependencies` must be a valid pointer to an array of `dependencyCount` valid `VkSubpassDependency2` structures

- VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-parameter
  If `correlatedViewMaskCount` is not 0, `pCorrelatedViewMasks` must be a valid pointer to an array of `correlatedViewMaskCount` `uint32_t` values

- VUID-VkRenderPassCreateInfo2-subpassCount-arraylength
  - `subpassCount` must be greater than 0

The `VkAttachmentDescription2` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescription2 {
    VkStructureType sType;
    const void* pNext;
    VkAttachmentDescriptionFlags flags;
    VkFormat format;
    VkSampleCountFlagBits samples;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkAttachmentLoadOp stencilLoadOp;
    VkAttachmentStoreOp stencilStoreOp;
    VkImageLayout initialLayout;
    VkImageLayout finalLayout;
} VkAttachmentDescription2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkAttachmentDescription2 VkAttachmentDescription2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkAttachmentDescriptionFlagBits` specifying additional properties of the attachment.
- `format` is a `VkFormat` value specifying the format of the image that will be used for the attachment.
- `samples` is a `VkSampleCountFlagBits` value specifying the number of samples of the image.
• **loadOp** is a `VkAttachmentLoadOp` value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.

• **storeOp** is a `VkAttachmentStoreOp` value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.

• **stencilLoadOp** is a `VkAttachmentLoadOp` value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.

• **stencilStoreOp** is a `VkAttachmentStoreOp` value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.

• **initialLayout** is the layout the attachment image subresource will be in when a render pass instance begins.

• **finalLayout** is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

Parameters defined by this structure with the same name as those in `VkAttachmentDescription` have the identical effect to those parameters.

If the **separateDepthStencilLayouts** feature is enabled, and **format** is a depth/stencil format, **initialLayout** and **finalLayout** can be set to a layout that only specifies the layout of the depth aspect.

If the **pNext** chain includes a `VkAttachmentDescriptionStencilLayout` structure, then the **stencilInitialLayout** and **stencilFinalLayout** members specify the initial and final layouts of the stencil aspect of a depth/stencil format, and **initialLayout** and **finalLayout** only apply to the depth aspect. For depth-only formats, the `VkAttachmentDescriptionStencilLayout` structure is ignored. For stencil-only formats, the initial and final layouts of the stencil aspect are taken from the `VkAttachmentDescriptionStencilLayout` structure if present, or **initialLayout** and **finalLayout** if not present.

If **format** is a depth/stencil format, and either **initialLayout** or **finalLayout** does not specify a layout for the stencil aspect, then the application **must** specify the initial and final layouts of the stencil aspect by including a `VkAttachmentDescriptionStencilLayout` structure in the **pNext** chain.

---

**Valid Usage**

- **VUID-VkAttachmentDescription2-format-06698**
  *format** must not be VK_FORMAT_UNDEFINED

- **VUID-VkAttachmentDescription2-format-06699**
  If **format** includes a color or depth aspect and **loadOp** is VK_ATTACHMENT_LOAD_OP_LOAD, then **initialLayout** must not be VK_IMAGE_LAYOUT_UNDEFINED

- **VUID-VkAttachmentDescription2-finalLayout-00843**
  **finalLayout** must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

- **VUID-VkAttachmentDescription2-format-03280**
  If **format** is a color format, **initialLayout** must not be VK_IMAGE_LAYOUTDEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUTDEPTH_STENCIL_READONLY_OPTIMAL
• VUID-VkAttachmentDescription2-format-03281
  If format is a depth/stencil format, \texttt{initialLayout} must not be \texttt{VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL}.

• VUID-VkAttachmentDescription2-format-03282
  If format is a color format, \texttt{finalLayout} must not be \texttt{VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL} or \texttt{VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL}.

• VUID-VkAttachmentDescription2-format-03283
  If format is a depth/stencil format, \texttt{finalLayout} must not be \texttt{VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL}.

• VUID-VkAttachmentDescription2-format-03286
  If format is a color format, \texttt{initialLayout} must not be \texttt{VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL}, \texttt{VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL}, \texttt{VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL}, or \texttt{VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL}.

• VUID-VkAttachmentDescription2-format-03287
  If format is a color format, \texttt{finalLayout} must not be \texttt{VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL}, \texttt{VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL}, \texttt{VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL}, or \texttt{VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL}.

• VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03284
  If the \texttt{separateDepthStencilLayouts} feature is not enabled, \texttt{initialLayout} must not be \texttt{VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL}, \texttt{VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL}, \texttt{VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL}, or \texttt{VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL}.

• VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03285
  If the \texttt{separateDepthStencilLayouts} feature is not enabled, \texttt{finalLayout} must not be \texttt{VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL}, \texttt{VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL}, \texttt{VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL}, or \texttt{VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL}.

• VUID-VkAttachmentDescription2-format-03288
  If format is a color format, \texttt{initialLayout} must not be \texttt{VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL}, \texttt{VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL}, \texttt{VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL}, or \texttt{VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL}.

• VUID-VkAttachmentDescription2-format-03289
  If format is a color format, \texttt{finalLayout} must not be \texttt{VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL}, \texttt{VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL}, \texttt{VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL}, or \texttt{VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL}.

• VUID-VkAttachmentDescription2-format-06906
  If format is a depth/stencil format which includes both depth and stencil aspects, \texttt{initialLayout} must not be \texttt{VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL} or \texttt{VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL}.

• VUID-VkAttachmentDescription2-format-06907
  If format is a depth/stencil format which includes both depth and stencil aspects,
**finalLayout** must not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-03290**
  If `format` is a depth/stencil format which includes only the depth aspect, **initialLayout** must not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-03291**
  If `format` is a depth/stencil format which includes only the depth aspect, **finalLayout** must not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription2-synchronization2-06908**
  If the `synchronization2` feature is not enabled, **initialLayout** must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- **VUID-VkAttachmentDescription2-synchronization2-06909**
  If the `synchronization2` feature is not enabled, **finalLayout** must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- **VUID-VkAttachmentDescription2-attachmentFeedbackLoopLayout-07309**
  If the `attachmentFeedbackLoopLayout` feature is not enabled, **initialLayout** must not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`

- **VUID-VkAttachmentDescription2-attachmentFeedbackLoopLayout-07310**
  If the `attachmentFeedbackLoopLayout` feature is not enabled, **finalLayout** must not be `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT`

- **VUID-VkAttachmentDescription2-pNext-06704**
  If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure, `format` includes a stencil aspect, and `stencilLoadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then **initialLayout** must not be `VK_IMAGE_LAYOUT_UNDEFINED`

- **VUID-VkAttachmentDescription2-pNext-06705**
  If the `pNext` chain does includes a `VkAttachmentDescriptionStencilLayout` structure, `format` includes a stencil aspect, and `stencilLoadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `VkAttachmentDescriptionStencilLayout::stencilInitialLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`

- **VUID-VkAttachmentDescription2-format-06249**
  If `format` is a depth/stencil format which includes both depth and stencil aspects, and **initialLayout** is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, the `pNext` chain **must** include a `VkAttachmentDescriptionStencilLayout` structure

- **VUID-VkAttachmentDescription2-format-06250**
  If `format` is a depth/stencil format which includes both depth and stencil aspects, and **finalLayout** is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, the `pNext` chain **must** include a `VkAttachmentDescriptionStencilLayout` structure

- **VUID-VkAttachmentDescription2-format-06247**
  If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure and
format only includes a stencil aspect, initialLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

- VUID-VkAttachmentDescription2-format-06248
  
  If the pNext chain does not include a VkAttachmentDescriptionStencilLayout structure and format only includes a stencil aspect, finalLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

Valid Usage (Implicit)

- VUID-VkAttachmentDescription2-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_2

- VUID-VkAttachmentDescription2-pNext-pNext
  
  pNext must be NULL or a pointer to a valid instance of VkAttachmentDescriptionStencilLayout

- VUID-VkAttachmentDescription2-sType-unique
  
  The sType value of each struct in the pNext chain must be unique

- VUID-VkAttachmentDescription2-flags-parameter
  
  flags must be a valid combination of VkAttachmentDescriptionFlagBits values

- VUID-VkAttachmentDescription2-format-parameter
  
  format must be a valid VkFormat value

- VUID-VkAttachmentDescription2-samples-parameter
  
  samples must be a valid VkSampleCountFlagBits value

- VUID-VkAttachmentDescription2-loadOp-parameter
  
  loadOp must be a valid VkAttachmentLoadOp value

- VUID-VkAttachmentDescription2-storeOp-parameter
  
  storeOp must be a valid VkAttachmentStoreOp value

- VUID-VkAttachmentDescription2-stencilLoadOp-parameter
  
  stencilLoadOp must be a valid VkAttachmentLoadOp value

- VUID-VkAttachmentDescription2-stencilStoreOp-parameter
  
  stencilStoreOp must be a valid VkAttachmentStoreOp value

- VUID-VkAttachmentDescription2-initialLayout-parameter
  
  initialLayout must be a valid VkImageLayout value

- VUID-VkAttachmentDescription2-finalLayout-parameter
  
  finalLayout must be a valid VkImageLayout value

The VkAttachmentDescriptionStencilLayout structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescriptionStencilLayout {
    VkStructureType   sType;
    void*              pNext;
} VkAttachmentDescriptionStencilLayout;
```
VkImageLayout stencilInitialLayout;
VkImageLayout stencilFinalLayout;
} VkAttachmentDescriptionStencilLayout;

or the equivalent

// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkAttachmentDescriptionStencilLayout VkAttachmentDescriptionStencilLayoutKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **stencilInitialLayout** is the layout the stencil aspect of the attachment image subresource will be in when a render pass instance begins.
- **stencilFinalLayout** is the layout the stencil aspect of the attachment image subresource will be transitioned to when a render pass instance ends.

### Valid Usage

- **VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-03308**
  
  stencilInitialLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, or
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- **VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03309**
  
  stencilFinalLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, or
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- **VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03310**
  
  stencilFinalLayout must not be VK_IMAGE_LAYOUT_UNDEFINED or
  VK_IMAGE_LAYOUT_PREINITIALIZED

### Valid Usage (Implicit)

- **VUID-VkAttachmentDescriptionStencilLayout-sType-sType**
  
  sType must be VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_STENCIL_LAYOUT

- **VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-parameter**
  
  stencilInitialLayout must be a valid VkImageLayout value
The `VkSubpassDescription2` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDescription2 {
    VkStructureType sType;
    const void* pNext;
    VkSubpassDescriptionFlags flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t viewMask;
    uint32_t inputAttachmentCount;
    const VkAttachmentReference2* pInputAttachments;
    uint32_t colorAttachmentCount;
    const VkAttachmentReference2* pColorAttachments;
    const VkAttachmentReference2* pResolveAttachments;
    const VkAttachmentReference2* pDepthStencilAttachment;
    uint32_t preserveAttachmentCount;
    const uint32_t* pPreserveAttachments;
} VkSubpassDescription2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDescription2 VkSubpassDescription2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkSubpassDescriptionFlagBits` specifying usage of the subpass.
- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying the pipeline type supported for this subpass.
- `viewMask` is a bitfield of view indices describing which views rendering is broadcast to in this subpass, when multiview is enabled.
- `inputAttachmentCount` is the number of input attachments.
- `pInputAttachments` is a pointer to an array of `VkAttachmentReference2` structures defining the input attachments for this subpass and their layouts.
- `colorAttachmentCount` is the number of color attachments.
- `pColorAttachments` is a pointer to an array of `colorAttachmentCount` `VkAttachmentReference2` structures defining the color attachments for this subpass and their layouts.
- `pResolveAttachments` is `NULL` or a pointer to an array of `colorAttachmentCount` `VkAttachmentReference2` structures defining the resolve attachments for this subpass and their layouts.
• `pDepthStencilAttachment` is a pointer to a `VkAttachmentReference2` structure specifying the depth/stencil attachment for this subpass and its layout.

• `preserveAttachmentCount` is the number of preserved attachments.

• `pPreserveAttachments` is a pointer to an array of `preserveAttachmentCount` render pass attachment indices identifying attachments that are not used by this subpass, but whose contents must be preserved throughout the subpass.

Parameters defined by this structure with the same name as those in `VkSubpassDescription` have the identical effect to those parameters.

`viewMask` has the same effect for the described subpass as `VkRenderPassMultiviewCreateInfo ::pViewMasks` has on each corresponding subpass.

If a `VkFragmentShadingRateAttachmentInfoKHR` structure is included in the `pNext` chain, `pFragmentShadingRateAttachment` is not NULL, and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the identified attachment defines a fragment shading rate attachment for that subpass.

---

**Valid Usage**

- **VUID-VkSubpassDescription2-attachment-06912**
  If the `attachment` member of an element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkSubpassDescription2-attachment-06913**
  If the `attachment` member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`.

- **VUID-VkSubpassDescription2-attachment-06914**
  If the `attachment` member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`.

- **VUID-VkSubpassDescription2-attachment-06915**
  If the `attachment` member of `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED`, its `layout` member must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`.

- **VUID-VkSubpassDescription2-attachment-06916**
  If the `attachment` member of an element of `pColorAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkSubpassDescription2-attachment-06917**
  If the `attachment` member of an element of `pResolveAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.
• VUID-VkSubpassDescription2-attachment-06918
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06919
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06920
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06921
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR

• VUID-VkSubpassDescription2-attachment-06922
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkSubpassDescription2-attachment-06923
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkSubpassDescription2-attachment-06251
  If the attachment member of pDepthStencilAttachment is not VK_ATTACHMENT_UNUSED and its pNext chain includes a VkAttachmentDescriptionStencilLayout structure, the layout member of pDepthStencilAttachment must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription2-pipelineBindPoint-04953
  pipelineBindPoint must be VK_PIPELINE_BIND_POINT_GRAPHICS or VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI

• VUID-VkSubpassDescription2-colorAttachmentCount-03063
  colorAttachmentCount must be less than or equal to VkPhysicalDeviceLimits::maxColorAttachments

• VUID-VkSubpassDescription2-loadOp-03064
  If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then loadOp must not be VK_ATTACHMENT_LOAD_OP_CLEAR

• VUID-VkSubpassDescription2-pResolveAttachments-03065
If `pResolveAttachments` is not `NULL`, for each resolve attachment that does not have the value `VK_ATTACHMENT_UNUSED`, the corresponding color attachment must not have the value `VK_ATTACHMENT_UNUSED`

- VUID-VkSubpassDescription2-pResolveAttachments-03066
  If `pResolveAttachments` is not `NULL`, for each resolve attachment that is not `VK_ATTACHMENT_UNUSED`, the corresponding color attachment must not have a sample count of `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkSubpassDescription2-pResolveAttachments-03067
  If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` must have a sample count of `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkSubpassDescription2-pResolveAttachments-03068
  Any given element of `pResolveAttachments` must have the same `VkFormat` as its corresponding color attachment

- VUID-VkSubpassDescription2-multisampledRenderToSingleSampled-06869
  If none of the `VK_AMD_mixed_attachment_samples` extension, the `VK_NV_framebuffer_mixed_samples` extension, or the `multisampledRenderToSingleSampled` feature are enabled, all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` must have the same sample count

- VUID-VkSubpassDescription2-pInputAttachments-02897
  All attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED` must have image formats whose potential format features contain at least `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkSubpassDescription2-pColorAttachments-02898
  All attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` must have image formats whose potential format features contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`

- VUID-VkSubpassDescription2-pResolveAttachments-02899
  All attachments in `pResolveAttachments` that are not `VK_ATTACHMENT_UNUSED` must have image formats whose potential format features contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`

- VUID-VkSubpassDescription2-pDepthStencilAttachment-02900
  If `pDepthStencilAttachment` is not `NULL` and the attachment is not `VK_ATTACHMENT_UNUSED` then it must have an image format whose potential format features contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkSubpassDescription2-linearColorAttachment-06499
  If the `linearColorAttachment` feature is enabled and the image is created with `VK_IMAGE_TILING_LINEAR`, all attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED` must have image formats whose potential format features must contain `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`

- VUID-VkSubpassDescription2-linearColorAttachment-06500
  If the `linearColorAttachment` feature is enabled and the image is created with `VK_IMAGE_TILING_LINEAR`, all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` must have image formats whose potential format features must contain `VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV`
• VUID-VkSubpassDescription2-linearColorAttachment-06501
  If the linearColorAttachment feature is enabled and the image is created with VK_IMAGE_TILING_LINEAR, all attachments in pResolveAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features must contain VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV.

• VUID-VkSubpassDescription2-pColorAttachments-03070
  If the VK_AMD_mixed_attachment_samples extension is enabled, all attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have a sample count that is smaller than or equal to the sample count of pDepthStencilAttachment if it is not VK_ATTACHMENT_UNUSED.

• VUID-VkSubpassDescription2-pNext-06870
  If the pNext chain includes a VkMultisampledRenderToSingleSampledInfoEXT structure with multisampledRenderToSingleSampledEnable equal to VK_TRUE, then all attachments in pColorAttachments and pDepthStencilAttachment that are not VK_ATTACHMENT_UNUSED must have a sample count that is either VK_SAMPLE_COUNT_1_BIT or equal to VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples.

• VUID-VkSubpassDescription2-pNext-06871
  If the pNext chain includes a VkMultisampledRenderToSingleSampledInfoEXT structure with multisampledRenderToSingleSampledEnable equal to VK_TRUE, and pDepthStencilAttachment is not NULL, does not have the value VK_ATTACHMENT_UNUSED, and has a sample count of VK_SAMPLE_COUNT_1_BIT, the pNext chain must also include a VkSubpassDescriptionDepthStencilResolve structure with pDepthStencilResolveAttachment that is either NULL or has the value VK_ATTACHMENT_UNUSED.

• VUID-VkSubpassDescription2-multisampledRenderToSingleSampled-06872
  If none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature are enabled, all attachments in pDepthStencilAttachment or pColorAttachments that are not VK_ATTACHMENT_UNUSED must have the same sample count.

• VUID-VkSubpassDescription2-attachment-03073
  Each element of pPreserveAttachments must not be VK_ATTACHMENT_UNUSED.

• VUID-VkSubpassDescription2-pPreserveAttachments-03074
  Any given element of pPreserveAttachments must not also be an element of any other member of the subpass description.

• VUID-VkSubpassDescription2-layout-02528
  If any attachment is used by more than one VkAttachmentReference2 member, then each use must use the same layout.

• VUID-VkSubpassDescription2-flags-03076
  If flags includes VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NV, it must also include VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX.

• VUID-VkSubpassDescription2-attachment-02799
  If the attachment member of any element of pInputAttachments is not VK_ATTACHMENT_UNUSED, then the aspectMask member must be a valid combination of VkImageAspectFlagBits.

• VUID-VkSubpassDescription2-attachment-02800
  If the attachment member of any element of pInputAttachments is not VK_ATTACHMENT_UNUSED,
then the `aspectMask` member **must** not be 0

- **VUID-VkSubpassDescription2-attachment-02801**
  If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** not include `VK_IMAGE_ASPECT_METADATA_BIT`.

- **VUID-VkSubpassDescription2-attachment-04563**
  If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index `i`.

- **VUID-VkSubpassDescription2-pDepthStencilAttachment-04440**
  An attachment **must** not be used in both `pDepthStencilAttachment` and `pColorAttachments`.

- **VUID-VkSubpassDescription2-multiview-06558**
  If the `multiview` feature is not enabled, `viewMask` **must** be 0.

- **VUID-VkSubpassDescription2-viewMask-06706**
  The index of the most significant bit in `viewMask` **must** be less than `maxMultiviewViewCount`.

### Valid Usage (Implicit)

- **VUID-VkSubpassDescription2-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_2`.

- **VUID-VkSubpassDescription2-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkFragmentShadingRateAttachmentInfoKHR`, `VkMultisampledRenderToSingleSampledInfoEXT`, `VkRenderPassCreationControlEXT`, `VkRenderPassSubpassFeedbackCreateInfoEXT`, or `VkSubpassDescriptionDepthStencilResolve`.

- **VUID-VkSubpassDescription2-sType-unique**
  The `sType` value of each struct in the `pNext` chain **must** be unique.

- **VUID-VkSubpassDescription2-flags-parameter**
  `flags` **must** be a valid combination of `VkSubpassDescriptionFlagBits` values.

- **VUID-VkSubpassDescription2-pipelineBindPoint-parameter**
  `pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value.

- **VUID-VkSubpassDescription2-pInputAttachments-parameter**
  If `inputAttachmentCount` is not 0, `pInputAttachments` **must** be a valid pointer to an array of `inputAttachmentCount` valid `VkAttachmentReference2` structures.

- **VUID-VkSubpassDescription2-pColorAttachments-parameter**
  If `colorAttachmentCount` is not 0, `pColorAttachments` **must** be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference2` structures.

- **VUID-VkSubpassDescription2-pResolveAttachments-parameter**
  If `colorAttachmentCount` is not 0, and `pResolveAttachments` is not `NULL`, `pResolveAttachments` **must** be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference2` structures.

- **VUID-VkSubpassDescription2-pDepthStencilAttachment-parameter**
If `pDepthStencilAttachment` is not `NULL`, `pDepthStencilAttachment` **must** be a valid pointer to a valid `VkAttachmentReference2` structure

- VUID-VkSubpassDescription2-pPreserveAttachments-parameter
  - If `preserveAttachmentCount` is not 0, `pPreserveAttachments` **must** be a valid pointer to an array of `preserveAttachmentCount` `uint32_t` values

If the `pNext` chain of `VkSubpassDescription2` includes a `VkSubpassDescriptionDepthStencilResolve` structure, then that structure describes multisample resolve operations for the depth/stencil attachment in a subpass.

The `VkSubpassDescriptionDepthStencilResolve` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDescriptionDepthStencilResolve {
    VkStructureType sType;
    const void* pNext;
    VkResolveModeFlagBits depthResolveMode;
    VkResolveModeFlagBits stencilResolveMode;
    const VkAttachmentReference2* pDepthStencilResolveAttachment;
} VkSubpassDescriptionDepthStencilResolve;
```

or the equivalent

```c
// Provided by VK_KHR_depth_stencil_resolve
typedef VkSubpassDescriptionDepthStencilResolve
    VkSubpassDescriptionDepthStencilResolveKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `depthResolveMode` is a `VkResolveModeFlagBits` value describing the depth resolve mode.
- `stencilResolveMode` is a `VkResolveModeFlagBits` value describing the stencil resolve mode.
- `pDepthStencilResolveAttachment` is `NULL` or a pointer to a `VkAttachmentReference2` structure defining the depth/stencil resolve attachment for this subpass and its layout.

If `pDepthStencilResolveAttachment` is `NULL`, or if its attachment index is `VK_ATTACHMENT_UNUSED`, it indicates that no depth/stencil resolve attachment will be used in the subpass.

### Valid Usage

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03177
  - If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `pDepthStencilAttachment` **must** not be `NULL` or have the value `VK_ATTACHMENT_UNUSED`

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03179
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `pDepthStencilAttachment` must not have a sample count of `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03180
  If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `pDepthStencilResolveAttachment` must have a sample count of `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-02651
  If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` then it must have an image format whose `potential format features` contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03181
  If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, and `VkFormat` of `pDepthStencilResolveAttachment` has a depth component, then the `VkFormat` of `pDepthStencilAttachment` must have a depth component with the same number of bits and numerical type

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03182
  If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, and `VkFormat` of `pDepthStencilResolveAttachment` has a stencil component, then the `VkFormat` of `pDepthStencilAttachment` must have a stencil component with the same number of bits and numerical type

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03183
  If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` must not both be `VK_RESOLVE_MODE_NONE`

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03184
  If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, and `VkFormat` of `pDepthStencilResolveAttachment` has a depth component, then the value of `depthResolveMode` must be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes` or `VK_RESOLVE_MODE_NONE`

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03185
  If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, the `VkFormat` of `pDepthStencilResolveAttachment` has both depth and stencil components, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_FALSE`, then the values of `depthResolveMode` and `stencilResolveMode` must be identical

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03186
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, the `VkFormat` of `pDepthStencilResolveAttachment` has both depth and stencil components, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE` and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_TRUE`, then the values of `depthResolveMode` and `stencilResolveMode` must be identical or one of them must be `VK_RESOLVE_MODE_NONE`.

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06873
  If the `pNext` chain of `VkSubpassDescription2` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure, the `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, and `pDepthStencilAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` must not both be `VK_RESOLVE_MODE_NONE`.

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06874
  If the `pNext` chain of `VkSubpassDescription2` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, and `pDepthStencilAttachment` is not `NULL`, does not have the value `VK_ATTACHMENT_UNUSED`, and has a `VkFormat` with a stencil component, then the value of `depthResolveMode` must be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes` or `VK_RESOLVE_MODE_NONE`.

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06875
  If the `pNext` chain of `VkSubpassDescription2` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, and `pDepthStencilAttachment` is not `NULL`, does not have the value `VK_ATTACHMENT_UNUSED`, and has a `VkFormat` with a stencil component, then the value of `stencilResolveMode` must be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes` or `VK_RESOLVE_MODE_NONE`.

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06876
  If the `pNext` chain of `VkSubpassDescription2` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, `pDepthStencilAttachment` is not `NULL`, does not have the value `VK_ATTACHMENT_UNUSED`, and has a `VkFormat` with both depth and stencil components, and both `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` are `VK_FALSE`, then the values of `depthResolveMode` and `stencilResolveMode` must be identical.

- VUID-VkSubpassDescriptionDepthStencilResolve-pNext-06877
  If the `pNext` chain of `VkSubpassDescription2` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, `pDepthStencilAttachment` is not `NULL`, does not have the value `VK_ATTACHMENT_UNUSED`, and has a `VkFormat` with both depth and stencil components, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_TRUE`, then the values of `depthResolveMode` and `stencilResolveMode` must be identical or one of them must be `VK_RESOLVE_MODE_NONE`.
Valid Usage (Implicit)

• VUID-VkSubpassDescriptionDepthStencilResolve-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_DEPTH_STENCIL_RESOLVE

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-parameter
  
  If pDepthStencilResolveAttachment is not NULL, pDepthStencilResolveAttachment must be a valid pointer to a valid VkAttachmentReference2 structure

Possible values of VkSubpassDescriptionDepthStencilResolve::depthResolveMode and stencilResolveMode, specifying the depth and stencil resolve modes, are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkResolveModeFlagBits {
  VK_RESOLVE_MODE_NONE = 0,
  VK_RESOLVE_MODE_SAMPLE_ZERO_BIT = 0x00000001,
  VK_RESOLVE_MODE_AVERAGE_BIT = 0x00000002,
  VK_RESOLVE_MODE_MIN_BIT = 0x00000004,
  VK_RESOLVE_MODE_MAX_BIT = 0x00000008,
  // Provided by VK_KHR_depth_stencil_resolve
  VK_RESOLVE_MODE_NONE_KHR = VK_RESOLVE_MODE_NONE,
  // Provided by VK_KHR_depth_stencil_resolve
  VK_RESOLVE_MODE_SAMPLE_ZERO_BIT_KHR = VK_RESOLVE_MODE_SAMPLE_ZERO_BIT,
  // Provided by VK_KHR_depth_stencil_resolve
  VK_RESOLVE_MODE_AVERAGE_BIT_KHR = VK_RESOLVE_MODE_AVERAGE_BIT,
  // Provided by VK_KHR_depth_stencil_resolve
  VK_RESOLVE_MODE_MIN_BIT_KHR = VK_RESOLVE_MODE_MIN_BIT,
  // Provided by VK_KHR_depth_stencil_resolve
  VK_RESOLVE_MODE_MAX_BIT_KHR = VK_RESOLVE_MODE_MAX_BIT,
} VkResolveModeFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_depth_stencil_resolve
typedef VkResolveModeFlagBits VkResolveModeFlagBitsKHR;
```

• VK_RESOLVE_MODE_NONE indicates that no resolve operation is done.

• VK_RESOLVE_MODE_SAMPLE_ZERO_BIT indicates that result of the resolve operation is equal to the value of sample 0.

• VK_RESOLVE_MODE_AVERAGE_BIT indicates that result of the resolve operation is the average of the sample values.

• VK_RESOLVE_MODE_MIN_BIT indicates that result of the resolve operation is the minimum of the sample values.

• VK_RESOLVE_MODE_MAX_BIT indicates that result of the resolve operation is the maximum of the
typedef VkFlags VkResolveModeFlags;

or the equivalent

typedef VkResolveModeFlags VkResolveModeFlagsKHR;

VkResolveModeFlags is a bitmask type for setting a mask of zero or more VkResolveModeFlagBits.

The VkFragmentShadingRateAttachmentInfoKHR structure is defined as:

typedef struct VkFragmentShadingRateAttachmentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const VkAttachmentReference2* pFragmentShadingRateAttachment;
    VkExtent2D shadingRateAttachmentTexelSize;
} VkFragmentShadingRateAttachmentInfoKHR;

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pFragmentShadingRateAttachment is NULL or a pointer to a VkAttachmentReference2 structure defining the fragment shading rate attachment for this subpass.
- shadingRateAttachmentTexelSize specifies the size of the portion of the framebuffer corresponding to each texel in pFragmentShadingRateAttachment.

If no shading rate attachment is specified, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

Valid Usage

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04524
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, its layout member must be equal to VK_IMAGE_LAYOUT_GENERAL or VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04525
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.width must be a power of two
value

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04526
  If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.width`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04527
  If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` must be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.width`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04528
  If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.height` must be a power of two

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04529
  If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.height` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.height`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04530
  If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.height` must be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.height`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04531
  If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the quotient of `shadingRateAttachmentTexelSize.width` and `shadingRateAttachmentTexelSize.height` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04532
  If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the quotient of `shadingRateAttachmentTexelSize.height` and `shadingRateAttachmentTexelSize.width` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`

Valid Usage (Implicit)

- VUID-VkFragmentShadingRateAttachmentInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR`
If `pFragmentShadingRateAttachment` is not `NULL`, `pFragmentShadingRateAttachment` must be a valid pointer to a valid `VkAttachmentReference2` structure.

If the `pNext` chain of `VkSubpassDescription2` or `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure, then that structure describes how multisampled rendering is performed on single sampled attachments in that subpass.

The `VkMultisampledRenderToSingleSampledInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_multisampled_render_to_single_sampled
typedef struct VkMultisampledRenderToSingleSampledInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 multisampledRenderToSingleSampledEnable;
    VkSampleCountFlagBits rasterizationSamples;
} VkMultisampledRenderToSingleSampledInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `multisampledRenderToSingleSampledEnable` controls whether multisampled rendering to single-sampled attachments is performed as described below.
- `rasterizationSamples` is a `VkSampleCountFlagBits` specifying the number of samples used in rasterization.

### Valid Usage

- **VUID-VkMultisampledRenderToSingleSampledInfoEXT-rasterizationSamples-06878**
  The value of `rasterizationSamples` must not be `VK_SAMPLE_COUNT_1_BIT`

- **VUID-VkMultisampledRenderToSingleSampledInfoEXT-pNext-06880**
  If added to the `pNext` chain of `VkRenderingInfo`, each `imageView` member of any element of `VkRenderingInfo::pColorAttachments`, `VkRenderingInfo::pDepthAttachment`, or `VkRenderingInfo::pStencilAttachment` that is not `VK_NULL_HANDLE` must have a format that supports the sample count specified in `rasterizationSamples`

### Valid Usage (Implicit)

- **VUID-VkMultisampledRenderToSingleSampledInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_INFO_EXT`

- **VUID-VkMultisampledRenderToSingleSampledInfoEXT-rasterizationSamples-parameter**
  `rasterizationSamples` must be a valid `VkSampleCountFlagBits` value
If the `pNext` chain of `VkSubpassDescription2` or `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure whose `multisampledRenderToSingleSampledEnable` field is `VK_TRUE`, the graphics pipelines must have `VkGraphicsPipelineCreateInfo::rasterizationSamples` equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`, and the subpass attachments can have a sample count of `VK_SAMPLE_COUNT_1_BIT`. For attachments with a sample count of `VK_SAMPLE_COUNT_1_BIT`, multisampled rendering is performed to an intermediate multisampled image with `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples` samples, implicitly allocated by the implementation for the duration of the subpass. For such attachments:

- If `loadOp` equals to `VK_ATTACHMENT_LOAD_OP_LOAD`, samples of the implicit image are initialized by replicating the value from the corresponding pixel in the attachment.
- If `storeOp` or `stencilStoreOp` is equal to `VK_ATTACHMENT_STORE_OP_STORE`, the implicit image is implicitly resolved prior to storage in the attachment.

Memory constraints due to high primitive counts may result in an implicit split of the subpass. This is the equivalent of partial rasterization of geometry in a render pass that ends in `storeOp` and `stencilStoreOp` equal to `VK_ATTACHMENT_STORE_OP_STORE`, followed by another render pass with `loadOp` and `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_LOAD` with appropriate barriers in between. When `VkMultisampledRenderToSingleSampledInfoEXT` is used, the implementation is allowed to resolve attachments with a sample count of `VK_SAMPLE_COUNT_1_BIT` and lose multisampled data on such splits. The implementation may similarly split the render pass at subpass boundaries even if they use the same value for `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`.

The `VkAttachmentReference2` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReference2 {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachment;
    VkImageLayout layout;
    VkImageAspectFlags aspectMask;
} VkAttachmentReference2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkAttachmentReference2 VkAttachmentReference2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachment` is either an integer value identifying an attachment at the corresponding index in `VkRenderPassCreateInfo2::pAttachments`, or `VK_ATTACHMENT_UNUSED` to signify that this attachment is not used.
• layout is a VkImageLayout value specifying the layout the attachment uses during the subpass.
• aspectMask is a mask of which aspect(s) can be accessed within the specified subpass as an input attachment.

Parameters defined by this structure with the same name as those in VkAttachmentReference have the identical effect to those parameters.

aspectMask is ignored when this structure is used to describe anything other than an input attachment reference.

If the separateDepthStencilLayouts feature is enabled, and attachment has a depth/stencil format, layout can be set to a layout that only specifies the layout of the depth aspect.

If layout only specifies the layout of the depth aspect of the attachment, the layout of the stencil aspect is specified by the stencilLayout member of a VkAttachmentReferenceStencilLayout structure included in the pNext chain. Otherwise, layout describes the layout for all relevant image aspects.

Valid Usage

• VUID-VkAttachmentReference2-layout-03077
  If attachment is not VK_ATTACHMENT_UNUSED, layout must not be VK_IMAGE_LAYOUT_UNDEFINED, VK_IMAGE_LAYOUT_PREINITIALIZED, or VK_IMAGE_LAYOUT_PRESENT_SRC_KHR

• VUID-VkAttachmentReference2-separateDepthStencilLayouts-03313
  If the separateDepthStencilLayouts feature is not enabled, and attachment is not VK_ATTACHMENT_UNUSED, layout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

• VUID-VkAttachmentReference2-synchronization2-06910
  If the synchronization2 feature is not enabled, layout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkAttachmentReference2-attachmentFeedbackLoopLayout-07311
  If the attachmentFeedbackLoopLayout feature is not enabled, layout must not be VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

Valid Usage (Implicit)

• VUID-VkAttachmentReference2-sType-sType
  sType must be VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_2

• VUID-VkAttachmentReference2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkAttachmentReferenceStencilLayout

• VUID-VkAttachmentReference2-sType-unique
  The sType value of each struct in the pNext chain must be unique
The `VkAttachmentReferenceStencilLayout` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReferenceStencilLayout {
    VkStructureType sType;
    void* pNext;
    VkImageLayout stencilLayout;
} VkAttachmentReferenceStencilLayout;
```

or the equivalent

```c
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkAttachmentReferenceStencilLayout VkAttachmentReferenceStencilLayoutKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **stencilLayout** is a `VkImageLayout` value specifying the layout the stencil aspect of the attachment uses during the subpass.

### Valid Usage

- **VUID-VkAttachmentReferenceStencilLayout-stencilLayout-03318**
  
  stencilLayout must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

### Valid Usage (Implicit)

- **VUID-VkAttachmentReferenceStencilLayout-sType-sType**
  
  sType must be `VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_STENCIL_LAYOUT`

- **VUID-VkAttachmentReferenceStencilLayout-layout-parameter**
  
  stencilLayout must be a valid `VkImageLayout` value

The `VkSubpassDependency2` structure is defined as:
// Provided by VK_VERSION_1_2

typedef struct VkSubpassDependency2 {
    VkStructureType sType;
    const void* pNext;
    uint32_t srcSubpass;
    uint32_t dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkDependencyFlags dependencyFlags;
    int32_t viewOffset;
} VkSubpassDependency2;

or the equivalent

// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDependency2 VkSubpassDependency2KHR;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• srcSubpass is the subpass index of the first subpass in the dependency, or VK_SUBPASS_EXTERNAL.
• dstSubpass is the subpass index of the second subpass in the dependency, or VK_SUBPASS_EXTERNAL.
• srcStageMask is a bitmask of VkPipelineStageFlagBits specifying the source stage mask.
• dstStageMask is a bitmask of VkPipelineStageFlagBits specifying the destination stage mask
• srcAccessMask is a bitmask of VkAccessFlagBits specifying a source access mask.
• dstAccessMask is a bitmask of VkAccessFlagBits specifying a destination access mask.
• dependencyFlags is a bitmask of VkDependencyFlagBits.
• viewOffset controls which views in the source subpass the views in the destination subpass depend on.

Parameters defined by this structure with the same name as those in VkSubpassDependency have the identical effect to those parameters.

viewOffset has the same effect for the described subpass dependency as VkRenderPassMultiviewCreateInfo::pViewOffsets has on each corresponding subpass dependency.

If a VkMemoryBarrier2 is included in the pNext chain, srcStageMask, dstStageMask, srcAccessMask, and dstAccessMask parameters are ignored. The synchronization and access scopes instead are defined by the parameters of VkMemoryBarrier2.
Valid Usage

- **VUID-VkSubpassDependency2-srcStageMask-04090**
  If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- **VUID-VkSubpassDependency2-srcStageMask-04091**
  If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-VkSubpassDependency2-srcStageMask-04092**
  If the `conditionalRendering` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-VkSubpassDependency2-srcStageMask-04093**
  If the `fragmentDensityMap` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-VkSubpassDependency2-srcStageMask-04094**
  If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-VkSubpassDependency2-srcStageMask-04095**
  If the `meshShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- **VUID-VkSubpassDependency2-srcStageMask-04096**
  If the `taskShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- **VUID-VkSubpassDependency2-shadingRateImage-07318**
  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-VkSubpassDependency2-srcStageMask-03937**
  If the `synchronization2` feature is not enabled, `srcStageMask` **must** not be `0`

- **VUID-VkSubpassDependency2-dstStageMask-04090**
  If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- **VUID-VkSubpassDependency2-dstStageMask-04091**
  If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-VkSubpassDependency2-dstStageMask-04092**
  If the `conditionalRendering` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-VkSubpassDependency2-dstStageMask-04093**
  If the `fragmentDensityMap` feature is not enabled, `dstStageMask` **must** not contain
If the transformFeedback feature is not enabled, \(\text{dstStageMask} \) must not contain \(\text{VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT}\).

If the meshShader feature is not enabled, \(\text{dstStageMask} \) must not contain \(\text{VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT}\).

If the taskShader feature is not enabled, \(\text{dstStageMask} \) must not contain \(\text{VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT}\).

If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, \(\text{dstStageMask} \) must not contain \(\text{VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR}\).

If the synchronization2 feature is not enabled, \(\text{dstStageMask} \) must not be \(0\).

\(\text{srcSubpass} \) must be less than or equal to \(\text{dstSubpass} \), unless one of them is \(\text{VK_SUBPASS_EXTERNAL}\), to avoid cyclic dependencies and ensure a valid execution order.

\(\text{srcSubpass} \) and \(\text{dstSubpass} \) must not both be equal to \(\text{VK_SUBPASS_EXTERNAL}\).

If \(\text{srcSubpass} \) is equal to \(\text{dstSubpass} \) and \(\text{srcStageMask} \) includes a framebuffer-space stage, \(\text{dstStageMask} \) must only contain framebuffer-space stages.

Any access flag included in \(\text{srcAccessMask} \) must be supported by one of the pipeline stages in \(\text{srcStageMask} \), as specified in the table of supported access types.

Any access flag included in \(\text{dstAccessMask} \) must be supported by one of the pipeline stages in \(\text{dstStageMask} \), as specified in the table of supported access types.

If \(\text{dependencyFlags} \) includes \(\text{VK_DEPENDENCY_VIEW_LOCAL_BIT}\), \(\text{srcSubpass} \) must not be equal to \(\text{VK_SUBPASS_EXTERNAL}\).

If \(\text{dependencyFlags} \) includes \(\text{VK_DEPENDENCY_VIEW_LOCAL_BIT}\), \(\text{dstSubpass} \) must not be equal to \(\text{VK_SUBPASS_EXTERNAL}\).

If \(\text{srcSubpass} \) equals \(\text{dstSubpass} \), and \(\text{srcStageMask} \) and \(\text{dstStageMask} \) both include a framebuffer-space stage, then \(\text{dependencyFlags} \) must include \(\text{VK_DEPENDENCY_BY_REGION_BIT}\).

If \(\text{viewOffset} \) is not equal to \(0\), \(\text{srcSubpass} \) must not be equal to \(\text{dstSubpass}\).

If the synchronization2 feature is not enabled, \(\text{dstStageMask} \) must not contain \(\text{VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT}\).
If dependencyFlags does not include VK_DEPENDENCY_VIEW_LOCAL_BIT, viewOffset must be 0.

Valid Usage (Implicit)

- VUID-VkSubpassDependency2-sType-sType
  
sType must be VK_STRUCTURE_TYPE_SUBPASS_DEPENDENCY_2

- VUID-VkSubpassDependency2-pNext-pNext
  
pNext must be NULL or a pointer to a valid instance of VkMemoryBarrier2

- VUID-VkSubpassDependency2-sType-unique
  
The sType value of each struct in the pNext chain must be unique

- VUID-VkSubpassDependency2-srcStageMask-parameter
  
srcStageMask must be a valid combination of VkPipelineStageFlagBits values

- VUID-VkSubpassDependency2-dstStageMask-parameter
  
dstStageMask must be a valid combination of VkPipelineStageFlagBits values

- VUID-VkSubpassDependency2-srcAccessMask-parameter
  
srcAccessMask must be a valid combination of VkAccessFlagBits values

- VUID-VkSubpassDependency2-dstAccessMask-parameter
  
dstAccessMask must be a valid combination of VkAccessFlagBits values

- VUID-VkSubpassDependency2-dependencyFlags-parameter
  
dependencyFlags must be a valid combination of VkDependencyFlagBits values

To destroy a render pass, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyRenderPass(
    VkDevice device, 
    VkRenderPass renderPass, 
    const VkAllocationCallbacks* pAllocator);
```

- device is the logical device that destroys the render pass.
- renderPass is the handle of the render pass to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyRenderPass-renderPass-00873
  
  All submitted commands that refer to renderPass must have completed execution

- VUID-vkDestroyRenderPass-renderPass-00874
  
  If VkAllocationCallbacks were provided when renderPass was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyRenderPass-renderPass-00875
If no `VkAllocationCallbacks` were provided when `renderPass` was created, `pAllocator` must be `NULL`.

### Valid Usage (Implicit)

- **VUID-vkDestroyRenderPass-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkDestroyRenderPass-renderPass-parameter**
  
  If `renderPass` is not `VK_NULL_HANDLE`, `renderPass` must be a valid `VkRenderPass` handle

- **VUID-vkDestroyRenderPass-pAllocator-parameter**
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyRenderPass-renderPass-parent**
  
  If `renderPass` is a valid handle, it must have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `renderPass` must be externally synchronized

### 8.2. Render Pass Compatibility

Framebuffers and graphics pipelines are created based on a specific render pass object. They must only be used with that render pass object, or one compatible with it.

Two attachment references are compatible if they have matching format and sample count, or are both `VK_ATTACHMENT_UNUSED` or the pointer that would contain the reference is `NULL`.

Two arrays of attachment references are compatible if all corresponding pairs of attachments are compatible. If the arrays are of different lengths, attachment references not present in the smaller array are treated as `VK_ATTACHMENT_UNUSED`.

Two render passes are compatible if their corresponding color, input, resolve, and depth/stencil attachment references are compatible and if they are otherwise identical except for:

- Initial and final image layout in attachment descriptions
- Load and store operations in attachment descriptions
- Image layout in attachment references

As an additional special case, if two render passes have a single subpass, the resolve attachment reference and depth/stencil resolve mode compatibility requirements are ignored.

A framebuffer is compatible with a render pass if it was created using the same render pass or a compatible render pass.
8.3. Framebuffers

Render passes operate in conjunction with framebuffers. Framebuffers represent a collection of specific memory attachments that a render pass instance uses.

Framebuffers are represented by VkFramebuffer handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFramebuffer)
```

To create a framebuffer, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkCreateFramebuffer(
    VkDevice device,
    const VkFramebufferCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFramebuffer* pFramebuffer);
```

- `device` is the logical device that creates the framebuffer.
- `pCreateInfo` is a pointer to a VkFramebufferCreateInfo structure describing additional information about framebuffer creation.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pFramebuffer` is a pointer to a VkFramebuffer handle in which the resulting framebuffer object is returned.

Valid Usage

- **VUID-vkCreateFramebuffer-pCreateInfo-02777**
  If pCreateInfo->flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, and attachmentCount is not 0, each element of pCreateInfo->pAttachments must have been created on device

Valid Usage (Implicit)

- **VUID-vkCreateFramebuffer-device-parameter**
  device must be a valid VkDevice handle
- **VUID-vkCreateFramebuffer-pCreateInfo-parameter**
  pCreateInfo must be a valid pointer to a valid VkFramebufferCreateInfo structure
- **VUID-vkCreateFramebuffer-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- **VUID-vkCreateFramebuffer-pFramebuffer-parameter**
pFramebuffer must be a valid pointer to a VkFramebuffer handle.

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkFramebufferCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkFramebufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFramebufferCreateFlags flags;
    VkRenderPass renderPass;
    uint32_t attachmentCount;
    const VkImageView* pAttachments;
    uint32_t width;
    uint32_t height;
    uint32_t layers;
} VkFramebufferCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkFramebufferCreateFlagBits
- **renderPass** is a render pass defining what render passes the framebuffer will be compatible with. See Render Pass Compatibility for details.
- **attachmentCount** is the number of attachments.
- **pAttachments** is a pointer to an array of VkImageView handles, each of which will be used as the corresponding attachment in a render pass instance. If **flags** includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, this parameter is ignored.
- **width**, **height** and **layers** define the dimensions of the framebuffer. If the render pass uses multiview, then **layers** must be one and each attachment requires a number of layers that is greater than the maximum bit index set in the view mask in the subpasses in which it is used.

Applications must ensure that all non-attachment writes to memory backing image subresources that are used as attachments that are not in VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT layout in a render pass instance happen-before or happen-after the render pass instance. If an image subresource is written during a render pass instance by anything other than load operations, store operations, and layout transitions, applications must ensure that all non-attachment reads
from memory backing that image subresource happen-before or happen-after the render pass instance. For depth/stencil images, the aspects are not treated independently for the above guarantees - writes to either aspect must be synchronized with accesses to the other aspect.

Note

An image subresource can be used as read-only as both an attachment and a non-attachment during a render pass instance, but care must still be taken to avoid data races with load/store operations and layout transitions. The simplest way to achieve this is to keep the non-attachment and attachment accesses within the same subpass, or to avoid layout transitions and load/store operations that perform writes.

It is legal for a subpass to use no color or depth/stencil attachments, either because it has no attachment references or because all of them are VK_ATTACHMENT_UNUSED. This kind of subpass can use shader side effects such as image stores and atomics to produce an output. In this case, the subpass continues to use the width, height, and layers of the framebuffer to define the dimensions of the rendering area, and the rasterizationSamples from each pipeline's VkPipelineMultisampleStateCreateInfo to define the number of samples used in rasterization; however, if VkPhysicalDeviceFeatures::variableMultisampleRate is VK_FALSE, then all pipelines to be bound with the subpass must have the same value for VkPipelineMultisampleStateCreateInfo::rasterizationSamples.

Valid Usage

- VUID-VkFramebufferCreateInfo-attachmentCount-00876
  attachmentCount must be equal to the attachment count specified in renderPass

- VUID-VkFramebufferCreateInfo-flags-02778
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT and attachmentCount is not 0, pAttachments must be a valid pointer to an array of attachmentCount valid VkImageView handles

- VUID-VkFramebufferCreateInfo-pAttachments-00877
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as a color attachment or resolve attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

- VUID-VkFramebufferCreateInfo-pAttachments-02633
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as a depth/stencil attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkFramebufferCreateInfo-pAttachments-02634
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as a depth/stencil resolve attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkFramebufferCreateInfo-pAttachments-00879
  If renderpass is not VK_NULL_HANDLE, flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an
input attachment by renderPass must have been created with a usage value including
VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

• VUID-VkFramebufferCreateInfo-pAttachments-02552
  Each element of pAttachments that is used as a fragment density map attachment by
  renderPass must not have been created with a flags value including
  VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

• VUID-VkFramebufferCreateInfo-renderPass-02553
  If renderPass has a fragment density map attachment and the
  fragmentDensityMapNonSubsampledImages feature is not enabled, each element of
  pAttachments must have been created with a flags value including
  VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT unless that element is the fragment density map
  attachment

• VUID-VkFramebufferCreateInfo-renderPass-06502
  If renderPass was created with fragment density map offsets other than (0,0), each
  element of pAttachments must have been created with a flags value including
  VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM.

• VUID-VkFramebufferCreateInfo-pAttachments-00880
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of
  pAttachments must have been created with a VkFormat value that matches the VkFormat
  specified by the corresponding VkAttachmentDescription in renderPass.

• VUID-VkFramebufferCreateInfo-pAttachments-00881
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of
  pAttachments must have been created with a samples value that matches the samples value
  specified by the corresponding VkAttachmentDescription in renderPass.

• VUID-VkFramebufferCreateInfo-flags-04533
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of
  pAttachments that is used as an input, color, resolve, or depth/stencil attachment by
  renderPass must have been created with a VkImageCreateInfo::extent.width greater than
  or equal to width

• VUID-VkFramebufferCreateInfo-flags-04534
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of
  pAttachments that is used as an input, color, resolve, or depth/stencil attachment by
  renderPass must have been created with a VkImageCreateInfo::extent.height greater than
  or equal to height

• VUID-VkFramebufferCreateInfo-flags-04535
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of
  pAttachments that is used as an input, color, resolve, or depth/stencil attachment by
  renderPass must have been created with a VkImageViewCreateInfo::subresourceRange.layerCount greater than or equal to layers

• VUID-VkFramebufferCreateInfo-renderPass-02746
  If renderPass was specified with non-zero view masks, each element of pAttachments that is
  used as an input, color, resolve, or depth/stencil attachment by renderPass must have a
  layerCount greater than the index of the most significant bit set in any of those view masks

• VUID-VkFramebufferCreateInfo-renderPass-02746
If `renderPass` was specified with non-zero view masks, each element of `pAttachments` that is referenced by `fragmentDensityMapAttachment` must have a `layerCount` equal to 1 or greater than the index of the most significant bit set in any of those view masks.

- VUID-VkFramebufferCreateInfo-renderPass-02747
  If `renderPass` was not specified with non-zero view masks, each element of `pAttachments` that is referenced by `fragmentDensityMapAttachment` must have a `layerCount` equal to 1.

- VUID-VkFramebufferCreateInfo-pAttachments-02555
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, an element of `pAttachments` that is referenced by `fragmentDensityMapAttachment` must have a width at least as large as \[
  \left\lceil \frac{width}{\text{maxFragmentDensityTexelSize.width}} \right\rceil
  \]

- VUID-VkFramebufferCreateInfo-pAttachments-02556
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, an element of `pAttachments` that is referenced by `fragmentDensityMapAttachment` must have a height at least as large as \[
  \left\lceil \frac{height}{\text{maxFragmentDensityTexelSize.height}} \right\rceil
  \]

- VUID-VkFramebufferCreateInfo-flags-04537
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and `renderPass` was specified with non-zero view masks, each element of `pAttachments` that is used as a fragment shading rate attachment by `renderPass` must have a `layerCount` that is either 1, or greater than the index of the most significant bit set in any of those view masks.

- VUID-VkFramebufferCreateInfo-flags-04538
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and `renderPass` was not specified with non-zero view masks, each element of `pAttachments` that is used as a fragment shading rate attachment by `renderPass` must have a `layerCount` that is either 1, or greater than `layers`.

- VUID-VkFramebufferCreateInfo-flags-04539
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, an element of `pAttachments` that is used as a fragment shading rate attachment must have a width at least as large as \[
  \left\lceil \frac{\text{width}}{\text{texelWidth}} \right\rceil
  \]
  where `texelWidth` is the largest value of `shadingRateAttachmentTexelSize.width` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment.

- VUID-VkFramebufferCreateInfo-flags-04540
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, an element of `pAttachments` that is used as a fragment shading rate attachment must have a height at least as large as \[
  \left\lceil \frac{\text{height}}{\text{texelHeight}} \right\rceil
  \]
  where `texelHeight` is the largest value of `shadingRateAttachmentTexelSize.height` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment.

- VUID-VkFramebufferCreateInfo-pAttachments-00883
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` must only specify a single mip level.

- VUID-VkFramebufferCreateInfo-pAttachments-00884
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` must have been created with the identity swizzle.

- VUID-VkFramebufferCreateInfo-width-00885
  `width` must be greater than 0.
• VUID-VkFramebufferCreateInfo-width-00886
  width must be less than or equal to maxFramebufferWidth

• VUID-VkFramebufferCreateInfo-height-00887
  height must be greater than 0

• VUID-VkFramebufferCreateInfo-height-00888
  height must be less than or equal to maxFramebufferHeight

• VUID-VkFramebufferCreateInfo-layers-00889
  layers must be greater than 0

• VUID-VkFramebufferCreateInfo-layers-00890
  layers must be less than or equal to maxFramebufferLayers

• VUID-VkFramebufferCreateInfo-renderPass-02531
  If renderPass was specified with non-zero view masks, layers must be 1

• VUID-VkFramebufferCreateInfo-pAttachments-00891
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is a 2D or 2D array image view taken from a 3D image must not be a depth/stencil format

• VUID-VkFramebufferCreateInfo-flags-03189
  If the imagelessFramebuffer feature is not enabled, flags must not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT

• VUID-VkFramebufferCreateInfo-flags-03190
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the pNext chain must include a VkFramebufferAttachmentsCreateInfo structure

• VUID-VkFramebufferCreateInfo-flags-03191
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the attachmentImageInfoCount member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain must be equal to either zero or attachmentCount

• VUID-VkFramebufferCreateInfo-flags-04541
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as an input, color, resolve or depth/stencil attachment in renderPass must be greater than or equal to width

• VUID-VkFramebufferCreateInfo-flags-04542
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the height member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as an input, color, resolve or depth/stencil attachment in renderPass must be greater than or equal to height

• VUID-VkFramebufferCreateInfo-flags-03196
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is referenced by VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment in renderPass must be greater than or equal to \[
  \frac{\text{width}}{\max\{\text{FragmentDensityTexelSize.width}\}}\]

• VUID-VkFramebufferCreateInfo-flags-03197
If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `height` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that is referenced by `VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment` in `renderPass` must be greater than or equal to \[
\left\lceil \frac{\text{height}}{\text{maxFragmentDensityTexelSize.height}} \right\rceil
\]

- **VUID-VkFramebufferCreateInfo-flags-04543**
  If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `width` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a fragment shading rate attachment must be greater than or equal to \[
\left\lceil \frac{\text{width}}{\text{texelWidth}} \right\rceil
\]
  where `texelWidth` is the largest value of `shadingRateAttachmentTexelSize.width` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment.

- **VUID-VkFramebufferCreateInfo-flags-04544**
  If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `height` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a fragment shading rate attachment must be greater than or equal to \[
\left\lceil \frac{\text{height}}{\text{texelHeight}} \right\rceil
\]
  where `texelHeight` is the largest value of `shadingRateAttachmentTexelSize.height` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment.

- **VUID-VkFramebufferCreateInfo-flags-04545**
  If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a fragment shading rate attachment must be either 1, or greater than or equal to `layers`.

- **VUID-VkFramebufferCreateInfo-flags-04587**
  If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT` and `renderPass` was specified with non-zero view masks, each element of `pAttachments` that is used as a fragment shading rate attachment by `renderPass` must have a `layerCount` that is either 1, or greater than the index of the most significant bit set in any of those view masks.

- **VUID-VkFramebufferCreateInfo-renderPass-03198**
  If multiview is enabled for `renderPass` and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain used as an input, color, resolve, or depth/stencil attachment in `renderPass` must be greater than the maximum bit index set in the view mask in the subpasses in which it is used in `renderPass`.

- **VUID-VkFramebufferCreateInfo-renderPass-04546**
  If multiview is not enabled for `renderPass` and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain used as an input, color, resolve, or depth/stencil attachment in `renderPass` must be greater than or equal to `layers`.

- **VUID-VkFramebufferCreateInfo-flags-03201**
  If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo`
structure included in the `pNext` chain that refers to an attachment used as a color attachment or resolve attachment by `renderPass` must include `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`.

- **VUID-VkFramebufferCreateInfo-flags-03202**
  If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a depth/stencil attachment by `renderPass` must include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkFramebufferCreateInfo-flags-03203**
  If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a depth/stencil resolve attachment by `renderPass` must include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkFramebufferCreateInfo-flags-03204**
  If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain must be equal to the corresponding value of `VkAttachmentDescription::format` used to create `renderPass`.

- **VUID-VkFramebufferCreateInfo-flags-04113**
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` must have been created with `VkImageViewCreateInfo::viewType` not equal to `VK_IMAGE_VIEW_TYPE_3D`.

- **VUID-VkFramebufferCreateInfo-flags-04548**
  If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as a fragment shading rate attachment by `renderPass` must have been created with a `usage` value including `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-VkFramebufferCreateInfo-flags-04549**
  If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `usage` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain that refers to an attachment used as a fragment shading rate attachment by `renderPass` must include `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-VkFramebufferCreateInfo-samples-06881**
  If `multisampled-render-to-single-sampled` is enabled for any subpass, all color, depth/stencil and input attachments used in that subpass which have `VkAttachmentDescription::samples` or `VkAttachmentDescription2::samples` equal to `VK_SAMPLE_COUNT_1_BIT` must have been created with
VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT in their VkImageCreateInfo::flags.

- VUID-VkFramebufferCreateInfo-samples-07009
  If multisampled-render-to-single-sampled is enabled for any subpass, all color, depth/stencil and input attachments used in that subpass which have VkAttachmentDescription::samples or VkAttachmentDescription2::samples equal to VK_SAMPLE_COUNT_1_BIT must have a format that supports the sample count specified in VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples

### Valid Usage (Implicit)

- VUID-VkFramebufferCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_FRAMEBUFFER_CREATE_INFO

- VUID-VkFramebufferCreateInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkFramebufferAttachmentsCreateInfo

- VUID-VkFramebufferCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkFramebufferCreateInfo-flags-parameter
  flags must be a valid combination of VkFramebufferCreateFlagBits values

- VUID-VkFramebufferCreateInfo-renderPass-parameter
  renderPass must be a valid VkRenderPass handle

- VUID-VkFramebufferCreateInfo-commonparent
  Both of renderPass, and the elements of pAttachments that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

The VkFramebufferAttachmentsCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkFramebufferAttachmentsCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentImageInfoCount;
    const VkFramebufferAttachmentImageInfo* pAttachmentImageInfos;
} VkFramebufferAttachmentsCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_imageless_framebuffer
typedef VkFramebufferAttachmentsCreateInfo VkFramebufferAttachmentsCreateInfoKHR;
```

- sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.

• attachmentImageInfoCount is the number of attachments being described.

• pAttachmentImageInfos is a pointer to an array of VkFramebufferAttachmentImageInfo structures, each structure describing a number of parameters of the corresponding attachment in a render pass instance.

Valid Usage (Implicit)

• VUID-VkFramebufferAttachmentsCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENTS_CREATE_INFO

• VUID-VkFramebufferAttachmentsCreateInfo-pAttachmentImageInfos-parameter
  If attachmentImageInfoCount is not 0, pAttachmentImageInfos must be a valid pointer to an array of attachmentImageInfoCount valid VkFramebufferAttachmentImageInfo structures

The VkFramebufferAttachmentImageInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkFramebufferAttachmentImageInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageCreateFlags flags;
    VkImageUsageFlags usage;
    uint32_t width;
    uint32_t height;
    uint32_t layerCount;
    uint32_t viewFormatCount;
    const VkFormat* pViewFormats;
} VkFramebufferAttachmentImageInfo;
```

or the equivalent

```c
// Provided by VK_KHR_imageless_framebuffer
typedef VkFramebufferAttachmentImageInfo VkFramebufferAttachmentImageInfoKHR;
```

• sType is the type of this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• flags is a bitmask of VkImageCreateFlagBits, matching the value of VkImageCreateInfo::flags used to create an image that will be used with this framebuffer.

• usage is a bitmask of VkImageUsageFlagBits, matching the value of VkImageCreateInfo::usage used to create an image used with this framebuffer.

• width is the width of the image view used for rendering.

• height is the height of the image view used for rendering.
• `layerCount` is the number of array layers of the image view used for rendering.

• `viewFormatCount` is the number of entries in the `pViewFormats` array, matching the value of `VkImageFormatListCreateInfo::viewFormatCount` used to create an image used with this framebuffer.

• `pViewFormats` is a pointer to an array of `VkFormat` values specifying all of the formats which can be used when creating views of the image, matching the value of `VkImageFormatListCreateInfo::pViewFormats` used to create an image used with this framebuffer.

Images that can be used with the framebuffer when beginning a render pass, as specified by `VkRenderPassAttachmentBeginInfo`, must be created with parameters that are identical to those specified here.

### Valid Usage (Implicit)

- `VUID-VkFramebufferAttachmentImageInfo-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENT_IMAGE_INFO`
- `VUID-VkFramebufferAttachmentImageInfo-pNext-pNext` `pNext` must be `NULL`
- `VUID-VkFramebufferAttachmentImageInfo-flags-parameter` `flags` must be a valid combination of `VkImageCreateFlagBits` values
- `VUID-VkFramebufferAttachmentImageInfo-usage-parameter` `usage` must be a valid combination of `VkImageUsageFlagBits` values
- `VUID-VkFramebufferAttachmentImageInfo-usage-requiredbitmask` `usage` must not be `0`
- `VUID-VkFramebufferAttachmentImageInfo-pViewFormats-parameter` If `viewFormatCount` is not `0`, `pViewFormats` must be a valid pointer to an array of `viewFormatCount` valid `VkFormat` values

Bits which can be set in `VkFramebufferCreateInfo::flags`, specifying options for framebuffers, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkFramebufferCreateFlagBits {
    // Provided by VK_VERSION_1_2
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT = 0x00000001,
    // Provided by VK_KHR_imageless_framebuffer
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR = VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT,
} VkFramebufferCreateFlagBits;
```

- `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT` specifies that image views are not specified, and only attachment compatibility information will be provided via a `VkFramebufferAttachmentImageInfo` structure.
typedef VkFlags VkFramebufferCreateFlags;

VkFramebufferCreateFlags is a bitmask type for setting a mask of zero or more VkFramebufferCreateFlagBits.

To destroy a framebuffer, call:

```c
void vkDestroyFramebuffer(
    VkDevice device,  // Provided by VK_VERSION_1_0
    VkFramebuffer framebuffer,  // Provided by VK_VERSION_1_0
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the framebuffer.
- **framebuffer** is the handle of the framebuffer to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyFramebuffer-framebuffer-00892**
  All submitted commands that refer to framebuffer must have completed execution
- **VUID-vkDestroyFramebuffer-framebuffer-00893**
  If VkAllocationCallbacks were provided when framebuffer was created, a compatible set of callbacks must be provided here
- **VUID-vkDestroyFramebuffer-framebuffer-00894**
  If no VkAllocationCallbacks were provided when framebuffer was created, pAllocator must be NULL

### Valid Usage (Implicit)

- **VUID-vkDestroyFramebuffer-device-parameter**
  device must be a valid VkDevice handle
- **VUID-vkDestroyFramebuffer-framebuffer-parameter**
  If framebuffer is not VK_NULL_HANDLE, framebuffer must be a valid VkFramebuffer handle
- **VUID-vkDestroyFramebuffer-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- **VUID-vkDestroyFramebuffer-framebuffer-parent**
  If framebuffer is a valid handle, it must have been created, allocated, or retrieved from device
Host Synchronization

- Host access to framebuffer must be externally synchronized

8.4. Render Pass Commands

An application records the commands for a render pass instance one subpass at a time, by beginning a render pass instance, iterating over the subpasses to record commands for that subpass, and then ending the render pass instance.

To begin a render pass instance, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBeginRenderPass(
    VkCommandBuffer commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    VkSubpassContents contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a `VkRenderPassBeginInfo` structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- `contents` is a `VkSubpassContents` value specifying how the commands in the first subpass will be provided.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

Valid Usage

- **VUID-vkCmdBeginRenderPass-initialLayout-00895**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- **VUID-vkCmdBeginRenderPass-initialLayout-01758**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment
image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-vkCmdBeginRenderPass-initialLayout-02842
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-vkCmdBeginRenderPass-stencilInitialLayout-02843
  If any of the stencilInitialLayout or stencilFinalLayout member of the VkAttachmentDescriptionStencilLayout structures or the stencilLayout member of the VkAttachmentReferenceStencilLayout structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-vkCmdBeginRenderPass-initialLayout-00897
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-vkCmdBeginRenderPass-initialLayout-00898
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_TRANSFER_SRC_BIT

- VUID-vkCmdBeginRenderPass-initialLayout-00899
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_TRANSFER_DST_BIT
If the `initialLayout` member of any of the `VkAttachmentDescription` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is not `VK_IMAGE_LAYOUT_UNDEFINED`, then each such `initialLayout` must be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin`.

The `srcStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` must be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from.

The `dstStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` must be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from.

For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments must have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set.

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` and either the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits.

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit.

**Valid Usage (Implicit)**

- **VUID-vkCmdBeginRenderPass-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
• VUID-vkCmdBeginRenderPass-pRenderPassBegin-parameter
  `pRenderPassBegin` must be a valid pointer to a valid `VkRenderPassBeginInfo` structure

• VUID-vkCmdBeginRenderPass-contents-parameter
  `contents` must be a valid `VkSubpassContents` value

• VUID-vkCmdBeginRenderPass-commandBuffer-recording
  `commandBuffer` must be in the recording state

• VUID-vkCmdBeginRenderPass-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

• VUID-vkCmdBeginRenderPass-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdBeginRenderPass-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdBeginRenderPass-bufferlevel
  `commandBuffer` must be a primary `VkCommandBuffer`

---

**Host Synchronization**

• Host access to `commandBuffer` must be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

Alternatively to begin a render pass, call:

```cpp
// Provided by VK_VERSION_1_2
void vkCmdBeginRenderPass2(
    VkCommandBuffer
    commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    const VkSubpassBeginInfo* pSubpassBeginInfo);
```

or the equivalent command

```cpp
// Provided by VK_KHR_create_renderpass2
```
void vkCmdBeginRenderPass2KHR(
  VkCommandBuffer commandBuffer,
  const VkRenderPassBeginInfo* pRenderPassBegin,
  const VkSubpassBeginInfo* pSubpassBeginInfo);

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a `VkRenderPassBeginInfo` structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

**Valid Usage**

- VUID-vkCmdBeginRenderPass2-framebuffer-02779
  Both the `framebuffer` and `renderPass` members of `pRenderPassBegin` **must** have been created on the same `VkDevice` that `commandBuffer` was allocated on.

- VUID-vkCmdBeginRenderPass2-initialLayout-03094
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`.

- VUID-vkCmdBeginRenderPass2-initialLayout-03096
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- VUID-vkCmdBeginRenderPass2-initialLayout-02844
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must**
have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-vkCmdBeginRenderPass2-stencilInitialLayout-02845
  If any of the stencilInitialLayout or stencilFinalLayout member of the VkAttachmentDescriptionStencilLayout structures or the stencilLayout member of the VkAttachmentReferenceStencilLayout structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-vkCmdBeginRenderPass2-initialLayout-03097
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

• VUID-vkCmdBeginRenderPass2-initialLayout-03098
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_TRANSFER_SRC_BIT

• VUID-vkCmdBeginRenderPass2-initialLayout-03099
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_TRANSFER_DST_BIT

• VUID-vkCmdBeginRenderPass2-initialLayout-03100
  If the initialLayout member of any of the VkAttachmentDescription structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is not VK_IMAGE_LAYOUT_UNDEFINED, then each such initialLayout must be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the framebuffer member of pRenderPassBegin

• VUID-vkCmdBeginRenderPass2-srcStageMask-06453
  The srcStageMask members of any element of the pDependencies member of VkRenderPassCreateInfo used to create renderPass must be supported by the capabilities of the queue family identified by the queueFamilyIndex member of the VkCommandPoolCreateInfo used to create the command pool which commandBuffer was
allocated from

- VUID-vkCmdBeginRenderPass2-dstStageMask-06454
  The `dstStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` must be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from.

- VUID-vkCmdBeginRenderPass2-framebuffer-02533
  For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments must have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set.

- VUID-vkCmdBeginRenderPass2-initialLayout-07002
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` and either the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits.

- VUID-vkCmdBeginRenderPass2-initialLayout-07003
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit.

---

**Valid Usage (Implicit)**

- VUID-vkCmdBeginRenderPass2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdBeginRenderPass2-pRenderPassBegin-parameter
  `pRenderPassBegin` must be a valid pointer to a valid `VkRenderPassBeginInfo` structure.

- VUID-vkCmdBeginRenderPass2-pSubpassBeginInfo-parameter
  `pSubpassBeginInfo` must be a valid pointer to a valid `VkSubpassBeginInfo` structure.

- VUID-vkCmdBeginRenderPass2-commandBuffer-recording
  `commandBuffer` must be in the `recording` state.

- VUID-vkCmdBeginRenderPass2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
• VUID-vkCmdBeginRenderPass2-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdBeginRenderPass2-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdBeginRenderPass2-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>

</tr>
</tbody>
</table>

The VkRenderPassBeginInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassBeginInfo {
  VkStructureType sType;
  const void* pNext;
  VkRenderPass renderPass;
  VkFramebuffer framebuffer;
  VkRect2D renderArea;
  uint32_t clearValueCount;
  const VkClearValue* pClearValues;
} VkRenderPassBeginInfo;
```

• `sType` is the type of this structure.

• `pNext` is NULL or a pointer to a structure extending this structure.

• `renderPass` is the render pass to begin an instance of.

• `framebuffer` is the framebuffer containing the attachments that are used with the render pass.

• `renderArea` is the render area that is affected by the render pass instance, and is described in more detail below.

• `clearValueCount` is the number of elements in `pClearValues`. 
• `pClearValues` is a pointer to an array of `clearValueCount` `VkClearValue` structures containing clear values for each attachment, if the attachment uses a `loadOp` value of `VK_ATTACHMENT_LOAD_OP_CLEAR` or if the attachment has a depth/stencil format and uses a `stencilLoadOp` value of `VK_ATTACHMENT_LOAD_OP_CLEAR`. The array is indexed by attachment number. Only elements corresponding to cleared attachments are used. Other elements of `pClearValues` are ignored.

`renderArea` is the render area that is affected by the render pass instance. The effects of attachment load, store and multisample resolve operations are restricted to the pixels whose x and y coordinates fall within the render area on all attachments. The render area extends to all layers of `framebuffer`. The application must ensure (using scissor if necessary) that all rendering is contained within the render area. The render area, after any transform specified by `VkRenderPassTransformBeginInfoQCOM::transform` is applied, must be contained within the framebuffer dimensions.

If render pass transform is enabled, then `renderArea` must equal the framebuffer pre-transformed dimensions. After `renderArea` has been transformed by `VkRenderPassTransformBeginInfoQCOM::transform`, the resulting render area must be equal to the framebuffer dimensions.

If the `subpassShading` feature is enabled, then `renderArea` must equal the framebuffer dimensions.

When multiview is enabled, the resolve operation at the end of a subpass applies to all views in the view mask.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>There may be a performance cost for using a render area smaller than the framebuffer, unless it matches the render area granularity for the render pass.</td>
</tr>
</tbody>
</table>

## Valid Usage

- **VUID-VkRenderPassBeginInfo-clearValueCount-00902**
  `clearValueCount` must be greater than the largest attachment index in `renderPass` specifying a `loadOp` (or `stencilLoadOp`, if the attachment has a depth/stencil format) of `VK_ATTACHMENT_LOAD_OP_CLEAR`.

- **VUID-VkRenderPassBeginInfo-clearValueCount-04962**
  If `clearValueCount` is not 0, `pClearValues` must be a valid pointer to an array of `clearValueCount` `VkClearValue` unions.

- **VUID-VkRenderPassBeginInfo-renderPass-00904**
  `renderPass` must be compatible with the `renderPass` member of the `VkFramebufferCreateInfo` structure specified when creating `framebuffer`.

- **VUID-VkRenderPassBeginInfo-pNext-02850**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` must be greater than or equal to 0.

- **VUID-VkRenderPassBeginInfo-pNext-02851**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its...
deviceRenderAreaCount member is equal to 0, renderArea.offset.y must be greater than or equal to 0

- VUID-VkRenderPassBeginInfo-pNext-02852
  If the pNext chain does not contain VkDeviceGroupRenderPassBeginInfo or its deviceRenderAreaCount member is equal to 0, renderArea.offset.x + renderArea.extent.width must be less than or equal to VkFramebufferCreateInfo::width the framebuffer was created with

- VUID-VkRenderPassBeginInfo-pNext-02853
  If the pNext chain does not contain VkDeviceGroupRenderPassBeginInfo or its deviceRenderAreaCount member is equal to 0, renderArea.offset.y + renderArea.extent.height must be less than or equal to VkFramebufferCreateInfo::height the framebuffer was created with

- VUID-VkRenderPassBeginInfo-pNext-02856
  If the pNext chain contains VkDeviceGroupRenderPassBeginInfo, offset.x + extent.width of each element of pDeviceRenderAreas must be less than or equal to VkFramebufferCreateInfo::width the framebuffer was created with

- VUID-VkRenderPassBeginInfo-pNext-02857
  If the pNext chain contains VkDeviceGroupRenderPassBeginInfo, offset.y + extent.height of each element of pDeviceRenderAreas must be less than or equal to VkFramebufferCreateInfo::height the framebuffer was created with

- VUID-VkRenderPassBeginInfo-framebuffer-03207
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that did not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, and the pNext chain includes a VkRenderPassAttachmentBeginInfo structure, its attachmentCount must be zero

- VUID-VkRenderPassBeginInfo-framebuffer-03208
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the attachmentCount of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be equal to the value of VkFramebufferAttachmentsCreateInfo::attachmentImageInfoCount used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-02780
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must have been created on the same VkDevice as framebuffer and renderPass

- VUID-VkRenderPassBeginInfo-framebuffer-03209
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageCreateInfo::flags equal to the flags member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-04627
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included
VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView with an inherited usage equal to the usage member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

• VUID-VkRenderPassBeginInfo-framebuffer-03211
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView with a width equal to the width member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

• VUID-VkRenderPassBeginInfo-framebuffer-03212
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView with a height equal to the height member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

• VUID-VkRenderPassBeginInfo-framebuffer-03213
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageViewCreateInfo::subresourceRange.layerCount equal to the layerCount member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

• VUID-VkRenderPassBeginInfo-framebuffer-03214
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageFormatListCreateInfo::viewFormatCount equal to the viewFormatCount member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

• VUID-VkRenderPassBeginInfo-framebuffer-03215
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a set of elements in VkImageFormatListCreateInfo::pViewFormats equal to the set of elements in the pViewFormats member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

• VUID-VkRenderPassBeginInfo-framebuffer-03216
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a VkImageView of an image created with a value of VkImageViewCreateInfo::format equal
to the corresponding value of \texttt{VkAttachmentDescription::format} in \texttt{renderPass}

- **VUID-VkRenderPassBeginInfo-framebuffer-03217**
  If \texttt{framebuffer} was created with a \texttt{VkFramebufferCreateInfo::flags} value that included \texttt{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT}, each element of the \texttt{pAttachments} member of a \texttt{VkRenderPassAttachmentBeginInfo} structure included in the \texttt{pNext} chain must be a \texttt{VkImageView} of an image created with a value of \texttt{VkImageCreateInfo::samples} equal to the corresponding value of \texttt{VkAttachmentDescription::samples} in \texttt{renderPass}

- **VUID-VkRenderPassBeginInfo-pNext-02869**
  If the \texttt{pNext} chain includes \texttt{VkRenderPassTransformBeginInfoQCOM}, \texttt{renderArea.offset} must equal (0,0)

- **VUID-VkRenderPassBeginInfo-pNext-02870**
  If the \texttt{pNext} chain includes \texttt{VkRenderPassTransformBeginInfoQCOM}, \texttt{renderArea.extent} transformed by \texttt{VkRenderPassTransformBeginInfoQCOM::transform} must equal the \texttt{framebuffer} dimensions

### Valid Usage (Implicit)

- **VUID-VkRenderPassBeginInfo-sType-sType**
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_RENDER_PASS_BEGIN_INFO}

- **VUID-VkRenderPassBeginInfo-pNext-pNext**
  Each \texttt{pNext} member of any structure (including this one) in the \texttt{pNext} chain must be either \texttt{NULL} or a pointer to a valid instance of \texttt{VkDeviceGroupRenderPassBeginInfo}, \texttt{VkRenderPassAttachmentBeginInfo}, \texttt{VkRenderPassSampleLocationsBeginInfoEXT}, or \texttt{VkRenderPassTransformBeginInfoQCOM}

- **VUID-VkRenderPassBeginInfo-sType-unique**
  The \texttt{sType} value of each struct in the \texttt{pNext} chain must be unique

- **VUID-VkRenderPassBeginInfo-renderPass-parameter**
  \texttt{renderPass} must be a valid \texttt{VkRenderPass} handle

- **VUID-VkRenderPassBeginInfo-framebuffer-parameter**
  \texttt{framebuffer} must be a valid \texttt{VkFramebuffer} handle

- **VUID-VkRenderPassBeginInfo-commonparent**
  Both of \texttt{framebuffer}, and \texttt{renderPass} must have been created, allocated, or retrieved from the same \texttt{VkDevice}

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with \texttt{VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT} is dependent on the last sample locations used to render to the image subresource, thus preserving the contents of such depth/stencil attachments across subpass boundaries requires the application to specify these sample locations whenever a layout transition of the attachment may occur. This information can be provided by adding a \texttt{VkRenderPassSampleLocationsBeginInfoEXT} structure to the \texttt{pNext} chain of \texttt{VkRenderPassBeginInfo}.

The \texttt{VkRenderPassSampleLocationsBeginInfoEXT} structure is defined as:
```c
// Provided by VK_EXT_sample_locations
typedef struct VkRenderPassSampleLocationsBeginInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentInitialSampleLocationsCount;
    const VkAttachmentSampleLocationsEXT* pAttachmentInitialSampleLocations;
    uint32_t postSubpassSampleLocationsCount;
    const VkSubpassSampleLocationsEXT* pPostSubpassSampleLocations;
} VkRenderPassSampleLocationsBeginInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentInitialSampleLocationsCount` is the number of elements in the `pAttachmentInitialSampleLocations` array.
- `pAttachmentInitialSampleLocations` is a pointer to an array of `attachmentInitialSampleLocationsCount` `VkAttachmentSampleLocationsEXT` structures specifying the attachment indices and their corresponding sample location state. Each element of `pAttachmentInitialSampleLocations` can specify the sample location state to use in the automatic layout transition performed to transition a depth/stencil attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.
- `postSubpassSampleLocationsCount` is the number of elements in the `pPostSubpassSampleLocations` array.
- `pPostSubpassSampleLocations` is a pointer to an array of `postSubpassSampleLocationsCount` `VkSubpassSampleLocationsEXT` structures specifying the subpass indices and their corresponding sample location state. Each element of `pPostSubpassSampleLocations` can specify the sample location state to use in the automatic layout transition performed to transition the depth/stencil attachment used by the specified subpass to the image layout specified in a dependent subpass or to the final layout of the attachment in case the specified subpass is the last subpass using that attachment. In addition, if `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE`, each element of `pPostSubpassSampleLocations` must specify the sample location state that matches the sample locations used by all pipelines that will be bound to a command buffer during the specified subpass. If `variableSampleLocations` is `VK_TRUE`, the sample locations used for rasterization do not depend on `pPostSubpassSampleLocations`.

**Valid Usage (Implicit)**

- VUID-VkRenderPassSampleLocationsBeginInfoEXT-sType-sType `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_SAMPLE_LOCATIONS_BEGIN_INFO_EXT`
- VUID-VkRenderPassSampleLocationsBeginInfoEXT-pAttachmentInitialSampleLocations-parameter If `attachmentInitialSampleLocationsCount` is not 0, `pAttachmentInitialSampleLocations` must be a valid pointer to an array of `attachmentInitialSampleLocationsCount` valid
**VkAttachmentSampleLocationsEXT** structures

- VUID-VkRenderPassSampleLocationsBeginInfoEXT-pPostSubpassSampleLocations-parameter
  
  If `postSubpassSampleLocationsCount` is not 0, `pPostSubpassSampleLocations` must be a valid pointer to an array of `postSubpassSampleLocationsCount` valid `VkSubpassSampleLocationsEXT` structures

The **VkAttachmentSampleLocationsEXT** structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkAttachmentSampleLocationsEXT {
    uint32_t attachmentIndex;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkAttachmentSampleLocationsEXT;
```

- `attachmentIndex` is the index of the attachment for which the sample locations state is provided.
- `sampleLocationsInfo` is the sample locations state to use for the layout transition of the given attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.

If the image referenced by the framebuffer attachment at index `attachmentIndex` was not created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` then the values specified in `sampleLocationsInfo` are ignored.

**Valid Usage**

- VUID-VkAttachmentSampleLocationsEXT-attachmentIndex-01531
  
  `attachmentIndex` must be less than the `attachmentCount` specified in `VkRenderPassCreateInfo` the render pass specified by `VkRenderPassBeginInfo::renderPass` was created with

**Valid Usage (Implicit)**

- VUID-VkAttachmentSampleLocationsEXT-sampleLocationsInfo-parameter
  
  `sampleLocationsInfo` must be a valid `VkSampleLocationsInfoEXT` structure

The **VkSubpassSampleLocationsEXT** structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSubpassSampleLocationsEXT {
    uint32_t subpassIndex;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkSubpassSampleLocationsEXT;
```
• **subpassIndex** is the index of the subpass for which the sample locations state is provided.

• **sampleLocationsInfo** is the sample locations state to use for the layout transition of the depth/stencil attachment away from the image layout the attachment is used with in the subpass specified in **subpassIndex**.

If the image referenced by the depth/stencil attachment used in the subpass identified by **subpassIndex** was not created with **VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT** or if the subpass does not use a depth/stencil attachment, and **VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations** is **VK_TRUE** then the values specified in **sampleLocationsInfo** are ignored.

**Valid Usage**

• **VUID-VkSubpassSampleLocationsEXT-subpassIndex-01532**

  **subpassIndex** must be less than the **subpassCount** specified in **VkRenderPassCreateInfo** the render pass specified by **VkRenderPassBeginInfo::renderPass** was created with

**Valid Usage (Implicit)**

• **VUID-VkSubpassSampleLocationsEXT-sampleLocationsInfo-parameter**

  **sampleLocationsInfo** must be a valid **VkSampleLocationsInfoEXT** structure

To begin a render pass instance with **render pass transform** enabled, add the **VkRenderPassTransformBeginInfoQCOM** to the **pNext** chain of **VkRenderPassBeginInfo** structure passed to the **vkCmdBeginRenderPass** command specifying the render pass transform.

The **VkRenderPassTransformBeginInfoQCOM** structure is defined as:

```c
// Provided by VK_QCOM_render_pass_transform
typedef struct VkRenderPassTransformBeginInfoQCOM {
    VkStructureType sType;
    void* pNext;
    VkSurfaceTransformFlagBitsKHR transform;
} VkRenderPassTransformBeginInfoQCOM;
```

• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **transform** is a **VkSurfaceTransformFlagBitsKHR** value describing the transform to be applied to rasterization.

**Valid Usage**

• **VUID-VkRenderPassTransformBeginInfoQCOM-transform-02871**

  **transform** must be **VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR**,
VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR, VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR, or VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR

• VUID-VkRenderPassTransformBeginInfoQCOM-flags-02872
  The renderpass must have been created with VkRenderPassCreateInfo::flags containing VK_RENDER_PASS_CREATE_TRANSFORM_BIT_QCOM

Valid Usage (Implicit)

• VUID-VkRenderPassTransformBeginInfoQCOM-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_TRANSFORM_BEGIN_INFO_QCOM

The VkSubpassBeginInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkSubpassContents contents;
} VkSubpassBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassBeginInfo VkSubpassBeginInfoKHR;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• contents is a VkSubpassContents value specifying how the commands in the next subpass will be provided.

Valid Usage (Implicit)

• VUID-VkSubpassBeginInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBPASS_BEGIN_INFO

• VUID-VkSubpassBeginInfo-pNext-pNext
  pNext must be NULL

• VUID-VkSubpassBeginInfo-contents-parameter
  contents must be a valid VkSubpassContents value

Possible values of vkCmdBeginRenderPass::contents, specifying how the commands in the first subpass will be provided, are:
typedef enum VkSubpassContents {
    VK_SUBPASS_CONTENTS_INLINE = 0,
    VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS = 1,
} VkSubpassContents;

- **VK_SUBPASS_CONTENTS_INLINE** specifies that the contents of the subpass will be recorded inline in the primary command buffer, and secondary command buffers **must** not be executed within the subpass.

- **VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS** specifies that the contents are recorded in secondary command buffers that will be called from the primary command buffer, and **vkCmdExecuteCommands** is the only valid command on the command buffer until **vkCmdNextSubpass** or **vkCmdEndRenderPass**.

If the **pNext** chain of **VkRenderPassBeginInfo** or **VkRenderingInfo** includes a **VkDeviceGroupRenderPassBeginInfo** structure, then that structure includes a device mask and set of render areas for the render pass instance.

The ** VkDeviceGroupRenderPassBeginInfo** structure is defined as:

```c
typedef struct VkDeviceGroupRenderPassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceMask;
    uint32_t deviceRenderAreaCount;
    const VkRect2D* pDeviceRenderAreas;
} VkDeviceGroupRenderPassBeginInfo;
```

or the equivalent

```c
typedef VkDeviceGroupRenderPassBeginInfo VkDeviceGroupRenderPassBeginInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **deviceMask** is the device mask for the render pass instance.
- **deviceRenderAreaCount** is the number of elements in the **pDeviceRenderAreas** array.
- **pDeviceRenderAreas** is a pointer to an array of **VkRect2D** structures defining the render area for each physical device.

The **deviceMask** serves several purposes. It is an upper bound on the set of physical devices that **can** be used during the render pass instance, and the initial device mask when the render pass instance begins. In addition, commands transitioning to the next subpass in a render pass instance and
commands ending the render pass instance, and, accordingly render pass attachment load, store, and resolve operations and subpass dependencies corresponding to the render pass instance, are executed on the physical devices included in the device mask provided here.

If \texttt{deviceRenderAreaCount} is not zero, then the elements of \texttt{pDeviceRenderAreas} override the value of \texttt{VkRenderPassBeginInfo::renderArea}, and provide a render area specific to each physical device. These render areas serve the same purpose as \texttt{VkRenderPassBeginInfo::renderArea}, including controlling the region of attachments that are cleared by \texttt{VK_ATTACHMENT_LOAD_OP_CLEAR} and that are resolved into resolve attachments.

If this structure is not present, the render pass instance's device mask is the value of \texttt{VkDeviceGroupCommandBufferBeginInfo::deviceMask}. If this structure is not present or if \texttt{deviceRenderAreaCount} is zero, \texttt{VkRenderPassBeginInfo::renderArea} is used for all physical devices.

### Valid Usage

- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00905
  \texttt{deviceMask} must be a valid device mask value

- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00906
  \texttt{deviceMask} must not be zero

- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00907
  \texttt{deviceMask} must be a subset of the command buffer's initial device mask

- VUID-VkDeviceGroupRenderPassBeginInfo-deviceRenderAreaCount-00908
  \texttt{deviceRenderAreaCount} must either be zero or equal to the number of physical devices in the logical device

- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06166
  The \texttt{offset.x} member of any element of \texttt{pDeviceRenderAreas} must be greater than or equal to 0

- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06167
  The \texttt{offset.y} member of any element of \texttt{pDeviceRenderAreas} must be greater than or equal to 0

- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06168
  The sum of the \texttt{offset.x} and \texttt{extent.width} members of any element of \texttt{pDeviceRenderAreas} must be less than or equal to \texttt{maxFramebufferWidth}

- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06169
  The sum of the \texttt{offset.y} and \texttt{extent.height} members of any element of \texttt{pDeviceRenderAreas} must be less than or equal to \texttt{maxFramebufferHeight}

### Valid Usage (Implicit)

- VUID-VkDeviceGroupRenderPassBeginInfo-sType-sType
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_DEVICE_GROUP_RENDER_PASS_BEGIN_INFO}

- VUID-VkDeviceGroupRenderPassBeginInfo-pDeviceRenderAreas-parameter
  If \texttt{deviceRenderAreaCount} is not 0, \texttt{pDeviceRenderAreas} must be a valid pointer to an array of
The `VkRenderPassAttachmentBeginInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassAttachmentBeginInfo {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             attachmentCount;
    const VkImageView*   pAttachments;
} VkRenderPassAttachmentBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_imageless_framebuffer
typedef VkRenderPassAttachmentBeginInfo VkRenderPassAttachmentBeginInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentCount` is the number of attachments.
- `pAttachments` is a pointer to an array of `VkImageView` handles, each of which will be used as the corresponding attachment in the render pass instance.

### Valid Usage

- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03218
  Each element of `pAttachments` must only specify a single mip level

- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03219
  Each element of `pAttachments` must have been created with the identity swizzle

- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-04114
  Each element of `pAttachments` must have been created with `VkImageViewCreateInfo::viewType` not equal to `VK_IMAGE_VIEW_TYPE_3D`

- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-07010
  If `multisampled-render-to-single-sampled` is enabled for any subpass, all element of `pAttachments` which have a sample count equal to `VK_SAMPLE_COUNT_1_BIT` must have a format that supports the sample count specified in `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`

### Valid Usage (Implicit)

- VUID-VkRenderPassAttachmentBeginInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_ATTACHMENT_BEGIN_INFO`
To query the render area granularity, call:

```c
// Provided by VK_VERSION_1_0
void vkGetRenderAreaGranularity(
    VkDevice device,
    VkRenderPass renderPass,
    VkExtent2D* pGranularity);
```

- `device` is the logical device that owns the render pass.
- `renderPass` is a handle to a render pass.
- `pGranularity` is a pointer to a `VkExtent2D` structure in which the granularity is returned.

The conditions leading to an optimal `renderArea` are:

- the `offset.x` member in `renderArea` is a multiple of the `width` member of the returned `VkExtent2D` (the horizontal granularity).
- the `offset.y` member in `renderArea` is a multiple of the `height` member of the returned `VkExtent2D` (the vertical granularity).
- either the `extent.width` member in `renderArea` is a multiple of the horizontal granularity or `offset.x + extent.width` is equal to the width of the framebuffer in the `VkRenderPassBeginInfo`.
- either the `extent.height` member in `renderArea` is a multiple of the vertical granularity or `offset.y + extent.height` is equal to the height of the framebuffer in the `VkRenderPassBeginInfo`.

Subpass dependencies are not affected by the render area, and apply to the entire image subresources attached to the framebuffer as specified in the description of automatic layout transitions. Similarly, pipeline barriers are valid even if their effect extends outside the render area.

---

**Valid Usage (Implicit)**

- VUID-vkGetRenderAreaGranularity-device-parameter
  
  `device` **must** be a valid `VkDevice` handle

- VUID-vkGetRenderAreaGranularity-renderPass-parameter
  
  `renderPass` **must** be a valid `VkRenderPass` handle

- VUID-vkGetRenderAreaGranularity-pGranularity-parameter
  
  `pGranularity` **must** be a valid pointer to a `VkExtent2D` structure

- VUID-vkGetRenderAreaGranularity-renderPass-parent
  
  `renderPass` **must** have been created, allocated, or retrieved from `device`
To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdNextSubpass(
    VkCommandBuffer commandBuffer,
    VkSubpassContents contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `contents` specifies how the commands in the next subpass will be provided, in the same fashion as the corresponding parameter of `vkCmdBeginRenderPass`.

The subpass index for a render pass begins at zero when `vkCmdBeginRenderPass` is recorded, and increments each time `vkCmdNextSubpass` is recorded.

Moving to the next subpass automatically performs any multisample resolve operations in the subpass being ended. End-of-subpass multisample resolves are treated as color attachment writes for the purposes of synchronization. This applies to resolve operations for both color and depth/stencil attachments. That is, they are considered to execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage and their writes are synchronized with `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`. Synchronization between rendering within a subpass and any resolve operations at the end of the subpass occurs automatically, without need for explicit dependencies or pipeline barriers. However, if the resolve attachment is also used in a different subpass, an explicit dependency is needed.

After transitioning to the next subpass, the application can record the commands for that subpass.

### Valid Usage

- VUID-vkCmdNextSubpass-None-00909
  The current subpass index must be less than the number of subpasses in the render pass minus one

- VUID-vkCmdNextSubpass-None-02349
  This command must not be recorded when transform feedback is active

### Valid Usage (Implicit)

- VUID-vkCmdNextSubpass-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdNextSubpass-contents-parameter
  `contents` must be a valid `VkSubpassContents` value

- VUID-vkCmdNextSubpass-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdNextSubpass-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdNextSubpass-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdNextSubpass-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdNextSubpass-bufferlevel
  `commandBuffer` must be a primary `VkCommandBuffer`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>

</table>

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdNextSubpass2(
    VkCommandBuffer commandBuffer,
    const VkSubpassBeginInfo* pSubpassBeginInfo,
    const VkSubpassEndInfo* pSubpassEndInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_create_renderpass2
void vkCmdNextSubpass2KHR(
    VkCommandBuffer commandBuffer,
    const VkSubpassBeginInfo* pSubpassBeginInfo,
    const VkSubpassEndInfo* pSubpassEndInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
• `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.

• `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfo` structure containing information about how the previous subpass will be ended.

`vkCmdNextSubpass2` is semantically identical to `vkCmdNextSubpass`, except that it is extensible, and that `contents` is provided as part of an extensible structure instead of as a flat parameter.

### Valid Usage

- VUID-vkCmdNextSubpass2-None-03102
  The current subpass index **must** be less than the number of subpasses in the render pass minus one

- VUID-vkCmdNextSubpass2-None-02350
  This command **must** not be recorded when transform feedback is active

### Valid Usage (Implicit)

- VUID-vkCmdNextSubpass2-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdNextSubpass2-pSubpassBeginInfo-parameter
  `pSubpassBeginInfo` **must** be a valid pointer to a valid `VkSubpassBeginInfo` structure

- VUID-vkCmdNextSubpass2-pSubpassEndInfo-parameter
  `pSubpassEndInfo` **must** be a valid pointer to a valid `VkSubpassEndInfo` structure

- VUID-vkCmdNextSubpass2-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdNextSubpass2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdNextSubpass2-renderpass
  This command **must** only be called inside of a render pass instance

- VUID-vkCmdNextSubpass2-videocoding
  This command **must** only be called outside of a video coding scope

- VUID-vkCmdNextSubpass2-bufferlevel
  `commandBuffer` **must** be a primary `VkCommandBuffer`

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
To record a command to end a render pass instance after recording the commands for the last subpass, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdEndRenderPass(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer in which to end the current render pass instance.

Ending a render pass instance performs any multisample resolve operations on the final subpass.

### Valid Usage

- VUID-vkCmdEndRenderPass-None-00910
  The current subpass index **must** be equal to the number of subpasses in the render pass minus one

- VUID-vkCmdEndRenderPass-None-02351
  This command **must** not be recorded when transform feedback is active

- VUID-vkCmdEndRenderPass-None-06170
  The current render pass instance **must** not have been begun with `vkCmdBeginRendering`

- VUID-vkCmdEndRenderPass-None-07004
  If `vkCmdBeginQuery*` was called within a subpass of the render pass, the corresponding `vkCmdEndQuery*` **must** have been called subsequently within the same subpass.

### Valid Usage (Implicit)

- VUID-vkCmdEndRenderPass-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdEndRenderPass-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdEndRenderPass-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdEndRenderPass-renderpass
This command **must** only be called inside of a render pass instance

- VUID-vkCmdEndRenderPass-videocoding
  This command **must** only be called outside of a video coding scope

- VUID-vkCmdEndRenderPass-bufferlevel
  commandBuffer **must** be a primary VkCommandBuffer

---

**Host Synchronization**

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

---

</table>

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdEndRenderPass2(
    VkCommandBuffer commandBuffer,
    const VkSubpassEndInfo* pSubpassEndInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_create_renderpass2
void vkCmdEndRenderPass2KHR(
    VkCommandBuffer commandBuffer,
    const VkSubpassEndInfo* pSubpassEndInfo);
```

- commandBuffer is the command buffer in which to end the current render pass instance.
- pSubpassEndInfo is a pointer to a VkSubpassEndInfo structure containing information about how the last subpass will be ended.

`vkCmdEndRenderPass2` is semantically identical to `vkCmdEndRenderPass`, except that it is extensible.
Valid Usage

- VUID-vkCmdEndRenderPass2-None-03103
  The current subpass index must be equal to the number of subpasses in the render pass minus one

- VUID-vkCmdEndRenderPass2-None-02352
  This command must not be recorded when transform feedback is active

- VUID-vkCmdEndRenderPass2-None-06171
  The current render pass instance must not have been begun with vkCmdBeginRendering

- VUID-vkCmdEndRenderPass2-None-07005
  If vkCmdBeginQuery* was called within a subpass of the render pass, the corresponding vkCmdEndQuery* must have been called subsequently within the same subpass.

Valid Usage (Implicit)

- VUID-vkCmdEndRenderPass2-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdEndRenderPass2-pSubpassEndInfo-parameter
  pSubpassEndInfo must be a valid pointer to a valid VkSubpassEndInfo structure

- VUID-vkCmdEndRenderPass2-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdEndRenderPass2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdEndRenderPass2-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdEndRenderPass2-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdEndRenderPass2-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkSubpassEndInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassEndInfo {
    VkStructureType sType;
    const void* pNext;
} VkSubpassEndInfo;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassEndInfo VkSubpassEndInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

### Valid Usage (Implicit)

- VUID-VkSubpassEndInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SUBPASS_END_INFO`

- VUID-VkSubpassEndInfo-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkSubpassFragmentDensityMapOffsetEndInfoQCOM`

- VUID-VkSubpassEndInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

If the `VkSubpassEndInfo::pNext` chain includes a `VkSubpassFragmentDensityMapOffsetEndInfoQCOM` structure, then that structure includes an array of fragment density map offsets per layer for the render pass.

The `VkSubpassFragmentDensityMapOffsetEndInfoQCOM` structure is defined as:

```c
// Provided by VK_QCOM_fragment_density_map_offset
typedef struct VkSubpassFragmentDensityMapOffsetEndInfoQCOM {
```
• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **fragmentDensityOffsetCount** is the number of offsets being specified.
• **pFragmentDensityOffsets** is a pointer to an array of **VkOffset2D** structs, each of which describes the offset per layer.

The array elements are given per layer as defined by Fetch Density Value, where index = layer. Each (x,y) offset is in framebuffer pixels and shifts the fetch of the fragment density map by that amount. Offsets can be positive or negative.

Offset values specified for any subpass that is not the last subpass in the render pass are ignored. If the **VkSubpassEndInfo::pNext** chain for the last subpass of a renderpass does not include **VkSubpassFragmentDensityMapOffsetEndInfoQCOM**, or if **fragmentDensityOffsetCount** is zero, then the offset (0,0) is used for Fetch Density Value.

---

### Valid Usage

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityMapOffsets-06503**
  If the fragmentDensityMapOffsets feature is not enabled or fragment density map is not enabled in the render pass, **fragmentDensityOffsetCount must equal 0**.

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityMapAttachment-06504**
  If **VkSubpassDescription::fragmentDensityMapAttachment** is not is not **VK_ATTACHMENT_UNUSED** and was not created with **VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM**, **fragmentDensityOffsetCount must equal 0**.

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pDepthStencilAttachment-06505**
  If **VkSubpassDescription::pDepthStencilAttachment** is not is not **VK_ATTACHMENT_UNUSED** and was not created with **VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM**, **fragmentDensityOffsetCount must equal 0**.

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pInputAttachments-06506**
  If any element of **VkSubpassDescription::pInputAttachments** is not is not **VK_ATTACHMENT_UNUSED** and was not created with **VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM**, **fragmentDensityOffsetCount must equal 0**.

- **VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pColorAttachments-06507**
  If any element of **VkSubpassDescription::pColorAttachments** is not is not **VK_ATTACHMENT_UNUSED** and was not created with **VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM**, **fragmentDensityOffsetCount must equal 0**.
VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM, fragmentDensityOffsetCount must equal 0.

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pResolveAttachments-06508
  If any element of VkSubpassDescription::pResolveAttachments is not not VK_ATTACHMENT_UNUSED and was not created with VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM, fragmentDensityOffsetCount must equal 0.

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pPreserveAttachments-06509
  If any element of VkSubpassDescription::pPreserveAttachments is not not VK_ATTACHMENT_UNUSED and was not created with VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM, fragmentDensityOffsetCount must equal 0.

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityOffsetCount-06510
  If fragmentDensityOffsetCount is not 0 and multiview is enabled for the render pass, fragmentDensityOffsetCount must equal the layerCount that was specified in creating the fragment density map attachment view.

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-fragmentDensityOffsetCount-06511
  If fragmentDensityOffsetCount is not 0 and multiview is not enabled for the render pass, fragmentDensityOffsetCount must equal 1.

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-x-06512
  The x component of each element of pFragmentDensityOffsets must be an integer multiple of fragmentDensityOffsetGranularity.width.

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-y-06513
  The y component of each element of pFragmentDensityOffsets must be an integer multiple of fragmentDensityOffsetGranularity.height.

**Valid Usage (Implicit)**

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBPASS_FRAGMENT_DENSITY_MAP_OFFSET_END_INFO_QCOM

- VUID-VkSubpassFragmentDensityMapOffsetEndInfoQCOM-pFragmentDensityOffsets-parameter
  If fragmentDensityOffsetCount is not 0, pFragmentDensityOffsets must be a valid pointer to an array of fragmentDensityOffsetCount VkOffset2D structures

### 8.5. Render Pass Creation Feedback

A VkRenderPassCreationControlEXT structure can be included in the pNext chain of VkRenderPassCreateInfo2 or pNext chain of VkSubpassDescription2. The VkRenderPassCreationControlEXT structure is defined as:
```c
typedef struct VkRenderPassCreationControlEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 disallowMerging;
} VkRenderPassCreationControlEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `disallowMerging` is a boolean value indicating whether subpass merging will be disabled.

If a `VkRenderPassCreationControlEXT` structure is included in the `pNext` chain of `VkRenderPassCreateInfo2` and its value of `disallowMerging` is `VK_TRUE`, the implementation will disable subpass merging for the entire render pass. If a `VkRenderPassCreationControlEXT` structure is included in the `pNext` chain of `VkSubpassDescription2` and its value of `disallowMerging` is `VK_TRUE`, the implementation will disable merging the described subpass with previous subpasses in the render pass.

---

### Valid Usage (Implicit)

- `VUID-VkRenderPassCreationControlEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATION_CONTROL_EXT`  

To obtain feedback about the creation of a render pass, include a `VkRenderPassCreationFeedbackCreateInfoEXT` structure in the `pNext` chain of `VkRenderPassCreateInfo2`. The `VkRenderPassCreationFeedbackCreateInfoEXT` structure is defined as:

```c
typedef struct VkRenderPassCreationFeedbackCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassCreationFeedbackInfoEXT* pRenderPassFeedback;
} VkRenderPassCreationFeedbackCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `pRenderPassFeedback` is a pointer to a `VkRenderPassCreationFeedbackInfoEXT` structure in which feedback is returned.

---

### Valid Usage (Implicit)

- `VUID-VkRenderPassCreationFeedbackCreateInfoEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATION_FEEDBACK_CREATE_INFO_EXT`
The `VkRenderPassCreationFeedbackInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassCreationFeedbackInfoEXT {
    uint32_t postMergeSubpassCount;
} VkRenderPassCreationFeedbackInfoEXT;
```

- `postMergeSubpassCount` is the subpass count after merge.

Feedback about the creation of a subpass can be obtained by including a `VkRenderPassSubpassFeedbackCreateInfoEXT` structure in the `pNext` chain of `VkSubpassDescription2`. The `VkRenderPassSubpassFeedbackCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassSubpassFeedbackCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassSubpassFeedbackCreateInfoEXT* pSubpassFeedback;
} VkRenderPassSubpassFeedbackCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `pSubpassFeedback` is a pointer to a `VkRenderPassSubpassFeedbackCreateInfoEXT` structure in which feedback is returned.

### Valid Usage (Implicit)

- **VUID-VkRenderPassSubpassFeedbackCreateInfoEXT-sType-sType**
  ```none```
  `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_SUBPASS_FEEDBACK_CREATE_INFO_EXT`

- **VUID-VkRenderPassSubpassFeedbackCreateInfoEXT-pSubpassFeedback-parameter**
  ```none```
  `pSubpassFeedback` must be a valid pointer to a `VkRenderPassSubpassFeedbackCreateInfoEXT` structure

The `VkRenderPassSubpassFeedbackInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_subpass_merge_feedback
typedef struct VkRenderPassSubpassFeedbackInfoEXT {
    VkSubpassMergeStatusEXT subpassMergeStatus;
    char description[VK_MAX_DESCRIPTION_SIZE];
    uint32_t postMergeIndex;
} VkRenderPassSubpassFeedbackInfoEXT;
```
• **subpassMergeStatus** is a `VkSubpassMergeStatusEXT` value specifying information about whether the subpass is merged with previous subpass and the reason why it is not merged.

• **description** is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which provides additional details.

• **postMergeIndex** is the subpass index after the subpass merging.

Possible values of `VkRenderPassSubpassFeedbackInfoEXT::subpassMergeStatus` are:

```c
// Provided by VK_EXT_subpass_merge_feedback
typedef enum VkSubpassMergeStatusEXT {
    VK_SUBPASS_MERGE_STATUS_MERGED_EXT = 0,
    VK_SUBPASS_MERGE_STATUS_DISALLOWED_EXT = 1,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SIDE_EFFECTS_EXT = 2,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SAMPLES_MISMATCH_EXT = 3,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_VIEWS_MISMATCH_EXT = 4,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_ALIasing_EXT = 5,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPENDENCIES_EXT = 6,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INCOMPATIBLE_INPUT_ATTACHMENT_EXT = 7,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_TOO_MANY_ATTACHMENTS_EXT = 8,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INSUFFICIENT_STORAGE_EXT = 9,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPTH_STENCIL_COUNT_EXT = 10,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_RESOLVE_ATTACHMENT_REUSE_EXT = 11,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SINGLE_SUBPASS_EXT = 12,
    VK_SUBPASS_MERGE_STATUS_NOT_MERGED_UNSPECIFIED_EXT = 13,
} VkSubpassMergeStatusEXT;
```

• **VK_SUBPASS_MERGE_STATUS_MERGED_EXT** specifies the subpass is merged with a previous subpass.

• **VK_SUBPASS_MERGE_STATUS_DISALLOWED_EXT** specifies the subpass is disallowed to merge with previous subpass. If the render pass does not allow subpass merging, then all subpass statuses are set to this value. If a subpass description does not allow subpass merging, then only that subpass’s status is set to this value.

• **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SIDE_EFFECTS_EXT** specifies the subpass is not merged because it contains side effects.

• **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SAMPLES_MISMATCH_EXT** specifies the subpass is not merged because sample count is not compatible with previous subpass.

• **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_VIEWS_MISMATCH_EXT** specifies the subpass is not merged because view masks do not match with previous subpass.

• **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_ALIasing_EXT** specifies the subpass is not merged because of attachments aliasing between them.

• **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPENDENCIES_EXT** specifies the subpass is not merged because subpass dependencies do not allow merging.

• **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INCOMPATIBLE_INPUT_ATTACHMENT_EXT** specifies the subpass is not merged
not merged because input attachment is not a color attachment from previous subpass or the formats are incompatible.

- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_TOO_MANY_ATTACHMENTS_EXT** specifies the subpass is not merged because of too many attachments.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_INSUFFICIENT_STORAGE_EXT** specifies the subpass is not merged because of insufficient memory.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_DEPTH_STENCIL_COUNT_EXT** specifies the subpass is not merged because of too many depth/stencil attachments.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_RESOLVE_ATTACHMENT_REUSE_EXT** specifies the subpass is not merged because a resolve attachment is reused as an input attachment in a subsequent subpass.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_SINGLE_SUBPASS_EXT** specifies the subpass is not merged because the render pass has only one subpass.
- **VK_SUBPASS_MERGE_STATUS_NOT_MERGED_UNSPECIFIED_EXT** specifies other reasons why subpass is not merged. It is also the recommended default value that should be reported when a subpass is not merged and when no other value is appropriate.
Chapter 9. Shaders

A shader specifies programmable operations that execute for each vertex, control point, tessellated vertex, primitive, fragment, or workgroup in the corresponding stage(s) of the graphics and compute pipelines.

Graphics pipelines include vertex shader execution as a result of primitive assembly, followed, if enabled, by tessellation control and evaluation shaders operating on patches, geometry shaders, if enabled, operating on primitives, and fragment shaders, if present, operating on fragments generated by Rasterization. In this specification, vertex, tessellation control, tessellation evaluation and geometry shaders are collectively referred to as pre-rasterization shader stages and occur in the logical pipeline before rasterization. The fragment shader occurs logically after rasterization.

Only the compute shader stage is included in a compute pipeline. Compute shaders operate on compute invocations in a workgroup.

Shaders can read from input variables, and read from and write to output variables. Input and output variables can be used to transfer data between shader stages, or to allow the shader to interact with values that exist in the execution environment. Similarly, the execution environment provides constants describing capabilities.

Shader variables are associated with execution environment-provided inputs and outputs using built-in decorations in the shader. The available decorations for each stage are documented in the following subsections.

9.1. Shader Modules

Shader modules contain shader code and one or more entry points. Shaders are selected from a shader module by specifying an entry point as part of pipeline creation. The stages of a pipeline can use shaders that come from different modules. The shader code defining a shader module must be in the SPIR-V format, as described by the Vulkan Environment for SPIR-V appendix.

Shader modules are represented by VkShaderModule handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderModule)
```

To create a shader module, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateShaderModule(
    VkDevice device,
    const VkShaderModuleCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkShaderModule* pShaderModule);
```

- `device` is the logical device that creates the shader module.
• pCreateInfo is a pointer to a VkShaderModuleCreateInfo structure.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.
• pShaderModule is a pointer to a VkShaderModule handle in which the resulting shader module object is returned.

Once a shader module has been created, any entry points it contains can be used in pipeline shader stages as described in Compute Pipelines and Graphics Pipelines.

Valid Usage

• VUID-vkCreateShaderModule-pCreateInfo-06904
  If pCreateInfo is not NULL, pCreateInfo->pNext must be NULL or a pointer to a VkShaderModuleValidationCacheCreateInfoEXT structure

Valid Usage (Implicit)

• VUID-vkCreateShaderModule-device-parameter
device must be a valid VkDevice handle
• VUID-vkCreateShaderModule-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkShaderModuleCreateInfo structure
• VUID-vkCreateShaderModule-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
• VUID-vkCreateShaderModule-pShaderModule-parameter
  pShaderModule must be a valid pointer to a VkShaderModule handle

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INVALID_SHADER_NV

The VkShaderModuleCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkShaderModuleCreateInfo {
    VkStructureType sType;
    const void* pNext;
} VkShaderModuleCreateInfo;
```
\begin{verbatim}
VkShaderModuleCreateInfo
{
    VkShaderModuleCreateFlags flags;
    size_t codeSize;
    const uint32_t* pCode;
} VkShaderModuleCreateInfo;
\end{verbatim}

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **codeSize** is the size, in bytes, of the code pointed to by **pCode**.
- **pCode** is a pointer to code that is used to create the shader module. The type and format of the code is determined from the content of the memory addressed by **pCode**.

### Valid Usage

- **VUID-VkShaderModuleCreateInfo-codeSize-01085**
  codeSize must be greater than 0

- **VUID-VkShaderModuleCreateInfo-pCode-01376**
  If **pCode** is a pointer to SPIR-V code, codeSize must be a multiple of 4

- **VUID-VkShaderModuleCreateInfo-pCode-01377**
  **pCode** must point to either valid SPIR-V code, formatted and packed as described by the Khronos SPIR-V Specification or valid GLSL code which must be written to the GL_KHR_vulkan_glsl extension specification

- **VUID-VkShaderModuleCreateInfo-pCode-01378**
  If **pCode** is a pointer to SPIR-V code, that code must adhere to the validation rules described by the Validation Rules within a Module section of the SPIR-V Environment appendix

- **VUID-VkShaderModuleCreateInfo-pCode-01379**
  If **pCode** is a pointer to GLSL code, it must be valid GLSL code written to the GL_KHR_vulkan_glsl GLSL extension specification

- **VUID-VkShaderModuleCreateInfo-pCode-01089**
  **pCode** must declare the Shader capability for SPIR-V code

- **VUID-VkShaderModuleCreateInfo-pCode-01090**
  **pCode** must not declare any capability that is not supported by the API, as described by the Capabilities section of the SPIR-V Environment appendix

- **VUID-VkShaderModuleCreateInfo-pCode-01091**
  If **pCode** declares any of the capabilities listed in the SPIR-V Environment appendix, one of the corresponding requirements must be satisfied

- **VUID-VkShaderModuleCreateInfo-pCode-04146**
  **pCode** must not declare any SPIR-V extension that is not supported by the API, as described by the Extension section of the SPIR-V Environment appendix

- **VUID-VkShaderModuleCreateInfo-pCode-04147**
  If **pCode** declares any of the SPIR-V extensions listed in the SPIR-V Environment appendix,
Valid Usage (Implicit)

- VUID-VkShaderModuleCreateInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO`

- VUID-VkShaderModuleCreateInfo-flags-zerobitmask
  
  `flags` must be `0`

- VUID-VkShaderModuleCreateInfo-pCode-parameter
  
  `pCode` must be a valid pointer to an array of \( \frac{\text{codeSize}}{4} \) `uint32_t` values

---

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderModuleCreateFlags;
```

`VkShaderModuleCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To use a `VkValidationCacheEXT` to cache shader validation results, add a `VkShaderModuleValidationCacheCreateInfoEXT` structure to the `pNext` chain of the `VkShaderModuleCreateInfo` structure, specifying the cache object to use.

The `VkShaderModuleValidationCacheCreateInfoEXT` struct is defined as:

```c
// Provided by VK_EXT_validation_cache
typedef struct VkShaderModuleValidationCacheCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkValidationCacheEXT validationCache;
} VkShaderModuleValidationCacheCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `validationCache` is the validation cache object from which the results of prior validation attempts will be written, and to which new validation results for this `VkShaderModule` will be written (if not already present).

---

Valid Usage (Implicit)

- VUID-VkShaderModuleValidationCacheCreateInfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_SHADER_MODULE_VALIDATION_CACHE_CREATE_INFO_EXT`

- VUID-VkShaderModuleValidationCacheCreateInfoEXT-validationCache-parameter
  
  `validationCache` must be a valid `VkValidationCacheEXT` handle
To destroy a shader module, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyShaderModule(
    VkDevice device,  
    VkShaderModule shaderModule,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the shader module.
- `shaderModule` is the handle of the shader module to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

A shader module **can** be destroyed while pipelines created using its shaders are still in use.

### Valid Usage

- VUID-vkDestroyShaderModule-shaderModule-01092
  If `VkAllocationCallbacks` were provided when `shaderModule` was created, a compatible set of callbacks **must** be provided here

- VUID-vkDestroyShaderModule-shaderModule-01093
  If no `VkAllocationCallbacks` were provided when `shaderModule` was created, `pAllocator` **must** be `NULL`

### Valid Usage (Implicit)

- VUID-vkDestroyShaderModule-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkDestroyShaderModule-shaderModule-parameter
  If `shaderModule` is not `VK_NULL_HANDLE`, `shaderModule` **must** be a valid `VkShaderModule` handle

- VUID-vkDestroyShaderModule-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyShaderModule-shaderModule-parent
  If `shaderModule` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `shaderModule` **must** be externally synchronized
9.2. Shader Module Identifiers

Shader modules have unique identifiers associated with them. To query an implementation provided identifier, call:

```c
// Provided by VK_EXT_shader_module_identifier
void vkGetShaderModuleIdentifierEXT(
    VkDevice device,
    VkShaderModule shaderModule,
    VkShaderModuleIdentifierEXT* pIdentifier);
```

- `device` is the logical device that created the shader module.
- `shaderModule` is the handle of the shader module.
- `pIdentifier` is a pointer to the returned `VkShaderModuleIdentifierEXT`.

The identifier returned by the implementation must only depend on `shaderIdentifierAlgorithmUUID` and information provided in the `VkShaderModuleCreateInfo` which created `shaderModule`. The implementation may return equal identifiers for two different `VkShaderModuleCreateInfo` structures if the difference does not affect pipeline compilation. Identifiers are only meaningful on different `VkDevice` objects if the device the identifier was queried from had the same `shaderModuleIdentifierAlgorithmUUID` as the device consuming the identifier.

**Valid Usage**

- VUID-vkGetShaderModuleIdentifierEXT-shaderModuleIdentifier-06884
  `shaderModuleIdentifier` feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkGetShaderModuleIdentifierEXT-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetShaderModuleIdentifierEXT-shaderModule-parameter
  `shaderModule` must be a valid `VkShaderModule` handle
- VUID-vkGetShaderModuleIdentifierEXT-pIdentifier-parameter
  `pIdentifier` must be a valid pointer to a `VkShaderModuleIdentifierEXT` structure
- VUID-vkGetShaderModuleIdentifierEXT-shaderModule-parent
  `shaderModule` must have been created, allocated, or retrieved from `device`
VkDevice
c
const VkShaderModuleCreateInfo*
pCreateInfo,
VkShaderModuleIdentifierEXT*
pIdentifier);

- **device** is the logical device that can create a **VkShaderModule** from **pCreateInfo**.
- **pCreateInfo** is a pointer to a **VkShaderModuleCreateInfo** structure.
- **pIdentifier** is a pointer to the returned **VkShaderModuleIdentifierEXT**.

The identifier returned by implementation must only depend on shaderIdentifierAlgorithmUUID and information provided in the **VkShaderModuleCreateInfo**. The implementation may return equal identifiers for two different **VkShaderModuleCreateInfo** structures if the difference does not affect pipeline compilation. Identifiers are only meaningful on different **VkDevice** objects if the device the identifier was queried from had the same shaderModuleIdentifierAlgorithmUUID as the device consuming the identifier.

The identifier returned by the implementation in **vkGetShaderModuleCreateInfoIdentifierEXT** must be equal to the identifier returned by **vkGetShaderModuleIdentifierEXT** given equivalent definitions of **VkShaderModuleCreateInfo** and any chained **pNext** structures.

**Valid Usage**

- VUID-vkGetShaderModuleCreateInfoIdentifierEXT-shaderModuleIdentifier-06885
  shaderModuleIdentifier feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkGetShaderModuleCreateInfoIdentifierEXT-device-parameter
device must be a valid **VkDevice** handle
- VUID-vkGetShaderModuleCreateInfoIdentifierEXT-pCreateInfo-parameter
  **pCreateInfo** must be a valid pointer to a valid **VkShaderModuleCreateInfo** structure
- VUID-vkGetShaderModuleCreateInfoIdentifierEXT-pIdentifier-parameter
  **pIdentifier** must be a valid pointer to a **VkShaderModuleIdentifierEXT** structure

**VkShaderModuleIdentifierEXT** represents a shader module identifier returned by the implementation.

```c
// Provided by VK_EXT_shader_module_identifier
typedef struct VkShaderModuleIdentifierEXT {
  VkStructureType sType;
  void* pNext;
  uint32_t identifierSize;
  uint8_t identifier[VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT];
} VkShaderModuleIdentifierEXT;
```
- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `identifierSize` is the size, in bytes, of valid data returned in `identifier`.
- `identifier` is a buffer of opaque data specifying an identifier.

Any returned values beyond the first `identifierSize` bytes are undefined. Implementations must return an `identifierSize` greater than 0, and less-or-equal to `VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT`.

Two identifiers are considered equal if `identifierSize` is equal and the first `identifierSize` bytes of `identifier` compare equal.

Implementations may return a different `identifierSize` for different modules. Implementations should ensure that `identifierSize` is large enough to uniquely define a shader module.

### Valid Usage (Implicit)

- `VUID-VkShaderModuleIdentifierEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_SHADER_MODULE_IDENTIFIER_EXT`  
- `VUID-VkShaderModuleIdentifierEXT-pNext-pNext`  
  `pNext` must be `NULL`

### 9.3. Shader Execution

At each stage of the pipeline, multiple invocations of a shader may execute simultaneously. Further, invocations of a single shader produced as the result of different commands may execute simultaneously. The relative execution order of invocations of the same shader type is undefined. Shader invocations may complete in a different order than that in which the primitives they originated from were drawn or dispatched by the application. However, fragment shader outputs are written to attachments in rasterization order.

The relative execution order of invocations of different shader types is largely undefined. However, when invoking a shader whose inputs are generated from a previous pipeline stage, the shader invocations from the previous stage are guaranteed to have executed far enough to generate input values for all required inputs.

#### 9.3.1. Shader Termination

A shader invocation that is terminated has finished executing instructions.

Executing `OpReturn` in the entry point, or executing `OpTerminateInvocation` in any function will terminate an invocation. Implementations may also terminate a shader invocation when `OpKill` is executed in any function; otherwise it becomes a helper invocation.

In addition to the above conditions, helper invocations are terminated when all non-helper invocations in the same derivative group either terminate or become helper invocations via
A shader stage for a given command completes execution when all invocations for that stage have terminated.

9.4. Shader Memory Access Ordering

The order in which image or buffer memory is read or written by shaders is largely undefined. For some shader types (vertex, tessellation evaluation, and in some cases, fragment), even the number of shader invocations that may perform loads and stores is undefined.

In particular, the following rules apply:

- **Vertex** and **tessellation evaluation** shaders will be invoked at least once for each unique vertex, as defined in those sections.
- **Fragment** shaders will be invoked zero or more times, as defined in that section.
- The relative execution order of invocations of the same shader type is undefined. A store issued by a shader when working on primitive B might complete prior to a store for primitive A, even if primitive A is specified prior to primitive B. This applies even to fragment shaders; while fragment shader outputs are always written to the framebuffer in rasterization order, stores executed by fragment shader invocations are not.
- The relative execution order of invocations of different shader types is largely undefined.

**Note**
The above limitations on shader invocation order make some forms of synchronization between shader invocations within a single set of primitives unimplementable. For example, having one invocation poll memory written by another invocation assumes that the other invocation has been launched and will complete its writes in finite time.

The **Memory Model** appendix defines the terminology and rules for how to correctly communicate between shader invocations, such as when a write is **Visible-To** a read, and what constitutes a **Data Race**.

Applications **must** not cause a data race.

The SPIR-V **SubgroupMemory**, **CrossWorkgroupMemory**, and **AtomicCounterMemory** memory semantics are ignored. Sequentially consistent atomics and barriers are not supported and **SequentiallyConsistent** is treated as **AcquireRelease**. **SequentiallyConsistent should** not be used.

9.5. Shader Inputs and Outputs

Data is passed into and out of shaders using variables with input or output storage class, respectively. User-defined inputs and outputs are connected between stages by matching their **Location** decorations. Additionally, data **can** be provided by or communicated to special functions provided by the execution environment using **BuiltIn** decorations.
In many cases, the same BuiltIn decoration can be used in multiple shader stages with similar meaning. The specific behavior of variables decorated as BuiltIn is documented in the following sections.

9.6. Task Shaders

Task shaders operate in conjunction with the mesh shaders to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline. Its primary purpose is to create a variable amount of subsequent mesh shader invocations.

Task shaders are invoked via the execution of the programmable mesh shading pipeline.

The task shader has no fixed-function inputs other than variables identifying the specific workgroup and invocation. In the TaskNV Execution Model the number of mesh shader workgroups to create is specified via a TaskCountNV decorated output variable. In the TaskEXT Execution Model the number of mesh shader workgroups to create is specified via the OpEmitMeshTasksEXT instruction.

The task shader can write additional outputs to task memory, which can be read by all of the mesh shader workgroups it created.

9.6.1. Task Shader Execution

Task workloads are formed from groups of work items called workgroups and processed by the task shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Task shaders execute in global workgroups which are divided into a number of local workgroups with a size that can be set by assigning a value to the LocalSize or LocalSizeId execution mode or via an object decorated by the WorkgroupSize decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup. If the subpass includes multiple views in its view mask, a Task shader using TaskEXT Execution Model may be invoked separately for each view.

9.7. Mesh Shaders

Mesh shaders operate in workgroups to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline. Each workgroup emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

Mesh shaders are invoked via the execution of the programmable mesh shading pipeline.

The only inputs available to the mesh shader are variables identifying the specific workgroup and invocation and, if applicable, any outputs written to task memory by the task shader that spawned the mesh shader’s workgroup. The mesh shader can operate without a task shader as well.

The invocations of the mesh shader workgroup write an output mesh, comprising a set of primitives with per-primitive attributes, a set of vertices with per-vertex attributes, and an array of indices identifying the mesh vertices that belong to each primitive. The primitives of this mesh are then processed by subsequent graphics pipeline stages, where the outputs of the mesh shader form an interface with the fragment shader.
9.7.1. Mesh Shader Execution

Mesh workloads are formed from groups of work items called workgroups and processed by the mesh shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Mesh shaders execute in *global workgroups* which are divided into a number of *local workgroups* with a size that *can* be set by assigning a value to the `LocalSize` or `LocalSizeId` execution mode or via an object decorated by the `WorkgroupSize` decoration. An invocation within a local workgroup *can* share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

The *global workgroups* may be generated explicitly via the API, or implicitly through the task shader's work creation mechanism. If the subpass includes multiple views in its view mask, a Mesh shader using *MeshEXT Execution Model* may be invoked separately for each view.

9.8. Vertex Shaders

Each vertex shader invocation operates on one vertex and its associated vertex attribute data, and outputs one vertex and associated data. Graphics pipelines using primitive shading *must* include a vertex shader, and the vertex shader stage is always the first shader stage in the graphics pipeline.

9.8.1. Vertex Shader Execution

A vertex shader *must* be executed at least once for each vertex specified by a drawing command. If the subpass includes multiple views in its view mask, the shader *may* be invoked separately for each view. During execution, the shader is presented with the index of the vertex and instance for which it has been invoked. Input variables declared in the vertex shader are filled by the implementation with the values of vertex attributes associated with the invocation being executed.

If the same vertex is specified multiple times in a drawing command (e.g. by including the same index value multiple times in an index buffer) the implementation *may* reuse the results of vertex shading if it can statically determine that the vertex shader invocations will produce identical results.

*Note*

It is implementation-dependent when and if results of vertex shading are reused, and thus how many times the vertex shader will be executed. This is true also if the vertex shader contains stores or atomic operations (see `vertexPipelineStoresAndAtomics`).

9.9. Tessellation Control Shaders

The tessellation control shader is used to read an input patch provided by the application and to produce an output patch. Each tessellation control shader invocation operates on an input patch (after all control points in the patch are processed by a vertex shader) and its associated data, and outputs a single control point of the output patch and its associated data, and *can* also output additional per-patch data. The input patch is sized according to the `patchControlPoints` member of
**VkPipelineTessellationStateCreateInfo**, as part of input assembly.

The input patch can also be dynamically sized with `patchControlPoints` parameter of `vkCmdSetPatchControlPointsEXT`.

To **dynamically set** the number of control points per patch, call:

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetPatchControlPointsEXT(
    VkCommandBuffer commandBuffer,
    uint32_t patchControlPoints);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `patchControlPoints` specifies the number of control points per patch.

This command sets the number of control points per patch for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineTessellationStateCreateInfo::patchControlPoints` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetPatchControlPointsEXT-None-04873
  The `extendedDynamicState2PatchControlPoints` feature **must** be enabled

- VUID-vkCmdSetPatchControlPointsEXT-patchControlPoints-04874
  `patchControlPoints` **must** be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

**Valid Usage (Implicit)**

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-recording
  `commandBuffer` **must** be in the `recording state`

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetPatchControlPointsEXT-videocoding
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

The size of the output patch is controlled by the `OpExecutionMode OutputVertices` specified in the tessellation control or tessellation evaluation shaders, which must be specified in at least one of the shaders. The size of the input and output patches must each be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`.

9.9.1. Tessellation Control Shader Execution

A tessellation control shader is invoked at least once for each output vertex in a patch. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.

Inputs to the tessellation control shader are generated by the vertex shader. Each invocation of the tessellation control shader can read the attributes of any incoming vertices and their associated data. The invocations corresponding to a given patch execute logically in parallel, with undefined relative execution order. However, the `OpControlBarrier` instruction can be used to provide limited control of the execution order by synchronizing invocations within a patch, effectively dividing tessellation control shader execution into a set of phases. Tessellation control shaders will read undefined values if one invocation reads a per-vertex or per-patch output written by another invocation at any point during the same phase, or if two invocations attempt to write different values to the same per-patch output in a single phase.

9.10. Tessellation Evaluation Shaders

The Tessellation Evaluation Shader operates on an input patch of control points and their associated data, and a single input barycentric coordinate indicating the invocation’s relative position within the subdivided patch, and outputs a single vertex and its associated data.

9.10.1. Tessellation Evaluation Shader Execution

A tessellation evaluation shader is invoked at least once for each unique vertex generated by the tessellator. If the subpass includes multiple views in its view mask, the shader may be invoked...
9.11. Geometry Shaders

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

9.11.1. Geometry Shader Execution

A geometry shader is invoked at least once for each primitive produced by the tessellation stages, or at least once for each primitive generated by primitive assembly when tessellation is not in use. A shader can request that the geometry shader runs multiple instances. A geometry shader is invoked at least once for each instance. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.

9.12. Fragment Shaders

Fragment shaders are invoked as a fragment operation in a graphics pipeline. Each fragment shader invocation operates on a single fragment and its associated data. With few exceptions, fragment shaders do not have access to any data associated with other fragments and are considered to execute in isolation of fragment shader invocations associated with other fragments.

9.13. Compute Shaders

Compute shaders are invoked via vkCmdDispatch and vkCmdDispatchIndirect commands. In general, they have access to similar resources as shader stages executing as part of a graphics pipeline.

Compute workloads are formed from groups of work items called workgroups and processed by the compute shader in the current compute pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Compute shaders execute in global workgroups which are divided into a number of local workgroups with a size that can be set by assigning a value to the LocalSize or LocalSizeId execution mode or via an object decorated by the WorkgroupSize decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

A ray generation shader is similar to a compute shader. Its main purpose is to execute ray tracing queries using OpTraceRayKHR instructions and process the results.

One ray generation shader is executed per ray tracing dispatch. Its location in the shader binding table (see Shader Binding Table for details) is passed directly into vkCmdTraceRaysKHR using the...
9.15. Intersection Shaders

Intersection shaders enable the implementation of arbitrary, application defined geometric primitives. An intersection shader for a primitive is executed whenever its axis-aligned bounding box is hit by a ray.

Like other ray tracing shader domains, an intersection shader operates on a single ray at a time. It also operates on a single primitive at a time. It is therefore the purpose of an intersection shader to compute the ray-primitive intersections and report them. To report an intersection, the shader calls the `OpReportIntersectionKHR` instruction.

An intersection shader communicates with any-hit and closest shaders by generating attribute values that they can read. Intersection shaders cannot read or modify the ray payload.

9.15.1. Intersection Shader Execution

The order in which intersections are found along a ray, and therefore the order in which intersection shaders are executed, is unspecified.

The intersection shader of the closest AABB which intersects the ray is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

9.16. Any-Hit Shaders

The any-hit shader is executed after the intersection shader reports an intersection that lies within the current \([t_{\text{min}}, t_{\text{max}}]\) of the ray. The main use of any-hit shaders is to programmatically decide whether or not an intersection will be accepted. The intersection will be accepted unless the shader calls the `OpIgnoreIntersectionKHR` instruction. Any-hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and can read or modify the ray payload.

9.16.1. Any-Hit Shader Execution

The order in which intersections are found along a ray, and therefore the order in which any-hit shaders are executed, is unspecified.

The any-hit shader of the closest hit is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

9.17. Closest Hit Shaders

Closest hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and can read or modify the ray payload. They also have access to a number of system-generated values. Closest hit shaders can call `OpTraceRayKHR` to recursively trace rays.
9.17.1. Closest Hit Shader Execution

Exactly one closest hit shader is executed when traversal is finished and an intersection has been found and accepted.

9.18. Miss Shaders

Miss shaders can access the ray payload and can trace new rays through the `OpTraceRayKHR` instruction, but cannot access attributes since they are not associated with an intersection.

9.18.1. Miss Shader Execution

A miss shader is executed instead of a closest hit shader if no intersection was found during traversal.

9.19. Callable Shaders

Callable shaders can access a callable payload that works similarly to ray payloads to do subroutine work.

9.19.1. Callable Shader Execution

A callable shader is executed by calling `OpExecuteCallableKHR` from an allowed shader stage.

9.20. Interpolation decorations

Variables in the Input storage class in a fragment shader’s interface are interpolated from the values specified by the primitive being rasterized.

Note

Interpolation decorations can be present on input and output variables in prerasterization shaders but have no effect on the interpolation performed.

An undecorated input variable will be interpolated with perspective-correct interpolation according to the primitive type being rasterized. Lines and polygons are interpolated in the same way as the primitive’s clip coordinates. If the NoPerspective decoration is present, linear interpolation is instead used for lines and polygons. For points, as there is only a single vertex, input values are never interpolated and instead take the value written for the single vertex.

If the Flat decoration is present on an input variable, the value is not interpolated, and instead takes its value directly from the provoking vertex. Fragment shader inputs that are signed or unsigned integers, integer vectors, or any double-precision floating-point type must be decorated with Flat.

Interpolation of input variables is performed at an implementation-defined position within the fragment area being shaded. The position is further constrained as follows:

- If the Centroid decoration is used, the interpolation position used for the variable must also fall...
within the bounds of the primitive being rasterized.

- If the Sample decoration is used, the interpolation position used for the variable must be at the position of the sample being shaded by the current fragment shader invocation.
- If a sample count of 1 is used, the interpolation position must be at the center of the fragment area.

Note
As Centroid restricts the possible interpolation position to the covered area of the primitive, the position can be forced to vary between neighboring fragments when it otherwise would not. Derivatives calculated based on these differing locations can produce inconsistent results compared to undecorated inputs. It is recommended that input variables used in derivative calculations are not decorated with Centroid.

If the PerVertexKHR decoration is present on an input variable, the value is not interpolated, and instead values from all input vertices are available in an array. Each index of the array corresponds to one of the vertices of the primitive that produced the fragment.

If the CustomInterpAMD decoration is present on an input variable, the value cannot be accessed directly; instead the extended instruction InterpolateAtVertexAMD must be used to obtain values from the input vertices.

9.21. Static Use

A SPIR-V module declares a global object in memory using the OpVariable instruction, which results in a pointer x to that object. A specific entry point in a SPIR-V module is said to statically use that object if that entry point’s call tree contains a function containing a instruction with x as an id operand.

Static use is not used to control the behavior of variables with Input and Output storage. The effects of those variables are applied based only on whether they are present in a shader entry point’s interface.

9.22. Scope

A scope describes a set of shader invocations, where each such set is a scope instance. Each invocation belongs to one or more scope instances, but belongs to no more than one scope instance for each scope.

The operations available between invocations in a given scope instance vary, with smaller scopes generally able to perform more operations, and with greater efficiency.

9.22.1. Cross Device

All invocations executed in a Vulkan instance fall into a single cross device scope instance.

Whilst the CrossDevice scope is defined in SPIR-V, it is disallowed in Vulkan. API synchronization
commands can be used to communicate between devices.

9.22.2. Device

All invocations executed on a single device form a device scope instance.

If the `vulkanMemoryModel` and `vulkanMemoryModelDeviceScope` features are enabled, this scope is represented in SPIR-V by the Device Scope, which can be used as a Memory Scope for barrier and atomic operations.

If both the `shaderDeviceClock` and `vulkanMemoryModelDeviceScope` features are enabled, using the Device Scope with the OpReadClockKHR instruction will read from a clock that is consistent across invocations in the same device scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this can only be done with API synchronization primitives.

Invocations executing on different devices in a device group operate in separate device scope instances.

9.22.3. Queue Family

Invocations executed by queues in a given queue family form a queue family scope instance.

This scope is identified in SPIR-V as the QueueFamily Scope if the `vulkanMemoryModel` feature is enabled, or if not, the Device Scope, which can be used as a Memory Scope for barrier and atomic operations.

If the `shaderDeviceClock` feature is enabled, but the `vulkanMemoryModelDeviceScope` feature is not enabled, using the Device Scope with the OpReadClockKHR instruction will read from a clock that is consistent across invocations in the same queue family scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this can only be done with API synchronization primitives.

Each invocation in a queue family scope instance must be in the same device scope instance.

9.22.4. Command

Any shader invocations executed as the result of a single command such as `vkCmdDispatch` or `vkCmdDraw` form a command scope instance. For indirect drawing commands with `drawCount` greater than one, invocations from separate draws are in separate command scope instances. For ray tracing shaders, an invocation group is an implementation-dependent subset of the set of shader invocations of a given shader stage which are produced by a single trace rays command.

There is no specific Scope for communication across invocations in a command scope instance. As this has a clear boundary at the API level, coordination here can be performed in the API, rather than in SPIR-V.

Each invocation in a command scope instance must be in the same queue-family scope instance.
For shaders without defined workgroups, this set of invocations forms an invocation group as defined in the SPIR-V specification.

### 9.22.5. Primitive

Any fragment shader invocations executed as the result of rasterization of a single primitive form a primitive scope instance.

There is no specific Scope for communication across invocations in a primitive scope instance.

Any generated helper invocations are included in this scope instance.

Each invocation in a primitive scope instance must be in the same command scope instance.

Any input variables decorated with Flat are uniform within a primitive scope instance.

### 9.22.6. Shader Call

Any shader-call-related invocations that are executed in one or more ray tracing execution models form a shader call scope instance.

The ShaderCallKHR Scope can be used as Memory Scope for barrier and atomic operations.

Each invocation in a shader call scope instance must be in the same queue family scope instance.

### 9.22.7. Workgroup

A local workgroup is a set of invocations that can synchronize and share data with each other using memory in the Workgroup storage class.

The Workgroup Scope can be used as both an Execution Scope and Memory Scope for barrier and atomic operations.

Each invocation in a local workgroup must be in the same command scope instance.

Only task, mesh, and compute shaders have defined workgroups - other shader types cannot use workgroup functionality. For shaders that have defined workgroups, this set of invocations forms an invocation group as defined in the SPIR-V specification.

### 9.22.8. Subgroup

A subgroup (see the subsection “Control Flow” of section 2 of the SPIR-V 1.3 Revision 1 specification) is a set of invocations that can synchronize and share data with each other efficiently.

The Subgroup Scope can be used as both an Execution Scope and Memory Scope for barrier and atomic operations. Other subgroup features allow the use of group operations with subgroup scope.

If the shaderSubgroupClock feature is enabled, using the Subgroup Scope with the OpReadClockKHR instruction will read from a clock that is consistent across invocations in the same subgroup.

For shaders that have defined workgroups, each invocation in a subgroup must be in the same
In other shader stages, each invocation in a subgroup **must** be in the same **device scope instance**. Only shader stages that support subgroup operations have defined subgroups.

### 9.22.9. Quad

A **quad scope instance** is formed of four shader invocations.

In a fragment shader, each invocation in a quad scope instance is formed of invocations in neighboring framebuffer locations \((x_i, y_i)\), where:

- \(i\) is the index of the invocation within the scope instance.
- \(w\) and \(h\) are the number of pixels the fragment covers in the \(x\) and \(y\) axes.
- \(w\) and \(h\) are identical for all participating invocations.
- \((x_0) = (x_1 - w) = (x_2) = (x_3 - w)\)
- \((y_0) = (y_1) = (y_2 - h) = (y_3 - h)\)
- Each invocation has the same layer and sample indices.

In a compute shader, if the **DerivativeGroupQuadsNV** execution mode is specified, each invocation in a quad scope instance is formed of invocations with adjacent local invocation IDs \((x_i, y_i)\), where:

- \(i\) is the index of the invocation within the quad scope instance.
- \((x_0) = (x_1 - 1) = (x_2) = (x_3 - 1)\)
- \((y_0) = (y_1) = (y_2 - 1) = (y_3 - 1)\)
- \(x_0\) and \(y_0\) are integer multiples of 2.
- Each invocation has the same \(z\) coordinate.

In a compute shader, if the **DerivativeGroupLinearNV** execution mode is specified, each invocation in a quad scope instance is formed of invocations with adjacent local invocation indices \((l_i)\), where:

- \(i\) is the index of the invocation within the quad scope instance.
- \((l_0) = (l_1 - 1) = (l_2 - 2) = (l_3 - 3)\)
- \(l_0\) is an integer multiple of 4.

In all shaders, each invocation in a quad scope instance is formed of invocations in adjacent subgroup invocation indices \((s_i)\), where:

- \(i\) is the index of the invocation within the quad scope instance.
- \((s_0) = (s_1 - 1) = (s_2 - 2) = (s_3 - 3)\)
- \(s_0\) is an integer multiple of 4.

Each invocation in a quad scope instance **must** be in the same **subgroup**.

In a fragment shader, each invocation in a quad scope instance **must** be in the same **primitive**.
Fragment and compute shaders have defined quad scope instances. If the `quadOperationsInAllStages` limit is supported, any shader stages that support subgroup operations also have defined quad scope instances.

### 9.22.10. Fragment Interlock

A *fragment interlock scope instance* is formed of fragment shader invocations based on their framebuffer locations (x,y,layer,sample), executed by commands inside a single subpass.

The specific set of invocations included varies based on the execution mode as follows:

- If the `SampleInterlockOrderedEXT` or `SampleInterlockUnorderedEXT` execution modes are used, only invocations with identical framebuffer locations (x,y,layer,sample) are included.
- If the `PixelInterlockOrderedEXT` or `PixelInterlockUnorderedEXT` execution modes are used, fragments with different sample ids are also included.
- If the `ShadingRateInterlockOrderedEXT` or `ShadingRateInterlockUnorderedEXT` execution modes are used, fragments from neighbouring framebuffer locations are also included, as determined by the shading rate.

Only fragment shaders with one of the above execution modes have defined fragment interlock scope instances.

There is no specific `Scope` value for communication across invocations in a fragment interlock scope instance. However, this is implicitly used as a memory scope by `OpBeginInvocationInterlockEXT` and `OpEndInvocationInterlockEXT`.

Each invocation in a fragment interlock scope instance **must** be in the same queue family scope instance.

### 9.22.11. Invocation

The smallest *scope* is a single invocation; this is represented by the Invocation Scope in SPIR-V.

Fragment shader invocations **must** be in a primitive scope instance.

Invocations in fragment shaders that have a defined fragment interlock scope **must** be in a fragment interlock scope instance.

Invocations in shaders that have defined workgroups **must** be in a local workgroup.

Invocations in shaders that have a defined subgroup scope **must** be in a subgroup.

Invocations in shaders that have a defined quad scope **must** be in a quad scope instance.

All invocations in all stages **must** be in a command scope instance.
9.23. Group Operations

*Group operations* are executed by multiple invocations within a *scope instance*; with each invocation involved in calculating the result. This provides a mechanism for efficient communication between invocations in a particular scope instance.

Group operations all take a *Scope* defining the desired *scope instance* to operate within. Only the *Subgroup* scope can be used for these operations; the *subgroupSupportedOperations* limit defines which types of operation can be used.

### 9.23.1. Basic Group Operations

Basic group operations include the use of *OpGroupNonUniformElect*, *OpControlBarrier*, *OpMemoryBarrier*, and atomic operations.

*OpGroupNonUniformElect* can be used to choose a single invocation to perform a task for the whole group. Only the invocation with the lowest id in the group will return *true*.

The *Memory Model* appendix defines the operation of barriers and atomics.

### 9.23.2. Vote Group Operations

The vote group operations allow invocations within a group to compare values across a group. The types of votes enabled are:

- Do all active group invocations agree that an expression is true?
- Do any active group invocations evaluate an expression to true?
- Do all active group invocations have the same value of an expression?

*Note*

These operations are useful in combination with control flow in that they allow for developers to check whether conditions match across the group and choose potentially faster code-paths in these cases.

### 9.23.3. Arithmetic Group Operations

The arithmetic group operations allow invocations to perform scans and reductions across a group. The operators supported are add, mul, min, max, and, or, xor.

For reductions, every invocation in a group will obtain the cumulative result of these operators applied to all values in the group. For exclusive scans, each invocation in a group will obtain the cumulative result of these operators applied to all values in invocations with a lower index in the group. Inclusive scans are identical to exclusive scans, except the cumulative result includes the operator applied to the value in the current invocation.

The order in which these operators are applied is implementation-dependent.
9.23.4. Ballot Group Operations

The ballot group operations allow invocations to perform more complex votes across the group. The ballot functionality allows all invocations within a group to provide a boolean value and get as a result what each invocation provided as their boolean value. The broadcast functionality allows values to be broadcast from an invocation to all other invocations within the group.

9.23.5. Shuffle Group Operations

The shuffle group operations allow invocations to read values from other invocations within a group.

9.23.6. Shuffle Relative Group Operations

The shuffle relative group operations allow invocations to read values from other invocations within the group relative to the current invocation in the group. The relative operations supported allow data to be shifted up and down through the invocations within a group.

9.23.7. Clustered Group Operations

The clustered group operations allow invocations to perform an operation among partitions of a group, such that the operation is only performed within the group invocations within a partition. The partitions for clustered group operations are consecutive power-of-two size groups of invocations and the cluster size must be known at pipeline creation time. The operations supported are add, mul, min, max, and, or, xor.

9.24. Quad Group Operations

Quad group operations (OpGroupNonUniformQuad*) are a specialized type of group operations that only operate on quad scope instances. Whilst these instructions do include a Scope parameter, this scope is always overridden; only the quad scope instance is included in its execution scope.

Fragment shaders that statically execute quad group operations must launch sufficient invocations to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.

The index used to select participating invocations is i, as described for a quad scope instance, defined as the quad index in the SPIR-V specification.

For OpGroupNonUniformQuadBroadcast this value is equal to Index. For OpGroupNonUniformQuadSwap, it is equal to the implicit Index used by each participating invocation.

9.25. Derivative Operations

Derivative operations calculate the partial derivative for an expression P as a function of an invocation's x and y coordinates.

Derivative operations operate on a set of invocations known as a derivative group as defined in the SPIR-V specification. A derivative group is equivalent to the quad scope instance for a compute
shader invocation, or the primitive scope instance for a fragment shader invocation.

Derivatives are calculated assuming that P is piecewise linear and continuous within the derivative group. All dynamic instances of explicit derivative instructions (OpDPdx*, OpDPdy*, and OpFwidth*) must be executed in control flow that is uniform within a derivative group. For other derivative operations, results are undefined if a dynamic instance is executed in control flow that is not uniform within the derivative group.

Fragment shaders that statically execute derivative operations must launch sufficient invocations to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.

Note
In a compute shader, it is the application’s responsibility to ensure that sufficient invocations are launched.

Derivative operations calculate their results as the difference between the result of P across invocations in the quad. For fine derivative operations (OpDPdxFine and OpDPdyFine), the values of DPdx(P) are calculated as

\[
\begin{align*}
DPdx(P_0) &= DPdx(P_1) = P_1 - P_0 \\
DPdx(P_2) &= DPdx(P_3) = P_3 - P_2
\end{align*}
\]

and the values of DPdy(P) are calculated as

\[
\begin{align*}
DPdy(P_0) &= DPdy(P_2) = P_2 - P_0 \\
DPdy(P_1) &= DPdy(P_3) = P_3 - P_1
\end{align*}
\]

where \( i \) is the index of each invocation as described in Quad.

Coarse derivative operations (OpDPdxCoarse and OpDPdyCoarse), calculate their results in roughly the same manner, but may only calculate two values instead of four (one for each of DPdx and DPdy), reusing the same result no matter the originating invocation. If an implementation does this, it should use the fine derivative calculations described for \( P_0 \).

Note
Derivative values are calculated between fragments rather than pixels. If the fragment shader invocations involved in the calculation cover multiple pixels, these operations cover a wider area, resulting in larger derivative values. This in turn will result in a coarser level of detail being selected for image sampling operations using derivatives.

Applications may want to account for this when using multi-pixel fragments; if
pixel derivatives are desired, applications should use explicit derivative operations and divide the results by the size of the fragment in each dimension as follows:

$$DPdx(P_n)' = \frac{DPdx(P_n)}{w}$$

$$DPdy(P_n)' = \frac{DPdy(P_n)}{h}$$

where $w$ and $h$ are the size of the fragments in the quad, and $DPdx(P_n)'$ and $DPdy(P_n)'$ are the pixel derivatives.

The results for $\text{OpDPdx}$ and $\text{OpDPdy}$ may be calculated as either fine or coarse derivatives, with implementations favouring the most efficient approach. Implementations must choose coarse or fine consistently between the two.

Executing $\text{OpFwidthFine}$, $\text{OpFwidthCoarse}$, or $\text{OpFwidth}$ is equivalent to executing the corresponding $\text{OpDPdx}^*$ and $\text{OpDPdy}^*$ instructions, taking the absolute value of the results, and summing them.

Executing an $\text{OpImage*Sample*ImplicitLod}$ instruction is equivalent to executing $\text{OpDPdx(Coordinate)}$ and $\text{OpDPdy(Coordinate)}$, and passing the results as the $\text{Grad}$ operands $dx$ and $dy$.

Note

It is expected that using the $\text{ImplicitLod}$ variants of sampling functions will be substantially more efficient than using the $\text{ExplicitLod}$ variants with explicitly generated derivatives.

### 9.26. Helper Invocations

When performing derivative or quad group operations in a fragment shader, additional invocations may be spawned in order to ensure correct results. These additional invocations are known as helper invocations and can be identified by a non-zero value in the $\text{HelperInvocation}$ built-in. Stores and atomics performed by helper invocations must not have any effect on memory except for the $\text{Function}$ and $\text{Private}$ storage classes, and values returned by atomic instructions in helper invocations are undefined.

For group operations other than derivative and quad group operations, helper invocations may be treated as inactive even if they would be considered otherwise active.

Helper invocations may become permanently inactive if all invocations in a quad scope instance become helper invocations.

### 9.27. Cooperative Matrices

A cooperative matrix type is a SPIR-V type where the storage for and computations performed on the matrix are spread across the invocations in a scope instance. These types give the implementation freedom in how to optimize matrix multiplies.
SPIR-V defines the types and instructions, but does not specify rules about what sizes/combinations are valid, and it is expected that different implementations may support different sizes.

To enumerate the supported cooperative matrix types and operations, call:

```
// Provided by VK_NV_cooperative_matrix
VkResult vkGetPhysicalDeviceCooperativeMatrixPropertiesNV(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkCooperativeMatrixPropertiesNV* pProperties);
```

- `physicalDevice` is the physical device.
- `pPropertyCount` is a pointer to an integer related to the number of cooperative matrix properties available or queried.
- `pProperties` is either `NULL` or a pointer to an array of `VkCooperativeMatrixPropertiesNV` structures.

If `pProperties` is `NULL`, then the number of cooperative matrix properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of cooperative matrix properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available cooperative matrix properties were returned.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- **VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-pPropertyCount-parameter**
  - `pPropertyCount` must be a valid pointer to a `uint32_t` value
- **VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-pProperties-parameter**
  - If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkCooperativeMatrixPropertiesNV` structures

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
Each `VkCooperativeMatrixPropertiesNV` structure describes a single supported combination of types for a matrix multiply/add operation (`OpCooperativeMatrixMulAddNV`). The multiply can be described in terms of the following variables and types (in SPIR-V pseudocode):

```plaintext
%A is of type OpTypeCooperativeMatrixNV %AType %scope %MSize %KSize
%B is of type OpTypeCooperativeMatrixNV %BType %scope %KSize %NSize
%C is of type OpTypeCooperativeMatrixNV % CType %scope %MSize %NSize
%D is of type OpTypeCooperativeMatrixNV %DType %scope %MSize %NSize

%D = %A * %B + %C // using OpCooperativeMatrixMulAddNV
```

A matrix multiply with these dimensions is known as an `MxNxB` matrix multiply.

The `VkCooperativeMatrixPropertiesNV` structure is defined as:

```plaintext
// Provided by VK_NV_cooperative_matrix
typedef struct VkCooperativeMatrixPropertiesNV {
    VkStructureType     sType;
    void*                pNext;
    uint32_t             MSize;
    uint32_t             NSize;
    uint32_t             KSize;
    VkComponentTypeNV   AType;
    VkComponentTypeNV   BType;
    VkComponentTypeNV   CType;
    VkComponentTypeNV   DType;
    VkScopeNV            scope;
} VkCooperativeMatrixPropertiesNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `MSize` is the number of rows in matrices A, C, and D.
- `KSize` is the number of columns in matrix A and rows in matrix B.
- `NSize` is the number of columns in matrices B, C, D.
- `AType` is the component type of matrix A, of type `VkComponentTypeNV`.
- `BType` is the component type of matrix B, of type `VkComponentTypeNV`.
- ` CType` is the component type of matrix C, of type `VkComponentTypeNV`.
- `DType` is the component type of matrix D, of type `VkComponentTypeNV`.
- `scope` is the scope of all the matrix types, of type `VkScopeNV`.

If some types are preferred over other types (e.g. for performance), they should appear earlier in the list enumerated by `vkGetPhysicalDeviceCooperativeMatrixPropertiesNV`. 
At least one entry in the list must have power of two values for all of MSize, KSize, and NSize.

**Valid Usage (Implicit)**

- **VUID-VkCooperativeMatrixPropertiesNV-sType-sType**
  
  *sType must be* VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_PROPERTIES_NV

- **VUID-VkCooperativeMatrixPropertiesNV-pNext-pNext**
  
  *pNext must be* NULL

- **VUID-VkCooperativeMatrixPropertiesNV-AType-parameter**
  
  *AType must be a valid VkComponentTypeNV value*

- **VUID-VkCooperativeMatrixPropertiesNV-BType-parameter**
  
  *BType must be a valid VkComponentTypeNV value*

- **VUID-VkCooperativeMatrixPropertiesNV-CType-parameter**
  
  * CType must be a valid VkComponentTypeNV value*

- **VUID-VkCooperativeMatrixPropertiesNV-DType-parameter**
  
  *DType must be a valid VkComponentTypeNV value*

- **VUID-VkCooperativeMatrixPropertiesNV-scope-parameter**
  
  *scope must be a valid VkScopeNV value*

Possible values for **VkScopeNV** include:

```c
// Provided by VK_NV_cooperative_matrix
typedef enum VkScopeNV {
    VK_SCOPE_DEVICE_NV = 1,
    VK_SCOPE_WORKGROUP_NV = 2,
    VK_SCOPE_SUBGROUP_NV = 3,
    VK_SCOPE_QUEUE_FAMILY_NV = 5,
} VkScopeNV;
```

- **VK_SCOPE_DEVICE_NV** corresponds to SPIR-V Device scope.
- **VK_SCOPE_WORKGROUP_NV** corresponds to SPIR-V Workgroup scope.
- **VK_SCOPE_SUBGROUP_NV** corresponds to SPIR-V Subgroup scope.
- **VK_SCOPE_QUEUE_FAMILY_NV** corresponds to SPIR-V QueueFamily scope.

All enum values match the corresponding SPIR-V value.

Possible values for **VkComponentTypeNV** include:

```c
// Provided by VK_NV_cooperative_matrix
typedef enum VkComponentTypeNV {
    VK_COMPONENT_TYPE_FLOAT16_NV = 0,
    VK_COMPONENT_TYPE_FLOAT32_NV = 1,
    VK_COMPONENT_TYPE_FLOAT64_NV = 2,
} VkComponentTypeNV;
```
VK_COMPONENT_TYPE_SINT8_NV = 3,
VK_COMPONENT_TYPE_SINT16_NV = 4,
VK_COMPONENT_TYPE_SINT32_NV = 5,
VK_COMPONENT_TYPE_SINT64_NV = 6,
VK_COMPONENT_TYPE_UINT8_NV = 7,
VK_COMPONENT_TYPE_UINT16_NV = 8,
VK_COMPONENT_TYPE_UINT32_NV = 9,
VK_COMPONENT_TYPE_UINT64_NV = 10,
} VkComponentTypeNV;

- VK_COMPONENT_TYPE_FLOAT16_NV corresponds to SPIR-V OpTypeFloat 16.
- VK_COMPONENT_TYPE_FLOAT32_NV corresponds to SPIR-V OpTypeFloat 32.
- VK_COMPONENT_TYPE_FLOAT64_NV corresponds to SPIR-V OpTypeFloat 64.
- VK_COMPONENT_TYPE_SINT8_NV corresponds to SPIR-V OpTypeInt 8 1.
- VK_COMPONENT_TYPE_SINT16_NV corresponds to SPIR-V OpTypeInt 16 1.
- VK_COMPONENT_TYPE_SINT32_NV corresponds to SPIR-V OpTypeInt 32 1.
- VK_COMPONENT_TYPE_SINT64_NV corresponds to SPIR-V OpTypeInt 64 1.
- VK_COMPONENT_TYPE_UINT8_NV corresponds to SPIR-V OpTypeInt 8 0.
- VK_COMPONENT_TYPE_UINT16_NV corresponds to SPIR-V OpTypeInt 16 0.
- VK_COMPONENT_TYPE_UINT32_NV corresponds to SPIR-V OpTypeInt 32 0.
- VK_COMPONENT_TYPE_UINT64_NV corresponds to SPIR-V OpTypeInt 64 0.

## 9.28. Validation Cache

Validation cache objects allow the result of internal validation to be reused, both within a single application run and between multiple runs. Reuse within a single run is achieved by passing the same validation cache object when creating supported Vulkan objects. Reuse across runs of an application is achieved by retrieving validation cache contents in one run of an application, saving the contents, and using them to preinitialize a validation cache on a subsequent run. The contents of the validation cache objects are managed by the validation layers. Applications can manage the host memory consumed by a validation cache object and control the amount of data retrieved from a validation cache object.

Validation cache objects are represented by VkValidationCacheEXT handles:

```cpp
// Provided by VK_EXT_validation_cache
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkValidationCacheEXT)
```

To create validation cache objects, call:

```cpp
// Provided by VK_EXT_validation_cache
VkResult vkCreateValidationCacheEXT(
    VkDevice device,
```
const VkValidationCacheCreateInfoEXT* pCreateInfo,
const VkAllocationCallbacks* pAllocator,
VkValidationCacheEXT* pValidationCache);

- **device** is the logical device that creates the validation cache object.
- **pCreateInfo** is a pointer to a VkValidationCacheCreateInfoEXT structure containing the initial parameters for the validation cache object.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pValidationCache** is a pointer to a VkValidationCacheEXT handle in which the resulting validation cache object is returned.

**Note**
Applications can track and manage the total host memory size of a validation cache object using the **pAllocator**. Applications can limit the amount of data retrieved from a validation cache object in vkGetValidationCacheDataEXT. Implementations should not internally limit the total number of entries added to a validation cache object or the total host memory consumed.

Once created, a validation cache can be passed to the vkCreateShaderModule command by adding this object to the VkShaderModuleCreateInfo structure’s **pNext** chain. If a VkShaderModuleValidationCacheCreateInfoEXT object is included in the VkShaderModuleCreateInfo::pNext chain, and its validationCache field is not **VK_NULL_HANDLE**, the implementation will query it for possible reuse opportunities and update it with new content. The use of the validation cache object in these commands is internally synchronized, and the same validation cache object can be used in multiple threads simultaneously.

**Note**
Implementations should make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the duration of the vkCreateShaderModule command.

### Valid Usage (Implicit)

- **VUID-vkCreateValidationCacheEXT-device-parameter**
  - **device** must be a valid VkDevice handle
- **VUID-vkCreateValidationCacheEXT-pCreateInfo-parameter**
  - **pCreateInfo** must be a valid pointer to a valid VkValidationCacheCreateInfoEXT structure
- **VUID-vkCreateValidationCacheEXT-pAllocator-parameter**
  - If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid VkAllocationCallbacks structure
- **VUID-vkCreateValidationCacheEXT-pValidationCache-parameter**
  - **pValidationCache** must be a valid pointer to a VkValidationCacheEXT handle
Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkValidationCacheCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_validation_cache
typedef struct VkValidationCacheCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkValidationCacheCreateFlagsEXT flags;
    size_t initialDataSize;
    const void* pInitialData;
} VkValidationCacheCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `initialDataSize` is the number of bytes in `pInitialData`. If `initialDataSize` is zero, the validation cache will initially be empty.
- `pInitialData` is a pointer to previously retrieved validation cache data. If the validation cache data is incompatible (as defined below) with the device, the validation cache will be initially empty. If `initialDataSize` is zero, `pInitialData` is ignored.

Valid Usage

- VUID-VkValidationCacheCreateInfoEXT-initialDataSize-01534
  If `initialDataSize` is not 0, it must be equal to the size of `pInitialData`, as returned by `vkGetValidationCacheDataEXT` when `pInitialData` was originally retrieved

- VUID-VkValidationCacheCreateInfoEXT-initialDataSize-01535
  If `initialDataSize` is not 0, `pInitialData` must have been retrieved from a previous call to `vkGetValidationCacheDataEXT`

Valid Usage (Implicit)

- VUID-VkValidationCacheCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VALIDATION_CACHE_CREATE_INFO_EXT`

- VUID-VkValidationCacheCreateInfoEXT-pNext-pNext
  `pNext` must be NULL
- **VUID-VkValidationCacheCreateInfoEXT-flags-zero bitmask**
  flags must be 0

- **VUID-VkValidationCacheCreateInfoEXT-pInitialData-parameter**
  If initialDataSize is not 0, pInitialData must be a valid pointer to an array of initialDataSize bytes

---

```c
// Provided by VK_EXT_validation_cache
typedef VkFlags VkValidationCacheCreateFlagsEXT;
```

**VkValidationCacheCreateFlagsEXT** is a bitmask type for setting a mask, but is currently reserved for future use.

Validation cache objects can be merged using the command:

```c
// Provided by VK_EXT_validation_cache
VkResult vkMergeValidationCachesEXT(
    VkDevice device,
    VkValidationCacheEXT dstCache,
    uint32_t srcCacheCount,
    const VkValidationCacheEXT* pSrcCaches);
```

- **device** is the logical device that owns the validation cache objects.
- **dstCache** is the handle of the validation cache to merge results into.
- **srcCacheCount** is the length of the pSrcCaches array.
- **pSrcCaches** is a pointer to an array of validation cache handles, which will be merged into dstCache. The previous contents of dstCache are included after the merge.

**Note**
The details of the merge operation are implementation-dependent, but implementations should merge the contents of the specified validation caches and prune duplicate entries.

---

**Valid Usage**

- **VUID-vkMergeValidationCachesEXT-dstCache-01536**
  dstCache must not appear in the list of source caches

---

**Valid Usage (Implicit)**

- **VUID-vkMergeValidationCachesEXT-device-parameter**
  device must be a valid VkDevice handle

- **VUID-vkMergeValidationCachesEXT-dstCache-parameter**
**dstCache must** be a valid `VkValidationCacheEXT` handle

- VUID-vkMergeValidationCachesEXT-pSrcCaches-parameter
  - `pSrcCaches must` be a valid pointer to an array of `srcCacheCount` valid `VkValidationCacheEXT` handles

- VUID-vkMergeValidationCachesEXT-srcCacheCount-arraylength
  - `srcCacheCount must` be greater than 0

- VUID-vkMergeValidationCachesEXT-dstCache-parent
  - `dstCache must` have been created, allocated, or retrieved from `device`

- VUID-vkMergeValidationCachesEXT-pSrcCaches-parent
  - Each element of `pSrcCaches must` have been created, allocated, or retrieved from `device`

---

**Host Synchronization**

- Host access to `dstCache must` be externally synchronized

---

**Return Codes**

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Data **can** be retrieved from a validation cache object using the command:

```c
// Provided by VK_EXT_validation_cache
VkResult vkGetValidationCacheDataEXT(
    VkDevice device,                          // device, is the logical device that owns the validation cache.
    VkValidationCacheEXT validationCache,    // validationCache is the validation cache to retrieve data from.
    size_t* pDataSize,                       // pDataSize is a pointer to a value related to the amount of data in the validation cache, as described below.
    void* pData                             // pData is either NULL or a pointer to a buffer.
);
```

If `pData` is **NULL**, then the maximum size of the data that **can** be retrieved from the validation cache, in bytes, is returned in `pDataSize`. Otherwise, `pDataSize must` point to a variable set by the user to the size of the buffer, in bytes, pointed to by `pData`, and on return the variable is overwritten with
the amount of data actually written to pData. If pDataSize is less than the maximum size that can be retrieved by the validation cache, at most pDataSize bytes will be written to pData, and vkGetValidationCacheDataEXT will return VK_INCOMPLETE instead of VK_SUCCESS, to indicate that not all of the validation cache was returned.

Any data written to pData is valid and can be provided as the pInitialData member of the VkValidationCacheCreateInfoEXT structure passed to vkCreateValidationCacheEXT.

Two calls to vkGetValidationCacheDataEXT with the same parameters must retrieve the same data unless a command that modifies the contents of the cache is called between them.

Applications can store the data retrieved from the validation cache, and use these data, possibly in a future run of the application, to populate new validation cache objects. The results of validation, however, may depend on the vendor ID, device ID, driver version, and other details of the device. To enable applications to detect when previously retrieved data is incompatible with the device, the initial bytes written to pData must be a header consisting of the following members:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Size</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>4</td>
<td>length in bytes of the entire validation cache header written as a stream of bytes, with the least significant byte first</td>
</tr>
<tr>
<td>4</td>
<td>4</td>
<td>a VkValidationCacheHeaderVersionEXT value written as a stream of bytes, with the least significant byte first</td>
</tr>
<tr>
<td>8</td>
<td>VK_UUID_SIZE</td>
<td>a layer commit ID expressed as a UUID, which uniquely identifies the version of the validation layers used to generate these validation results</td>
</tr>
</tbody>
</table>

The first four bytes encode the length of the entire validation cache header, in bytes. This value includes all fields in the header including the validation cache version field and the size of the length field.

The next four bytes encode the validation cache version, as described for VkValidationCacheHeaderVersionEXT. A consumer of the validation cache should use the cache version to interpret the remainder of the cache header.

If pDataSize is less than what is necessary to store this header, nothing will be written to pData and zero will be written to pDataSize.

Valid Usage (Implicit)

- VUID-vkGetValidationCacheDataEXT-device-parameter device must be a valid VkDevice handle
- VUID-vkGetValidationCacheDataEXT-validationCache-parameter validationCache must be a valid VkValidationCacheEXT handle
• VUID-vkGetValidationCacheDataEXT-pDataSize-parameter
  `pDataSize` must be a valid pointer to a `size_t` value

• VUID-vkGetValidationCacheDataEXT-pData-parameter
  If the value referenced by `pDataSize` is not 0, and `pData` is not NULL, `pData` must be a valid pointer to an array of `pDataSize` bytes

• VUID-vkGetValidationCacheDataEXT-validationCache-parent
  `validationCache` must have been created, allocated, or retrieved from `device`

### Return Codes

#### Success
- `VK_SUCCESS`
- `VK_INCOMPLETE`

#### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Possible values of the second group of four bytes in the header returned by `vkGetValidationCacheDataEXT`, encoding the validation cache version, are:

```c
// Provided by VK_EXT_validation_cache
typedef enum VkValidationCacheHeaderVersionEXT {
    VK_VALIDATION_CACHE_HEADER_VERSION_ONE_EXT = 1,
} VkValidationCacheHeaderVersionEXT;
```

- `VK_VALIDATION_CACHE_HEADER_VERSION_ONE_EXT` specifies version one of the validation cache.

To destroy a validation cache, call:

```c
// Provided by VK_EXT_validation_cache
void vkDestroyValidationCacheEXT(
    VkDevice device,               // device
    VkValidationCacheEXT validationCache, // validationCache
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the validation cache object.
- `validationCache` is the handle of the validation cache to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyValidationCacheEXT-validationCache-01537
If `VkAllocationCallbacks` were provided when `validationCache` was created, a compatible set of callbacks **must** be provided here

- VUID-vkDestroyValidationCacheEXT-validationCache-01538
  If no `VkAllocationCallbacks` were provided when `validationCache` was created, `pAllocator` **must** be `NULL`

### Valid Usage (Implicit)

- VUID-vkDestroyValidationCacheEXT-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkDestroyValidationCacheEXT-validationCache-parameter
  If `validationCache` is not `VK_NULL_HANDLE`, `validationCache` **must** be a valid `VkValidationCacheEXT` handle

- VUID-vkDestroyValidationCacheEXT-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyValidationCacheEXT-validationCache-parent
  If `validationCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `validationCache` **must** be externally synchronized
Chapter 10. Pipelines

The following figure shows a block diagram of the Vulkan pipelines. Some Vulkan commands specify geometric objects to be drawn or computational work to be performed, while others specify state controlling how objects are handled by the various pipeline stages, or control data transfer between memory organized as images and buffers. Commands are effectively sent through a processing pipeline, either a graphics pipeline, a ray tracing pipeline, or a compute pipeline.

The graphics pipeline can be operated in two modes, as either primitive shading or mesh shading pipeline.

**Primitive Shading**

The first stage of the graphics pipeline (Input Assembler) assembles vertices to form geometric primitives such as points, lines, and triangles, based on a requested primitive topology. In the next stage (Vertex Shader) vertices can be transformed, computing positions and attributes for each vertex. If tessellation and/or geometry shaders are supported, they can then generate multiple primitives from a single input primitive, possibly changing the primitive topology or generating additional attribute data in the process.

**Mesh Shading**

When using the mesh shading pipeline input primitives are not assembled implicitly, but explicitly through the (Mesh Shader). The work on the mesh pipeline is initiated by the application drawing a set of mesh tasks. If an optional (Task Shader) is active, each task triggers the execution of a task shader workgroup that will generate a new set of tasks upon completion. Each of these spawned tasks, or each of the original dispatched tasks if no task shader is present, triggers the execution of a mesh shader workgroup that produces an output mesh with a variable-sized number of primitives assembled from vertices stored in the output mesh.

**Common**

The final resulting primitives are clipped to a clip volume in preparation for the next stage, Rasterization. The rasterizer produces a series of fragments associated with a region of the framebuffer, from a two-dimensional description of a point, line segment, or triangle. These fragments are processed by fragment operations to determine whether generated values will be written to the framebuffer. Fragment shading determines the values to be written to the framebuffer attachments. Framebuffer operations then read and write the color and depth/stencil attachments of the framebuffer for a given subpass of a render pass instance. The attachments can be used as input attachments in the fragment shader in a later subpass of the same render pass.

The compute pipeline is a separate pipeline from the graphics pipeline, which operates on one-, two-, or three-dimensional workgroups which can read from and write to buffer and image memory.

This ordering is meant only as a tool for describing Vulkan, not as a strict rule of how Vulkan is implemented, and we present it only as a means to organize the various operations of the pipelines.
Actual ordering guarantees between pipeline stages are explained in detail in the synchronization chapter.

![Block diagram of the Vulkan pipeline](image)

Figure 2. Block diagram of the Vulkan pipeline

Each pipeline is controlled by a monolithic object created from a description of all of the shader stages and any relevant fixed-function stages. Linking the whole pipeline together allows the optimization of shaders based on their input/outputs and eliminates expensive draw time state validation.

A pipeline object is bound to the current state using `vkCmdBindPipeline`. Any pipeline object state that is specified as dynamic is not applied to the current state when the pipeline object is bound, but is instead set by dynamic state setting commands.

No state, including dynamic state, is inherited from one command buffer to another.

Compute, ray tracing, and graphics pipelines are each represented by `VkPipeline` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipeline)
```

## 10.1. Compute Pipelines

Compute pipelines consist of a single static compute shader stage and the pipeline layout.

The compute pipeline represents a compute shader and is created by calling `vkCreateComputePipelines` with `module` and `pName` selecting an entry point from a shader module, where that entry point defines a valid compute shader, in the `VkPipelineShaderStageCreateInfo` structure contained within the `VkComputePipelineCreateInfo` structure.

To create compute pipelines, call:
// Provided by VK_VERSION_1_0
VkResult vkCreateComputePipelines(
    VkDevice device,
    VkPipelineCache pipelineCache,
    uint32_t createInfoCount,
    const VkComputePipelineCreateInfo* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkPipeline* pPipelines);

- **device** is the logical device that creates the compute pipelines.
- **pipelineCache** is either **VK_NULL_HANDLE**, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- **createInfoCount** is the length of the **pCreateInfos** and **pPipelines** arrays.
- **pCreateInfos** is a pointer to an array of VkComputePipelineCreateInfo structures.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pPipelines** is a pointer to an array of VkPipeline handles in which the resulting compute pipeline objects are returned.

### Valid Usage

- **VUID-vkCreateComputePipelines-flags-00695**
  If the **flags** member of any element of **pCreateInfos** contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and the basePipelineIndex member of that same element is not -1, basePipelineIndex must be less than the index into **pCreateInfos** that corresponds to that element

- **VUID-vkCreateComputePipelines-flags-00696**
  If the **flags** member of any element of **pCreateInfos** contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, the base pipeline must have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set

- **VUID-vkCreateComputePipelines-pipelineCache-02873**
  If **pipelineCache** was created with VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, host access to **pipelineCache** must be externally synchronized

### Valid Usage (Implicit)

- **VUID-vkCreateComputePipelines-device-parameter**
  **device** must be a valid VkDevice handle

- **VUID-vkCreateComputePipelines-pipelineCache-parameter**
  If **pipelineCache** is not **VK_NULL_HANDLE**, **pipelineCache** must be a valid VkPipelineCache handle

- **VUID-vkCreateComputePipelines-pCreateInfos-parameter**
pCreateInfos must be a valid pointer to an array of createInfoCount valid VkComputePipelineCreateInfo structures

• VUID-vkCreateComputePipelines-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateComputePipelines-pPipelines-parameter
  pPipelines must be a valid pointer to an array of createInfoCount VkPipeline handles

• VUID-vkCreateComputePipelines-createInfoCount-arraylength
  createInfoCount must be greater than 0

• VUID-vkCreateComputePipelines-pipelineCache-parent
  If pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success
  • VK_SUCCESS
  • VK_PIPELINE_COMPILE_REQUIRED_EXT

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_INVALID_SHADER_NV

The VkComputePipelineCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkComputePipelineCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    VkPipelineShaderStageCreateInfo stage;
    VkPipelineLayout layout;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkComputePipelineCreateInfo;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is a bitmask of VkPipelineCreateFlagBits specifying how the pipeline will be generated.
• stage is a VkPipelineShaderStageCreateInfo structure describing the compute shader.
• layout is the description of binding locations used by both the pipeline and descriptor sets used
with the pipeline.

- `basePipelineHandle` is a pipeline to derive from
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in Pipeline Derivatives.

### Valid Usage

- **VUID-VkComputePipelineCreateInfo-flags-00697**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` must be a valid handle to a compute `VkPipeline`

- **VUID-VkComputePipelineCreateInfo-flags-00698**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` must be a valid index into the calling command's `pCreateInfos` parameter

- **VUID-VkComputePipelineCreateInfo-flags-00699**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is not -1, `basePipelineHandle` must be `VK_NULL_HANDLE`

- **VUID-VkComputePipelineCreateInfo-flags-00700**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is not `VK_NULL_HANDLE`, `basePipelineIndex` must be -1

- **VUID-VkComputePipelineCreateInfo-stage-00701**
  The `stage` member of `stage` must be `VK_SHADER_STAGE_COMPUTE_BIT`

- **VUID-VkComputePipelineCreateInfo-stage-00702**
  The shader code for the entry point identified by `stage` and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter

- **VUID-VkComputePipelineCreateInfo-layout-00703**
  `layout` must be consistent with the layout of the compute shader specified in `stage`

- **VUID-VkComputePipelineCreateInfo-layout-01687**
  The number of resources in `layout` accessible to the compute shader stage must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`

- **VUID-VkComputePipelineCreateInfo-flags-03364**
  `flags` must not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`

- **VUID-VkComputePipelineCreateInfo-flags-03365**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`

- **VUID-VkComputePipelineCreateInfo-flags-03366**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`

- **VUID-VkComputePipelineCreateInfo-flags-03367**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`
• VUID-VkComputePipelineCreateInfo-flags-03368
  flags \textbf{must} not include \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR}

• VUID-VkComputePipelineCreateInfo-flags-03369
  flags \textbf{must} not include \texttt{VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR}

• VUID-VkComputePipelineCreateInfo-flags-03370
  flags \textbf{must} not include \texttt{VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR}

• VUID-VkComputePipelineCreateInfo-flags-03576
  flags \textbf{must} not include \texttt{VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR}

• VUID-VkComputePipelineCreateInfo-flags-04945
  flags \textbf{must} not include \texttt{VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV}

• VUID-VkComputePipelineCreateInfo-flags-02874
  flags \textbf{must} not include \texttt{VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV}

• VUID-VkComputePipelineCreateInfo-pipelineCreationCacheControl-02875
  If the pipelineCreationCacheControl feature is not enabled, flags \textbf{must} not include \texttt{VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT} or \texttt{VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT}

• VUID-VkComputePipelineCreateInfo-pipelineStageCreationFeedbackCount-06566
  If \texttt{VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount} is not 0, it \textbf{must} be 1

• VUID-VkComputePipelineCreateInfo-flags-07367
  flags \textbf{must} not include \texttt{VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT}

\textbf{Valid Usage (Implicit)}

• VUID-VkComputePipelineCreateInfo-sType-sType
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_CREATE_INFO}

• VUID-VkComputePipelineCreateInfo-pNext-pNext
  Each \texttt{pNext} member of any structure (including this one) in the \texttt{pNext} chain \textbf{must} be either \texttt{NULL} or a pointer to a valid instance of \texttt{VkPipelineCompilerControlCreateInfoAMD}, \texttt{VkPipelineCreationFeedbackCreateInfo}, \texttt{VkPipelineRobustnessCreateInfoEXT}, \texttt{or VkSubpassShadingPipelineCreateInfoHUAWEI}

• VUID-VkComputePipelineCreateInfo-sType-unique
  The \texttt{sType} value of each struct in the \texttt{pNext} chain \textbf{must} be unique

• VUID-VkComputePipelineCreateInfo-flags-parameter
  flags \textbf{must} be a valid combination of \texttt{VkPipelineCreateFlagBits} values

• VUID-VkComputePipelineCreateInfo-stage-parameter
  stage \textbf{must} be a valid \texttt{VkPipelineShaderStageCreateInfo} structure

• VUID-VkComputePipelineCreateInfo-layout-parameter
  layout \textbf{must} be a valid \texttt{VkPipelineLayout} handle
Both of `basePipelineHandle`, and `layout` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

The `VkPipelineShaderStageCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineShaderStageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineShaderStageCreateFlags flags;
    VkShaderStageFlagBits stage;
    VkShaderModule module;
    const char* pName;
    const VkSpecializationInfo* pSpecializationInfo;
} VkPipelineShaderStageCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineShaderStageCreateFlagBits` specifying how the pipeline shader stage will be generated.
- `stage` is a `VkShaderStageFlagBits` value specifying a single pipeline stage.
- `module` is optionally a `VkShaderModule` object containing the shader code for this stage.
- `pName` is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.
- `pSpecializationInfo` is a pointer to a `VkSpecializationInfo` structure, as described in Specialization Constants, or `NULL`.

If the `graphicsPipelineLibrary` feature is enabled and an instance of `VkShaderModuleCreateInfo` is included in the `pNext` chain, `module` can be `VK_NULL_HANDLE`. If `module` is not `VK_NULL_HANDLE`, the shader code used by the pipeline is defined by `module`. If `module` is `VK_NULL_HANDLE`, the shader code is defined by the chained `VkShaderModuleCreateInfo` if present.

If the `shaderModuleIdentifier` feature is enabled, applications can omit shader code for `stage` and instead provide a module identifier. This is done by including a `VkPipelineShaderStageModuleIdentifierCreateInfoEXT` struct with `identifierSize` not equal to 0 in the `pNext` chain. A shader stage created in this way is equivalent to one created using a shader module with the same identifier. The identifier allows an implementation to look up a pipeline without consuming a valid SPIR-V module. If a pipeline is not found, pipeline compilation is not possible and the implementation must fail as specified by `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT`.

When an identifier is used in lieu of a shader module, implementations may fail pipeline compilation with `VK_PIPELINE_COMPILE_REQUIRED` for any reason.
Note
The rationale for the relaxed requirement on implementations to return a pipeline with `VkPipelineShaderStageModuleIdentifierCreateInfoEXT` is that layers or tools may intercept pipeline creation calls and require the full SPIR-V context to operate correctly. ICDs are not expected to fail pipeline compilation if the pipeline exists in a cache somewhere.

Applications can use identifiers when creating pipelines with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`. When creating such pipelines, `VK_SUCCESS` may be returned, but subsequently fail when referencing the pipeline in a `VkPipelineLibraryCreateInfoKHR` struct. Applications must allow pipeline compilation to fail during link steps with `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` as it may not be possible to determine if a pipeline can be created from identifiers until the link step.

Valid Usage

- VUID-VkPipelineShaderStageCreateInfo-stage-00704
  If the `geometryShader` feature is not enabled, `stage` must not be `VK_SHADER_STAGE_GEOMETRY_BIT`

- VUID-VkPipelineShaderStageCreateInfo-stage-00705
  If the `tessellationShader` feature is not enabled, `stage` must not be `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- VUID-VkPipelineShaderStageCreateInfo-stage-02091
  If the `meshShaders` feature is not enabled, `stage` must not be `VK_SHADER_STAGE_MESH_BIT_EXT`

- VUID-VkPipelineShaderStageCreateInfo-stage-02092
  If the `taskShaders` feature is not enabled, `stage` must not be `VK_SHADER_STAGE_TASK_BIT_EXT`

- VUID-VkPipelineShaderStageCreateInfo-stage-00706
  `stage` must not be `VK_SHADER_STAGE_ALL_GRAPHICS`, or `VK_SHADER_STAGE_ALL`

- VUID-VkPipelineShaderStageCreateInfo-pName-00707
  `pName` must be the name of an `OpEntryPoint` in `module` with an execution model that matches `stage`

- VUID-VkPipelineShaderStageCreateInfo-maxClipDistances-00708
  If the identified entry point includes any variable in its interface that is declared with the `ClipDistance BuiltIn` decoration, that variable must not have an array size greater than `VkPhysicalDeviceLimits::maxClipDistances`

- VUID-VkPipelineShaderStageCreateInfo-maxCullDistances-00709
  If the identified entry point includes any variable in its interface that is declared with the `CullDistance BuiltIn` decoration, that variable must not have an array size greater than `VkPhysicalDeviceLimits::maxCullDistances`

- VUID-VkPipelineShaderStageCreateInfo-maxCombinedClipAndCullDistances-00710
  If the identified entry point includes any variables in its interface that are declared with the `ClipDistance` or `CullDistance BuiltIn` decoration, those variables must not have array sizes which sum to more than `VkPhysicalDeviceLimits::maxCombinedClipAndCullDistances`
If the identified entry point includes any variable in its interface that is declared with the `SampleMask` `BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxSampleMaskWords`.

If `stage` is `VK_SHADER_STAGE_VERTEX_BIT`, the identified entry point **must** not include any input variable in its interface that is decorated with `CullDistance`.

If `stage` is either `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSellation_CONTROL_BIT`, `VK_SHADER_STAGE_TESSellation_EVALUATION_BIT`, or `VK_SHADER_STAGE_GEOMETRY_BIT`, and the identified entry point writes to `Layer` for any primitive, it **must** write the same value to `Layer` for all vertices of a given primitive.

If `stage` is either `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSellation_CONTROL_BIT`, `VK_SHADER_STAGE_TESSellation_EVALUATION_BIT`, or `VK_SHADER_STAGE_GEOMETRY_BIT`, and the identified entry point writes to `ViewportIndex` for any primitive, it **must** write the same value to `ViewportIndex` for all vertices of a given primitive.

If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, the identified entry point **must** not include any output variables in its interface decorated with `CullDistance`.

If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragDepth` in any execution path, all execution paths that are not exclusive to helper invocations **must** either discard the fragment, or write or initialize the value of `FragDepth`.

If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragStencilRefEXT` in any execution path, all execution paths that are not exclusive to helper invocations **must** either discard the fragment, or write or initialize the value of `FragStencilRefEXT`.
If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set, the `subgroupSizeControl` feature must be enabled.

- VUID-VkPipelineShaderStageCreateInfo-flags-02785
  If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag set, the `computeFullSubgroups` feature must be enabled.

- VUID-VkPipelineShaderStageCreateInfo-pNext-02754
  If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, the `subgroupSizeControl` feature must be enabled, and `stage` must be a valid bit specified in `requiredSubgroupSizeStages`.

- VUID-VkPipelineShaderStageCreateInfo-pNext-02755
  If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, the local workgroup size of the shader must be less than or equal to the product of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize` and `maxComputeWorkgroupSubgroups`.

- VUID-VkPipelineShaderStageCreateInfo-pNext-02756
  If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain and `stage` is `VK_SHADER_STAGE_COMPUTE_BIT`, the local workgroup size in the X dimension of the pipeline must be a multiple of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize`.

- VUID-VkPipelineShaderStageCreateInfo-pNext-02757
  If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, and `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag set, the local workgroup size in the X dimension of the pipeline must be a multiple of `maxSubgroupSize`.

- VUID-VkPipelineShaderStageCreateInfo-pNext-02758
  If `flags` has both the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` and `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flags set, the local workgroup size in the X dimension of the pipeline must be a multiple of `subgroupSize`.

- VUID-VkPipelineShaderStageCreateInfo-pNext-02759
  If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag set and `flags` does not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set and no `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, the local workgroup size in the X dimension of the pipeline must be a multiple of `subgroupSize`.

- VUID-VkPipelineShaderStageCreateInfo-stage-06844
  If a shader module identifier is specified for this `stage`, a `VkShaderModuleCreateInfo` structure must not be present in the `pNext` chain.

- VUID-VkPipelineShaderStageCreateInfo-stage-06845
  If a shader module identifier is not specified for this `stage`, `module` must be a valid `VkShaderModule` or there must be a valid `VkShaderModuleCreateInfo` structure in the `pNext` chain.

- VUID-VkPipelineShaderStageCreateInfo-stage-06846
  If a shader module identifier is not specified for this `stage`, and the
• VUID-VkPipelineShaderStageCreateInfo-stage-06848
If a shader module identifier is specified for this stage, module must be `VK_NULL_HANDLE`.

• VUID-VkPipelineShaderStageCreateInfo-pSpecializationInfo-06849
If a shader module identifier is not specified, the shader code used by the pipeline must be valid as described by the Khronos SPIR-V Specification after applying the specializations provided in `pSpecializationInfo`, if any, and then converting all specialization constants into fixed constants.

### Valid Usage (Implicit)

• VUID-VkPipelineShaderStageCreateInfo-sType-sType
The `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO`.

• VUID-VkPipelineShaderStageCreateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDebugUtilsObjectNameInfoEXT`, `VkPipelineRobustnessCreateInfoEXT`, `VkPipelineShaderStageModuleIdentifierCreateInfoEXT`, `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo`, `VkShaderModuleCreateInfo`, or `VkShaderModuleValidationCacheCreateInfoEXT`.

• VUID-VkPipelineShaderStageCreateInfo-sType-unique
The `sType` value of each struct in the `pNext` chain must be unique.

• VUID-VkPipelineShaderStageCreateInfo-flags-parameter
The `flags` must be a valid combination of `VkPipelineShaderStageCreateFlagBits` values.

• VUID-VkPipelineShaderStageCreateInfo-stage-parameter
The `stage` must be a valid `VkShaderStageFlagBits` value.

• VUID-VkPipelineShaderStageCreateInfo-module-parameter
If `module` is not `VK_NULL_HANDLE`, `module` must be a valid `VkShaderModule` handle.

• VUID-VkPipelineShaderStageCreateInfo-pName-parameter
The `pName` must be a null-terminated UTF-8 string.

• VUID-VkPipelineShaderStageCreateInfo-pSpecializationInfo-parameter
If `pSpecializationInfo` is not `NULL`, `pSpecializationInfo` must be a valid pointer to a valid `VkSpecializationInfo` structure.

---

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineShaderStageCreateFlags;
```

`VkPipelineShaderStageCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineShaderStageCreateFlagBits` values.

Possible values of the `flags` member of `VkPipelineShaderStageCreateInfo` specifying how a pipeline shader stage is created, are:
typedef enum VkPipelineShaderStageCreateFlagBits {
    // Provided by VK_VERSION_1_0
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT = 0x00000001,
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT = 0x00000002,
    // Provided by VK_EXT_subgroup_size_control
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT = VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT,
    // Provided by VK_EXT_subgroup_size_control
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT = VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT,
} VkPipelineShaderStageCreateFlagBits;

• **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT** specifies that the SubgroupSize may vary in the shader stage.

• **VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT** specifies that the subgroup sizes must be launched with all invocations active in the compute stage.

Note
If **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT** and **VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT** are specified and minSubgroupSize does not equal maxSubgroupSize and no required subgroup size is specified, then the only way to guarantee that the 'X' dimension of the local workgroup size is a multiple of SubgroupSize is to make it a multiple of maxSubgroupSize. Under these conditions, you are guaranteed full subgroups but not any particular subgroup size.

Bits which can be set by commands and structures, specifying one or more shader stages, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkShaderStageFlagBits {
    VK_SHADER_STAGE_VERTEX_BIT = 0x00000001,
    VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT = 0x00000002,
    VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT = 0x00000004,
    VK_SHADER_STAGE_GEOMETRY_BIT = 0x00000008,
    VK_SHADER_STAGE_FRAGMENT_BIT = 0x00000010,
    VK_SHADER_STAGE_COMPUTE_BIT = 0x00000020,
    VK_SHADER_STAGE_ALL_GRAPHICS = 0x0000001F,
    VK_SHADER_STAGE_ALL = 0x7FFFFFFF,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_RAYGEN_BIT_KHR = 0x00000100,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_ANY_HIT_BIT_KHR = 0x00000200,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR = 0x00000400,
} VkShaderStageFlagBits;
```
VK_SHADER_STAGE_MISS_BIT_KHR = 0x00000800,
// Provided by VK_KHR_ray_tracing_pipeline
VK_SHADER_STAGE_INTERSECTION_BIT_KHR = 0x00001000,
// Provided by VK_KHR_ray_tracing_pipeline
VK_SHADER_STAGE_CALLABLE_BIT_KHR = 0x00002000,
// Provided by VK_EXT_mesh_shader
VK_SHADER_STAGE_TASK_BIT_EXT = 0x00000040,
// Provided by VK_EXT_mesh_shader
VK_SHADER_STAGE_MESH_BIT_EXT = 0x00000080,
// Provided by VK_HUAWEI_subpass_shading
VK_SHADER_STAGE_SUBPASS_SHADING_BIT_HUAWEI = 0x00004000,
// Provided by VK_NV_ray_tracing
VK_SHADER_STAGE_RAYGEN_BIT_NV = VK_SHADER_STAGE_RAYGEN_BIT_KHR,
// Provided by VK_NV_ray_tracing
VK_SHADER_STAGE_ANY_HIT_BIT_NV = VK_SHADER_STAGE_ANY_HIT_BIT_KHR,
// Provided by VK_NV_ray_tracing
VK_SHADER_STAGE_CLOSEST_HIT_BIT_NV = VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR,
// Provided by VK_NV_ray_tracing
VK_SHADER_STAGE_MISS_BIT_NV = VK_SHADER_STAGE_MISS_BIT_KHR,
// Provided by VK_NV_ray_tracing
VK_SHADER_STAGE_INTERSECTION_BIT_NV = VK_SHADER_STAGE_INTERSECTION_BIT_KHR,
// Provided by VK_NV_ray_tracing
VK_SHADER_STAGE_CALLABLE_BIT_NV = VK_SHADER_STAGE_CALLABLE_BIT_KHR,
// Provided by VK_NV_mesh_shader
VK_SHADER_STAGE_TASK_BIT_NV = VK_SHADER_STAGE_TASK_BIT_EXT,
// Provided by VK_NV_mesh_shader
VK_SHADER_STAGE_MESH_BIT_NV = VK_SHADER_STAGE_MESH_BIT_EXT,
} VkShaderStageFlagBits;

- **VK_SHADER_STAGE_VERTEX_BIT** specifies the vertex stage.
- **VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT** specifies the tessellation control stage.
- **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT** specifies the tessellation evaluation stage.
- **VK_SHADER_STAGE_GEOMETRY_BIT** specifies the geometry stage.
- **VK_SHADER_STAGE_FRAGMENT_BIT** specifies the fragment stage.
- **VK_SHADER_STAGE_COMPUTE_BIT** specifies the compute stage.
- **VK_SHADER_STAGE_ALL_GRAPHICS** is a combination of bits used as shorthand to specify all graphics stages defined above (excluding the compute stage).
- **VK_SHADER_STAGE_ALL** is a combination of bits used as shorthand to specify all shader stages supported by the device, including all additional stages which are introduced by extensions.
- **VK_SHADER_STAGE_TASK_BIT_EXT** specifies the task stage.
- **VK_SHADER_STAGE_MESH_BIT_EXT** specifies the mesh stage.
- **VK_SHADER_STAGE_RAYGEN_BIT_KHR** specifies the ray generation stage.
- **VK_SHADER_STAGE_ANY_HIT_BIT_KHR** specifies the any-hit stage.
- **VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR** specifies the closest hit stage.
• **VK_SHADER_STAGE_MISS_BIT_KHR** specifies the miss stage.
• **VK_SHADER_STAGE_INTERSECTION_BIT_KHR** specifies the intersection stage.
• **VK_SHADER_STAGE_CALLABLE_BIT_KHR** specifies the callable stage.

**Note**

**VK_SHADER_STAGE_ALL_GRAPHICS** only includes the original five graphics stages included in Vulkan 1.0, and not any stages added by extensions. Thus, it may not have the desired effect in all cases.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderStageFlags;
```

**VkShaderStageFlags** is a bitmask type for setting a mask of zero or more **VkShaderStageFlagBits**.

The **VkPipelineShaderStageRequiredSubgroupSizeCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPipelineShaderStageRequiredSubgroupSizeCreateInfo {
    VkStructureType sType;
    void* pNext;
    uint32_t requiredSubgroupSize;
} VkPipelineShaderStageRequiredSubgroupSizeCreateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_subgroup_size_control
typedef VkPipelineShaderStageRequiredSubgroupSizeCreateInfo
    VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT;
```

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **requiredSubgroupSize** is an unsigned integer value specifying the required subgroup size for the newly created pipeline shader stage.

If a **VkPipelineShaderStageRequiredSubgroupSizeCreateInfo** structure is included in the **pNext** chain of **VkPipelineShaderStageCreateInfo**, it specifies that the pipeline shader stage being compiled has a required subgroup size.

**Valid Usage**

• VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02760
  **requiredSubgroupSize** **must** be a power-of-two integer
A subpass shading pipeline is a compute pipeline which must be called only in a subpass of a render pass with work dimensions specified by render area size. The subpass shading pipeline shader is a compute shader allowed to access input attachments specified in the calling subpass. To create a subpass shading pipeline, call `vkCreateComputePipelines` with `VkSubpassShadingPipelineCreateInfoHUAWEI` in the `pNext` chain of `VkComputePipelineCreateInfo`.

The `VkSubpassShadingPipelineCreateInfoHUAWEI` structure is defined as:

```c
// Provided by VK_HUAWEI_subpass_shading
typedef struct VkSubpassShadingPipelineCreateInfoHUAWEI {
    VkStructureType sType;
    void* pNext;
    VkRenderPass renderPass;
    uint32_t subpass;
} VkSubpassShadingPipelineCreateInfoHUAWEI;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `renderPass` is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline must only be used with a render pass instance compatible with the one provided. See Render Pass Compatibility for more information.
- `subpass` is the index of the subpass in the render pass where this pipeline will be used.
A subpass shading pipeline's workgroup size is a 2D vector with number of power-of-two in width and height. The maximum number of width and height is implementation dependent, and may vary for different formats and sample counts of attachments in a render pass.

To query the maximum workgroup size, call:

```c
// Provided by VK_HUAWEI_subpass_shading
VkResult vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI(
    VkDevice device,       // device is a handle to a local device object that was used to create the given render pass.
    VkRenderPass renderpass, // renderPass is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline must only be used with a render pass instance compatible with the one provided. See Render Pass Compatibility for more information.
    VkExtent2D* pMaxWorkgroupSize // pMaxWorkgroupSize is a pointer to a VkExtent2D structure.
);
```

Valid Usage (Implicit)

- **VUID-VkSubpassShadingPipelineCreateInfoHUAWEI-sType-sType**
  - *sType* must be **VK_STRUCTURE_TYPE_SUBPASS_SHADING_PIPELINE_CREATE_INFO_HUAWEI**

Return Codes

**Success**
- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
The `VkPipelineRobustnessCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_pipeline_robustness
typedef struct VkPipelineRobustnessCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRobustnessBufferBehaviorEXT storageBuffers;
    VkPipelineRobustnessBufferBehaviorEXT uniformBuffers;
    VkPipelineRobustnessBufferBehaviorEXT vertexInputs;
    VkPipelineRobustnessImageBehaviorEXT images;
} VkPipelineRobustnessCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `storageBuffers` sets the behaviour of out of bounds accesses made to resources bound as:
  - `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`
  - `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`
  - `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`
- `uniformBuffers` describes the behaviour of out of bounds accesses made to resources bound as:
  - `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`
  - `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`
  - `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`
  - `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`
- `vertexInputs` describes the behaviour of out of bounds accesses made to vertex input attributes
- `images` describes the behaviour of out of bounds accesses made to resources bound as:
  - `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`
  - `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`

Resources bound as `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` will have the robustness behavior that covers its active descriptor type.

The scope of the effect of `VkPipelineRobustnessCreateInfoEXT` depends on which structure’s `pNext` chain it is included in.

- `VkGraphicsPipelineCreateInfo`, `VkRayTracingPipelineCreateInfoKHR`, `VkComputePipelineCreateInfo`: The robustness behavior described by `VkPipelineRobustnessCreateInfoEXT` applies to all accesses through this pipeline
- `VkPipelineShaderStageCreateInfo`: The robustness behavior described by `VkPipelineRobustnessCreateInfoEXT` applies to all accesses through this pipeline
The robustness behavior described by `VkPipelineRobustnessCreateInfoEXT` applies to all accesses emanating from the shader code of this shader stage.

If `VkPipelineRobustnessCreateInfoEXT` is specified for both a pipeline and a pipeline stage, the `VkPipelineRobustnessCreateInfoEXT` specified for the pipeline stage will take precedence.

When `VkPipelineRobustnessCreateInfoEXT` is specified for a pipeline, it only affects the subset of the pipeline that is specified by the create info, as opposed to subsets linked from pipeline libraries. For `VkGraphicsPipelineCreateInfo`, that subset is specified by `VkGraphicsPipelineLibraryCreateInfoEXT::flags`. For `VkRayTracingPipelineCreateInfoKHR`, that subset is specified by the specific stages in `VkRayTracingPipelineCreateInfoKHR::pStages`.

**Valid Usage**

- **VUID-VkPipelineRobustnessCreateInfoEXT-pipelineRobustness-06926**
  If the `pipelineRobustness` feature is not enabled, `storageBuffers` must be `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT`.

- **VUID-VkPipelineRobustnessCreateInfoEXT-pipelineRobustness-06927**
  If the `pipelineRobustness` feature is not enabled, `uniformBuffers` must be `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT`.

- **VUID-VkPipelineRobustnessCreateInfoEXT-pipelineRobustness-06928**
  If the `pipelineRobustness` feature is not enabled, `vertexInputs` must be `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT`.

- **VUID-VkPipelineRobustnessCreateInfoEXT-pipelineRobustness-06929**
  If the `pipelineRobustness` feature is not enabled, `images` must be `VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT_EXT`.

- **VUID-VkPipelineRobustnessCreateInfoEXT-robustImageAccess-06930**
  If the `robustImageAccess` feature is not supported, `images` must not be `VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_EXT`.

- **VUID-VkPipelineRobustnessCreateInfoEXT-robustBufferAccess2-06931**
  If the `robustBufferAccess2` feature is not supported, `storageBuffers` must not be `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT`.

- **VUID-VkPipelineRobustnessCreateInfoEXT-robustBufferAccess2-06932**
  If the `robustBufferAccess2` feature is not supported, `uniformBuffers` must not be `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT`.

- **VUID-VkPipelineRobustnessCreateInfoEXT-robustBufferAccess2-06933**
  If the `robustBufferAccess2` feature is not supported, `vertexInputs` must not be `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT`.

- **VUID-VkPipelineRobustnessCreateInfoEXT-robustImageAccess2-06934**
  If the `robustImageAccess2` feature is not supported, `images` must not be `VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2_EXT`.
Valid Usage (Implicit)

- VUID-VkPipelineRobustnessCreateInfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_ROBUSTNESS_CREATE_INFO_EXT`

- VUID-VkPipelineRobustnessCreateInfoEXT-storageBuffers-parameter
  
  `storageBuffers` must be a valid `VkPipelineRobustnessBufferBehaviorEXT` value

- VUID-VkPipelineRobustnessCreateInfoEXT-uniformBuffers-parameter
  
  `uniformBuffers` must be a valid `VkPipelineRobustnessBufferBehaviorEXT` value

- VUID-VkPipelineRobustnessCreateInfoEXT-vertexInputs-parameter
  
  `vertexInputs` must be a valid `VkPipelineRobustnessBufferBehaviorEXT` value

- VUID-VkPipelineRobustnessCreateInfoEXT-images-parameter
  
  `images` must be a valid `VkPipelineRobustnessImageBehaviorEXT` value

Possible values of the `storageBuffers`, `uniformBuffers`, and `vertexInputs` members of `VkPipelineRobustnessCreateInfoEXT` are:

```c
// Provided by VK_EXT_pipeline_robustness
typedef enum VkPipelineRobustnessBufferBehaviorEXT {
  VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT = 0,
  VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DISABLED_EXT = 1,
  VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT = 2,
  VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT = 3,
} VkPipelineRobustnessBufferBehaviorEXT;
```

- `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT` specifies that this pipeline stage follows the behavior of robustness features that are enabled on the device that created this pipeline

- `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DISABLED_EXT` specifies that buffer accesses by this pipeline stage to the relevant resource types must not be out of bounds

- `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` specifies that out of bounds accesses by this pipeline stage to the relevant resource types behave as if the `robustBufferAccess` feature is enabled

- `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` specifies that out of bounds accesses by this pipeline stage to the relevant resource types behave as if the `robustBufferAccess2` feature is enabled

Possible values of the `images` member of `VkPipelineRobustnessCreateInfoEXT` are:

```c
// Provided by VK_EXT_pipeline_robustness
typedef enum VkPipelineRobustnessImageBehaviorEXT {
  VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT_EXT = 0,
  VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DISABLED_EXT = 1,
  VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_EXT = 2,
  VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2_EXT = 3,
} VkPipelineRobustnessImageBehaviorEXT;
```
- **VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT_EXT** specifies that this pipeline stage follows the behavior of robustness features that are enabled on the device that created this pipeline.

- **VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DISABLED_EXT** specifies that image accesses by this pipeline stage to the relevant resource types must not be out of bounds.

- **VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_EXT** specifies that out of bounds accesses by this pipeline stage to images behave as if the robustImageAccess feature is enabled.

- **VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2_EXT** specifies that out of bounds accesses by this pipeline stage to images behave as if the robustImageAccess2 feature is enabled.

An identifier can be provided instead of shader code in an attempt to compile pipelines without providing complete SPIR-V to the implementation.

The **VkPipelineShaderStageModuleIdentifierCreateInfoEXT** structure is defined as:

```c
typedef struct VkPipelineShaderStageModuleIdentifierCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t identifierSize;
    const uint8_t* pIdentifier;
} VkPipelineShaderStageModuleIdentifierCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **identifierSize** is the size, in bytes, of the buffer pointed to by **pIdentifier**.
- **pIdentifier** points to a buffer of opaque data specifying an identifier.

Any identifier can be used. If the pipeline being created with identifier requires compilation to complete the pipeline creation call, pipeline compilation must fail as defined by **VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT**.

**pIdentifier** and **identifierSize** can be obtained from an **VkShaderModuleIdentifierEXT** queried earlier.

### Valid Usage

- **VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-pNext-06850**
  If this structure is included in a **pNext** chain and **identifierSize** is not equal to 0, the **shaderModuleIdentifier** feature must be enabled.

- **VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-pNext-06851**
  If this struct is included in a **pNext** chain of **VkPipelineShaderStageCreateInfo** and **identifierSize** is not equal to 0, the pipeline must be created with the
10.2. Graphics Pipelines

Graphics pipelines consist of multiple shader stages, multiple fixed-function pipeline stages, and a pipeline layout.

To create graphics pipelines, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateGraphicsPipelines(
    VkDevice device,                  // Logical device
    VkPipelineCache pipelineCache,    // Pipeline cache handle, VK_NULL_HANDLE to disable
    uint32_t createInfoCount,         // Length of the pCreateInfos array
    const VkGraphicsPipelineCreateInfo* pCreateInfos, // Array of VkGraphicsPipelineCreateInfo structures
    const VkAllocationCallbacks* pAllocator, // Controls host memory allocation
    VkPipeline* pPipelines);           // Storage for created pipelines
```

- `device` is the logical device that creates the graphics pipelines.
- `pipelineCache` is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of `VkGraphicsPipelineCreateInfo` structures.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelines` is a pointer to an array of `VkPipeline` handles in which the resulting graphics pipeline objects are returned.

The `VkGraphicsPipelineCreateInfo` structure includes an array of `VkPipelineShaderStageCreateInfo` structures for each of the desired active shader stages, as well as creation information for all relevant fixed-function stages, and a pipeline layout.
Valid Usage

- **VUID-vkCreateGraphicsPipelines-flags-00720**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the `basePipelineIndex` member of that same element is not `-1`, `basePipelineIndex` must be less than the index into `pCreateInfos` that corresponds to that element.

- **VUID-vkCreateGraphicsPipelines-flags-00721**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline must have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set.

- **VUID-vkCreateGraphicsPipelines-pipelineCache-02876**
  If `pipelineCache` was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, host access to `pipelineCache` must be externally synchronized.

Note

An implicit cache may be provided by the implementation or a layer. For this reason, it is still valid to set `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` on `flags` for any element of `pCreateInfos` while passing `VK_NULL_HANDLE` for `pipelineCache`.

Valid Usage (Implicit)

- **VUID-vkCreateGraphicsPipelines-device-parameter**
  `device` must be a valid `VkDevice` handle.

- **VUID-vkCreateGraphicsPipelines-pipelineCache-parameter**
  If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` must be a valid `VkPipelineCache` handle.

- **VUID-vkCreateGraphicsPipelines-pCreateInfos-parameter**
  `pCreateInfos` must be a valid pointer to an array of `createInfoCount` valid `VkGraphicsPipelineCreateInfo` structures.

- **VUID-vkCreateGraphicsPipelines-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkCreateGraphicsPipelines-pPipelines-parameter**
  `pPipelines` must be a valid pointer to an array of `createInfoCount` `VkPipeline` handles.

- **VUID-vkCreateGraphicsPipelines-createInfoCount-arraylength**
  `createInfoCount` must be greater than 0.

- **VUID-vkCreateGraphicsPipelines-pipelineCache-parent**
  If `pipelineCache` is a valid handle, it must have been created, allocated, or retrieved from `device`.
### Return Codes

**Success**
- VK_SUCCESS
- VK_PIPELINE_COMPILE_REQUIRED_EXT

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_SHADER_NV

The `VkGraphicsPipelineCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkGraphicsPipelineCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    const VkPipelineVertexInputStateCreateInfo* pVertexInputState;
    const VkPipelineInputAssemblyStateCreateInfo* pInputAssemblyState;
    const VkPipelineTessellationStateCreateInfo* pTessellationState;
    const VkPipelineViewportStateCreateInfo* pViewportState;
    const VkPipelineRasterizationStateCreateInfo* pRasterizationState;
    const VkPipelineMultisampleStateCreateInfo* pMultisampleState;
    const VkPipelineDepthStencilStateCreateInfo* pDepthStencilState;
    const VkPipelineColorBlendStateCreateInfo* pColorBlendState;
    const VkPipelineDynamicStateCreateInfo* pDynamicState;
    VkPipelineLayout layout;
    VkRenderPass renderPass;
    uint32_t subpass;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkGraphicsPipelineCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- **stageCount** is the number of entries in the **pStages** array.
- **pStages** is a pointer to an array of stageCount `VkPipelineShaderStageCreateInfo` structures describing the set of the shader stages to be included in the graphics pipeline.
- **pVertexInputState** is a pointer to a `VkPipelineVertexInputStateCreateInfo` structure. It is ignored if the pipeline includes a mesh shader stage. It is ignored if the pipeline is created with the
VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state set.

- **pInputAssemblyState** is a pointer to a VkPipelineInputAssemblyStateCreateInfo structure which determines input assembly behavior for vertex shading, as described in Drawing Commands. It is ignored if the pipeline includes a mesh shader stage.
- **pTessellationState** is a pointer to a VkPipelineTessellationStateCreateInfo structure defining tessellation state used by tessellation shaders.
- **pViewportState** is a pointer to a VkPipelineViewportStateCreateInfo structure defining viewport state used when rasterization is enabled.
- **pRasterizationState** is a pointer to a VkPipelineRasterizationStateCreateInfo structure defining rasterization state.
- **pMultisampleState** is a pointer to a VkPipelineMultisampleStateCreateInfo structure defining multisample state used when rasterization is enabled.
- **pDepthStencilState** is a pointer to a VkPipelineDepthStencilStateCreateInfo structure defining depth/stencil state used when rasterization is enabled for depth or stencil attachments accessed during rendering.
- **pColorBlendState** is a pointer to a VkPipelineColorBlendStateCreateInfo structure defining color blend state used when rasterization is enabled for any color attachments accessed during rendering.
- **pDynamicState** is a pointer to a VkPipelineDynamicStateCreateInfo structure defining which properties of the pipeline state object are dynamic and can be changed independently of the pipeline state. This can be NULL, which means no state in the pipeline is considered dynamic.
- **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- **renderPass** is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline must only be used with a render pass instance compatible with the one provided. See Render Pass Compatibility for more information.
- **subpass** is the index of the subpass in the render pass where this pipeline will be used.
- **basePipelineHandle** is a pipeline to derive from.
- **basePipelineIndex** is an index into the pCreateInfos parameter to use as a pipeline to derive from.

The parameters basePipelineHandle and basePipelineIndex are described in more detail in Pipeline Derivatives.

If any shader stage fails to compile, the compile log will be reported back to the application, and VK_ERROR_INVALID_SHADER_NV will be generated.

The state required for a graphics pipeline is divided into vertex input state, pre-rasterization shader state, fragment shader state, and fragment output state.

Vertex input state is defined by:

- VkPipelineVertexInputStateCreateInfo
Pre-rasterization shader state is defined by:

- **VkPipelineShaderStageCreateInfo** entries for:
  - Vertex shaders
  - Tessellation control shaders
  - Tessellation evaluation shaders
  - Geometry shaders
  - Task shaders
  - Mesh shaders

Within the **VkPipelineLayout**, all descriptor sets with pre-rasterization shader bindings if `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` was specified.

- If `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` was not specified, the full pipeline layout must be specified.

- **VkPipelineViewportStateCreateInfo**
- **VkPipelineRasterizationStateCreateInfo**
- **VkPipelineTessellationStateCreateInfo**
- **VkRenderPass** and `subpass` parameter
- The `viewMask` parameter of **VkPipelineRenderingCreateInfo** (formats are ignored)
- **VkPipelineDiscardRectangleStateCreateInfoEXT**
- **VkPipelineFragmentShadingRateStateCreateInfoKHR**

Fragment shader state is defined by:

- A **VkPipelineShaderStageCreateInfo** entry for the fragment shader

Within the **VkPipelineLayout**, all descriptor sets with fragment shader bindings if `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` was specified.

- If `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` was not specified, the full pipeline layout must be specified.

- **VkPipelineMultisampleStateCreateInfo** if sample shading is enabled or `renderpass` is not `VK_NULL_HANDLE`
- **VkPipelineDepthStencilStateCreateInfo**
- **VkRenderPass** and `subpass` parameter
- The `viewMask` parameter of **VkPipelineRenderingCreateInfo** (formats are ignored)
- **VkPipelineFragmentShadingRateStateCreateInfoKHR**
- **VkPipelineFragmentShadingRateEnumStateCreateInfoNV**
- **VkPipelineRepresentativeFragmentTestStateCreateInfoNV**

- Inclusion/omission of the
Fragment output state is defined by:

- `VkPipelineColorBlendStateCreateInfo`
- `VkRenderPass` and `subpass` parameter
- `VkPipelineMultisampleStateCreateInfo`
- `VkPipelineRenderingCreateInfo`
- `VkAttachmentSampleCountInfoAMD`
- `VkAttachmentSampleCountInfoNV`

Inclusion/omission of the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` and `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` flags

Dynamic state values set via `pDynamicState` must be ignored if the state they correspond to is not otherwise statically set by one of the state subsets used to create the pipeline. Additionally, setting dynamic state values must not modify whether state in a linked library is static or dynamic; this is set and unchangeable when the library is created. For example, if a pipeline only included pre-rasterization shader state, then any dynamic state value corresponding to depth or stencil testing has no effect. Any linked library that has dynamic state enabled that same dynamic state must also be enabled in all the other linked libraries to which that dynamic state applies.

A complete graphics pipeline always includes pre-rasterization shader state, with other subsets included depending on that state. If the pre-rasterization shader state includes a vertex shader, then vertex input state is included in a complete graphics pipeline. If the value of `VkPipelineRasterizationStateCreateInfo::rasterizerDiscardEnable` in the pre-rasterization shader state is `VK_FALSE` or the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state is enabled fragment shader state and fragment output interface state is included in a complete graphics pipeline.

If different subsets are linked together with pipeline layouts created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, the final effective pipeline layout is effectively the union of the linked pipeline layouts. When binding descriptor sets for this pipeline, the pipeline layout used must be compatible with this union. This pipeline layout can be overridden when linking with `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT` by providing a `VkPipelineLayout` that is compatible with this union other than `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, or when linking without `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT` by providing a `VkPipelineLayout` that is fully compatible with this union.

---

**Valid Usage**

- `VUID-VkGraphicsPipelineCreateInfo-flags-00722`
  - If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` must be a valid handle to a graphics `VkPipeline`
• VUID-VkGraphicsPipelineCreateInfo-flags-00723
If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineHandle is VK_NULL_HANDLE, basePipelineIndex must be a valid index into the calling command’s pCreateInfos parameter

• VUID-VkGraphicsPipelineCreateInfo-flags-00724
If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineIndex is not -1, basePipelineHandle must be VK_NULL_HANDLE

• VUID-VkGraphicsPipelineCreateInfo-flags-00725
If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineHandle is not VK_NULL_HANDLE, basePipelineIndex must be -1

• VUID-VkGraphicsPipelineCreateInfo-pStages-02095
If the pipeline is being created with pre-rasterization shader state the geometric shader stages provided in pStages must be either from the mesh shading pipeline (stage isVK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT) or from the primitive shading pipeline (stage isVK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, or VK_SHADER_STAGE_GEOMETRY_BIT)

• VUID-VkGraphicsPipelineCreateInfo-stage-02096
If the pipeline is being created with pre-rasterization shader state the stage member of one element of pStages must be either VK_SHADER_STAGE_VERTEX_BIT or VK_SHADER_STAGE_MESH_BIT_EXT

• VUID-VkGraphicsPipelineCreateInfo-TaskNV-07063
The shader stages for VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT must use either the TaskNV and MeshNV Execution Model or the TaskEXT and MeshEXT Execution Model, but must not use both

• VUID-VkGraphicsPipelineCreateInfo-pStages-00729
If the pipeline is being created with pre-rasterization shader state and pStages includes a tessellation control shader stage, it must include a tessellation evaluation shader stage

• VUID-VkGraphicsPipelineCreateInfo-pStages-00730
If the pipeline is being created with pre-rasterization shader state and pStages includes a tessellation evaluation shader stage, it must include a tessellation control shader stage

• VUID-VkGraphicsPipelineCreateInfo-pStages-00731
If the pipeline is being created with pre-rasterization shader state and pStages includes tessellation shader stages, the shader code of at least one stage must contain an OpExecutionMode instruction specifying the type of subdivision in the pipeline

• VUID-VkGraphicsPipelineCreateInfo-pStages-00732
If the pipeline is being created with pre-rasterization shader state and pStages includes tessellation shader stages, and the shader code of both stages contain an OpExecutionMode instruction specifying the type of subdivision in the pipeline, they must both specify the...
same subdivision mode

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00734**
  If the pipeline is being created with pre-rasterization shader state and `pStages` includes tessellation shader stages, the shader code of at least one stage **must** contain an `OpExecutionMode` instruction specifying the output patch size in the pipeline.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00735**
  If the pipeline is being created with pre-rasterization shader state and `pStages` includes tessellation shader stages, and the shader code of both contain an `OpExecutionMode` instruction specifying the out patch size in the pipeline, they **must** both specify the same patch size.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00736**
  If the pipeline is being created with pre-rasterization shader state and `pStages` includes tessellation shader stages, the `topology` member of `pInputAssembly` **must** be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`.

- **VUID-VkGraphicsPipelineCreateInfo-topology-00737**
  If the pipeline is being created with pre-rasterization shader state and the `topology` member of `pInputAssembly` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, `pStages` **must** include tessellation shader stages.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00738**
  If the pipeline is being created with pre-rasterization shader state and `pStages` includes a geometry shader stage, and does not include any tessellation shader stages, its shader code **must** contain an `OpExecutionMode` instruction specifying an input primitive type that is compatible with the primitive topology specified in `pInputAssembly`.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00739**
  If the pipeline is being created with pre-rasterization shader state and `pStages` includes a geometry shader stage, and also includes tessellation shader stages, its shader code **must** contain an `OpExecutionMode` instruction specifying an input primitive type that is compatible with the primitive topology that is output by the tessellation stages.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00740**
  If the pipeline is being created with pre-rasterization shader state and fragment shader state, it includes both a fragment shader and a geometry shader, and the fragment shader code reads from an input variable that is decorated with `PrimitiveId`, then the geometry shader code **must** write to a matching output variable, decorated with `PrimitiveId`, in all execution paths.

- **VUID-VkGraphicsPipelineCreateInfo-PrimitiveId-06264**
  If the pipeline is being created with pre-rasterization shader state, it includes a mesh shader and the fragment shader code reads from an input variable that is decorated with `PrimitiveId`, then the mesh shader code **must** write to a matching output variable, decorated with `PrimitiveId`, in all execution paths.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06038**
  If `renderPass` is not `VK_NULL_HANDLE` and the pipeline is being created with fragment shader state the fragment shader **must** not read from any input attachment that is defined as `VK_ATTACHMENT_UNUSED` in `subpass`.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00742**
If the pipeline is being created with pre-rasterization shader state and multiple pre-rasterization shader stages are included in `pStages`, the shader code for the entry points identified by those `pStages` and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter.

- **VUID-VkGraphicsPipelineCreateInfo-None-04889**
  If the pipeline is being created with pre-rasterization shader state and fragment shader state, the fragment shader and last pre-rasterization shader stage and any relevant state must adhere to the pipeline linking rules described in the Shader Interfaces chapter.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06041**
  If `renderPass` is not `VK_NULL_HANDLE`, and the pipeline is being created with fragment output interface state, then for each color attachment in the subpass, if the potential format features of the format of the corresponding attachment description do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06042**
  If `renderPass` is not `VK_NULL_HANDLE`, and the pipeline is being created with fragment output interface state, and the subpass uses color attachments, the `attachmentCount` member of `pColorBlendState` must be equal to the `colorAttachmentCount` used to create subpass.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04130**
  If the pipeline is being created with pre-rasterization shader state, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_VIEWPORT` or `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`, the `pViewports` member of `pViewportState` must be a valid pointer to an array of `pViewportState->viewportCount` valid `VkViewport` structures.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04131**
  If the pipeline is being created with pre-rasterization shader state, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_SCISSOR` or `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`, the `pScissors` member of `pViewportState` must be a valid pointer to an array of `pViewportState->scissorCount` `VkRect2D` structures.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00749**
  If the pipeline is being created with pre-rasterization shader state, and the `wideLines` feature is not enabled, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_LINE_WIDTH`, the `lineWidth` member of `pRasterizationState` must be `1.0`.

- **VUID-VkGraphicsPipelineCreateInfo-rasterizerDiscardEnable-00750**
  If the pipeline is being created with pre-rasterization shader state, and the `rasterizerDiscardEnable` member of `pRasterizationState` is `VK_FALSE`, `pViewportState` must be a valid pointer to a valid `VkPipelineViewportStateCreateInfo` structure.

- **VUID-VkGraphicsPipelineCreateInfo-pViewportState-04892**
  If the pipeline is being created with pre-rasterization shader state, and the graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled, `pViewportState` must be a valid pointer to a valid `VkPipelineViewportStateCreateInfo` structure.

- **VUID-VkGraphicsPipelineCreateInfo-rasterizerDiscardEnable-00751**
  If the pipeline is being created with fragment output interface state, `pMultisampleState` must be a valid pointer to a valid `VkPipelineMultisampleStateCreateInfo` structure.
must be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06043**
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment shader state, and subpass uses a depth/stencil attachment, pDepthStencilState must be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06044**
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment output interface state, and subpass uses color attachments, pColorBlendState must be a valid pointer to a valid VkPipelineColorBlendStateCreateInfo structure

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00754**
  If the pipeline is being created with pre-rasterization shader state, the depthBiasClamp feature is not enabled, no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DEPTH_BIAS, and the depthBiasEnable member of pRasterizationState is VK_TRUE, the depthBiasClamp member of pRasterizationState must be 0.0

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-02510**
  If the pipeline is being created with fragment shader state, and the VK_EXT_depth_range_unrestricted extension is not enabled and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DEPTH_BOUNDS, and the depthBoundsTestEnable member of pDepthStencilState is VK_TRUE, the minDepthBounds and maxDepthBounds members of pDepthStencilState must be between 0.0 and 1.0, inclusive

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-01521**
  If the pipeline is being created with fragment shader state or fragment output interface state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT, and the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT structure included in the pNext chain of pMultisampleState is VK_TRUE, sampleLocationsInfo.sampleLocationGridSize.width must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.width as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-01522**
  If the pipeline is being created with fragment shader state or fragment output interface state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT, and the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT structure included in the pNext chain of pMultisampleState is VK_TRUE, sampleLocationsInfo.sampleLocationGridSize.height must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.height as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-01523**
  If the pipeline is being created with fragment shader state or fragment output interface state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT, and the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT structure included in the pNext chain of pMultisampleState is VK_TRUE, sampleLocationsInfo.sampleLocationsPerPixel must equal rasterizationSamples
If the pipeline is being created with fragment shader state, and the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT structure included in the pNext chain of pMultisampleState is VK_TRUE, the fragment shader code must not statically use the extended instruction InterpolateAtSample.

layout must be consistent with all shaders specified in pStages.

If the pipeline is being created with fragment output interface state, and none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature are enabled, and if subpass uses color and/or depth/stencil attachments, then the rasterizationSamples member of pMultisampleState must be the same as the sample count for those subpass attachments.

If the pipeline is being created with fragment output interface state, and the VK_AMD_mixed_attachment_samples extension is enabled, and if subpass uses color and/or depth/stencil attachments, then the rasterizationSamples member of pMultisampleState must equal the maximum of the sample counts of those subpass attachments.

If renderPass is not VK_NULL_HANDLE, the VK_EXT_multisampled_render_to_single_sampled extension is enabled, and subpass has a VkMultisampledRenderToSingleSampledInfoEXT structure included in the VkSubpassDescription2::pNext chain with multisampledRenderToSingleSampledEnable equal to VK_TRUE, then the rasterizationSamples member of pMultisampleState must be equal to VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples.

If the pipeline is being created with fragment output interface state, and the VK_NV_framebuffer_mixed_samples extension is enabled, and if subpass has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled, then the rasterizationSamples member of pMultisampleState must be the same as the sample count of the depth/stencil attachment.

If the pipeline is being created with fragment output interface state, and the VK_NV_framebuffer_mixed_samples extension is enabled, and if subpass has any color attachments, then the rasterizationSamples member of pMultisampleState must be greater than or equal to the sample count for those subpass attachments.

If the pipeline is being created with fragment output interface state, and the VK_NV_coverage_reduction_mode extension is enabled, the coverage reduction mode specified by VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode, the rasterizationSamples member of pMultisampleState and the sample counts for the color and depth/stencil attachments (if the subpass has them) must be a valid combination returned by vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV.

If the pipeline is being created with fragment output interface state, and subpass does not...
use any color and/or depth/stencil attachments, then the rasterizationSamples member of pMultisampleState must follow the rules for a zero-attachment subpass

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06046
  If renderPass is a valid renderPass, subpass must be a valid subpass within renderPass

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06047
  If renderPass is a valid renderPass, the pipeline is being created with pre-rasterization shader state, and the renderPass has multiview enabled and subpass has more than one bit set in the view mask and multiviewTessellationShader is not enabled, then pStages must not include tessellation shaders

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06048
  If renderPass is a valid renderPass, the pipeline is being created with pre-rasterization shader state, and the renderPass has multiview enabled and subpass has more than one bit set in the view mask and multiviewGeometryShader is not enabled, then pStages must not include a geometry shader

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06049
  If renderPass is a valid renderPass and the pipeline is being created with pre-rasterization shader state, and the renderPass has multiview enabled, then all shaders must not include variables decorated with the Layer built-in decoration

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-01565
  If the pipeline is being created with pre-rasterization shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV, and the viewportWScalingEnable member of a VkPipelineViewportWScalingStateCreateInfoNV structure, included in the pNext chain of pViewportState, is VK_TRUE, the pViewportWScalings member of the VkPipelineViewportWScalingStateCreateInfoNV must be a pointer to an array of VkPipelineViewportWScalingStateCreateInfoNV::viewportCount valid VkViewportWScalingNV structures
• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04056
  If the pipeline is being created with pre-rasterization shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV, and if pViewportState->pNext chain includes a VkPipelineViewportExclusiveScissorStateCreateInfoNV structure, and if its exclusiveScissorCount member is not 0, then its pExclusiveScissors member must be a valid pointer to an array of exclusiveScissorCount VkRect2D structures.

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04057
  If the pipeline is being created with pre-rasterization shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV, and if pViewportState->pNext chain includes a VkPipelineViewportShadingRateImageStateCreateInfoNV structure, then its pShadingRatePalettes member must be a valid pointer to an array of viewportCount valid VkShadingRatePaletteNV structures.

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04058
  If the pipeline is being created with pre-rasterization shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT, and if pNext chain includes a VkPipelineDiscardRectangleStateCreateInfoEXT structure, and if its discardRectangleCount member is not 0, then its pDiscardRectangles member must be a valid pointer to an array of discardRectangleCount VkRect2D structures.

• VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-04910
  If the pipeline is being created with vertex input state, and VK_DYNAMIC_STATE_VERTEX_INPUT_EXT is not set, pVertexInputState must be a valid pointer to a valid VkPipelineVertexInputStateCreateInfo structure.

• VUID-VkGraphicsPipelineCreateInfo-pStages-02098
  If the pipeline is being created with vertex input state, pInputAssemblyState must be a valid pointer to a valid VkPipelineInputAssemblyStateCreateInfo structure.

• VUID-VkGraphicsPipelineCreateInfo-pStages-02317
  If the pipeline is being created with pre-rasterization shader state, the Xfb execution mode can be specified by no more than one shader stage in pStages.

• VUID-VkGraphicsPipelineCreateInfo-pStages-02318
  If the pipeline is being created with pre-rasterization shader state, and any shader stage in pStages specifies Xfb execution mode it must be the last pre-rasterization shader stage.

• VUID-VkGraphicsPipelineCreateInfo-rasterizationStream-02319
  If the pipeline is being created with pre-rasterization shader state, and a VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream value other than zero is specified, all variables in the output interface of the entry point being compiled decorated with Position, PointSize, ClipDistance, or CullDistance must be decorated with identical Stream values that match the rasterizationStream.

• VUID-VkGraphicsPipelineCreateInfo-rasterizationStream-02320
  If the pipeline is being created with pre-rasterization shader state, andVkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream is zero, or not specified, all variables in the output interface of the entry point being compiled decorated with Position, PointSize, ClipDistance, or CullDistance must be decorated with a Stream value of zero, or must not specify the Stream decoration.
- **VUID-VkGraphicsPipelineCreateInfo-geometryStreams-02321**
  If the pipeline is being created with pre-rasterization shader state, and the last pre-rasterization shader stage is a geometry shader, and that geometry shader uses the GeometryStreams capability, then `VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams` feature must be enabled.

- **VUID-VkGraphicsPipelineCreateInfo-None-02322**
  If the pipeline is being created with pre-rasterization shader state, and there are any mesh shader stages in the pipeline there must not be any shader stage in the pipeline with a Xfb execution mode.

- **VUID-VkGraphicsPipelineCreateInfo-lineRasterizationMode-02766**
  If the pipeline is being created with pre-rasterization shader state and at least one of fragment output interface state or fragment shader state, and pMultisampleState is not NULL, the lineRasterizationMode member of a `VkPipelineRasterizationLineStateCreateInfoEXT` structure included in thepNext chain of pRasterizationState is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT` or `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then the alphaToCoverageEnable, alphaToOneEnable, and sampleShadingEnable members of pMultisampleState must all be VK_FALSE.

- **VUID-VkGraphicsPipelineCreateInfo-stippledLineEnable-02767**
  If the pipeline is being created with pre-rasterization shader state, the stippledLineEnable member of `VkPipelineRasterizationLineStateCreateInfoEXT` is VK_TRUE, and no element of the pDynamicStates member of pDynamicState is `VK_DYNAMIC_STATE_LINE_STIPPLE_EXT`, then the lineStippleFactor member of `VkPipelineRasterizationLineStateCreateInfoEXT` must be in the range [1,256].

- **VUID-VkGraphicsPipelineCreateInfo-flags-03372**
  Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-03373**
  Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-03374**
  Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-03375**
  Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-03376**
  Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-03377**
  Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-03577**
  Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-04947**
  Flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV`.
If the pipeline is being created with pre-rasterization shader state, and `VK_DYNAMIC_STATEifdef viewportCount must be zero

If the pipeline is being created with pre-rasterization shader state, and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` is included in the `pDynamicStates` array then `viewportCount must be zero

If the pipeline is being created with pre-rasterization shader state, and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` is included in the `pDynamicStates` array then `scissorCount must be zero

If the pipeline is being created with pre-rasterization shader state, and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` is included in the `pDynamicStates` array then `VK_DYNAMIC_STATE_VIEWPORT must not be present

If the pipeline is being created with pre-rasterization shader state, and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` is included in the `pDynamicStates` array then `VK_DYNAMIC_STATE_SCISSOR must not be present

If the pipeline is being created with pre-rasterization shader state, and includes a mesh shader, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY`, or `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE`

If the `extendedDynamicState2LogicOp` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_LOGIC_OP_EXT`

If the `extendedDynamicState2PatchControlPoints` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`

If the pipeline is being created with pre-rasterization shader state, and includes a mesh shader, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE`, or `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`

If `flags` includes `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`, then the `deviceGeneratedCommands` feature must be enabled

If the pipeline is being created with pre-rasterization shader state and `flags` includes `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`, then all stages must not specify Xfb execution mode

If the `pipelineCreationCacheControl` feature is not enabled, `flags must not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT or VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT

If the pipeline is being created with pre-rasterization shader state, and includes a mesh shader, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY`, or `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE`

If the `extendedDynamicState2LogicOp` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_LOGIC_OP_EXT`

If the `extendedDynamicState2PatchControlPoints` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`

If the pipeline is being created with pre-rasterization shader state, and includes a mesh shader, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE`, or `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`

If `flags` includes `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`, then the `deviceGeneratedCommands` feature must be enabled

If the pipeline is being created with pre-rasterization shader state and `flags` includes `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`, then all stages must not specify Xfb execution mode

If the `pipelineCreationCacheControl` feature is not enabled, `flags must not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT or VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT

If the pipeline is being created with pre-rasterization shader state, and includes a mesh shader, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY`, or `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE`

If the `extendedDynamicState2LogicOp` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_LOGIC_OP_EXT`

If the `extendedDynamicState2PatchControlPoints` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`

If the pipeline is being created with pre-rasterization shader state, and includes a mesh shader, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE`, or `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`

If `flags` includes `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`, then the `deviceGeneratedCommands` feature must be enabled

If the pipeline is being created with pre-rasterization shader state and `flags` includes `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`, then all stages must not specify Xfb execution mode

If the `pipelineCreationCacheControl` feature is not enabled, `flags must not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT or VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT

If the pipeline is being created with pre-rasterization shader state, and includes a mesh shader, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY`, or `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE`

If the `extendedDynamicState2LogicOp` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_LOGIC_OP_EXT`

If the `extendedDynamicState2PatchControlPoints` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`

If the pipeline is being created with pre-rasterization shader state, and includes a mesh shader, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE`, or `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`
If the `pipelineProtectedAccess` feature is not enabled, flags must not include `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT` or `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-07369**
  - flags must not include both `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT` and `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04494**
  - If the pipeline is being created with pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width` must be greater than or equal to 1.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04495**
  - If the pipeline is being created with pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height` must be greater than or equal to 1.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04496**
  - If the pipeline is being created with pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width` must be a power-of-two value.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04497**
  - If the pipeline is being created with pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height` must be a power-of-two value.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04498**
  - If the pipeline is being created with pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width` must be less than or equal to 4.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04499**
  - If the pipeline is being created with pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height` must be less than or equal to 4.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04500**
  - If the pipeline is being created with pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicStates`, and the `pipelineFragmentShadingRate` feature is not enabled, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width` and `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height` must both be equal to 1.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06567**
If the pipeline is being created with pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps must be a valid VkFragmentShadingRateCombinerOpKHR value.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06568
  If the pipeline is being created with pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0] must be a valid VkFragmentShadingRateCombinerOpKHR value.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04501
  If the pipeline is being created with pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the primitiveFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0] must be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04502
  If the pipeline is being created with pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the attachmentFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1] must be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR.

- VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04503
  If the pipeline is being created with pre-rasterization shader state and the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT is not included in pDynamicState->pDynamicStates, and VkPipelineViewportStateCreateInfo::viewportCount is greater than 1, entry points specified in pStages must not write to the PrimitiveShadingRateKHR built-in.

- VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04504
  If the pipeline is being created with pre-rasterization shader state and the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, and entry points specified in pStages write to the ViewportIndex built-in, they must not also write to the PrimitiveShadingRateKHR built-in.

- VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04505
  If the pipeline is being created with pre-rasterization shader state and the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, and entry points specified in pStages write to the ViewportMaskNV built-in, they must not also write to the PrimitiveShadingRateKHR built-in.

- VUID-VkGraphicsPipelineCreateInfo-fragmentShadingRateNonTrivialCombinerOps-04506
  If the pipeline is being created with pre-rasterization shader state or fragment shader state, the fragmentShadingRateNonTrivialCombinerOps limit is not supported, and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, elements of VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps must be a valid VkFragmentShadingRateCombinerOpKHR value.
::combinerOps must be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR or VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR

• VUID-VkGraphicsPipelineCreateInfo-None-06569
If the pipeline is being created with fragment shader state and 
VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState- 
> pDynamicStates, VkPipelineFragmentShadingRateEnumStateCreateInfoNV 
::shadingRateType must be a valid VkFragmentShadingRateTypeNV value

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06570
If the pipeline is being created with fragment shader state and 
VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState- > pDynamicStates, VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate 
must be a valid VkFragmentShadingRateNV value

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06571
If the pipeline is being created with fragment shader state and 
VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState- > pDynamicStates, VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[0] 
must be a valid VkFragmentShadingRateCombinerOpKHR value

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06572
If the pipeline is being created with fragment shader state and 
VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState- > pDynamicStates, VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[1] 
must be a valid VkFragmentShadingRateCombinerOpKHR value

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04569
If the pipeline is being created with fragment shader state and 
VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState- > pDynamicStates, and the fragmentShadingRateEnums feature is not enabled, 
VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRateType must be equal 
to VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04570
If the pipeline is being created with fragment shader state and 
VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState- > pDynamicStates, and the pipelineFragmentShadingRate feature is not enabled, 
VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate must be equal to 
VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04571
If the pipeline is being created with fragment shader state and 
VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState- > pDynamicStates, and the primitiveFragmentShadingRate feature is not enabled, 
VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[0] must be 
VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04572
If the pipeline is being created with fragment shader state and 
VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState- > pDynamicStates, and the attachmentFragmentShadingRate feature is not enabled, 
VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[1] must be
VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR

- VUID-VkGraphicsPipelineCreateInfo-fragmentShadingRateNonTrivialCombinerOps-04573
  If the pipeline is being created with fragment shader state, and the
  fragmentShadingRateNonTrivialCombinerOps limit is not supported and
  VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in
  pDynamicStates, elements of
  VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps
  must be
  VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR or
  VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR

- VUID-VkGraphicsPipelineCreateInfo-None-04574
  If the pipeline is being created with fragment shader state, and the
  supersampleFragmentShadingRates feature is not enabled,
  VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate
  must not be equal to
  VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV,
  VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV,
  or
  VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV

- VUID-VkGraphicsPipelineCreateInfo-None-04575
  If the pipeline is being created with fragment shader state, and the
  noInvocationFragmentShadingRates feature is not enabled,
  VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate
  must not be equal to
  VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03578
  All elements of the pDynamicStates member of pDynamicState
  must not be
  VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04807
  If the pipeline is being created with pre-rasterization shader state and the
  vertexInputDynamicState feature is not enabled, there must be no element of the
  pDynamicStates member of pDynamicState set to
  VK_DYNAMIC_STATE_VERTEX_INPUT_EXT

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07067
  If the pipeline is being created with pre-rasterization shader state, and includes a mesh
  shader, there must be no element of the pDynamicStates member of pDynamicState set to
  VK_DYNAMIC_STATE_VERTEX_INPUT_EXT

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04800
  If the colorWriteEnable feature is not enabled, there must be no element of the
  pDynamicStates member of pDynamicState set to
  VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT

- VUID-VkGraphicsPipelineCreateInfo-rasterizationSamples-04899
  If the pipeline is being created with fragment shader state, and the
  VK_QCOM_render_pass_shader_resolve extension is enabled, and if subpass has any input
  attachments, and if the subpass description contains
  VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM, then the sample count of the input
  attachments must equal rasterizationSamples

- VUID-VkGraphicsPipelineCreateInfo-sampleShadingEnable-04900
  If the pipeline is being created with fragment shader state, and the
  VK_QCOM_render_pass_shader_resolve extension is enabled, and if the subpass description
contains VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_QCOM, then sampleShadingEnable must be false

• VUID-VkGraphicsPipelineCreateInfo-flags-04901
  If flags includes VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM, then the subpass must be the last subpass in a subpass dependency chain

• VUID-VkGraphicsPipelineCreateInfo-flags-04902
  If flags includes VK_SUBPASS_DESCRIPTION_SHADER_RESOLVE_BIT_QCOM, and if pResolveAttachments is not NULL, then each resolve attachment must be VK_ATTACHMENT_UNUSED

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06575
  If the pipeline is being created with pre-rasterization shader state, fragment shader state, or fragment output interface state, renderPass must be VK_NULL_HANDLE or a valid render pass object

• VUID-VkGraphicsPipelineCreateInfo-dynamicRendering-06576
  If the dynamicRendering feature is not enabled and the pipeline is being created with pre-rasterization shader state, fragment shader state, or fragment output interface state, renderPass must not be VK_NULL_HANDLE

• VUID-VkGraphicsPipelineCreateInfo-multiview-06577
  If the multiview feature is not enabled, the pipeline is being created with pre-rasterization shader state, fragment shader state, or fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::viewMask must be 0

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06578
  If the pipeline is being created with fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::pColorAttachmentFormats must be a valid pointer to an array of colorAttachmentCount valid VkFormat values

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06579
  If the pipeline is being created with fragment output interface state, and renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::colorAttachmentCount is not 0, each element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats must be a valid VkFormat value

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06580
  If the pipeline is being created with fragment output interface state, and renderPass is VK_NULL_HANDLE, and any element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats is not VK_FORMAT_UNDEFINED, that format must be a format with potential format features that include VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06582
  If the pipeline is being created with fragment output interface state, renderPass is VK_NULL_HANDLE, and any element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats is not VK_FORMAT_UNDEFINED, that format must be a format with potential format features that include VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06583
  If the pipeline is being created with fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::depthAttachmentFormat must be a
valid VkFormat value

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06584
  If the pipeline is being created with fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::stencilAttachmentFormat must be a valid VkFormat value

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06585
  If the pipeline is being created with fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::depthAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format with potential format features that include VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06586
  If the pipeline is being created with fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format that includes a depth aspect

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06587
  If the pipeline is being created with fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, depthAttachmentFormat must equal stencilAttachmentFormat

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06588
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with fragment shader state and fragment output interface state, and either of VkPipelineRenderingCreateInfo::depthAttachmentFormat or VkPipelineRenderingCreateInfo::stencilAttachmentFormat are not VK_FORMAT_UNDEFINED, pDepthStencilState must be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06589
  If renderPass is VK_NULL_HANDLE and the pipeline is being created with fragment shader state but not fragment output interface state, pDepthStencilState must be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06590
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with fragment output interface state, and VkPipelineRenderingCreateInfo::colorAttachmentCount is not equal to 0, pColorBlendState must be a valid pointer to a valid VkPipelineColorBlendStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06595
If `renderPass` is `VK_NULL_HANDLE` and the pipeline is being created with fragment output interface state, `pColorBlendState->attachmentCount` must be equal to `VkPipelineRenderingCreateInfo::colorAttachmentCount`.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06056
  If `renderPass` is `VK_NULL_HANDLE` and the pipeline is being created with fragment shader state the fragment shader must not read from any input attachment.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06057
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, the `viewMask` member of a `VkPipelineRenderingCreateInfo` structure included in the `pNext` chain is not 0, and the `multiviewTessellationShader` feature is not enabled, then `pStages` must not include tessellation shaders.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06058
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, the `viewMask` member of a `VkPipelineRenderingCreateInfo` structure included in the `pNext` chain is not 0, and the `multiviewGeometryShader` feature is not enabled, then `pStages` must not include a geometry shader.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06059
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, and the `viewMask` member of a `VkPipelineRenderingCreateInfo` structure included in the `pNext` chain is not 0, shaders in `pStages` must not include variables decorated with the `Layer` built-in decoration in their interfaces.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06061
  If the pipeline is being created with fragment shader state and `renderPass` is `VK_NULL_HANDLE`, fragment shaders in `pStages` must not include the `InputAttachment` capability.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06062
  If the pipeline is being created with fragment output interface state and `renderPass` is `VK_NULL_HANDLE`, for each color attachment format defined by the `pColorAttachmentFormats` member of `VkPipelineRenderingCreateInfo`, if its potential format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06063
  If the pipeline is being created with fragment output interface state and `renderPass` is `VK_NULL_HANDLE`, if the `pNext` chain includes `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV`, the `colorAttachmentCount` member of that structure must be equal to the value of `VkPipelineRenderingCreateInfo::colorAttachmentCount`.

- VUID-VkGraphicsPipelineCreateInfo-flags-06591
  If `pStages` includes a fragment shader stage, and the fragment shader declares the `EarlyFragmentTests` execution mode, the `flags` member of `VkPipelineDepthStencilStateCreateInfo` must not include `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT` or `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`.
If the pipeline is being created with fragment output interface state and the flags member of
VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT,
renderpass must not be VK_NULL_HANDLE.

If the pipeline is being created with fragment output interface state and the flags member
of VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT
or VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT,
renderpass must not be VK_NULL_HANDLE.

If the pipeline is being created with fragment output interface state, elements of the pColorAttachmentSamples member of
VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV must be valid
VkSampleCountFlagBits values.

If the fragment output interface state and the depthStencilAttachmentSamples member of
VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV is not 0, it
must be a valid VkSampleCountFlagBits value.

If the pipeline is being created with fragment output interface state and the flags member of
VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT
subpass must have been created with VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT.

If the pipeline is being created with fragment output interface state and the flags member of
VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT
or VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT,
subpass must have been created with VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT.

If the pipeline is being created with fragment output interface state and the flags member of
VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT,
subpass must have been created with VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT.

If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it
must be equal to stageCount.

If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization
shader state or fragment shader state, and VkMultiviewPerViewAttributesInfoNVX::perViewAttributesPositionXOnly is VK_TRUE then VkMultiviewPerViewAttributesInfoNVX::
::perViewAttributes must also be VK_TRUE

- VUID-VkGraphicsPipelineCreateInfo-flags-06596
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of
  VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BITS_EXT, and an element of
  VkPipelineLibraryCreateInfoKHR::pLibraries includes the other flag, the value of
  VkMultiviewPerViewAttributesInfoNVX::perViewAttributes specified in both this pipeline
  and the library must be equal

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06597
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes
  VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element
  includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BITS_EXT, the value of
  VkMultiviewPerViewAttributesInfoNVX::perViewAttributes specified in both libraries
  must be equal

- VUID-VkGraphicsPipelineCreateInfo-flags-06598
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of
  VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or
  VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BITS_EXT, and an element of
  VkPipelineLibraryCreateInfoKHR::pLibraries includes the other flag, the value of
  VkMultiviewPerViewAttributesInfoNVX::perViewAttributesPositionXOnly specified in both
  this pipeline and the library must be equal

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06599
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes
  VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element
  includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BITS_EXT, the value of
  VkMultiviewPerViewAttributesInfoNVX::perViewAttributesPositionXOnly specified in both
  libraries must be equal

- VUID-VkGraphicsPipelineCreateInfo-flags-06606
  If the graphicsPipelineLibrary feature is not enabled, flags must not include
  VK_PIPELINE_CREATE_LIBRARY_BIT_KHR

- VUID-VkGraphicsPipelineCreateInfo-flags-06607
  If the graphicsPipelineLibrary feature is not enabled, the pipeline must be created with a
  complete set of state

- VUID-VkGraphicsPipelineCreateInfo-flags-06608
  If the pipeline is being created with all possible state subsets, flags must not include
  VK_PIPELINE_CREATE_LIBRARY_BIT_KHR

- VUID-VkGraphicsPipelineCreateInfo-flags-06609
  If flags includes VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT, pipeline libraries
  included via VkPipelineLibraryCreateInfoKHR must have been created with
  VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_EXT

- VUID-VkGraphicsPipelineCreateInfo-flags-06610
  If flags includes VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_EXT, pipeline
  libraries included via VkPipelineLibraryCreateInfoKHR must have been created with
  VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_EXT
• VUID-VkGraphicsPipelineCreateInfo-pLibraries-06611
   Any pipeline libraries included via VkPipelineLibraryCreateInfoKHR:pLibraries must not include any state subset already defined by this structure or defined by any other pipeline library in VkPipelineLibraryCreateInfoKHR:pLibraries

• VUID-VkGraphicsPipelineCreateInfo-flags-06612
   If VkGraphicsPipelineLibraryCreateInfoEXT:flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR:pLibraries includes the other flag, and layout was not created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then the layout used by this pipeline and the library must be identically defined

• VUID-VkGraphicsPipelineCreateInfo-pLibraries-06613
   If one element of VkPipelineLibraryCreateInfoKHR:pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and the layout specified by either library was not created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then the layout used by each library must be identically defined

• VUID-VkGraphicsPipelineCreateInfo-flags-06614
   If VkGraphicsPipelineLibraryCreateInfoEXT:flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of VkPipelineLibraryCreateInfoKHR:pLibraries includes the other subset, and layout was created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then the layout used by the library must also have been created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT

• VUID-VkGraphicsPipelineCreateInfo-pLibraries-06615
   If one element of VkPipelineLibraryCreateInfoKHR:pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and the layout specified by either library was created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then the layout used by both libraries must have been created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT

• VUID-VkGraphicsPipelineCreateInfo-flags-06616
   If VkGraphicsPipelineLibraryCreateInfoEXT:flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of VkPipelineLibraryCreateInfoKHR:pLibraries includes the other subset, and layout was created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, elements of the pSetLayouts array which layout was created with that are not VK_NULL_HANDLE must be identically defined to the element at the same index of pSetLayouts used to create the library's layout

• VUID-VkGraphicsPipelineCreateInfo-pLibraries-06617
   If one element of VkPipelineLibraryCreateInfoKHR:pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element...
includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and the `layout` specified by either library was created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, elements of the `pSetLayouts` array which either `layout` was created with that are not `VK_NULL_HANDLE` must be *identically defined* to the element at the same index of `pSetLayouts` used to create the other library's `layout`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06618**
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other flag, any descriptor set layout `N` specified by `layout` in both this pipeline and the library which include bindings accessed by shader stages in each must be *identically defined*.

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06619**
  If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` and another element includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, any descriptor set layout `N` specified by `layout` in both libraries which include bindings accessed by shader stages in each must be *identically defined*.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06620**
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, and an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other flag, push constants specified in `layout` in both this pipeline and the library which are available to shader stages in each must be *identically defined*.

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06621**
  If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` and another element includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, push constants specified in `layout` in both this pipeline and the library which are available to shader stages in each must be *identically defined*.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06679**
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other subset, and any element of the `pSetLayouts` array which `layout` was created with was `VK_NULL_HANDLE`, then the corresponding element of the `pSetLayouts` array used to create the library's `layout` must not be `VK_NULL_HANDLE`.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06680**
  If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes only one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT` or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes the other subset, and any element of the `pSetLayouts` array used to create the library's `layout` was `VK_NULL_HANDLE`, then
the corresponding element of the pSetLayouts array used to create this pipeline's layout must not be VK_NULL_HANDLE

• VUID-VkGraphicsPipelineCreateInfo-pLibraries-06681
If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and any element of the pSetLayouts array used to create each library's layout was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create the other library's layout must not be VK_NULL_HANDLE

• VUID-VkGraphicsPipelineCreateInfo-flags-06756
If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other subset, and any element of the pSetLayouts array which layout was created with was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create this pipeline's layout must not have shader bindings for shaders in the other subset

• VUID-VkGraphicsPipelineCreateInfo-flags-06757
If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other subset, and any element of the pSetLayouts array used to create the library's layout was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create this pipeline's layout must not have shader bindings for shaders in the other subset

• VUID-VkGraphicsPipelineCreateInfo-pLibraries-06758
If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and any element of the pSetLayouts array used to create each library's layout was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create this pipeline's layout must have been created with no elements of the pSetLayouts array set to VK_NULL_HANDLE

• VUID-VkGraphicsPipelineCreateInfo-flags-06682
If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes both VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, layout must have been created with no elements of the pSetLayouts array set to VK_NULL_HANDLE

• VUID-VkGraphicsPipelineCreateInfo-flags-06683
If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and pRasterizationState->rasterizerDiscardEnable is VK_TRUE, layout must have been created with no elements of the pSetLayouts array set to VK_NULL_HANDLE

• VUID-VkGraphicsPipelineCreateInfo-flags-06684
If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes at least one of and no more than two of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT,
• VUID-VkGraphicsPipelineCreateInfo-pLibraries-06623
If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes at least one of and no more than two of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and another element of VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, the value of subpass must be equal to that used to create the library.

• VUID-VkGraphicsPipelineCreateInfo-renderpass-06624
If renderpass is not VK_NULL_HANDLE, VkGraphicsPipelineLibraryCreateInfoEXT::flags includes at least one of and no more than two of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, renderPass must be compatible with that used to create the library.

• VUID-VkGraphicsPipelineCreateInfo-renderpass-06625
If renderpass is VK_NULL_HANDLE, VkGraphicsPipelineLibraryCreateInfoEXT::flags includes at least one of and no more than two of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, the value of renderPass used to create that library must also be VK_NULL_HANDLE.

• VUID-VkGraphicsPipelineCreateInfo-flags-06626
If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes at least one of and no more than two of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, and renderPass is VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::viewMask used by this pipeline and that specified by the library must be identical.

• VUID-VkGraphicsPipelineCreateInfo-pLibraries-06627
If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes at least one of and no more than two of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, another element of VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, and renderPass was VK_NULL_HANDLE for both libraries, the value of VkPipelineRenderingCreateInfo::viewMask set by each library must be identical.
If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes at least one of `VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT`, `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, or `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, and another element of `VkPipelineLibraryCreateInfoKHR::pLibraries` includes one of the other flags, the `renderPass` objects used to create each library **must** be compatible or all equal to `VK_NULL_HANDLE`.

If the pipeline is being created with fragment shader state `pMultisampleState` **must** be `NULL` or a valid pointer to a valid `VkPipelineMultisampleStateCreateInfo` structure.

If the pipeline is being created with fragment shader state and `renderpass` is not `VK_NULL_HANDLE`, then `pMultisampleState` **must** not be `NULL`.

If the pipeline is being created with fragment shader state with a fragment shader that either enables sample shading or decorates any variable in the `Input` storage class with `Sample`, then `pMultisampleState` **must** not be `NULL`.

If `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT` with a `pMultisampleState` that was not `NULL`, and an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, `pMultisampleState` **must** be identically defined to that used to create the library.

If an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT` with a `pMultisampleState` that was not `NULL`, and if `VkGraphicsPipelineLibraryCreateInfoEXT::flags` includes `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, `pMultisampleState` **must** be identically defined to that used to create the library.

If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT` with a `pMultisampleState` that was not `NULL`, and if a different element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT`, the `pMultisampleState` used to create each library **must** be identically defined.

If one element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT` and a value of `pMultisampleState->sampleShading` equal `VK_TRUE`, and if a different element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, the `pMultisampleState` used to create each library **must** be identically defined.

If an element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT` and a value of `pMultisampleState->sampleShading` equal `VK_TRUE`, and if a different element of `VkPipelineLibraryCreateInfoKHR::pLibraries` was created with `VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT`, the `pMultisampleState` used to create each library **must** be identically defined.
If \( VkGraphicsPipelineLibraryCreateInfoEXT::\text{flags} \) includes 
\( VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT \), 
\( pMultisampleState- >\text{sampleShading} \) is \( VK_TRUE \), and an element of \( VkPipelineLibraryCreateInfoKHR::pLibraries \) was created with 
\( VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT \), the 
\( pMultisampleState \) used to create that library must be identically defined 
\( pMultisampleState \).

- **VUID-VkGraphicsPipelineCreateInfo-flags-06638**
  If \( VkGraphicsPipelineLibraryCreateInfoEXT::\text{flags} \) includes only one of 
\( VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT \) or 
\( VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT \), and an element of 
\( VkPipelineLibraryCreateInfoKHR::pLibraries \) includes the other flag, values specified in 
\( VkPipelineFragmentShadingRateStateCreateInfoKHR \) for both this pipeline and that library must be identical.

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06639**
  If one element of \( VkPipelineLibraryCreateInfoKHR::pLibraries \) includes 
\( VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT \) and another element includes 
\( VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT \), values specified in 
\( VkPipelineFragmentShadingRateStateCreateInfoKHR \) for both this pipeline and that library must be identical.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06640**
  If \( VkGraphicsPipelineLibraryCreateInfoEXT::\text{flags} \) includes 
\( VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT \) or 
\( VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT \), \( pStages \) must be a valid pointer to an array of \( stageCount \) valid \( VkPipelineShaderStageCreateInfo \) structures.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06641**
  If \( VkGraphicsPipelineLibraryCreateInfoEXT::\text{flags} \) includes 
\( VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT \), \( pRasterizationState \) must be a valid pointer to a valid \( VkPipelineRasterizationStateCreateInfo \) structure.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06642**
  If \( VkGraphicsPipelineLibraryCreateInfoEXT::\text{flags} \) includes 
\( VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT \) or 
\( VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT \), layout must be a valid \( VkPipelineLayout \) handle.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06643**
  If \( VkGraphicsPipelineLibraryCreateInfoEXT::\text{flags} \) includes 
\( VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT \), 
\( VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT \), \( VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT \), and \( renderPass \) is not \( VK_NULL_HANDLE \), \( renderPass \) must be a valid \( VkRenderPass \) handle.

- **VUID-VkGraphicsPipelineCreateInfo-flags-06644**
  If \( VkGraphicsPipelineLibraryCreateInfoEXT::\text{flags} \) includes 
\( VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT \) or 
\( VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT \), \( stageCount \) must be greater than \( 0 \).

- **VUID-VkGraphicsPipelineCreateInfo-flags-06645**
  If \( VkGraphicsPipelineLibraryCreateInfoEXT::\text{flags} \) is non-zero, if \( flags \) includes 
\( VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR \), any libraries must have
also been created with `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06646**
  If `VkPipelineLibraryCreateInfoKHR::pLibraries` includes more than one library, and any library was created with `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`, all libraries **must** have also been created with `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`

- **VUID-VkGraphicsPipelineCreateInfo-pLibraries-06647**
  If `VkPipelineLibraryCreateInfoKHR::pLibraries` includes at least one library, `VkGraphicsPipelineLibraryCreateInfoEXT::flags` is non-zero, and any library was created with `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`, flags **must** include `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`

- **VUID-VkGraphicsPipelineCreateInfo-libraryCount-06648**
  If the pipeline is not created with a complete set of state, or `VkPipelineLibraryCreateInfoKHR::libraryCount` is not `0`, `VkGraphicsPipelineShaderGroupsCreateInfoNV::groupCount` and `VkGraphicsPipelineShaderGroupsCreateInfoNV::pipelineCount` **must** be `0`

- **VUID-VkGraphicsPipelineCreateInfo-libraryCount-06649**
  If the pipeline is created with a complete set of state, `VkPipelineLibraryCreateInfoKHR::libraryCount` is `0`, and the `pNext` chain includes an instance of `VkGraphicsPipelineShaderGroupsCreateInfoNV`, `VkGraphicsPipelineShaderGroupsCreateInfoNV::groupCount` **must** be greater than `0`

- **VUID-VkGraphicsPipelineCreateInfo-flags-06729**
  If `flags` includes `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT`, the pipeline includes a complete set of state specified entirely by libraries, and each library was created with a `VkPipelineLayout` created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, then `layout` **must** be a valid `VkPipelineLayout` that is compatible with the union of the libraries' pipeline layouts other than the inclusion/exclusion of `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`

- **VUID-VkGraphicsPipelineCreateInfo-flags-06730**
  If `flags` does not include `VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT`, the pipeline includes a complete set of state specified entirely by libraries, and each library was created with a `VkPipelineLayout` created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, then `layout` **must** be a valid `VkPipelineLayout` that is compatible with the union of the libraries' pipeline layouts

- **VUID-VkGraphicsPipelineCreateInfo-conservativePointAndLineRasterization-06759**
  If `conservativePointAndLineRasterization` is not supported; the pipeline is being created with vertex input state and pre-rasterization shader state; the pipeline does not include a geometry shader; and the value of `VkPipelineInputAssemblyStateCreateInfo::topology` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, then `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode` **must** be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`

- **VUID-VkGraphicsPipelineCreateInfo-conservativePointAndLineRasterization-06760**
  If `conservativePointAndLineRasterization` is not supported, the pipeline is being created with pre-rasterization shader state, and the pipeline includes a geometry shader with
either the OutputPoints or OutputLineStrip execution modes, 
\texttt{VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode} must be \texttt{VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT}

• VUID-VkGraphicsPipelineCreateInfo-conservativePointAndLineRasterization-06761 If conservativePointAndLineRasterization is not supported, the pipeline is being created with pre-rasterization shader state, and the pipeline includes a mesh shader with either the OutputPoints or OutputLinesNV execution modes, 
\texttt{VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode} must be \texttt{VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT}

• VUID-VkGraphicsPipelineCreateInfo-pStages-06894 If the pipeline is being created with pre-rasterization shader state but not fragment shader state, elements of pStages must not have stage set to \texttt{VK_SHADER_STAGE_FRAGMENT_BIT}

• VUID-VkGraphicsPipelineCreateInfo-pStages-06895 If the pipeline is being created with fragment shader state but not pre-rasterization shader state, elements of pStages must not have stage set to a shader stage which participates in pre-rasterization

• VUID-VkGraphicsPipelineCreateInfo-pStages-06896 If the pipeline is being created with pre-rasterization shader state, all elements of pStages must have a stage set to a shader stage which participates in fragment shader state or pre-rasterization shader state

• VUID-VkGraphicsPipelineCreateInfo-stage-06897 If the pipeline is being created with fragment shader state and/or pre-rasterization shader state, any value of stage must not be set in more than one element of pStages

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3TessellationDomainOrigin-07370 If the extendedDynamicState3TessellationDomainOrigin feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to \texttt{VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT}

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClampEnable-07371 If the extendedDynamicState3DepthClampEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to \texttt{VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT}

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3PolygonMode-07372 If the extendedDynamicState3PolygonMode feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to \texttt{VK_DYNAMIC_STATE_POLYGON_MODE_EXT}

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RasterizationSamples-07373 If the extendedDynamicState3RasterizationSamples feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to \texttt{VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT}

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3SampleMask-07374 If the extendedDynamicState3SampleMask feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to \texttt{VK_DYNAMIC_STATE_SAMPLE_MASK_EXT}

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3AlphaToCoverageEnable-
If the `extendedDynamicState3AlphaToCoverageEnable` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3AlphaToOneEnable-07376**
  If the `extendedDynamicState3AlphaToOneEnable` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LogicOpEnable-07377**
  If the `extendedDynamicState3LogicOpEnable` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendEnable-07378**
  If the `extendedDynamicState3ColorBlendEnable` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendEquation-07379**
  If the `extendedDynamicState3ColorBlendEquation` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorWriteMask-07380**
  If the `extendedDynamicState3ColorWriteMask` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RasterizationStream-07381**
  If the `extendedDynamicState3RasterizationStream` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ConservativeRasterizationMode-07382**
  If the `extendedDynamicState3ConservativeRasterizationMode` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ExtraPrimitiveOverestimationSize-07383**
  If the `extendedDynamicState3ExtraPrimitiveOverestimationSize` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClipEnable-07384**
  If the `extendedDynamicState3DepthClipEnable` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT`.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3SampleLocationsEnable-07385**
  If the `extendedDynamicState3SampleLocationsEnable` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT`.  

If the `extendedDynamicState3SampleLocationsEnable` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendAdvanced-07386
  If the `extendedDynamicState3ColorBlendAdvanced` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ProvokingVertexMode-07387
  If the `extendedDynamicState3ProvokingVertexMode` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LineRasterizationMode-07388
  If the `extendedDynamicState3LineRasterizationMode` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LineStippleEnable-07389
  If the `extendedDynamicState3LineStippleEnable` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClipNegativeOneToOne-07390
  If the `extendedDynamicState3DepthClipNegativeOneToOne` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ViewportWScalingEnable-07391
  If the `extendedDynamicState3ViewportWScalingEnable` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ViewportSwizzle-07392
  If the `extendedDynamicState3ViewportSwizzle` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageToColorEnable-07393
  If the `extendedDynamicState3CoverageToColorEnable` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV`

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageToColorLocation-07394
  If the `extendedDynamicState3CoverageToColorLocation` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV`
• **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageModulationMode-07395**
  If the `extendedDynamicState3CoverageModulationMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV`.

• **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageModulationTableEnable-07396**
  If the `extendedDynamicState3CoverageModulationTableEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV`.

• **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageModulationTable-07397**
  If the `extendedDynamicState3CoverageModulationTable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV`.

• **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageReductionMode-07398**
  If the `extendedDynamicState3CoverageReductionMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV`.

• **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RepresentativeFragmentTestEnable-07399**
  If the `extendedDynamicState3RepresentativeFragmentTestEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV`.

• **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ShadingRateImageEnable-07400**
  If the `extendedDynamicState3ShadingRateImageEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV`.

• **VUID-VkGraphicsPipelineCreateInfo-flags-07401**
  Flags **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT`.

**Valid Usage (Implicit)**

• **VUID-VkGraphicsPipelineCreateInfo-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO`.

• **VUID-VkGraphicsPipelineCreateInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkAttachmentSampleCountInfoAMD`, `VkGraphicsPipelineLibraryCreateInfoEXT`, `VkGraphicsPipelineShaderGroupsCreateInfoNV`, `VkMultiviewPerViewAttributesInfoNVX`, `VkPipelineCompilerControlCreateInfoAMD`, `VkPipelineCreationFeedbackCreateInfo`, `VkPipelineDiscardRectangleStateCreateInfoEXT`,...
The `VkPipelineRenderingCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPipelineRenderingCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkFormat* pColorAttachmentFormats;
    VkFormat depthAttachmentFormat;
    VkFormat stencilAttachmentFormat;
} VkPipelineRenderingCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkPipelineRenderingCreateInfo VkPipelineRenderingCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `viewMask` is the viewMask used for rendering.
- `colorAttachmentCount` is the number of entries in `pColorAttachmentFormats`.
- `pColorAttachmentFormats` is a pointer to an array of `VkFormat` values defining the format of color attachments used in this pipeline.
- `depthAttachmentFormat` is a `VkFormat` value defining the format of the depth attachment used in this pipeline.
• **stencilAttachmentFormat** is a **VkFormat** value defining the format of the stencil attachment used in this pipeline.

When a pipeline is created without a **VkRenderPass**, if this structure is present in the **pNext** chain of **VkGraphicsPipelineCreateInfo**, it specifies the view mask and format of attachments used for rendering. If this structure is not specified, and the pipeline does not include a **VkRenderPass**, **viewMask** and **colorAttachmentCount** are 0, and **depthAttachmentFormat** and **stencilAttachmentFormat** are **VK_FORMAT_UNDEFINED**. If a graphics pipeline is created with a valid **VkRenderPass**, parameters of this structure are ignored.

If **depthAttachmentFormat**, **stencilAttachmentFormat**, or any element of **pColorAttachmentFormats** is **VK_FORMAT_UNDEFINED**, it indicates that the corresponding attachment is unused within the render pass. Valid formats indicate that an attachment can be used - but it is still valid to set the attachment to **NULL** when beginning rendering.

---

**Valid Usage (Implicit)**

- VUID-VkPipelineRenderingCreateInfo-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_RENDERING_CREATE_INFO**

Bits which can be set in

- **VkGraphicsPipelineCreateInfo::flags**
- **VkComputePipelineCreateInfo::flags**
- **VkRayTracingPipelineCreateInfoKHR::flags**
- **VkRayTracingPipelineCreateInfoNV::flags**

 specify how a pipeline is created, and are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCreateFlagBits {
    VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT = 0x00000001,
    VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT = 0x00000002,
    VK_PIPELINE_CREATE_DERIVATIVE_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_PIPELINE_CREATE_DISPATCH_BASE_BIT = 0x00000010,
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT = 0x00000100,
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT = 0x00000200,
    // Provided by VK_KHR_dynamic_rendering with VK_KHR_fragment_shading_rate
    VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR = 0x00200000,
    // Provided by VK_KHR_dynamic_rendering with VK_EXT_fragment_density_map
    VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT = 0x00400000,
};
```
// Provided by VK_KHR_ray_tracing_pipeline
VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR = 0x00004000,
// Provided by VK_KHR_ray_tracing_pipeline

    // Provided by VK_EXT_pipeline_creation_cache_control
    VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT =
    VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT,
    // Provided by VK_EXT_pipeline_creation_cache_control
    VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT_EXT =
    VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT,
} VkPipelineCreateFlagBits;

• **VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT** specifies that the created pipeline will not be optimized. Using this flag may reduce the time taken to create the pipeline.

• **VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT** specifies that the pipeline to be created is allowed to be the parent of a pipeline that will be created in a subsequent pipeline creation call.

• **VK_PIPELINE_CREATE_DERIVATIVE_BIT** specifies that the pipeline to be created will be a child of a previously created parent pipeline.

• **VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT** specifies that any shader input variables decorated as `ViewIndex` will be assigned values as if they were decorated as `DeviceIndex`.

• **VK_PIPELINE_CREATE_DISPATCH_BASE** specifies that a compute pipeline can be used with `vkCmdDispatchBase` with a non-zero base workgroup.

• **VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV** specifies that a pipeline is created with all shaders in the deferred state. Before using the pipeline the application must call `vkCompileDeferredNV` exactly once on each shader in the pipeline before using the pipeline.

• **VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR** specifies that the shader compiler should capture statistics for the pipeline executables produced by the compile process which can later be retrieved by calling `vkGetPipelineExecutableStatisticsKHR`. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time.

• **VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR** specifies that the shader compiler should capture the internal representations of pipeline executables produced by the compile process which can later be retrieved by calling `vkGetPipelineExecutableInternalRepresentationsKHR`. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time. When capturing IR from pipelines created with pipeline libraries, there is no guarantee that IR from libraries can be retrieved from the linked pipeline. Applications should retrieve IR from each library, and any linked pipelines, separately.

• **VK_PIPELINE_CREATE_LIBRARY_BIT_KHR** specifies that the pipeline cannot be used directly, and instead defines a pipeline library that can be combined with other pipelines using the `VkPipelineLibraryCreateInfoKHR` structure. This is available in ray tracing and graphics pipelines.

• **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR** specifies that an any-hit shader will always be present when an any-hit shader would be executed. A NULL any-hit shader is an any-hit shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader
group consisting entirely of zeros.

• **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR** specifies that a closest hit shader will always be present when a closest hit shader would be executed. A NULL closest hit shader is a closest hit shader which is effectively **VK_SHADER_UNUSED_KHR**, such as from a shader group consisting entirely of zeros.

• **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR** specifies that a miss shader will always be present when a miss shader would be executed. A NULL miss shader is a miss shader which is effectively **VK_SHADER_UNUSED_KHR**, such as from a shader group consisting entirely of zeros.

• **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR** specifies that an intersection shader will always be present when an intersection shader would be executed. A NULL intersection shader is an intersection shader which is effectively **VK_SHADER_UNUSED_KHR**, such as from a shader group consisting entirely of zeros.

• **VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR** specifies that triangle primitives will be skipped during traversal using **OpTraceRayKHR**.

• **VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR** specifies that AABB primitives will be skipped during traversal using **OpTraceRayKHR**.

• **VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR** specifies that the shader group handles can be saved and reused on a subsequent run (e.g. for trace capture and replay).

• **VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV** specifies that the pipeline can be used in combination with **Device-Generated Commands**.

• **VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT** specifies that pipeline creation will fail if a compile is required for creation of a valid **VkPipeline** object; **VK_PIPELINE_COMPILE_REQUIRED** will be returned by pipeline creation, and the **VkPipeline** will be set to **VK_NULL_HANDLE**.

When creating multiple pipelines, **VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT** specifies that control will be returned to the application if any individual pipeline returns a result which is not **VK_SUCCESS** rather than continuing to create additional pipelines.

• **VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV** specifies that the pipeline is allowed to use **OpTraceRayMotionNV**.

• **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies that the pipeline will be used with a fragment shading rate attachment.

• **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT** specifies that the pipeline will be used with a fragment density map attachment.

• **VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT** specifies that pipeline libraries being linked into this library should have link time optimizations applied. If this bit is omitted, implementations should instead perform linking as rapidly as possible.

• **VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT** specifies that pipeline libraries should retain any information necessary to later perform an optimal link with **VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT**.

• **VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** specifies that the pipeline may be
used with an attachment feedback loop including color attachments.

- **VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** specifies that the pipeline **may** be used with an attachment feedback loop including depth-stencil attachments.
- **VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT** specifies that the pipeline **can** be used with acceleration structures which reference an opacity micromap array.
- **VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT** specifies that the pipeline **must** not be bound to a protected command buffer.
- **VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT** specifies that the pipeline **must** not be bound to an unprotected command buffer.

It is valid to set both **VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT** and **VK_PIPELINE_CREATE_DERIVATIVE_BIT**. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See [Pipeline Derivatives](#) for more information.

When an implementation is looking up a pipeline in a pipeline cache, if that pipeline is being created using linked libraries, implementations should always return an equivalent pipeline created with **VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT** if available, whether or not that bit was specified.

---

**Note**

Using **VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT** (or not) when linking pipeline libraries is intended as a performance tradeoff between host and device. If the bit is omitted, linking should be faster and produce a pipeline more rapidly, but performance of the pipeline on the target device may be reduced. If the bit is included, linking may be slower but should produce a pipeline with device performance comparable to a monolithically created pipeline. Using both options can allow latency-sensitive applications to generate a suboptimal but usable pipeline quickly, and then perform an optimal link in the background, substituting the result for the suboptimally linked pipeline as soon as it is available.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCreateFlags;

VkPipelineCreateFlags is a bitmask type for setting a mask of zero or more VkPipelineCreateFlagBits.

The **VkGraphicsPipelineLibraryCreateInfoEXT** structure is defined as:

```c
// Provided by VK_EXT_graphics_pipeline_library
typedef struct VkGraphicsPipelineLibraryCreateInfoEXT {
    VkStructureType sType;
    void* pNext;
    VkGraphicsPipelineLibraryFlagsEXT flags;
} VkGraphicsPipelineLibraryCreateInfoEXT;
```
• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is a bitmask of VkGraphicsPipelineLibraryFlagBitsEXT specifying the subsets of the graphics pipeline that are being compiled.

If a VkGraphicsPipelineLibraryCreateInfoEXT structure is included in the pNext chain of VkGraphicsPipelineCreateInfo, it specifies the subsets of the graphics pipeline being created, excluding any subsets from linked pipeline libraries. If the pipeline is created with pipeline libraries, state from those libraries is aggregated with said subset.

If this structure is omitted, and either VkGraphicsPipelineCreateInfo::flags includes VK_PIPELINE_CREATE_LIBRARY_BIT_KHR or the VkGraphicsPipelineCreateInfo::pNext chain includes a VkPipelineLibraryCreateInfoKHR structure with a libraryCount greater than 0, it is as if flags is 0. Otherwise if this structure is omitted, it is as if flags includes all possible subsets of the graphics pipeline (i.e. a complete graphics pipeline).

---

**Valid Usage (Implicit)**

- **VUID-VkGraphicsPipelineLibraryCreateInfoEXT-sType-sType**
  
  sType must be VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_LIBRARY_CREATE_INFO_EXT

- **VUID-VkGraphicsPipelineLibraryCreateInfoEXT-flags-parameter**
  
  flags must be a valid combination of VkGraphicsPipelineLibraryFlagBitsEXT values

- **VUID-VkGraphicsPipelineLibraryCreateInfoEXT-flags-requiredbitmask**
  
  flags must not be 0

---

```c
// Provided by VK_EXT_graphics_pipeline_library
typedef VkFlags VkGraphicsPipelineLibraryFlagsEXT;
```

**VkGraphicsPipelineLibraryFlagsEXT** is a bitmask type for setting a mask of zero or more VkGraphicsPipelineLibraryFlagBitsEXT.

Possible values of the flags member of VkGraphicsPipelineLibraryCreateInfoEXT, specifying the subsets of a graphics pipeline to compile are:

```c
// Provided by VK_EXT_graphics_pipeline_library
typedef enum VkGraphicsPipelineLibraryFlagBitsEXT {
    VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT = 0x00000001,
    VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT = 0x00000002,
    VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT = 0x00000004,
    VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT = 0x00000008,
} VkGraphicsPipelineLibraryFlagBitsEXT;
```

- **VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT** specifies that a pipeline will include vertex input interface state.
VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT specifies that a pipeline will include pre-rasterization shader state.

VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT specifies that a pipeline will include fragment shader state.

VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT specifies that a pipeline will include fragment output interface state.

The VkPipelineDynamicStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDynamicStateCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkPipelineDynamicStateCreateFlags flags;
    uint32_t                 dynamicStateCount;
    const VkDynamicState*    pDynamicStates;
} VkPipelineDynamicStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `dynamicStateCount` is the number of elements in the `pDynamicStates` array.
- `pDynamicStates` is a pointer to an array of `VkDynamicState` values specifying which pieces of pipeline state will use the values from dynamic state commands rather than from pipeline state creation information.

### Valid Usage

- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-01442
  Each element of `pDynamicStates` must be unique

### Valid Usage (Implicit)

- VUID-VkPipelineDynamicStateCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_DYNAMIC_STATE_CREATE_INFO`

- VUID-VkPipelineDynamicStateCreateInfo-pNext-pNext
  `pNext` must be NULL

- VUID-VkPipelineDynamicStateCreateInfo-flags-zerobitmask
  `flags` must be 0

- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-parameter
  If `dynamicStateCount` is not 0, `pDynamicStates` must be a valid pointer to an array of `VkDynamicState` values
typedef VkFlags VkPipelineDynamicStateCreateFlags;

VkPipelineDynamicStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The source of different pieces of dynamic state is specified by the VkPipelineDynamicStateCreateInfo::pDynamicStates property of the currently active pipeline, each of whose elements must be one of the values:

typedef enum VkDynamicState {
    VK_DYNAMIC_STATE_VIEWPORT = 0,
    VK_DYNAMIC_STATE_SCISSOR = 1,
    VK_DYNAMIC_STATE_LINE_WIDTH = 2,
    VK_DYNAMIC_STATE_DEPTH_BIAS = 3,
    VK_DYNAMIC_STATE_BLEND_CONSTANTS = 4,
    VK_DYNAMIC_STATE_DEPTH_BOUNDS = 5,
    VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK = 6,
    VK_DYNAMIC_STATE_STENCIL_WRITE_MASK = 7,
    VK_DYNAMIC_STATE_STENCIL_REFERENCE = 8,
    // Provided by VK_VERSION_1_3

} VkDynamicState;

• VK_DYNAMIC_STATE_VIEWPORT specifies that the pViewports state in VkPipelineViewportStateCreateInfo will be ignored and must be set dynamically with vkCmdSetViewport before any drawing commands. The number of viewports used by a pipeline is still specified by the viewportCount member of VkPipelineViewportStateCreateInfo.

• VK_DYNAMIC_STATE_SCISSOR specifies that the pScissors state in VkPipelineViewportStateCreateInfo will be ignored and must be set dynamically with vkCmdSetScissor before any drawing commands. The number of scissor rectangles used by a pipeline is still specified by the scissorCount member of VkPipelineViewportStateCreateInfo.

• VK_DYNAMIC_STATE_LINE_WIDTH specifies that the lineWidth state in VkPipelineRasterizationStateCreateInfo will be ignored and must be set dynamically with vkCmdSetLineWidth before any drawing commands that generate line primitives for the rasterizer.

• VK_DYNAMIC_STATE_DEPTH_BIAS specifies that the depthBiasConstantFactor, depthBiasClamp and depthBiasSlopeFactor states in VkPipelineRasterizationStateCreateInfo will be ignored and must be set dynamically with vkCmdSetDepthBias before any draws are performed with depthBiasEnable in VkPipelineRasterizationStateCreateInfo set to VK_TRUE.

• VK_DYNAMIC_STATE_BLEND_CONSTANTS specifies that the blendConstants state in VkPipelineColorBlendStateCreateInfo will be ignored and must be set dynamically with vkCmdSetBlendConstants before any draws are performed with a pipeline state with VkPipelineColorBlendAttachmentState member blendEnable set to VK_TRUE and any of the blend functions using a constant blend color.

• VK_DYNAMIC_STATE_DEPTH_BOUNDS specifies that the minDepthBounds and maxDepthBounds states of VkPipelineDepthStencilStateCreateInfo will be ignored and must be set dynamically with
vkCmdSetDepthBounds before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member depthBoundsTestEnable set to VK_TRUE.

- **VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK** specifies that the compareMask state in VkPipelineDepthStencilStateCreateInfo for both front and back will be ignored and **must** be set dynamically with vkCmdSetStencilCompareMask before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member stencilTestEnable set to VK_TRUE

- **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** specifies that the writeMask state in VkPipelineDepthStencilStateCreateInfo for both front and back will be ignored and **must** be set dynamically with vkCmdSetStencilWriteMask before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member stencilTestEnable set to VK_TRUE

- **VK_DYNAMIC_STATE_STENCIL_REFERENCE** specifies that the reference state in VkPipelineDepthStencilStateCreateInfo for both front and back will be ignored and **must** be set dynamically with vkCmdSetStencilReference before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member stencilTestEnable set to VK_TRUE

- **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV** specifies that the pViewportWScalings state in VkPipelineViewportWScalingStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetViewportWScalingNV before any draws are performed with a pipeline state with VkPipelineViewportWScalingStateCreateInfoNV member viewportScalingEnable set to VK_TRUE

- **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT** specifies that the pDiscardRectangles state in VkPipelineDiscardRectangleStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetDiscardRectangleEXT before any draw or clear commands. The VkDiscardRectangleModeEXT and the number of active discard rectangles is still specified by the discardRectangleMode and discardRectangleCount members of VkPipelineDiscardRectangleStateCreateInfoEXT.

- **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** specifies that the sampleLocationsInfo state in VkPipelineSampleLocationsStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetSampleLocationsEXT before any draw or clear commands. Enabling custom sample locations is still indicated by the sampleLocationsEnable member of VkPipelineSampleLocationsStateCreateInfoEXT.

- **VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV** specifies that the pExclusiveScissors state in VkPipelineViewportExclusiveScissorStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetExclusiveScissorNV before any drawing commands. The number of exclusive scissor rectangles used by a pipeline is still specified by the exclusiveScissorCount member of VkPipelineViewportExclusiveScissorStateCreateInfoNV.

- **VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV** specifies that the pShadingRatePalettes state in VkPipelineViewportShadingRateImageStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetViewportShadingRatePaletteNV before any drawing commands.

- **VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV** specifies that the coarse sample order state in VkPipelineViewportCoarseSampleOrderStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetViewportCoarseSampleOrderNV before any drawing commands.

- **VK_DYNAMIC_STATE_LINE_STIPPLE_EXT** specifies that the lineStippleFactor and lineStipplePattern state in VkPipelineRasterizationLineStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetLineStippleEXT before any draws are performed with a pipeline.
state with `VkPipelineRasterizationLineStateCreateInfoEXT` member `stippledLineEnable` set to `VK_TRUE`.

- **VK_DYNAMIC_STATE_CULL_MODE** specifies that the `cullMode` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetCullMode` before any drawing commands.

- **VK_DYNAMIC_STATE_FRONT_FACE** specifies that the `frontFace` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetFrontFace` before any drawing commands.

- **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY** specifies that the `topology` state in `VkPipelineInputAssemblyStateCreateInfo` only specifies the topology class, and the specific topology order and adjacency **must** be set dynamically with `vkCmdSetPrimitiveTopology` before any drawing commands.

- **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** specifies that the `viewportCount` and `pViewports` state in `VkPipelineViewportStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetViewportWithCount` before any draw call.

- **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** specifies that the `scissorCount` and `pScissors` state in `VkPipelineViewportStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetScissorWithCount` before any draw call.

- **VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE** specifies that the `stride` state in `VkVertexInputBindingDescription` will be ignored and **must** be set dynamically with `vkCmdBindVertexBuffers2` before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE** specifies that the `depthTestEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthTestEnable` before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE** specifies that the `depthWriteEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthWriteEnable` before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_COMPARE_OP** specifies that the `depthCompareOp` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthCompareOp` before any draw call.

- **VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE** specifies that the `depthBoundsTestEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthBoundsTestEnable` before any draw call.

- **VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE** specifies that the `stencilTestEnable` state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetStencilTestEnable` before any draw call.

- **VK_DYNAMIC_STATE_STENCIL_OP** specifies that the `failOp`, `passOp`, `depthFailOp`, and `compareOp` states in `VkPipelineDepthStencilStateCreateInfo` for both `front` and `back` will be ignored and **must** be set dynamically with `vkCmdSetStencilOp` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to `VK_TRUE`.

- **VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT** specifies that the `patchControlPoints` state in `VkPipelineTessellationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetPatchControlPointsEXT` before any drawing commands.
• **VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE** specifies that the `rasterizerDiscardEnable` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetRasterizerDiscardEnable` before any drawing commands.

• **VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE** specifies that the `depthBiasEnable` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthBiasEnable` before any drawing commands.

• **VK_DYNAMIC_STATE_LOGIC_OP_EXT** specifies that the `logicOp` state in `VkPipelineColorBlendStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetLogicOpEXT` before any drawing commands.

• **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE** specifies that the `primitiveRestartEnable` state in `VkPipelineInputAssemblyStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetPrimitiveRestartEnable` before any drawing commands.

• **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** specifies that state in `VkPipelineFragmentShadingRateStateCreateInfoKHR` and ` VkPipelineFragmentShadingRateEnumStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetFragmentShadingRateKHR` or `vkCmdSetFragmentShadingRateEnumNV` before any drawing commands.

• **VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR** specifies that the default stack size computation for the pipeline will be ignored and **must** be set dynamically with `vkCmdSetRayTracingPipelineStackSizeKHR` before any ray tracing calls are performed.

• **VK_DYNAMIC_STATE_VERTEX_INPUT_EXT** specifies that the `pVertexInputState` state will be ignored and **must** be set dynamically with `vkCmdSetVertexInputEXT` before any drawing commands.

• **VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT** specifies that the `pColorWriteEnables` state in `VkPipelineColorWriteCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetColorWriteEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT** specifies that the `domainOrigin` state in `VkPipelineTessellationDomainOriginStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetTessellationDomainOriginEXT` before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT** specifies that the `depthClampEnable` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthClampEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_POLYGON_MODE_EXT** specifies that the `polygonMode` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetPolygonModeEXT` before any draw call.

• **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** specifies that the `rasterizationSamples` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetRasterizationSamplesEXT` before any draw call.

• **VK_DYNAMIC_STATE_SAMPLE_MASK_EXT** specifies that the `pSampleMask` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetSampleMaskEXT` before any draw call.

• **VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT** specifies that the `alphaToCoverageEnable` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetAlphaToCoverageEnableEXT` before any draw call.
• **VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT** specifies that the `alphaToOneEnable` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetAlphaToOneEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT** specifies that the `logicOpEnable` state in ` VkPipelineColorBlendStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetLogicOpEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT** specifies that the `blendEnable` state in `VkPipelineColorBlendAttachmentState` will be ignored and **must** be set dynamically with `vkCmdSetColorBlendEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT** specifies that the `srcColorBlendFactor`, `dstColorBlendFactor`, `colorBlendOp`, `srcAlphaBlendFactor`, `dstAlphaBlendFactor`, and `alphaBlendOp` states in `VkPipelineColorBlendAttachmentState` will be ignored and **must** be set dynamically with `vkCmdSetColorBlendEquationEXT` before any draw call.

• **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** specifies that the `colorWriteMask` state in `VkPipelineColorBlendAttachmentState` will be ignored and **must** be set dynamically with `vkCmdSetColorWriteMaskEXT` before any draw call.

• **VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT** specifies that the `rasterizationStream` state in `VkPipelineRasterizationStateStreamCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetRasterizationStreamEXT` before any draw call.

• **VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT** specifies that the `conservativeRasterizationMode` state in `VkPipelineRasterizationConservativeStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetConservativeRasterizationModeEXT` before any draw call.

• **VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT** specifies that the `extraPrimitiveOverestimationSize` state in `VkPipelineRasterizationConservativeStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetExtraPrimitiveOverestimationSizeEXT` before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT** specifies that the `depthClipEnable` state in `VkPipelineRasterizationDepthClipStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetDepthClipEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT** specifies that the `sampleLocationsEnable` state in `VkPipelineSampleLocationsStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetSampleLocationsEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT** specifies that the `colorBlendOp` state in `VkPipelineColorBlendAttachmentState`, and `srcPremultiplied`, `dstPremultiplied`, and `blendOverlap` states in `VkPipelineColorBlendAdvancedStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetColorBlendAdvancedEXT` before any draw call.

• **VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT** specifies that the `provokingVertexMode` state in `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetProvokingVertexModeEXT` before any draw call.

• **VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT** specifies that the `lineRasterizationMode` state in `VkPipelineRasterizationLineStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetLineRasterizationModeEXT` before any draw call.
• **VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT** specifies that the *stippledLineEnable* state in *VkPipelineRasterizationLineStateCreateInfoEXT* will be ignored and **must** be set dynamically with *vkCmdSetLineStippleEnableEXT* before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT** specifies that the *negativeOneToOne* state in *VkPipelineViewportDepthClipControlCreateInfoEXT* will be ignored and **must** be set dynamically with *vkCmdSetDepthClipNegativeOneToOneEXT* before any draw call.

• **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV** specifies that the *viewportWScalingEnable* state in *VkPipelineViewportWScalingStateCreateInfoNV* will be ignored and **must** be set dynamically with *vkCmdSetViewportWScalingEnableNV* before any draw call.

• **VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV** specifies that the *viewportCount*, and *pViewportSwizzles* states in *VkPipelineViewportSwizzleStateCreateInfoNV* will be ignored and **must** be set dynamically with *vkCmdSetViewportSwizzleNV* before any draw call.

• **VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV** specifies that the *coverageToColorEnable* state in *VkPipelineCoverageToColorStateCreateInfoNV* will be ignored and **must** be set dynamically with *vkCmdSetCoverageToColorEnableNV* before any draw call.

• **VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV** specifies that the *coverageToColorLocation* state in *VkPipelineCoverageToColorStateCreateInfoNV* will be ignored and **must** be set dynamically with *vkCmdSetCoverageToColorLocationNV* before any draw call.

• **VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV** specifies that the *coverageModulationMode* state in *VkPipelineCoverageModulationStateCreateInfoNV* will be ignored and **must** be set dynamically with *vkCmdSetCoverageModulationModeNV* before any draw call.

• **VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV** specifies that the *coverageModulationTableEnable* state in *VkPipelineCoverageModulationStateCreateInfoNV* will be ignored and **must** be set dynamically with *vkCmdSetCoverageModulationTableEnableNV* before any draw call.

• **VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV** specifies that the *coverageModulationTableCount*, and *pCoverageModulationTable* states in *VkPipelineCoverageModulationStateCreateInfoNV* will be ignored and **must** be set dynamically with *vkCmdSetCoverageModulationTableNV* before any draw call.

• **VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV** specifies that the *shadingRateImageEnable* state in *VkPipelineViewportShadingRateImageStateCreateInfoNV* will be ignored and **must** be set dynamically with *vkCmdSetShadingRateImageEnableNV* before any draw call.

• **VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV** specifies that the *representativeFragmentTestEnable* state in *VkPipelineRepresentativeFragmentTestStateCreateInfoNV* will be ignored and **must** be set dynamically with *vkCmdSetRepresentativeFragmentTestEnableNV* before any draw call.

• **VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV** specifies that the *coverageReductionMode* state in *VkPipelineCoverageReductionStateCreateInfoNV* will be ignored and **must** be set dynamically with *vkCmdSetCoverageReductionModeNV* before any draw call.

### 10.2.1. Valid Combinations of Stages for Graphics Pipelines

Primitive processing can be handled either on a per primitive basis by the vertex, tessellation, and geometry shader stages, or on a per mesh basis using task and mesh shader stages. If the pipeline
includes a mesh shader stage, it uses the mesh pipeline, otherwise it uses the primitive pipeline.

If a task shader is omitted, the task shading stage is skipped.

If tessellation shader stages are omitted, the tessellation shading and fixed-function stages of the pipeline are skipped.

If a geometry shader is omitted, the geometry shading stage is skipped.

If a fragment shader is omitted, fragment color outputs have undefined values, and the fragment depth value is determined by Fragment Operations state. This can be useful for depth-only rendering.

Presence of a shader stage in a pipeline is indicated by including a valid VkPipelineShaderStageCreateInfo with module and pName selecting an entry point from a shader module, where that entry point is valid for the stage specified by stage.

Presence of some of the fixed-function stages in the pipeline is implicitly derived from enabled shaders and provided state. For example, the fixed-function tessellator is always present when the pipeline has valid Tessellation Control and Tessellation Evaluation shaders.

For example:

- Depth/stencil-only rendering in a subpass with no color attachments
  - Active Pipeline Shader Stages
    - Vertex Shader
  - Required: Fixed-Function Pipeline Stages
    - VkPipelineVertexInputStateCreateInfo
    - VkPipelineInputAssemblyStateCreateInfo
    - VkPipelineViewportStateCreateInfo
    - VkPipelineRasterizationStateCreateInfo
    - VkPipelineMultisampleStateCreateInfo
    - VkPipelineDepthStencilStateCreateInfo
- Color-only rendering in a subpass with no depth/stencil attachment
  - Active Pipeline Shader Stages
    - Vertex Shader
    - Fragment Shader
  - Required: Fixed-Function Pipeline Stages
    - VkPipelineVertexInputStateCreateInfo
    - VkPipelineInputAssemblyStateCreateInfo
    - VkPipelineViewportStateCreateInfo
    - VkPipelineRasterizationStateCreateInfo
    - VkPipelineMultisampleStateCreateInfo
• VkPipelineColorBlendStateCreateInfo

- Rendering pipeline with tessellation and geometry shaders
  ◦ Active Pipeline Shader Stages
    ▪ Vertex Shader
    ▪ Tessellation Control Shader
    ▪ Tessellation Evaluation Shader
    ▪ Geometry Shader
    ▪ Fragment Shader
  ◦ Required: Fixed-Function Pipeline Stages
    ▪ VkPipelineVertexInputStateCreateInfo
    ▪ VkPipelineInputAssemblyStateCreateInfo
    ▪ VkPipelineTessellationStateCreateInfo
    ▪ VkPipelineViewportStateCreateInfo
    ▪ VkPipelineRasterizationStateCreateInfo
    ▪ VkPipelineMultisampleStateCreateInfo
    ▪ VkPipelineDepthStencilStateCreateInfo
    ▪ VkPipelineColorBlendStateCreateInfo

- Rendering pipeline with task and mesh shaders
  ◦ Active Pipeline Shader Stages
    ▪ Task Shader
    ▪ Mesh Shader
    ▪ Fragment Shader
  ◦ Required: Fixed-Function Pipeline Stages
    ▪ VkPipelineViewportStateCreateInfo
    ▪ VkPipelineRasterizationStateCreateInfo
    ▪ VkPipelineMultisampleStateCreateInfo
    ▪ VkPipelineDepthStencilStateCreateInfo
    ▪ VkPipelineColorBlendStateCreateInfo

10.2.2. Graphics Pipeline Shader Groups

Graphics pipelines can contain multiple shader groups that can be bound individually. Each shader group behaves as if it was a pipeline using the shader group’s state. When the pipeline is bound by regular means, it behaves as if the state of group 0 is active, use vkCmdBindPipelineShaderGroupNV to bind an individual shader group.

The primary purpose of shader groups is allowing the device to bind different pipeline state using Device-Generated Commands.
The `VkGraphicsPipelineShaderGroupsCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkGraphicsPipelineShaderGroupsCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t groupCount;
    const VkGraphicsShaderGroupCreateInfoNV* pGroups;
    uint32_t pipelineCount;
    const VkPipeline* pPipelines;
} VkGraphicsPipelineShaderGroupsCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `groupCount` is the number of elements in the `pGroups` array.
- `pGroups` is a pointer to an array of `VkGraphicsShaderGroupCreateInfoNV` structures specifying which state of the original `VkGraphicsPipelineCreateInfo` each shader group overrides.
- `pipelineCount` is the number of elements in the `pPipelines` array.
- `pPipelines` is a pointer to an array of graphics `VkPipeline` structures which are referenced within the created pipeline, including all their shader groups.

When referencing shader groups by index, groups defined in the referenced pipelines are treated as if they were defined as additional entries in `pGroups`. They are appended in the order they appear in the `pPipelines` array and in the `pGroups` array when those pipelines were defined.

The application **must** maintain the lifetime of all such referenced pipelines based on the pipelines that make use of them.

**Valid Usage**

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-groupCount-02879
  
  `groupCount` **must** be at least 1 and as maximum `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxGraphicsShaderGroupCount`

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-groupCount-02880
  
  The sum of `groupCount` including those groups added from referenced `pPipelines` **must** also be as maximum `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxGraphicsShaderGroupCount`

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02881
  
  The state of the first element of `pGroups` **must** match its equivalent within the parent's `VkGraphicsPipelineCreateInfo`

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02882
  
  Each element of `pGroups` **must** in combination with the rest of the pipeline state yield a valid state configuration

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02884
All elements of `pGroups` must use the same shader stage combinations unless any mesh shader stage is used, then either combination of task and mesh or just mesh shader is valid

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02885
  Mesh and regular primitive shading stages cannot be mixed across `pGroups`

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pPipelines-02886
  Each element of `pPipelines` must have been created with identical state to the pipeline currently created except the state that can be overridden by `VkGraphicsShaderGroupCreateInfoNV`

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-deviceGeneratedCommands-02887
  The `deviceGeneratedCommands` feature must be enabled

### Valid Usage (Implicit)

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_SHADER_GROUPS_CREATE_INFO_NV`

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-parameter
  If `groupCount` is not 0, `pGroups` must be a valid pointer to an array of `groupCount` valid `VkGraphicsShaderGroupCreateInfoNV` structures

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pPipelines-parameter
  If `pipelineCount` is not 0, `pPipelines` must be a valid pointer to an array of `pipelineCount` valid `VkPipeline` handles

The `VkGraphicsShaderGroupCreateInfoNV` structure provides the state overrides for each shader group. Each shader group behaves like a pipeline that was created from its state as well as the remaining parent’s state. It is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkGraphicsShaderGroupCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    const VkPipelineVertexInputStateCreateInfo* pVertexInputState;
    const VkPipelineTessellationStateCreateInfo* pTessellationState;
} VkGraphicsShaderGroupCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array `VkPipelineShaderStageCreateInfo` structures specifying the set of the shader stages to be included in this shader group.
• `pVertexInputState` is a pointer to a `VkPipelineVertexInputStateCreateInfo` structure.

• `pTessellationState` is a pointer to a `VkPipelineTessellationStateCreateInfo` structure, and is ignored if the shader group does not include a tessellation control shader stage and tessellation evaluation shader stage.

### Valid Usage

- VUID-VkGraphicsShaderGroupCreateInfoNV-stageCount-02888
  For `stageCount`, the same restrictions as in `VkGraphicsPipelineCreateInfo::stageCount` apply

- VUID-VkGraphicsShaderGroupCreateInfoNV-pStages-02889
  For `pStages`, the same restrictions as in `VkGraphicsPipelineCreateInfo::pStages` apply

- VUID-VkGraphicsShaderGroupCreateInfoNV-pVertexInputState-02890
  For `pVertexInputState`, the same restrictions as in `VkGraphicsPipelineCreateInfo::pVertexInputState` apply

- VUID-VkGraphicsShaderGroupCreateInfoNV-pTessellationState-02891
  For `pTessellationState`, the same restrictions as in `VkGraphicsPipelineCreateInfo::pTessellationState` apply

### Valid Usage (Implicit)

- VUID-VkGraphicsShaderGroupCreateInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_GRAPHICS_SHADER_GROUP_CREATE_INFO_NV`

- VUID-VkGraphicsShaderGroupCreateInfoNV-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkGraphicsShaderGroupCreateInfoNV-pStages-parameter
  `pStages` must be a valid pointer to an array of `stageCount` valid `VkPipelineShaderStageCreateInfo` structures

- VUID-VkGraphicsShaderGroupCreateInfoNV-stageCount-arraylength
  `stageCount` must be greater than 0

### 10.3. Ray Tracing Pipelines

Ray tracing pipelines consist of multiple shader stages, fixed-function traversal stages, and a pipeline layout.

`VK_SHADER_UNUSED_KHR` is a special shader index used to indicate that a ray generation, miss, or callable shader member is not used.

```c
#define VK_SHADER_UNUSED_KHR (~0U)
```

or the equivalent
To create ray tracing pipelines, call:

```c
// Provided by VK_NV_ray_tracing
VkResult vkCreateRayTracingPipelinesNV(
    VkDevice device,
    VkPipelineCache pipelineCache,
    uint32_t createInfoCount,
    const VkRayTracingPipelineCreateInfoNV* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkPipeline* pPipelines);
```

- `device` is the logical device that creates the ray tracing pipelines.
- `pipelineCache` is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled, or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of `VkRayTracingPipelineCreateInfoNV` structures.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelines` is a pointer to an array in which the resulting ray tracing pipeline objects are returned.

**Valid Usage**

- VUID-vkCreateRayTracingPipelinesNV-flags-03415
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the `basePipelineIndex` member of that same element is not `-1`, `basePipelineIndex` must be less than the index into `pCreateInfos` that corresponds to that element.

- VUID-vkCreateRayTracingPipelinesNV-flags-03416
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline must have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set.

- VUID-vkCreateRayTracingPipelinesNV-flags-03816
  `flags` must not contain the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag.

- VUID-vkCreateRayTracingPipelinesNV-pipelineCache-02903
  If `pipelineCache` was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, host access to `pipelineCache` must be `externally synchronized`.
Valid Usage (Implicit)

- VUID-vkCreateRayTracingPipelinesNV-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkCreateRayTracingPipelinesNV-pipelineCache-parameter
  
  If pipelineCache is not VK_NULL_HANDLE, pipelineCache must be a valid VkPipelineCache handle

- VUID-vkCreateRayTracingPipelinesNV-pCreateInfos-parameter
  
  pCreateInfos must be a valid pointer to an array of createInfoCount valid VkRayTracingPipelineCreateInfoNV structures

- VUID-vkCreateRayTracingPipelinesNV-pAllocator-parameter
  
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateRayTracingPipelinesNV-pPipelines-parameter
  
  pPipelines must be a valid pointer to an array of createInfoCount VkPipeline handles

- VUID-vkCreateRayTracingPipelinesNV-createInfoCount-arraylength
  
  createInfoCount must be greater than 0

- VUID-vkCreateRayTracingPipelinesNV-pipelineCache-parent
  
  If pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_PIPELINE_COMPILE_REQUIRED_EXT

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_SHADER_NV

To create ray tracing pipelines, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkCreateRayTracingPipelinesKHR(
    VkDevice device,                      device,
    VkDeferredOperationKHR deferredOperation,   deferredOperation,
    VkPipelineCache pipelineCache,            pipelineCache,
    uint32_t createInfoCount,                 createInfoCount,
    const VkRayTracingPipelineCreateInfoKHR* pCreateInfos,  pCreateInfos,
    const VkAllocationCallbacks* pAllocator,  pAllocator,
);
```
VkPipeline* pPipelines);

- `device` is the logical device that creates the ray tracing pipelines.
- `deferredOperation` is `VK_NULL_HANDLE` or the handle of a valid `VkDeferredOperationKHR` request deferral object for this command.
- `pipelineCache` is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled, or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of `VkRayTracingPipelineCreateInfoKHR` structures.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelines` is a pointer to an array in which the resulting ray tracing pipeline objects are returned.

The `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS` error is returned if the implementation is unable to re-use the shader group handles provided in `VkRayTracingShaderGroupCreateInfoKHR ::pShaderGroupCaptureReplayHandle` when `VkPhysicalDeviceRayTracingPipelineFeaturesKHR ::rayTracingPipelineShaderGroupHandleCaptureReplay` is enabled.

### Valid Usage

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03415**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the `basePipelineIndex` member of that same element is not `-1`, `basePipelineIndex` must be less than the index into `pCreateInfos` that corresponds to that element.

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03416**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline must have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set.

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03816**
  `flags` must not contain the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag.

- **VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-02903**
  If `pipelineCache` was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, host access to `pipelineCache` must be externally synchronized.

- **VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03677**
  If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object.

- **VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03678**
  Any previous deferred operation that was associated with `deferredOperation` must be complete.

- **VUID-vkCreateRayTracingPipelinesKHR-rayTracingPipeline-03586**
  684
The **rayTracingPipeline** feature **must** be enabled

- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03587
  If `deferredOperation` is not `VK_NULL_HANDLE`, the `flags` member of elements of `pCreateInfos` **must** not include `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`

### Valid Usage (Implicit)

- VUID-vkCreateRayTracingPipelinesKHR-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-parameter
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` **must** be a valid `VkDeferredOperationKHR` handle

- VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-parameter
  If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` **must** be a valid `VkPipelineCache` handle

- VUID-vkCreateRayTracingPipelinesKHR-pCreateInfos-parameter
  `pCreateInfos` **must** be a valid pointer to an array of `createInfoCount` valid `VkRayTracingPipelineCreateInfoKHR` structures

- VUID-vkCreateRayTracingPipelinesKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateRayTracingPipelinesKHR-pPipelines-parameter
  `pPipelines` **must** be a valid pointer to an array of `createInfoCount` `VkPipeline` handles

- VUID-vkCreateRayTracingPipelinesKHR-createInfoCount-arraylength
  `createInfoCount` **must** be greater than `0`

- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-parent
  If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

- VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-parent
  If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`
- `VK_PIPELINE_COMPILE_REQUIRED_EXT`
The `VkRayTracingPipelineCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkRayTracingPipelineCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    uint32_t groupCount;
    const VkRayTracingShaderGroupCreateInfoNV* pGroups;
    uint32_t maxRecursionDepth;
    VkPipelineLayout layout;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkRayTracingPipelineCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array of `VkPipelineShaderStageCreateInfo` structures specifying the set of the shader stages to be included in the ray tracing pipeline.
- `groupCount` is the number of entries in the `pGroups` array.
- `pGroups` is a pointer to an array of `VkRayTracingShaderGroupCreateInfoNV` structures describing the set of the shader stages to be included in each shader group in the ray tracing pipeline.
- `maxRecursionDepth` is the maximum recursion depth of shaders executed by this pipeline.
- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- `basePipelineHandle` is a pipeline to derive from.
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in Pipeline Derivatives.
Valid Usage

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03421**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` must be a valid handle to a ray tracing `VkPipeline`.

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03422**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` must be a valid index into the calling command's `pCreateInfos` parameter.

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03423**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is not -1, `basePipelineHandle` must be `VK_NULL_HANDLE`.

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03424**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is not `VK_NULL_HANDLE`, `basePipelineIndex` must be -1.

- **VUID-VkRayTracingPipelineCreateInfoNV-pStages-03426**
  The shader code for the entry points identified by `pStages`, and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter.

- **VUID-VkRayTracingPipelineCreateInfoNV-layout-03427**
  `layout` must be consistent with all shaders specified in `pStages`.

- **VUID-VkRayTracingPipelineCreateInfoNV-layout-03428**
  The number of resources in `layout` accessible to each shader stage that is used by the pipeline must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`.

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-02904**
  `flags` must not include `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`.

- **VUID-VkRayTracingPipelineCreateInfoNV-pipelineCreationCacheControl-02905**
  If the `pipelineCreationCacheControl` feature is not enabled, `flags` must not include `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` or `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`.

- **VUID-VkRayTracingPipelineCreateInfoNV-stage-06232**
  The `stage` member of at least one element of `pStages` must be `VK_SHADER_STAGE_RAYGEN_BIT_KHR`.

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03456**
  `flags` must not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`.

- **VUID-VkRayTracingPipelineCreateInfoNV-maxRecursionDepth-03457**
  `maxRecursionDepth` must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxRecursionDepth`.

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03458**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`.

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03459**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`.
VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03460**
  - `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03461**
  - `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03462**
  - `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03463**
  - `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-03588**
  - `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-04948**
  - `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV`

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-02957**
  - `flags` must not include both `VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV` and `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` at the same time

- **VUID-VkRayTracingPipelineCreateInfoNV-pipelineStageCreationFeedbackCount-06651**
  - If `VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount` is not 0, it must be equal to `stageCount`

- **VUID-VkRayTracingPipelineCreateInfoNV-stage-06898**
  - The `stage` value in all `pStages` elements must be one of `VK_SHADER_STAGE_RAYGEN_BIT_KHR`, `VK_SHADER_STAGE_ANY_HIT_BIT_KHR`, `VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR`, `VK_SHADER_STAGE_MISS_BIT_KHR`, `VK_SHADER_STAGE_INTERSECTION_BIT_KHR`, or `VK_SHADER_STAGE_CALLABLE_BIT_KHR`

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-07402**
  - `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT`

---

**Valid Usage (Implicit)**

- **VUID-VkRayTracingPipelineCreateInfoNV-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CREATE_INFO_NV`

- **VUID-VkRayTracingPipelineCreateInfoNV-pNext-pNext**
  - `pNext` must be `NULL` or a pointer to a valid instance of `VkPipelineCreationFeedbackCreateInfo`

- **VUID-VkRayTracingPipelineCreateInfoNV-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkRayTracingPipelineCreateInfoNV-flags-parameter**
  - `flags` must be a valid combination of `VkPipelineCreateFlagBits` values

- **VUID-VkRayTracingPipelineCreateInfoNV-pStages-parameter**
pStages must be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures

- VUID-VkRayTracingPipelineCreateInfoNV-pGroups-parameter
pGroups must be a valid pointer to an array of groupCount valid VkRayTracingShaderGroupCreateInfoNV structures

- VUID-VkRayTracingPipelineCreateInfoNV-layout-parameter
layout must be a valid VkPipelineLayout handle

- VUID-VkRayTracingPipelineCreateInfoNV-stageCount-arraylength
stageCount must be greater than 0

- VUID-VkRayTracingPipelineCreateInfoNV-groupCount-arraylength
groupCount must be greater than 0

- VUID-VkRayTracingPipelineCreateInfoNV-commonparent
Both of basePipelineHandle, and layout that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

The VkRayTracingPipelineCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingPipelineCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    uint32_t groupCount;
    const VkRayTracingShaderGroupCreateInfoKHR* pGroups;
    uint32_t maxPipelineRayRecursionDepth;
    const VkPipelineLibraryCreateInfoKHR* pLibraryInfo;
    const VkRayTracingPipelineInterfaceCreateInfoKHR* pLibraryInterface;
    const VkPipelineDynamicStateCreateInfo* pDynamicState;
    VkPipelineLayout layout;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkRayTracingPipelineCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkPipelineCreateFlagBits specifying how the pipeline will be generated.
- **stageCount** is the number of entries in the **pStages** array.
- **pStages** is a pointer to an array of **stageCount** VkPipelineShaderStageCreateInfo structures describing the set of the shader stages to be included in the ray tracing pipeline.
- **groupCount** is the number of entries in the **pGroups** array.
- **pGroups** is a pointer to an array of **groupCount** VkRayTracingShaderGroupCreateInfoKHR structures.
structures describing the set of the shader stages to be included in each shader group in the ray tracing pipeline.

- maxPipelineRayRecursionDepth is the maximum recursion depth of shaders executed by this pipeline.
- pLibraryInfo is a pointer to a VkPipelineLibraryCreateInfoKHR structure defining pipeline libraries to include.
- pLibraryInterface is a pointer to a VkRayTracingPipelineInterfaceCreateInfoKHR structure defining additional information when using pipeline libraries.
- pDynamicState is a pointer to a VkPipelineDynamicStateCreateInfo structure, and is used to indicate which properties of the pipeline state object are dynamic and can be changed independently of the pipeline state. This can be NULL, which means no state in the pipeline is considered dynamic.
- layout is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- basePipelineHandle is a pipeline to derive from.
- basePipelineIndex is an index into the pCreateInfos parameter to use as a pipeline to derive from.

The parameters basePipelineHandle and basePipelineIndex are described in more detail in Pipeline Derivatives.

When VK_PIPELINE_CREATE_LIBRARY_BIT_KHR is specified, this pipeline defines a pipeline library which cannot be bound as a ray tracing pipeline directly. Instead, pipeline libraries define common shaders and shader groups which can be included in future pipeline creation.

If pipeline libraries are included in pLibraryInfo, shaders defined in those libraries are treated as if they were defined as additional entries in pStages, appended in the order they appear in the pLibraries array and in the pStages array when those libraries were defined.

When referencing shader groups in order to obtain a shader group handle, groups defined in those libraries are treated as if they were defined as additional entries in pGroups, appended in the order they appear in the pLibraries array and in the pGroups array when those libraries were defined. The shaders these groups reference are set when the pipeline library is created, referencing those specified in the pipeline library, not in the pipeline that includes it.

The default stack size for a pipeline if VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR is not provided is computed as described in Ray Tracing Pipeline Stack.

Valid Usage

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03421
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineIndex is -1, basePipelineHandle must be a valid handle to a ray tracing VkPipeline

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03422
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineHandle is
VK_NULL_HANDLE, basePipelineIndex must be a valid index into the calling command's pCreateInfos parameter

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03423
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineIndex is not -1, basePipelineHandle must be VK_NULL_HANDLE

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03424
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineHandle is not VK_NULL_HANDLE, basePipelineIndex must be -1

- VUID-VkRayTracingPipelineCreateInfoKHR-pStages-03426
  The shader code for the entry points identified by pStages, and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-03427
  layout must be consistent with all shaders specified in pStages

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-03428
  The number of resources in layout accessible to each shader stage that is used by the pipeline must be less than or equal to VkPhysicalDeviceLimits::maxPerStageResources

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-02904
  flags must not include VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV

- VUID-VkRayTracingPipelineCreateInfoKHR-pipelineCreationCacheControl-02905
  If the pipelineCreationCacheControl feature is not enabled, flags must not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT or VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT

- VUID-VkRayTracingPipelineCreateInfoKHR-stage-03425
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, the stage member of at least one element of pStages, including those implicitly added by pLibraryInfo, must be VK_SHADER_STAGE_RAYGEN_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-maxPipelineRayRecursionDepth-03589
  maxPipelineRayRecursionDepth must be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayRecursionDepth

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03465
  If flags includes VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, pLibraryInterface must not be NULL

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03590
  If pLibraryInfo is not NULL and its libraryCount member is greater than 0, pLibraryInterface must not be NULL

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraries-03591
  Each element of pLibraryInfo->pLibraries must have been created with the value of maxPipelineRayRecursionDepth equal to that in this pipeline

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03592
  If pLibraryInfo is not NULL, each element of its pLibraries member must have been created with a layout that is compatible with the layout in this pipeline

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03593
If \texttt{pLibraryInfo} is not NULL, each element of its \texttt{pLibraries} member \textbf{must} have been created with values of the \texttt{maxPipelineRayPayloadSize} and \texttt{maxPipelineRayHitAttributeSize} members of \texttt{pLibraryInterface} equal to those in this pipeline.

- \textbf{VUID-VkRayTracingPipelineCreateInfoKHR-flags-03594}
  If \texttt{flags} includes \texttt{VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR}, each element of \texttt{pLibraryInfo->pLibraries} must have been created with the \texttt{VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR} bit set.

- \textbf{VUID-VkRayTracingPipelineCreateInfoKHR-flags-04718}
  If \texttt{flags} includes \texttt{VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR}, each element of \texttt{pLibraryInfo->pLibraries} must have been created with the \texttt{VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR} bit set.

- \textbf{VUID-VkRayTracingPipelineCreateInfoKHR-flags-04719}
  If \texttt{flags} includes \texttt{VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR}, each element of \texttt{pLibraryInfo->pLibraries} must have been created with the \texttt{VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR} bit set.

- \textbf{VUID-VkRayTracingPipelineCreateInfoKHR-flags-04720}
  If \texttt{flags} includes \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR}, each element of \texttt{pLibraryInfo->pLibraries} must have been created with the \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR} bit set.

- \textbf{VUID-VkRayTracingPipelineCreateInfoKHR-flags-04721}
  If \texttt{flags} includes \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR}, each element of \texttt{pLibraryInfo->pLibraries} must have been created with the \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR} bit set.

- \textbf{VUID-VkRayTracingPipelineCreateInfoKHR-flags-04722}
  If \texttt{flags} includes \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR}, each element of \texttt{pLibraryInfo->pLibraries} must have been created with the \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR} bit set.

- \textbf{VUID-VkRayTracingPipelineCreateInfoKHR-flags-04723}
  If \texttt{flags} includes \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR}, each element of \texttt{pLibraryInfo->pLibraries} must have been created with the \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR} bit set.

- \textbf{VUID-VkRayTracingPipelineCreateInfoKHR-flags-03470}
  If \texttt{flags} includes \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR}, for any element of \texttt{pGroups} with a type of \texttt{VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR} or \texttt{VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR}, the anyHitShader of that element must not be \texttt{VK_SHADER_UNUSED_KHR}.

- \textbf{VUID-VkRayTracingPipelineCreateInfoKHR-flags-03471}
  If \texttt{flags} includes \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR}, for any element of \texttt{pGroups} with a type of
VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, the closestHitShader of that element **must** not be VK_SHADER_UNUSED_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03596
  If the rayTraversalPrimitiveCulling feature is not enabled, flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBBS_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03597
  If the rayTraversalPrimitiveCulling feature is not enabled, flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-06546
  flags **must** not include both VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR and VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBBS_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-03598
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR, rayTracingPipelineShaderGroupHandleCaptureReplay **must** be enabled

• VUID-VkRayTracingPipelineCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03599
  If VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay is VK_TRUE and the pShaderGroupCaptureReplayHandle member of any element of pGroups is not NULL, flags **must** include VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03600
  If pLibraryInfo is not NULL and its libraryCount is 0, stageCount **must** not be 0

• VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03601
  If pLibraryInfo is not NULL and its libraryCount is 0, groupCount **must** not be 0

• VUID-VkRayTracingPipelineCreateInfoKHR-pDynamicStates-03602
  Any element of the pDynamicStates member of pDynamicState **must** be VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-pipelineStageCreationFeedbackCount-06652
  If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it **must** be equal to stageCount

• VUID-VkRayTracingPipelineCreateInfoKHR-stage-06899
  The stage value in all pStages elements **must** be one of VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_ANY_HIT_BIT_KHR, VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, VK_SHADER_STAGE_INTERSECTION_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-07403
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT, each element of pLibraryInfo->pLibraries **must** have been created with the VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT bit set
Valid Usage (Implicit)

- **VUID-VkRayTracingPipelineCreateInfoKHR-sType-sType**
  
  The `sType` must be `VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CREATE_INFO_KHR`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineCreationFeedbackCreateInfo` or `VkPipelineRobustnessCreateInfoEXT`.

- **VUID-VkRayTracingPipelineCreateInfoKHR-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-parameter**
  
  The `flags` must be a valid combination of `VkPipelineCreateFlagBits` values.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pStages-parameter**
  
  If `stageCount` is not 0, the `pStages` must be a valid pointer to an array of `stageCount` valid `VkPipelineShaderStageCreateInfo` structures.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pGroups-parameter**
  
  If `groupCount` is not 0, the `pGroups` must be a valid pointer to an array of `groupCount` valid `VkRayTracingShaderGroupCreateInfoKHR` structures.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-parameter**
  
  If `pLibraryInfo` is not `NULL`, the `pLibraryInfo` must be a valid pointer to a valid `VkPipelineLibraryCreateInfoKHR` structure.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInterface-parameter**
  
  If `pLibraryInterface` is not `NULL`, the `pLibraryInterface` must be a valid pointer to a valid `VkRayTracingPipelineInterfaceCreateInfoKHR` structure.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pDynamicState-parameter**
  
  If `pDynamicState` is not `NULL`, the `pDynamicState` must be a valid pointer to a valid `VkPipelineDynamicStateCreateInfo` structure.

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-parameter**
  
  The `layout` must be a valid `VkPipelineLayout` handle.

- **VUID-VkRayTracingPipelineCreateInfoKHR-commonparent**
  
  Both of `basePipelineHandle`, and `layout` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

The `VkRayTracingShaderGroupCreateInfoNV` structure is defined as:

```c
typedef struct VkRayTracingShaderGroupCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkRayTracingShaderGroupTypeKHR type;
    uint32_t generalShader;
    uint32_t closestHitShader;
    uint32_t anyHitShader;
} VkRayTracingShaderGroupCreateInfoNV;
```
uint32_t intersectionShader;
} VkRayTracingShaderGroupCreateInfoNV;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **type** is the type of hit group specified in this structure.

- **generalShader** is the index of the ray generation, miss, or callable shader from `VkRayTracingPipelineCreateInfoNV::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV`, and `VK_SHADER_UNUSED_NV` otherwise.

- **closestHitShader** is the optional index of the closest hit shader from `VkRayTracingPipelineCreateInfoNV::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV`, and `VK_SHADER_UNUSED_NV` otherwise.

- **anyHitShader** is the optional index of the any-hit shader from `VkRayTracingPipelineCreateInfoNV::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV`, and `VK_SHADER_UNUSED_NV` otherwise.

- **intersectionShader** is the index of the intersection shader from `VkRayTracingPipelineCreateInfoNV::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV`, and `VK_SHADER_UNUSED_NV` otherwise.

### Valid Usage

- **VUID-VkRayTracingShaderGroupCreateInfoNV-type-02413**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV` then `generalShader` **must** be a valid index into `VkRayTracingPipelineCreateInfoNV::pStages` referring to a shader of `VK_SHADER_STAGE_RAYGEN_BIT_NV`, `VK_SHADER_STAGE_MISS_BIT_NV`, or `VK_SHADER_STAGE_CALLABLE_BIT_NV`.

- **VUID-VkRayTracingShaderGroupCreateInfoNV-type-02414**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV` then `closestHitShader`, `anyHitShader`, and `intersectionShader` **must** be `VK_SHADER_UNUSED_NV`.

- **VUID-VkRayTracingShaderGroupCreateInfoNV-type-02415**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV` then `intersectionShader` **must** be a valid index into `VkRayTracingPipelineCreateInfoNV::pStages` referring to a shader of `VK_SHADER_STAGE_INTERSECTION_BIT_NV`.

- **VUID-VkRayTracingShaderGroupCreateInfoNV-type-02416**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV` then `intersectionShader` **must** be `VK_SHADER_UNUSED_NV`.

- **VUID-VkRayTracingShaderGroupCreateInfoNV-closestHitShader-02417**
  `closestHitShader` **must** be either `VK_SHADER_UNUSED_NV` or a valid index into `VkRayTracingPipelineCreateInfoNV::pStages` referring to a shader of `VK_SHADER_STAGE_CLOSEST_HIT_BIT_NV`.

- **VUID-VkRayTracingShaderGroupCreateInfoNV-anyHitShader-02418**
anyHitShader must be either VK_SHADER_UNUSED_NV or a valid index into VkRayTracingPipelineCreateInfoNV::pStages referring to a shader of VK_SHADER_STAGE_ANY_HIT_BIT_NV

Valid Usage (Implicit)

- VUID-VkRayTracingShaderGroupCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_NV
- VUID-VkRayTracingShaderGroupCreateInfoNV-pNext-pNext
  pNext must be NULL
- VUID-VkRayTracingShaderGroupCreateInfoNV-type-parameter
  type must be a valid VkRayTracingShaderGroupTypeKHR value

The VkRayTracingShaderGroupCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingShaderGroupCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkRayTracingShaderGroupTypeKHR type;
    uint32_t generalShader;
    uint32_t closestHitShader;
    uint32_t anyHitShader;
    uint32_t intersectionShader;
    const void* pShaderGroupCaptureReplayHandle;
} VkRayTracingShaderGroupCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `type` is the type of hit group specified in this structure.
- `generalShader` is the index of the ray generation, miss, or callable shader from VkRayTracingPipelineCreateInfoKHR::pStages in the group if the shader group has type of VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR, and VK_SHADER_UNUSED_KHR otherwise.
- `closestHitShader` is the optional index of the closest hit shader from VkRayTracingPipelineCreateInfoKHR::pStages in the group if the shader group has type of VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, and VK_SHADER_UNUSED_KHR otherwise.
- `anyHitShader` is the optional index of the any-hit shader from VkRayTracingPipelineCreateInfoKHR::pStages in the group if the shader group has type of VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, and VK_SHADER_UNUSED_KHR otherwise.
• intersectionShader is the index of the intersection shader from VkRayTracingPipelineCreateInfoKHR::pStages in the group if the shader group has type of VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, and VK.shader.unused_KHR otherwise.

• pShaderGroupCaptureReplayHandle is NULL or a pointer to replay information for this shader group. Ignored if VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay is VK_FALSE.

Valid Usage

• VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03474
  If type is VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR then generalShader must be a valid index into VkRayTracingPipelineCreateInfoKHR::pStages referring to a shader of VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR

• VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03475
  If type is VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR then closestHitShader, anyHitShader, and intersectionShader must be VK_SHADER_UNUSED_KHR

• VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03476
  If type is VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR then intersectionShader must be a valid index into VkRayTracingPipelineCreateInfoKHR::pStages referring to a shader of VK_SHADER_STAGE_INTERSECTION_BIT_KHR

• VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03477
  If type is VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR then intersectionShader must be VK_SHADER_UNUSED_KHR

• VUID-VkRayTracingShaderGroupCreateInfoKHR-closestHitShader-03478
  closestHitShader must be either VK_SHADER_UNUSED_KHR or a valid index into VkRayTracingPipelineCreateInfoKHR::pStages referring to a shader of VK_SHADER.Stage.CLOSEST_HIT_BIT_KHR

• VUID-VkRayTracingShaderGroupCreateInfoKHR-anyHitShader-03479
  anyHitShader must be either VK_SHADER_UNUSED_KHR or a valid index into VkRayTracingPipelineCreateInfoKHR::pStages referring to a shader of VK_SHADER_STAGE_ANY_HIT_BIT_KHR

• VUID-VkRayTracingShaderGroupCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03603
  If VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplayMixed is VK_FALSE then pShaderGroupCaptureReplayHandle must not be provided if it has not been provided on a previous call to ray tracing pipeline creation

• VUID-VkRayTracingShaderGroupCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03604
  If VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplayMixed is VK_FALSE then the caller must guarantee that no ray tracing pipeline creation commands with...
Valid Usage (Implicit)

- VUID-VkRayTracingShaderGroupCreateInfoKHR-sType-sType
  
sType must be VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_KHR

- VUID-VkRayTracingShaderGroupCreateInfoKHR-pNext-pNext
  
pNext must be NULL

- VUID-VkRayTracingShaderGroupCreateInfoKHR-type-parameter
  
type must be a valid VkRayTracingShaderGroupTypeKHR value

Possible values of type in VkRayTracingShaderGroupCreateInfoKHR are:

// Provided by VK_KHR_ray_tracing_pipeline
typedef enum VkRayTracingShaderGroupTypeKHR {
    VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR = 0,
    VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR = 1,
    VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR = 2,
} VkRayTracingShaderGroupTypeKHR;

or the equivalent

// Provided by VK_NV_ray_tracing
typedef VkRayTracingShaderGroupTypeKHR VkRayTracingShaderGroupTypeNV;

- VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR indicates a shader group with a single
  VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, or
  VK_SHADER_STAGE_CALLABLE_BIT_KHR shader in it.

- VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR specifies a shader group that only
  hits triangles and must not contain an intersection shader, only closest hit and any-hit shaders.

- VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR specifies a shader group that only
  intersects with custom geometry and must contain an intersection shader and may contain
  closest hit and any-hit shaders.
Note
For current group types, the hit group type could be inferred from the presence or absence of the intersection shader, but we provide the type explicitly for future hit groups that do not have that property.

The `VkRayTracingPipelineInterfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingPipelineInterfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxPipelineRayPayloadSize;
    uint32_t maxPipelineRayHitAttributeSize;
} VkRayTracingPipelineInterfaceCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxPipelineRayPayloadSize` is the maximum payload size in bytes used by any shader in the pipeline.
- `maxPipelineRayHitAttributeSize` is the maximum attribute structure size in bytes used by any shader in the pipeline.

`maxPipelineRayPayloadSize` is calculated as the maximum number of bytes used by any block declared in the `RayPayloadKHR` or `IncomingRayPayloadKHR` storage classes. `maxPipelineRayHitAttributeSize` is calculated as the maximum number of bytes used by any block declared in the `HitAttributeKHR` storage class. As variables in these storage classes do not have explicit offsets, the size should be calculated as if each variable has a scalar alignment equal to the largest scalar alignment of any of the block’s members.

Note
There is no explicit upper limit for `maxPipelineRayPayloadSize`, but in practice it should be kept as small as possible. Similar to invocation local memory, it must be allocated for each shader invocation and for devices which support many simultaneous invocations, this storage can rapidly be exhausted, resulting in failure.

Valid Usage

- `VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-maxPipelineRayHitAttributeSize-03605`
  
  `maxPipelineRayHitAttributeSize` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayHitAttributeSize`
Valid Usage (Implicit)

- VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_INTERFACE_CREATE_INFO_KHR

- VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

To query the opaque handles of shaders in the ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkGetRayTracingShaderGroupHandlesKHR(
    VkDevice device,
    VkPipeline pipeline,
    uint32_t firstGroup,
    uint32_t groupCount,
    size_t dataSize,
    void* pData);
```

or the equivalent command

```c
// Provided by VK_NV_ray_tracing
VkResult vkGetRayTracingShaderGroupHandlesNV(
    VkDevice device,
    VkPipeline pipeline,
    uint32_t firstGroup,
    uint32_t groupCount,
    size_t dataSize,
    void* pData);
```

- device is the logical device containing the ray tracing pipeline.
- pipeline is the ray tracing pipeline object containing the shaders.
- firstGroup is the index of the first group to retrieve a handle for from the
  VkRayTracingPipelineCreateInfoKHR::pGroups or VkRayTracingPipelineCreateInfoNV::pGroups
  array.
- groupCount is the number of shader handles to retrieve.
- dataSize is the size in bytes of the buffer pointed to by pData.
- pData is a pointer to a user-allocated buffer where the results will be written.

Valid Usage

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-04619
  pipeline must be a ray tracing pipeline

- VUID-vkGetRayTracingShaderGroupHandlesKHR-firstGroup-04050

700
**Valid Usage (Implicit)**

- VUID-vkGetRayTracingShaderGroupHandlesKHR-device-parameter
device **must** be a valid VkDevice handle

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parameter
pipeline **must** be a valid VkPipeline handle

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pData-parameter
pData **must** be a valid pointer to an array of dataSize bytes

- VUID-vkGetRayTracingShaderGroupHandlesKHR-dataSize-arraylength
dataSize **must** be greater than 0

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parent
pipeline **must** have been created, allocated, or retrieved from device

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query the optional capture handle information of shaders in the ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkGetRayTracingCaptureReplayShaderGroupHandlesKHR(    
    VkDevice              device,           
    VkPipeline           pipeline,         
    uint32_t              firstGroup,      
    uint32_t              groupCount,      
    size_t                dataSize,        
);```
```c
void* pData);
```

- **device** is the logical device containing the ray tracing pipeline.
- **pipeline** is the ray tracing pipeline object containing the shaders.
- **firstGroup** is the index of the first group to retrieve a handle for from the `VkRayTracingPipelineCreateInfoKHR::pGroups` array.
- **groupCount** is the number of shader handles to retrieve.
- **dataSize** is the size in bytes of the buffer pointed to by `pData`.
- **pData** is a pointer to a user-allocated buffer where the results will be written.

## Valid Usage

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-04620
  - `pipeline` must be a ray tracing pipeline
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-04051
  - `firstGroup` must be less than the number of shader groups in `pipeline`
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-03483
  - The sum of `firstGroup` and `groupCount` must be less than or equal to the number of shader groups in `pipeline`
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-03484
  - `dataSize` must be at least `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleCaptureReplaySize × groupCount`
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03606
  - `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay` must be enabled to call this function
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-03607
  - `pipeline` must have been created with a flags that included `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-06720
  - `pipeline` must not have been created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`

## Valid Usage (Implicit)

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-parameter
  - `pipeline` must be a valid `VkPipeline` handle
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pData-parameter
  - `pData` must be a valid pointer to an array of `dataSize` bytes
• VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-arraylength
  `dataSize` must be greater than 0

• VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-parent
  `pipeline` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Ray tracing pipelines **can** contain more shaders than a graphics or compute pipeline, so to allow parallel compilation of shaders within a pipeline, an application **can** choose to defer compilation until a later point in time.

To compile a deferred shader in a pipeline call:

```c
// Provided by VK_NV_ray_tracing
VkResult vkCompileDeferredNV(
  VkDevice device,
  VkPipeline pipeline,
  uint32_t shader);
```

- `device` is the logical device containing the ray tracing pipeline.
- `pipeline` is the ray tracing pipeline object containing the shaders.
- `shader` is the index of the shader to compile.

### Valid Usage

- VUID-vkCompileDeferredNV-pipeline-04621
  `pipeline` must be a ray tracing pipeline

- VUID-vkCompileDeferredNV-pipeline-02237
  `pipeline` must have been created with `VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV`

- VUID-vkCompileDeferredNV-shader-02238
  `shader` must not have been called as a deferred compile before

### Valid Usage (Implicit)

- VUID-vkCompileDeferredNV-device-parameter
**device** must be a valid **VkDevice** handle

- VUID-vkCompileDeferredNV-pipeline-parameter
  **pipeline** must be a valid **VkPipeline** handle

- VUID-vkCompileDeferredNV-pipeline-parent
  **pipeline** must have been created, allocated, or retrieved from **device**

---

**Return Codes**

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

To query the pipeline stack size of shaders in a shader group in the ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkDeviceSize vkGetRayTracingShaderGroupStackSizeKHR(
    VkDevice device,
    VkPipeline pipeline,
    uint32_t group,
    VkShaderGroupShaderKHR groupShader);
```

- **device** is the logical device containing the ray tracing pipeline.
- **pipeline** is the ray tracing pipeline object containing the shaders groups.
- **group** is the index of the shader group to query.
- **groupShader** is the type of shader from the group to query.

The return value is the ray tracing pipeline stack size in bytes for the specified shader as called from the specified shader group.

---

**Valid Usage**

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-04622
  **pipeline** must be a ray tracing pipeline

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-group-03608
  The value of **group** must be less than the number of shader groups in **pipeline**

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-groupShader-03609
  The shader identified by **groupShader** in **group** must not be **VK_SHADER_UNUSED_KHR**
Valid Usage (Implicit)

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-parameter
pipeline must be a valid VkPipeline handle

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-groupShader-parameter
groupShader must be a valid VkShaderGroupShaderKHR value

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-parent
pipeline must have been created, allocated, or retrieved from device

Possible values of groupShader in vkGetRayTracingShaderGroupStackSizeKHR are:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef enum VkShaderGroupShaderKHR {
    VK_SHADER_GROUP_SHADER_GENERAL_KHR = 0,
    VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR = 1,
    VK_SHADER_GROUP_SHADER_ANY_HIT_KHR = 2,
    VK_SHADER_GROUP_SHADER_INTERSECTION_KHR = 3,
} VkShaderGroupShaderKHR;
```

- VK_SHADER_GROUP_SHADER_GENERAL_KHR uses the shader specified in the group with VkRayTracingShaderGroupCreateInfoKHR::generalShader
- VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR uses the shader specified in the group with VkRayTracingShaderGroupCreateInfoKHR::closestHitShader
- VK_SHADER_GROUP_SHADER_ANY_HIT_KHR uses the shader specified in the group with VkRayTracingShaderGroupCreateInfoKHR::anyHitShader
- VK_SHADER_GROUP_SHADER_INTERSECTION_KHR uses the shader specified in the group with VkRayTracingShaderGroupCreateInfoKHR::intersectionShader

To dynamically set the stack size for a ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdSetRayTracingPipelineStackSizeKHR(
    VkCommandBuffer commandBuffer,
    uint32_t pipelineStackSize);
```

- commandBuffer is the command buffer into which the command will be recorded.
- pipelineStackSize is the stack size to use for subsequent ray tracing trace commands.

This command sets the stack size for subsequent ray tracing commands when the ray tracing pipeline is created with VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, the stack size is computed as
Valid Usage

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-pipelineStackSize-03610
  
  pipelineStackSize must be large enough for any dynamic execution through the shaders in the ray tracing pipeline used by a subsequent trace call.

Valid Usage (Implicit)

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-parameter
  
  commandBuffer must be a valid VkCommandBuffer handle.

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-recording
  
  commandBuffer must be in the recording state.

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-cmdpool
  
  The VkCommandPool that commandBuffer was allocated from must support compute operations.

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-renderpass
  
  This command must only be called outside of a render pass instance.

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-videocoding
  
  This command must only be called outside of a video coding scope.

Host Synchronization

- Host access to commandBuffer must be externally synchronized.

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

10.4. Pipeline Destruction

To destroy a pipeline, call:

```c
// Provided by VK_VERSION_1_0
```
```c
void vkDestroyPipeline(
    VkDevice device,
    VkPipeline pipeline,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the pipeline.
- **pipeline** is the handle of the pipeline to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyPipeline-pipeline-00765**
  All submitted commands that refer to **pipeline** must have completed execution

- **VUID-vkDestroyPipeline-pipeline-00766**
  If **VkAllocationCallbacks** were provided when **pipeline** was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyPipeline-pipeline-00767**
  If no **VkAllocationCallbacks** were provided when **pipeline** was created, **pAllocator** must be **NULL**

### Valid Usage (Implicit)

- **VUID-vkDestroyPipeline-device-parameter**
  **device** must be a valid **VkDevice** handle

- **VUID-vkDestroyPipeline-pipeline-parameter**
  If **pipeline** is not **VK_NULL_HANDLE**, **pipeline** must be a valid **VkPipeline** handle

- **VUID-vkDestroyPipeline-pAllocator-parameter**
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- **VUID-vkDestroyPipeline-pipeline-parent**
  If **pipeline** is a valid handle, it must have been created, allocated, or retrieved from **device**

### Host Synchronization

- Host access to **pipeline** must be externally synchronized

### 10.5. Multiple Pipeline Creation

Multiple pipelines can be created simultaneously by passing an array of **VkGraphicsPipelineCreateInfo**, **VkRayTracingPipelineCreateInfoKHR**, **VkRayTracingPipelineCreateInfoNV**, or **VkComputePipelineCreateInfo** structures into the
vkCreateGraphicsPipelines, vkCreateRayTracingPipelinesKHR, vkCreateRayTracingPipelinesNV, and vkCreateComputePipelines commands, respectively. Applications can group together similar pipelines to be created in a single call, and implementations are encouraged to look for reuse opportunities within a group-create.

When an application attempts to create many pipelines in a single command, it is possible that some subset may fail creation. In that case, the corresponding entries in the pPipelines output array will be filled with VK_NULL_HANDLE values. If any pipeline fails creation despite valid arguments (for example, due to out of memory errors), the VkResult code returned by vkCreate*Pipelines will indicate why. The implementation will attempt to create all pipelines, and only return VK_NULL_HANDLE values for those that actually failed.

If creation fails for a pipeline that had VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT set, pipelines at an index in the pPipelines array greater than or equal to that of the failing pipeline must be set to VK_NULL_HANDLE.

If multiple pipelines fail to be created, the VkResult must be the return value of any of the pipelines which did not return VK_SUCCESS.

### 10.6. Pipeline Derivatives

A pipeline derivative is a child pipeline created from a parent pipeline, where the child and parent are expected to have much commonality. The goal of derivative pipelines is that they be cheaper to create using the parent as a starting point, and that it be more efficient (on either host or device) to switch/bind between children of the same parent.

A derivative pipeline is created by setting the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag in the Vk*PipelineCreateInfo structure. If this is set, then exactly one of basePipelineHandle or basePipelineIndex members of the structure must have a valid handle/index, and specifies the parent pipeline. If basePipelineHandle is used, the parent pipeline must have already been created. If basePipelineIndex is used, then the parent is being created in the same command. VK_NULL_HANDLE acts as the invalid handle for basePipelineHandle, and -1 is the invalid index for basePipelineIndex. If basePipelineIndex is used, the base pipeline must appear earlier in the array. The base pipeline must have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set.

### 10.7. Pipeline Cache

Pipeline cache objects allow the result of pipeline construction to be reused between pipelines and between runs of an application. Reuse between pipelines is achieved by passing the same pipeline cache object when creating multiple related pipelines. Reuse across runs of an application is achieved by retrieving pipeline cache contents in one run of an application, saving the contents, and using them to preinitialize a pipeline cache on a subsequent run. The contents of the pipeline cache objects are managed by the implementation. Applications can manage the host memory consumed by a pipeline cache object and control the amount of data retrieved from a pipeline cache object.

Pipeline cache objects are represented by VkPipelineCache handles:
10.7.1. Creating a Pipeline Cache

To create pipeline cache objects, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineCache(
    VkDevice device,
    const VkPipelineCacheCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkPipelineCache* pPipelineCache);
```

- `device` is the logical device that creates the pipeline cache object.
- `pCreateInfo` is a pointer to a `VkPipelineCacheCreateInfo` structure containing initial parameters for the pipeline cache object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelineCache` is a pointer to a `VkPipelineCache` handle in which the resulting pipeline cache object is returned.

**Note**

Applications can track and manage the total host memory size of a pipeline cache object using the `pAllocator`. Applications can limit the amount of data retrieved from a pipeline cache object in `vkGetPipelineCacheData`. Implementations should not internally limit the total number of entries added to a pipeline cache object or the total host memory consumed.

Once created, a pipeline cache can be passed to the `vkCreateGraphicsPipelines`, `vkCreateRayTracingPipelinesKHR`, `vkCreateRayTracingPipelinesNV`, and `vkCreateComputePipelines` commands. If the pipeline cache passed into these commands is not `VK_NULL_HANDLE`, the implementation will query it for possible reuse opportunities and update it with new content. The use of the pipeline cache object in these commands is internally synchronized, and the same pipeline cache object can be used in multiple threads simultaneously.

If flags of `pCreateInfo` includes `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, all commands that modify the returned pipeline cache object must be externally synchronized.

**Note**

Implementations should make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the duration of the `vkCreate*Pipelines` commands.
Valid Usage (Implicit)

- VUID-vkCreatePipelineCache-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCreatePipelineCache-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkPipelineCacheCreateInfo structure

- VUID-vkCreatePipelineCache-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreatePipelineCache-pPipelineCache-parameter
  pPipelineCache must be a valid pointer to a VkPipelineCache handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkPipelineCacheCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineCacheCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCacheCreateFlags flags;
    size_t initialDataSize;
    const void* pInitialData;
} VkPipelineCacheCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkPipelineCacheCreateFlagBits specifying the behavior of the pipeline cache.
- `initialDataSize` is the number of bytes in `pInitialData`. If `initialDataSize` is zero, the pipeline cache will initially be empty.
- `pInitialData` is a pointer to previously retrieved pipeline cache data. If the pipeline cache data is incompatible (as defined below) with the device, the pipeline cache will be initially empty. If `initialDataSize` is zero, `pInitialData` is ignored.
Valid Usage

- VUID-VkPipelineCacheCreateInfo-initialDataSize-00768
  If `initialDataSize` is not 0, it **must** be equal to the size of `pInitialData`, as returned by `vkGetPipelineCacheData` when `pInitialData` was originally retrieved.

- VUID-VkPipelineCacheCreateInfo-initialDataSize-00769
  If `initialDataSize` is not 0, `pInitialData` **must** have been retrieved from a previous call to `vkGetPipelineCacheData`.

- VUID-VkPipelineCacheCreateInfo-pipelineCreationCacheControl-02892
  If the `pipelineCreationCacheControl` feature is not enabled, flags **must** not include `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`.

Valid Usage (Implicit)

- VUID-VkPipelineCacheCreateInfo-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_CACHE_CREATE_INFO`.

- VUID-VkPipelineCacheCreateInfo-pNext-pNext
  `pNext` **must** be NULL.

- VUID-VkPipelineCacheCreateInfo-flags-parameter
  `flags` **must** be a valid combination of `VkPipelineCacheCreateFlagBits` values.

- VUID-VkPipelineCacheCreateInfo-pInitialData-parameter
  If `initialDataSize` is not 0, `pInitialData` **must** be a valid pointer to an array of `initialDataSize` bytes.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCacheCreateFlags;
```

`VkPipelineCacheCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineCacheCreateFlagBits`.

Bits which **can** be set in `VkPipelineCacheCreateInfo::flags`, specifying behavior of the pipeline cache, are:

```c
// Provided by VK_EXT_pipeline_creation_cache_control
typedef enum VkPipelineCacheCreateFlagBits {
  // Provided by VK_VERSION_1_3
  VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT = 0x00000001,
  // Provided by VK_EXT_pipeline_creation_cache_control
  VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT = VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT,
} VkPipelineCacheCreateFlagBits;
```
VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT specifies that all commands that modify the created VkPipelineCache will be externally synchronized. When set, the implementation may skip any unnecessary processing needed to support simultaneous modification from multiple threads where allowed.

### 10.7.2. Merging Pipeline Caches

Pipeline cache objects can be merged using the command:

```c
// Provided by VK_VERSION_1_0
VkResult vkMergePipelineCaches(
    VkDevice device,
    VkPipelineCache dstCache,
    uint32_t srcCacheCount,
    const VkPipelineCache* pSrcCaches);
```

- **device** is the logical device that owns the pipeline cache objects.
- **dstCache** is the handle of the pipeline cache to merge results into.
- **srcCacheCount** is the length of the **pSrcCaches** array.
- **pSrcCaches** is a pointer to an array of pipeline cache handles, which will be merged into **dstCache**. The previous contents of **dstCache** are included after the merge.

**Note**

The details of the merge operation are implementation-dependent, but implementations should merge the contents of the specified pipelines and prune duplicate entries.

**Valid Usage**

- VUID-vkMergePipelineCaches-dstCache-00770
  **dstCache** must not appear in the list of source caches

**Valid Usage (Implicit)**

- VUID-vkMergePipelineCaches-device-parameter
  **device** must be a valid **VkDevice** handle

- VUID-vkMergePipelineCaches-dstCache-parameter
  **dstCache** must be a valid **VkPipelineCache** handle

- VUID-vkMergePipelineCaches-pSrcCaches-parameter
  **pSrcCaches** must be a valid pointer to an array of **srcCacheCount** valid **VkPipelineCache** handles

- VUID-vkMergePipelineCaches-srcCacheCount-arraylength
  **srcCacheCount** must be greater than 0
Host Synchronization

- Host access to **dstCache** must be externally synchronized

Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

10.7.3. Retrieving Pipeline Cache Data

Data can be retrieved from a pipeline cache object using the command:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetPipelineCacheData(
    VkDevice device,
    VkPipelineCache pipelineCache,
    size_t* pDataSize,
    void* pData);
```

- **device** is the logical device that owns the pipeline cache.
- **pipelineCache** is the pipeline cache to retrieve data from.
- **pDataSize** is a pointer to a size_t value related to the amount of data in the pipeline cache, as described below.
- **pData** is either **NULL** or a pointer to a buffer.

If **pData** is **NULL**, then the maximum size of the data that can be retrieved from the pipeline cache, in bytes, is returned in **pDataSize**. Otherwise, **pDataSize** must point to a variable set by the user to the size of the buffer, in bytes, pointed to by **pData**, and on return the variable is overwritten with the amount of data actually written to **pData**. If **pDataSize** is less than the maximum size that can be retrieved by the pipeline cache, at most **pDataSize** bytes will be written to **pData**, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all of the pipeline cache was returned.

Any data written to **pData** is valid and can be provided as the **pInitialData** member of the
**VkPipelineCacheCreateInfo** structure passed to **vkCreatePipelineCache**.

Two calls to **vkGetPipelineCacheData** with the same parameters **must** retrieve the same data unless a command that modifies the contents of the cache is called between them.

The initial bytes written to **pData** **must** be a header as described in the Pipeline Cache Header section.

If **pDataSize** is less than what is necessary to store this header, nothing will be written to **pData** and zero will be written to **pDataSize**.

---

### Valid Usage (Implicit)

- **VUID-vkGetPipelineCacheData-device-parameter**
  - **device** **must** be a valid **VkDevice** handle

- **VUID-vkGetPipelineCacheData-pipelineCache-parameter**
  - **pipelineCache** **must** be a valid **VkPipelineCache** handle

- **VUID-vkGetPipelineCacheData-pDataSize-parameter**
  - **pDataSize** **must** be a valid pointer to a **size_t** value

- **VUID-vkGetPipelineCacheData-pData-parameter**
  - If the value referenced by **pDataSize** is not 0, and **pData** is not NULL, **pData** **must** be a valid pointer to an array of **pDataSize** bytes

- **VUID-vkGetPipelineCacheData-pipelineCache-parent**
  - **pipelineCache** **must** have been created, allocated, or retrieved from **device**

---

### Return Codes

**Success**

- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

---

### 10.7.4. Pipeline Cache Header

Applications **can** store the data retrieved from the pipeline cache, and use these data, possibly in a future run of the application, to populate new pipeline cache objects. The results of pipeline compiles, however, **may** depend on the vendor ID, device ID, driver version, and other details of the device. To enable applications to detect when previously retrieved data is incompatible with the device, the pipeline cache data **must** begin with a valid pipeline cache header.

Version one of the pipeline cache header is defined as:
typedef struct VkPipelineCacheHeaderVersionOne {
    uint32_t headerSize;
    VkPipelineCacheHeaderVersion headerVersion;
    uint32_t vendorID;
    uint32_t deviceID;
    uint8_t pipelineCacheUUID[VK_UUID_SIZE];
} VkPipelineCacheHeaderVersionOne;

- **headerSize** is the length in bytes of the pipeline cache header.
- **headerVersion** is a `VkPipelineCacheHeaderVersion` enum value specifying the version of the header. A consumer of the pipeline cache should use the cache version to interpret the remainder of the cache header.
- **vendorID** is the `VkPhysicalDeviceProperties::vendorID` of the implementation.
- **deviceId** is the `VkPhysicalDeviceProperties::deviceID` of the implementation.
- **pipelineCacheUUID** is the `VkPhysicalDeviceProperties::pipelineCacheUUID` of the implementation.

Unlike most structures declared by the Vulkan API, all fields of this structure are written with the least significant byte first, regardless of host byte-order.

The C language specification does not define the packing of structure members. This layout assumes tight structure member packing, with members laid out in the order listed in the structure, and the intended size of the structure is 32 bytes. If a compiler produces code that diverges from that pattern, applications must employ another method to set values at the correct offsets.

**Valid Usage**

- VUID-VkPipelineCacheHeaderVersionOne-headerSize-04967
  
  headerSize must be 32

- VUID-VkPipelineCacheHeaderVersionOne-headerVersion-04968
  
  headerVersion must be `VK_PIPELINE_CACHE_HEADER_VERSION_ONE`

**Valid Usage (Implicit)**

- VUID-VkPipelineCacheHeaderVersionOne-headerVersion-parameter
  
  headerVersion must be a valid `VkPipelineCacheHeaderVersion` value

Possible values of the **headerVersion** value of the pipeline cache header are:

typedef enum VkPipelineCacheHeaderVersion {
    VK_PIPELINE_CACHE_HEADER_VERSION_ONE = 1,
} VkPipelineCacheHeaderVersion;
10.7.5. Destroying a Pipeline Cache

To destroy a pipeline cache, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipelineCache(
    VkDevice device,         // Provides by VK_VERSION_1_0
    VkPipelineCache pipelineCache,  // device
    const VkAllocationCallbacks* pAllocator);  // pipelineCache
```

- `device` is the logical device that destroys the pipeline cache object.
- `pipelineCache` is the handle of the pipeline cache to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- VUID-vkDestroyPipelineCache-pipelineCache-00771
  If `VkAllocationCallbacks` were provided when `pipelineCache` was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyPipelineCache-pipelineCache-00772
  If no `VkAllocationCallbacks` were provided when `pipelineCache` was created, `pAllocator` must be `NULL`.

**Valid Usage (Implicit)**

- VUID-vkDestroyPipelineCache-device-parameter
  `device` must be a valid `VkDevice` handle.

- VUID-vkDestroyPipelineCache-pipelineCache-parameter
  If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` must be a valid `VkPipelineCache` handle.

- VUID-vkDestroyPipelineCache-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- VUID-vkDestroyPipelineCache-pipelineCache-parent
  If `pipelineCache` is a valid handle, it must have been created, allocated, or retrieved from `device`.

**Host Synchronization**

- Host access to `pipelineCache` must be externally synchronized.
## 10.8. Specialization Constants

Specialization constants are a mechanism whereby constants in a SPIR-V module can have their constant value specified at the time the VkPipeline is created. This allows a SPIR-V module to have constants that can be modified while executing an application that uses the Vulkan API.

**Note**
Specialization constants are useful to allow a compute shader to have its local workgroup size changed at runtime by the user, for example.

Each `VkPipelineShaderStageCreateInfo` structure contains a `pSpecializationInfo` member, which can be `NULL` to indicate no specialization constants, or point to a `VkSpecializationInfo` structure.

The `VkSpecializationInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationInfo {
    uint32_t mapEntryCount;
    const VkSpecializationMapEntry* pMapEntries;
    size_t dataSize;
    const void* pData;
} VkSpecializationInfo;
```

- `mapEntryCount` is the number of entries in the `pMapEntries` array.
- `pMapEntries` is a pointer to an array of `VkSpecializationMapEntry` structures, which map constant IDs to offsets in `pData`.
- `dataSize` is the byte size of the `pData` buffer.
- `pData` contains the actual constant values to specialize with.

### Valid Usage

- VUID-VkSpecializationInfo-offset-00773
  The `offset` member of each element of `pMapEntries` must be less than `dataSize`

- VUID-VkSpecializationInfo-pMapEntries-00774
  The `size` member of each element of `pMapEntries` must be less than or equal to `dataSize` minus `offset`

- VUID-VkSpecializationInfo-constantID-04911
  The `constantID` value of each element of `pMapEntries` must be unique within `pMapEntries`

### Valid Usage (Implicit)

- VUID-VkSpecializationInfo-pMapEntries-parameter
  If `mapEntryCount` is not 0, `pMapEntries` must be a valid pointer to an array of `mapEntryCount` valid `VkSpecializationMapEntry` structures
If `dataSize` is not 0, `pData` must be a valid pointer to an array of `dataSize` bytes.

The `VkSpecializationMapEntry` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationMapEntry {
    uint32_t constantID;
    uint32_t offset;
    size_t size;
} VkSpecializationMapEntry;
```

- `constantID` is the ID of the specialization constant in SPIR-V.
- `offset` is the byte offset of the specialization constant value within the supplied data buffer.
- `size` is the byte size of the specialization constant value within the supplied data buffer.

If a `constantID` value is not a specialization constant ID used in the shader, that map entry does not affect the behavior of the pipeline.

**Valid Usage**

- VUID-VkSpecializationMapEntry-constantID-00776
  For a `constantID` specialization constant declared in a shader, `size` must match the byte size of the `constantID`. If the specialization constant is of type `boolean`, `size` must be the byte size of `VkBool32`.

In human readable SPIR-V:

```
OpDecorate %x SpecId 13 ; decorate .x component of WorkgroupSize with ID 13
OpDecorate %y SpecId 42 ; decorate .y component of WorkgroupSize with ID 42
OpDecorate %z SpecId 3 ; decorate .z component of WorkgroupSize with ID 3
OpDecorate %wsize BuiltIn WorkgroupSize ; decorate WorkgroupSize onto constant
%132 = OpTypeInt 32 0 ; declare an unsigned 32-bit type
%uvec3 = OpTypeVector %i32 3 ; declare a 3 element vector type of unsigned 32-bit
%1x = OpSpecConstant %i32 1 ; declare the .x component of WorkgroupSize
%1y = OpSpecConstant %i32 1 ; declare the .y component of WorkgroupSize
%1z = OpSpecConstant %i32 1 ; declare the .z component of WorkgroupSize
%wsize = OpSpecConstantComposite %uvec3 %1x %1y %1z ; declare WorkgroupSize
```

From the above we have three specialization constants, one for each of the x, y & z elements of the WorkgroupSize vector.

Now to specialize the above via the specialization constants mechanism:

```c
const VkSpecializationMapEntry entries[] =
```
Then when calling `vkCreateComputePipelines`, and passing the `VkSpecializationInfo` we defined as the `pSpecializationInfo` parameter of `VkPipelineShaderStageCreateInfo`, we will create a compute pipeline with the runtime specified local workgroup size.

Another example would be that an application has a SPIR-V module that has some platform-dependent constants they wish to use.

In human readable SPIR-V:

```
OpDecorate %1 SpecId 0;  // decorate our signed 32-bit integer constant
OpDecorate %2 SpecId 12;  // decorate our 32-bit floating-point constant
%32 = OpTypeInt 32 1;  // declare a signed 32-bit type
%float = OpTypeFloat 32;  // declare a 32-bit floating-point type
%1 = OpSpecConstant %32 -1;  // some signed 32-bit integer constant
%2 = OpSpecConstant %float 0.5;  // some 32-bit floating-point constant
```

From the above we have two specialization constants, one is a signed 32-bit integer and the second is a 32-bit floating-point value.

Now to specialize the above via the specialization constants mechanism:
It is legal for a SPIR-V module with specializations to be compiled into a pipeline where no specialization information was provided. SPIR-V specialization constants contain default values such that if a specialization is not provided, the default value will be used. In the examples above, it would be valid for an application to only specialize some of the specialization constants within the SPIR-V module, and let the other constants use their default values encoded within the OpSpecConstant declarations.

10.9. Pipeline Libraries

A pipeline library is a special pipeline that was created using the `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` and cannot be bound, instead it defines a set of pipeline state which can be linked into other pipelines. For ray tracing pipelines this includes shaders and shader groups. For graphics pipelines this includes distinct library types defined by `VkGraphicsPipelineLibraryFlagBitsEXT`. The application must maintain the lifetime of a pipeline library based on the pipelines that link with it.

This linkage is achieved by using the following structure within the appropriate creation
mechanisms:

The `VkPipelineLibraryCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_library
typedef struct VkPipelineLibraryCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t libraryCount;
    const VkPipeline* pLibraries;
} VkPipelineLibraryCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `libraryCount` is the number of pipeline libraries in `pLibraries`.
- `pLibraries` is a pointer to an array of `VkPipeline` structures specifying pipeline libraries to use when creating a pipeline.

### Valid Usage

- **VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-03381**
  Each element of `pLibraries` must have been created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`.

- **VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-06855**
  If any library in `pLibraries` was created with a shader stage with `VkPipelineShaderStageModuleIdentifierCreateInfoEXT` and `identifierSize` not equal to 0, the pipeline must be created with the `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` flag set.

- **VUID-VkPipelineLibraryCreateInfoKHR-pipeline-07404**
  If `pipeline` is being created with `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT`, every element of `pLibraries` must have been created with `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT`.

- **VUID-VkPipelineLibraryCreateInfoKHR-pipeline-07405**
  If `pipeline` is being created without `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT`, every element of `pLibraries` must have been created without `VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT`.

- **VUID-VkPipelineLibraryCreateInfoKHR-pipeline-07406**
  If `pipeline` is being created with `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`, every element of `pLibraries` must have been created with `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`.

- **VUID-VkPipelineLibraryCreateInfoKHR-pipeline-07407**
  If `pipeline` is being created without `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`, every element of `pLibraries` must have been created without `VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT`.

721
Valid Usage (Implicit)

- VUID-VkPipelineLibraryCreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PIPELINE_LIBRARY_CREATE_INFO_KHR

- VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-parameter
  If libraryCount is not 0, pLibraries **must** be a valid pointer to an array of libraryCount valid VkPipeline handles

Pipelines created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR libraries **can** depend on other pipeline libraries in VkPipelineLibraryCreateInfoKHR.

A pipeline library is considered in-use, as long as one of the linking pipelines is in-use. This applies recursively if a pipeline library includes other pipeline libraries.

10.10. Pipeline Binding

Once a pipeline has been created, it **can** be bound to the command buffer using the command:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindPipeline(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipeline pipeline);
```

- `commandBuffer` is the command buffer that the pipeline will be bound to.
- `pipelineBindPoint` is a VkPipelineBindPoint value specifying to which bind point the pipeline is bound. Binding one does not disturb the others.
- `pipeline` is the pipeline to be bound.

Once bound, a pipeline binding affects subsequent commands that interact with the given pipeline type in the command buffer until a different pipeline of the same type is bound to the bind point. Commands that do not interact with the given pipeline type **must** not be affected by the pipeline state.

- The pipeline bound to VK_PIPELINE_BIND_POINT_COMPUTE controls the behavior of all dispatching commands.
- The pipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS controls the behavior of all drawing commands.
- The pipeline bound to VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR controls the behavior of vkCmdTraceRaysKHR and vkCmdTraceRaysIndirectKHR.
- The pipeline bound to VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI controls the behavior of vkCmdSubpassShadingHUAWEI.
Valid Usage

- VUID-vkCmdBindPipeline-pipelineBindPoint-00777
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE`, the `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.

- VUID-vkCmdBindPipeline-pipelineBindPoint-00778
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdBindPipeline-pipelineBindPoint-00779
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE`, `pipeline` must be a compute pipeline.

- VUID-vkCmdBindPipeline-pipelineBindPoint-00780
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, `pipeline` must be a graphics pipeline.

- VUID-vkCmdBindPipeline-pipeline-00781
  If the `variableMultisampleRate` feature is not supported, `pipeline` is a graphics pipeline, the current subpass uses no attachments, and this is not the first call to this function with a graphics pipeline after transitioning to the current subpass, then the sample count specified by this pipeline must match that set in the previous pipeline.

- VUID-vkCmdBindPipeline-variableSampleLocations-01525
  If `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE`, and `pipeline` is a graphics pipeline created with a `VkPipelineSampleLocationsStateCreateInfoEXT` structure having its `sampleLocationsEnable` member set to `VK_TRUE` but without `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` enabled then the current render pass instance must have been begun by specifying a `VkRenderPassSampleLocationsBeginInfoEXT` structure whose `pPostSubpassSampleLocations` member contains an element with a `subpassIndex` matching the current subpass index and the `sampleLocationsInfo` member of that element must match the `sampleLocationsInfo` specified in `VkPipelineSampleLocationsStateCreateInfoEXT` when the pipeline was created.

- VUID-vkCmdBindPipeline-None-02323
  This command must not be recorded when transform feedback is active.

- VUID-vkCmdBindPipeline-pipelineBindPoint-02391
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, the `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.

- VUID-vkCmdBindPipeline-pipelineBindPoint-02392
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, `pipeline` must be a ray tracing pipeline.

- VUID-vkCmdBindPipeline-pipelineProtectedAccess-07408
  If the `pipelineProtectedAccess` feature is enabled, and `commandBuffer` is a protected command buffer.
command buffer, pipeline must have been created without
VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT

- VUID-vkCmdBindPipeline-pipelineProtectedAccess-07409
  If the pipelineProtectedAccess feature is enabled, and commandBuffer is not a protected
  command buffer, pipeline must have been created without
  VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT

- VUID-vkCmdBindPipeline-pipeline-03382
  pipeline must not have been created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR set

- VUID-vkCmdBindPipeline-commandBuffer-04808
  If commandBuffer is a secondary command buffer with
  VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D enabled and
  pipelineBindPoint is VK_PIPELINE_BIND_POINT_GRAPHICS, then the pipeline must have been
  created with VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT or VK_DYNAMIC_STATE_VIEWPORT, and
  VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT or VK_DYNAMIC_STATE_SCISSOR enabled

- VUID-vkCmdBindPipeline-commandBuffer-04809
  If commandBuffer is a secondary command buffer with
  VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D enabled and
  pipelineBindPoint is VK_PIPELINE_BIND_POINT_GRAPHICS and pipeline was created with
  VkPipelineDiscardRectangleStateCreateInfoEXT structure and its discardRectangleCount
  member is not 0, then the pipeline must have been created with
  VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT enabled

- VUID-vkCmdBindPipeline-pipelineBindPoint-04881
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_GRAPHICS and the
  provokingVertexModePerPipeline limit is VK_FALSE, then pipeline's
  VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode must
  be the same as that of any other pipelines previously bound to this bind point within the
  current render pass instance, including any pipeline already bound when beginning the
  render pass instance

- VUID-vkCmdBindPipeline-pipelineBindPoint-04949
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI, the VkCommandPool
  that commandBuffer was allocated from must support compute operations

- VUID-vkCmdBindPipeline-pipelineBindPoint-04950
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI, pipeline must be a
  subpass shading pipeline

- VUID-vkCmdBindPipeline-pipeline-06195
  If pipeline is a graphics pipeline, this command has been called inside a render pass
  instance started with vkCmdBeginRendering, and commands using the previously bound
  graphics pipeline have been recorded within the render pass instance, then the value of
  VkPipelineRenderingCreateInfo::colorAttachmentCount specified by this pipeline must
  match that set in the previous pipeline

- VUID-vkCmdBindPipeline-pipeline-06196
  If pipeline is a graphics pipeline, this command has been called inside a render pass
  instance started with vkCmdBeginRendering, and commands using the previously bound
  graphics pipeline have been recorded within the render pass instance, then the elements
of VkPipelineRenderingCreateInfo::pColorAttachmentFormats specified by this pipeline must match that set in the previous pipeline

- VUID-vkCmdBindPipeline-pipeline-06197
  If pipeline is a graphics pipeline, this command has been called inside a render pass instance started with vkCmdBeginRendering, and commands using the previously bound graphics pipeline have been recorded within the render pass instance, then the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat specified by this pipeline must match that set in the previous pipeline

- VUID-vkCmdBindPipeline-pipeline-06194
  If pipeline is a graphics pipeline, this command has been called inside a render pass instance started with vkCmdBeginRendering, and commands using the previously bound graphics pipeline have been recorded within the render pass instance, then the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat specified by this pipeline must match that set in the previous pipeline

- VUID-vkCmdBindPipeline-pipeline-06856
  If pipeline is a graphics pipeline, this command has been called inside a render pass instance started with vkCmdBeginRendering, and the pNext chain of VkRenderingInfo includes a VkMultisampledRenderToSingleSampledInfoEXT structure with multisampledRenderToSingleSampledEnable equal to VK_TRUE, then the value of VkGraphicsPipelineCreateInfo::pMultisampleState::rasterizationSamples must be equal to VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples.

- VUID-vkCmdBindPipeline-pipelineBindPoint-06653
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_GRAPHICS, pipeline must have been created without VK_PIPELINE_CREATE_LIBRARY_BIT_KHR

Valid Usage (Implicit)

- VUID-vkCmdBindPipeline-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBindPipeline-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-vkCmdBindPipeline-pipeline-parameter
  pipeline must be a valid VkPipeline handle

- VUID-vkCmdBindPipeline-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBindPipeline-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdBindPipeline-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBindPipeline-commonparent
  Both of commandBuffer, and pipeline must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

</tbody>
</table>

Possible values of `vkCmdBindPipeline::pipelineBindPoint`, specifying the bind point of a pipeline object, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineBindPoint {
    VK_PIPELINE_BIND_POINT_GRAPHICS = 0,
    VK_PIPELINE_BIND_POINT_COMPUTE = 1,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR = 1000165000,
    // Provided by VK_HUAWEI_subpass_shading
    VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI = 1000369003,
    // Provided by VK_NV_ray_tracing
    VK_PIPELINE_BIND_POINT_RAY_TRACING_NV = VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR,
} VkPipelineBindPoint;
```

- `VK_PIPELINE_BIND_POINT_COMPUTE` specifies binding as a compute pipeline.
- `VK_PIPELINE_BIND_POINT_GRAPHICS` specifies binding as a graphics pipeline.
- `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR` specifies binding as a ray tracing pipeline.
- `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI` specifies binding as a subpass shading pipeline.

For pipelines that were created with the support of multiple shader groups (see Graphics Pipeline Shader Groups), the regular `vkCmdBindPipeline` command will bind Shader Group 0. To explicitly bind a shader group use:

```c
// Provided by VK_NV_device_generated_commands
void vkCmdBindPipelineShaderGroupNV(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipeline pipeline,
)
```
• `commandBuffer` is the command buffer that the pipeline will be bound to.

• `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying the bind point to which the pipeline will be bound.

• `pipeline` is the pipeline to be bound.

• `groupIndex` is the shader group to be bound.

---

**Valid Usage**

- `VUID-vkCmdBindPipelineShaderGroupNV-groupIndex-02893`  
  `groupIndex` must be 0 or less than the effective `VkGraphicsPipelineShaderGroupsCreateInfoNV::groupCount` including the referenced pipelines

- `VUID-vkCmdBindPipelineShaderGroupNV-pipelineBindPoint-02894`  
  The `pipelineBindPoint` must be `VK_PIPELINE_BIND_POINT_GRAPHICS`

- `VUID-vkCmdBindPipelineShaderGroupNV-groupIndex-02895`  
  The same restrictions as `vkCmdBindPipeline` apply as if the bound pipeline was created only with the Shader Group from the `groupIndex` information

- `VUID-vkCmdBindPipelineShaderGroupNV-deviceGeneratedCommands-02896`  
  The `deviceGeneratedCommands` feature must be enabled

---

**Valid Usage (Implicit)**

- `VUID-vkCmdBindPipelineShaderGroupNV-commandBuffer-parameter`  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- `VUID-vkCmdBindPipelineShaderGroupNV-pipelineBindPoint-parameter`  
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value

- `VUID-vkCmdBindPipelineShaderGroupNV-pipeline-parameter`  
  `pipeline` must be a valid `VkPipeline` handle

- `VUID-vkCmdBindPipelineShaderGroupNV-commandBuffer-recording`  
  `commandBuffer` must be in the recording state

- `VUID-vkCmdBindPipelineShaderGroupNV-commandBuffer-cmdpool`  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- `VUID-vkCmdBindPipelineShaderGroupNV-videocoding`  
  This command must only be called outside of a video coding scope

- `VUID-vkCmdBindPipelineShaderGroupNV-commonparent`  
  Both of `commandBuffer`, and `pipeline` must have been created, allocated, or retrieved from the same `VkDevice`
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

### 10.11. Dynamic State

Dynamic state that does not affect the result of operations can be left undefined.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>For example, if blending is disabled by the pipeline object state then the dynamic color blend constants do not need to be specified in the command buffer, even if this state is specified as dynamic in the pipeline object.</td>
</tr>
</tbody>
</table>
10.12. Pipeline Properties and Shader Information

When a pipeline is created, its state and shaders are compiled into zero or more device-specific executables, which are used when executing commands against that pipeline. To query the properties of these pipeline executables, call:

```c
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutablePropertiesKHR(
    VkDevice device,
    const VkPipelineInfoKHR* pPipelineInfo,
    uint32_t* pExecutableCount,
    VkPipelineExecutablePropertiesKHR* pProperties);
```

- `device` is the device that created the pipeline.
- `pPipelineInfo` describes the pipeline being queried.
- `pExecutableCount` is a pointer to an integer related to the number of pipeline executables available or queried, as described below.
- `pProperties` is either NULL or a pointer to an array of `VkPipelineExecutablePropertiesKHR` structures.

If `pProperties` is NULL, then the number of pipeline executables associated with the pipeline is returned in `pExecutableCount`. Otherwise, `pExecutableCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pExecutableCount` is less than the number of pipeline executables associated with the pipeline, at most `pExecutableCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

**Valid Usage**

- VUID-vkGetPipelineExecutablePropertiesKHR-pipelineExecutableInfo-03270
  The `pipelineExecutableInfo` feature must be enabled
- VUID-vkGetPipelineExecutablePropertiesKHR-pipeline-03271
  The pipeline member of `pPipelineInfo` must have been created with `device`

**Valid Usage (Implicit)**

- VUID-vkGetPipelineExecutablePropertiesKHR-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetPipelineExecutablePropertiesKHR-pPipelineInfo-parameter
  `pPipelineInfo` must be a valid pointer to a valid `VkPipelineInfoKHR` structure
- VUID-vkGetPipelineExecutablePropertiesKHR-pExecutableCount-parameter
  `pExecutableCount` must be a valid pointer to a `uint32_t` value
• VUID-vkGetPipelineExecutablePropertiesKHR-pProperties-parameter
If the value referenced by `pExecutableCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pExecutableCount` `VkPipelineExecutablePropertiesKHR` structures

### Return Codes

#### Success
- `VK_SUCCESS`
- `VK_INCOMPLETE`

#### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineExecutablePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutablePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkShaderStageFlags stages;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
    uint32_t subgroupSize;
} VkPipelineExecutablePropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stages` is a bitmask of zero or more `VkShaderStageFlagBits` indicating which shader stages (if any) were principally used as inputs to compile this pipeline executable.
- `name` is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a short human readable name for this pipeline executable.
- `description` is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a human readable description for this pipeline executable.
- `subgroupSize` is the subgroup size with which this pipeline executable is dispatched.

Not all implementations have a 1:1 mapping between shader stages and pipeline executables and some implementations may reduce a given shader stage to fixed function hardware programming such that no pipeline executable is available. No guarantees are provided about the mapping between shader stages and pipeline executables and `stages` should be considered a best effort hint. Because the application cannot rely on the `stages` field to provide an exact description, `name` and `description` provide a human readable name and description which more accurately describes the
given pipeline executable.

**Valid Usage (Implicit)**

- VUID-VkPipelineExecutablePropertiesKHR-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_PROPERTIES_KHR`

- VUID-VkPipelineExecutablePropertiesKHR-pNext-pNext
  
  `pNext` **must** be `NULL`

To query the pipeline properties call:

```c
// Provided by VK_EXT_pipeline_properties
VkResult vkGetPipelinePropertiesEXT(
    VkDevice device,
    const VkPipelineInfoEXT* pPipelineInfo,
    VkBaseOutStructure* pPipelineProperties);
```

- `device` is the logical device that created the pipeline.
- `pPipelineInfo` is a pointer to a `VkPipelineInfoEXT` structure which describes the pipeline being queried.
- `pPipelineProperties` is a pointer to a `VkBaseOutStructure` structure in which the pipeline properties will be written.

To query a pipeline's `pipelineIdentifier` pass a `VkPipelinePropertiesIdentifierEXT` structure in `pPipelineProperties`. Each pipeline is associated with a `pipelineIdentifier` and the identifier is implementation specific.

**Valid Usage**

- VUID-vkGetPipelinePropertiesEXT-pipeline-06738
  
  The `pipeline` member of `pPipelineInfo` must have been created with `device`

- VUID-vkGetPipelinePropertiesEXT-pPipelineProperties-06739
  
  `pPipelineProperties` **must** be a valid pointer to a `VkPipelinePropertiesIdentifierEXT` structure

- VUID-vkGetPipelinePropertiesEXT-None-06766
  
  The `pipelinePropertiesIdentifier` feature **must** be enabled

**Valid Usage (Implicit)**

- VUID-vkGetPipelinePropertiesEXT-device-parameter
  
  `device` **must** be a valid `VkDevice` handle

- VUID-vkGetPipelinePropertiesEXT-pPipelineInfo-parameter
  
  `pPipelineInfo` **must** be a valid pointer to a valid `VkPipelineInfoEXT` structure
Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY

The `VkPipelinePropertiesIdentifierEXT` structure is defined as:

```c
// Provided by VK_EXT_pipeline_properties
typedef struct VkPipelinePropertiesIdentifierEXT {
    VkStructureType sType;
    void* pNext;
    uint8_t pipelineIdentifier[VK_UUID_SIZE];
} VkPipelinePropertiesIdentifierEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `pipelineIdentifier` is an array of `VK_UUID_SIZE` `uint8_t` values into which the pipeline identifier will be written.

Valid Usage (Implicit)

- VUID-VkPipelinePropertiesIdentifierEXT-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_PROPERTIES_IDENTIFIER_EXT`
- VUID-VkPipelinePropertiesIdentifierEXT-pNext-pNext `pNext` must be `NULL`

The `VkPipelineInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipeline pipeline;
} VkPipelineInfoKHR;
```

or the equivalent

```c
// Provided by VK_EXT_pipeline_properties
typedef VkPipelineInfoKHR VkPipelineInfoEXT;
```
• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **pipeline** is a **VkPipeline** handle.

### Valid Usage (Implicit)

- VUID-VkPipelineInfoKHR-sType-sType
  - **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_INFO_KHR**
- VUID-VkPipelineInfoKHR-pNext-pNext
  - **pNext** must be **NULL**
- VUID-VkPipelineInfoKHR-pipeline-parameter
  - **pipeline** must be a valid **VkPipeline** handle

Each pipeline executable **may** have a set of statistics associated with it that are generated by the pipeline compilation process. These statistics **may** include things such as instruction counts, amount of spilling (if any), maximum number of simultaneous threads, or anything else which **may** aid developers in evaluating the expected performance of a shader. To query the compile-time statistics associated with a pipeline executable, call:

```c
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutableStatisticsKHR(
    VkDevice device,
    const VkPipelineExecutableInfoKHR* pExecutableInfo,
    uint32_t* pStatisticCount,
    VkPipelineExecutableStatisticKHR* pStatistics);
```

- **device** is the device that created the pipeline.
- **pExecutableInfo** describes the pipeline executable being queried.
- **pStatisticCount** is a pointer to an integer related to the number of statistics available or queried, as described below.
- **pStatistics** is either **NULL** or a pointer to an array of **VkPipelineExecutableStatisticKHR** structures.

If **pStatistics** is **NULL**, then the number of statistics associated with the pipeline executable is returned in **pStatisticCount**. Otherwise, **pStatisticCount** must point to a variable set by the user to the number of elements in the **pStatistics** array, and on return the variable is overwritten with the number of structures actually written to **pStatistics**. If **pStatisticCount** is less than the number of statistics associated with the pipeline executable, at most **pStatisticCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available statistics were returned.
Valid Usage

- **VUID-vkGetPipelineExecutableStatisticsKHR-pipelineExecutableInfo-03272**
  The `pipelineExecutableInfo` feature **must** be enabled

- **VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03273**
  The `pipeline` member of `pExecutableInfo` **must** have been created with `device`

- **VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03274**
  The `pipeline` member of `pExecutableInfo` **must** have been created with
  `VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR`

Valid Usage (Implicit)

- **VUID-vkGetPipelineExecutableStatisticsKHR-device-parameter**
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkGetPipelineExecutableStatisticsKHR-pExecutableInfo-parameter**
  `pExecutableInfo` **must** be a valid pointer to a valid `VkPipelineExecutableInfoKHR` structure

- **VUID-vkGetPipelineExecutableStatisticsKHR-pStatisticCount-parameter**
  `pStatisticCount` **must** be a valid pointer to a `uint32_t` value

- **VUID-vkGetPipelineExecutableStatisticsKHR-pStatistics-parameter**
  If the value referenced by `pStatisticCount` is not 0, and `pStatistics` is not `NULL`, `pStatistics` **must** be a valid pointer to an array of `pStatisticCount` `VkPipelineExecutableStatisticKHR` structures

Return Codes

**Success**

- VK_SUCCESS
- VK_INCOMPLETE

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkPipelineExecutableInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipeline pipeline;
    uint32_t executableIndex;
} VkPipelineExecutableInfoKHR;
```
VkPipelineExecutableInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pipeline** is the pipeline to query.
- **executableIndex** is the index of the pipeline executable to query in the array of executable properties returned by `vkGetPipelineExecutablePropertiesKHR`.

**Valid Usage**

- **VUID-VkPipelineExecutableInfoKHR-executableIndex-03275**
  
  `executableIndex` **must** be less than the number of pipeline executables associated with `pipeline` as returned in the `pExecutableCount` parameter of `vkGetPipelineExecutablePropertiesKHR`.

**Valid Usage (Implicit)**

- **VUID-VkPipelineExecutableInfoKHR-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INFO_KHR`.

- **VUID-VkPipelineExecutableInfoKHR-pNext-pNext**
  
  `pNext` **must** be NULL.

- **VUID-VkPipelineExecutableInfoKHR-pipeline-parameter**
  
  `pipeline` **must** be a valid `VkPipeline` handle.

The `VkPipelineExecutableStatisticKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableStatisticKHR {
    VkStructureType sType;
    void* pNext;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
    VkPipelineExecutableStatisticFormatKHR format;
    VkPipelineExecutableStatisticValueKHR value;
} VkPipelineExecutableStatisticKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **name** is an array of `VK_MAX_DESCRIPTION_SIZE` char containing a null-terminated UTF-8 string which is a short human readable name for this statistic.
- **description** is an array of `VK_MAX_DESCRIPTION_SIZE` char containing a null-terminated UTF-8 string which is a human readable description for this statistic.
- **format** is a `VkPipelineExecutableStatisticFormatKHR` value specifying the format of the data found in **value**.
- **value** is the value of this statistic.

## Valid Usage (Implicit)

- VUID-VkPipelineExecutableStatisticKHR-sType-sType
  - sType **must** be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_STATISTIC_KHR`
- VUID-VkPipelineExecutableStatisticKHR-pNext-pNext
  - pNext **must** be `NULL`

The `VkPipelineExecutableStatisticFormatKHR` enum is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef enum VkPipelineExecutableStatisticFormatKHR {
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR = 0,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR = 1,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR = 2,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR = 3,
} VkPipelineExecutableStatisticFormatKHR;
```

- `VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR` specifies that the statistic is returned as a 32-bit boolean value which **must** be either `VK_TRUE` or `VK_FALSE` and **should** be read from the `b32` field of `VkPipelineExecutableStatisticValueKHR`.
- `VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR` specifies that the statistic is returned as a signed 64-bit integer and **should** be read from the `i64` field of `VkPipelineExecutableStatisticValueKHR`.
- `VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR` specifies that the statistic is returned as an unsigned 64-bit integer and **should** be read from the `u64` field of `VkPipelineExecutableStatisticValueKHR`.
- `VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR` specifies that the statistic is returned as a 64-bit floating-point value and **should** be read from the `f64` field of `VkPipelineExecutableStatisticValueKHR`.

The `VkPipelineExecutableStatisticValueKHR` union is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef union VkPipelineExecutableStatisticValueKHR {
    VkBool32 b32;
    int64_t i64;
    uint64_t u64;
    double f64;
} VkPipelineExecutableStatisticValueKHR;
```
• b32 is the 32-bit boolean value if the VkPipelineExecutableStatisticFormatKHR is VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR.

• i64 is the signed 64-bit integer value if the VkPipelineExecutableStatisticFormatKHR is VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR.

• u64 is the unsigned 64-bit integer value if the VkPipelineExecutableStatisticFormatKHR is VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR.

• f64 is the 64-bit floating-point value if the VkPipelineExecutableStatisticFormatKHR is VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR.

Each pipeline executable may have one or more text or binary internal representations associated with it which are generated as part of the compile process. These may include the final shader assembly, a binary form of the compiled shader, or the shader compiler’s internal representation at any number of intermediate compile steps. To query the internal representations associated with a pipeline executable, call:

```c
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutableInternalRepresentationsKHR(
    VkDevice device,
    const VkPipelineExecutableInfoKHR* pExecutableInfo,
    uint32_t* pInternalRepresentationCount,
    VkPipelineExecutableInternalRepresentationKHR* pInternalRepresentations);
```

- `device` is the device that created the pipeline.
- `pExecutableInfo` describes the pipeline executable being queried.
- `pInternalRepresentationCount` is a pointer to an integer related to the number of internal representations available or queried, as described below.
- `pInternalRepresentations` is either `NULL` or a pointer to an array of VkPipelineExecutableInternalRepresentationKHR structures.

If `pInternalRepresentations` is `NULL`, then the number of internal representations associated with the pipeline executable is returned in `pInternalRepresentationCount`. Otherwise, `pInternalRepresentationCount` must point to a variable set by the user to the number of elements in the `pInternalRepresentations` array, and on return the variable is overwritten with the number of structures actually written to `pInternalRepresentations`. If `pInternalRepresentationCount` is less than the number of internal representations associated with the pipeline executable, at most `pInternalRepresentationCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available representations were returned.

While the details of the internal representations remain implementation-dependent, the implementation should order the internal representations in the order in which they occur in the compiled pipeline with the final shader assembly (if any) last.

**Valid Usage**

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipelineExecutableInfo-03276
The `pipelineExecutableInfo` feature **must** be enabled

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipeline-03277
  The `pipeline` member of `pExecutableInfo` **must** have been created with `device`

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipeline-03278
  The `pipeline` member of `pExecutableInfo` **must** have been created with `VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR`

**Valid Usage (Implicit)**

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pExecutableInfo-parameter
  `pExecutableInfo` **must** be a valid pointer to a valid `VkPipelineExecutableInfoKHR` structure

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pInternalRepresentationCount-parameter
  `pInternalRepresentationCount` **must** be a valid pointer to a `uint32_t` value

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pInternalRepresentations-parameter
  If the value referenced by `pInternalRepresentationCount` is not 0, and `pInternalRepresentations` is not NULL, `pInternalRepresentations` **must** be a valid pointer to an array of `VkPipelineExecutableInternalRepresentationKHR` structures

**Return Codes**

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineExecutableInternalRepresentationKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableInternalRepresentationKHR {
    VkStructureType sType;
    void* pNext;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
} VkPipelineExecutableInternalRepresentationKHR;
```
VkBool32 isText;
size_t dataSize;
void* pData;
} VkPipelineExecutableInternalRepresentationKHR;

• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **name** is an array of **VK_MAX_DESCRIPTION_SIZE** char containing a null-terminated UTF-8 string which is a short human readable name for this internal representation.

• **description** is an array of **VK_MAX_DESCRIPTION_SIZE** char containing a null-terminated UTF-8 string which is a human readable description for this internal representation.

• **isText** specifies whether the returned data is text or opaque data. If **isText** is **VK_TRUE** then the data returned in **pData** is text and is guaranteed to be a null-terminated UTF-8 string.

• **dataSize** is an integer related to the size, in bytes, of the internal representation’s data, as described below.

• **pData** is either **NULL** or a pointer to a block of data into which the implementation will write the internal representation.

If **pData** is **NULL**, then the size, in bytes, of the internal representation data is returned in **dataSize**. Otherwise, **dataSize** must be the size of the buffer, in bytes, pointed to by **pData** and on return **dataSize** is overwritten with the number of bytes of data actually written to **pData** including any trailing null character. If **dataSize** is less than the size, in bytes, of the internal representation’s data, at most **dataSize** bytes of data will be written to **pData**, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available representation was returned.

If **isText** is **VK_TRUE** and **pData** is not **NULL** and **dataSize** is not zero, the last byte written to **pData** will be a null character.

---

**Valid Usage (Implicit)**

- **VUID-VkPipelineExecutableInternalRepresentationKHR-sType-sType**  
  **sType** **must** be **VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INTERNAL_REPRESENTATION_KHR**

- **VUID-VkPipelineExecutableInternalRepresentationKHR-pNext-pNext**  
  **pNext** **must** be **NULL**

---

Information about a particular shader that has been compiled as part of a pipeline object can be extracted by calling:

```c
// Provided by VK_AMD_shader_info
VkResult vkGetShaderInfoAMD(
    VkDevice device,  
    VkPipeline pipeline,  
    VkShaderStageFlagBits shaderStage,  
    VkShaderInfoTypeAMD infoType,  
```
size_t pInfoSize,
void* pInfo);

- **device** is the device that created **pipeline**.
- **pipeline** is the target of the query.
- **shaderStage** is a **VkShaderStageFlagBits** specifying the particular shader within the pipeline about which information is being queried.
- **infoType** describes what kind of information is being queried.
- **pInfoSize** is a pointer to a value related to the amount of data the query returns, as described below.
- **pInfo** is either **NULL** or a pointer to a buffer.

If **pInfo** is **NULL**, then the maximum size of the information that **can** be retrieved about the shader, in bytes, is returned in **pInfoSize**. Otherwise, **pInfoSize** **must** point to a variable set by the user to the size of the buffer, in bytes, pointed to by **pInfo**, and on return the variable is overwritten with the amount of data actually written to **pInfo**. If **pInfoSize** is less than the maximum size that **can** be retrieved by the pipeline cache, then at most **pInfoSize** bytes will be written to **pInfo**, and **VK_INCOMPLETE** will be returned, instead of **VK_SUCCESS**, to indicate that not all required of the pipeline cache was returned.

Not all information is available for every shader and implementations may not support all kinds of information for any shader. When a certain type of information is unavailable, the function returns **VK_ERROR_FEATURE_NOT_PRESENT**.

If information is successfully and fully queried, the function will return **VK_SUCCESS**.

For **infoType** **VK_SHADER_INFO_TYPE_STATISTICS_AMD**, a **VkShaderStatisticsInfoAMD** structure will be written to the buffer pointed to by **pInfo**. This structure will be populated with statistics regarding the physical device resources used by that shader along with other miscellaneous information and is described in further detail below.

For **infoType** **VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD**, **pInfo** is a pointer to a UTF-8 null-terminated string containing human-readable disassembly. The exact formatting and contents of the disassembly string are vendor-specific.

The formatting and contents of all other types of information, including **infoType** **VK_SHADER_INFO_TYPE_BINARY_AMD**, are left to the vendor and are not further specified by this extension.

### Valid Usage (Implicit)

- **VUID-vkGetShaderInfoAMD-device-parameter**
  - **device** **must** be a valid **VkDevice** handle

- **VUID-vkGetShaderInfoAMD-pipeline-parameter**
  - **pipeline** **must** be a valid **VkPipeline** handle

- **VUID-vkGetShaderInfoAMD-shaderStage-parameter**
shaderStage must be a valid VkShaderStageFlagBits value

- VUID-vkGetShaderInfoAMD-infoType-parameter
  infoType must be a valid VkShaderInfoTypeAMD value

- VUID-vkGetShaderInfoAMD-pInfoSize-parameter
  pInfoSize must be a valid pointer to a size_t value

- VUID-vkGetShaderInfoAMD-pInfo-parameter
  If the value referenced by pInfoSize is not 0, and pInfo is not NULL, pInfo must be a valid pointer to an array of pInfoSize bytes

- VUID-vkGetShaderInfoAMD-pipeline-parameter
  pipeline must have been created, allocated, or retrieved from device

### Return Codes

**Success**

- VK_SUCCESS
- VK_INCOMPLETE

**Failure**

- VK_ERROR_FEATURE_NOT_PRESENT
- VK_ERROR_OUT_OF_HOST_MEMORY

Possible values of vkGetShaderInfoAMD::infoType, specifying the information being queried from a shader, are:

```c
// Provided by VK_AMD_shader_info
typedef enum VkShaderInfoTypeAMD {
    VK_SHADER_INFO_TYPE_STATISTICS_AMD = 0,
    VK_SHADER_INFO_TYPE_BINARY_AMD = 1,
    VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD = 2,
} VkShaderInfoTypeAMD;
```

- **VK_SHADER_INFO_TYPE_STATISTICS_AMD** specifies that device resources used by a shader will be queried.
- **VK_SHADER_INFO_TYPE_BINARY_AMD** specifies that implementation-specific information will be queried.
- **VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD** specifies that human-readable disassembly of a shader.

The VkShaderStatisticsInfoAMD structure is defined as:

```c
// Provided by VK_AMD_shader_info
typedef struct VkShaderStatisticsInfoAMD {
    VkShaderStageFlags shaderStageMask;
    VkShaderResourceUsageAMD resourceUsage;
} VkShaderStatisticsInfoAMD;
```
typedef struct VkShaderResourceUsageAMD {
    uint32_t numUsedVgprs;
    uint32_t numUsedSgprs;
    uint32_t ldsSizePerLocalWorkGroup;
    size_t ldsUsageSizeInBytes;
    size_t scratchMemUsageInBytes;
} VkShaderResourceUsageAMD;

- numUsedVgprs is the number of vector instruction general-purpose registers used by this shader.
- numUsedSgprs is the number of scalar instruction general-purpose registers used by this shader.
- ldsSizePerLocalWorkGroup is the maximum local data store size per work group in bytes.
- ldsUsageSizeInBytes is the LDS usage size in bytes per work group by this shader.
- scratchMemUsageInBytes is the scratch memory usage in bytes by this shader.
10.13. Pipeline Compiler Control

The compilation of a pipeline can be tuned by adding a VkPipelineCompilerControlCreateInfoAMD structure to the pNext chain of VkGraphicsPipelineCreateInfo or VkComputePipelineCreateInfo.

```c
// Provided by VK_AMD_pipeline_compiler_control
typedef struct VkPipelineCompilerControlCreateInfoAMD {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCompilerControlFlagsAMD compilerControlFlags;
} VkPipelineCompilerControlCreateInfoAMD;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `compilerControlFlags` is a bitmask of VkPipelineCompilerControlFlagBitsAMD affecting how the pipeline will be compiled.

Valid Usage (Implicit)

- VUID-VkPipelineCompilerControlCreateInfoAMD-sType-sType `sType` must be VK_STRUCTURE_TYPE_PIPELINE_COMPILER_CONTROL_CREATE_INFO_AMD
- VUID-VkPipelineCompilerControlCreateInfoAMD-compilerControlFlags-zerobitmask `compilerControlFlags` must be 0

There are currently no available flags for this extension; flags will be added by future versions of this extension.

```c
// Provided by VK_AMD_pipeline_compiler_control
typedef enum VkPipelineCompilerControlFlagBitsAMD {
} VkPipelineCompilerControlFlagBitsAMD;
```

```c
// Provided by VK_AMD_pipeline_compiler_control
typedef VkFlags VkPipelineCompilerControlFlagsAMD;
```

`VkPipelineCompilerControlFlagsAMD` is a bitmask type for setting a mask of zero or more VkPipelineCompilerControlFlagBitsAMD.

10.14. Pipeline Creation Feedback

Feedback about the creation of a particular pipeline object can be obtained by adding a VkPipelineCreationFeedbackCreateInfo structure to the pNext chain of VkGraphicsPipelineCreateInfo, VkRayTracingPipelineCreateInfoKHR, VkRayTracingPipelineCreateInfoNV, or VkComputePipelineCreateInfo. The VkPipelineCreationFeedbackCreateInfo structure is defined as:
typedef struct VkPipelineCreationFeedbackCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreationFeedback* pPipelineCreationFeedback;
    uint32_t pipelineStageCreationFeedbackCount;
    VkPipelineCreationFeedback* pPipelineStageCreationFeedbacks;
} VkPipelineCreationFeedbackCreateInfo;

or the equivalent

// Provided by VK_EXT_pipeline_creation_feedback

typedef VkPipelineCreationFeedbackCreateInfo VkPipelineCreationFeedbackCreateInfoEXT;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• pPipelineCreationFeedback is a pointer to a VkPipelineCreationFeedback structure.
• pipelineStageCreationFeedbackCount is the number of elements in pPipelineStageCreationFeedbacks.
• pPipelineStageCreationFeedbacks is a pointer to an array of pipelineStageCreationFeedbackCount VkPipelineCreationFeedback structures.

An implementation should write pipeline creation feedback to pPipelineCreationFeedback and may write pipeline stage creation feedback to pPipelineStageCreationFeedbacks. An implementation must set or clear the VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT in VkPipelineCreationFeedback::flags for pPipelineCreationFeedback and every element of pPipelineStageCreationFeedbacks.

Note

One common scenario for an implementation to skip per-stage feedback is when VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT is set in pPipelineCreationFeedback.

When chained to VkRayTracingPipelineCreateInfoKHR, VkRayTracingPipelineCreateInfoNV, or VkGraphicsPipelineCreateInfo, the i element of pPipelineStageCreationFeedbacks corresponds to the i element of VkRayTracingPipelineCreateInfoKHR::pStages, VkRayTracingPipelineCreateInfoNV::pStages, or VkGraphicsPipelineCreateInfo::pStages. When chained to VkComputePipelineCreateInfo, the first element of pPipelineStageCreationFeedbacks corresponds to VkComputePipelineCreateInfo::stage.

Valid Usage (Implicit)

• VUID-VkPipelineCreationFeedbackCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_CREATION_FEEDBACK_CREATE_INFO
• VUID-VkPipelineCreationFeedbackCreateInfo-pPipelineCreationFeedback-parameter
**pPipelineCreationFeedback** must be a valid pointer to a `VkPipelineCreationFeedback` structure

- **VUID-VkPipelineCreationFeedbackCreateInfo-pPipelineStageCreationFeedbacks** parameter
  
  If `pipelineStageCreationFeedbackCount` is not 0, `pPipelineStageCreationFeedbacks` must be a valid pointer to an array of `pipelineStageCreationFeedbackCount` `VkPipelineCreationFeedback` structures

The `VkPipelineCreationFeedback` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPipelineCreationFeedback {
    VkPipelineCreationFeedbackFlags flags;
    uint64_t duration;
} VkPipelineCreationFeedback;
```

or the equivalent

```c
// Provided by VK_EXT_pipeline_creation_feedback
typedef VkPipelineCreationFeedback VkPipelineCreationFeedbackEXT;
```

- **flags** is a bitmask of `VkPipelineCreationFeedbackFlagBits` providing feedback about the creation of a pipeline or of a pipeline stage.
- **duration** is the duration spent creating a pipeline or pipeline stage in nanoseconds.

If the `VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT` is not set in `flags`, an implementation must not set any other bits in `flags`, and the values of all other `VkPipelineCreationFeedback` data members are undefined.

Possible values of the `flags` member of `VkPipelineCreationFeedback` are:

```c
// Provided by VK_VERSION_1_3
typedef enum VkPipelineCreationFeedbackFlagBits {
    VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT = 0x00000001,
    VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT = 0x00000002,
    VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT = 0x00000004,
    VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT_EXT = VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT,
    VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT_EXT = VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT,
    VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT_EXT = VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT,
} VkPipelineCreationFeedbackFlagBits;
```

or the equivalent
• **VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT** indicates that the feedback information is valid.

• **VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT** indicates that a readily usable pipeline or pipeline stage was found in the `pipelineCache` specified by the application in the pipeline creation command.

Note
Implementation are encouraged to provide a meaningful signal to applications using this bit. The intention is to communicate to the application that the pipeline or pipeline stage was created “as fast as it gets” using the pipeline cache provided by the application. If an implementation uses an internal cache, it is discouraged from setting this bit as the feedback would be unactionable.

• **VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT** indicates that the base pipeline specified by the `basePipelineHandle` or `basePipelineIndex` member of the `Vk*PipelineCreateInfo` structure was used to accelerate the creation of the pipeline.

Note
While “significant amount of work” is subjective, implementations are encouraged to provide a meaningful signal to applications using this bit. For example, a 1% reduction in duration may not warrant setting this bit, while a 50% reduction would.

// Provided by VK_VERSION_1_3
typedef VkFlags VkPipelineCreationFeedbackFlags;

or the equivalent

// Provided by VK_EXT_pipeline_creation_feedback
typedef VkPipelineCreationFeedbackFlags VkPipelineCreationFeedbackFlagsEXT;
`VkPipelineCreationFeedbackFlags` is a bitmask type for providing zero or more `VkPipelineCreationFeedbackFlagBits`. 
Chapter 11. Memory Allocation

Vulkan memory is broken up into two categories, host memory and device memory.

11.1. Host Memory

Host memory is memory needed by the Vulkan implementation for non-device-visible storage.

Note

This memory may be used to store the implementation's representation and state of Vulkan objects.

Vulkan provides applications the opportunity to perform host memory allocations on behalf of the Vulkan implementation. If this feature is not used, the implementation will perform its own memory allocations. Since most memory allocations are off the critical path, this is not meant as a performance feature. Rather, this can be useful for certain embedded systems, for debugging purposes (e.g. putting a guard page after all host allocations), or for memory allocation logging.

 Allocators are provided by the application as a pointer to a VkAllocationCallbacks structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkAllocationCallbacks {
    void* pUserData;
   PFN_vkAllocationFunction pfnAllocation;
   PFN_vkReallocationFunction pfnReallocation;
   PFN_vkFreeFunction pfnFree;
   PFN_vkInternalAllocationNotification pfnInternalAllocation;
   PFN_vkInternalFreeNotification pfnInternalFree;
} VkAllocationCallbacks;
```

- `pUserData` is a value to be interpreted by the implementation of the callbacks. When any of the callbacks in `VkAllocationCallbacks` are called, the Vulkan implementation will pass this value as the first parameter to the callback. This value can vary each time an allocator is passed into a command, even when the same object takes an allocator in multiple commands.

- `pfnAllocation` is a `PFN_vkAllocationFunction` pointer to an application-defined memory allocation function.

- `pfnReallocation` is a `PFN_vkReallocationFunction` pointer to an application-defined memory reallocation function.

- `pfnFree` is a `PFN_vkFreeFunction` pointer to an application-defined memory free function.

- `pfnInternalAllocation` is a `PFN_vkInternalAllocationNotification` pointer to an application-defined function that is called by the implementation when the implementation makes internal allocations.

- `pfnInternalFree` is a `PFN_vkInternalFreeNotification` pointer to an application-defined function that is called by the implementation when the implementation frees internal allocations.
Valid Usage

- **VUID-VkAllocationCallbacks-pfnAllocation-00632**
  
  `pfnAllocation` must be a valid pointer to a valid user-defined `PFN_vkAllocationFunction`

- **VUID-VkAllocationCallbacks-pfnReallocation-00633**
  
  `pfnReallocation` must be a valid pointer to a valid user-defined `PFN_vkReallocationFunction`

- **VUID-VkAllocationCallbacks-pfnFree-00634**
  
  `pfnFree` must be a valid pointer to a valid user-defined `PFN_vkFreeFunction`

- **VUID-VkAllocationCallbacks-pfnInternalAllocation-00635**
  
  If either of `pfnInternalAllocation` or `pfnInternalFree` is not NULL, both must be valid callbacks.

The type of `pfnAllocation` is:

```c
// Provided by VK_VERSION_1_0
typedef void* (VKAPI_PTR *PFN_vkAllocationFunction)(
    void* pUserData,
    size_t size,
    size_t alignment,
    VkSystemAllocationScope allocationScope);
```

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `size` is the size in bytes of the requested allocation.
- `alignment` is the requested alignment of the allocation in bytes and must be a power of two.
- `allocationScope` is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described here.

If `pfnAllocation` is unable to allocate the requested memory, it must return NULL. If the allocation was successful, it must return a valid pointer to memory allocation containing at least size bytes, and with the pointer value being a multiple of `alignment`.

**Note**

Correct Vulkan operation cannot be assumed if the application does not follow these rules.

For example, `pfnAllocation` (or `pfnReallocation`) could cause termination of running Vulkan instance(s) on a failed allocation for debugging purposes, either directly or indirectly. In these circumstances, it cannot be assumed that any part of any affected `VkInstance` objects are going to operate correctly (even `vkDestroyInstance`), and the application must ensure it cleans up properly via other means (e.g. process termination).
If `pfnAllocation` returns `NULL`, and if the implementation is unable to continue correct processing of the current command without the requested allocation, it **must** treat this as a runtime error, and generate `VK_ERROR_OUT_OF_HOST_MEMORY` at the appropriate time for the command in which the condition was detected, as described in **Return Codes**.

If the implementation is able to continue correct processing of the current command without the requested allocation, then it **may** do so, and **must** not generate `VK_ERROR_OUT_OF_HOST_MEMORY` as a result of this failed allocation.

The type of `pfnReallocate` is:

```c
// Provided by VK_VERSION_1_0
typedef void* (VKAPI_PTR *PFN_vkReallocateFunction)(
    void* pUserData,
    void* pOriginal,
    size_t size,
    size_t alignment,
    VkSystemAllocationScope allocationScope);
```

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `pOriginal` **must** be either `NULL` or a pointer previously returned by `pfnReallocate` or `pfnAllocation` of a compatible allocator.
- `size` is the size in bytes of the requested allocation.
- `alignment` is the requested alignment of the allocation in bytes and **must** be a power of two.
- `allocationScope` is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described here.

`pfnReallocate` **must** return an allocation with enough space for `size` bytes, and the contents of the original allocation from bytes zero to min(original size, new size) - 1 **must** be preserved in the returned allocation. If `size` is larger than the old size, the contents of the additional space are undefined. If satisfying these requirements involves creating a new allocation, then the old allocation **should** be freed.

If `pOriginal` is `NULL`, then `pfnReallocate` **must** behave equivalently to a call to `PFN_vkAllocationFunction` with the same parameter values (without `pOriginal`).

If `size` is zero, then `pfnReallocate` **must** behave equivalently to a call to `PFN_vkFreeFunction` with the same `pUserData` parameter value, and `pMemory` equal to `pOriginal`.

If `pOriginal` is non-NULL, the implementation **must** ensure that `alignment` is equal to the `alignment` used to originally allocate `pOriginal`.

If this function fails and `pOriginal` is non-NULL the application **must** not free the old allocation.

`pfnReallocate` **must** follow the same rules for return values as `PFN_vkAllocationFunction`.

The type of `pfnFree` is:
typedef void (VKAPI_PTR *PFN_vkFreeFunction)(
    void* pUserData,
    void* pMemory);

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `pMemory` is the allocation to be freed.

`pMemory` may be `NULL`, which the callback must handle safely. If `pMemory` is non-NULL, it must be a pointer previously allocated by `PFN_allocation` or `PFN_reallocation`. The application should free this memory.

The type of `PFN_InternalAllocation` is:

typedef void (VKAPI_PTR *PFN_vkInternalAllocationNotification)(
    void* pUserData,
    size_t size,
    VkInternalAllocationType allocationType,
    VkSystemAllocationScope allocationScope);

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `size` is the requested size of an allocation.
- `allocationType` is a `VkInternalAllocationType` value specifying the requested type of an allocation.
- `allocationScope` is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described here.

This is a purely informational callback.

The type of `PFN_InternalFree` is:

typedef void (VKAPI_PTR *PFN_vkInternalFreeNotification)(
    void* pUserData,
    size_t size,
    VkInternalAllocationType allocationType,
    VkSystemAllocationScope allocationScope);

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `size` is the requested size of an allocation.
• allocationType is a VkInternalAllocationType value specifying the requested type of an allocation.

• allocationScope is a VkSystemAllocationScope value specifying the allocation scope of the lifetime of the allocation, as described here.

Each allocation has an allocation scope defining its lifetime and which object it is associated with. Possible values passed to the allocationScope parameter of the callback functions specified by VkAllocationCallbacks, indicating the allocation scope, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSystemAllocationScope {
    VK_SYSTEM_ALLOCATION_SCOPE_COMMAND = 0,
    VK_SYSTEM_ALLOCATION_SCOPE_OBJECT = 1,
    VK_SYSTEM_ALLOCATION_SCOPE_CACHE = 2,
    VK_SYSTEM_ALLOCATION_SCOPE_DEVICE = 3,
    VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE = 4,
} VkSystemAllocationScope;
```

• VK_SYSTEM_ALLOCATION_SCOPE_COMMAND specifies that the allocation is scoped to the duration of the Vulkan command.

• VK_SYSTEM_ALLOCATION_SCOPE_OBJECT specifies that the allocation is scoped to the lifetime of the Vulkan object that is being created or used.

• VK_SYSTEM_ALLOCATION_SCOPE_CACHE specifies that the allocation is scoped to the lifetime of a VkPipelineCache or VkValidationCacheEXT object.

• VK_SYSTEM_ALLOCATION_SCOPE_DEVICE specifies that the allocation is scoped to the lifetime of the Vulkan device.

• VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE specifies that the allocation is scoped to the lifetime of the Vulkan instance.

Most Vulkan commands operate on a single object, or there is a sole object that is being created or manipulated. When an allocation uses an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_OBJECT or VK_SYSTEM_ALLOCATION_SCOPE_CACHE, the allocation is scoped to the object being created or manipulated.

When an implementation requires host memory, it will make callbacks to the application using the most specific allocator and allocation scope available:

• If an allocation is scoped to the duration of a command, the allocator will use the VK_SYSTEM_ALLOCATION_SCOPE_COMMAND allocation scope. The most specific allocator available is used: if the object being created or manipulated has an allocator, that object's allocator will be used, else if the parent VkDevice has an allocator it will be used, else if the parent VkInstance has an allocator it will be used. Else,

• If an allocation is associated with a VkValidationCacheEXT or VkPipelineCache object, the allocator will use the VK_SYSTEM_ALLOCATION_SCOPE_CACHE allocation scope. The most specific allocator available is used (cache, else device, else instance). Else,
If an allocation is scoped to the lifetime of an object, that object is being created or manipulated by the command, and that object’s type is not VkDevice or VkInstance, the allocator will use an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_OBJECT. The most specific allocator available is used (object, else device, else instance). Else,

- If an allocation is scoped to the lifetime of a device, the allocator will use an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_DEVICE. The most specific allocator available is used (device, else instance). Else,

- If the allocation is scoped to the lifetime of an instance and the instance has an allocator, its allocator will be used with an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE.

- Otherwise an implementation will allocate memory through an alternative mechanism that is unspecified.

Objects that are allocated from pools do not specify their own allocator. When an implementation requires host memory for such an object, that memory is sourced from the object’s parent pool’s allocator.

The application is not expected to handle allocating memory that is intended for execution by the host due to the complexities of differing security implementations across multiple platforms. The implementation will allocate such memory internally and invoke an application provided informational callback when these internal allocations are allocated and freed. Upon allocation of executable memory, pfnInternalAllocation will be called. Upon freeing executable memory, pfnInternalFree will be called. An implementation will only call an informational callback for executable memory allocations and frees.

The allocationType parameter to the pfnInternalAllocation and pfnInternalFree functions may be one of the following values:

```c
// Provided by VK_VERSION_1_0
typedef enum VkInternalAllocationType {
    VK_INTERNAL_ALLOCATION_TYPE_EXECUTABLE = 0,
} VkInternalAllocationType;
```

- Vk_INTERNAL_ALLOCATION_TYPE_EXECUTABLE specifies that the allocation is intended for execution by the host.

An implementation must only make calls into an application-provided allocator during the execution of an API command. An implementation must only make calls into an application-provided allocator from the same thread that called the provoking API command. The implementation should not synchronize calls to any of the callbacks. If synchronization is needed, the callbacks must provide it themselves. The informational callbacks are subject to the same restrictions as the allocation callbacks.

If an implementation intends to make calls through a VkAllocationCallbacks structure between the time a vkCreate* command returns and the time a corresponding vkDestroy* command begins, that implementation must save a copy of the allocator before the vkCreate* command returns. The callback functions and any data structures they rely upon must remain valid for the lifetime of the object they are associated with.
If an allocator is provided to a vkCreate* command, a compatible allocator must be provided to the corresponding vkDestroy* command. Two VkAllocationCallbacks structures are compatible if memory allocated with pfnAllocation or pfnReallocation in each can be freed with pfnReallocation or pfnFree in the other. An allocator must not be provided to a vkDestroy* command if an allocator was not provided to the corresponding vkCreate* command.

If a non-NULL allocator is used, the pfnAllocation, pfnReallocation and pfnFree members must be non-NULL and point to valid implementations of the callbacks. An application can choose to not provide informational callbacks by setting both pfnInternalAllocation and pfnInternalFree to NULL. pfnInternalAllocation and pfnInternalFree must either both be NULL or both be non-NULL.

If pfnAllocation or pfnReallocation fail, the implementation may fail object creation and/or generate a VK_ERROR_OUT_OF_HOST_MEMORY error, as appropriate.

Allocation callbacks must not call any Vulkan commands.

The following sets of rules define when an implementation is permitted to call the allocator callbacks.

pfnAllocation or pfnReallocation may be called in the following situations:

- Allocations scoped to a VkDevice or VkInstance may be allocated from any API command.
- Allocations scoped to a command may be allocated from any API command.
- Allocations scoped to a VkPipelineCache may only be allocated from:
  - vkCreatePipelineCache
  - vkMergePipelineCaches for dstCache
  - vkCreateGraphicsPipelines for pipelineCache
  - vkCreateComputePipelines for pipelineCache
- Allocations scoped to a VkValidationCacheEXT may only be allocated from:
  - vkCreateValidationCacheEXT
  - vkMergeValidationCachesEXT for dstCache
  - vkCreateShaderModule for validationCache in VkShaderModuleValidationCacheCreateInfoEXT
- Allocations scoped to a VkDescriptorPool may only be allocated from:
  - any command that takes the pool as a direct argument
  - vkAllocateDescriptorSets for the descriptorPool member of its pAllocateInfo parameter
  - vkCreateDescriptorPool
- Allocations scoped to a VkCommandPool may only be allocated from:
  - any command that takes the pool as a direct argument
  - vkCreateCommandPool
  - vkAllocateCommandBuffers for the commandPool member of its pAllocateInfo parameter
  - any vkCmd* command whose commandBuffer was allocated from that VkCommandPool
• Allocations scoped to any other object may only be allocated in that object’s `vkCreate*` command.

`pfnFree`, or `pfnReallocation` with zero size, may be called in the following situations:

• Allocations scoped to a `VkDevice` or `VkInstance` may be freed from any API command.
• Allocations scoped to a command must be freed by any API command which allocates such memory.
• Allocations scoped to a `VkPipelineCache` may be freed from `vkDestroyPipelineCache`.
• Allocations scoped to a `VkValidationCacheEXT` may be freed from `vkDestroyValidationCacheEXT`.
• Allocations scoped to a `VkDescriptorPool` may be freed from
  ◦ any command that takes the pool as a direct argument
• Allocations scoped to a `VkCommandPool` may be freed from:
  ◦ any command that takes the pool as a direct argument
  ◦ `vkResetCommandBuffer` whose `commandBuffer` was allocated from that `VkCommandPool`
• Allocations scoped to any other object may be freed in that object’s `vkDestroy*` command.
• Any command that allocates host memory may also free host memory of the same scope.

### 11.2. Device Memory

*Device memory* is memory that is visible to the device — for example the contents of the image or buffer objects, which can be natively used by the device.

#### 11.2.1. Device Memory Properties

Memory properties of a physical device describe the memory heaps and memory types available.

To query memory properties, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceMemoryProperties(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceMemoryProperties* pMemoryProperties);
```

• `physicalDevice` is the handle to the device to query.
• `pMemoryProperties` is a pointer to a `VkPhysicalDeviceMemoryProperties` structure in which the properties are returned.

### Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceMemoryProperties-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
• VUID-vkGetPhysicalDeviceMemoryProperties-pMemoryProperties-parameter
The `VkPhysicalDeviceMemoryProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceMemoryProperties {
    uint32_t memoryTypeCount;
    VkMemoryType memoryTypes[VK_MAX_MEMORY_TYPES];
    uint32_t memoryHeapCount;
    VkMemoryHeap memoryHeaps[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryProperties;
```

- `memoryTypeCount` is the number of valid elements in the `memoryTypes` array.
- `memoryTypes` is an array of `VK_MAX_MEMORY_TYPES` `VkMemoryType` structures describing the memory types that can be used to access memory allocated from the heaps specified by `memoryHeaps`.
- `memoryHeapCount` is the number of valid elements in the `memoryHeaps` array.
- `memoryHeaps` is an array of `VK_MAX_MEMORY_HEAPS` `VkMemoryHeap` structures describing the memory heaps from which memory can be allocated.

The `VkPhysicalDeviceMemoryProperties` structure describes a number of memory heaps as well as a number of memory types that can be used to access memory allocated in those heaps. Each heap describes a memory resource of a particular size, and each memory type describes a set of memory properties (e.g. host cached vs. uncached) that can be used with a given memory heap. Allocations using a particular memory type will consume resources from the heap indicated by that memory type's heap index. More than one memory type may share each heap, and the heaps and memory types provide a mechanism to advertise an accurate size of the physical memory resources while allowing the memory to be used with a variety of different properties.

The number of memory heaps is given by `memoryHeapCount` and is less than or equal to `VK_MAX_MEMORY_HEAPS`. Each heap is described by an element of the `memoryHeaps` array as a `VkMemoryHeap` structure. The number of memory types available across all memory heaps is given by `memoryTypeCount` and is less than or equal to `VK_MAX_MEMORY_TYPES`. Each memory type is described by an element of the `memoryTypes` array as a `VkMemoryType` structure.

At least one heap must include `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` in `VkMemoryHeap::flags`. If there are multiple heaps that all have similar performance characteristics, they may all include `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT`. In a unified memory architecture (UMA) system there is often only a single memory heap which is considered to be equally “local” to the host and to the device, and such an implementation must advertise the heap as device-local.

Each memory type returned by `vkGetPhysicalDeviceMemoryProperties` must have its `propertyFlags` set to one of the following values:

- 0
• VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT

• VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT

• VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORYPROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD
VK_MEMORYPROPERTYDEVICECOHERENT_BIT_AMD | VK_MEMORYPROPERTYDEVICEUNCACHED_BIT_AMD

• VK_MEMORYPROPERTYHOSTVISIBLE_BIT | VK_MEMORYPROPERTYHOSTCACHED_BIT | VK_MEMORYPROPERTYHOSTCOHERENT_BIT | VK_MEMORYPROPERTYDEVICECOHERENT_BIT_AMD | VK_MEMORYPROPERTYDEVICEUNCACHED_BIT_AMD

• VK_MEMORYPROPERTYDEVICELOCAL_BIT | VK_MEMORYPROPERTYDEVICECOHERENT_BIT_AMD | VK_MEMORYPROPERTYDEVICEUNCACHED_BIT_AMD

• VK_MEMORYPROPERTYDEVICELOCAL_BIT | VK_MEMORYPROPERTYHOSTVISIBLE_BIT | VKMEMORYPROPERTYHOSTCOHERENT_BIT | VK_MEMORYPROPERTYDEVICECOHERENT_BIT_AMD | VK_MEMORYPROPERTYDEVICEUNCACHED_BIT_AMD

• VK_MEMORYPROPERTYDEVICELOCAL_BIT | VK_MEMORYPROPERTYHOSTVISIBLE_BIT | VK_MEMORYPROPERTYHOSTCACHED_BIT | VK_MEMORYPROPERTYHOSTCOHERENT_BIT | VK_MEMORYPROPERTYDEVICECOHERENT_BIT_AMD | VK_MEMORYPROPERTYDEVICEUNCACHED_BIT_AMD

• VK_MEMORYPROPERTYDEVICELOCAL_BIT | VK_MEMORYPROPERTYHOSTVISIBLE_BIT | VK_MEMORYPROPERTYHOSTCACHED_BIT | VK_MEMORYPROPERTYHOSTCOHERENT_BIT | VK_MEMORYPROPERTYDEVICECOHERENT_BIT_AMD | VK_MEMORYPROPERTYDEVICEUNCACHED_BIT_AMD

• VK_MEMORYPROPERTYDEVICELOCAL_BIT | VK_MEMORYPROPERTYHOSTVISIBLE_BIT | VK_MEMORYPROPERTYHOSTCACHED_BIT | VK_MEMORYPROPERTYHOSTCOHERENT_BIT | VK_MEMORYPROPERTYDEVICECOHERENT_BIT_AMD | VK_MEMORYPROPERTYDEVICEUNCACHED_BIT_AMD

• VK_MEMORYPROPERTYDEVICELOCAL_BIT | VK_MEMORYPROPERTYRDMACAPABLE_BIT_NV

There must be at least one memory type with both the VK_MEMORYPROPERTYHOSTVISIBLE_BIT and VK_MEMORYPROPERTYHOSTCOHERENT_BIT bits set in its propertyFlags. There must be at least one memory type with the VK_MEMORYPROPERTYDEVICELOCAL_BIT bit set in its propertyFlags. If the deviceCoherentMemory feature is enabled, there must be at least one memory type with the VK_MEMORYPROPERTYDEVICECOHERENT_BIT_AMD bit set in its propertyFlags.

For each pair of elements $X$ and $Y$ returned in memoryTypes, $X$ must be placed at a lower index position than $Y$ if:

• the set of bit flags returned in the propertyFlags member of $X$ is a strict subset of the set of bit flags returned in the propertyFlags member of $Y$; or

• the propertyFlags members of $X$ and $Y$ are equal, and $X$ belongs to a memory heap with greater performance (as determined in an implementation-specific manner); or

• the propertyFlags members of $Y$ includes VK_MEMORYPROPERTYDEVICECOHERENT_BIT_AMD or VK_MEMORYPROPERTYDEVICEUNCACHED_BIT_AMD and $X$ does not

Note
There is no ordering requirement between $X$ and $Y$ elements for the case their propertyFlags members are not in a subset relation. That potentially allows more than one possible way to order the same set of memory types. Notice that the list of all allowed memory property flag combinations is written in a valid order. But if
instead \texttt{VK\_MEMORY\_PROPERTY\_DEVICE\_LOCAL\_BIT} was before \texttt{VK\_MEMORY\_PROPERTY\_HOST\_VISIBLE\_BIT} | \texttt{VK\_MEMORY\_PROPERTY\_HOST\_COHERENT\_BIT}, the list would still be in a valid order.

There may be a performance penalty for using device coherent or uncached device memory types, and using these accidentally is undesirable. In order to avoid this, memory types with these properties always appear at the end of the list; but are subject to the same rules otherwise.

This ordering requirement enables applications to use a simple search loop to select the desired memory type along the lines of:

```c
// Find a memory in `memoryTypeBitsRequirement` that includes all of `requiredProperties`
int32_t findProperties(const VkPhysicalDeviceMemoryProperties* pMemoryProperties,
                        uint32_t memoryTypeBitsRequirement,
                        VkMemoryPropertyFlags requiredProperties) {
    const uint32_t memoryCount = pMemoryProperties->memoryTypeCount;
    for (uint32_t memoryIndex = 0; memoryIndex < memoryCount; ++memoryIndex) {
        const uint32_t memoryTypeBits = (1 << memoryIndex);
        const bool isRequiredMemoryType = memoryTypeBitsRequirement & memoryTypeBits;

        const VkMemoryPropertyFlags properties = pMemoryProperties->memoryTypes[memoryIndex].propertyFlags;
        const bool hasRequiredProperties = (properties & requiredProperties) == requiredProperties;

        if (isRequiredMemoryType && hasRequiredProperties)
            return static_cast<int32_t>(memoryIndex);
    }

    // failed to find memory type
    return -1;
}
```

// Try to find an optimal memory type, or if it does not exist try fallback memory type
// `device` is the VkDevice
// `image` is the VkImage that requires memory to be bound
// `memoryProperties` properties as returned by vkGetPhysicalDeviceMemoryProperties
// `requiredProperties` are the property flags that must be present
// `optimalProperties` are the property flags that are preferred by the application
VkMemoryRequirements memoryRequirements;
vkGetImageMemoryRequirements(device, image, &memoryRequirements);
int32_t memoryType = findProperties(&memoryProperties, memoryRequirements.memoryTypeBits, optimalProperties);
if (memoryType == -1) // not found; try fallback properties
    memoryType = findProperties(&memoryProperties, memoryRequirements.memoryTypeBits,
```
**VK_MAX_MEMORY_TYPES** is the length of an array of `VkMemoryType` structures describing memory types, as returned in `VkPhysicalDeviceMemoryProperties::memoryTypes`.

```c
#define VK_MAX_MEMORY_TYPES 32U
```

**VK_MAX_MEMORY_HEAPS** is the length of an array of `VkMemoryHeap` structures describing memory heaps, as returned in `VkPhysicalDeviceMemoryProperties::memoryHeaps`.

```c
#define VK_MAX_MEMORY_HEAPS 16U
```

To query memory properties, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceMemoryProperties2(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceMemoryProperties2* pMemoryProperties);
```

or the equivalent command

```c
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceMemoryProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceMemoryProperties2* pMemoryProperties);
```

- **physicalDevice** is the handle to the device to query.
- **pMemoryProperties** is a pointer to a `VkPhysicalDeviceMemoryProperties2` structure in which the properties are returned.

`vkGetPhysicalDeviceMemoryProperties2` behaves similarly to `vkGetPhysicalDeviceMemoryProperties`, with the ability to return extended information in a `pNext` chain of output structures.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceMemoryProperties2-physicalDevice-parameter physicalDevice must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceMemoryProperties2-pMemoryProperties-parameter pMemoryProperties must be a valid pointer to a `VkPhysicalDeviceMemoryProperties2` structure

The `VkPhysicalDeviceMemoryProperties2` structure is defined as:
```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMemoryProperties2 {
    VkStructureType sType;
    void* pNext;
    VkPhysicalDeviceMemoryProperties memoryProperties;
} VkPhysicalDeviceMemoryProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceMemoryProperties2 VkPhysicalDeviceMemoryProperties2KHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **memoryProperties** is a `VkPhysicalDeviceMemoryProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceMemoryProperties`.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceMemoryProperties2-sType-sType**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

  ```c
  sType must be VK_STRUCTURE_TYPE_PHYSICAL DEVICE_MEMORY_PROPERTIES_2
  ```

- **VUID-VkPhysicalDeviceMemoryProperties2-pNext-pNext**
  
  The `pNext` value of each struct in the `pNext` chain must be unique.

  ```c
  pNext must be NULL or a pointer to a valid instance of
  VkPhysicalDeviceMemoryBudgetPropertiesEXT
  ```

The **VkMemoryHeap** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryHeap {
    VkDeviceSize size;
    VkMemoryHeapFlags flags;
} VkMemoryHeap;
```

- **size** is the total memory size in bytes in the heap.
- **flags** is a bitmask of `VkMemoryHeapFlagBits` specifying attribute flags for the heap.

Bits which **may** be set in `VkMemoryHeap::flags`, indicating attribute flags for the heap, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkMemoryHeapFlagBits {
    VK_MEMORY_HEAP_DEVICE_LOCAL_BIT = 0x00000001,
```

761
• **VK_MEMORY_HEAP_DEVICE_LOCAL_BIT** specifies that the heap corresponds to device-local memory. Device-local memory may have different performance characteristics than host-local memory, and may support different memory property flags.

• **VK_MEMORY_HEAP_MULTI_INSTANCE_BIT** specifies that in a logical device representing more than one physical device, there is a per-physical device instance of the heap memory. By default, an allocation from such a heap will be replicated to each physical device's instance of the heap.

---

**VkMemoryHeapFlags** is a bitmask type for setting a mask of zero or more **VkMemoryHeapFlagBits**.

The **VkMemoryType** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryHeapFlags;
```

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryType {
    VkMemoryPropertyFlags propertyFlags;
    uint32_t heapIndex;
} VkMemoryType;
```

• **heapIndex** describes which memory heap this memory type corresponds to, and must be less than memoryHeapCount from the **VkPhysicalDeviceMemoryProperties** structure.

• **propertyFlags** is a bitmask of **VkMemoryPropertyFlagBits** of properties for this memory type.

Bits which may be set in **VkMemoryType::propertyFlags**, indicating properties of a memory type, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkMemoryPropertyFlagBits {
    VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT = 0x00000001,
    VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT = 0x00000002,
    VK_MEMORY_PROPERTY_HOST_COHERENT_BIT = 0x00000004,
    VK_MEMORY_PROPERTY_HOST_CACHED_BIT = 0x00000008,
    VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_MEMORY_PROPERTY_PROTECTED_BIT = 0x00000020,
    // Provided by VK_AMD_device_coherent_memory
    VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD = 0x00000040,
    // Provided by VK_AMD_device_coherent_memory
    VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD = 0x00000080,
};
```
• **VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT** bit specifies that memory allocated with this type is the most efficient for device access. This property will be set if and only if the memory type belongs to a heap with the **VK_MEMORY_HEAP_DEVICE_LOCAL_BIT** set.

• **VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT** bit specifies that memory allocated with this type can be mapped for host access using `vkMapMemory`.

• **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** bit specifies that the host cache management commands `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges` are not needed to flush host writes to the device or make device writes visible to the host, respectively.

• **VK_MEMORY_PROPERTY_HOST_CACHED_BIT** bit specifies that memory allocated with this type is cached on the host. Host memory accesses to uncached memory are slower than to cached memory, however uncached memory is always host coherent.

• **VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT** bit specifies that the memory type only allows device access to the memory. Memory types must not have both **VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT** and **VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT** set. Additionally, the object's backing memory may be provided by the implementation lazily as specified in Lazily Allocated Memory.

• **VK_MEMORY_PROPERTY_PROTECTED_BIT** bit specifies that the memory type only allows device access to the memory, and allows protected queue operations to access the memory. Memory types must not have **VK_MEMORY_PROPERTY_PROTECTED_BIT** set and any of **VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT** set, or **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** set, or **VK_MEMORY_PROPERTY_HOST_CACHED_BIT** set.

• **VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD** bit specifies that device accesses to allocations of this memory type are automatically made available and visible.

• **VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD** bit specifies that memory allocated with this type is not cached on the device. Uncached device memory is always device coherent.

• **VK_MEMORY_PROPERTY_RDMA_CAPABLE_BIT_NV** bit specifies that external devices can access this memory directly.

For any memory allocated with both the **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** and the **VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD**, host or device accesses also perform automatic memory domain transfer operations, such that writes are always automatically available and visible to both host and device memory domains.

---

**Note**

Device coherence is a useful property for certain debugging use cases (e.g. crash analysis, where performing separate coherence actions could mean values are not reported correctly). However, device coherent accesses may be slower than equivalent accesses without device coherence, particularly if they are also device uncached. For device uncached memory in particular, repeated accesses to the same or neighbouring memory locations over a short time period (e.g. within a
frame) may be slower than it would be for the equivalent cached memory type. As such, it is generally inadvisable to use device coherent or device uncached memory except when really needed.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryPropertyFlags;
```

`VkMemoryPropertyFlags` is a bitmask type for setting a mask of zero or more `VkMemoryPropertyFlagBits`. If the `VkPhysicalDeviceMemoryBudgetPropertiesEXT` structure is included in the `pNext` chain of `VkPhysicalDeviceMemoryProperties2`, it is filled with the current memory budgets and usages.

The `VkPhysicalDeviceMemoryBudgetPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_memory_budget
typedef struct VkPhysicalDeviceMemoryBudgetPropertiesEXT {
    VkStructureType   sType;
    void*             pNext;
    VkDeviceSize      heapBudget[VK_MAX_MEMORY_HEAPS];
    VkDeviceSize      heapUsage[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryBudgetPropertiesEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `heapBudget` is an array of `VK_MAX_MEMORY_HEAPS` `VkDeviceSize` values in which memory budgets are returned, with one element for each memory heap. A heap’s budget is a rough estimate of how much memory the process can allocate from that heap before allocations may fail or cause performance degradation. The budget includes any currently allocated device memory.
- `heapUsage` is an array of `VK_MAX_MEMORY_HEAPS` `VkDeviceSize` values in which memory usages are returned, with one element for each memory heap. A heap’s usage is an estimate of how much memory the process is currently using in that heap.

The values returned in this structure are not invariant. The `heapBudget` and `heapUsage` values must be zero for array elements greater than or equal to `VkPhysicalDeviceMemoryProperties::memoryHeapCount`. The `heapBudget` value must be non-zero for array elements less than `VkPhysicalDeviceMemoryProperties::memoryHeapCount`. The `heapBudget` value must be less than or equal to `VkMemoryHeap::size` for each heap.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceMemoryBudgetPropertiesEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_BUDGET_PROPERTIES_EXT`
11.2.2. Device Memory Objects

A Vulkan device operates on data in device memory via memory objects that are represented in the API by a `VkDeviceMemory` handle:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeviceMemory)
```

11.2.3. Device Memory Allocation

To allocate memory objects, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateMemory(      VkDevice device,      const VkMemoryAllocateInfo* pAllocateInfo,      const VkAllocationCallbacks* pAllocator,      VkDeviceMemory* pMemory);
```

- `device` is the logical device that owns the memory.
- `pAllocateInfo` is a pointer to a `VkMemoryAllocateInfo` structure describing parameters of the allocation. A successfully returned allocation must use the requested parameters—no substitution is permitted by the implementation.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pMemory` is a pointer to a `VkDeviceMemory` handle in which information about the allocated memory is returned.

Allocations returned by `vkAllocateMemory` are guaranteed to meet any alignment requirement of the implementation. For example, if an implementation requires 128 byte alignment for images and 64 byte alignment for buffers, the device memory returned through this mechanism would be 128-byte aligned. This ensures that applications can correctly suballocate objects of different types (with potentially different alignment requirements) in the same memory object.

When memory is allocated, its contents are undefined with the following constraint:

- The contents of unprotected memory must not be a function of the contents of data protected memory objects, even if those memory objects were previously freed.

**Note**

The contents of memory allocated by one application should not be a function of data from protected memory objects of another application, even if those memory objects were previously freed.

The maximum number of valid memory allocations that can exist simultaneously within a `VkDevice` may be restricted by implementation- or platform-dependent limits. The `maxMemoryAllocationCount` feature describes the number of allocations that can exist simultaneously.
before encountering these internal limits.

**Note**

For historical reasons, if `maxMemoryAllocationCount` is exceeded, some implementations may return `VK_ERROR_TOO_MANY_OBJECTS`. Exceeding this limit will result in undefined behavior, and an application should not rely on the use of the returned error code in order to identify when the limit is reached.

**Note**

Many protected memory implementations involve complex hardware and system software support, and often have additional and much lower limits on the number of simultaneous protected memory allocations (from memory types with the `VK_MEMORY_PROPERTY_PROTECTED_BIT` property) than for non-protected memory allocations. These limits can be system-wide, and depend on a variety of factors outside of the Vulkan implementation, so they cannot be queried in Vulkan. Applications should use as few allocations as possible from such memory types by suballocating aggressively, and be prepared for allocation failure even when there is apparently plenty of capacity remaining in the memory heap. As a guideline, the Vulkan conformance test suite requires that at least 80 minimum-size allocations can exist concurrently when no other uses of protected memory are active in the system.

Some platforms may have a limit on the maximum size of a single allocation. For example, certain systems may fail to create allocations with a size greater than or equal to 4GB. Such a limit is implementation-dependent, and if such a failure occurs then the error `VK_ERROR_OUT_OF_DEVICE_MEMORY` must be returned. This limit is advertised in `VkPhysicalDeviceMaintenance3Properties::maxMemoryAllocationSize`.

The cumulative memory size allocated to a heap can be limited by the size of the specified heap. In such cases, allocated memory is tracked on a per-device and per-heap basis. Some platforms allow overallocation into other heaps. The overallocation behavior can be specified through the `VK_AMD_memory_overallocation_behavior` extension.

If the `VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT::pageableDeviceLocalMemory` feature is enabled, memory allocations made from a heap that includes `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` in `VkMemoryHeap::flags` may be transparently moved to host-local memory allowing multiple applications to share device-local memory. If there is no space left in device-local memory when this new allocation is made, other allocations may be moved out transparently to make room. The operating system will determine which allocations to move to device-local memory or host-local memory based on platform-specific criteria. To help the operating system make good choices, the application should set the appropriate memory priority with `VkMemoryPriorityAllocateInfoEXT` and adjust it as necessary with `vkSetDeviceMemoryPriorityEXT`. Higher priority allocations will moved to device-local memory first.

Memory allocations made on heaps without the `VK_MEMORY_HEAPDEVICE_LOCAL_BIT` property will not be transparently promoted to device-local memory by the operating system.
Valid Usage

- VUID-vkAllocateMemory-pAllocateInfo-01713
  \( p\text{AllocateInfo}\rightarrow\text{allocationSize} \) must be less than or equal to
  \( \text{VkPhysicalDeviceMemoryProperties}::\text{memoryHeaps}[\text{memindex}].\text{size} \) where
  \( \text{memindex} = \text{VkPhysicalDeviceMemoryProperties}::\text{memoryTypes}[p\text{AllocateInfo}\rightarrow\text{memoryTypeIndex}].\text{heapIndex} \) as returned by \( \text{vkGetPhysicalDeviceMemoryProperties} \) for the
  \( \text{VkPhysicalDevice} \) that \text{device} was created from

- VUID-vkAllocateMemory-pAllocateInfo-01714
  \( p\text{AllocateInfo}\rightarrow\text{memoryTypeIndex} \) must be less than
  \( \text{VkPhysicalDeviceMemoryProperties}::\text{memoryTypeCount} \) as returned by \( \text{vkGetPhysicalDeviceMemoryProperties} \) for the
  \( \text{VkPhysicalDevice} \) that \text{device} was created from

- VUID-vkAllocateMemory-deviceCoherentMemory-02790
  If the \text{deviceCoherentMemory} feature is not enabled, \( p\text{AllocateInfo}\rightarrow\text{memoryTypeIndex} \) must
  not identify a memory type supporting \text{VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD}

- VUID-vkAllocateMemory-maxMemoryAllocationCount-04101
  There must be less than \( \text{VkPhysicalDeviceLimits}::\text{maxMemoryAllocationCount} \) device memory
  allocations currently allocated on the device

Valid Usage (Implicit)

- VUID-vkAllocateMemory-device-parameter
  \text{device} must be a valid \text{VkDevice} handle

- VUID-vkAllocateMemory-pAllocateInfo-parameter
  \( p\text{AllocateInfo} \) must be a valid pointer to a valid \text{VkMemoryAllocateInfo} structure

- VUID-vkAllocateMemory-pAllocator-parameter
  If \text{pAllocator} is not \text{NULL}, \text{pAllocator} must be a valid pointer to a valid
  \text{VkAllocationCallbacks} structure

- VUID-vkAllocateMemory-pMemory-parameter
  \( p\text{Memory} \) must be a valid pointer to a \text{VkDeviceMemory} handle

Return Codes

Success
- \text{VK_SUCCESS}

Failure
- \text{VK_ERROR_OUT_OF_HOST_MEMORY}
- \text{VK_ERROR_OUT_OF_DEVICE_MEMORY}
- \text{VK_ERROR_INVALID_EXTERNAL_HANDLE}
- \text{VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR}
The VkMemoryAllocateInfo structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize allocationSize;
    uint32_t memoryTypeIndex;
} VkMemoryAllocateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `allocationSize` is the size of the allocation in bytes.
- `memoryTypeIndex` is an index identifying a memory type from the `memoryTypes` array of the `VkPhysicalDeviceMemoryProperties` structure.

The internal data of an allocated device memory object **must** include a reference to implementation-specific resources, referred to as the memory object's `payload`. Applications **can** also import and export that internal data to and from device memory objects to share data between Vulkan instances and other compatible APIs. A `VkMemoryAllocateInfo` structure defines a memory import operation if its `pNext` chain includes one of the following structures:

- `VkImportMemoryWin32HandleInfoKHR` with a non-zero `handleType` value
- `VkImportMemoryFdInfoKHR` with a non-zero `handleType` value
- `VkImportMemoryHostPointerInfoEXT` with a non-zero `handleType` value
- `VkImportAndroidHardwareBufferInfoANDROID` with a non-NULL `buffer` value
- `VkImportMemoryZirconHandleInfoFUCHSIA` with a non-zero `handleType` value
- `VkImportMemoryBufferCollectionFUCHSIA`

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, `allocationSize` is ignored. The implementation **must** query the size of these allocations from the OS.

Whether device memory objects constructed via a memory import operation hold a reference to their `payload` depends on the properties of the handle type used to perform the import, as defined below for each valid handle type. Importing memory **must** not modify the content of the memory. Implementations **must** ensure that importing memory does not enable the importing Vulkan instance to access any memory or resources in other Vulkan instances other than that corresponding to the memory object imported. Implementations **must** also ensure accessing imported memory which has not been initialized does not allow the importing Vulkan instance to obtain data from the exporting Vulkan instance or vice-versa.

**Note**
How exported and imported memory is isolated is left to the implementation, but applications should be aware that such isolation may prevent implementations from placing multiple exportable memory objects in the same physical or virtual page. Hence, applications should avoid creating many small external memory objects whenever possible.

Importing memory must not increase overall heap usage within a system. However, it must affect the following per-process values:

- VkPhysicalDeviceMaintenance3Properties::maxMemoryAllocationCount
- VkPhysicalDeviceMemoryBudgetPropertiesEXT::heapUsage

When performing a memory import operation, it is the responsibility of the application to ensure the external handles and their associated payloads meet all valid usage requirements. However, implementations must perform sufficient validation of external handles and payloads to ensure that the operation results in a valid memory object which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its allocation parameters. If the external handle provided does not meet these requirements, the implementation must fail the memory import operation with the error code VK_ERROR_INVALID_EXTERNAL_HANDLE. If the parameters define an export operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, implementations should not strictly follow memoryTypeIndex. Instead, they should modify the allocation internally to use the required memory type for the application's given usage. This is because for an export operation, there is currently no way for the client to know the memory type index before allocating.

Valid Usage

- VUID-VkMemoryAllocateInfo-None-06657
  The parameters must not define more than one import operation

- VUID-VkMemoryAllocateInfo-buffer-06380
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA, and VkMemoryDedicatedAllocateInfo::buffer is present and non-NULL, VkImportMemoryBufferCollectionFUCHSIA::collection and VkImportMemoryBufferCollectionFUCHSIA::index must match VkBufferCollectionBufferCreateInfoFUCHSIA::collection and VkBufferCollectionBufferCreateInfoFUCHSIA::index, respectively, of the VkBufferCollectionBufferCreateInfoFUCHSIA structure used to create the VkMemoryDedicatedAllocateInfo::buffer

- VUID-VkMemoryAllocateInfo-image-06381
  If the parameters define an import operation from an VkBufferCollectionFUCHSIA, and VkMemoryDedicatedAllocateInfo::image is present and non-NULL, VkImportMemoryBufferCollectionFUCHSIA::collection and VkImportMemoryBufferCollectionFUCHSIA::index must match VkBufferCollectionImageCreateInfoFUCHSIA::collection and VkBufferCollectionImageCreateInfoFUCHSIA::index, respectively, of the VkBufferCollectionImageCreateInfoFUCHSIA structure used to create the
• VUID-VkMemoryAllocateInfo-allocationSize-06382
  If the parameters define an import operation from an `VkBufferCollectionFUCHSIA`, `allocationSize` must match `VkMemoryRequirements::size` value retrieved by `vkGetImageMemoryRequirements` or `vkGetBufferMemoryRequirements` for image-based or buffer-based collections respectively.

• VUID-VkMemoryAllocateInfo-pNext-06383
  If the parameters define an import operation from an `VkBufferCollectionFUCHSIA`, the `pNext` chain must include a `VkMemoryDedicatedAllocateInfo` structure with either its `image` or `buffer` field set to a value other than `VK_NULL_HANDLE`.

• VUID-VkMemoryAllocateInfo-image-06384
  If the parameters define an import operation from an `VkBufferCollectionFUCHSIA` and `VkMemoryDedicatedAllocateInfo::image` is not `VK_NULL_HANDLE`, the `image` must be created with a `VkBufferCollectionImageCreateInfoFUCHSIA` structure chained to its `VkImageCreateInfo::pNext` pointer.

• VUID-VkMemoryAllocateInfo-buffer-06385
  If the parameters define an import operation from an `VkBufferCollectionFUCHSIA` and `VkMemoryDedicatedAllocateInfo::buffer` is not `VK_NULL_HANDLE`, the `buffer` must be created with a `VkBufferCollectionBufferCreateInfoFUCHSIA` structure chained to its `VkBufferCreateInfo::pNext` pointer.

• VUID-VkMemoryAllocateInfo-memoryTypeIndex-06386
  If the parameters define an import operation from an `VkBufferCollectionFUCHSIA`, `memoryTypeIndex` must be from `VkBufferCollectionPropertiesFUCHSIA` as retrieved by `vkGetBufferCollectionPropertiesFUCHSIA`.

• VUID-VkMemoryAllocateInfo-pNext-00639
  If the `pNext` chain includes a `VkExportMemoryAllocateInfo` structure, and any of the handle types specified in `VkExportMemoryAllocateInfo::handleTypes` require a dedicated allocation, as reported by `vkGetPhysicalDeviceImageFormatProperties2` in `VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures` or `VkExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures`, the `pNext` chain must include a `VkMemoryDedicatedAllocateInfo` or `VkDedicatedAllocationMemoryAllocateInfoNV` structure with either its `image` or `buffer` member set to a value other than `VK_NULL_HANDLE`.

• VUID-VkMemoryAllocateInfo-pNext-00640
  If the `pNext` chain includes a `VkExportMemoryAllocateInfo` structure, it must not include a `VkExportMemoryAllocateInfoNV` or `VkExportMemoryWin32HandleInfoNV` structure.

• VUID-VkMemoryAllocateInfo-pNext-00641
  If the `pNext` chain includes a `VkImportMemoryWin32HandleInfoKHR` structure, it must not include a `VkImportMemoryWin32HandleInfoNV` structure.

• VUID-VkMemoryAllocateInfo-allocationSize-01742
  If the parameters define an import operation, the external handle specified was created by the Vulkan API, and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT`, then the values of `allocationSize` and `memoryTypeIndex` must match those specified when the payload being imported was
• VUID-VkMemoryAllocateInfo-None-00643
If the parameters define an import operation and the external handle specified was created by the Vulkan API, the device mask specified by VkMemoryAllocateFlagsInfo must match the mask specified when the payload being imported was allocated.

• VUID-VkMemoryAllocateInfo-None-00644
If the parameters define an import operation and the external handle specified was created by the Vulkan API, the list of physical devices that comprise the logical device passed to vkAllocateMemory must match the list of physical devices that comprise the logical device on which the payload was originally allocated.

• VUID-VkMemoryAllocateInfo-memoryTypeIndex-00645
If the parameters define an import operation and the external handle is an NT handle or a global share handle created outside of the Vulkan API, the value of memoryTypeIndex must be one of those returned by vkGetMemoryWin32HandlePropertiesKHR.

• VUID-VkMemoryAllocateInfo-allocationSize-01743
If the parameters define an import operation, the external handle was created by the Vulkan API, and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, then the values of allocationSize and memoryTypeIndex must match those specified when the payload being imported was created.

• VUID-VkMemoryAllocateInfo-allocationSize-00647
If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT, allocationSize must match the size specified when creating the Direct3D 12 heap from which the payload was extracted.

• VUID-VkMemoryAllocateInfo-memoryTypeIndex-00648
If the parameters define an import operation and the external handle is a POSIX file descriptor created outside of the Vulkan API, the value of memoryTypeIndex must be one of those returned by vkGetMemoryFdPropertiesKHR.

• VUID-VkMemoryAllocateInfo-memoryTypeIndex-01872
If the protectedMemory feature is not enabled, the VkMemoryAllocateInfo::memoryTypeIndex must not indicate a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT.

• VUID-VkMemoryAllocateInfo-memoryTypeIndex-01744
If the parameters define an import operation and the external handle is a host pointer, the value of memoryTypeIndex must be one of those returned by vkGetMemoryHostPointerPropertiesEXT.

• VUID-VkMemoryAllocateInfo-allocationSize-01745
If the parameters define an import operation and the external handle is a host pointer, allocationSize must be an integer multiple of VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment.

• VUID-VkMemoryAllocateInfo-pNext-02805
If the parameters define an import operation and the external handle is a host pointer, the pNext chain must not include a VkDedicatedAllocationMemoryAllocateInfoNV structure with either its image or buffer field set to a value other than VK_NULL_HANDLE.
• **VUID-VkMemoryAllocateInfo-pNext-02806**
  If the parameters define an import operation and the external handle is a host pointer, the `pNext` chain must not include a `VkMemoryDedicatedAllocateInfo` structure with either its `image` or `buffer` field set to a value other than `VK_NULL_HANDLE`.

• **VUID-VkMemoryAllocateInfo-allocationSize-02383**
  If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, `allocationSize` must be the size returned by `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer.

• **VUID-VkMemoryAllocateInfo-pNext-02384**
  If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, and the `pNext` chain does not include a `VkMemoryDedicatedAllocateInfo` structure or `VkMemoryDedicatedAllocateInfo::image` is `VK_NULL_HANDLE`, the Android hardware buffer must have a `AHardwareBuffer_Desc::format` of `AHARDWAREBUFFER_FORMAT_BLOB` and a `AHardwareBuffer_Desc::usage` that includes `AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER`.

• **VUID-VkMemoryAllocateInfo-memoryTypeIndex-02385**
  If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, `memoryTypeIndex` must be one of those returned by `vkGetAndroidHardwareBufferPropertiesANDROID` for the Android hardware buffer.

• **VUID-VkMemoryAllocateInfo-pNext-01874**
  If the parameters do not define an import operation, and the `pNext` chain includes a `VkExportMemoryAllocateInfo` structure with `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID` included in its `handleTypes` member, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `image` not equal to `VK_NULL_HANDLE`, then `allocationSize` must be 0, otherwise `allocationSize` must be greater than 0.

• **VUID-VkMemoryAllocateInfo-pNext-02386**
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` with `image` that is not `VK_NULL_HANDLE`, the Android hardware buffer's `AHardwareBuffer::usage` must include at least one of `AHARDWAREBUFFER_USAGE_GPU_FRAMEBUFFER`, `AHARDWAREBUFFER_USAGE_GPU_SAMPLED_IMAGE` or `AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER`.

• **VUID-VkMemoryAllocateInfo-pNext-02387**
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` with `image` that is not `VK_NULL_HANDLE`, the format of `image` must be `VK_FORMAT_UNDEFINED` or the format returned by `vkGetAndroidHardwareBufferPropertiesANDROID::format` for the Android hardware buffer.

• **VUID-VkMemoryAllocateInfo-pNext-02388**
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure with `image` that is not `VK_NULL_HANDLE`, the width, height, and array layer dimensions of
image and the Android hardware buffer's AHardwareBuffer_Desc must be identical

- VUID-VkMemoryAllocateInfo-pNext-02389
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the pNext chain includes a VkMemoryDedicatedAllocateInfo structure with image that is not VK_NULL_HANDLE, and the Android hardware buffer's AHardwareBuffer ::usage includes AHWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE, the image must have a complete mipmap chain

- VUID-VkMemoryAllocateInfo-pNext-02586
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the pNext chain includes a VkMemoryDedicatedAllocateInfo structure with image that is not VK_NULL_HANDLE, and the Android hardware buffer's AHardwareBuffer ::usage does not include AHWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE, the image must have exactly one mipmap level

- VUID-VkMemoryAllocateInfo-pNext-02390
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the pNext chain includes a VkMemoryDedicatedAllocateInfo structure with image that is not VK_NULL_HANDLE, each bit set in the usage of image must be listed in AHardwareBuffer Usage Equivalence, and if there is a corresponding AHWAREBUFFER USAGE bit listed that bit must be included in the Android hardware buffer's AHardwareBuffer_Desc::usage

- VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03329
  If VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress is not zero, VkMemoryAllocateFlagsInfo::flags must include VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT

- VUID-VkMemoryAllocateInfo-flags-03330
  If VkMemoryAllocateFlagsInfo::flags includes VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, the bufferDeviceAddressCaptureReplay feature must be enabled

- VUID-VkMemoryAllocateInfo-flags-03331
  If VkMemoryAllocateFlagsInfo::flags includes VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT, the bufferDeviceAddress feature must be enabled

- VUID-VkMemoryAllocateInfo-pNext-03332
  If the pNext chain includes a VkImportMemoryHostPointerInfoEXT structure, VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress must be zero

- VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03333
  If the parameters define an import operation, VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress must be zero

- VUID-VkMemoryAllocateInfo-None-04749
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the value of memoryTypeIndex must be an index identifying a memory type from the memoryTypeBits field of the VkMemoryZirconHandlePropertiesFUCHSIA structure populated by a call to vkGetMemoryZirconHandlePropertiesFUCHSIA

- VUID-VkMemoryAllocateInfo-allocationSize-04750
If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA`, the value of `allocationSize` must be greater than 0 and must be less than or equal to the size of the VMO as determined by `zx_vmo_get_size(handle)` where `handle` is the VMO handle to the imported external memory.

- VUID-VkMemoryAllocateInfo-pNext-06780
  If the `pNext` chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its `exportObjectType` member must be `VK_EXPORT_METAL_OBJECT_TYPE_METAL_BUFFER_BIT_EXT`.

### Valid Usage (Implicit)

- VUID-VkMemoryAllocateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO`

- VUID-VkMemoryAllocateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDedicatedAllocationMemoryAllocateInfoNV`, `VkExportMemoryAllocateInfo`, `VkExportMemoryWin32HandleInfoKHR`, `VkExportMetalObjectCreateInfoEXT`, `VkImportAndroidHardwareBufferInfoANDROID`, `VkImportMemoryBufferCollectionFUCHSIA`, `VkImportMemoryHostPointerInfoEXT`, `VkImportMemoryWin32HandleInfoKHR`, `VkImportMemoryWin32HandleInfoNV`, `VkImportMemoryZirconHandleInfoFUCHSIA`, `VkImportMemoryBufferInfoEXT`, `VkMemoryAllocateFlagsInfo`, `VkMemoryDedicatedAllocateInfo`, `VkMemoryOpaqueCaptureAddressAllocateInfo`, or `VkMemoryPriorityAllocateInfoEXT`.

- VUID-VkMemoryAllocateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkExportMetalObjectCreateInfoEXT`.

If the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure, then that structure includes a handle of the sole buffer or image resource that the memory can be bound to.

The `VkMemoryDedicatedAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedAllocateInfo {
    VkStructureType   sType;
    const void*       pNext;
    VkImage           image;
    VkBuffer          buffer;
} VkMemoryDedicatedAllocateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dedicated_allocation
```
typedef VkMemoryDedicatedAllocateInfo VkMemoryDedicatedAllocateInfoKHR;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is `VK_NULL_HANDLE` or a handle of an image which this memory will be bound to.
- `buffer` is `VK_NULL_HANDLE` or a handle of a buffer which this memory will be bound to.

### Valid Usage

- **VUID-VkMemoryDedicatedAllocateInfo-image-01432**
  At least one of `image` and `buffer` **must** be `VK_NULL_HANDLE`.

- **VUID-VkMemoryDedicatedAllocateInfo-image-02964**
  If `image` is not `VK_NULL_HANDLE` and the memory is not an imported Android Hardware Buffer, `VkMemoryAllocateInfo::allocationSize` **must** equal the `VkMemoryRequirements::size` of the image.

- **VUID-VkMemoryDedicatedAllocateInfo-image-01434**
  If `image` is not `VK_NULL_HANDLE`, `image` **must** have been created without `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` set in `VkImageCreateInfo::flags`.

- **VUID-VkMemoryDedicatedAllocateInfo-buffer-02965**
  If `buffer` is not `VK_NULL_HANDLE` and the memory is not an imported Android Hardware Buffer, `VkMemoryAllocateInfo::allocationSize` **must** equal the `VkMemoryRequirements::size` of the buffer.

- **VUID-VkMemoryDedicatedAllocateInfo-image-01436**
  If `buffer` is not `VK_NULL_HANDLE`, `buffer` **must** have been created without `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` set in `VkBufferCreateInfo::flags`.

- **VUID-VkMemoryDedicatedAllocateInfo-image-01876**
  If `image` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation with handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, and the external handle was created by the Vulkan API, then the memory being imported **must** also be a dedicated image allocation and `image` **must** be identical to the image associated with the imported memory.

- **VUID-VkMemoryDedicatedAllocateInfo-buffer-01877**
  If `buffer` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation with handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, and the external handle was created...
by the Vulkan API, then the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory

- **VUID-VkMemoryDedicatedAllocateInfo-image-01878**
  If image is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, the memory being imported must also be a dedicated image allocation and image must be identical to the image associated with the imported memory

- **VUID-VkMemoryDedicatedAllocateInfo-buffer-01879**
  If buffer is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory

- **VUID-VkMemoryDedicatedAllocateInfo-image-01797**
  If image is not VK_NULL_HANDLE, image must not have been created with VK_IMAGE_CREATE_DISJOINT_BIT set in VkImageCreateInfo::flags

- **VUID-VkMemoryDedicatedAllocateInfo-image-04751**
  If image is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the memory being imported must also be a dedicated image allocation and image must be identical to the image associated with the imported memory

- **VUID-VkMemoryDedicatedAllocateInfo-buffer-04752**
  If buffer is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory

---

**Valid Usage (Implicit)**

- **VUID-VkMemoryDedicatedAllocateInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO

- **VUID-VkMemoryDedicatedAllocateInfo-image-parameter**
  If image is not VK_NULL_HANDLE, image must be a valid VkImage handle

- **VUID-VkMemoryDedicatedAllocateInfo-buffer-parameter**
  If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle

- **VUID-VkMemoryDedicatedAllocateInfo-commonparent**
  Both of buffer, and image that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

If the pNext chain includes a VkDedicatedAllocationMemoryAllocateInfoNV structure, then that structure includes a handle of the sole buffer or image resource that the memory can be bound to.

The VkDedicatedAllocationMemoryAllocateInfoNV structure is defined as:
typedef struct VkDedicatedAllocationMemoryAllocateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkBuffer buffer;
} VkDedicatedAllocationMemoryAllocateInfoNV;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **image** is VK_NULL_HANDLE or a handle of an image which this memory will be bound to.
- **buffer** is VK_NULL_HANDLE or a handle of a buffer which this memory will be bound to.

### Valid Usage

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00649**
  At least one of **image** and **buffer** must be VK_NULL_HANDLE

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00650**
  If **image** is not VK_NULL_HANDLE, the image must have been created with VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation equal to VK_TRUE

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-00651**
  If **buffer** is not VK_NULL_HANDLE, the buffer must have been created with VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation equal to VK_TRUE

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00652**
  If **image** is not VK_NULL_HANDLE, VkMemoryAllocateInfo::allocationSize must equal the VkMemoryRequirements::size of the image

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-00653**
  If **buffer** is not VK_NULL_HANDLE, VkMemoryAllocateInfo::allocationSize must equal the VkMemoryRequirements::size of the buffer

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00654**
  If **image** is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation, the memory being imported must also be a dedicated image allocation and **image** must be identical to the image associated with the imported memory

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-00655**
  If **buffer** is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation, the memory being imported must also be a dedicated buffer allocation and **buffer** must be identical to the buffer associated with the imported memory

### Valid Usage (Implicit)

- **VUID-VkDedicatedAllocationMemoryAllocateInfoNV-sType-sType**
  **sType** must be VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_MEMORY_ALLOCATE_INFO_NV
If the `pNext` chain includes a `VkMemoryPriorityAllocateInfoEXT` structure, then that structure includes a priority for the memory.

The `VkMemoryPriorityAllocateInfoEXT` structure is defined as:

```c
typedef struct VkMemoryPriorityAllocateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    float priority;
} VkMemoryPriorityAllocateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `priority` is a floating-point value between 0 and 1, indicating the priority of the allocation relative to other memory allocations. Larger values are higher priority. The granularity of the priorities is implementation-dependent.

Memory allocations with higher priority may be more likely to stay in device-local memory when the system is under memory pressure.

If this structure is not included, it is as if the `priority` value were 0.5.

**Valid Usage**

- VUID-VkMemoryPriorityAllocateInfoEXT-priority-02602
  priority must be between 0 and 1, inclusive

**Valid Usage (Implicit)**

- VUID-VkMemoryPriorityAllocateInfoEXT-sType-sType
  sType must be `VK_STRUCTURE_TYPE_MEMORY_PRIORITY_ALLOCATE_INFO_EXT`

To modify the priority of an existing memory allocation, call:
void vkSetDeviceMemoryPriorityEXT(
    VkDevice device,
    VkDeviceMemory memory,
    float priority);

- **device** is the logical device that owns the memory.
- **memory** is the `VkDeviceMemory` object to which the new priority will be applied.
- **priority** is a floating-point value between 0 and 1, indicating the priority of the allocation relative to other memory allocations. Larger values are higher priority. The granularity of the priorities is implementation-dependent.

Memory allocations with higher priority may be more likely to stay in device-local memory when the system is under memory pressure.

**Valid Usage**

- VUID-vkSetDeviceMemoryPriorityEXT-priority-06258
  priority must be between 0 and 1, inclusive

**Valid Usage (Implicit)**

- VUID-vkSetDeviceMemoryPriorityEXT-device-parameter
  device must be a valid `VkDevice` handle
- VUID-vkSetDeviceMemoryPriorityEXT-memory-parameter
  memory must be a valid `VkDeviceMemory` handle
- VUID-vkSetDeviceMemoryPriorityEXT-memory-parent
  memory must have been created, allocated, or retrieved from device

When allocating memory whose payload may be exported to another process or Vulkan instance, add a `VkExportMemoryAllocateInfo` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure, specifying the handle types that may be exported.

The `VkExportMemoryAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExportMemoryAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExportMemoryAllocateInfo;
```

or the equivalent
typedef VkExportMemoryAllocateInfo VkExportMemoryAllocateInfoKHR;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **handleTypes** is zero or a bitmask of **VkExternalMemoryHandleTypeFlagBits** specifying one or more memory handle types the application **can** export from the resulting allocation. The application **can** request multiple handle types for the same allocation.

### Valid Usage

- **VUID-VkExportMemoryAllocateInfo-handleTypes-00656**
  The bits in **handleTypes** must be supported and compatible, as reported by **VkExternalImageFormatProperties** or **VkExternalBufferProperties**

### Valid Usage (Implicit)

- **VUID-VkExportMemoryAllocateInfo-sType-sType**
  **sType** must be **VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO**

- **VUID-VkExportMemoryAllocateInfo-handleTypes-parameter**
  **handleTypes** must be a valid combination of **VkExternalMemoryHandleTypeFlagBits** values

When allocating memory that **may** be exported to another process or Vulkan instance, add a **VkExportMemoryAllocateInfoNV** structure to the **pNext** chain of the **VkMemoryAllocateInfo** structure, specifying the handle types that **may** be exported.

The **VkExportMemoryAllocateInfoNV** structure is defined as:

```c
// Provided by VK_NV_external_memory
typedef struct VkExportMemoryAllocateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagsNV handleTypes;
} VkExportMemoryAllocateInfoNV;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **handleTypes** is a bitmask of **VkExternalMemoryHandleTypeFlagBitsNV** specifying one or more memory handle types that **may** be exported. Multiple handle types **may** be requested for the same allocation as long as they are compatible, as reported by **vkGetPhysicalDeviceExternalImageFormatPropertiesNV**.
Valid Usage (Implicit)

- VUID-VkExportMemoryAllocateInfoNV-sType-sType
  
sType must be VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO_NV

- VUID-VkExportMemoryAllocateInfoNV-handleTypes-parameter
  
handleTypes must be a valid combination of VkExternalMemoryHandleTypeFlagBitsNV values

11.2.4. Win32 External Memory

To specify additional attributes of NT handles exported from a memory object, add a VkExportMemoryWin32HandleInfoKHR structure to the pNext chain of the VkMemoryAllocateInfo structure. The VkExportMemoryWin32HandleInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkExportMemoryWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD dwAccess;
    LPCWSTR name;
} VkExportMemoryWin32HandleInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pAttributes is a pointer to a Windows SECURITY_ATTRIBUTES structure specifying security attributes of the handle.
- dwAccess is a DWORD specifying access rights of the handle.
- name is a null-terminated UTF-16 string to associate with the payload referenced by NT handles exported from the created memory.

If VkExportMemoryAllocateInfo is not included in the same pNext chain, this structure is ignored.

If VkExportMemoryAllocateInfo is included in the pNext chain of VkMemoryAllocateInfo with a Windows handleType, but either VkExportMemoryWin32HandleInfoKHR is not included in the pNext chain, or if it is but pAttributes is set to NULL, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights used depend on the handle type.

For handles of the following types:

- VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT

The implementation must ensure the access rights allow read and write access to the memory.
Valid Usage

- VUID-VkExportMemoryWin32HandleInfoKHR-handleTypes-00657
  
  If `VkExportMemoryAllocateInfo::handleTypes` does not include `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, a `VkExportMemoryWin32HandleInfoKHR` structure must not be included in the `pNext` chain of `VkMemoryAllocateInfo`.

Valid Usage (Implicit)

- VUID-VkExportMemoryWin32HandleInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_KHR`.

- VUID-VkExportMemoryWin32HandleInfoKHR-pAttributes-parameter
  
  If `pAttributes` is not `NULL`, `pAttributes` must be a valid pointer to a valid `SECURITY_ATTRIBUTES` value.

To import memory from a Windows handle, add a `VkImportMemoryWin32HandleInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure.

The `VkImportMemoryWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkImportMemoryWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportMemoryWin32HandleInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of `handle` or `name`.
- `handle` is `NULL` or the external handle to import.
- `name` is `NULL` or a null-terminated UTF-16 string naming the payload to import.

Importing memory object payloads from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release handle ownership using the `CloseHandle` system call when the handle is no longer needed. For handle types defined as NT handles, the imported memory object holds a reference to
its payload.

Note

Non-NT handle import operations do not add a reference to their associated payload. If the original object owning the payload is destroyed, all resources and handles sharing that payload will become invalid.

Applications can import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation must create a distinct VkDeviceMemory object.

Valid Usage

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00658
  If handleType is not 0, it must be supported for import, as reported by VkExternalImageFormatProperties or VkExternalBufferProperties

- VUID-VkImportMemoryWin32HandleInfoKHR-handle-00659
  The memory from which handle was exported, or the memory named by name must have been created on the same underlying physical device as device

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00660
  If handleType is not 0, it must be defined as an NT handle or a global share handle

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01439
  If handleType is not VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT, or VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, name must be NULL

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01440
  If handleType is not 0 and handle is NULL, name must name a valid memory resource of the type specified by handleType

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00661
  If handleType is not 0 and name is NULL, handle must be a valid handle of the type specified by handleType

- VUID-VkImportMemoryWin32HandleInfoKHR-handle-01441
  if handle is not NULL, name must be NULL

- VUID-VkImportMemoryWin32HandleInfoKHR-handle-01518
  If handle is not NULL, it must obey any requirements listed for handleType in external memory handle types compatibility

- VUID-VkImportMemoryWin32HandleInfoKHR-name-01519
  If name is not NULL, it must obey any requirements listed for handleType in external memory handle types compatibility
Valid Usage (Implicit)

- VUID-VkImportMemoryWin32HandleInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_KHR

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-parameter
  If handleType is not 0, handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

To export a Windows handle representing the payload of a Vulkan device memory object, call:

```c
// Provided by VK_KHR_external_memory_win32
VkResult vkGetMemoryWin32HandleKHR( VkDevice device, const VkMemoryGetWin32HandleInfoKHR* pGetWin32HandleInfo, HANDLE* pHandle);
```

- device is the logical device that created the device memory being exported.
- pGetWin32HandleInfo is a pointer to a VkMemoryGetWin32HandleInfoKHR structure containing parameters of the export operation.
- pHandle will return the Windows handle representing the payload of the device memory object.

For handle types defined as NT handles, the handles returned by vkGetMemoryWin32HandleKHR are owned by the application and hold a reference to their payload. To avoid leaking resources, the application must release ownership of them using the CloseHandle system call when they are no longer needed.

Note
Non-NT handle types do not add a reference to their associated payload. If the original object owning the payload is destroyed, all resources and handles sharing that payload will become invalid.

Valid Usage (Implicit)

- VUID-vkGetMemoryWin32HandleKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetMemoryWin32HandleKHR-pGetWin32HandleInfo-parameter
  pGetWin32HandleInfo must be a valid pointer to a valid VkMemoryGetWin32HandleInfoKHR structure

- VUID-vkGetMemoryWin32HandleKHR-pHandle-parameter
  pHandle must be a valid pointer to a HANDLE value
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkMemoryGetWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkMemoryGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetWin32HandleInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` is the memory object from which the handle will be exported.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalMemoryHandleTypeFlagBits` for a description of the properties of the defined external memory handle types.

**Valid Usage**

- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00662
  `handleType` must have been included in `VkExportMemoryAllocateInfo::handleTypes` when `memory` was created

- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00663
  If `handleType` is defined as an NT handle, `vkGetMemoryWin32HandleKHR` must be called no more than once for each valid unique combination of `memory` and `handleType`

- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00664
  `handleType` must be defined as an NT handle or a global share handle

**Valid Usage (Implicit)**

- VUID-VkMemoryGetWin32HandleInfoKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_MEMORY_GET_WIN32_HANDLE_INFO_KHR

- VUID-VkMemoryGetWin32HandleInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkMemoryGetWin32HandleInfoKHR-memory-parameter
  memory must be a valid VkDeviceMemory handle

- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-parameter
  handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

Windows memory handles compatible with Vulkan may also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```c
// Provided by VK_KHR_external_memory_win32
VkResult vkGetMemoryWin32HandlePropertiesKHR(
    VkDevice device, 
    VkExternalMemoryHandleTypeFlagBits handleType, 
    HANDLE handle, 
    VkMemoryWin32HandlePropertiesKHR* pMemoryWin32HandleProperties);
```

- device is the logical device that will be importing handle.
- handleType is a VkExternalMemoryHandleTypeFlagBits value specifying the type of the handle handle.
- handle is the handle which will be imported.
- pMemoryWin32HandleProperties is a pointer to a VkMemoryWin32HandlePropertiesKHR structure in which properties of handle are returned.

### Valid Usage

- VUID-vkGetMemoryWin32HandlePropertiesKHR-handle-00665
  handle must be an external memory handle created outside of the Vulkan API

- VUID-vkGetMemoryWin32HandlePropertiesKHR-handleType-00666
  handleType must not be one of the handle types defined as opaque

### Valid Usage (Implicit)

- VUID-vkGetMemoryWin32HandlePropertiesKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetMemoryWin32HandlePropertiesKHR-handleType-parameter
  handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

- VUID-vkGetMemoryWin32HandlePropertiesKHR-pMemoryWin32HandleProperties-
  pMemoryWin32HandleProperties must be a valid pointer to a
**VkMemoryWin32HandlePropertiesKHR structure**

**Return Codes**

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkMemoryWin32HandlePropertiesKHR` structure returned is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkMemoryWin32HandlePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
} VkMemoryWin32HandlePropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified windows handle can be imported as.

**Valid Usage (Implicit)**

- `VUID-VkMemoryWin32HandlePropertiesKHR-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_MEMORY_WIN32_HANDLE_PROPERTIES_KHR`
- `VUID-VkMemoryWin32HandlePropertiesKHR-pNext-pNext` `pNext` must be `NULL`

When `VkExportMemoryAllocateInfoNV::handleTypes` includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV`, add a `VkExportMemoryWin32HandleInfoNV` structure to the `pNext` chain of the `VkExportMemoryAllocateInfoNV` structure to specify security attributes and access rights for the memory object's external handle.

The `VkExportMemoryWin32HandleInfoNV` structure is defined as:

```c
// Provided by VK_NV_external_memory_win32
typedef struct VkExportMemoryWin32HandleInfoNV {
    VkStructureType sType;
    const void* pNext;
} VkExportMemoryWin32HandleInfoNV;
```
```c
const SECURITY_ATTRIBUTES* pAttributes;
DWORD dwAccess;
} VkExportMemoryWin32HandleInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- `dwAccess` is a `DWORD` specifying access rights of the handle.

If this structure is not present, or if `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights will be

```
DXGI_SHARED_RESOURCE_READ | DXGI_SHARED_RESOURCE_WRITE
```

### Valid Usage (Implicit)

- VUID-VkExportMemoryWin32HandleInfoNV-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_NV`
- VUID-VkExportMemoryWin32HandleInfoNV-pAttributes-parameter
  - If `pAttributes` is not `NULL`, `pAttributes` must be a valid pointer to a valid `SECURITY_ATTRIBUTES` value

To import memory created on the same physical device but outside of the current Vulkan instance, add a `VkImportMemoryWin32HandleInfoNV` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure, specifying a handle to and the type of the memory.

The `VkImportMemoryWin32HandleInfoNV` structure is defined as:

```c
// Provided by VK_NV_external_memory_win32
typedef struct VkImportMemoryWin32HandleInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagsNV handleType;
    HANDLE handle;
} VkImportMemoryWin32HandleInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• `handleType` is 0 or a `VkExternalMemoryHandleTypeFlagBitsNV` value specifying the type of memory handle in `handle`.

• `handle` is a Windows `HANDLE` referring to the memory.

If `handleType` is 0, this structure is ignored by consumers of the `VkMemoryAllocateInfo` structure it is chained from.

Valid Usage

- VUID-VkImportMemoryWin32HandleInfoNV-handleType-01327
  `handleType` must not have more than one bit set

- VUID-VkImportMemoryWin32HandleInfoNV-handle-01328
  `handle` must be a valid handle to memory, obtained as specified by `handleType`

Valid Usage (Implicit)

- VUID-VkImportMemoryWin32HandleInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_NV`

- VUID-VkImportMemoryWin32HandleInfoNV-handleType-parameter
  `handleType` must be a valid combination of `VkExternalMemoryHandleTypeFlagBitsNV` values

Bits which can be set in `handleType` are:

Possible values of `VkImportMemoryWin32HandleInfoNV::handleType`, specifying the type of an external memory handle, are:

```c
// Provided by VK_NV_external_memory_capabilities
typedef enum VkExternalMemoryHandleTypeFlagBitsNV {
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV = 0x00000001,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_NV = 0x00000002,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_BIT_NV = 0x00000004,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_KMT_BIT_NV = 0x00000008,
} VkExternalMemoryHandleTypeFlagBitsNV;
```

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_NV` specifies a handle to memory returned by `vkGetMemoryWin32HandleNV`.

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV` specifies a handle to memory returned by `vkGetMemoryWin32HandleNV`, or one duplicated from such a handle using `DuplicateHandle()`.

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_BIT_NV` specifies a valid NT handle to memory returned by `IDXGIResource1::CreateSharedHandle`, or a handle duplicated from such a handle using `DuplicateHandle()`.

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_KMT_BIT_NV` specifies a handle to memory returned
by IDXGIResource::GetSharedHandle().

```cpp
// Provided by VK_NV_external_memory_capabilities
typedef VkFlags VkExternalMemoryHandleTypeFlagsNV;
```

VkExternalMemoryHandleTypeFlagsNV is a bitmask type for setting a mask of zero or more VkExternalMemoryHandleTypeFlagBitsNV.

To retrieve the handle corresponding to a device memory object created with VkExportMemoryAllocateInfoNV::handleTypes set to include VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV or VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_NV, call:

```cpp
// Provided by VK_NV_external_memory_win32
VkResult vkGetMemoryWin32HandleNV(
    VkDevice device,                 // logical device that owns the memory.
    VkDeviceMemory memory,          // VkDeviceMemory object.
    VkExternalMemoryHandleTypeFlagsNV handleType, // VkExternalMemoryHandleTypeFlagBitsNV containing a single bit
                                                // specifying the type of handle requested.
    HANDLE* pHandle);                // pointer to a Windows HANDLE in which the handle is returned.
```

• `device` is the logical device that owns the memory.

• `memory` is the VkDeviceMemory object.

• `handleType` is a bitmask of VkExternalMemoryHandleTypeFlagBitsNV containing a single bit specifying the type of handle requested.

• `handle` is a pointer to a Windows HANDLE in which the handle is returned.

### Valid Usage

- **VUID-vkGetMemoryWin32HandleNV-handleType-01326**
  `handleType` must be a flag specified in VkExportMemoryAllocateInfoNV::handleTypes when allocating memory

### Valid Usage (Implicit)

- **VUID-vkGetMemoryWin32HandleNV-device-parameter**
  `device` must be a valid VkDevice handle

- **VUID-vkGetMemoryWin32HandleNV-memory-parameter**
  `memory` must be a valid VkDeviceMemory handle

- **VUID-vkGetMemoryWin32HandleNV-handleType-parameter**
  `handleType` must be a valid combination of VkExternalMemoryHandleTypeFlagBitsNV values

- **VUID-vkGetMemoryWin32HandleNV-handleType-requiredbitmap**
  `handleType` must not be 0
• VUID-vkGetMemoryWin32HandleNV-pHandle-parameter
  
  `pHandle` must be a valid pointer to a `HANDLE` value

• VUID-vkGetMemoryWin32HandleNV-memory-parent
  
  `memory` must have been created, allocated, or retrieved from `device`

---

## Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

---

### 11.2.5. File Descriptor External Memory

To import memory from a POSIX file descriptor handle, add a `VkImportMemoryFdInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkImportMemoryFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkImportMemoryFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    int fd;
} VkImportMemoryFdInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the handle type of `fd`.
- `fd` is the external handle to import.

Importing memory from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application must not perform any operations on the file descriptor after a successful import. The imported memory object holds a reference to its payload.

Applications can import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation must create a distinct `VkDeviceMemory` object.
Valid Usage

- VUID-VkImportMemoryFdInfoKHR-handleType-00667
  If `handleType` is not 0, it **must** be supported for import, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`.

- VUID-VkImportMemoryFdInfoKHR-fd-00668
  The memory from which `fd` was exported **must** have been created on the same underlying physical device as `device`.

- VUID-VkImportMemoryFdInfoKHR-handleType-00669
  If `handleType` is not 0, it **must** be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT`.

- VUID-VkImportMemoryFdInfoKHR-handleType-00670
  If `handleType` is not 0, `fd` **must** be a valid handle of the type specified by `handleType`.

- VUID-VkImportMemoryFdInfoKHR-fd-01746
  The memory represented by `fd` **must** have been created from a physical device and driver that is compatible with `device` and `handleType`, as described in External memory handle types compatibility.

- VUID-VkImportMemoryFdInfoKHR-fd-01520
  `fd` **must** obey any requirements listed for `handleType` in external memory handle types compatibility.

Valid Usage (Implicit)

- VUID-VkImportMemoryFdInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_FD_INFO_KHR`.

- VUID-VkImportMemoryFdInfoKHR-handleType-parameter
  If `handleType` is not 0, `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value.

To export a POSIX file descriptor referencing the payload of a Vulkan device memory object, call:

```c
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdKHR(
    VkDevice device,
    const VkMemoryGetFdInfoKHR* pGetFdInfo,
    int* pFd);
```

- `device` is the logical device that created the device memory being exported.
- `pGetFdInfo` is a pointer to a `VkMemoryGetFdInfoKHR` structure containing parameters of the export operation.
- `pFd` will return a file descriptor referencing the payload of the device memory object.
Each call to `vkGetMemoryFdKHR` must create a new file descriptor holding a reference to the memory object's payload and transfer ownership of the file descriptor to the application. To avoid leaking resources, the application must release ownership of the file descriptor using the `close` system call when it is no longer needed, or by importing a Vulkan memory object from it. Where supported by the operating system, the implementation must set the file descriptor to be closed automatically when an `execve` system call is made.

### Valid Usage (Implicit)

- VUID-vkGetMemoryFdKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetMemoryFdKHR-pGetFdInfo-parameter
  - `pGetFdInfo` must be a valid pointer to a valid `VkMemoryGetFdInfoKHR` structure
- VUID-vkGetMemoryFdKHR-pFd-parameter
  - `pFd` must be a valid pointer to an `int` value

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkMemoryGetFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkMemoryGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetFdInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` is the memory object from which the handle will be exported.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the file descriptor exported depend on the value of `handleType`. See `VkExternalMemoryHandleTypeFlagBits` for a description of the properties of the defined external
memory handle types.

**Note**

The size of the exported file **may** be larger than the size requested by `VkMemoryAllocateInfo::allocationSize`. If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT`, then the application **can** query the file’s actual size with `lseek`.

### Valid Usage

- **VUID-VkMemoryGetFdInfoKHR-handleType-00671**
  
  `handleType` **must** have been included in `VkExportMemoryAllocateInfo::handleTypes` when `memory` was created

- **VUID-VkMemoryGetFdInfoKHR-handleType-00672**
  
  `handleType` **must** be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT`

### Valid Usage (Implicit)

- **VUID-VkMemoryGetFdInfoKHR-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_GET_FD_INFO_KHR`

- **VUID-VkMemoryGetFdInfoKHR-pNext-pNext**
  
  `pNext` **must** be `NULL`

- **VUID-VkMemoryGetFdInfoKHR-memory-parameter**
  
  `memory` **must** be a valid `VkDeviceMemory` handle

- **VUID-VkMemoryGetFdInfoKHR-handleType-parameter**
  
  `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

POSIX file descriptor memory handles compatible with Vulkan **may** also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```cpp
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdPropertiesKHR(
    VkDevice    device,    
    VkExternalMemoryHandleTypeFlagBits handleType,    
    int         fd,    
    VkMemoryFdPropertiesKHR* pMemoryFdProperties);
```

- **device** is the logical device that will be importing `fd`.

- **handleType** is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of the handle `fd`.

794
- \textit{fd} is the handle which will be imported.
- \texttt{pMemoryFdProperties} is a pointer to a \texttt{VkMemoryFdPropertiesKHR} structure in which the properties of the handle \textit{fd} are returned.

### Valid Usage

- VUID-vkGetMemoryFdPropertiesKHR-fd-00673
  \textit{fd} must be an external memory handle created outside of the Vulkan API

- VUID-vkGetMemoryFdPropertiesKHR-handleType-00674
  \texttt{handleType} must not be VK\_EXTERNAL\_MEMORY\_HANDLE\_TYPE\_OPAQUE\_FD\_BIT

### Valid Usage (Implicit)

- VUID-vkGetMemoryFdPropertiesKHR-device-parameter
  \texttt{device} must be a valid \texttt{VkDevice} handle

- VUID-vkGetMemoryFdPropertiesKHR-handleType-parameter
  \texttt{handleType} must be a valid \texttt{VkExternalMemoryHandleTypeFlagBits} value

- VUID-vkGetMemoryFdPropertiesKHR-pMemoryFdProperties-parameter
  \texttt{pMemoryFdProperties} must be a valid pointer to a \texttt{VkMemoryFdPropertiesKHR} structure

### Return Codes

**Success**
- VK\_SUCCESS

**Failure**
- VK\_ERROR\_OUT\_OF\_HOST\_MEMORY
- VK\_ERROR\_INVALID\_EXTERNAL\_HANDLE

The \texttt{VkMemoryFdPropertiesKHR} structure returned is defined as:

```c
// Provided by VK\_KHR\_external\_memory\_fd
typedef struct VkMemoryFdPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
} VkMemoryFdPropertiesKHR;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is NULL or a pointer to a structure extending this structure.
- \texttt{memoryTypeBits} is a bitmask containing one bit set for every memory type which the specified file descriptor can be imported as.
11.2.6. Host External Memory

To import memory from a host pointer, add a `VkImportMemoryHostPointerInfoEXT` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkImportMemoryHostPointerInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_external_memory_host
typedef struct VkImportMemoryHostPointerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    void* pHostPointer;
} VkImportMemoryHostPointerInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the handle type.
- `pHostPointer` is the host pointer to import from.

Importing memory from a host pointer shares ownership of the memory between the host and the Vulkan implementation. The application can continue to access the memory through the host pointer but it is the application's responsibility to synchronize device and non-device access to the payload as defined in Host Access to Device Memory Objects.

Applications can import the same payload into multiple instances of Vulkan and multiple times into a given Vulkan instance. However, implementations may fail to import the same payload multiple times into a given physical device due to platform constraints.

Importing memory from a particular host pointer may not be possible due to additional platform-specific restrictions beyond the scope of this specification in which case the implementation must fail the memory import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR`.

Whether device memory objects imported from a host pointer hold a reference to their payload is undefined. As such, the application must ensure that the imported memory range remains valid and accessible for the lifetime of the imported memory object.
Valid Usage

- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01747
  If `handleType` is not 0, it **must** be supported for import, as reported in `VkExternalMemoryProperties`

- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01748
  If `handleType` is not 0, it **must** be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`

- VUID-VkImportMemoryHostPointerInfoEXT-pHostPointer-01749
  `pHostPointer` **must** be a pointer aligned to an integer multiple of `VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment`

- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01750
  If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT`, `pHostPointer` **must** be a pointer to `allocationSize` number of bytes of host memory, where `allocationSize` is the member of the `VkMemoryAllocateInfo` structure this structure is chained to

- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01751
  If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`, `pHostPointer` **must** be a pointer to `allocationSize` number of bytes of host mapped foreign memory, where `allocationSize` is the member of the `VkMemoryAllocateInfo` structure this structure is chained to

Valid Usage (Implicit)

- VUID-VkImportMemoryHostPointerInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_HOST_POINTER_INFO_EXT`

- VUID-VkImportMemoryHostPointerInfoEXT-handleType-parameter
  `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

To determine the correct parameters to use when importing host pointers, call:

```c
// Provided by VK_EXT_external_memory_host
VkResult vkGetMemoryHostPointerPropertiesEXT(
    VkDevice device,                // Logical device that will be importing pHostPointer.
    VkExternalMemoryHandleTypeFlagBits handleType, // VkExternalMemoryHandleTypeFlagBits value specifying the type of the handle pHostPointer.
    const void* pHostPointer,      // Host pointer to import from.
    VkMemoryHostPointerPropertiesEXT* pMemoryHostPointerProperties);
```
• `pMemoryHostPointerProperties` is a pointer to a `VkMemoryHostPointerPropertiesEXT` structure in which the host pointer properties are returned.

### Valid Usage

- **VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01752**
  `handleType must be VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`

- **VUID-vkGetMemoryHostPointerPropertiesEXT-pHostPointer-01753**
  `pHostPointer must be a pointer aligned to an integer multiple of VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment`

- **VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01754**
  If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT`, `pHostPointer` must be a pointer to host memory

- **VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01755**
  If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`, `pHostPointer` must be a pointer to host mapped foreign memory

### Valid Usage (Implicit)

- **VUID-vkGetMemoryHostPointerPropertiesEXT-device-parameter**
  `device must be a valid VkDevice handle`

- **VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-parameter**
  `handleType must be a valid VkExternalMemoryHandleTypeFlagBits value`

- **VUID-vkGetMemoryHostPointerPropertiesEXT-pMemoryHostPointerProperties-parameter**
  `pMemoryHostPointerProperties must be a valid pointer to a VkMemoryHostPointerPropertiesEXT structure`

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkMemoryHostPointerPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_external_memory_host
typedef struct VkMemoryHostPointerPropertiesEXT {
```
 VkMemoryHostPointerPropertiesEXT;

- \textit{sType} is the type of this structure.
- \textit{pNext} is NULL or a pointer to a structure extending this structure.
- \textit{memoryTypeBits} is a bitmask containing one bit set for every memory type which the specified host pointer \textbf{can} be imported as.

The value returned by \textit{memoryTypeBits} \textbf{must} only include bits that identify memory types which are host visible.

\textbf{Valid Usage (Implicit)}

- VUID-VkMemoryHostPointerPropertiesEXT-sType-sType
  \textit{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_MEMORY_HOST_POINTER_PROPERTIES_EXT}
- VUID-VkMemoryHostPointerPropertiesEXT-pNext-pNext
  \textit{pNext} \textbf{must} be NULL

\subsection*{11.2.7. Android Hardware Buffer External Memory}

To import memory created outside of the current Vulkan instance from an Android hardware buffer, add a \texttt{VkImportAndroidHardwareBufferInfoANDROID} structure to the \textit{pNext} chain of the \texttt{VkMemoryAllocateInfo} structure. The \texttt{VkImportAndroidHardwareBufferInfoANDROID} structure is defined as:

// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkImportAndroidHardwareBufferInfoANDROID {
  VkStructureType sType;
  const void* pNext;
  struct AHardwareBuffer* buffer;
} VkImportAndroidHardwareBufferInfoANDROID;

- \textit{sType} is the type of this structure.
- \textit{pNext} is NULL or a pointer to a structure extending this structure.
- \textit{buffer} is the Android hardware buffer to import.

If the \texttt{vkAllocateMemory} command succeeds, the implementation \textbf{must} acquire a reference to the imported hardware buffer, which it \textbf{must} release when the device memory object is freed. If the command fails, the implementation \textbf{must} not retain a reference.
Valid Usage

• VUID-VkImportAndroidHardwareBufferInfoANDROID-buffer-01880
  If buffer is not NULL, Android hardware buffers must be supported for import, as reported by VkExternalImageFormatProperties or VkExternalBufferProperties

• VUID-VkImportAndroidHardwareBufferInfoANDROID-buffer-01881
  If buffer is not NULL, it must be a valid Android hardware buffer object with AHardwareBuffer_Desc::usage compatible with Vulkan as described in Android Hardware Buffers

Valid Usage (Implicit)

• VUID-VkImportAndroidHardwareBufferInfoANDROID-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMPORT_ANDROID_HARDWARE_BUFFER_INFO_ANDROID

• VUID-VkImportAndroidHardwareBufferInfoANDROID-buffer-parameter
  buffer must be a valid pointer to an AHardwareBuffer value

To export an Android hardware buffer referencing the payload of a Vulkan device memory object, call:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
VkResult vkGetMemoryAndroidHardwareBufferANDROID(
    VkDevice device,
    const VkMemoryGetAndroidHardwareBufferInfoANDROID* pInfo,
    struct AHardwareBuffer** pBuffer);
```

• device is the logical device that created the device memory being exported.

• pInfo is a pointer to a VkMemoryGetAndroidHardwareBufferInfoANDROID structure containing parameters of the export operation.

• pBuffer will return an Android hardware buffer referencing the payload of the device memory object.

Each call to vkGetMemoryAndroidHardwareBufferANDROID must return an Android hardware buffer with a new reference acquired in addition to the reference held by the VkDeviceMemory. To avoid leaking resources, the application must release the reference by calling AHardwareBuffer_release when it is no longer needed. When called with the same handle in VkMemoryGetAndroidHardwareBufferInfoANDROID::memory, vkGetMemoryAndroidHardwareBufferANDROID must return the same Android hardware buffer object. If the device memory was created by importing an Android hardware buffer, vkGetMemoryAndroidHardwareBufferANDROID must return that same Android hardware buffer object.
Valid Usage (Implicit)

- VUID-vkGetMemoryAndroidHardwareBufferANDROID-device-parameter device must be a valid VkDevice handle
- VUID-vkGetMemoryAndroidHardwareBufferANDROID-pInfo-parameter pInfo must be a valid pointer to a valid VkMemoryGetAndroidHardwareBufferInfoANDROID structure
- VUID-vkGetMemoryAndroidHardwareBufferANDROID-pBuffer-parameter pBuffer must be a valid pointer to a valid pointer to an AHardwareBuffer value

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkMemoryGetAndroidHardwareBufferInfoANDROID structure is defined as:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkMemoryGetAndroidHardwareBufferInfoANDROID {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
} VkMemoryGetAndroidHardwareBufferInfoANDROID;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memory is the memory object from which the Android hardware buffer will be exported.

Valid Usage

- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-handleTypes-01882 VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID must have been included in VkExportMemoryAllocateInfo::handleTypes when memory was created
- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-pNext-01883 If the pNext chain of the VkMemoryAllocateInfo used to allocate memory included a VkMemoryDedicatedAllocateInfo with non-NULL image member, then that image must already be bound to memory
Valid Usage (Implicit)

- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-sType-sType
  sType **must** be `VK_STRUCTURE_TYPE_MEMORY_GET_ANDROID_HARDWARE_BUFFER_INFO_ANDROID`

- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-pNext-pNext
  pNext **must** be `NULL`

- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-memory-parameter
  memory **must** be a valid `VkDeviceMemory` handle

To determine the memory parameters to use when importing an Android hardware buffer, call:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
VkResult vkGetAndroidHardwareBufferPropertiesANDROID(
    VkDevice device,
    const struct AHardwareBuffer* buffer,
    VkAndroidHardwareBufferPropertiesANDROID* pProperties);
```

- **device** is the logical device that will be importing **buffer**.
- **buffer** is the Android hardware buffer which will be imported.
- **pProperties** is a pointer to a `VkAndroidHardwareBufferPropertiesANDROID` structure in which the properties of **buffer** are returned.

Valid Usage

- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-buffer-01884
  buffer **must** be a valid Android hardware buffer object with at least one of the
  `AHARDWAREBUFFER_USAGE_GPU_*` flags in its `AHardwareBuffer_Desc::usage`

Valid Usage (Implicit)

- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-device-parameter
  device **must** be a valid `VkDevice` handle

- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-buffer-parameter
  buffer **must** be a valid pointer to a valid `AHardwareBuffer` value

- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-pProperties-parameter
  pProperties **must** be a valid pointer to a `VkAndroidHardwareBufferPropertiesANDROID` structure
Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR

The \texttt{VkAndroidHardwareBufferPropertiesANDROID} structure returned is defined as:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkAndroidHardwareBufferPropertiesANDROID {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize allocationSize;
    uint32_t memoryTypeBits;
} VkAndroidHardwareBufferPropertiesANDROID;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is NULL or a pointer to a structure extending this structure.
- \texttt{allocationSize} is the size of the external memory
- \texttt{memoryTypeBits} is a bitmask containing one bit set for every memory type which the specified Android hardware buffer can be imported as.

Valid Usage (Implicit)

- VUID-VkAndroidHardwareBufferPropertiesANDROID-sType-sType \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_PROPERTIES_ANDROID}
- VUID-VkAndroidHardwareBufferPropertiesANDROID-pNext-pNext Each \texttt{pNext} member of any structure (including this one) in the \texttt{pNext} chain must be either NULL or a pointer to a valid instance of \texttt{VkAndroidHardwareBufferFormatProperties2ANDROID} or \texttt{VkAndroidHardwareBufferFormatPropertiesANDROID}
- VUID-VkAndroidHardwareBufferPropertiesANDROID-sType-unique The \texttt{sType} value of each struct in the \texttt{pNext} chain must be unique

To obtain format properties of an Android hardware buffer, include a \texttt{VkAndroidHardwareBufferFormatPropertiesANDROID} structure in the \texttt{pNext} chain of the \texttt{VkAndroidHardwareBufferPropertiesANDROID} structure passed to \texttt{vkGetAndroidHardwareBufferPropertiesANDROID}. This structure is defined as:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
```
typedef struct VkAndroidHardwareBufferFormatPropertiesANDROID {
    VkStructureType sType;
    void* pNext;
    VkFormat format;
    uint64_t externalFormat;
    VkFormatFeatureFlags formatFeatures;
    VkComponentMapping samplerYcbcrConversionComponents;
    VkSamplerYcbcrModelConversion suggestedYcbcrModel;
    VkSamplerYcbcrRange suggestedYcbcrRange;
    VkChromaLocation suggestedXChromaOffset;
    VkChromaLocation suggestedYChromaOffset;
} VkAndroidHardwareBufferFormatPropertiesANDROID;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **format** is the Vulkan format corresponding to the Android hardware buffer’s format, or **VK_FORMAT_UNDEFINED** if there is not an equivalent Vulkan format.
- **externalFormat** is an implementation-defined external format identifier for use with VkExternalFormatANDROID. It must not be zero.
- **formatFeatures** describes the capabilities of this external format when used with an image bound to memory imported from buffer.
- **samplerYcbcrConversionComponents** is the component swizzle that should be used in VkSamplerYcbcrConversionCreateInfo.
- **suggestedYcbcrModel** is a suggested color model to use in the VkSamplerYcbcrConversionCreateInfo.
- **suggestedYcbcrRange** is a suggested numerical value range to use in VkSamplerYcbcrConversionCreateInfo.
- **suggestedXChromaOffset** is a suggested X chroma offset to use in VkSamplerYcbcrConversionCreateInfo.
- **suggestedYChromaOffset** is a suggested Y chroma offset to use in VkSamplerYcbcrConversionCreateInfo.

If the Android hardware buffer has one of the formats listed in the Format Equivalence table, then **format** must have the equivalent Vulkan format listed in the table. Otherwise, **format** may be **VK_FORMAT_UNDEFINED**, indicating the Android hardware buffer can only be used with an external format.

The **formatFeatures** member must include **VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT** and at least one of **VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT** or **VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT**, and should include **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT** and **VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT**.

**Note**

The **formatFeatures** member only indicates the features available when using an external-format image created from the Android hardware buffer. Images from
Android hardware buffers with a format other than VK_FORMAT_UNDEFINED are subject to the format capabilities obtained from vkGetPhysicalDeviceFormatProperties2, and vkGetPhysicalDeviceImageFormatProperties2 with appropriate parameters. These sets of features are independent of each other, e.g. the external format will support sampler Y’CbCr conversion even if the non-external format does not, and writing to non-external format images is possible but writing to external format images is not.

Android hardware buffers with the same external format must have the same support for VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT, VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT, VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT, VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT, VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT, and VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT, in formatFeatures. Other format features may differ between Android hardware buffers that have the same external format. This allows applications to use the same VkSamplerYcbcrConversion object (and samplers and pipelines created from them) for any Android hardware buffers that have the same external format.

If format is not VK_FORMAT_UNDEFINED, then the value of samplerYcbcrConversionComponents must be valid when used as the components member of VkSamplerYcbcrConversionCreateInfo with that format. If format is VK_FORMAT_UNDEFINED, all members of samplerYcbcrConversionComponents must be the identity swizzle.

Implementations may not always be able to determine the color model, numerical range, or chroma offsets of the image contents, so the values in VkAndroidHardwareBufferFormatPropertiesANDROID are only suggestions. Applications should treat these values as sensible defaults to use in the absence of more reliable information obtained through some other means. If the underlying physical device is also usable via OpenGL ES with the GL_OES_EGL_image_external extension, the implementation should suggest values that will produce similar sampled values as would be obtained by sampling the same external image via samplerExternalOES in OpenGL ES using equivalent sampler parameters.

Note
Since GL_OES_EGL_image_external does not require the same sampling and conversion calculations as Vulkan does, achieving identical results between APIs may not be possible on some implementations.

Valid Usage (Implicit)

- VUID-VkAndroidHardwareBufferFormatPropertiesANDROID-sType-sType
  sType must be VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_FORMAT_PROPERTIES_ANDROID

The format properties of an Android hardware buffer can be obtained by including a VkAndroidHardwareBufferFormatProperties2ANDROID structure in the pNext chain of the VkAndroidHardwareBufferPropertiesANDROID structure passed to
vkGetAndroidHardwareBufferPropertiesANDROID. This structure is defined as:

```c
// Provided by VK_KHR_format_feature_flags2 with
// VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkAndroidHardwareBufferFormatProperties2ANDROID {
    VkStructureType sType;
    void* pNext;
    VkFormat format;
    uint64_t externalFormat;
    VkFormatFeatureFlags2 formatFeatures;
    VkComponentMapping samplerYcbcrConversionComponents;
    VkSamplerYcbcrModelConversion suggestedYcbcrModel;
    VkSamplerYcbcrRange suggestedYcbcrRange;
    VkChromaLocation suggestedXChromaOffset;
    VkChromaLocation suggestedYChromaOffset;
} VkAndroidHardwareBufferFormatProperties2ANDROID;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `format` is the Vulkan format corresponding to the Android hardware buffer’s format, or `VK_FORMAT_UNDEFINED` if there is not an equivalent Vulkan format.
- `externalFormat` is an implementation-defined external format identifier for use with `VkExternalFormatANDROID`. It must not be zero.
- `formatFeatures` describes the capabilities of this external format when used with an image bound to memory imported from `buffer`.
- `samplerYcbcrConversionComponents` is the component swizzle that should be used in `VkSamplerYcbcrConversionCreateInfo`.
- `suggestedYcbcrModel` is a suggested color model to use in `VkSamplerYcbcrConversionCreateInfo`.
- `suggestedYcbcrRange` is a suggested numerical value range to use in `VkSamplerYcbcrConversionCreateInfo`.
- `suggestedXChromaOffset` is a suggested X chroma offset to use in `VkSamplerYcbcrConversionCreateInfo`.
- `suggestedYChromaOffset` is a suggested Y chroma offset to use in `VkSamplerYcbcrConversionCreateInfo`.

The bits reported in `formatFeatures` must include the bits reported in the corresponding fields of `VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures`.

**Valid Usage (Implicit)**

- VUID-VkAndroidHardwareBufferFormatProperties2ANDROID-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_FORMAT_PROPERTIES_2ANDROID`
11.2.8. Remote Device External Memory

To export an address representing the payload of a Vulkan device memory object accessible by remote devices, call:

```c
// Provided by VK_NV_external_memory_rdma
VkResult vkGetMemoryRemoteAddressNV(
    VkDevice device,
    const VkMemoryGetRemoteAddressInfoNV* pMemoryGetRemoteAddressInfo,
    VkRemoteAddressNV* pAddress);
```

- `device` is the logical device that created the device memory being exported.
- `pMemoryGetRemoteAddressInfo` is a pointer to a `VkMemoryGetRemoteAddressInfoNV` structure containing parameters of the export operation.
- `pAddress` will return the address representing the payload of the device memory object.

More communication may be required between the kernel-mode drivers of the devices involved. This information is out of scope of this documentation and should be requested from the vendors of the devices.

Valid Usage (Implicit)

- VUID-vkGetMemoryRemoteAddressNV-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkGetMemoryRemoteAddressNV-pMemoryGetRemoteAddressInfo-parameter `pMemoryGetRemoteAddressInfo` must be a valid pointer to a valid `VkMemoryGetRemoteAddressInfoNV` structure
- VUID-vkGetMemoryRemoteAddressNV-pAddress-parameter `pAddress` must be a valid pointer to a `VkRemoteAddressNV` value

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkMemoryGetRemoteAddressInfoNV` structure is defined as:

```c
// Provided by VK_NV_external_memory_rdma
typedef struct VkMemoryGetRemoteAddressInfoNV {
    VkStructureType sType;
    const void* pNext;
} VkMemoryGetRemoteAddressInfoNV;
```
• `sType` is the type of this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `memory` is the memory object from which the remote accessible address will be exported.
• `handleType` is the type of handle requested.

## Valid Usage

• VUID-VkMemoryGetRemoteAddressInfoNV-handleType-04966
  `handleType` must have been included in `VkExportMemoryAllocateInfo::handleTypes` when `memory` was created

## Valid Usage (Implicit)

• VUID-VkMemoryGetRemoteAddressInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_GET_REMOTE_ADDRESS_INFO_NV`

• VUID-VkMemoryGetRemoteAddressInfoNV-pNext-pNext
  `pNext` must be NULL

• VUID-VkMemoryGetRemoteAddressInfoNV-memory-parameter
  `memory` must be a valid `VkDeviceMemory` handle

• VUID-VkMemoryGetRemoteAddressInfoNV-handleType-parameter
  `handleType` must be a valid `VkExternalMemoryHandleTypeFlagBits` value

### 11.2.9. Fuchsia External Memory

On Fuchsia, when allocating memory that may be imported from another device, process or Vulkan instance, add a `VkImportMemoryZirconHandleInfoFUCHSIA` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure.

External memory on Fuchsia is imported and exported using VMO handles of type `zx_handle_t`. VMO handles to external memory are canonically obtained from Fuchsia’s Sysmem service or from syscalls such as `zx_vmo_create()`. VMO handles for import can also be obtained by exporting them from another Vulkan instance as described in exporting fuchsia device memory.

Importing VMO handles to the Vulkan instance transfers ownership of the handle to the instance from the application. The application must not perform any operations on the handle after successful import.

Applications can import the same underlying memory into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation must create a distinct `VkDeviceMemory` object.
Importing Fuchsia External Memory

The `VkImportMemoryZirconHandleInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_external_memory
typedef struct VkImportMemoryZirconHandleInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    zx_handle_t handle;
} VkImportMemoryZirconHandleInfoFUCHSIA;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of `handle`.
- `handle` is a `zx_handle_t` (Zircon) handle to the external memory.

**Valid Usage**

- VUID-VkImportMemoryZirconHandleInfoFUCHSIA-handleType-04771
  `handleType` must be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA`
- VUID-VkImportMemoryZirconHandleInfoFUCHSIA-handle-04772
  `handle` must be a valid VMO handle

**Valid Usage (Implicit)**

- VUID-VkImportMemoryZirconHandleInfoFUCHSIA-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_ZIRCON_HANDLE_INFO_FUCHSIA`
- VUID-VkImportMemoryZirconHandleInfoFUCHSIA-handleType-parameter
  If `handleType` is not 0, `handleType` must be a valid `VkExternalMemoryHandleTypeFlagBits` value

To obtain the `memoryTypeIndex` for the `VkMemoryAllocateInfo` structure, call `vkGetMemoryZirconHandlePropertiesFUCHSIA`:

```c
// Provided by VK_FUCHSIA_external_memory
VkResult vkGetMemoryZirconHandlePropertiesFUCHSIA(
    VkDevice device,                      device,
    VkExternalMemoryHandleTypeFlagBits handleType,  handleType,
    zx_handle_t zirconHandle,           zirconHandle,
    VkMemoryZirconHandlePropertiesFUCHSIA* pMemoryZirconHandleProperties);  pMemoryZirconHandleProperties);
```

- `device` is the `VkDevice`.
• **handleType** is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of **zirconHandle**.

• **zirconHandle** is a `zx_handle_t` (Zircon) handle to the external resource.

• **pMemoryZirconHandleProperties** is a pointer to a `VkMemoryZirconHandlePropertiesFUCHSIA` structure in which the result will be stored.

## Valid Usage

- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-handleType-04773
  
  **handleType** must be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA`.

- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-zirconHandle-04774
  
  **zirconHandle** must reference a valid VMO.

## Valid Usage (Implicit)

- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-device-parameter
  
  **device** must be a valid `VkDevice` handle.

- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-handleType-parameter
  
  **handleType** must be a valid `VkExternalMemoryHandleTypeFlagBits` value.

- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-pMemoryZirconHandleProperties-parameter
  
  **pMemoryZirconHandleProperties** must be a valid pointer to a `VkMemoryZirconHandlePropertiesFUCHSIA` structure.

## Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_INVALID_EXTERNAL_HANDLE**

The `VkMemoryZirconHandlePropertiesFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_external_memory
typedef struct VkMemoryZirconHandlePropertiesFUCHSIA {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
} VkMemoryZirconHandlePropertiesFUCHSIA;
```

• **sType** is the type of this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.
• memoryTypeBits a bitmask containing one bit set for every memory type which the specified handle can be imported as.

Valid Usage (Implicit)

- VUID-VkMemoryZirconHandlePropertiesFUCHSIA-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_ZIRCON_HANDLE_PROPERTIES_FUCHSIA

- VUID-VkMemoryZirconHandlePropertiesFUCHSIA-pNext-pNext
  pNext must be NULL

With pMemoryZirconHandleProperties now successfully populated by vkGetMemoryZirconHandlePropertiesFUCHSIA, assign the VkMemoryAllocateInfo memoryTypeIndex field to a memory type which has a bit set in the VkMemoryZirconHandlePropertiesFUCHSIA memoryTypeBits field.

Exporting Fuchsia Device Memory

Similar to importing, exporting a VMO handle from Vulkan transfers ownership of the handle from the Vulkan instance to the application. The application is responsible for closing the handle with zx_handle_close() when it is no longer in use.

To export device memory as a Zircon handle that can be used by another instance, device, or process, the handle to the VkDeviceMemory must be retrieved using vkGetMemoryZirconHandleFUCHSIA:

```c
// Provided by VK_FUCHSIA_external_memory
VkResult vkGetMemoryZirconHandleFUCHSIA(
    VkDevice device,
    const VkMemoryGetZirconHandleInfoFUCHSIA* pGetZirconHandleInfo,
    zx_handle_t* pZirconHandle);
```

- device is the VkDevice.
- pGetZirconHandleInfo is a pointer to a VkMemoryGetZirconHandleInfoFUCHSIA structure.
- pZirconHandle is a pointer to a zx_handle_t which holds the resulting Zircon handle.

Valid Usage (Implicit)

- VUID-vkGetMemoryZirconHandleFUCHSIA-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetMemoryZirconHandleFUCHSIA-pGetZirconHandleInfo-parameter
  pGetZirconHandleInfo must be a valid pointer to a valid VkMemoryGetZirconHandleInfoFUCHSIA structure

- VUID-vkGetMemoryZirconHandleFUCHSIA-pZirconHandle-parameter
  pZirconHandle must be a valid pointer to a zx_handle_t value
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

VkMemoryGetZirconHandleInfoFUCHSIA is defined as:

```c
// Provided by VK_FUCHSIA_external_memory
typedef struct VkMemoryGetZirconHandleInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetZirconHandleInfoFUCHSIA;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` the `VkDeviceMemory` being exported.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of the handle pointed to by `vkGetMemoryZirconHandleFUCHSIA::pZirconHandle`.

Valid Usage

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-handleType-04775
  `handleType` must be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA`

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-handleType-04776
  `handleType` must have been included in the `handleTypes` field of the `VkExportMemoryAllocateInfo` structure when the external memory was allocated.

Valid Usage (Implicit)

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_GET_ZIRCON_HANDLE_INFO_FUCHSIA`

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-memory-parameter
  `memory` must be a valid `VkDeviceMemory` handle

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-handleType-parameter
handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

With the result pZirconHandle now obtained, the memory properties for the handle can be retrieved using vkGetMemoryZirconHandlePropertiesFUCHSIA as documented above substituting the dereferenced, retrieved pZirconHandle in for the zirconHandle argument.

11.2.10. Metal Objects

A Vulkan implementation that is layered on top of Metal on Apple device platform, and implements the VK_EXT_metal_objects extension, supports the ability to import and export the underlying Metal objects associated with specific Vulkan objects.

The underlying Metal objects associated with certain Vulkan objects can be exported from those Vulkan objects using the pNext chain of the VkExportMetalObjectsInfoEXT parameter of the vkExportMetalObjectsEXT command.

An VkDeviceMemory object can be allocated on an existing MTLBuffer object, by including the MTLBuffer object in a VkImportMetalBufferInfoEXT structure in the pNext chain of the VkMemoryAllocateInfo structure in the vkAllocateMemory command.

A new VkImage object can be created on an existing IOSurface object, or one or more existing Metal MTLTexture objects, by including those Metal objects in either VkImportMetalIOSurfaceInfoEXT or VkImportMetalTextureInfoEXT structures in the pNext chain of the VkImageCreateInfo structure in the vkCreateImage command.

To export Metal objects from Vulkan objects, the app must first indicate the intention to do so during the creation of the Vulkan object, by including one or more VkExportMetalObjectCreateInfoEXT structures in the pNext chain of the VkInstanceCreateInfo, VkMemoryAllocateInfo, VkImageCreateInfo, VkImageViewCreateInfo, VkBufferViewCreateInfo, VkSemaphoreCreateInfo, or VkEventCreateInfo, in the corresponding Vulkan object creation command.

The VkExportMetalObjectCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalObjectCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkExportMetalObjectTypeFlagBitsEXT exportObjectType;
} VkExportMetalObjectCreateInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- exportObjectType is a VkExportMetalObjectTypeFlagBitsEXT indicating the type of Metal object that the application may request to be exported from the Vulkan object.
Valid Usage (Implicit)

- **VUID-VkExportMetalObjectCreateInfoEXT-sType-sType**
  
  *sType must be VK_STRUCTURE_TYPE_EXPORT_METAL_OBJECT_CREATE_INFO_EXT*

- **VUID-VkExportMetalObjectCreateInfoEXT-exportObjectType-parameter**
  
  If *exportObjectType* is not 0, *exportObjectType* must be a valid
  *VkExportMetalObjectTypeFlagBitsEXT* value

Bits which indicate the types of Metal objects that may be exported from a corresponding Vulkan object are:

```c
// Provided by VK_EXT_metal_objects
typedef enum VkExportMetalObjectTypeFlagBitsEXT {
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_DEVICE_BIT_EXT = 0x00000001,
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_COMMAND_QUEUE_BIT_EXT = 0x00000002,
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_BUFFER_BIT_EXT = 0x00000004,
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT = 0x00000008,
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_IOSURFACE_BIT_EXT = 0x00000010,
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT = 0x00000020,
} VkExportMetalObjectTypeFlagBitsEXT;
```

- **VK_EXPORT_METAL_OBJECT_TYPE_METAL_DEVICE_BIT_EXT** indicates a Metal *MTLDevice* may be exported.
- **VK_EXPORT_METAL_OBJECT_TYPE_METAL_COMMAND_QUEUE_BIT_EXT** indicates a Metal *MTLCommandQueue* may be exported.
- **VK_EXPORT_METAL_OBJECT_TYPE_METAL_BUFFER_BIT_EXT** indicates a Metal *MTLBuffer* may be exported.
- **VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT** indicates a Metal *MTLTexture* may be exported.
- **VK_EXPORT_METAL_OBJECT_TYPE_METAL_IOSURFACE_BIT_EXT** indicates a Metal *IOSurface* may be exported.
- **VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT** indicates a Metal *MTLSharedEvent* may be exported.

```c
// Provided by VK_EXT_metal_objects
typedef VkFlags VkExportMetalObjectTypeFlagsEXT;
```

*VkExportMetalObjectTypeFlagsEXT* is a bitmask type for setting a mask of zero or more *VkExportMetalObjectTypeFlagBitsEXT*.

To export Metal objects that underlie Vulkan objects, call:

```c
// Provided by VK_EXT_metal_objects
void vkExportMetalObjectsEXT(  
    VkDevice device,  
);```
• device is the device that created the Vulkan objects.

• pMetalObjectsInfo is a pointer to a VkExportMetalObjectsInfoEXT structure whose pNext chain contains structures, each identifying a Vulkan object and providing a pointer through which the Metal object will be returned.

Valid Usage (Implicit)

• VUID-vkExportMetalObjectsEXT-device-parameter
device must be a valid VkDevice handle

• VUID-vkExportMetalObjectsEXT-pMetalObjectsInfo-parameter
pMetalObjectsInfo must be a valid pointer to a VkExportMetalObjectsInfoEXT structure

The VkExportMetalObjectsInfoEXT structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalObjectsInfoEXT {
    VkStructureType sType;
    const void* pNext;
} VkExportMetalObjectsInfoEXT;
```

• sType is the type of this structure.

• pNext is NULL or a pointer to a structure extending this structure.

Valid Usage

• VUID-VkExportMetalObjectsInfoEXT-pNext-06791
If the pNext chain includes a VkExportMetalDeviceInfoEXT structure, the VkInstance must have been created with VK_EXPORT_METAL_OBJECT_TYPE_METAL_DEVICE_BIT_EXT in the exportObjectType member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkInstanceCreateInfo structure in the vkCreateInstance command.

• VUID-VkExportMetalObjectsInfoEXT-pNext-06792
If the pNext chain includes a VkExportMetalCommandQueueInfoEXT structure, the VkInstance must have been created with VK_EXPORT_METAL_OBJECT_TYPE_METAL_COMMAND_QUEUE_BIT_EXT in the exportObjectType member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkInstanceCreateInfo structure in the vkCreateInstance command.

• VUID-VkExportMetalObjectsInfoEXT-pNext-06793
If the pNext chain includes a VkExportMetalBufferInfoEXT structure, the VkDeviceMemory in its memory member must have been allocated with VK_EXPORT_METAL_OBJECT_TYPE_METAL_BUFFER_BIT_EXT in the exportObjectType member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkMemoryAllocateInfo structure in the vkAllocateMemory command.
If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, exactly one of its `image`, `imageView`, or `bufferView` members must not be `VK_NULL_HANDLE`.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and its `image` member is not `VK_NULL_HANDLE`, the `VkImage` in its `image` member must have been created with `VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT` in the `exportObjectType` member of a `VkExportMetalObjectCreateInfoEXT` structure in the `pNext` chain of the `VkImageCreateInfo` structure in the `vkCreateImage` command.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and its `imageView` member is not `VK_NULL_HANDLE`, the `VkImageView` in its `imageView` member must have been created with `VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT` in the `exportObjectType` member of a `VkExportMetalObjectCreateInfoEXT` structure in the `pNext` chain of the `VkImageViewCreateInfo` structure in the `vkCreateImageView` command.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and its `bufferView` member is not `VK_NULL_HANDLE`, the `VkBufferView` in its `bufferView` member must have been created with `VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT` in the `exportObjectType` member of a `VkExportMetalObjectCreateInfoEXT` structure in the `pNext` chain of the `VkBufferViewCreateInfo` structure in the `vkCreateBufferView` command.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and if either its `image` or `imageView` member is not `VK_NULL_HANDLE`, then `plane` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and if the `VkImage` in its `image` member does not have a multi-planar format, then its `plane` member must be `VK_IMAGE_ASPECT_PLANE_0_BIT`.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and if the `VkImage` in its `image` member has a multi-planar format with only two planes, then its `plane` member must not be `VK_IMAGE_ASPECT_PLANE_2_BIT`.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and if the `VkImageView` in its `imageView` member does not have a multi-planar format, then its `plane` member must be `VK_IMAGE_ASPECT_PLANE_0_BIT`.

If the `pNext` chain includes a `VkExportMetalTextureInfoEXT` structure, and if the `VkImageView` in its `imageView` member has a multi-planar format with only two planes, then its `plane` member must not be `VK_IMAGE_ASPECT_PLANE_2_BIT`.
its image member must have been created with 
VK_EXPORT_METAL_OBJECT_TYPE_METAL_IOSURFACE_BIT_EXT in the exportObjectType member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkImageCreateInfo structure in the vkCreateImage command.

- VUID-VkExportMetalObjectsInfoEXT-pNext-06804
  If the pNext chain includes a VkExportMetalSharedEventInfoEXT structure, exactly one of its semaphore or event members must not be VK_NULL_HANDLE.

- VUID-VkExportMetalObjectsInfoEXT-pNext-06805
  If the pNext chain includes a VkExportMetalSharedEventInfoEXT structure, and its semaphore member is not VK_NULL_HANDLE, the VkSemaphore in its semaphore member must have been created with VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT in the exportObjectType member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkSemaphoreCreateInfo structure in the vkCreateSemaphore command.

- VUID-VkExportMetalObjectsInfoEXT-pNext-06806
  If the pNext chain includes a VkExportMetalSharedEventInfoEXT structure, and its event member is not VK_NULL_HANDLE, the VkEvent in its event member must have been created with VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT in the exportObjectType member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkEventCreateInfo structure in the vkCreateEvent command.

Valid Usage (Implicit)

- VUID-VkExportMetalObjectsInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_EXPORT_METAL_OBJECTS_INFO_EXT

- VUID-VkExportMetalObjectsInfoEXT-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkExportMetalBufferInfoEXT, VkExportMetalCommandQueueInfoEXT, VkExportMetalIOSurfaceInfoEXT, VkExportMetalSharedEventInfoEXT, or VkExportMetalTextureInfoEXT

- VUID-VkExportMetalObjectsInfoEXT-sType-unique
  The sType value of each struct in the pNext chain must be unique, with the exception of structures of type VkExportMetalBufferInfoEXT, VkExportMetalCommandQueueInfoEXT, VkExportMetalIOSurfaceInfoEXT, VkExportMetalSharedEventInfoEXT, or VkExportMetalTextureInfoEXT

To export the Metal MTLDevice object underlying the VkPhysicalDevice associated with a VkDevice object, include a VkExportMetalDeviceInfoEXT structure in the pNext chain of the pMetalObjectsInfo parameter of a vkExportMetalObjectsEXT call.

The VkExportMetalDeviceInfoEXT structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalDeviceInfoEXT {
```
VkStructureType sType;
const void* pNext;
MTLDevice_id mtlDevice;
} VkExportMetalDeviceInfoEXT;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **mtlDevice** is the Metal `id<MTLDevice>` object underlying the `VkPhysicalDevice` associated with the `VkDevice` object identified in the call. The implementation will return the `MTLDevice` in this member, or it will return **NULL** if no `MTLDevice` could be found underlying the `VkPhysicalDevice` object.

**Valid Usage (Implicit)**

- VUID-VkExportMetalDeviceInfoEXT-sType-sType
  
sType must be `VK_STRUCTURE_TYPE_EXPORT_METAL_DEVICE_INFO_EXT`

The type `id<MTLDevice>` is defined in Apple's Metal framework, but to remove an unnecessary compile-time dependency, an incomplete type definition of `MTLDevice_id` is provided in the Vulkan headers:

```c
// Provided by VK_EXT_metal_objects
#ifdef __OBJC__
@protocol MTLDevice;
typedef id<MTLDevice> MTLDevice_id;
#else
typedef void* MTLDevice_id;
#endif
```

To export the Metal `MTLCommandQueue` object underlying a `VkQueue` object, include a `VkExportMetalCommandQueueInfoEXT` structure in the `pNext` chain of the `pMetalObjectsInfo` parameter of a `vkExportMetalObjectsEXT` call.

The `VkExportMetalCommandQueueInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalCommandQueueInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkQueue queue;
    MTLCommandQueue_id mtlCommandQueue;
} VkExportMetalCommandQueueInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
• queue is a VkQueue.

• mtlCommandQueue is the Metal id<MTLCommandQueue> object underlying the VkQueue object in queue. The implementation will return the MTLCommandQueue in this member, or it will return NULL if no MTLCommandQueue could be found underlying the VkQueue object.

### Valid Usage (Implicit)

- VUID-VkExportMetalCommandQueueInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_EXPORT_Metal_COMMAND_QUEUE_INFO_EXT

- VUID-VkExportMetalCommandQueueInfoEXT-queue-parameter
  queue must be a valid VkQueue handle

The type id<MTLCommandQueue> is defined in Apple’s Metal framework, but to remove an unnecessary compile-time dependency, an incomplete type definition of MTLCommandQueue_id is provided in the Vulkan headers:

```c
// Provided by VK_EXT_metal_objects
#ifdef __OBJC__
@protocol MTLCommandQueue;
typedef id<MTLCommandQueue> MTLCommandQueue_id;
#else
typedef void* MTLCommandQueue_id;
#endif
```

To export the Metal MTLBuffer object underlying a VkDeviceMemory object, include a VkExportMetalBufferInfoEXT structure in the pNext chain of the pMetalObjectsInfo parameter of a vkExportMetalObjectsEXT call.

The VkExportMetalBufferInfoEXT structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalBufferInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    MTLBuffer_id mtlBuffer;
} VkExportMetalBufferInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memory is a VkDeviceMemory.
- mtlBuffer is the Metal id<MTLBuffer> object underlying the VkDeviceMemory object in memory. The implementation will return the MTLBuffer in this member, or it will return NULL if no MTLBuffer could be found underlying the VkDeviceMemory object.
To import a Metal `MTLBuffer` object to underlie a `VkDeviceMemory` object, include a `VkImportMetalBufferInfoEXT` structure in the `pNext` chain of the `VkMemoryAllocateInfo` structure in a `vkAllocateMemory` command.

The `VkImportMetalBufferInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkImportMetalBufferInfoEXT {
    VkStructureType sType;
    const void* pNext;
    MTLBuffer_id mtlBuffer;
} VkImportMetalBufferInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mtlBuffer` is the Metal `id<MTLBuffer>` object that is to underlie the `VkDeviceMemory`.

The app must ensure that the configuration of the `id<MTLBuffer>` object is compatible with the configuration of the `VkDeviceMemory`. Failure to do so results in undefined behavior.

The type `id<MTLBuffer>` is defined in Apple's Metal framework, but to remove an unnecessary compile-time dependency, an incomplete type definition of `MTLBuffer_id` is provided in the Vulkan headers:

```c
// Provided by VK_EXT_metal_objects
#ifdef __OBJC__
@protocol MTLBuffer;
typedef id<MTLBuffer> MTLBuffer_id;
#else
typedef void* MTLBuffer_id;
#endif
```
To export a Metal `MTLTexture` object underlying a `VkImage`, `VkImageView`, or `VkBufferView` object, include a `VkExportMetalTextureInfoEXT` structure in the `pNext` chain of the `pMetalObjectsInfo` parameter of a `vkExportMetalObjectsEXT` call.

The `VkExportMetalTextureInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalTextureInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkImage            image;
    VkImageView        imageView;
    VkBufferView       bufferView;
    VkImageAspectFlagBits plane;
    MTLTexture_id      mtlTexture;
} VkExportMetalTextureInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is `VK_NULL_HANDLE` or a `VkImage`.
- `imageView` is `VK_NULL_HANDLE` or a `VkImageView`.
- `bufferView` is `VK_NULL_HANDLE` or a `VkBufferView`.
- `plane` indicates the plane of a multi-planar `VkImage` or `VkImageView`.
- `mtlTexture` is the Metal `id<MTLTexture>` object underlying the `VkImage`, `VkImageView`, or `VkBufferView` object in `image`, `imageView`, or `bufferView`, respectively, at the plane indicated in `aspectMask`. The implementation will return the `MTLTexture` in this member, or it will return `NULL` if no `MTLTexture` could be found underlying the `VkImage`, `VkImageView`, or `VkBufferView` object, at the plane indicated in `aspectMask`.

**Valid Usage (Implicit)**

- `VUID-VkExportMetalTextureInfoEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_METAL_TEXTURE_INFO_EXT`

- `VUID-VkExportMetalTextureInfoEXT-image-parameter`  
  If `image` is not `VK_NULL_HANDLE`, `image` must be a valid `VkImage` handle

- `VUID-VkExportMetalTextureInfoEXT-imageView-parameter`  
  If `imageView` is not `VK_NULL_HANDLE`, `imageView` must be a valid `VkImageView` handle

- `VUID-VkExportMetalTextureInfoEXT-bufferView-parameter`  
  If `bufferView` is not `VK_NULL_HANDLE`, `bufferView` must be a valid `VkBufferView` handle

- `VUID-VkExportMetalTextureInfoEXT-plane-parameter`  
  `plane` must be a valid `VkImageAspectFlagBits` value

- `VUID-VkExportMetalTextureInfoEXT-commonparent`  
  Each of `bufferView`, `image`, and `imageView` that are valid handles of non-ignored parameters
must have been created, allocated, or retrieved from the same VkDevice

To import one or more existing Metal MTLTexture objects to underlie a VkImage object, include one or more VkImportMetalTextureInfoEXT structures in the pNext chain of the VkImageCreateInfo structure in a vkCreateImage command.

The VkImportMetalTextureInfoEXT structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkImportMetalTextureInfoEXT {
    VkStructureType           sType;
    const void*               pNext;
    VkImageAspectFlagBits     plane;
    MTLTexture_id             mtlTexture;
} VkImportMetalTextureInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **plane** indicates the plane of the VkImage that the id<MTLTexture> object should be attached to.
- **mtlTexture** is a a the Metal id<MTLTexture> object that is to underlie the VkImage plane.

The pNext chain must include one VkImportMetalTextureInfoEXT structure for each plane in the VkImage. The app must ensure that the configuration of the Metal id<MTLTexture> objects are compatible with the configuration of the VkImage. Failure to do so results in undefined behavior.

### Valid Usage (Implicit)

- VUID-VkImportMetalTextureInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMPORT_METAL_TEXTURE_INFO_EXT
- VUID-VkImportMetalTextureInfoEXT-plane-parameter
  plane must be a valid VkImageAspectFlagBits value

The type id<MTLTexture> is defined in Apple’s Metal framework, but to remove an unnecessary compile-time dependency, an incomplete type definition of MTLTexture_id is provided in the Vulkan headers:

```c
// Provided by VK_EXT_metal_objects
#ifdef __OBJC__
@protocol MTLTexture;
typedef id<MTLTexture> MTLTexture_id;
#else
typedef void* MTLTexture_id;
#endif
```
To export the Metal IOSurfaceRef object underlying a VkImage object, include a VkExportMetalIOSurfaceInfoEXT structure in the pNext chain of the pMetalObjectsInfo parameter of a vkExportMetalObjectsEXT call.

The VkExportMetalIOSurfaceInfoEXT structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalIOSurfaceInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    IOSurfaceRef ioSurface;
} VkExportMetalIOSurfaceInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **image** is a VkImage.
- **ioSurface** is the Metal IOSurfaceRef object underlying the VkImage object in image. The implementation will return the IOSurfaceRef in this member, or it will return NULL if no IOSurfaceRef could be found underlying the VkImage object.

Valid Usage (Implicit)

- VUID-VkExportMetalIOSurfaceInfoEXT-sType-sType
  - sType must be VK_STRUCTURE_TYPE_EXPORT_METAL_IO_SURFACE_INFO_EXT
- VUID-VkExportMetalIOSurfaceInfoEXT-image-parameter
  - image must be a valid VkImage handle

To import, or create, a Metal IOSurfaceRef object to underlie a VkImage object, include a VkImportMetalIOSurfaceInfoEXT structure in the pNext chain of the VkImageCreateInfo structure in a vkCreateImage command.

The VkImportMetalIOSurfaceInfoEXT structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkImportMetalIOSurfaceInfoEXT {
    VkStructureType sType;
    const void* pNext;
    IOSurfaceRef ioSurface;
} VkImportMetalIOSurfaceInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **ioSurface** is VK_NULL_HANDLE or the Metal IOSurfaceRef object that is to underlie the VkImage.
If `ioSurface` is not `VK_NULL_HANDLE`, it will be used to underlie the `VkImage`. If `ioSurface` is `VK_NULL_HANDLE`, the implementation will create a new `IOSurface` to underlie the `VkImage`.

If provided, the app must ensure that the configuration of the `IOSurfaceRef` object is compatible with the configuration of the `VkImage`. Failure to do so results in undefined behavior.

### Valid Usage (Implicit)

- VUID-VkImportMetalIOSurfaceInfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_IMPORT_METAL_IO_SURFACE_INFO_EXT`

The type `IOSurfaceRef` is defined in Apple’s CoreGraphics framework, but to remove an unnecessary compile-time dependency, an incomplete type definition of `IOSurfaceRef` is provided in the Vulkan headers:

```c
// Provided by VK_EXT_metal_objects
typedef struct __IOSurface* IOSurfaceRef;
```

To export the Metal `MTLSharedEvent` object underlying a `VkSemaphore` or `VkEvent` object, include a `VkExportMetalSharedEventInfoEXT` structure in the `pNext` chain of the `pMetalObjectsInfo` parameter of a `vkExportMetalObjectsEXT` call.

The `VkExportMetalSharedEventInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalSharedEventInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkEvent event;
    MTLSharedEvent_id mtlSharedEvent;
} VkExportMetalSharedEventInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is `VK_NULL_HANDLE` or a `VkSemaphore`.
- `event` is `VK_NULL_HANDLE` or a `VkEvent`.
- `mtlSharedEvent` is the Metal id<MTLSharedEvent> object underlying the `VkSemaphore` or `VkEvent` object in `semaphore` or `event`, respectively. The implementation will return the `MTLSharedEvent` in this member, or it will return `NULL` if no `MTLSharedEvent` could be found underlying the `VkSemaphore` or `VkEvent` object.
Valid Usage (Implicit)

- **VUID-VkExportMetalSharedEventInfoEXT-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_EXPORT_METAL_SHARED_EVENT_INFO_EXT`

- **VUID-VkExportMetalSharedEventInfoEXT-semaphore-parameter**
  
  If `semaphore` is not `VK_NULL_HANDLE`, `semaphore` must be a valid `VkSemaphore` handle

- **VUID-VkExportMetalSharedEventInfoEXT-event-parameter**
  
  If `event` is not `VK_NULL_HANDLE`, `event` must be a valid `VkEvent` handle

- **VUID-VkExportMetalSharedEventInfoEXT-commonparent**
  
  Both of `event`, and `semaphore` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

To import a Metal `MTLSharedEvent` object to underlie a `VkSemaphore` or `VkEvent` object, include a `VkImportMetalSharedEventInfoEXT` structure in the `pNext` chain of the `VkSemaphoreCreateInfo` or `VkEventCreateInfo` structure in a `vkCreateSemaphore` or `vkCreateEvent` command, respectively.

The `VkImportMetalSharedEventInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_metal_objects
typedef struct VkImportMetalSharedEventInfoEXT {
    VkStructureType sType;
    const void* pNext;
    MTLSharedEvent_id mtlSharedEvent;
} VkImportMetalSharedEventInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mtlSharedEvent` is the Metal `id<MTLSharedEvent>` object that is to underlie the `VkSemaphore` or `VkEvent`.

If the `pNext` chain of the `VkSemaphoreCreateInfo` structure includes both `VkImportMetalSharedEventInfoEXT` and `VkSemaphoreTypeCreateInfo`, the `signaledValue` property of the imported `MTLSharedEvent` object will be set to `initialValue` of `VkSemaphoreTypeCreateInfo`.

Valid Usage (Implicit)

- **VUID-VkImportMetalSharedEventInfoEXT-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_IMPORT_METAL_SHARED_EVENT_INFO_EXT`

The type `id<MTLSharedEvent>` is defined in Apple's Metal framework, but to remove an unnecessary compile-time dependency, an incomplete type definition of `MTLSharedEvent_id` is provided in the Vulkan headers:
11.2.11. Device Group Memory Allocations

If the `pNext` chain of `VkMemoryAllocateInfo` includes a `VkMemoryAllocateFlagsInfo` structure, then that structure includes flags and a device mask controlling how many instances of the memory will be allocated.

The `VkMemoryAllocateFlagsInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryAllocateFlagsInfo {
    VkStructureType sType;
    const void* pNext;
    VkMemoryAllocateFlags flags;
    uint32_t deviceMask;
} VkMemoryAllocateFlagsInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkMemoryAllocateFlagsInfo VkMemoryAllocateFlagsInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkMemoryAllocateFlagBits` controlling the allocation.
- `deviceMask` is a mask of physical devices in the logical device, indicating that memory must be allocated on each device in the mask, if `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set in `flags`.

If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is not set, the number of instances allocated depends on whether `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is set in the memory heap. If `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is set, then memory is allocated for every physical device in the logical device (as if `deviceMask` has bits set for all device indices). If `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is not set, then a single instance of memory is allocated (as if `deviceMask` is set to one).

On some implementations, allocations from a multi-instance heap may consume memory on all physical devices even if the `deviceMask` excludes some devices. If `VkPhysicalDeviceGroupProperties::subsetAllocation` is `VK_TRUE`, then memory is only consumed for
the devices in the device mask.

Note
In practice, most allocations on a multi-instance heap will be allocated across all physical devices. Unicast allocation support is an optional optimization for a minority of allocations.

Valid Usage

- VUID-VkMemoryAllocateFlagsInfo-deviceMask-00675
  If VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT is set, deviceMask must be a valid device mask

- VUID-VkMemoryAllocateFlagsInfo-deviceMask-00676
  If VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT is set, deviceMask must not be zero

Valid Usage (Implicit)

- VUID-VkMemoryAllocateFlagsInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_FLAGS_INFO

- VUID-VkMemoryAllocateFlagsInfo-flags-parameter
  flags must be a valid combination of VkMemoryAllocateFlagBits values

Bits which can be set in VkMemoryAllocateFlagsInfo::flags, controlling device memory allocation, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkMemoryAllocateFlagBits {
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT = 0x00000001,
    // Provided by VK_VERSION_1_2
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT = 0x00000002,
    // Provided by VK_VERSION_1_2
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000004,
    // Provided by VK_KHR_device_group
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT,
    // Provided by VK_KHR_buffer_device_address
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT,
    // Provided by VK_KHR_buffer_device_address
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT
} VkMemoryAllocateFlagBits;
```
or the equivalent

```c
// Provided by VK_KHR_device_group
```
typedef VkMemoryAllocateFlagBits VkMemoryAllocateFlagBitsKHR;

- VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT specifies that memory will be allocated for the devices in VkMemoryAllocateFlagsInfo::deviceMask.
- VK_MEMORY_ALLOCATEDEVICEADDRESS_BIT specifies that the memory can be attached to a buffer object created with the VK_BUFFERUSAGE_SHADERDEVICEADDRESS_BIT bit set in usage, and that the memory handle can be used to retrieve an opaque address via vkGetDeviceMemoryOpaqueCaptureAddress.
- VK_MEMORY_ALLOCATEDEVICEADDRESS_CAPTUREREPLAY_BIT specifies that the memory’s address can be saved and reused on a subsequent run (e.g. for trace capture and replay), see VkBufferOpaqueCaptureAddressCreateInfo for more detail.

// Provided by VK_VERSION_1_1
typedef VkFlags VkMemoryAllocateFlags;

or the equivalent

// Provided by VK_KHR_device_group
typedef VkMemoryAllocateFlags VkMemoryAllocateFlagsKHR;

VkMemoryAllocateFlags is a bitmask type for setting a mask of zero or more VkMemoryAllocateFlagBits.

### 11.2.12. Opaque Capture Address Allocation

To request a specific device address for a memory allocation, add a VkMemoryOpaqueCaptureAddressAllocateInfo structure to the pNext chain of the VkMemoryAllocateInfo structure. The VkMemoryOpaqueCaptureAddressAllocateInfo structure is defined as:

// Provided by VK_VERSION_1_2
typedef struct VkMemoryOpaqueCaptureAddressAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    uint64_t opaqueCaptureAddress;
} VkMemoryOpaqueCaptureAddressAllocateInfo;

or the equivalent

// Provided by VK_KHR_buffer_device_address
typedef VkMemoryOpaqueCaptureAddressAllocateInfo VkMemoryOpaqueCaptureAddressAllocateInfoKHR;

- sType is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **opaqueCaptureAddress** is the opaque capture address requested for the memory allocation.

If **opaqueCaptureAddress** is zero, no specific address is requested.

If **opaqueCaptureAddress** is not zero, it **should** be an address retrieved from `vkGetDeviceMemoryOpaqueCaptureAddress` on an identically created memory allocation on the same implementation.

**Note**

In most cases, it is expected that a non-zero **opaqueAddress** is an address retrieved from `vkGetDeviceMemoryOpaqueCaptureAddress` on an identically created memory allocation. If this is not the case, it is likely that **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS** errors will occur.

This is, however, not a strict requirement because trace capture/replay tools may need to adjust memory allocation parameters for imported memory.

If this structure is not present, it is as if **opaqueCaptureAddress** is zero.

---

**Valid Usage (Implicit)**

- **VUID-VkMemoryOpaqueCaptureAddressAllocateInfo-sType-sType**
  - **sType** must be `VK_STRUCTURE_TYPE_MEMORY_OPAQUE_CAPTURE_ADDRESS_ALLOCATE_INFO`

---

### 11.2.13. Freeing Device Memory

To free a memory object, call:

```c
// Provided by VK_VERSION_1_0
void vkFreeMemory(
    VkDevice device,
    VkDeviceMemory memory,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that owns the memory.
- **memory** is the **VkDeviceMemory** object to be freed.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

Before freeing a memory object, an application **must** ensure the memory object is no longer in use by the device — for example by command buffers in the **pending state**. Memory **can** be freed whilst still bound to resources, but those resources **must** not be used afterwards. Freeing a memory object releases the reference it held, if any, to its payload. If there are still any bound images or buffers, the memory object’s payload **may** not be immediately released by the implementation, but **must** be released by the time all bound images and buffers have been destroyed. Once all references to a payload are released, it is returned to the heap from which it was allocated.
How memory objects are bound to Images and Buffers is described in detail in the Resource Memory Association section.

If a memory object is mapped at the time it is freed, it is implicitly unmapped.

Note
As described below, host writes are not implicitly flushed when the memory object is unmapped, but the implementation must guarantee that writes that have not been flushed do not affect any other memory.

Valid Usage

- VUID-vkFreeMemory-memory-00677
  All submitted commands that refer to memory (via images or buffers) must have completed execution

Valid Usage (Implicit)

- VUID-vkFreeMemory-device-parameter
device must be a valid VkDevice handle
- VUID-vkFreeMemory-memory-parameter
  If memory is not VK_NULL_HANDLE, memory must be a valid VkDeviceMemory handle
- VUID-vkFreeMemory-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkFreeMemory-memory-parent
  If memory is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to memory must be externally synchronized

11.2.14. Host Access to Device Memory Objects

Memory objects created with vkAllocateMemory are not directly host accessible.

Memory objects created with the memory property VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT are considered mappable. Memory objects must be mappable in order to be successfully mapped on the host.

To retrieve a host virtual address pointer to a region of a mappable memory object, call:

// Provided by VK_VERSION_1_0
VkResult vkMapMemory(
    VkDevice device,
    VkDeviceMemory memory,
    VkDeviceSize offset,
    VkDeviceSize size,
    VkMemoryMapFlags flags,
    void** ppData);

- `device` is the logical device that owns the memory.
- `memory` is the VkDeviceMemory object to be mapped.
- `offset` is a zero-based byte offset from the beginning of the memory object.
- `size` is the size of the memory range to map, or VK_WHOLE_SIZE to map from offset to the end of the allocation.
- `flags` is reserved for future use.
- `ppData` is a pointer to a void* variable in which a host-accessible pointer to the beginning of the mapped range is returned. This pointer minus offset must be aligned to at least VkPhysicalDeviceLimits::minMemoryMapAlignment.

After a successful call to `vkMapMemory` the memory object `memory` is considered to be currently host mapped.

```
Note
It is an application error to call `vkMapMemory` on a memory object that is already host mapped.
```

```
Note
`vkMapMemory` will fail if the implementation is unable to allocate an appropriately sized contiguous virtual address range, e.g. due to virtual address space fragmentation or platform limits. In such cases, `vkMapMemory` must return VK_ERROR_MEMORY_MAP_FAILED. The application can improve the likelihood of success by reducing the size of the mapped range and/or removing unneeded mappings using `vkUnmapMemory`.
```

`vkMapMemory` does not check whether the device memory is currently in use before returning the host-accessible pointer. The application must guarantee that any previously submitted command that writes to this range has completed before the host reads from or writes to that range, and that any previously submitted command that reads from that range has completed before the host writes to that region (see here for details on fulfilling such a guarantee). If the device memory was allocated without the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT set, these guarantees must be made for an extended range: the application must round down the start of the range to the nearest multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize, and round the end of the range up to the nearest multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize.

While a range of device memory is host mapped, the application is responsible for synchronizing both device and host access to that memory range.
Note
It is important for the application developer to become meticulously familiar with all of the mechanisms described in the chapter on Synchronization and Cache Control as they are crucial to maintaining memory access ordering.

Valid Usage

- VUID-vkMapMemory-memory-00678
  memory must not be currently host mapped

- VUID-vkMapMemory-offset-00679
  offset must be less than the size of memory

- VUID-vkMapMemory-size-00680
  If size is not equal to VK_WHOLE_SIZE, size must be greater than 0

- VUID-vkMapMemory-size-00681
  If size is not equal to VK_WHOLE_SIZE, size must be less than or equal to the size of the memory minus offset

- VUID-vkMapMemory-memory-00682
  memory must have been created with a memory type that reports VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT

- VUID-vkMapMemory-memory-00683
  memory must not have been allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkMapMemory-device-parameter
  device must be a valid VkDevice handle

- VUID-vkMapMemory-memory-parameter
  memory must be a valid VkDeviceMemory handle

- VUID-vkMapMemory-flags-zerobitmask
  flags must be 0

- VUID-vkMapMemory-ppData-parameter
  ppData must be a valid pointer to a pointer value

- VUID-vkMapMemory-memory-parent
  memory must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to memory must be externally synchronized
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_MEMORY_MAP_FAILED

// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryMapFlags;

VkMemoryMapFlags is a bitmask type for setting a mask, but is currently reserved for future use.

Two commands are provided to enable applications to work with non-coherent memory allocations: vkFlushMappedMemoryRanges and vkInvalidateMappedMemoryRanges.

Note

If the memory object was created with the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT set, vkFlushMappedMemoryRanges and vkInvalidateMappedMemoryRanges are unnecessary and may have a performance cost. However, availability and visibility operations still need to be managed on the device. See the description of host access types for more information.

Note

While memory objects imported from a handle type of VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT are inherently mapped to host address space, they are not considered to be host mapped device memory unless they are explicitly host mapped using vkMapMemory. That means flushing or invalidating host caches with respect to host accesses performed on such memory through the original host pointer specified at import time is the responsibility of the application and must be performed with appropriate synchronization primitives provided by the platform which are outside the scope of Vulkan. vkFlushMappedMemoryRanges and vkInvalidateMappedMemoryRanges, however, can still be used on such memory objects to synchronize host accesses performed through the host pointer of the host mapped device memory range returned by vkMapMemory.

To flush ranges of non-coherent memory from the host caches, call:

// Provided by VK_VERSION_1_0
VkResult vkFlushMappedMemoryRanges(

VkDevice
device,
uint32_t
memoryRangeCount,
const VkMappedMemoryRange*
pMemoryRanges);

• device is the logical device that owns the memory ranges.
• memoryRangeCount is the length of the pMemoryRanges array.
• pMemoryRanges is a pointer to an array of VkMappedMemoryRange structures describing the memory ranges to flush.

vkFlushMappedMemoryRanges guarantees that host writes to the memory ranges described by pMemoryRanges are made available to the host memory domain, such that they can be made available to the device memory domain via memory domain operations using the VK_ACCESS_HOST_WRITE_BIT access type.

Within each range described by pMemoryRanges, each set of nonCoherentAtomSize bytes in that range is flushed if any byte in that set has been written by the host since it was first host mapped, or the last time it was flushed. If pMemoryRanges includes sets of nonCoherentAtomSize bytes where no bytes have been written by the host, those bytes must not be flushed.

Unmapping non-coherent memory does not implicitly flush the host mapped memory, and host writes that have not been flushed may not ever be visible to the device. However, implementations must ensure that writes that have not been flushed do not become visible to any other memory.

Note
The above guarantee avoids a potential memory corruption in scenarios where host writes to a mapped memory object have not been flushed before the memory is unmapped (or freed), and the virtual address range is subsequently reused for a different mapping (or memory allocation).

Valid Usage (Implicit)
• VUID-vkFlushMappedMemoryRanges-device-parameter
device must be a valid VkDevice handle
• VUID-vkFlushMappedMemoryRanges-pMemoryRanges-parameter
  pMemoryRanges must be a valid pointer to an array of memoryRangeCount valid VkMappedMemoryRange structures
• VUID-vkFlushMappedMemoryRanges-memoryRangeCount-arraylength
  memoryRangeCount must be greater than 0

Return Codes
Success
• VK_SUCCESS
To invalidate ranges of non-coherent memory from the host caches, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkInvalidateMappedMemoryRanges(
    VkDevice device,
    uint32_t memoryRangeCount,
    const VkMappedMemoryRange* pMemoryRanges);
```

- `device` is the logical device that owns the memory ranges.
- `memoryRangeCount` is the length of the `pMemoryRanges` array.
- `pMemoryRanges` is a pointer to an array of `VkMappedMemoryRange` structures describing the memory ranges to invalidate.

`vkInvalidateMappedMemoryRanges` guarantees that device writes to the memory ranges described by `pMemoryRanges`, which have been made available to the host memory domain using the `VK_ACCESS_HOST_WRITE_BIT` and `VK_ACCESS_HOST_READ_BIT` access types, are made visible to the host. If a range of non-coherent memory is written by the host and then invalidated without first being flushed, its contents are undefined.

Within each range described by `pMemoryRanges`, each set of `nonCoherentAtomSize` bytes in that range is invalidated if any byte in that set has been written by the device since it was first host mapped, or the last time it was invalidated.

**Note**

Mapping non-coherent memory does not implicitly invalidate that memory.

### Valid Usage (Implicit)

- VUID-vkInvalidateMappedMemoryRanges-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkInvalidateMappedMemoryRanges-pMemoryRanges-parameter
  - `pMemoryRanges` must be a valid pointer to an array of `memoryRangeCount` valid `VkMappedMemoryRange` structures
- VUID-vkInvalidateMappedMemoryRanges-memoryRangeCount-arraylength
  - `memoryRangeCount` must be greater than 0
### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OFDEVICE_MEMORY

The `VkMappedMemoryRange` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMappedMemoryRange {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkMappedMemoryRange;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `memory` is the memory object to which this range belongs.
- `offset` is the zero-based byte offset from the beginning of the memory object.
- `size` is either the size of range, or VK_WHOLE_SIZE to affect the range from `offset` to the end of the current mapping of the allocation.

### Valid Usage

- VUID-VkMappedMemoryRange-memory-00684
  memory must be currently host mapped

- VUID-VkMappedMemoryRange-size-00685
  If size is not equal to VK_WHOLE_SIZE, offset and size must specify a range contained within the currently mapped range of memory

- VUID-VkMappedMemoryRange-size-00686
  If size is equal to VK_WHOLE_SIZE, offset must be within the currently mapped range of memory

- VUID-VkMappedMemoryRange-offset-00687
  offset must be a multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize

- VUID-VkMappedMemoryRange-size-01389
  If size is equal to VK_WHOLE_SIZE, the end of the current mapping of memory must either be a multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize bytes from the beginning of the memory object, or be equal to the end of the memory object
If `size` is not equal to `VK_WHOLE_SIZE`, `size` must either be a multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize`, or `offset` plus `size` must equal the size of `memory`.

**Valid Usage (Implicit)**

- VUID-VkMappedMemoryRange-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE`

- VUID-VkMappedMemoryRange-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkMappedMemoryRange-memory-parameter
  `memory` must be a valid `VkDeviceMemory` handle

To unmap a memory object once host access to it is no longer needed by the application, call:

```c
// Provided by VK_VERSION_1_0
void vkUnmapMemory(
    VkDevice device,  // device is the logical device that owns the memory.
    VkDeviceMemory memory);  // memory is the memory object to be unmapped.
```

**Valid Usage**

- VUID-vkUnmapMemory-memory-00689
  `memory` must be currently host mapped

**Valid Usage (Implicit)**

- VUID-vkUnmapMemory-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkUnmapMemory-memory-parameter
  `memory` must be a valid `VkDeviceMemory` handle

- VUID-vkUnmapMemory-memory-parent
  `memory` must have been created, allocated, or retrieved from `device`

**Host Synchronization**

- Host access to `memory` must be externally synchronized
11.2.15. Lazily Allocated Memory

If the memory object is allocated from a heap with the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set, that object’s backing memory may be provided by the implementation lazily. The actual committed size of the memory may initially be as small as zero (or as large as the requested size), and monotonically increases as additional memory is needed.

A memory type with this flag set is only allowed to be bound to a `VkImage` whose usage flags include `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`.

Note

Using lazily allocated memory objects for framebuffer attachments that are not needed once a render pass instance has completed may allow some implementations to never allocate memory for such attachments.

To determine the amount of lazily-allocated memory that is currently committed for a memory object, call:

```c
// Provided by VK_VERSION_1_0
void vkGetDeviceMemoryCommitment(
    VkDevice device,
    VkDeviceMemory memory,
    VkDeviceSize* pCommittedMemoryInBytes);
```

- `device` is the logical device that owns the memory.
- `memory` is the memory object being queried.
- `pCommittedMemoryInBytes` is a pointer to a `VkDeviceSize` value in which the number of bytes currently committed is returned, on success.

The implementation may update the commitment at any time, and the value returned by this query may be out of date.

The implementation guarantees to allocate any committed memory from the `heapIndex` indicated by the memory type that the memory object was created with.

### Valid Usage

- VUID-vkGetDeviceMemoryCommitment-memory-00690
  `memory` must have been created with a memory type that reports `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT`

### Valid Usage (Implicit)

- VUID-vkGetDeviceMemoryCommitment-device-parameter
  `device` must be a valid `VkDevice` handle
11.2.16. Protected Memory

Protected memory divides device memory into protected device memory and unprotected device memory.

Protected memory adds the following concepts:

- Memory:
  - Unprotected device memory, which can be visible to the device and can be visible to the host
  - Protected device memory, which can be visible to the device but must not be visible to the host
- Resources:
  - Unprotected images and unprotected buffers, to which unprotected memory can be bound
  - Protected images and protected buffers, to which protected memory can be bound
- Command buffers:
  - Unprotected command buffers, which can be submitted to a device queue to execute unprotected queue operations
  - Protected command buffers, which can be submitted to a protected-capable device queue to execute protected queue operations
- Device queues:
  - Unprotected device queues, to which unprotected command buffers can be submitted
  - Protected-capable device queues, to which unprotected command buffers or protected command buffers can be submitted
- Queue submissions
  - Unprotected queue submissions, through which unprotected command buffers can be submitted
  - Protected queue submissions, through which protected command buffers can be submitted
- Queue operations
  - Unprotected queue operations
  - Protected queue operations

Note
When the protectedMemory feature is enabled, all pipelines may be recorded in either protected or unprotected command buffers (or both), which may incur an extra cost on some implementations. This can be mitigated by enabling the pipelineProtectedAccess feature, in which case pipelines created with VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT may only be recorded in protected command buffers, and pipelines created with VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT may only be recorded in unprotected command buffers.

Protected Memory Access Rules

If VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault is VK_FALSE, applications must not perform any of the following operations:

- Write to unprotected memory within protected queue operations.
- Access protected memory within protected queue operations other than in framebuffer-space pipeline stages, the compute shader stage, or the transfer stage.
- Perform a query within protected queue operations.

If VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault is VK_TRUE, these operations are valid, but reads will return undefined values, and writes will either be dropped or store undefined values.

Additionally, indirect operations must not be performed within protected queue operations.

Whether these operations are valid or not, or if any other invalid usage is performed, the implementation must guarantee that:

- Protected device memory must never be visible to the host.
- Values written to unprotected device memory must not be a function of values from protected memory.

11.2.17. External Memory Handle Types

Android Hardware Buffer

Android’s NDK defines AHardwareBuffer objects, which represent device memory that is shareable across processes and that can be accessed by a variety of media APIs and the hardware used to implement them. These Android hardware buffer objects may be imported into VkDeviceMemory objects for access via Vulkan, or exported from Vulkan. An VkImage or VkBuffer can be bound to the imported or exported VkDeviceMemory object if it is created with VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID.

To remove an unnecessary compile-time dependency, an incomplete type definition of AHardwareBuffer is provided in the Vulkan headers:

// Provided by VK_ANDROID_external_memory_android_hardware_buffer
The actual `AHardwareBuffer` type is defined in Android NDK headers.

**Note**
The NDK format, usage, and size(dimensions) of an `AHardwareBuffer` object can be obtained with the `AHardwareBuffer_describe` function. While Android hardware buffers can be imported to or exported from Vulkan without using that function, valid usage and implementation behavior is defined in terms of the `AHardwareBuffer_Desc` properties it returns.

Android hardware buffer objects are reference-counted using Android NDK functions outside of the scope of this specification. A `VkDeviceMemory` imported from an Android hardware buffer or that can be exported to an Android hardware buffer must acquire a reference to its `AHardwareBuffer` object, and must release this reference when the device memory is freed. During the host execution of a Vulkan command that has an Android hardware buffer as a parameter (including indirect parameters via `pNext` chains), the application must not decrement the Android hardware buffer's reference count to zero.

Android hardware buffers can be mapped and unmapped for CPU access using the NDK functions. These lock and unlock APIs are considered to acquire and release ownership of the Android hardware buffer, and applications must follow the rules described in External Resource Sharing to transfer ownership between the Vulkan instance and these native APIs.

Android hardware buffers can be shared with external APIs and Vulkan instances on the same device, and also with foreign devices. When transferring ownership of the Android hardware buffer, the external and foreign special queue families described in Queue Family Ownership Transfer are not identical. All APIs which produce or consume Android hardware buffers are considered to use foreign devices, except OpenGL ES contexts and Vulkan logical devices that have matching device and driver UUIDs. Implementations may treat a transfer to or from the foreign queue family as if it were a transfer to or from the external queue family when the Android hardware buffer's usage only permits it to be used on the same physical device.

**Android Hardware Buffer Optimal Usages**

Vulkan buffer and image usage flags do not correspond exactly to Android hardware buffer usage flags. When allocating Android hardware buffers with non-Vulkan APIs, if any `AHARDWAREBUFFER_USAGE_GPU_*` usage bits are included, by default the allocator must allocate the memory in such a way that it supports Vulkan usages and creation flags in the usage equivalence table which do not have Android hardware buffer equivalents.

An `VkAndroidHardwareBufferUsageANDROID` structure can be included in the `pNext` chain of a `VkImageFormatProperties2` structure passed to `vkGetPhysicalDeviceImageFormatProperties2` to obtain optimal Android hardware buffer usage flags for specific Vulkan resource creation parameters. Some usage flags returned by these commands are required based on the input parameters, but additional vendor-specific usage flags (`AHARDWAREBUFFER_USAGE_VENDOR_*) may also be returned. Any Android hardware buffer allocated with these vendor-specific usage flags and imported to Vulkan must only be bound to resources created with parameters that are a subset of
the parameters used to obtain the Android hardware buffer usage, since the memory may have been allocated in a way incompatible with other parameters. If an Android hardware buffer is successfully allocated with additional non-vendor-specific usage flags in addition to the recommended usage, it must support being used in the same ways as an Android hardware buffer allocated with only the recommended usage, and also in ways indicated by the additional usage.

Android Hardware Buffer External Formats

Android hardware buffers may represent images using implementation-specific formats, layouts, color models, etc., which do not have Vulkan equivalents. Such external formats are commonly used by external image sources such as video decoders or cameras. Vulkan can import Android hardware buffers that have external formats, but since the image contents are in an undiscoverable and possibly proprietary representation, images with external formats must only be used as sampled images, must only be sampled with a sampler that has Y’CbCr conversion enabled, and must have optimal tiling.

Images that will be backed by an Android hardware buffer can use an external format by setting VkImageCreateInfo::format to VK_FORMAT_UNDEFINED and including a VkExternalFormatANDROID structure in the pNext chain. Images can be created with an external format even if the Android hardware buffer has a format which has an equivalent Vulkan format to enable consistent handling of images from sources that might use either category of format. However, all images created with an external format are subject to the valid usage requirements associated with external formats, even if the Android hardware buffer's format has a Vulkan equivalent. The external format of an Android hardware buffer can be obtained by passing a VkAndroidHardwareBufferFormatPropertiesANDROID structure to vkGetAndroidHardwareBufferPropertiesANDROID.

Android Hardware Buffer Image Resources

Android hardware buffers have intrinsic width, height, format, and usage properties, so Vulkan images bound to memory imported from an Android hardware buffer must use dedicated allocations: VkMemoryDedicatedRequirements::requiresDedicatedAllocation must be VK_TRUE for images created with VkExternalMemoryImageCreateInfo::handleTypes that includes VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID. When creating an image that will be bound to an imported Android hardware buffer, the image creation parameters must be equivalent to the AHardwareBuffer properties as described by the valid usage of VkMemoryAllocateInfo. Similarly, device memory allocated for a dedicated image must not be exported to an Android hardware buffer until it has been bound to that image, and the implementation must return an Android hardware buffer with properties derived from the image:

- The width and height members of AHardwareBuffer_Desc must be the same as the width and height members of VkImageCreateInfo::extent, respectively.
- The layers member of AHardwareBuffer_Desc must be the same as the arrayLayers member of VkImageCreateInfo.
- The format member of AHardwareBuffer_Desc must be equivalent to VkImageCreateInfo::format as defined by AHardwareBuffer Format Equivalence.
- The usage member of AHardwareBuffer_Desc must include bits corresponding to bits included in VkImageCreateInfo::usage and VkImageCreateInfo::flags where such a correspondence exists.
according to AHardwareBuffer Usage Equivalence. It may also include additional usage bits, including vendor-specific usages. Presence of vendor usage bits may make the Android hardware buffer only usable in ways indicated by the image creation parameters, even when used outside Vulkan, in a similar way that allocating the Android hardware buffer with usage returned in VkAndroidHardwareBufferUsageANDROID does.

Implementations may support fewer combinations of image creation parameters for images with Android hardware buffer external handle type than for non-external images. Support for a given set of parameters can be determined by passing VkExternalImageFormatProperties to vkGetPhysicalDeviceImageFormatProperties2 with handleType set to VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID. Any Android hardware buffer successfully allocated outside Vulkan with usage that includes AHWAREBUFFER_USAGE_GPU_* must be supported when using equivalent Vulkan image parameters. If a given choice of image parameters are supported for import, they can also be used to create an image and memory that will be exported to an Android hardware buffer.

1. Vulkan does not differentiate between `AHARDWAREBUFFER_FORMAT_R8G8B8A8_UNORM` and `AHARDWAREBUFFER_FORMAT_R8G8B8X8_UNORM`: they both behave as `VK_FORMAT_R8G8B8A8_UNORM`. After an external entity writes to a `AHARDWAREBUFFER_FORMAT_R8G8B8X8_UNORM` Android hardware buffer, the values read by Vulkan from the X/A component are undefined. To emulate the traditional behavior of the X component during sampling or blending, applications should use `VK_COMPONENT_SWIZZLE_ONE` in image view component mappings and `VK_BLEND_FACTOR_ONE` in color blend factors. There is no way to avoid copying these undefined values when copying from such an image to another image or buffer.

2. The `AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE` flag does not correspond to a Vulkan image usage or creation flag. Instead, its presence indicates that the Android hardware buffer contains a complete mipmap chain, and its absence indicates that the Android hardware buffer contains only a single mip level.

3. Only image usages valid for the format are valid. It would be invalid to take a Android Hardware Buffer with a format of `AHARDWAREBUFFER_FORMAT_R8G8B8A8_UNORM` that has a `AHARDWAREBUFFER_USAGE_GPU_FRAMEBUFFER` usage and try to create an image with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

4. In combination with a hardware buffer format other than `BLOB`.

**Note**

When using `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` with Android hardware buffer images, applications should use `VkImageFormatListCreateInfo` to inform the implementation which view formats will be used with the image. For some common sets of format, this allows some implementations to provide significantly better performance when accessing the image via Vulkan.

### Android Hardware Buffer Buffer Resources

Android hardware buffers with a format of `AHARDWAREBUFFER_FORMAT_BLOB` and usage that includes `AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER` can be used as the backing store for `VkBuffer` objects. Such Android hardware buffers have a size in bytes specified by their `width`; `height` and `layers` are both 1.

Unlike images, buffer resources backed by Android hardware buffers do not require dedicated allocations.

Exported `AHardwareBuffer` objects that do not have dedicated images must have a format of
AHARDWAREBUFFER_FORMAT_BLOB, usage must include AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER, width must equal the device memory allocation size, and height and layers must be 1.

11.2.18. Peer Memory Features

Peer memory is memory that is allocated for a given physical device and then bound to a resource and accessed by a different physical device, in a logical device that represents multiple physical devices. Some ways of reading and writing peer memory may not be supported by a device.

To determine how peer memory can be accessed, call:

```c
// Provided by VK_VERSION_1_1
void vkGetDeviceGroupPeerMemoryFeatures(
    VkDevice device,
    uint32_t heapIndex,
    uint32_t localDeviceIndex,
    uint32_t remoteDeviceIndex,
    VkPeerMemoryFeatureFlags* pPeerMemoryFeatures);
```

or the equivalent command

```c
// Provided by VK_KHR_device_group
void vkGetDeviceGroupPeerMemoryFeaturesKHR(
    VkDevice device,
    uint32_t heapIndex,
    uint32_t localDeviceIndex,
    uint32_t remoteDeviceIndex,
    VkPeerMemoryFeatureFlags* pPeerMemoryFeatures);
```

- **device** is the logical device that owns the memory.
- **heapIndex** is the index of the memory heap from which the memory is allocated.
- **localDeviceIndex** is the device index of the physical device that performs the memory access.
- **remoteDeviceIndex** is the device index of the physical device that the memory is allocated for.
- **pPeerMemoryFeatures** is a pointer to a VkPeerMemoryFeatureFlags bitmask indicating which types of memory accesses are supported for the combination of heap, local, and remote devices.

### Valid Usage

- VUID-vkGetDeviceGroupPeerMemoryFeatures-heapIndex-00691
  heapIndex must be less than memoryHeapCount
- VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00692
  localDeviceIndex must be a valid device index
- VUID-vkGetDeviceGroupPeerMemoryFeatures-remoteDeviceIndex-00693
  remoteDeviceIndex must be a valid device index
• VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00694
  localDeviceIndex must not equal remoteDeviceIndex

### Valid Usage (Implicit)

- VUID-vkGetDeviceGroupPeerMemoryFeatures-device-parameter
  device must be a valid VkDevice handle
- VUID-vkGetDeviceGroupPeerMemoryFeatures-pPeerMemoryFeatures-parameter
  pPeerMemoryFeatures must be a valid pointer to a VkPeerMemoryFeatureFlags value

Bits which may be set in vkGetDeviceGroupPeerMemoryFeatures::pPeerMemoryFeatures, indicating supported peer memory features, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkPeerMemoryFeatureFlagBits {
    VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT = 0x00000001,
    VK_PEER_MEMORY_FEATURE_COPY_DST_BIT = 0x00000002,
    VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT = 0x00000004,
    VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT = 0x00000008,
} VkPeerMemoryFeatureFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkPeerMemoryFeatureFlagBits VkPeerMemoryFeatureFlagBits_KHR;
```

- **VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT** specifies that the memory can be accessed as the source of any vkCmdCopy* command.
- **VK_PEER_MEMORY_FEATURE_COPY_DST_BIT** specifies that the memory can be accessed as the destination of any vkCmdCopy* command.
- **VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT** specifies that the memory can be read as any memory access type.
- **VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT** specifies that the memory can be written as any memory access type. Shader atomics are considered to be writes.
Note

The peer memory features of a memory heap also apply to any accesses that may be performed during image layout transitions.

**VK_PEER_MEMORY_FEATURE_COPY_DST_BIT** must be supported for all host local heaps and for at least one device-local memory heap.

If a device does not support a peer memory feature, it is still valid to use a resource that includes both local and peer memory bindings with the corresponding access type as long as only the local bindings are actually accessed. For example, an application doing split-frame rendering would use framebuffer attachments that include both local and peer memory bindings, but would scissor the rendering to only update local memory.

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkPeerMemoryFeatureFlags;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkPeerMemoryFeatureFlags VkPeerMemoryFeatureFlagsKHR;
```

`VkPeerMemoryFeatureFlags` is a bitmask type for setting a mask of zero or more `VkPeerMemoryFeatureFlagBits`.

### 11.2.19. Opaque Capture Address Query

To query a 64-bit opaque capture address value from a memory object, call:

```c
// Provided by VK_VERSION_1_2
uint64_t vkGetDeviceMemoryOpaqueCaptureAddress(
    VkDevice device,
    const VkDeviceMemoryOpaqueCaptureAddressInfo* pInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_buffer_device_address
uint64_t vkGetDeviceMemoryOpaqueCaptureAddressKHR(
    VkDevice device,
    const VkDeviceMemoryOpaqueCaptureAddressInfo* pInfo);
```

- `device` is the logical device that the memory object was allocated on.
- `pInfo` is a pointer to a `VkDeviceMemoryOpaqueCaptureAddressInfo` structure specifying the memory object to retrieve an address for.
The 64-bit return value is an opaque address representing the start of pInfo->memory.

If the memory object was allocated with a non-zero value of VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress, the return value must be the same address.

Note

The expected usage for these opaque addresses is only for trace capture/replay tools to store these addresses in a trace and subsequently specify them during replay.

Valid Usage

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-None-03334
  The bufferDeviceAddress feature must be enabled

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-device-03335
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled

Valid Usage (Implicit)

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-pInfo-parameter
  pInfo must be a valid pointer to a valid VkDeviceMemoryOpaqueCaptureAddressInfo structure

The VkDeviceMemoryOpaqueCaptureAddressInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkDeviceMemoryOpaqueCaptureAddressInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
} VkDeviceMemoryOpaqueCaptureAddressInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkDeviceMemoryOpaqueCaptureAddressInfo
    VkDeviceMemoryOpaqueCaptureAddressInfoKHR;
```

- sType is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `memory` specifies the memory whose address is being queried.

### Valid Usage

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-03336
  
  `memory` must have been allocated with `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT`

### Valid Usage (Implicit)

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_MEMORY_OPAQUE_CAPTURE_ADDRESS_INFO`

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-parameter
  
  `memory` must be a valid `VkDeviceMemory` handle
Chapter 12. Resource Creation

Vulkan supports two primary resource types: buffers and images. Resources are views of memory with associated formatting and dimensionality. Buffers provide access to raw arrays of bytes, whereas images can be multidimensional and may have associated metadata.

12.1. Buffers

Buffers represent linear arrays of data which are used for various purposes by binding them to a graphics or compute pipeline via descriptor sets or via certain commands, or by directly specifying them as parameters to certain commands.

Buffers are represented by VkBuffer handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBuffer)
```

To create buffers, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkCreateBuffer(
    VkDevice device,              // device
    const VkBufferCreateInfo* pCreateInfo, // pCreateInfo
    const VkAllocationCallbacks* pAllocator, // pAllocator
    VkBuffer* pBuffer); // pBuffer
```

- device is the logical device that creates the buffer object.
- pCreateInfo is a pointer to a VkBufferCreateInfo structure containing parameters affecting creation of the buffer.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pBuffer is a pointer to a VkBuffer handle in which the resulting buffer object is returned.

Valid Usage

- VUID-vkCreateBuffer-flags-00911
  If the flags member of pCreateInfo includes VK_BUFFER_CREATE_SPARSE_BINDING_BIT, creating this VkBuffer must not cause the total required sparse memory for all currently valid sparse resources on the device to exceed VkPhysicalDeviceLimits::sparseAddressSpaceSize

- VUID-vkCreateBuffer-pNext-06387
  If using the VkBuffer for an import operation from a VkBufferCollectionFUCHSIA where a VkBufferCollectionBufferCreateInfoFUCHSIA has been chained to pNext, pCreateInfo must match the VkBufferConstraintsInfoFUCHSIA::createInfo used when setting the constraints on the buffer collection with vkSetBufferCollectionBufferConstraintsFUCHSIA
Valid Usage (Implicit)

- **VUID-vkCreateBuffer-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkCreateBuffer-pCreateInfo-parameter**
  
  `pCreateInfo` must be a valid pointer to a valid `VkBufferCreateInfo` structure

- **VUID-vkCreateBuffer-pAllocator-parameter**
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateBuffer-pBuffer-parameter**
  
  `pBuffer` must be a valid pointer to a `VkBuffer` handle

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`

The `VkBufferCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkBufferCreateFlags flags;
    VkDeviceSize size;
    VkBufferUsageFlags usage;
    VkSharingMode sharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
} VkBufferCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkBufferCreateFlagBits` specifying additional parameters of the buffer.
- `size` is the size in bytes of the buffer to be created.
- `usage` is a bitmask of `VkBufferUsageFlagBits` specifying allowed usages of the buffer.
- `sharingMode` is a `VkSharingMode` value specifying the sharing mode of the buffer when it will be...
accessed by multiple queue families.

- `queueFamilyIndexCount` is the number of entries in the `pQueueFamilyIndices` array.
- `pQueueFamilyIndices` is a pointer to an array of queue families that will access this buffer. It is ignored if `sharingMode` is not `VK_SHARING_MODE_CONCURRENT`.

### Valid Usage

- VUID-VkBufferCreateInfo-size-00912
  - `size` must be greater than 0

- VUID-VkBufferCreateInfo-sharingMode-00913
  - If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `pQueueFamilyIndices` must be a valid pointer to an array of `queueFamilyIndexCount` uint32_t values

- VUID-VkBufferCreateInfo-sharingMode-00914
  - If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `queueFamilyIndexCount` must be greater than 1

- VUID-VkBufferCreateInfo-sharingMode-01419
  - If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` must be unique and must be less than `pQueueFamilyPropertyCount` returned by either `vkGetPhysicalDeviceQueueFamilyProperties` or `vkGetPhysicalDeviceQueueFamilyProperties2` for the `physicalDevice` that was used to create `device`

- VUID-VkBufferCreateInfo-flags-00915
  - If the `sparseBinding` feature is not enabled, `flags` must not contain `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`

- VUID-VkBufferCreateInfo-flags-00916
  - If the `sparseResidencyBuffer` feature is not enabled, `flags` must not contain `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`

- VUID-VkBufferCreateInfo-flags-00917
  - If the `sparseResidencyAliased` feature is not enabled, `flags` must not contain `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT`

- VUID-VkBufferCreateInfo-flags-00918
  - If `flags` contains `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` or `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT`, it must also contain `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`

- VUID-VkBufferCreateInfo-pNext-00920
  - If the `pNext` chain includes a `VkExternalMemoryBufferCreateInfo` structure, its `handleTypes` member must only contain bits that are also in `VkExternalBufferProperties::externalMemoryProperties.compatibleHandleTypes`, as returned by `vkGetPhysicalDeviceExternalBufferProperties` with `pExternalBufferInfo->handleType` equal to any one of the handle types specified in `VkExternalMemoryBufferCreateInfo::handleTypes`

- VUID-VkBufferCreateInfo-flags-01887
  - If the `protectedMemory` feature is not enabled, `flags` must not contain
VK_BUFFER_CREATE_PROTECTED_BIT

- **VUID-VkBufferCreateInfo-None-01888**
  If any of the bits VK_BUFFER_CREATE_SPARSE_BINDING_BIT, VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT, or VK_BUFFER_CREATE_SPARSE_ALIASED_BIT are set, VK_BUFFER_CREATE_PROTECTED_BIT must not also be set.

- **VUID-VkBufferCreateInfo-pNext-01571**
  If the pNext chain includes a VkDedicatedAllocationBufferCreateInfoNV structure, and the dedicatedAllocation member of the chained structure is VK_TRUE, then flags must not include VK_BUFFER_CREATE_SPARSE_BINDING_BIT, VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT, or VK_BUFFER_CREATE_SPARSE_ALIASED_BIT.

- **VUID-VkBufferCreateInfo-deviceAddress-02604**
  If VkBufferDeviceAddressCreateInfoEXT::deviceAddress is not zero, flags must include VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT.

- **VUID-VkBufferCreateInfo-opaqueCaptureAddress-03337**
  If VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress is not zero, flags must include VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT.

- **VUID-VkBufferCreateInfo-flags-03338**
  If flags includes VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, the bufferDeviceAddressCaptureReplay or bufferDeviceAddressCaptureReplayEXT feature must be enabled.

- **VUID-VkBufferCreateInfo-usage-04813**
  If usage includes VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR, VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR, then the pNext chain must include a valid VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles including at least one VkVideoProfileInfoKHR::videoCodecOperation specifying a decode operation.

- **VUID-VkBufferCreateInfo-usage-04814**
  If usage includes VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR, then the pNext chain must include a valid VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles including at least one VkVideoProfileInfoKHR::videoCodecOperation specifying an encode operation.

- **VUID-VkBufferCreateInfo-size-06409**
  size must be less than or equal to VkPhysicalDeviceMaintenance4Properties::maxBufferSize.

---

**Valid Usage (Implicit)**

- **VUID-VkBufferCreateInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO.

- **VUID-VkBufferCreateInfo-pNext-pNext**
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkBufferCollectionBufferCreateInfoFUCHSIA.
VkBufferDeviceAddressCreateInfoEXT, VkBufferOpaqueCaptureAddressCreateInfo, VkDedicatedAllocationBufferCreateInfoNV, VkExternalMemoryBufferCreateInfo, or VkVideoProfileListInfoKHR

- VUID-VkBufferCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkBufferCreateInfo-flags-parameter
  flags must be a valid combination of VkBufferCreateFlagBits values

- VUID-VkBufferCreateInfo-usage-parameter
  usage must be a valid combination of VkBufferUsageFlagBits values

- VUID-VkBufferCreateInfo-usage-requiredbitmask
  usage must not be 0

- VUID-VkBufferCreateInfo-sharingMode-parameter
  sharingMode must be a valid VkSharingMode value

Bits which can be set in VkBufferCreateInfo::usage, specifying usage behavior of a buffer, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBufferUsageFlagBits {
    VK_BUFFER_USAGE_TRANSFER_SRC_BIT = 0x00000001,
    VK_BUFFER_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT = 0x00000004,
    VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT = 0x00000008,
    VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT = 0x00000010,
    VK_BUFFER_USAGE_STORAGE_BUFFER_BIT = 0x00000020,
    VK_BUFFER_USAGE_INDEX_BUFFER_BIT = 0x00000040,
    VK_BUFFER_USAGE_VERTEX_BUFFER_BIT = 0x00000080,
    VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT = 0x00000100,
    // Provided by VK_VERSION_1_2
    VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT = 0x00020000,
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_decode_queue
    VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR = 0x00002000,
#endif
#endif
    // Provided by VK_KHR_video_decode_queue
    VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR = 0x00004000,
#ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_decode_queue
    VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR = 0x00004000,
#endif
    // Provided by VK_EXT_transform_feedback
    VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT = 0x00000000,
    // Provided by VK_EXT_transform_feedback
    VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT = 0x00000100,
    // Provided by VK_KHR_acceleration_structure
    VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR = 0x00080000,
    // Provided by VK_KHR_acceleration_structure
    VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR = 0x00100000,
    // Provided by VK_KHR_acceleration_structure
    VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR = 0x00100000,
```
- **VK_BUFFER_USAGE_TRANSFER_SRC_BIT** specifies that the buffer can be used as the source of a transfer command (see the definition of VK_PIPELINE_STAGE_TRANSFER_BIT).

- **VK_BUFFER_USAGE_TRANSFER_DST_BIT** specifies that the buffer can be used as the destination of a transfer command.

- **VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT** specifies that the buffer can be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER.

- **VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT** specifies that the buffer can be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER.

- **VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT** specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC.

- **VK_BUFFER_USAGE_STORAGE_BUFFER_BIT** specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC.

- **VK_BUFFER_USAGE_INDEX_BUFFER_BIT** specifies that the buffer is suitable for passing as the buffer parameter to vkCmdBindIndexBuffer.

- **VK_BUFFER_USAGE_VERTEX_BUFFER_BIT** specifies that the buffer is suitable for passing as an element of the pBuffers array to vkCmdBindVertexBuffers.

- **VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT** specifies that the buffer is suitable for passing as the buffer parameter to vkCmdDrawIndirect, vkCmdDrawIndexedIndirect,
vkCmdDrawMeshTasksIndirectNV, vkCmdDrawMeshTasksIndirectCountNV, vkCmdDrawMeshTasksIndirectEXT, vkCmdDrawMeshTasksIndirectCountEXT, or vkCmdDispatchIndirect. It is also suitable for passing as the buffer member of VkIndirectCommandsStreamNV, or sequencesCountBuffer or sequencesIndexBuffer or preprocessedBuffer member of VkGeneratedCommandsInfoNV

• VK_BUFFER_USAGE_CONDITIONAL_RENDERING_BIT_EXT specifies that the buffer is suitable for passing as the buffer parameter to vkCmdBeginConditionalRenderingEXT.

• VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT specifies that the buffer is suitable for using for binding as a transform feedback buffer with vkCmdBindTransformFeedbackBuffersEXT.

• VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT specifies that the buffer is suitable for using as a counter buffer with vkCmdBeginTransformFeedbackEXT and vkCmdEndTransformFeedbackEXT.

• VK_BUFFER_USAGE_RAY_TRACING_BIT_NV specifies that the buffer is suitable for use in vkCmdTraceRaysNV.

• VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR specifies that the buffer is suitable for use as a Shader Binding Table.

• VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR specifies that the buffer is suitable for use as a read-only input to an acceleration structure build.

• VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR specifies that the buffer is suitable for storage space for a VkAccelerationStructureKHR.

• VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT specifies that the buffer can be used to retrieve a buffer device address via vkGetBufferDeviceAddress and use that address to access the buffer’s memory from a shader.

• VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR specifies that the buffer can be used as the source bitstream buffer in a video decode operation.

• VK_BUFFER_USAGE_VIDEO_Decode_DST_BIT_KHR specifies that the buffer can be used as the destination status buffer in a video decode operation.

• VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR specifies that the buffer can be used as the destination bitstream buffer in a video encode operation.

• VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR specifies that the buffer can be used as the destination status buffer in a video encode operation.

// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferUsageFlags;

VkBufferUsageFlags is a bitmask type for setting a mask of zero or more VkBufferUsageFlagBits.

Bits which can be set in VkBufferCreateInfo::flags, specifying additional parameters of a buffer, are:

// Provided by VK_VERSION_1_0
typedef enum VkBufferCreateFlagBits {
VK_BUFFER_CREATE_SPARSE_BINDING_BIT = 0x00000001,
VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
VK_BUFFER_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
// Provided by VK_VERSION_1_1
VK_BUFFER_CREATE_PROTECTED_BIT = 0x00000008,
// Provided by VK_VERSION_1_2
VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000010,
// Provided by VK_EXT_buffer_device_address
VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT = VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT,
// Provided by VK_KHR_buffer_device_address
VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT,
} VkBufferCreateFlagBits;

- **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** specifies that the buffer will be backed using sparse memory binding.

- **VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT** specifies that the buffer can be partially backed using sparse memory binding. Buffers created with this flag must also be created with the **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** flag.

- **VK_BUFFER_CREATE_SPARSE_ALIASED_BIT** specifies that the buffer will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another buffer (or another portion of the same buffer). Buffers created with this flag must also be created with the **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** flag.

- **VK_BUFFER_CREATE_PROTECTED_BIT** specifies that the buffer is a protected buffer.

- **VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT** specifies that the buffer’s address can be saved and reused on a subsequent run (e.g. for trace capture and replay), see **VkBufferOpaqueCaptureAddressCreateInfo** for more detail.

See **Sparse Resource Features** and **Physical Device Features** for details of the sparse memory features supported on a device.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferCreateFlags;
```

**VkBufferCreateFlags** is a bitmask type for setting a mask of zero or more **VkBufferCreateFlagBits**.

If the **pNext** chain includes a **VkDedicatedAllocationBufferCreateInfoNV** structure, then that structure includes an enable controlling whether the buffer will have a dedicated memory allocation bound to it.

The **VkDedicatedAllocationBufferCreateInfoNV** structure is defined as:

```
// Provided by VK_NV_dedicated_allocation
typedef struct VkDedicatedAllocationBufferCreateInfoNV {
    VkStructureType     sType;
```
const void* pNext;
VkBool32 dedicatedAllocation;
} VkDedicatedAllocationBufferCreateInfoNV;

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `dedicatedAllocation` specifies whether the buffer will have a dedicated allocation bound to it.

**Valid Usage (Implicit)**

• `VUID-VkDedicatedAllocationBufferCreateInfoNV-sType-sType`
  `sType` must be `VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_BUFFER_CREATE_INFO_NV`

To define a set of external memory handle types that **may** be used as backing store for a buffer, add a `VkExternalMemoryBufferCreateInfo` structure to the `pNext` chain of the `VkBufferCreateInfo` structure. The `VkExternalMemoryBufferCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryBufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExternalMemoryBufferCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_memory
typedef VkExternalMemoryBufferCreateInfo VkExternalMemoryBufferCreateInfoKHR;
```

**Note**

A `VkExternalMemoryBufferCreateInfo` structure with a non-zero `handleTypes` field must be included in the creation parameters for a buffer that will be bound to memory that is either exported or imported.

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `handleTypes` is zero or a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more external memory handle types.

**Valid Usage (Implicit)**

• `VUID-VkExternalMemoryBufferCreateInfo-sType-sType`
  `sType` must be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_BUFFER_CREATE_INFO`
To request a specific device address for a buffer, add a `VkBufferOpaqueCaptureAddressCreateInfo` structure to the `pNext` chain of the `VkBufferCreateInfo` structure. The `VkBufferOpaqueCaptureAddressCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkBufferOpaqueCaptureAddressCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint64_t opaqueCaptureAddress;
} VkBufferOpaqueCaptureAddressCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkBufferOpaqueCaptureAddressCreateInfo VkBufferOpaqueCaptureAddressCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `opaqueCaptureAddress` is the opaque capture address requested for the buffer.

If `opaqueCaptureAddress` is zero, no specific address is requested.

If `opaqueCaptureAddress` is not zero, then it should be an address retrieved from `vkGetBufferOpaqueCaptureAddress` for an identically created buffer on the same implementation.

If this structure is not present, it is as if `opaqueCaptureAddress` is zero.

Apps should avoid creating buffers with app-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS` errors.

**Note**

The expected usage for this is that a trace capture/replay tool will add the `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` flag to all buffers that use `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT`, and during capture will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Apps/tools should avoid
Mixing app-provided and implementation-provided addresses for buffers created with `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`, to avoid address space allocation conflicts.

**Valid Usage (Implicit)**

- `VUID-VkBufferOpaqueCaptureAddressCreateInfo-sType-sType`
  - `sType` must be `VK_STRUCTURE_TYPE_BUFFER_OPAQUE_CAPTURE_ADDRESS_CREATE_INFO`  

Alternatively, to request a specific device address for a buffer, add a `VkBufferDeviceAddressCreateInfoEXT` structure to the `pNext` chain of the `VkBufferCreateInfo` structure. The `VkBufferDeviceAddressCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_buffer_device_address
typedef struct VkBufferDeviceAddressCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceAddress deviceAddress;
} VkBufferDeviceAddressCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceAddress` is the device address requested for the buffer.

If `deviceAddress` is zero, no specific address is requested.

If `deviceAddress` is not zero, then it must be an address retrieved from an identically created buffer on the same implementation. The buffer must also be bound to an identically created `VkDeviceMemory` object.

If this structure is not present, it is as if `deviceAddress` is zero.

Apps should avoid creating buffers with app-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of `VK_ERROR_INVALID_DEVICE_ADDRESS_EXT` errors.

**Valid Usage (Implicit)**

- `VUID-VkBufferDeviceAddressCreateInfoEXT-sType-sType`
  - `sType` must be `VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_CREATE_INFO_EXT`  

The `VkBufferCollectionBufferCreateInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionBufferCreateInfoFUCHSIA {
```

860
VkStructureType sType;
const void* pNext;
VkBufferCollectionFUCHSIA collection;
uint32_t index;
} VkBufferCollectionBufferCreateInfoFUCHSIA;

- `sType` is the type of this structure
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `collection` is the `VkBufferCollectionFUCHSIA` handle
- `index` is the index of the buffer in the buffer collection from which the memory will be imported

Valid Usage

- VUID-VkBufferCollectionBufferCreateInfoFUCHSIA-index-06388
  `index` must be less than `VkBufferCollectionPropertiesFUCHSIA::bufferCount`

Valid Usage (Implicit)

- VUID-VkBufferCollectionBufferCreateInfoFUCHSIA-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_COLLECTION_BUFFER_CREATE_INFO_FUCHSIA`

To destroy a buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyBuffer(
    VkDevice device,        // Logical device that destroys the buffer.
    VkBuffer buffer,        // Buffer to destroy.
    const VkAllocationCallbacks* pAllocator);    // Controls host memory allocation as described in the Memory Allocation chapter.
```

Valid Usage

- VUID-vkDestroyBuffer-buffer-00922
  All submitted commands that refer to `buffer`, either directly or via a `VkBufferView`, must have completed execution

- VUID-vkDestroyBuffer-buffer-00923
  If `VkAllocationCallbacks` were provided when `buffer` was created, a compatible set of
callbacks **must** be provided here

- VUID-vkDestroyBuffer-buffer-00924
  If no VkAllocationCallbacks were provided when buffer was created, pAllocator **must** be NULL

### Valid Usage (Implicit)

- VUID-vkDestroyBuffer-device-parameter
  device **must** be a valid VkDevice handle

- VUID-vkDestroyBuffer-buffer-parameter
  If buffer is not VK_NULL_HANDLE, buffer **must** be a valid VkBuffer handle

- VUID-vkDestroyBuffer-pAllocator-parameter
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyBuffer-buffer-parent
  If buffer is a valid handle, it **must** have been created, allocated, or retrieved from device

### Host Synchronization

- Host access to buffer **must** be externally synchronized

### 12.2. Buffer Views

A *buffer view* represents a contiguous range of a buffer and a specific format to be used to interpret the data. Buffer views are used to enable shaders to access buffer contents using image operations. In order to create a valid buffer view, the buffer **must** have been created with at least one of the following usage flags:

- VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT
- VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT

Buffer views are represented by VkBufferView handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBufferView)
```

To create a buffer view, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkCreateBufferView(
    VkDevice device,  // Provided
    const VkBufferViewCreateInfo* pCreateInfo,  // Provided
    const VkAllocationCallbacks* pAllocator);  // Optional
```
```c
const VkAllocationCallbacks* pAllocator,
VkBufferView* pView);
```

- `device` is the logical device that creates the buffer view.
- `pCreateInfo` is a pointer to a `VkBufferViewCreateInfo` structure containing parameters to be used to create the buffer view.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pView` is a pointer to a `VkBufferView` handle in which the resulting buffer view object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateBufferView-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkCreateBufferView-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkBufferViewCreateInfo` structure
- VUID-vkCreateBufferView-pAllocator-parameter
  - If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateBufferView-pView-parameter
  - `pView` must be a valid pointer to a `VkBufferView` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkBufferViewCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferViewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkBufferViewCreateFlags flags;
    VkBuffer buffer;
    VkFormat format;
    VkDeviceSize offset;
    VkDeviceSize range;
} VkBufferViewCreateInfo;
```
VkBufferViewCreateInfo;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **buffer** is a VkBuffer on which the view will be created.
- **format** is a VkFormat describing the format of the data elements in the buffer.
- **offset** is an offset in bytes from the base address of the buffer. Accesses to the buffer view from shaders use addressing that is relative to this starting offset.
- **range** is a size in bytes of the buffer view. If **range** is equal to VK_WHOLE_SIZE, the range from **offset** to the end of the buffer is used. If VK_WHOLE_SIZE is used and the remaining size of the buffer is not a multiple of the texel block size of **format**, the nearest smaller multiple is used.

### Valid Usage

- **VUID-VkBufferViewCreateInfo-offset-00925**
  - **offset** must be less than the size of **buffer**

- **VUID-VkBufferViewCreateInfo-range-00928**
  - If **range** is not equal to VK_WHOLE_SIZE, **range** must be greater than 0

- **VUID-VkBufferViewCreateInfo-range-00929**
  - If **range** is not equal to VK_WHOLE_SIZE, **range** must be an integer multiple of the texel block size of **format**

- **VUID-VkBufferViewCreateInfo-range-00930**
  - If **range** is not equal to VK_WHOLE_SIZE, the number of texel buffer elements given by 
    \[ \left\lfloor \frac{\text{range}}{\text{texel block size}} \right\rfloor \times \text{texels per block} \] 
    where texel block size and texels per block are as defined in the Compatible Formats table for **format**, must be less than or equal to VkPhysicalDeviceLimits::maxTexelBufferElements

- **VUID-VkBufferViewCreateInfo-offset-00931**
  - If **range** is not equal to VK_WHOLE_SIZE, the sum of **offset** and **range** must be less than or equal to the size of **buffer**

- **VUID-VkBufferViewCreateInfo-range-04059**
  - If **range** is equal to VK_WHOLE_SIZE, the number of texel buffer elements given by 
    \[ \left\lfloor \frac{\text{size} - \text{offset}}{\text{texel block size}} \right\rfloor \times \text{texels per block} \] 
    where size is the size of **buffer**, and texel block size and texels per block are as defined in the Compatible Formats table for **format**, must be less than or equal to VkPhysicalDeviceLimits::maxTexelBufferElements

- **VUID-VkBufferViewCreateInfo-buffer-00932**
  - **buffer** must have been created with a usage value containing at least one of VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT or VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT

- **VUID-VkBufferViewCreateInfo-buffer-00933**
  - If **buffer** was created with usage containing VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT, **format** must be supported for uniform texel buffers, as specified by the VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT flag in VkFormatProperties::bufferFeatures
returned by `vkGetPhysicalDeviceFormatProperties`

- **VUID-VkBufferViewCreateInfo-buffer-00934**
  If buffer was created with usage containing `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`, format must be supported for storage texel buffers, as specified by the `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT` flag in `VkFormatProperties::bufferFeatures` returned by `vkGetPhysicalDeviceFormatProperties`

- **VUID-VkBufferViewCreateInfo-buffer-00935**
  If buffer is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkBufferViewCreateInfo-offset-02749**
  If the texelBufferAlignment feature is not enabled, offset must be a multiple of `VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`

- **VUID-VkBufferViewCreateInfo-offset-02750**
  If the texelBufferAlignment feature is enabled and if buffer was created with usage containing `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`, offset must be a multiple of the lesser of `VkPhysicalDeviceTexelBufferAlignmentProperties::storageTexelBufferOffsetAlignmentBytes` or, if `VkPhysicalDeviceTexelBufferAlignmentProperties::storageTexelBufferOffsetSingleTexelAlignment` is `VK_TRUE`, the size of a texel of the requested format. If the size of a texel is a multiple of three bytes, then the size of a single component of format is used instead

- **VUID-VkBufferViewCreateInfo-offset-02751**
  If the texelBufferAlignment feature is enabled and if buffer was created with usage containing `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT`, offset must be a multiple of the lesser of `VkPhysicalDeviceTexelBufferAlignmentProperties::uniformTexelBufferOffsetAlignmentBytes` or, if `VkPhysicalDeviceTexelBufferAlignmentProperties::uniformTexelBufferOffsetSingleTexelAlignment` is `VK_TRUE`, the size of a texel of the requested format. If the size of a texel is a multiple of three bytes, then the size of a single component of format is used instead

- **VUID-VkBufferViewCreateInfo-pNext-06782**
  If the pNext chain includes a `VkExportMetalObjectCreateInfoEXT` structure, its exportObjectType member must be `VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT`.

## Valid Usage (Implicit)

- **VUID-VkBufferViewCreateInfo-sType-sType**
  sType must be `VK_STRUCTURE_TYPE_BUFFER_VIEW_CREATE_INFO`

- **VUID-VkBufferViewCreateInfo-pNext-pNext**
  pNext must be `NULL` or a pointer to a valid instance of `VkExportMetalObjectCreateInfoEXT`

- **VUID-VkBufferViewCreateInfo-sType-unique**
  The sType value of each struct in the pNext chain must be unique, with the exception of structures of type `VkExportMetalObjectCreateInfoEXT`

- **VUID-VkBufferViewCreateInfo-flags-zerobitmask**
  flags must be 0
- **VUID-VkBufferViewCreateInfo-buffer-parameter**
  - `buffer` must be a valid `VkBuffer` handle
- **VUID-VkBufferViewCreateInfo-format-parameter**
  - `format` must be a valid `VkFormat` value

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferViewCreateFlags;
```

`VkBufferViewCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a buffer view, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyBufferView(
  VkDevice device, 
  VkBufferView bufferView, 
  const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the buffer view.
- `bufferView` is the buffer view to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyBufferView-bufferView-00936**
  - All submitted commands that refer to `bufferView` must have completed execution.
- **VUID-vkDestroyBufferView-bufferView-00937**
  - If `VkAllocationCallbacks` were provided when `bufferView` was created, a compatible set of callbacks must be provided here.
- **VUID-vkDestroyBufferView-bufferView-00938**
  - If no `VkAllocationCallbacks` were provided when `bufferView` was created, `pAllocator` must be `NULL`.

### Valid Usage (Implicit)

- **VUID-vkDestroyBufferView-device-parameter**
  - `device` must be a valid `VkDevice` handle.
- **VUID-vkDestroyBufferView-bufferView-parameter**
  - If `bufferView` is not `VK_NULL_HANDLE`, `bufferView` must be a valid `VkBufferView` handle.
- **VUID-vkDestroyBufferView-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid
12.3. Images

Images represent multidimensional - up to 3 - arrays of data which can be used for various purposes (e.g. attachments, textures), by binding them to a graphics or compute pipeline via descriptor sets, or by directly specifying them as parameters to certain commands.

Images are represented by VkImage handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImage)
```

To create images, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateImage(
    VkDevice device,
    const VkImageCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkImage* pImage);
```

- device is the logical device that creates the image.
- pCreateInfo is a pointer to a VkImageCreateInfo structure containing parameters to be used to create the image.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pImage is a pointer to a VkImage handle in which the resulting image object is returned.

Valid Usage

- VUID-vkCreateImage-flags-00939
  If the flags member of pCreateInfo includes VK_IMAGE_CREATE_SPARSE_BINDING_BIT, creating this VkImage must not cause the total required sparse memory for all currently valid sparse resources on the device to exceed VkPhysicalDeviceLimits.sparseAddressSpaceSize
- VUID-vkCreateImage-pNext-06389
If a `VkBufferCollectionImageCreateInfoFUCHSIA` has been chained to `pNext`, `pCreateInfo` must match the `Sysmem chosen` `VkImageCreateInfo` excepting members `VkImageCreateInfo::extent` and `VkImageCreateInfo::usage` in the match criteria.

### Valid Usage (Implicit)

- VUID-vkCreateImage-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkCreateImage-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkImageCreateInfo` structure
- VUID-vkCreateImage-pAllocator-parameter
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateImage-pImage-parameter
  - `pImage` must be a valid pointer to a `VkImage` handle

### Return Codes

#### Success

- `VK_SUCCESS`

#### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_COMPRESSION_EXHAUSTED_EXT`

The `VkImageCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1.0
typedef struct VkImageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageCreateFlags flags;
    VkImageType imageType;
    VkFormat format;
    VkExtent3D extent;
    uint32_t mipLevels;
    uint32_t arrayLayers;
    VkSampleCountFlagBits samples;
    VkImageTiling tiling;
    VkImageUsageFlags usage;
    VkSharingMode sharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
} VkImageCreateInfo;
```

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is a bitmask of `VkImageCreateFlagBits` describing additional parameters of the image.
• `imageType` is a `VkImageType` value specifying the basic dimensionality of the image. Layers in array textures do not count as a dimension for the purposes of the image type.
• `format` is a `VkFormat` describing the format and type of the texel blocks that will be contained in the image.
• `extent` is a `VkExtent3D` describing the number of data elements in each dimension of the base level.
• `mipLevels` describes the number of levels of detail available for minified sampling of the image.
• `arrayLayers` is the number of layers in the image.
• `samples` is a `VkSampleCountFlagBits` value specifying the number of samples per texel.
• `tiling` is a `VkImageTiling` value specifying the tiling arrangement of the texel blocks in memory.
• `usage` is a bitmask of `VkImageUsageFlagBits` describing the intended usage of the image.
• `sharingMode` is a `VkSharingMode` value specifying the sharing mode of the image when it will be accessed by multiple queue families.
• `queueFamilyIndexCount` is the number of entries in the `pQueueFamilyIndices` array.
• `pQueueFamilyIndices` is a pointer to an array of queue families that will access this image. It is ignored if `sharingMode` is not `VK_SHARING_MODE_CONCURRENT`.
• `initialLayout` is a `VkImageLayout` value specifying the initial `VkImageLayout` of all image subresources of the image. See Image Layouts.

Images created with `tiling` equal to `VK_IMAGE_TILING_LINEAR` have further restrictions on their limits and capabilities compared to images created with `tiling` equal to `VK_IMAGE_TILING_OPTIMAL`. Creation of images with `tiling` `VK_IMAGE_TILING_LINEAR` may not be supported unless other parameters meet all of the constraints:

• `imageType` is `VK_IMAGE_TYPE_2D`
• `format` is not a depth/stencil format
• `mipLevels` is 1
• `arrayLayers` is 1
• `samples` is `VK_SAMPLE_COUNT_1_BIT`
• `usage` only includes `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` and/or `VK_IMAGE_USAGE_TRANSFER_DST_BIT`

Images created with one of the formats that require a sampler Y’C_bC_r conversion, have further restrictions on their limits and capabilities compared to images created with other formats. Creation of images with a format requiring Y’C_bC_r conversion may not be supported unless other parameters meet all of the constraints:
• imageType is VK_IMAGE_TYPE_2D
• mipLevels is 1
• arrayLayers is 1, unless the ycbcrImageArrays feature is enabled, or otherwise indicated by VkImageFormatProperties::maxArrayLayers, as returned by vkGetPhysicalDeviceImageFormatProperties
• samples is VK_SAMPLE_COUNT_1_BIT

Implementations may support additional limits and capabilities beyond those listed above.

To determine the set of valid usage bits for a given format, call vkGetPhysicalDeviceFormatProperties.

If the size of the resultant image would exceed maxResourceSize, then vkCreateImage must fail and return VK_ERROR_OUT_OF_DEVICE_MEMORY. This failure may occur even when all image creation parameters satisfy their valid usage requirements.

Note
For images created without VK_IMAGE_CREATE_EXTENDED_USAGE_BIT a usage bit is valid if it is supported for the format the image is created with.

For images created with VK_IMAGE_CREATE_EXTENDED_USAGE_BIT a usage bit is valid if it is supported for at least one of the formats a VkImageView created from the image can have (see Image Views for more detail).

**Image Creation Limits**

Valid values for some image creation parameters are limited by a numerical upper bound or by inclusion in a bitset. For example, VkImageCreateInfo::arrayLayers is limited by imageCreateMaxArrayLayers, defined below; and VkImageCreateInfo::samples is limited by imageCreateSampleCounts, also defined below.

Several limiting values are defined below, as well as assisting values from which the limiting values are derived. The limiting values are referenced by the relevant valid usage statements of VkImageCreateInfo.

• Let uint64_t imageCreateDrmFormatModifiers[] be the set of Linux DRM format modifiers that the resultant image may have.
  • If tiling is not VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then imageCreateDrmFormatModifiers is empty.
  • If VkImageCreateInfo::pNext contains VkImageDrmFormatModifierExplicitCreateInfoEXT, then imageCreateDrmFormatModifiers contains exactly one modifier, VkImageDrmFormatModifierExplicitCreateInfoEXT::drmFormatModifier.
  • If VkImageCreateInfo::pNext contains VkImageDrmFormatModifierListCreateInfoEXT, then imageCreateDrmFormatModifiers contains the entire array VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers.
Let VkBool32 imageCreateMaybeLinear indicate if the resultant image may be linear.

- If tiling is VK_IMAGE_TILING_LINEAR, then imageCreateMaybeLinear is VK_TRUE.
- If tiling is VK_IMAGE_TILING_OPTIMAL, then imageCreateMaybeLinear is VK_FALSE.
- If tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then imageCreateMaybeLinear is VK_TRUE if and only if imageCreateDrmFormatModifiers contains DRM_FORMAT_MOD_LINEAR.

Let VkFormatFeatureFlags imageCreateFormatFeatures be the set of valid format features available during image creation.

- If tiling is VK_IMAGE_TILING_LINEAR, then imageCreateFormatFeatures is the value of VkFormatProperties::linearTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties with parameter format equal to VkImageCreateInfo::format.
- If tiling is VK_IMAGE_TILING_OPTIMAL, and if the pNext chain includes no VkExternalFormatANDROID structure with non-zero externalFormat, then imageCreateFormatFeatures is the value of VkFormatProperties::optimalTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties with parameter format equal to VkImageCreateInfo::format.
- If tiling is VK_IMAGE_TILING_OPTIMAL, and if the pNext chain includes a VkExternalFormatANDROID structure with non-zero externalFormat, then imageCreateFormatFeatures is the value of VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures obtained by vkGetAndroidHardwareBufferPropertiesANDROID with a matching externalFormat value.
- If the pNext chain includes a VkBufferCollectionImageCreateInfoFUCHSIA structure, then imageCreateFormatFeatures is the value of VkBufferCollectionLayoutPropertiesFUCHSIA::formatFeatures found by calling vkGetBufferCollectionPropertiesFUCHSIA with a parameter collection equal to VkBufferCollectionImageCreateInfoFUCHSIA::collection.
- If tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the value of imageCreateFormatFeatures is found by calling vkGetPhysicalDeviceFormatProperties2 with VkImageFormatProperties::format equal to VkImageCreateInfo::format and with VkDrmFormatModifierPropertiesListEXT chained into VkFormatProperties2; by collecting all members of the returned array VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties whose drmFormatModifier belongs to imageCreateDrmFormatModifiers; and by taking the bitwise intersection, over the collected array members, of drmFormatModifierTilingFeatures. (The resultant imageCreateFormatFeatures may be empty).

Let VkImageFormatProperties2 imageCreateImageFormatPropertiesList[] be defined as follows.

- If VkImageCreateInfo::pNext contains no VkExternalFormatANDROID structure with non-zero externalFormat, then imageCreateImageFormatPropertiesList is the list of structures obtained by calling vkGetPhysicalDeviceImageFormatProperties2, possibly multiple times, as follows:
  - The parameters VkPhysicalDeviceImageFormatInfo2::format, imageType, tiling,
usage, and flags must be equal to those in VkImageCreateInfo.

- If VkImageCreateInfo::pNext contains a VkExternalMemoryImageCreateInfo structure whose handleTypes is not 0, then VkPhysicalDeviceImageFormatInfo2::pNext must contain a VkPhysicalDeviceExternalImageFormatInfo structure whose handleType is not 0; and vkGetPhysicalDeviceImageFormatProperties2 must be called for each handle type in VkExternalMemoryImageCreateInfo::handleTypes, successively setting VkPhysicalDeviceExternalImageFormatInfo::handleType on each call.

- If VkImageCreateInfo::pNext contains no VkExternalMemoryImageCreateInfo structure, or contains a structure whose handleTypes is 0, then VkPhysicalDeviceImageFormatInfo2::pNext must either contain no VkPhysicalDeviceExternalImageFormatInfo structure, or contain a structure whose handleType is 0.

- If VkImageCreateInfo::pNext contains a VkVideoProfileListInfoKHR structure then VkPhysicalDeviceImageFormatInfo2::pNext must also contain the sameVkVideoProfileListInfoKHR structure on each call.

- If tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then:
  - VkPhysicalDeviceImageFormatInfo2::pNext must contain a VkPhysicalDeviceImageDrmFormatModifierInfoEXT structure where sharingMode is equal to VkImageCreateInfo::sharingMode;
  - if sharingMode is VK_SHARING_MODE_CONCURRENT, then queueFamilyIndexCount and pQueueFamilyIndices must be equal to those in VkImageCreateInfo;
  - if flags contains VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT, then the VkImageFormatListCreateInfo structure included in the pNext chain of VkPhysicalDeviceImageFormatInfo2 must be equivalent to the one included in the pNext chain of VkImageCreateInfo;
  - if VkImageCreateInfo::pNext contains a VkImageCompressionControlEXT structure, then the VkPhysicalDeviceImageFormatInfo2::pNext chain must contain an equivalent structure;
  - vkGetPhysicalDeviceImageFormatProperties2 must be called for each modifier in imageCreateDrmFormatModifiers, successively setting VkPhysicalDeviceImageDrmFormatModifierInfoEXT::drmFormatModifier on each call.

- If tiling is not VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then VkPhysicalDeviceImageFormatInfo2::pNext must contain no VkPhysicalDeviceImageDrmFormatModifierInfoEXT structure.

- If any call to vkGetPhysicalDeviceImageFormatProperties2 returns an error, then imageCreateImageFormatPropertiesList is defined to be the empty list.

- If VkImageCreateInfo::pNext contains a VkExternalFormatANDROID structure with non-zero externalFormat, then imageCreateImageFormatPropertiesList contains a single element where:
  - VkImageFormatProperties::maxMipLevels is \( \lceil \log_2(\max(\text{extent.width, extent.height, extent.depth})) \rceil + 1 \).
● **VkImageFormatProperties::maxArrayLayers** is **VkPhysicalDeviceLimits::maxImageArrayLayers**.

● Each component of **VkImageFormatProperties::maxExtent** is **VkPhysicalDeviceLimits::maxImageDimension2D**.

● **VkImageFormatProperties::sampleCounts** contains exactly **VK_SAMPLE_COUNT_1_BIT**.

- Let **uint32_t imageCreateMaxMipLevels** be the minimum value of **VkImageFormatProperties::maxMipLevels** in **imageCreateImageFormatPropertiesList**. The value is undefined if **imageCreateImageFormatPropertiesList** is empty.

- Let **uint32_t imageCreateMaxArrayLayers** be the minimum value of **VkImageFormatProperties::maxArrayLayers** in **imageCreateImageFormatPropertiesList**. The value is undefined if **imageCreateImageFormatPropertiesList** is empty.

- Let **VkExtent3D imageCreateMaxExtent** be the component-wise minimum over all **VkImageFormatProperties::maxExtent** values in **imageCreateImageFormatPropertiesList**. The value is undefined if **imageCreateImageFormatPropertiesList** is empty.

- Let **VkSampleCountFlags imageCreateSampleCounts** be the intersection of each **VkImageFormatProperties::sampleCounts** in **imageCreateImageFormatPropertiesList**. The value is undefined if **imageCreateImageFormatPropertiesList** is empty.

- Let **VkVideoFormatPropertiesKHR videoFormatProperties[]** be defined as follows.
  - **videoFormatProperties** is the list of structures obtained by calling **vkGetPhysicalDeviceVideoFormatPropertiesKHR** with **VkPhysicalDeviceVideoFormatInfoKHR::imageUsage** equal to the **usage** member of **VkImageCreateInfo** and **VkPhysicalDeviceVideoFormatInfoKHR::pNext** containing the same **VkVideoProfileListInfoKHR** structure chained to **VkImageCreateInfo**.
  - Otherwise **videoFormatProperties** is an empty list.

- Let **VkBool32 supportedVideoFormat** indicate if the image parameters are supported by the specified video profiles.
  - **supportedVideoFormat** is **VK_TRUE** if there exists an element in the **videoFormatProperties** list for which all of the following conditions are true:
    - **VkImageCreateInfo::format** equals **VkVideoFormatPropertiesKHR::format**.
    - **VkImageCreateInfo::flags** only contains bits also set in **VkVideoFormatPropertiesKHR::imageCreateFlags**.
    - **VkImageCreateInfo::imageType** equals **VkVideoFormatPropertiesKHR::imageType**.
    - **VkImageCreateInfo::tiling** equals **VkVideoFormatPropertiesKHR::imageTiling**.
    - **VkImageCreateInfo::usage** only contains bits also set in **VkVideoFormatPropertiesKHR::imageUsageFlags**.
  - Otherwise **supportedVideoFormat** is **VK_FALSE**.
Valid Usage

- VUID-VkImageCreateInfo-imageCreateMaxMipLevels-02251
  Each of the following values (as described in Image Creation Limits) must not be undefined: imageCreateMaxMipLevels, imageCreateMaxArrayLayers, imageCreateMaxExtent, and imageCreateSampleCounts

- VUID-VkImageCreateInfo-sharingMode-00941
  If sharingMode is VK_SHARING_MODE_CONCURRENT, pQueueFamilyIndices must be a valid pointer to an array of queueFamilyIndexCount uint32_t values

- VUID-VkImageCreateInfo-sharingMode-00942
  If sharingMode is VK_SHARING_MODE_CONCURRENT, queueFamilyIndexCount must be greater than 1

- VUID-VkImageCreateInfo-sharingMode-01420
  If sharingMode is VK_SHARING_MODE_CONCURRENT, each element of pQueueFamilyIndices must be unique and must be less than pQueueFamilyPropertyCount returned by either vkGetPhysicalDeviceQueueFamilyProperties or vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to create device

- VUID-VkImageCreateInfo-pNext-01974
  If the pNext chain includes a VkExternalFormatANDROID structure, and its externalFormat member is non-zero the format must be VK_FORMAT_UNDEFINED

- VUID-VkImageCreateInfo-pNext-01975
  If the pNext chain does not include a VkExternalFormatANDROID structure, or does and its externalFormat member is 0, the format must not be VK_FORMAT_UNDEFINED

- VUID-VkImageCreateInfo-extent-00944
  extent.width must be greater than 0

- VUID-VkImageCreateInfo-extent-00945
  extent.height must be greater than 0

- VUID-VkImageCreateInfo-extent-00946
  extent.depth must be greater than 0

- VUID-VkImageCreateInfo-mipLevels-00947
  mipLevels must be greater than 0

- VUID-VkImageCreateInfo-arrayLayers-00948
  arrayLayers must be greater than 0

- VUID-VkImageCreateInfo-flags-00949
  If flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, imageType must be VK_IMAGE_TYPE_2D

- VUID-VkImageCreateInfo-flags-02557
  If flags contains VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT, imageType must be VK_IMAGE_TYPE_2D

- VUID-VkImageCreateInfo-flags-00950
  If flags contains VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT, imageType must be
• VUID-VkImageCreateInfo-extent-02252
extent.width must be less than or equal to imageCreateMaxExtent.width (as defined in Image Creation Limits)

• VUID-VkImageCreateInfo-extent-02253
extent.height must be less than or equal to imageCreateMaxExtent.height (as defined in Image Creation Limits)

• VUID-VkImageCreateInfo-extent-02254
extent.depth must be less than or equal to imageCreateMaxExtent.depth (as defined in Image Creation Limits)

• VUID-VkImageCreateInfo-imageType-00954
If imageType is VK_IMAGE_TYPE_2D and flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, extent.width and extent.height must be equal and arrayLayers must be greater than or equal to 6

• VUID-VkImageCreateInfo-imageType-00956
If imageType is VK_IMAGE_TYPE_1D, both extent.height and extent.depth must be 1

• VUID-VkImageCreateInfo-imageType-00957
If imageType is VK_IMAGE_TYPE_2D, extent.depth must be 1

• VUID-VkImageCreateInfo-mipLevels-00958
mipLevels must be less than or equal to the number of levels in the complete mipmap chain based on extent.width, extent.height, and extent.depth

• VUID-VkImageCreateInfo-mipLevels-02255
mipLevels must be less than or equal to imageCreateMaxMipLevels (as defined in Image Creation Limits)

• VUID-VkImageCreateInfo-arrayLayers-02256
arrayLayers must be less than or equal to imageCreateMaxArrayLayers (as defined in Image Creation Limits)

• VUID-VkImageCreateInfo-imageType-00961
If imageType is VK_IMAGE_TYPE_3D, arrayLayers must be 1

• VUID-VkImageCreateInfo-samples-02257
If samples is not VK_SAMPLE_COUNT_1_BIT, then imageType must be VK_IMAGE_TYPE_2D, flags must not contain VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, mipLevels must be equal to 1, and imageCreateMaybeLinear (as defined in Image Creation Limits) must be VK_FALSE,

• VUID-VkImageCreateInfo-samples-02558
If samples is not VK_SAMPLE_COUNT_1_BIT, usage must not contain VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT

• VUID-VkImageCreateInfo-usage-00963
If usage includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, then bits other than VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT must not be set

• VUID-VkImageCreateInfo-usage-00964
If usage includes VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT,
VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT,
or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.width must be less than or equal to
VkPhysicalDeviceLimits::maxFramebufferWidth

- VUID-VkImageCreateInfo-usage-00965
  If usage includes VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT,
  VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT,
or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.height must be less than or equal to
  VkPhysicalDeviceLimits::maxFramebufferHeight

- VUID-VkImageCreateInfo-fragmentDensityMapOffset-06514
  If the fragmentDensityMapOffset feature is not enabled and usage includes
  VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT, extent.width must be less than or equal to
  \[
  \frac{\text{maxFramebufferWidth}}{\text{minFragmentDensityTexelSize.width}}
  \]

- VUID-VkImageCreateInfo-fragmentDensityMapOffset-06515
  If the fragmentDensityMapOffset feature is not enabled and usage includes
  VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT, extent.height must be less than or equal to
  \[
  \frac{\text{maxFramebufferHeight}}{\text{minFragmentDensityTexelSize.height}}
  \]

- VUID-VkImageCreateInfo-usage-00966
  If usage includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, usage must also contain at
  least one of VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT,
or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkImageCreateInfo-samples-02258
  samples must be a bit value that is set in imageCreateSampleCounts (as defined in Image
  Creation Limits)

- VUID-VkImageCreateInfo-usage-00968
  If the shaderStorageImageMultisample feature is not enabled, and usage contains
  VK_IMAGE_USAGE_STORAGE_BIT, samples must be VK_SAMPLE_COUNT_1_BIT

- VUID-VkImageCreateInfo-flags-00969
  If the sparseBinding feature is not enabled, flags must not contain
  VK_IMAGE_CREATE_SPARSE_BINDING_BIT

- VUID-VkImageCreateInfo-flags-01924
  If the sparseResidencyAliased feature is not enabled, flags must not contain
  VK_IMAGE_CREATE_SPARSE_ALIASED_BIT

- VUID-VkImageCreateInfo-tiling-04121
  If tiling is VK_IMAGE_TILING_LINEAR, flags must not contain
  VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

- VUID-VkImageCreateInfo-imageType-00970
  If imageType is VK_IMAGE_TYPE_1D, flags must not contain
  VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

- VUID-VkImageCreateInfo-imageType-00971
  If the sparseResidencyImage2D feature is not enabled, and imageType is VK_IMAGE_TYPE_2D,
  flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

- VUID-VkImageCreateInfo-imageType-00972
  If the sparseResidencyImage3D feature is not enabled, and imageType is VK_IMAGE_TYPE_3D,
flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

• VUID-VkImageCreateInfo-imageType-00973
  If the sparseResidency2Samples feature is not enabled, imageType is VK_IMAGE_TYPE_2D, and samples is VK_SAMPLE_COUNT_2_BIT, flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

• VUID-VkImageCreateInfo-imageType-00974
  If the sparseResidency4Samples feature is not enabled, imageType is VK_IMAGE_TYPE_2D, and samples is VK_SAMPLE_COUNT_4_BIT, flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

• VUID-VkImageCreateInfo-imageType-00975
  If the sparseResidency8Samples feature is not enabled, imageType is VK_IMAGE_TYPE_2D, and samples is VK_SAMPLE_COUNT_8_BIT, flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

• VUID-VkImageCreateInfo-imageType-00976
  If the sparseResidency16Samples feature is not enabled, imageType is VK_IMAGE_TYPE_2D, and samples is VK_SAMPLE_COUNT_16_BIT, flags must not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

• VUID-VkImageCreateInfo-flags-00987
  If flags contains VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT, it must also contain VK_IMAGE_CREATE_SPARSE_BINDING_BIT

• VUID-VkImageCreateInfo-None-01925
  If any of the bits VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT are set, VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT must not also be set

• VUID-VkImageCreateInfo-flags-01890
  If the protectedMemory feature is not enabled, flags must not contain VK_IMAGE_CREATE_PROTECTED_BIT

• VUID-VkImageCreateInfo-None-01891
  If any of the bits VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT are set, VK_IMAGE_CREATE_PROTECTED_BIT must not also be set

• VUID-VkImageCreateInfo-pNext-00988
  If the pNext chain includes a VkExternalMemoryImageCreateInfoNV structure, it must not contain a VkExternalMemoryImageCreateInfo structure

• VUID-VkImageCreateInfo-pNext-00990
  If the pNext chain includes a VkExternalMemoryImageCreateInfo structure, its handleTypes member must only contain bits that are also in VkExternalImageFormatProperties::externalMemoryProperties.compatibleHandleTypes, as returned by vkGetPhysicalDeviceImageFormatProperties2 with format, imageType, tiling, usage, and flags equal to those in this structure, and with a VkPhysicalDeviceExternalImageFormatInfo structure included in the pNext chain, with a handleType equal to any one of the handle types specified in VkExternalMemoryImageCreateInfo::handleTypes
If the `pNext` chain includes a `VkExternalMemoryImageCreateInfoNV` structure, its `handleTypes` member must only contain bits that are also in `VkExternalImageFormatPropertiesNV::externalMemoryProperties.compatibleHandleTypes`, as returned by `vkGetPhysicalDeviceExternalImageFormatPropertiesNV` with `format`, `imageType`, `tiling`, `usage`, and `flags` equal to those in this structure, and with `externalHandleType` equal to any one of the handle types specified in `VkExternalMemoryImageCreateInfoNV::handleTypes`.

If the logical device was created with `VkDeviceGroupDeviceCreateInfo::physicalDeviceCount` equal to 1, `flags` must not contain `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT`.

If `flags` contains `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT`, then `mipLevels` must be one, `arrayLayers` must be one, `imageType` must be `VK_IMAGE_TYPE_2D`, and `imageCreateMaybeLinear` (as defined in Image Creation Limits) must be `VK_FALSE`.

If `flags` contains `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT`, then `format` must be a compressed image format.

If `flags` contains `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT`, then `flags` must also contain `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`.

Initial layout must be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

If the `pNext` chain includes a `VkExternalMemoryImageCreateInfo` or `VkExternalMemoryImageCreateInfoNV` structure whose `handleTypes` member is not 0, initial layout must be `VK_IMAGE_LAYOUT_UNDEFINED`.

If the `format` is one of the formats that require a sampler Y’CₙCₐR conversion, `mipLevels` must be 1.

If the `format` is one of the formats that require a sampler Y’CₙCₐR conversion, `samples` must be `VK_SAMPLE_COUNT_1_BIT`.

If the `format` is one of the formats that require a sampler Y’CₙCₐR conversion, `imageType` must be `VK_IMAGE_TYPE_2D`.

If `format` is a multi-planar format, and if `imageCreateFormatFeatures` (as defined in Image Creation Limits) does not contain `VK_FORMAT_FEATURE_DISJOINT_BIT`, then `flags` must not contain `VK_IMAGE_CREATE_DISJOINT_BIT`.

If `format` is not a multi-planar format, and `flags` does not include...
VK_IMAGE_CREATE_ALIAS_BIT, flags must not contain VK_IMAGE_CREATE_DISJOINT_BIT

- VUID-VkImageCreateInfo-format-04712
  If format has a _422 or _420 suffix, width must be a multiple of 2

- VUID-VkImageCreateInfo-format-04713
  If format has a _420 suffix, height must be a multiple of 2

- VUID-VkImageCreateInfo-tiling-02261
  If tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the pNext chain must include exactly one of VkImageDrmFormatModifierListCreateInfoEXT or VkImageDrmFormatModifierExplicitCreateInfoEXT structures

- VUID-VkImageCreateInfo-pNext-02262
  If the pNext chain includes a VkImageDrmFormatModifierListCreateInfoEXT or VkImageDrmFormatModifierExplicitCreateInfoEXT structure, then tiling must be VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT

- VUID-VkImageCreateInfo-tiling-02353
  If tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT and flags contains VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT, then the pNext chain must include a VkImageFormatListCreateInfo structure with non-zero viewFormatCount

- VUID-VkImageCreateInfo-pNext-02393
  If the pNext chain includes a VkExternalMemoryImageCreateInfo structure whose handleTypes member includes VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, imageType must be VK_IMAGE_TYPE_2D

- VUID-VkImageCreateInfo-pNext-02394
  If the pNext chain includes a VkExternalMemoryImageCreateInfo structure whose handleTypes member includes VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, mipLevels must either be 1 or equal to the number of levels in the complete mipmap chain based on extent.width, extent.height, and extent.depth

- VUID-VkImageCreateInfo-pNext-02396
  If the pNext chain includes a VkExternalFormatANDROID structure whose externalFormat member is not 0, flags must not include VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT

- VUID-VkImageCreateInfo-pNext-02397
  If the pNext chain includes a VkExternalFormatANDROID structure whose externalFormat member is not 0, usage must not include any usages except VK_IMAGE_USAGE_SAMPLED_BIT

- VUID-VkImageCreateInfo-pNext-02398
  If the pNext chain includes a VkExternalFormatANDROID structure whose externalFormat member is not 0, tiling must be VK_IMAGE_TILING_OPTIMAL

- VUID-VkImageCreateInfo-format-02795
  If format is a depth-stencil format, usage includes VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and the pNext chain includes a
VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo ::stencilUsage member must also include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageCreateInfo-format-02796
  If format is a depth-stencil format, usage does not include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo ::stencilUsage member must also not include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageCreateInfo-format-02797
  If format is a depth-stencil format, usage includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo ::stencilUsage member must also include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT

- VUID-VkImageCreateInfo-format-02798
  If format is a depth-stencil format, usage does not include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo ::stencilUsage member must also not include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT

- VUID-VkImageCreateInfo-Format-02536
  If format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage member including VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.width must be less than or equal to VkPhysicalDeviceLimits::maxFramebufferWidth

- VUID-VkImageCreateInfo-format-02537
  If format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage member including VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.height must be less than or equal to VkPhysicalDeviceLimits::maxFramebufferHeight

- VUID-VkImageCreateInfo-format-02538
  If the shaderStorageImageMultisample feature is not enabled, format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage including VK_IMAGE_USAGE_STORAGE_BIT, samples must be VK_SAMPLE_COUNT_1_BIT

- VUID-VkImageCreateInfo-flags-02050
  If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV, imageType must be VK_IMAGE_TYPE_2D or VK_IMAGE_TYPE_3D

- VUID-VkImageCreateInfo-flags-02051
  If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV, it must not contain VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT and the format must not be a depth/stencil format

- VUID-VkImageCreateInfo-flags-02052
  If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV and imageType is VK_IMAGE_TYPE_2D, extent.width and extent.height must be greater than 1

- VUID-VkImageCreateInfo-flags-02053
  If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV and imageType is VK_IMAGE_TYPE_3D,
extent.width, extent.height, and extent.depth must be greater than 1

- VUID-VkImageCreateInfo-imageType-02082
  If usage includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, imageType must be VK_IMAGE_TYPE_2D

- VUID-VkImageCreateInfo-samples-02083
  If usage includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, samples must be VK_SAMPLE_COUNT_1_BIT

- VUID-VkImageCreateInfo-tiling-02084
  If usage includes VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV, tiling must be VK_IMAGE_TILING_OPTIMAL

- VUID-VkImageCreateInfo-flags-02565
  If flags contains VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT, tiling must be VK_IMAGE_TILING_OPTIMAL

- VUID-VkImageCreateInfo-flags-02566
  If flags contains VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT, imageType must be VK_IMAGE_TYPE_2D

- VUID-VkImageCreateInfo-flags-02567
  If flags contains VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT, flags must not contain VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT

- VUID-VkImageCreateInfo-flags-02568
  If flags contains VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT, mipLevels must be 1

- VUID-VkImageCreateInfo-pNext-06722
  If a VkImageFormatListCreateInfo structure was included in the pNext chain and VkImageFormatListCreateInfo::viewFormatCount is not zero, then each format in VkImageFormatListCreateInfo::pViewFormats must either be compatible with the format as described in the compatibility table or, if flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, be an uncompressed format that is size-compatible with format

- VUID-VkImageCreateInfo-flags-04738
  If flags does not contain VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and the pNext chain includes a VkImageFormatListCreateInfo structure, then VkImageFormatListCreateInfo::viewFormatCount must be 0 or 1

- VUID-VkImageCreateInfo-usage-04815
If usage includes VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, then the pNext chain must include a valid VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles including at least one VkVideoProfileInfoKHR::videoCodecOperation specifying a decode operation

• VUID-VkImageCreateInfo-usage-04816
  If usage includes VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR, then the pNext chain must include a valid VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles including at least one VkVideoProfileInfoKHR::videoCodecOperation specifying an encode operation

• VUID-VkImageCreateInfo-pNext-06811
  If the pNext chain includes a VkVideoProfileListInfoKHR structure then supportedVideoFormat must be VK_TRUE

• VUID-VkImageCreateInfo-pNext-06390
  If the VkImage is to be used to import memory from a VkBufferCollectionFUCHSIA, a VkBufferCollectionImageCreateInfoFUCHSIA structure must be chained to pNext.

• VUID-VkImageCreateInfo-multisampledRenderToSingleSampled-06882
  If the multisampledRenderToSingleSampled feature is not enabled, flags must not contain VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT.

• VUID-VkImageCreateInfo-flags-06883
  If flags contains VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT, samples must be VK_SAMPLE_COUNT_1_BIT.

• VUID-VkImageCreateInfo-pNext-06743
  If the pNext chain includes a VkImageCompressionControlEXT structure, format is a multi-planar format, and VkImageCompressionControlEXT::flags includes VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT, then VkImageCompressionControlEXT::compressionControlPlaneCount must be equal to the number of planes in format

• VUID-VkImageCreateInfo-pNext-06744
  If the pNext chain includes a VkImageCompressionControlEXT structure, format is not a multi-planar format, and VkImageCompressionControlEXT::flags includes VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT, then VkImageCompressionControlEXT::compressionControlPlaneCount must be 1

• VUID-VkImageCreateInfo-pNext-06746
  If the pNext chain includes a VkImageCompressionControlEXT structure, it must not contain a VkImageDrmFormatModifierExplicitCreateInfoEXT structure

• VUID-VkImageCreateInfo-pNext-06783
  If the pNext chain includes a VkExportMetalObjectCreateInfoEXT structure, its exportObjectType member must be either VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT or VK_EXPORT_METAL_OBJECT_TYPE_METAL_IOSURFACE_BIT_EXT.

• VUID-VkImageCreateInfo-pNext-06784
  If the pNext chain includes a VkImportMetalTextureInfoEXT structure its plane member must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or
VK_IMAGE_ASPECT_PLANE_2_BIT.

• VUID-VkImageCreateInfo-pNext-06785
  If the pNext chain includes a VkImportMetalTextureInfoEXT structure and the image does not have a multi-planar format, then VkImportMetalTextureInfoEXT::plane must be VK_IMAGE_ASPECT_PLANE_0_BIT.

• VUID-VkImageCreateInfo-pNext-06786
  If the pNext chain includes a VkImportMetalTextureInfoEXT structure and the image has a multi-planar format with only two planes, then VkImportMetalTextureInfoEXT::plane must not be VK_IMAGE_ASPECT_PLANE_2_BIT.

Valid Usage (Implicit)

• VUID-VkImageCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO

• VUID-VkImageCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkBufferCollectionImageCreateInfoFUCHSIA, VkDedicatedAllocationImageCreateInfoNV, VkExportMetalObjectCreateInfoEXT, VkExternalFormatANDROID, VkExternalMemoryImageCreateInfo, VkImageCompressionControlEXT, VkImageDrmFormatModifierExplicitCreateInfoEXT, VkImageDrmFormatModifierListCreateInfoEXT, VkImageFormatListCreateInfo, VkImageStencilUsageCreateInfo, VkImageSwapchainCreateInfoKHR, VkOpticalFlowImageFormatInfoNV, or VkVideoProfileListInfoKHR

• VUID-VkImageCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique, with the exception of structures of type VkExportMetalObjectCreateInfoEXT or VkImportMetalTextureInfoEXT

• VUID-VkImageCreateInfo-flags-parameter
  flags must be a valid combination of VkImageCreateFlagBits values

• VUID-VkImageCreateInfo-imageType-parameter
  imageType must be a valid VkImageType value

• VUID-VkImageCreateInfo-format-parameter
  format must be a valid VkFormat value

• VUID-VkImageCreateInfo-samples-parameter
  samples must be a valid VkSampleCountFlagBits value

• VUID-VkImageCreateInfo-tiling-parameter
  tiling must be a valid VkImageTiling value

• VUID-VkImageCreateInfo-usage-parameter
  usage must be a valid combination of VkImageUsageFlagBits values

• VUID-VkImageCreateInfo-usage-requiredbitmask
  usage must not be 0
• VUID-VkImageCreateInfo-sharingMode-parameter
  sharingMode must be a valid VkSharingMode value
• VUID-VkImageCreateInfo-initialLayout-parameter
  initialLayout must be a valid VkImageLayout value

The VkBufferCollectionImageCreateInfoFUCHSIA structure is defined as:

```
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionImageCreateInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkBufferCollectionFUCHSIA collection;
    uint32_t index;
} VkBufferCollectionImageCreateInfoFUCHSIA;
```

• sType is the type of this structure
• pNext is NULL or a pointer to a structure extending this structure
• collection is the VkBufferCollectionFUCHSIA handle
• index is the index of the buffer in the buffer collection from which the memory will be imported

Valid Usage

• VUID-VkBufferCollectionImageCreateInfoFUCHSIA-index-06391
  index must be less than VkBufferCollectionPropertiesFUCHSIA::bufferCount

Valid Usage (Implicit)

• VUID-VkBufferCollectionImageCreateInfoFUCHSIA-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_COLLECTION_IMAGE_CREATE_INFO_FUCHSIA
• VUID-VkBufferCollectionImageCreateInfoFUCHSIA-collection-parameter
  collection must be a valid VkBufferCollectionFUCHSIA handle

The VkImageStencilUsageCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkImageStencilUsageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageUsageFlags stencilUsage;
} VkImageStencilUsageCreateInfo;
```

or the equivalent
// Provided by VK_EXT_separate_stencil_usage

typedef VkImageStencilUsageCreateInfo VkImageStencilUsageCreateInfoEXT;

• \textit{sType} is the type of this structure.
• \textit{pNext} is NULL or a pointer to a structure extending this structure.
• \textit{stencilUsage} is a bitmask of \textit{VkImageUsageFlagBits} describing the intended usage of the stencil aspect of the image.

If the \textit{pNext} chain of \textit{VkImageCreateInfo} includes a \textit{VkImageStencilUsageCreateInfo} structure, then that structure includes the usage flags specific to the stencil aspect of the image for an image with a depth-stencil format.
