  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08646
  If the `colorWriteEnable` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-attachmentCount-07750
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08647
  If the `colorWriteEnable` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `attachmentCount` parameter of most recent call to `vkCmdSetColorWriteEnableEXT` in the current command buffer must be greater than or equal to the number of color attachments in the current render pass instance

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07751
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT dynamic state enabled then vkCmdSetDiscardRectangleEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command in VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07880
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT dynamic state enabled then vkCmdSetDiscardRectangleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-rasterizerDiscardEnable-09236
  If the VK_EXT_discard_rectangles extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDiscardRectangleEnableEXT in the current command buffer set discardRectangleEnable to VK_TRUE, then vkCmdSetDiscardRectangleEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08648
  If the VK_EXT_discard_rectangles extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDiscardRectangleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07881
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT dynamic state enabled then vkCmdSetDiscardRectangleModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08649
  If the VK_EXT_discard_rectangles extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDiscardRectangleEnableEXT in the current command buffer set discardRectangleEnable to VK_TRUE, then vkCmdSetDiscardRectangleModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-08913
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-08914
If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-08915**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-08916**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-08917**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-08918**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06184**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not ```2481```
VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-colorAttachmentCount-06185
  If the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the corresponding element of the pColorAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pDepthAttachment-06186
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pStencilAttachment-06187
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-multisampledRenderToSingleSampled-07285
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of rasterizationSamples for the currently bound graphics pipeline.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-multisampledRenderToSingleSampled-07286
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView.
If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

If this command has been called inside a render pass instance started with `vkCmdBeginRendering`, and the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.
If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07619**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` dynamic state enabled then `vkCmdSetTessellationDomainOriginEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07620**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClampEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-09237**
  If a shader object is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, then `vkCmdSetTessellationDomainOriginEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08650**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then `vkCmdSetRasterizationSamplesEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07621**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled then `vkCmdSetPolygonModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08651**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08652**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
drawing command

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07623**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08653**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07624**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-alphaToCoverageEnable-08919**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08654**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-alphaToCoverageEnable-08920**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07625**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08655**
  If the `alphaToOne` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled then `vkCmdSetLogicOpEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `logicOp` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorBlendEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` for any attachment set that attachment’s value in `pColorBlendEnables` to `VK_TRUE`, then `vkCmdSetColorBlendEquationEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then
vkCmdSetColorWriteMaskEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07630
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` dynamic state enabled then `vkCmdSetRasterizationStreamEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08660
  If the `geometryStreams` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, then `vkCmdSetRasterizationStreamEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07631
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetConservativeRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08661
  If the `VK_EXT_conservative_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetConservativeRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07632
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT` dynamic state enabled then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08662
  If the `VK_EXT_conservative_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetConservativeRasterizationModeEXT` in the current command buffer set `conservativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07633
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClipEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08663
  If the `depthClipEnable` feature is enabled, and a shader object is bound to any graphics
stage, then `vkCmdSetDepthClipEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07634
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08664
  If the `VK_EXT_sample_locations` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleLocationsEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07635
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled then `vkCmdSetColorBlendAdvancedEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-rasterizerDiscardEnable-09416
  If the `VK_EXT_blend_operation_advanced` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then at least one of `vkCmdSetColorBlendEquationEXT` and `vkCmdSetColorBlendAdvancedEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07636
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled then `vkCmdSetProvokingVertexModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08665
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetProvokingVertexModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07637
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08666
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonMode` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08667**
  
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08668**
  
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07638**
  
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08669**
  
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonMode` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08670**
  
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command
If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STENCIL_KHR` dynamic state enabled then `vkCmdSetLineStippleKHR` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetLineStippleEnableEXT` in the current command buffer set `stippledLineEnable` to `VK_TRUE`, then `vkCmdSetLineStippleEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT` dynamic state enabled then `vkCmdSetDepthClipNegativeOneToOneEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `depthClipControl` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetDepthClipNegativeOneToOneEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV` dynamic state enabled then `vkCmdSetViewportWScalingEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_NV_clip_space_w_scaling` extension is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetViewportWScalingEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic state enabled then `vkCmdSetViewportSwizzleNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If the `VK_NV_viewport_swizzle` extension is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetViewportSwizzleNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` dynamic state enabled then `vkCmdSetCoverageToColorEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageToColorEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV` dynamic state enabled then `vkCmdSetCoverageModulationModeNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageModulationModeNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` dynamic state enabled then `vkCmdSetCoverageModulationTableEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08679**

  If the *VK_NV_framebuffer_mixed_samples* extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to *vkCmdSetRasterizerDiscardEnable* in the current command buffer set *rasterizerDiscardEnable* to *VK_FALSE*, and the most recent call to *vkCmdSetCoverageModulationModeNV* in the current command buffer set *coverageModulationMode* to any value other than *VK_COVERAGE_MODULATION_MODE_NONE_NV*, then *vkCmdSetCoverageModulationTableEnableNV* must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07646**

  If the bound graphics pipeline state was created with the *VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV* dynamic state enabled then *vkCmdSetCoverageModulationTableEnableNV* must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08680**

  If the *VK_NV_framebuffer_mixed_samples* extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to *vkCmdSetRasterizerDiscardEnable* in the current command buffer set *rasterizerDiscardEnable* to *VK_FALSE*, and the most recent call to *vkCmdSetCoverageModulationTableEnableNV* in the current command buffer set *coverageModulationTableEnable* to *VK_TRUE*, then *vkCmdSetCoverageModulationTableEnableNV* must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07647**

  If the bound graphics pipeline state was created with the *VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV* dynamic state enabled then *vkCmdSetShadingRateImageEnableNV* must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-pipelineFragmentShadingRate-09238**

  If the *pipelineFragmentShadingRate* feature is enabled, and a shader object is bound to the *VK_SHADER_STAGE_FRAGMENT_BIT* stage, and the most recent call to *vkCmdSetRasterizerDiscardEnable* in the current command buffer set *rasterizerDiscardEnable* to *VK_FALSE*, then *vkCmdSetFragmentShadingRateKHR* must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08681**

  If the *shadingRateImage* feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to *vkCmdSetRasterizerDiscardEnable* in the current command buffer set *rasterizerDiscardEnable* to *VK_FALSE*, then *vkCmdSetShadingRateImageEnableNV* must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07648**

  If the bound graphics pipeline state was created with the *VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV* dynamic state enabled then *vkCmdSetRepresentativeFragmentTestEnableNV* must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If the `representativeFragmentTest` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRepresentativeFragmentTestEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV` dynamic state enabled then `vkCmdSetCoverageReductionModeNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `coverageReductionMode` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageReductionModeNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last call to `vkCmdSetColorBlendEnableEXT` set `pColorBlendEnables` for any attachment to `VK_TRUE`, then for those attachments in the subpass the corresponding image view’s format features must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must follow the rules for a zero-attachment subpass.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and neither the
VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are enabled, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-09211
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, or a shader object is bound to any graphics stage, and the current render pass instance includes a VkMultisampledRenderToSingleSampledInfoEXT structure with multisampledRenderToSingleSampledEnable equal to VK_TRUE, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT must be the same as the rasterizationSamples member of that structure

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-firstAttachment-07476
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls must specify an enable for all active color attachments in the current subpass

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-rasterizerDiscardEnable-09417
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls must specify an enable for all active color attachments in the current subpass

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-firstAttachment-07477
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then vkCmdSetColorBlendEquationEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEquationEXT calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-rasterizerDiscardEnable-09418
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and both the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE and there are color attachments bound, then vkCmdSetColorBlendEquationEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEquationEXT calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-firstAttachment-07478
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-rasterizerDiscardEnable-09419**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-firstAttachment-07479**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled then `vkCmdSetColorBlendAdvancedEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendAdvancedEXT` calls must specify the advanced blend equations for all active color attachments in the current subpass where blending is enabled

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-advancedBlendMaxColorAttachments-07480**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled and the last calls to `vkCmdSetColorBlendEnableEXT` and `vkCmdSetColorBlendAdvancedEXT` have enabled advanced blending, then the number of active color attachments in the current subpass must not exceed `advancedBlendMaxColorAttachments`

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-primitivesGeneratedQueryWithNonZeroStreams-07481**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to `vkCmdSetRasterizationStreamEXT` must have set the `rasterizationStream` to zero

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsPerPixel-07482**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` must equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsPerPixel-07483**
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07484**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07485**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.sampleLocationGridSize.width` in the last call to `vkCmdSetSampleLocationsEXT` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07486**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.sampleLocationGridSize.height` in the last call to `vkCmdSetSampleLocationsEXT` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07487**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, the fragment shader code must not statically use the extended instruction `InterpolateAtSample`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07936**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` in the
bound graphics pipeline is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then, `sampleLocationsInfo.sampleLocationGridSize.width` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07937**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` in the bound graphics pipeline is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then, `sampleLocationsInfo.sampleLocationGridSize.height` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07938**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` in the bound graphics pipeline is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then, `sampleLocationsInfo.sampleLocationsPerPixel` must equal `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-coverageModulationTableEnable-07488**
  If a shader object is bound to any graphics stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` state enabled, and the last call to `vkCmdSetCoverageModulationTableEnableNV` set `coverageModulationTableEnable` to `VK_TRUE`, then the `coverageModulationTableCount` parameter in the last call to `vkCmdSetCoverageModulationTableNV` must equal the current `rasterizationSamples` divided by the number of color samples in the current subpass.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-rasterizationSamples-07489**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if current subpass has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled in the currently bound pipeline state, then the current `rasterizationSamples` must be the same as the sample count of the depth/stencil attachment.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-coverageToColorEnable-07490**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` state enabled and the last call to `vkCmdSetCoverageToColorEnableNV` set `coverageToColorEnable` to `VK_TRUE`, then the current `coverageToColorLocation` have a color attachment at the location selected by the last call to `vkCmdSetCoverageToColorLocationNV`, with a `VkFormat` of `VK_FORMAT_R8_UINT`, `VK_FORMAT_R8_SINT`, `VK_FORMAT_R16_UINT`, `VK_FORMAT_R16_SINT`, `VK_FORMAT_R32_UINT`, or `VK_FORMAT_R32_SINT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-rasterizerDiscardEnable-09420**
If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the last call to `vkCmdSetCoverageToColorEnableNV` set the `coverageToColorEnable` to `VK_TRUE`, then the current subpass **must** have a color attachment at the location selected by the last call to `vkCmdSetCoverageToColorLocationNV` `coverageToColorLocation`, with a `VkFormat` of `VK_FORMAT_R8_UINT`, `VK_FORMAT_R8_SINT`, `VK_FORMAT_R16_UINT`, `VK_FORMAT_R16_SINT`, `VK_FORMAT_R32_UINT`, or `VK_FORMAT_R32_SINT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-coverageReductionMode-07491**
  If this `VK_NV_coverage_reduction_mode` extension is enabled, the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, the current `coverageReductionMode` `coverageReductionMode`, then the current `rasterizationSamples`, and the sample counts for the color and depth/stencil attachments (if the subpass has them) **must** be a valid combination returned by `vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-07492**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic state enabled, then the bound graphics pipeline **must** have been created with `VkPipelineViewportSwizzleStateCreateInfoNV` `viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-07493**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportSwizzleNV` **must** be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-09421**
  If the `VK_NV_viewport_swizzle` extension is enabled, and a shader object is bound to any graphics stage, then the `viewportCount` parameter in the last call to `vkCmdSetViewportSwizzleNV` **must** be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-rasterizationSamples-07494**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if the current subpass has any color attachments and `rasterizationSamples` of the last call to `vkCmdSetRasterizationSamplesEXT` is greater than the number of color samples, then the pipeline `sampleShadingEnable` **must** be `VK_FALSE`.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-stippledLineEnable-07495**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is...
VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR, then the `stippedRectangularLines` feature must be enabled

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-stippledLineEnable-07496**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or
  `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current
  `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is
  `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR`, then the `stippledBresenhamLines` feature must
  be enabled

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-stippledLineEnable-07497**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or
  `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current
  `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is
  `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR`, then the `stippledSmoothLines` feature
  must be enabled

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-stippledLineEnable-07498**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or
  `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current
  `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is
  `VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR`, then the `stippledRectangularLines` feature
  must be enabled and `VkPhysicalDeviceLimits::strictLines` must be `VK_TRUE`

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-conservativePointAndLineRasterization-07499**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled,
  `conservativePointAndLineRasterization` is not supported, and the effective primitive
  topology output by the last pre-rasterization shader stage is a line or point, then the
  `conservativeRasterizationMode` set by the last call to `vkCmdSetConservativeRasterizationModeEXT`
  must be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-stage-07073**
  If the currently bound pipeline was created with the
  `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages`
  set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`,
  `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then Mesh
  Shader Queries must not be active

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08877**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` dynamic state
  `vkCmdSetAttachmentFeedbackLoopEnableEXT` must have been called and not
  subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07850**
  If dynamic state was inherited from
VkCommandBufferInheritanceViewportScissorInfoNV, it **must** be set in the current command buffer prior to this drawing command

- **VID-vkCmdDrawMeshTasksIndirectCountEXT-None-08684**
  If there is no bound graphics pipeline, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_VERTEX_BIT**

- **VID-vkCmdDrawMeshTasksIndirectCountEXT-None-08685**
  If there is no bound graphics pipeline, and the **tessellationShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT**

- **VID-vkCmdDrawMeshTasksIndirectCountEXT-None-08686**
  If there is no bound graphics pipeline, and the **tessellationShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT**

- **VID-vkCmdDrawMeshTasksIndirectCountEXT-None-08687**
  If there is no bound graphics pipeline, and the **geometryShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_GEOMETRY_BIT**

- **VID-vkCmdDrawMeshTasksIndirectCountEXT-None-08688**
  If there is no bound graphics pipeline, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_FRAGMENT_BIT**

- **VID-vkCmdDrawMeshTasksIndirectCountEXT-None-08689**
  If there is no bound graphics pipeline, and the **taskShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_TASK_BIT_EXT**

- **VID-vkCmdDrawMeshTasksIndirectCountEXT-None-08690**
  If there is no bound graphics pipeline, and the **meshShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_MESH_BIT_EXT**

- **VID-vkCmdDrawMeshTasksIndirectCountEXT-None-08693**
  If there is no bound graphics pipeline, and at least one of the **taskShader** and **meshShader** features is enabled, one of the **VK_SHADER_STAGE_VERTEX_BIT** or **VK_SHADER_STAGE_MESH_BIT_EXT** stages **must** have a valid **VkShaderEXT** bound, and the other **must** have no **VkShaderEXT** bound

- **VID-vkCmdDrawMeshTasksIndirectCountEXT-None-08694**
  If there is no bound graphics pipeline, and both the **taskShader** and **meshShader** features are enabled, and a valid **VkShaderEXT** is bound to the the **VK_SHADER_STAGE_MESH_BIT_EXT** stage, and that **VkShaderEXT** was created without the **VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT** flag, a valid **VkShaderEXT** **must** be bound to the **VK_SHADER_STAGE_TASK_BIT_EXT** stage

- **VID-vkCmdDrawMeshTasksIndirectCountEXT-None-08695**
  If there is no bound graphics pipeline, and both the **taskShader** and **meshShader** features are enabled, and a valid **VkShaderEXT** is bound to the **VK_SHADER_STAGE_MESH_BIT_EXT** stage, and that **VkShaderEXT** was created with the **VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT** flag, there **must** be no **VkShaderEXT** bound to the **VK_SHADER_STAGE_TASK_BIT_EXT** stage
If there is no bound graphics pipeline, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, there **must** be no `VkShaderEXT` bound to either the `VK_SHADER_STAGE_TASK_BIT_EXT` stage or the `VK_SHADER_STAGE_MESH_BIT_EXT` stage.

If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, then all shaders created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag in the same `vkCreateShadersEXT` call **must** also be bound.

If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, any stages in between stages whose shaders which did not create a shader with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag as part of the same `vkCreateShadersEXT` call **must** not have any `VkShaderEXT` bound.

All bound graphics shader objects **must** have been created with identical or identically defined push constant ranges.

All bound graphics shader objects **must** have been created with identical or identically defined arrays of descriptor set layouts.

If the current render pass instance was begun with `vkCmdBeginRendering` and a `VkRenderingInfo::colorAttachmentCount` equal to 1, a color attachment with a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, and a fragment shader is bound, it **must** not declare the `DepthReplacing` or `StencilRefReplacingEXT` execution modes.

If the `attachmentFeedbackLoopDynamicState` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` **must** be `VK_FALSE`.

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpStencilAttachmentReadEXT`, the `writeMask` parameter in the last call to `vkCmdSetStencilWriteMask` **must** be 0.
If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the corresponding element of the `pColorWriteMasks` parameter of `vkCmdSetColorWriteMaskEXT` must either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, and `VK_COLOR_COMPONENT_B_BIT`, or none of them.

If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of `Location` for any output attachment statically used in the Fragment Execution Model executed by this command must be less than `maxFragmentDualSrcAttachments`.

If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, the value of each element of `VkRenderingAttachmentLocationInfoKHR::pColorAttachmentLocations` set by `vkCmdSetRenderingAttachmentLocationsKHR` must match the value set for the corresponding element in the currently bound pipeline.

If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, input attachment index mappings in the currently bound pipeline must match those set for the current render pass instance via `VkRenderingInputAttachmentIndexInfoKHR`.

If the bound graphics pipeline was created with `VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT`, the current render pass must have begun with `vkCmdBeginRendering` with the `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT` flag.

The bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`.

Transform Feedback Queries must not be active.

Primitives Generated Queries must not be active.

The `pipelineStatistics` member used to create any active Pipeline Statistics Query must...
not contain VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT, VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT, VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT, VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT, VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT, VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT, VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT, VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT, or VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-buffer-02708
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-offset-02710
  offset must be a multiple of 4

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-02711
  commandBuffer must not be a protected command buffer

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-02714
  If countBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-02715
  countBuffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBufferOffset-02716
  countBufferOffset must be a multiple of 4

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-02717
  The count stored in countBuffer must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBufferOffset-04129
  (countBufferOffset + sizeof(uint32_t)) must be less than or equal to the size of countBuffer

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-04445
  If drawIndirectCount is not enabled this function must not be used

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-stride-07096
  stride must be a multiple of 4 and must be greater than or equal to sizeof (VkDrawMeshTasksIndirectCommandEXT)

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-maxDrawCount-07097
  If maxDrawCount is greater than or equal to 1, ((stride × (maxDrawCount - 1)) + offset + sizeof (VkDrawMeshTasksIndirectCommandEXT)) must be less than or equal to the size of buffer

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-07098
  If the count stored in countBuffer is equal to 1, (offset + sizeof (VkDrawMeshTasksIndirectCommandEXT)) must be less than or equal to the size of buffer
If the count stored in `countBuffer` is greater than 1, \((\text{stride} \times (\text{drawCount} - 1) + \text{offset} + \text{sizeof}(VkDrawMeshTasksIndirectCommandEXT))\) must be less than or equal to the size of `buffer`.

The current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` must contain a shader stage using the `MeshEXT Execution Model`.

### Valid Usage (Implicit)

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-buffer-parameter**
  
  `buffer` must be a valid `VkBuffer` handle.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-parameter**
  
  `countBuffer` must be a valid `VkBuffer` handle.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-renderpass**
  
  This command must only be called inside of a render pass instance.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-videocoding**
  
  This command must only be called outside of a video coding scope.

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-commonparent**
  
  Each of `buffer`, `commandBuffer`, and `countBuffer` must have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

21.6. Programmable Cluster Culling Shading

In this drawing approach, cluster are generated by the cluster culling shader stage. It operates similarly to dispatching compute as the shaders make use of workgroups.

To record a cluster culling shader drawing command, call:

```c
// Provided by VK_HUAWEI_cluster_culling_shader
void vkCmdDrawClusterHUAWEI(  
    VkCommandBuffer commandBuffer,  
    uint32_t groupCountX,  
    uint32_t groupCountY,  
    uint32_t groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of `groupCountX*groupCountY*groupCountZ` local workgroup is assembled. Note that the cluster culling shader pipeline only accepts `vkCmdDrawClusterHUAWEI` and `vkCmdDrawClusterIndirectHUAWEI` as drawing commands.

### Valid Usage

- **VUID-vkCmdDrawClusterHUAWEI-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawClusterHUAWEI-magFilter-09598**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`.

- **VUID-vkCmdDrawClusterHUAWEI-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawClusterHUAWEI-mipmapMode-09599**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawClusterHUAWEI-mipmapMode-09599**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.
If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and reductionMode equal to either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT

- VUID-vkCmdDrawClusterHUAWEI-unnormalizedCoordinates-09635
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view's levelCount and layerCount must be 1

- VUID-vkCmdDrawClusterHUAWEI-unnormalizedCoordinates-09636
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view's viewType must be VK_IMAGE_VIEW_TYPE_1D or VK_IMAGE_VIEW_TYPE_2D

- VUID-vkCmdDrawClusterHUAWEI-None-06479
  If a VkImageView is sampled with depth comparison, the image view's format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- VUID-vkCmdDrawClusterHUAWEI-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdDrawClusterHUAWEI-None-07888
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-vkCmdDrawClusterHUAWEI-None-02692
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it must not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- VUID-vkCmdDrawClusterHUAWEI-None-02693
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawClusterHUAWEI-filterCubicMinmax-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2
If the `cubicRangeClamp` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM`.

Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.

If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have `VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights` equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

Any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in `Pipeline Layout Compatibility`.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkShaderEXT`.
**VkPipeline** or the **VkDescriptorSetLayout** array used to create the current **VkShaderEXT**, as described in **Pipeline Layout Compatibility**

- **VUID-vkCmdDrawClusterHUAWEI-maintenance4-08602**
  If the **maintenance4** feature is not enabled, then for each push constant that is statically used by a **bound shader**, a push constant value **must** have been set for the same pipeline bind point, with a **VkPipelineLayout** that is compatible for push constants, with the **VkPipelineLayout** used to create the current **VkPipeline** or the **VkDescriptorSetLayout** and **VkPushConstantRange** arrays used to create the current **VkShaderEXT**, as described in **Pipeline Layout Compatibility**

- **VUID-vkCmdDrawClusterHUAWEI-None-08114**
  Descriptors in each bound descriptor set, specified via **vkCmdBindDescriptorSets**, **must** be valid as described by **descriptor validity** if they are statically used by the **VkPipeline** bound to the pipeline bind point used by this command and the bound **VkPipeline** was not created with **VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**

- **VUID-vkCmdDrawClusterHUAWEI-None-08115**
  If the descriptors used by the **VkPipeline** bound to the pipeline bind point were specified via **vkCmdBindDescriptorSets**, the bound **VkPipeline** **must** have been created without **VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**

- **VUID-vkCmdDrawClusterHUAWEI-None-08116**
  Descriptors in bound descriptor buffers, specified via **vkCmdSetDescriptorBufferOffsetsEXT**, **must** be valid if they are dynamically used by the **VkPipeline** bound to the pipeline bind point used by this command and the bound **VkPipeline** was created with **VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**

- **VUID-vkCmdDrawClusterHUAWEI-None-08604**
  Descriptors in bound descriptor buffers, specified via **vkCmdSetDescriptorBufferOffsetsEXT**, **must** be valid if they are dynamically used by any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDrawClusterHUAWEI-None-08117**
  If the descriptors used by the **VkPipeline** bound to the pipeline bind point were specified via **vkCmdSetDescriptorBufferOffsetsEXT**, the bound **VkPipeline** **must** have been created with **VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**

- **VUID-vkCmdDrawClusterHUAWEI-None-08119**
  If a descriptor is dynamically used with a **VkPipeline** created with **VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**, the descriptor memory **must** be resident

- **VUID-vkCmdDrawClusterHUAWEI-None-08605**
  If a descriptor is dynamically used with a **VkShaderEXT** created with a **VkDescriptorSetLayout** that was created with **VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**, the descriptor memory **must** be resident

- **VUID-vkCmdDrawClusterHUAWEI-None-08606**
  If the **shaderObject** feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command

- **VUID-vkCmdDrawClusterHUAWEI-None-08608**
If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDrawClusterHUAWEI-None-08609**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

- **VUID-vkCmdDrawClusterHUAWEI-None-08610**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

- **VUID-vkCmdDrawClusterHUAWEI-None-08611**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDrawClusterHUAWEI-None-08607**
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdDrawClusterHUAWEI-uniformBuffers-06935**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawClusterHUAWEI-None-08612**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawClusterHUAWEI-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or
VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawClusterHUAWEI-None-08613**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawClusterHUAWEI-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource.

- **VUID-vkCmdDrawClusterHUAWEI-None-06550**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C_{aC_b} conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

- **VUID-vkCmdDrawClusterHUAWEI-ConstOffset-06551**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C_{aC_b} conversion, that object must not use the ConstOffset and Offset operands.

- **VUID-vkCmdDrawClusterHUAWEI-viewType-07752**
  If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation.

- **VUID-vkCmdDrawClusterHUAWEI-format-07753**
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match.

- **VUID-vkCmdDrawClusterHUAWEI-OpImageWrite-08795**
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- **VUID-vkCmdDrawClusterHUAWEI-OpImageWrite-08796**
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components.

- **VUID-vkCmdDrawClusterHUAWEI-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- **VUID-vkCmdDrawClusterHUAWEI-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- **VUID-vkCmdDrawClusterHUAWEI-SampledType-04471**
If a \texttt{VkImageView} with a \texttt{VkFormat} that has a component width less than 64-bit is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction \textbf{must} have a \texttt{Width} of 32.

- VUID-vkCmdDrawClusterHUAWEI-SampledType-04472
  If a \texttt{VkBufferView} with a \texttt{VkFormat} that has a 64-bit component width is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction \textbf{must} have a \texttt{Width} of 64.

- VUID-vkCmdDrawClusterHUAWEI-SampledType-04473
  If a \texttt{VkBufferView} with a \texttt{VkFormat} that has a component width less than 64-bit is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction \textbf{must} have a \texttt{Width} of 32.

- VUID-vkCmdDrawClusterHUAWEI-sparseImageInt64Atomics-04474
  If the \texttt{sparseImageInt64Atomics} feature is not enabled, \texttt{VkImage} objects created with the \texttt{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT} flag \textbf{must} not be accessed by atomic instructions through an \texttt{OpTypeImage} with a \texttt{SampledType} with a \texttt{Width} of 64 by this command.

- VUID-vkCmdDrawClusterHUAWEI-sparseImageInt64Atomics-04475
  If the \texttt{sparseImageInt64Atomics} feature is not enabled, \texttt{VkBuffer} objects created with the \texttt{VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT} flag \textbf{must} not be accessed by atomic instructions through an \texttt{OpTypeImage} with a \texttt{SampledType} with a \texttt{Width} of 64 by this command.

- VUID-vkCmdDrawClusterHUAWEI-OpImageWeightedSampleQCOM-06971
  If \texttt{OpImageWeightedSampleQCOM} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM}.

- VUID-vkCmdDrawClusterHUAWEI-OpImageWeightedSampleQCOM-06972
  If \texttt{OpImageWeightedSampleQCOM} uses a \texttt{VkImageView} as a sample weight image as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM}.

- VUID-vkCmdDrawClusterHUAWEI-OpImageBoxFilterQCOM-06973
  If \texttt{OpImageBoxFilterQCOM} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM}.

- VUID-vkCmdDrawClusterHUAWEI-OpImageBlockMatchSSDQCOM-06974
  If \texttt{OpImageBlockMatchSSDQCOM} is used to read from a \texttt{VkImageView} as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM}.

- VUID-vkCmdDrawClusterHUAWEI-OpImageBlockMatchSADQCOM-06975
  If \texttt{OpImageBlockMatchSADQCOM} is used to read from a \texttt{VkImageView} as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM}.

- VUID-vkCmdDrawClusterHUAWEI-OpImageBlockMatchSADQCOM-06976
  If \texttt{OpImageBlockMatchSADQCOM} or \texttt{OpImageBlockMatchSSDQCOM} is used to read from a reference image as result of this command, then the specified reference coordinates \textbf{must} not fail integer texel coordinate validation.
If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, or `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format must be a single-component format.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

Any shader invocation executed by this command must terminate.

If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM`, `VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written.

The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set.
If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.

Input attachment views accessed in a dynamic render pass with a `InputAttachmentIndex` referenced by `VkRenderingInputAttachmentIndexInfoKHR`, or no `InputAttachmentIndex` if `VkRenderingInputAttachmentIndexInfoKHR:pDepthInputAttachmentIndex` or `VkRenderingInputAttachmentIndexInfoKHR:pStencilInputAttachmentIndex` are NULL, **must** be created with a `VkImageView` that is compatible with the corresponding color, depth, or stencil attachment in `VkRenderingInfo`.

Input attachment views accessed in a dynamic render pass via a shader object **must** have an `InputAttachmentIndex` if both `VkRenderingInputAttachmentIndexInfoKHR:pDepthInputAttachmentIndex` and `VkRenderingInputAttachmentIndexInfoKHR:pStencilInputAttachmentIndex` are non-NULL.

If an input attachment view accessed in a dynamic render pass via a shader object has an `InputAttachmentIndex`, the `InputAttachmentIndex` **must** match an index in `VkRenderingInputAttachmentIndexInfoKHR`.

Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command.

If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_COLOR_BIT` and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it **must** not be accessed in any way other than as an attachment by this command.

If a depth attachment is written by any prior command in this subpass or by the load,
store, or resolve operations for this subpass, it is not in the
\texttt{VK\_IMAGE\_LAYOUT\_ATTACHMENT\_FEEDBACK\_LOOP\_OPTIMAL\_EXT} image layout, and either:

\begin{itemize}
  \item the \texttt{VK\_PIPELINE\_CREATE\_DEPTH\_STENCIL\_ATTACHMENT\_FEEDBACK\_LOOP\_BIT\_EXT} is set on the
    currently bound pipeline or
  \item the last call to \texttt{vkCmdSetAttachmentFeedbackLoopEnableEXT} included
    \texttt{VK\_IMAGE\_ASPECT\_DEPTH\_BIT} and
    \begin{itemize}
      \item there is no currently bound graphics pipeline or
      \item the currently bound graphics pipeline was created with
        \texttt{VK\_DYNAMIC\_STATE\_ATTACHMENT\_FEEDBACK\_LOOP\_ENABLE\_EXT} it \textbf{must} not be accessed
        in any way other than as an attachment by this command
    \end{itemize}
\end{itemize}

\textbf{VUID-vkCmdDrawClusterHUAWEI-None-09002}

If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the \texttt{VK\_IMAGE\_LAYOUT\_ATTACHMENT\_FEEDBACK\_LOOP\_OPTIMAL\_EXT} image layout, and either:

\begin{itemize}
  \item the \texttt{VK\_PIPELINE\_CREATE\_DEPTH\_STENCIL\_ATTACHMENT\_FEEDBACK\_LOOP\_BIT\_EXT} is set on the
    currently bound pipeline or
  \item the last call to \texttt{vkCmdSetAttachmentFeedbackLoopEnableEXT} included
    \texttt{VK\_IMAGE\_ASPECT\_STENCIL\_BIT} and
    \begin{itemize}
      \item there is no currently bound graphics pipeline or
      \item the currently bound graphics pipeline was created with
        \texttt{VK\_DYNAMIC\_STATE\_ATTACHMENT\_FEEDBACK\_LOOP\_ENABLE\_EXT} it \textbf{must} not be accessed
        in any way other than as an attachment by this command
    \end{itemize}
\end{itemize}

\textbf{VUID-vkCmdDrawClusterHUAWEI-None-09003}

If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it \textbf{must} not be accessed in any way other than as an attachment, storage image, or sampled image by this command.

\textbf{VUID-vkCmdDrawClusterHUAWEI-None-06539}

If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command \textbf{must} not write to that image subresource as an attachment.

\textbf{VUID-vkCmdDrawClusterHUAWEI-None-06886}

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, \textbf{depth writes must be disabled}

\textbf{VUID-vkCmdDrawClusterHUAWEI-None-06887}

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back \texttt{writeMask} are not zero, and stencil test is enabled, \textbf{all stencil ops must be \texttt{VK\_STENCIL\_OP\_KEEP}}

\textbf{VUID-vkCmdDrawClusterHUAWEI-None-07831}

If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT} dynamic state enabled then \texttt{vkCmdSetViewport} \textbf{must} have been called and not subsequently \texttt{invalidated} in the current command buffer prior to this drawing command.

\textbf{VUID-vkCmdDrawClusterHUAWEI-None-07832}
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR` dynamic state enabled then `vkCmdSetScissor` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterHUAWEI-None-07833
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state enabled then `vkCmdSetLineWidth` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterHUAWEI-None-08617
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, `vkCmdSetLineWidth` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterHUAWEI-None-08618
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, `vkCmdSetLineWidth` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterHUAWEI-None-08619
  If a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, `vkCmdSetLineWidth` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterHUAWEI-None-07834
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state enabled then `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterHUAWEI-None-08620
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBiasEnable` in the current command buffer set `depthBiasEnable` to `VK_TRUE`, `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterHUAWEI-None-07835
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled then `vkCmdSetBlendConstants` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer set any element of `pColorBlendEnables` to `VK_TRUE`, and the most recent call to `vkCmdSetColorBlendEquationEXT` in the current command buffer set the same element of `pColorBlendEquations` to a `VkColorBlendEquationEXT` structure with any `VkBlendFactor` member with a value of `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, `vkCmdSetBlendConstants` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, and if the current `depthBoundsTestEnable` state is `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBoundsTestEnable` in the current command buffer set `depthBoundsTestEnable` to `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilCompareMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilCompareMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilWriteMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilWriteMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilWriteMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilReference` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.

If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetSampleLocationsEnableEXT` in the current command buffer set `sampleLocationsEnable` to `VK_TRUE`, `vkCmdSetSampleLocationsEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled then `vkCmdSetCullMode` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08627**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCullMode` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-07841**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled then `vkCmdSetFrontFace` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08628**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetFrontFace` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-07843**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthTestEnable` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08629**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthTestEnable` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-07844**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled then `vkCmdSetDepthWriteEnable` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08630**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthWriteEnable` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-07845**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled then `vkCmdSetDepthCompareOp` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
• VUID-vkCmdDrawClusterHUAWEI-None-08631
  If a shader object is bound to any graphics stage, and the most recent call to
  `vkCmdSetRasterizerDiscardEnable` in the current command buffer set
  `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to
  `vkCmdSetDepthTestEnable` in the current command buffer set `depthTestEnable` to `VK_TRUE`,
  then `vkCmdSetDepthCompareOp` must have been called and not subsequently invalidated
  in the current command buffer prior to this drawing command

• VUID-vkCmdDrawClusterHUAWEI-None-07846
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then
  `vkCmdSetDepthBoundsTestEnable` must have been called and not subsequently invalidated
  in the current command buffer prior to this drawing command

• VUID-vkCmdDrawClusterHUAWEI-None-08632
  If a shader object is bound to any graphics stage, and the `depthBounds` feature is enabled,
  and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command
  buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `vkCmdSetDepthBoundsTestEnable`
  must have been called and not subsequently invalidated in the current command buffer
  prior to this drawing command

• VUID-vkCmdDrawClusterHUAWEI-None-07847
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then
  `vkCmdSetStencilTestEnable` must have been called and not subsequently invalidated
  in the current command buffer prior to this drawing command

• VUID-vkCmdDrawClusterHUAWEI-None-08633
  If a shader object is bound to any graphics stage, and the most recent call to
  `vkCmdSetRasterizerDiscardEnable` in the current command buffer set
  `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetStencilTestEnable` must have been
  called and not subsequently invalidated in the current command buffer prior to this
  drawing command

• VUID-vkCmdDrawClusterHUAWEI-None-07848
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_OP`
  dynamic state enabled then `vkCmdSetStencilOp` must have been called and not subsequently
  invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawClusterHUAWEI-None-08634
  If a shader object is bound to any graphics stage, and the most recent call to
  `vkCmdSetRasterizerDiscardEnable` in the current command buffer set
  `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to
  `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to
  `VK_TRUE`, then `vkCmdSetStencilOp` must have been called and not subsequently invalidated
  in the current command buffer prior to this drawing command

• VUID-vkCmdDrawClusterHUAWEI-viewportCount-03417
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`
  dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled,
  then `vkCmdSetViewportWithCount` must have been called in the current command buffer
prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- **VUID-vkCmdDrawClusterHUAWEI-scissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- **VUID-vkCmdDrawClusterHUAWEI-viewportCount-03419**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`

- **VUID-vkCmdDrawClusterHUAWEI-None-08635**
  If a shader object is bound to any graphics stage, then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`

- **VUID-vkCmdDrawClusterHUAWEI-viewportCount-04137**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawClusterHUAWEI-viewportCount-04138**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawClusterHUAWEI-None-09232**
  If the `VK_NV_clip_space_w_scaling` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetViewportWScalingEnableNV` in the current command buffer set `viewportWScalingEnable` to `VK_TRUE`, then `vkCmdSetViewportWScalingNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08636**
  If the `VK_NV_clip_space_w_scaling` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetViewportWScalingEnableNV` in
the current command buffer set \texttt{viewportWScalingEnable} to \texttt{VK_TRUE}, then the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWScalingNV} \textbf{must} be greater than or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}

- **VUID-vkCmdDrawClusterHUAWEI-viewportCount-04139**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT} dynamic state enabled, but not the \texttt{VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV} dynamic state enabled, then the bound graphics pipeline \textbf{must} have been created with \texttt{VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}

- **VUID-vkCmdDrawClusterHUAWEI-viewportCount-04140**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT} \texttt{and} \texttt{VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV} dynamic states enabled then the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportShadingRatePaletteNV} \textbf{must} be greater than or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}

- **VUID-vkCmdDrawClusterHUAWEI-shadingRateImage-09233**
  If the \texttt{shadingRateImage} feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetCoarseSampleOrderNV} \textbf{must} have been called and not subsequently \texttt{invalidated} in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-shadingRateImage-09234**
  If the \texttt{shadingRateImage} feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and the most recent call to \texttt{vkCmdSetShadingRateImageEnableNV} in the current command buffer set \texttt{shadingRateImageEnable} to \texttt{VK_TRUE}, then \texttt{vkCmdSetViewportShadingRatePaletteNV} \textbf{must} have been called and not subsequently \texttt{invalidated} in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08637**
  If the \texttt{shadingRateImage} feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and the most recent call to \texttt{vkCmdSetShadingRateImageEnableNV} in the current command buffer set \texttt{shadingRateImageEnable} to \texttt{VK_TRUE}, then the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportShadingRatePaletteNV} \textbf{must} be greater than or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}

- **VUID-vkCmdDrawClusterHUAWEI-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT} dynamic state enabled and a \texttt{VkPipelineViewportSwizzleStateCreateInfoNV} structure chained from \texttt{VkPipelineViewportStateCreateInfo}, then the bound graphics pipeline \textbf{must} have been created with \texttt{VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount} greater or
equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawClusterHUAWEI-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline **must** have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawClusterHUAWEI-None-07878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV` dynamic state enabled then `vkCmdSetExclusiveScissorEnableNV` **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-07879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` dynamic state enabled then `vkCmdSetExclusiveScissorNV` **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-exclusiveScissor-09235**
  If the `exclusiveScissor` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetExclusiveScissorEnableNV` **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08638**
  If the `exclusiveScissor` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetExclusiveScissorEnableNV` in the current command buffer set any element of `pExclusiveScissorEnables` to `VK_TRUE`, then `vkCmdSetExclusiveScissorNV` **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08639**
  If a shader object is bound to any graphics stage, then `vkCmdSetRasterizerDiscardEnable` **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08640**
If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
data
rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthBiasEnable must have been
called and not subsequently invalidated in the current command buffer prior to this
drawing command

• VUID-vkCmdDrawClusterHUAWEI-logicOp-04878
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT
dynamic state enabled then vkCmdSetLogicOpEXT must have been called and not subsequently
invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawClusterHUAWEI-None-08641
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent
call to vkCmdSetRasterizerDiscardEnable in the current command buffer set
data
rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetLogicOpEnableEXT set logicOpEnable to VK_TRUE, then vkCmdSetLogicOpEXT
must have been called and not subsequently invalidated in the current command buffer
prior to this drawing command

• VUID-vkCmdDrawClusterHUAWEI-primitiveFragmentShadingRateWithMultipleViewports-04552
If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the
bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT
dynamic state enabled, and any of the shader stages of the bound graphics pipeline write
to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have been
called in the current command buffer prior to this drawing command, and the
viewportCount parameter of vkCmdSetViewportWithCount must be 1

• VUID-vkCmdDrawClusterHUAWEI-primitiveFragmentShadingRateWithMultipleViewports-08642
If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, and any
shader object bound to a graphics stage writes to the PrimitiveShadingRateKHR built-in, then
vkCmdSetViewportWithCount must have been called in the current command
buffer prior to this drawing command, and the viewportCount parameter of
vkCmdSetViewportWithCount must be 1

• VUID-vkCmdDrawClusterHUAWEI-blendEnable-04727
If rasterization is not disabled in the bound graphics pipeline, then for each color
attachment in the subpass, if the corresponding image view’s format features do not
contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of
the corresponding element of the pAttachments member of pColorBlendState must be
VK_FALSE

• VUID-vkCmdDrawClusterHUAWEI-None-08643
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent
call to vkCmdSetRasterizerDiscardEnable in the current command buffer set
data
rasterizerDiscardEnable to VK_FALSE, then for each color attachment in the render pass, if
the corresponding image view’s format features do not contain
VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the corresponding member of
pColorBlendEnables in the most recent call to vkCmdSetColorBlendEnableEXT in the current
command buffer that affected that attachment index must have been VK_FALSE
If rasterization is not disabled in the bound graphics pipeline, and none of the following is enabled:

- the `VK_AMD_mixed_attachment_samples` extension
- the `VK_NV_framebuffer_mixed_samples` extension
- the `multisampledRenderToSingleSampled` feature

then `rasterizationSamples` for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and none of the following is enabled:

- the `VK_AMD_mixed_attachment_samples` extension
- the `VK_NV_framebuffer_mixed_samples` extension
- the `multisampledRenderToSingleSampled` feature

then the most recent call to `vkCmdSetRasterizationSamplesEXT` in the current command buffer must have set `rasterizationSamples` to be the same as the number of samples for the current render pass color and/or depth/stencil attachments

If a shader object is bound to any graphics stage, the current render pass instance must have been begun with `vkCmdBeginRendering`

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment
• VUID-vkCmdDrawClusterHUAWEI-imageView-06176
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

• VUID-vkCmdDrawClusterHUAWEI-imageView-06177
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

• VUID-vkCmdDrawClusterHUAWEI-viewMask-06178
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::viewMask equal to VkRenderingInfo::viewMask

• VUID-vkCmdDrawClusterHUAWEI-colorAttachmentCount-06179
  If the dynamicRenderingUnusedAttachments feature is not enabled and the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::colorAttachmentCount equal to VkRenderingInfo::colorAttachmentCount

• VUID-vkCmdDrawClusterHUAWEI-dynamicRenderingUnusedAttachments-08910
  If the dynamicRenderingUnusedAttachments feature is not enabled, and the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with an imageView not equal to VK_NULL_HANDLE must have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound graphics pipeline

• VUID-vkCmdDrawClusterHUAWEI-dynamicRenderingUnusedAttachments-08912
  If the dynamicRenderingUnusedAttachments feature is not enabled, and the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with an imageView equal to VK_NULL_HANDLE must have the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound pipeline equal to VK_FORMAT_UNDEFINED

• VUID-vkCmdDrawClusterHUAWEI-dynamicRenderingUnusedAttachments-08911
  If the dynamicRenderingUnusedAttachments feature is enabled, and the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with an imageView not equal to VK_NULL_HANDLE must have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound graphics pipeline, or the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats, if it exists, must be VK_FORMAT_UNDEFINED

• VUID-vkCmdDrawClusterHUAWEI-colorAttachmentCount-09362
If the current render pass instance was begun with `vkCmdBeginRendering`, with a `VkRenderingInfo::colorAttachmentCount` equal to 1, there is no shader object bound to any graphics stage, and a color attachment with a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, each element of the `VkRenderingInfo::pColorAttachments` array with a `resolveImageView` not equal to `VK_NULL_HANDLE` must have been created with an image created with a `VkExternalFormatANDROID::externalFormat` value equal to the `VkExternalFormatANDROID::externalFormat` value used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawClusterHUAWEI-None-09363**
  If there is no shader object bound to any graphics stage, the current render pass instance was begun with `vkCmdBeginRendering` and a `VkRenderingInfo::colorAttachmentCount` equal to 1, and a color attachment with a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with an image created with a `VkExternalFormatANDROID::externalFormat` value equal to the `VkExternalFormatANDROID::externalFormat` value used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawClusterHUAWEI-None-09364**
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, then `vkCmdSetColorBlendEnableEXT` must have set the blend enable to `VK_FALSE` prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-09365**
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled, then `vkCmdSetRasterizationSamplesEXT` must have set `rasterizationSamples` to `VK_SAMPLE_COUNT_1_BIT` prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-09366**
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` resolve mode, then `vkCmdSetColorBlendEnableEXT` must have set blend enable to `VK_FALSE` prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-rasterizationSamples-09367**
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` resolve mode, then `vkCmdSetRasterizationSamplesEXT` must have set `rasterizationSamples` to `VK_SAMPLE_COUNT_1_BIT` prior to this drawing command.
If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero \texttt{VkExternalFormatANDROID::externalFormat} value and with the \texttt{VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR} dynamic state enabled, then \texttt{vkCmdSetFragmentShadingRateKHR} must have set \texttt{pFragmentSize->width} to 1 prior to this drawing command.

If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero \texttt{VkExternalFormatANDROID::externalFormat} value and with the \texttt{VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR} dynamic state enabled, then \texttt{vkCmdSetFragmentShadingRateKHR} must have set \texttt{pFragmentSize->height} to 1 prior to this drawing command.

If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the \texttt{VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID} resolve mode, then \texttt{vkCmdSetFragmentShadingRateKHR} must have set \texttt{pFragmentSize->width} to 1 prior to this drawing command.

If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the \texttt{VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID} resolve mode, then \texttt{vkCmdSetFragmentShadingRateKHR} must have set \texttt{pFragmentSize->height} to 1 prior to this drawing command.

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT} dynamic state enabled then \texttt{vkCmdSetColorWriteEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the \texttt{colorWriteEnable} feature is enabled on the device, and a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetColorWriteEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT} dynamic state enabled then the \texttt{attachmentCount} parameter of \texttt{vkCmdSetColorWriteEnableEXT} must be greater than or equal to the \texttt{VkPipelineColorBlendStateCreateInfo::attachmentCount} of the currently bound graphics pipeline.

If the \texttt{colorWriteEnable} feature is enabled on the device, and a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetColorWriteEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT} dynamic state enabled then the \texttt{attachmentCount} parameter of \texttt{vkCmdSetColorWriteEnableEXT} must be greater than or equal to the \texttt{VkPipelineColorBlendStateCreateInfo::attachmentCount} of the currently bound graphics pipeline.
If the `colorWriteEnable` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `attachmentCount` parameter of most recent call to `vkCmdSetColorWriteEnableEXT` in the current command buffer must be greater than or equal to the number of color attachments in the current render pass instance.

- **VUID-vkCmdDrawClusterHUAWEI-None-07751**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`.

- **VUID-vkCmdDrawClusterHUAWEI-None-07880**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-09236**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-08648**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-07881**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-08649**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-dynamicRenderingUnusedAttachments-08913**
If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawClusterHUAWEI-dynamicRenderingUnusedAttachments-08914
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawClusterHUAWEI-dynamicRenderingUnusedAttachments-08915
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawClusterHUAWEI-dynamicRenderingUnusedAttachments-08916
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawClusterHUAWEI-dynamicRenderingUnusedAttachments-08917
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawClusterHUAWEI-dynamicRenderingUnusedAttachments-08918
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawClusterHUAWEI-imageView-06183
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdDrawClusterHUAWEI-imageView-06184
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

- **VUID-vkCmdDrawClusterHUAWEI-colorAttachmentCount-06185**
  If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawClusterHUAWEI-pDepthAttachment-06186**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawClusterHUAWEI-pStencilAttachment-06187**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawClusterHUAWEI-multisampledRenderToSingleSampled-07285**
  If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `rasterizationSamples` for the currently bound graphics pipeline.

- **VUID-vkCmdDrawClusterHUAWEI-multisampledRenderToSingleSampled-07286**
  If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

2530
If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

If this command has been called inside a render pass instance started with `vkCmdBeginRendering`, and the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must...
not have been created with a non-zero value in 

\( Vk\text{PipelineRasterizationStateStreamCreateInfoEXT}\cdot raserizationStream \)

• **VUID-vkCmdDrawClusterHUAWEI-None-07619**
  If the bound graphics pipeline state was created with the
  \( Vk\text{DynamicStateTessellationDomainOrigin}\_\text{EXT} \)
  dynamic state enabled then
  \( vkc\text{mdSetTessellationDomainOriginEXT must} \)
  have been called and not subsequently
  invalidated in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawClusterHUAWEI-None-07620**
  If the bound graphics pipeline state was created with the
  \( Vk\text{DynamicStateDepthClampEnable}\_\text{EXT} \)
  dynamic state enabled then
  \( vkc\text{mdSetDepthClampEnableEXT must} \)
  have been called and not subsequently
  invalidated in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawClusterHUAWEI-None-09237**
  If a shader object is bound to the \( Vk\text{ShaderStageTessellationEvaluation}\_\text{Bit} \)
  stage, then
  \( vkc\text{mdSetTessellationDomainOriginEXT must} \)
  have been called and not subsequently
  invalidated in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawClusterHUAWEI-None-08650**
  If the \( depth\text{Clamp} \)
  feature is enabled, and a shader object is bound to any graphics stage,
  and the most recent call to \( vkc\text{mdSetRasterizerDiscardEnable} \)
  in the current command buffer set \( rasterizerDiscardEnable \)
  to \( VK\text{.F}a\ell \), then \( vkc\text{mdSetDepthClampEnableEXT must} \)
  have been called and not subsequently
  invalidated in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawClusterHUAWEI-None-07621**
  If the bound graphics pipeline state was created with the
  \( Vk\text{DynamicStatePolygonMode}\_\text{EXT} \)
  dynamic state enabled then
  \( vkc\text{mdSetPolygonModeEXT must} \)
  have been called and not subsequently
  invalidated in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawClusterHUAWEI-None-08651**
  If a shader object is bound to any graphics stage, and the most recent call to
  \( vkc\text{mdSetRasterizerDiscardEnable} \)
  in the current command buffer set \( rasterizerDiscardEnable \)
  to \( VK\text{.F}a\ell \), then \( vkc\text{mdSetPolygonModeEXT must} \)
  have been called and not subsequently
  invalidated in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawClusterHUAWEI-None-07622**
  If the bound graphics pipeline state was created with the
  \( Vk\text{DynamicStateRasterizationSamples}\_\text{EXT} \)
  dynamic state enabled then
  \( vkc\text{mdSetRasterizationSamplesEXT must} \)
  have been called and not subsequently
  invalidated in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawClusterHUAWEI-None-08652**
  If a shader object is bound to any graphics stage, and the most recent call to
  \( vkc\text{mdSetRasterizerDiscardEnable} \)
  in the current command buffer set \( rasterizerDiscardEnable \)
  to \( VK\text{.F}a\ell \), then \( vkc\text{mdSetRasterizationSamplesEXT must} \)
  have been called and not subsequently
  invalidated in the current command buffer prior to this drawing command
• VUID-vkCmdDrawClusterHUAWEI-None-07623
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterHUAWEI-None-08653
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterHUAWEI-None-07624
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterHUAWEI-alphaToCoverageEnable-08919
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

• VUID-vkCmdDrawClusterHUAWEI-None-08654
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterHUAWEI-alphaToCoverageEnable-08920
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

• VUID-vkCmdDrawClusterHUAWEI-None-07625
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterHUAWEI-None-08655
  If the `alphaToOne` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterHUAWEI-None-07626
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled then `vkCmdSetLogicOpEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-08656**
  If the `logicOp` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-07627**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-08657**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and there are color attachments bound, then `vkCmdSetColorBlendEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-07628**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-08658**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` for any attachment set that attachment's value in `pColorBlendEnables` to `VK_TRUE`, then `vkCmdSetColorBlendEquationEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-07629**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-08659**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorWriteMaskEXT` must have been called and not subsequently invalidated in
the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-07630**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` dynamic state enabled then `vkCmdSetRasterizationStreamEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08660**
  If the `geometryStreams` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, then `vkCmdSetRasterizationStreamEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-07631**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetConservativeRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08661**
  If the `VK_EXT_conservative_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetConservativeRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-07632**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT` dynamic state enabled then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08662**
  If the `VK_EXT_conservative_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetConservativeRasterizationModeEXT` in the current command buffer set `conservativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-07633**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClipEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08663**
  If the `depthClipEnable` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetDepthClipEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command
invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-07634**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08664**
  If the `VK_EXT_sample_locations` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleLocationsEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-07635**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled then `vkCmdSetColorBlendAdvancedEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08665**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleLocationsEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-07636**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled then `vkCmdSetProvokingVertexModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08666**
  If the `VK_EXT_provoking_vertex` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetProvokingVertexModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-07637**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08666**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, then vkCmdSetLineRasterizationModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterHUAWEI-None-08667
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, then vkCmdSetLineRasterizationModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterHUAWEI-None-08668
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineRasterizationModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterHUAWEI-None-07638
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT dynamic state enabled then vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterHUAWEI-None-08669
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, then vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterHUAWEI-None-08670
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, then vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterHUAWEI-None-08671
If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterHUAWEI-None-07849
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_KHR dynamic state enabled then vkCmdSetLineStippleKHR must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterHUAWEI-None-08672
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetLineStippleEnableEXT in the current command buffer set stippledLineEnable to VK_TRUE, then vkCmdSetLineStippleEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterHUAWEI-None-07639
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT dynamic state enabled then vkCmdSetDepthClipNegativeOneToOneEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterHUAWEI-None-08673
  If the depthClipControl feature is enabled, and a shader object is bound to any graphics stage, then vkCmdSetDepthClipNegativeOneToOneEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterHUAWEI-None-07640
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV dynamic state enabled then vkCmdSetViewportWScalingEnableNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterHUAWEI-None-08674
  If the VK_NV_clip_space_w_scaling extension is enabled, and a shader object is bound to any graphics stage, then vkCmdSetViewportWScalingEnableNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterHUAWEI-None-07641
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV dynamic state enabled then vkCmdSetViewportSwizzleNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterHUAWEI-None-08675
If the \texttt{VK\_NV\_viewport\_swizzle} extension is enabled, and a shader object is bound to any graphics stage, then \texttt{vkCmdSetViewportSwizzleNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterHUAWEI-None-07642
  If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_COVERAGE\_TO\_COLOR\_ENABLE\_NV} dynamic state enabled then \texttt{vkCmdSetCoverageToColorEnableNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterHUAWEI-None-08676
  If the \texttt{VK\_NV\_fragment\_coverage\_to\_color} extension is enabled, and a shader object is bound to the \texttt{VK\_SHADER\_STAGE\_FRAGMENT\_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK\_FALSE}, then \texttt{vkCmdSetCoverageToColorEnableNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterHUAWEI-None-07643
  If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_COVERAGE\_TO\_COLOR\_LOCATION\_NV} dynamic state enabled then \texttt{vkCmdSetCoverageToColorLocationNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterHUAWEI-None-08677
  If the \texttt{VK\_NV\_fragment\_coverage\_to\_color} extension is enabled, and a shader object is bound to the \texttt{VK\_SHADER\_STAGE\_FRAGMENT\_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK\_FALSE}, and the most recent call to \texttt{vkCmdSetCoverageToColorEnableNV} in the current command buffer set \texttt{coverageToColorEnable} to \texttt{VK\_TRUE}, then \texttt{vkCmdSetCoverageToColorLocationNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterHUAWEI-None-07644
  If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_COVERAGE\_MODULATION\_MODE\_NV} dynamic state enabled then \texttt{vkCmdSetCoverageModulationModeNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterHUAWEI-None-08678
  If the \texttt{VK\_NV\_framebuffer\_mixed\_samples} extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK\_FALSE}, then \texttt{vkCmdSetCoverageModulationModeNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterHUAWEI-None-07645
  If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_COVERAGE\_MODULATION\_TABLE\_ENABLE\_NV} dynamic state enabled then \texttt{vkCmdSetCoverageModulationTableEnableNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If the \texttt{VK_NV_framebuffer_mixed_samples} extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and the most recent call to \texttt{vkCmdSetCoverageModulationModeNV} in the current command buffer set \texttt{coverageModulationMode} to any value other than \texttt{VK_COVERAGE_MODULATION_MODE_NONE_NV}, then \texttt{vkCmdSetCoverageModulationTableEnableNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV} dynamic state enabled then \texttt{vkCmdSetCoverageModulationTableNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the \texttt{VK_NV_framebuffer_mixed_samples} extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and the most recent call to \texttt{vkCmdSetCoverageModulationTableEnableNV} in the current command buffer set \texttt{coverageModulationTableEnable} to \texttt{VK_TRUE}, then \texttt{vkCmdSetCoverageModulationTableNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV} dynamic state enabled then \texttt{vkCmdSetShadingRateImageEnableNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the \texttt{pipelineFragmentShadingRate} feature is enabled, and a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetFragmentShadingRateKHR} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the \texttt{shadingRateImage} feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetShadingRateImageEnableNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV} dynamic state enabled then \texttt{vkCmdSetRepresentativeFragmentTestEnableNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the \texttt{shadingRateImage} feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetShadingRateImageEnableNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If the `representativeFragmentTest` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRepresentativeFragmentTestEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-07649**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV` dynamic state enabled then `vkCmdSetCoverageReductionModeNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-08683**
  If the `coverageReductionMode` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageReductionModeNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-pColorBlendEnables-07470**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last call to `vkCmdSetColorBlendEnableEXT` set `pColorBlendEnables` for any attachment to `VK_TRUE`, then for those attachments in the subpass the corresponding image view's format features must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`.

- **VUID-vkCmdDrawClusterHUAWEI-rasterizationSamples-07471**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must follow the rules for a zero-attachment subpass.

- **VUID-vkCmdDrawClusterHUAWEI-samples-07472**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline.

- **VUID-vkCmdDrawClusterHUAWEI-samples-07473**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdDrawClusterHUAWEI-rasterizationSamples-07474**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are
enabled, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must be the same as the current subpass color and/or depth/stencil attachments

- **VUID-vkCmdDrawClusterHUAWEI-None-09211**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, or a shader object is bound to any graphics stage, and the current render pass instance includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must be the same as the `rasterizationSamples` member of that structure

- **VUID-vkCmdDrawClusterHUAWEI-firstAttachment-07476**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass

- **VUID-vkCmdDrawClusterHUAWEI-rasterizerDiscardEnable-09417**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass

- **VUID-vkCmdDrawClusterHUAWEI-firstAttachment-07477**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled

- **VUID-vkCmdDrawClusterHUAWEI-rasterizerDiscardEnable-09418**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled

- **VUID-vkCmdDrawClusterHUAWEI-firstAttachment-07478**
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic state enabled then
vkCmdSetColorWriteMaskEXT must have been called in the current command buffer
prior to this drawing command, and the attachments specified by the firstAttachment
attachmentCount parameters of vkCmdSetColorWriteMaskEXT calls must specify the color
write mask for all active color attachments in the current subpass

• VUID-vkCmdDrawClusterHUAWEI-rasterizerDiscardEnable-09419
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent
request to vkCmdSetRasterizerDiscardEnable in the current command buffer set
eraserizerDiscardEnable to VK_FALSE, then vkCmdSetColorWriteMaskEXT must have been
called in the current command buffer prior to this drawing command, and the
attachments specified by the firstAttachment and attachmentCount parameters of
vkCmdSetColorWriteMaskEXT calls must specify the color write mask for all active color
attachments in the current subpass

• VUID-vkCmdDrawClusterHUAWEI-firstAttachment-07479
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT dynamic state enabled then
vkCmdSetColorBlendAdvancedEXT must have been called in the current command buffer
prior to this drawing command, and the attachments specified by the firstAttachment and
attachmentCount parameters of vkCmdSetColorBlendAdvancedEXT calls must specify the advanced blend equations for all active color attachments in the current subpass where
blending is enabled

• VUID-vkCmdDrawClusterHUAWEI-advancedBlendMaxColorAttachments-07480
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT and VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT
dynamic states enabled and the last calls to vkCmdSetColorBlendEnableEXT and
vkCmdSetColorBlendAdvancedEXT have enabled advanced blending, then the number of
active color attachments in the current subpass must not exceed
advancedBlendMaxColorAttachments

• VUID-vkCmdDrawClusterHUAWEI-primitivesGeneratedQueryWithNonZeroStreams-07481
If the primitivesGeneratedQueryWithNonZeroStreams feature is not enabled and the
VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, and the bound graphics pipeline
was created with VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT state enabled, the last call to
vkCmdSetRasterizationStreamEXT must have set the rasterizationStream to zero

• VUID-vkCmdDrawClusterHUAWEI-sampleLocationsPerPixel-07482
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the
VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state disabled, then the
sampleLocationsPerPixel member of pSampleLocationsInfo in the last call to
vkCmdSetSampleLocationsEXT must equal the rasterizationSamples member of the
VkPipelineMultisampleStateCreateInfo structure the bound graphics pipeline has been
created with

• VUID-vkCmdDrawClusterHUAWEI-sampleLocationsPerPixel-07483
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the
VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, then the
sampleLocationsPerPixel member of pSampleLocationsInfo in the last call to 
vkCmdSetSampleLocationsEXT must equal the rasterizationSamples parameter of the last call to vkCmdSetRasterizationSamplesEXT

• VUID-vkCmdDrawClusterHUAWEI-sampleLocationsEnable-07484
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

• VUID-vkCmdDrawClusterHUAWEI-sampleLocationsEnable-07485
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, then the sampleLocationsInfo.sampleLocationGridSize.width in the last call to vkCmdSetSampleLocationsEXT must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.width as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

• VUID-vkCmdDrawClusterHUAWEI-sampleLocationsEnable-07486
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, then the sampleLocationsInfo.sampleLocationGridSize.height in the last call to vkCmdSetSampleLocationsEXT must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.height as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

• VUID-vkCmdDrawClusterHUAWEI-sampleLocationsEnable-07487
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, the fragment shader code must not statically use the extended instruction InterpolateAtSample

• VUID-vkCmdDrawClusterHUAWEI-sampleLocationsEnable-07936
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable in the bound graphics pipeline is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, then, sampleLocationsInfo.sampleLocationGridSize.width must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.width as returned by
**vkGetPhysicalDeviceMultisamplePropertiesEXT** with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to **vkCmdSetRasterizationSamplesEXT**

- **VUID-vkCmdDrawClusterHUAWEI-sampleLocationsEnable-07937**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` in the bound graphics pipeline is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then, `sampleLocationsInfo.sampleLocationGridSize.height` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to **vkCmdSetRasterizationSamplesEXT**

- **VUID-vkCmdDrawClusterHUAWEI-sampleLocationsEnable-07938**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` in the bound graphics pipeline is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then, `sampleLocationsInfo.sampleLocationsPerPixel` must equal `rasterizationSamples` in the last call to **vkCmdSetRasterizationSamplesEXT**

- **VUID-vkCmdDrawClusterHUAWEI-coverageModulationTableEnable-07488**
  If a shader object is bound to any graphics stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` state enabled, and the last call to `vkCmdSetCoverageModulationTableEnableNV` set `coverageModulationTableEnable` to `VK_TRUE`, then the `coverageModulationTableCount` parameter in the last call to `vkCmdSetCoverageModulationTableNV` must equal the current `rasterizationSamples` divided by the number of color samples in the current subpass

- **VUID-vkCmdDrawClusterHUAWEI-rasterizationSamples-07489**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if current subpass has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled in the currently bound pipeline state, then the current `rasterizationSamples` must be the same as the sample count of the depth/stencil attachment

- **VUID-vkCmdDrawClusterHUAWEI-coverageToColorEnable-07490**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` state enabled and the last call to `vkCmdSetCoverageToColorEnableNV` set `coverageToColorEnable` to `VK_TRUE`, then the current subpass must have a color attachment at the location selected by the last call to `vkCmdSetCoverageToColorLocationNV coverageToColorLocation`, with a `VkFormat` of `VK_FORMAT_R8_UINT`, `VK_FORMAT_R8_SINT`, `VK_FORMAT_R16_UINT`, `VK_FORMAT_R16_SINT`, `VK_FORMAT_R32_UINT`, or `VK_FORMAT_R32_SINT`

- **VUID-vkCmdDrawClusterHUAWEI-rasterizerDiscardEnable-09420**
  If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the last call to
vkCmdSetCoverageToColorEnableNV set the coverageToColorEnable to VK_TRUE, then the current subpass must have a color attachment at the location selected by the last call to
vkCmdSetCoverageToColorLocationNV coverageToColorLocation, with a VkFormat of
VK_FORMAT_R8_UINT, VK_FORMAT_R8_SINT, VK_FORMAT_R16_UINT, VK_FORMAT_R16_SINT,
VK_FORMAT_R32_UINT, or VK_FORMAT_R32_SINT

• VUID-vkCmdDrawClusterHUAWEI-coverageReductionMode-07491
  If this VK_NV_coverage_reduction_mode extension is enabled, the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV and
VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT states enabled, the current coverage reduction mode coverageReductionMode, then the current rasterizationSamples, and the sample counts for the color and depth/stencil attachments (if the subpass has them) must be a valid combination returned by
vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV

• VUID-vkCmdDrawClusterHUAWEI-viewportCount-07492
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the
VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV dynamic state enabled, then the bound graphics pipeline must have been created with
VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to
vkCmdSetViewportWithCount

• VUID-vkCmdDrawClusterHUAWEI-viewportCount-07493
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV dynamic states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportSwizzleNV must be greater than or equal to the viewportCount parameter in the last call to
vkCmdSetViewportWithCount

• VUID-vkCmdDrawClusterHUAWEI-viewportCount-09421
  If the VK_NV_viewport_swizzle extension is enabled, and a shader object is bound to any graphics stage, then the viewportCount parameter in the last call to
vkCmdSetViewportSwizzleNV must be greater than or equal to the viewportCount parameter in the last call to
vkCmdSetViewportWithCount

• VUID-vkCmdDrawClusterHUAWEI-rasterizationSamples-07494
  If the VK_NV_framebuffer_mixed_samples extension is enabled, and if the current subpass has any color attachments and rasterizationSamples of the last call to
vkCmdSetRasterizationSamplesEXT is greater than the number of color samples, then the pipeline sampleShadingEnable must be VK_FALSE

• VUID-vkCmdDrawClusterHUAWEI-stippledLineEnable-07495
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or
VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is
VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR, then the stippledRectangularLines feature must be enabled

• VUID-vkCmdDrawClusterHUAWEI-stippledLineEnable-07496

2546
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR`, then the `stippledBresenhamLines` feature **must** be enabled

- **VUID-vkCmdDrawClusterHUAWEI-stippledLineEnable-07497**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR`, then the `stippledSmoothLines` feature **must** be enabled

- **VUID-vkCmdDrawClusterHUAWEI-stippledLineEnable-07498**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR`, then the `stippledRectangularLines` feature **must** be enabled and `VkPhysicalDeviceLimits::strictLines` must be `VK_TRUE`

- **VUID-vkCmdDrawClusterHUAWEI-conservativePointAndLineRasterization-07499**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled, `conservativePointAndLineRasterization` is not supported, and the effective primitive topology output by the last pre-rasterization shader stage is a line or point, then the `conservativeRasterizationMode` set by the last call to `vkCmdSetConservativeRasterizationModeEXT` **must** be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`

- **VUID-vkCmdDrawClusterHUAWEI-stage-07073**
  If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then Mesh Shader Queries **must** not be active

- **VUID-vkCmdDrawClusterHUAWEI-None-08877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` dynamic state `vkCmdSetAttachmentFeedbackLoopEnableEXT` **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-07850**
  If dynamic state was inherited from `VkCommandBufferInheritanceViewportScissorInfoNV`, it **must** be set in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-None-08684**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** have been called in the
current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`

- VUID-vkCmdDrawClusterHUAWEI-None-08685
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`

- VUID-vkCmdDrawClusterHUAWEI-None-08686
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- VUID-vkCmdDrawClusterHUAWEI-None-08687
  If there is no bound graphics pipeline, and the `geometryShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`

- VUID-vkCmdDrawClusterHUAWEI-None-08688
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`

- VUID-vkCmdDrawClusterHUAWEI-None-08689
  If there is no bound graphics pipeline, and the `taskShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TASK_BIT_EXT`

- VUID-vkCmdDrawClusterHUAWEI-None-08690
  If there is no bound graphics pipeline, and the `meshShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_MESH_BIT_EXT`

- VUID-vkCmdDrawClusterHUAWEI-None-08693
  If there is no bound graphics pipeline, and at least one of the `taskShader` and `meshShader` features is enabled, one of the `VK_SHADER_STAGE_VERTEX_BIT` or `VK_SHADER_STAGE_MESH_BIT_EXT` stages must have a valid `VkShaderEXT` bound, and the other must have no `VkShaderEXT` bound

- VUID-vkCmdDrawClusterHUAWEI-None-08694
  If there is no bound graphics pipeline, and both the `taskShader` and `meshShader` features are enabled, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created without the `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, a valid `VkShaderEXT` must be bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage

- VUID-vkCmdDrawClusterHUAWEI-None-08695
  If there is no bound graphics pipeline, and both the `taskShader` and `meshShader` features are enabled, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created with the `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, there must be no `VkShaderEXT` bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage

- VUID-vkCmdDrawClusterHUAWEI-None-08696
  If there is no bound graphics pipeline, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, there must be no `VkShaderEXT` bound to either the `VK_SHADER_STAGE_TASK_BIT_EXT` stage or the `VK_SHADER_STAGE_MESH_BIT_EXT` stage
If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, then all shaders created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag in the same `vkCreateShadersEXT` call must also be bound.

If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, any stages in between stages whose shaders which did not create a shader with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag as part of the same `vkCreateShadersEXT` call must not have any `VkShaderEXT` bound.

All bound graphics shader objects must have been created with identical or identically defined push constant ranges.

All bound graphics shader objects must have been created with descriptor set layouts.

If the current render pass instance was begun with `vkCmdBeginRendering` and a `VkRenderingInfo::colorAttachmentCount` equal to 1, a color attachment with a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, and a fragment shader is bound, it must not declare the `DepthReplacing` or `StencilRefReplacingEXT` execution modes.

If the attachmentFeedbackLoopDynamicState feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnableEXT` must be `VK_FALSE`.

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpStencilAttachmentReadEXT`, the `writeMask` parameter in the last call to `vkCmdSetStencilWriteMaskEXT` must be 0.

If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the corresponding element of the `pColorWriteMasks` parameter of `vkCmdSetColorWriteMaskEXT` must either include all of
VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, and VK_COLOR_COMPONENT_B_BIT, or none of them

• VUID-vkCmdDrawClusterHUAWEI-maxFragmentDualSrcAttachments-09239
If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments

• VUID-vkCmdDrawClusterHUAWEI-None-09548
If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, the value of each element of VkRenderingAttachmentLocationInfoKHR::pColorAttachmentLocations set by vkCmdSetRenderingAttachmentLocationsKHR must match the value set for the corresponding element in the currently bound pipeline

• VUID-vkCmdDrawClusterHUAWEI-None-09549
If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, input attachment index mappings in the currently bound pipeline must match those set for the current render pass instance via VkRenderingInputAttachmentIndexInfoKHR

• VUID-vkCmdDrawClusterHUAWEI-None-09642
If the current render pass was begun with vkCmdBeginRendering with the VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT flag, the bound graphics pipeline must have been created with VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT

• VUID-vkCmdDrawClusterHUAWEI-None-09643
If the bound graphics pipeline was created with VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT, the current render pass must have begun with vkCmdBeginRendering with the VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT flag

• VUID-vkCmdDrawClusterHUAWEI-stage-06480
The bound graphics pipeline must not have been created with the VkPipelineShaderStageCreateInfo::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT

• VUID-vkCmdDrawClusterHUAWEI-None-07074
Transform Feedback Queries must not be active

• VUID-vkCmdDrawClusterHUAWEI-None-07075
Primitives Generated Queries must not be active

• VUID-vkCmdDrawClusterHUAWEI-pipelineStatistics-07076
The pipelineStatistics member used to create any active Pipeline Statistics Query must not contain VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT, VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT, VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT, VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT, VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT,
VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT,
VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT,
VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT,
VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT

- VUID-vkCmdDrawClusterHUAWEI-None-07819
  The pipelineStatistics member used to create any active Pipeline Statistics Query must not contain VK_QUERY_PIPELINE_STATISTIC_TASK_SHADER_INVOCATIONS_BIT_EXT, or VK_QUERY_PIPELINE_STATISTIC_MESH_SHADER_INVOCATIONS_BIT_EXT

- VUID-vkCmdDrawClusterHUAWEI-groupCountX-07820
  groupCountX must be less than or equal to VkPhysicalDeviceClusterCullingShaderPropertiesHUAWEI::maxWorkGroupCount[0]

- VUID-vkCmdDrawClusterHUAWEI-groupCountY-07821
  groupCountY must be less than or equal to VkPhysicalDeviceClusterCullingShaderPropertiesHUAWEI::maxWorkGroupCount[1]

- VUID-vkCmdDrawClusterHUAWEI-groupCountZ-07822
  groupCountZ must be less than or equal to VkPhysicalDeviceClusterCullingShaderPropertiesHUAWEI::maxWorkGroupCount[2]

- VUID-vkCmdDrawClusterHUAWEI-ClusterCullingHUAWEI-07823
  The current pipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS must contain a shader stage using the ClusterCullingHUAWEI Execution Model

Valid Usage (Implicit)

- VUID-vkCmdDrawClusterHUAWEI-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDrawClusterHUAWEI-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDrawClusterHUAWEI-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdDrawClusterHUAWEI-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawClusterHUAWEI-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To record an indirect cluster culling drawing command, call:

```c
// Provided by VK_HUAWEI_cluster_culling_shader
define void vkCmdDrawClusterIndirectHUAWEI(  
    VkCommandBuffer commandBuffer,  
    VkBuffer buffer,  
    VkDeviceSize offset);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.

`vkCmdDrawClusterIndirectHUAWEI` behaves similarly to `vkCmdDrawClusterHUAWEI` except that the parameters are read by the device from a buffer during execution. The parameters of the dispatch are encoded in a `VkDispatchIndirectCommand` structure taken from `buffer` starting at `offset`. Note the cluster culling shader pipeline only accepts `vkCmdDrawClusterHUAWEI` and `vkCmdDrawClusterIndirectHUAWEI` as drawing commands.

### Valid Usage

- **VUID-vkCmdDrawClusterIndirectHUAWEI-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-magFilter-09598**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`.

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view’s `levelCount` and `layerCount` must be 1.

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view’s `viewType` must be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`.

If a `VkImageView` is sampled with `depth comparison`, the image view’s format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer’s format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by
VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- **VUID-vkCmdDrawClusterIndirectHUAWEI-cubicRangeClamp-09212**
  If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command **must** not have a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM

- **VUID-vkCmdDrawClusterIndirectHUAWEI-reductionMode-09213**
  Any VkImageView being sampled with a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM as a result of this command **must** sample with VK_FILTER_CUBIC_EXT

- **VUID-vkCmdDrawClusterIndirectHUAWEI-selectableCubicWeights-09214**
  If the selectableCubicWeights feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command **must** have VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM

- **VUID-vkCmdDrawClusterIndirectHUAWEI-selectableCubicWeights-09214**
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command **must** only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- **VUID-vkCmdDrawClusterIndirectHUAWEI-OpTypeImage-07027**
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- **VUID-vkCmdDrawClusterIndirectHUAWEI-OpTypeImage-07028**
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- **VUID-vkCmdDrawClusterIndirectHUAWEI-OpTypeImage-07029**
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- **VUID-vkCmdDrawClusterIndirectHUAWEI-OpTypeImage-07030**
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features **must** contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08600**
  For each set n that is statically used by a bound shader, a descriptor set **must** have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT , as described in Pipeline Layout Compatibility

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value
must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawClusterIndirectHUAWEI-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08115
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08116
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08604
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08117
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08119
  If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08605
  If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline
bind point used by this command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08607
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

• VUID-vkCmdDrawClusterIndirectHUAWEI-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDrawClusterIndirectHUAWEI-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this
command accesses a storage buffer, and that stage was created without enabling either
\texttt{VK\_PIPELINE\_ROBUSTNESS\_BUFFER\_BEHAVIOR\_ROBUST\_BUFFER\_ACCESS\_EXT}
 or
\texttt{VK\_PIPELINE\_ROBUSTNESS\_BUFFER\_BEHAVIOR\_ROBUST\_BUFFER\_ACCESS\_2\_EXT} for storageBuffers,
and the \texttt{robustBufferAccess} feature is not enabled, that stage \textbf{must} not access values
outside of the range of the buffer as specified in the descriptor set bound to the same
pipeline bind point

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08613
  If the \texttt{robustBufferAccess} feature is not enabled, and any \texttt{VkShaderEXT} bound to a stage
  corresponding to the pipeline bind point used by this command accesses a storage buffer,
it \textbf{must} not access values outside of the range of the buffer as specified in the descriptor
  set bound to the same pipeline bind point

- VUID-vkCmdDrawClusterIndirectHUAWEI-commandBuffer-02707
  If \texttt{commandBuffer} is an unprotected command buffer and \texttt{protectedNoFault} is not supported,
  any resource accessed by \texttt{bound shaders} \textbf{must} not be a protected resource

- VUID-vkCmdDrawClusterIndirectHUAWEI-ConstOffset-06550
  If a \texttt{bound shader} accesses a \texttt{VkSampler} or \texttt{VkImageView} object that enables \texttt{sampler YC}
  \texttt{C\_\_\_\_} conversion, that object \textbf{must} only be used with \texttt{OpImageSample*} or \texttt{OpImageSparseSample*}
  instructions

- VUID-vkCmdDrawClusterIndirectHUAWEI-ConstOffset-06551
  If a \texttt{bound shader} accesses a \texttt{VkSampler} or \texttt{VkImageView} object that enables \texttt{sampler YC}
  \texttt{C\_\_\_\_} conversion, that object \textbf{must} not use the \texttt{ConstOffset} and \texttt{Offset} operands

- VUID-vkCmdDrawClusterIndirectHUAWEI-viewType-07752
  If a \texttt{VkImageView} is accessed as a result of this command, then the image view's \texttt{viewType}
  \textbf{must} match the \texttt{Dim} operand of the \texttt{OpTypeImage} as described in \texttt{Instruction/Sampler/Image}
  View Validation

- VUID-vkCmdDrawClusterIndirectHUAWEI-format-07753
  If a \texttt{VkImageView} is accessed as a result of this command, then the \texttt{numeric type} of the
  image view's \texttt{format} and the \texttt{Sampled Type} operand of the \texttt{OpTypeImage} \textbf{must} match

- VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageWrite-08795
  If a \texttt{VkImageView} created with a format other than \texttt{VK\_FORMAT\_A8\_UNORM\_KHR} is accessed
  using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that
  instruction \textbf{must} have at least as many components as the image view's \texttt{format}

- VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageWrite-08796
  If a \texttt{VkImageView} created with the format \texttt{VK\_FORMAT\_A8\_UNORM\_KHR} is accessed using
  \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that
  instruction \textbf{must} have four components

- VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageWrite-04469
  If a \texttt{VkBufferView} is accessed using \texttt{OpImageWrite} as a result of this command, then the
  \texttt{Type} of the \texttt{Texel} operand of that instruction \textbf{must} have at least as many components as
  the buffer view's \texttt{format}

- VUID-vkCmdDrawClusterIndirectHUAWEI-SampledType-04470
  If a \texttt{VkImageView} with a \texttt{VkFormat} that has a \texttt{64-bit component width} is accessed as a
  result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction
  \textbf{must} have a \texttt{Width} of \texttt{64}
If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`

If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`

If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`

If `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation
If \emph{OpImageWeightedSampleQCOM}, \emph{OpImageBoxFilterQCOM}, \emph{OpImageBlockMatchWindowSSDQCOM}, \emph{OpImageBlockMatchWindowSADQCOM}, \emph{OpImageBlockMatchGatherSSDQCOM}, \emph{OpImageBlockMatchGatherSADQCOM}, \emph{OpImageBlockMatchSSDQCOM}, or \emph{OpImageBlockMatchSADQCOM} uses a \emph{VkSampler} as a result of this command, then the sampler \textbf{must} have been created with \texttt{VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM}.

If any command other than \emph{OpImageWeightedSampleQCOM}, \emph{OpImageBoxFilterQCOM}, \emph{OpImageBlockMatchWindowSSDQCOM}, \emph{OpImageBlockMatchWindowSADQCOM}, \emph{OpImageBlockMatchGatherSSDQCOM}, \emph{OpImageBlockMatchGatherSADQCOM}, \emph{OpImageBlockMatchSSDQCOM}, or \emph{OpImageBlockMatchSADQCOM} uses a \emph{VkSampler} as a result of this command, then the sampler \textbf{must} not have been created with \texttt{VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM}.

If a \emph{OpImageBlockMatchWindow*QCOM} or \emph{OpImageBlockMatchGather*QCOM} instruction is used to read from an \emph{VkImageView} as a result of this command, then the image view's \texttt{format features} \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM}.

If a \emph{OpImageBlockMatchWindow*QCOM} or \emph{OpImageBlockMatchGather*QCOM} instruction is used to read from an \emph{VkImageView} as a result of this command, then the image view's \texttt{format} \textbf{must} be a single-component format.

If a \emph{OpImageBlockMatchWindow*QCOM} or \emph{OpImageBlockMatchGather*QCOM} read from a reference image as result of this command, then the specified reference coordinates \textbf{must} not fail \emph{integer texel coordinate validation}.

Any shader invocation executed by this command \textbf{must} terminate.

If a descriptor with type equal to any of \texttt{VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM}, \texttt{VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM}, \texttt{VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE}, \texttt{VK_DESCRIPTOR_TYPE_STORAGE_IMAGE}, or \texttt{VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT} is accessed as a result of this command, the image subresource identified by that descriptor \textbf{must} be in the image layout identified when the descriptor was written.

The current render pass \textbf{must} be \emph{compatible} with the \emph{renderPass} member of the \emph{VkGraphicsPipelineCreateInfo} structure specified when creating the \emph{VkPipeline} bound to \texttt{VK_PIPELINE_BIND_POINT_GRAPHICS}.

The subpass index of the current render pass \textbf{must} be equal to the \emph{subpass} member of the \emph{VkGraphicsPipelineCreateInfo} structure specified when creating the \emph{VkPipeline} bound to \texttt{VK_PIPELINE_BIND_POINT_GRAPHICS}.

If any shader statically accesses an input attachment, a valid descriptor \textbf{must} be bound to the pipeline via a descriptor set.
If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass’ `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.

Input attachment views accessed in a dynamic render pass with a `InputAttachmentIndex` referenced by `VkRenderingInputAttachmentIndexInfoKHR`, or no `InputAttachmentIndex` if `VkRenderingInputAttachmentIndexInfoKHR:pDepthInputAttachmentIndex` or `VkRenderingInputAttachmentIndexInfoKHR:pStencilInputAttachmentIndex` are NULL, **must** be created with a `VkImageView` that is compatible with the corresponding color, depth, or stencil attachment in `VkRenderingInfo`.

Input attachment views accessed in a dynamic render pass via a shader object **must** have an `InputAttachmentIndex` if both `VkRenderingInputAttachmentIndexInfoKHR:pDepthInputAttachmentIndex` and `VkRenderingInputAttachmentIndexInfoKHR:pStencilInputAttachmentIndex` are non-NULL.

If an input attachment view accessed in a dynamic render pass via a shader object has an `InputAttachmentIndex`, the `InputAttachmentIndex` **must** match an index in `VkRenderingInputAttachmentIndexInfoKHR`.

Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command.

If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_COLOR_BIT` and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it **must** not be accessed in any way other than as an attachment by this command.

If a depth attachment is written by any prior command in this subpass or by the load,
store, or resolve operations for this subpass, it is not in the
VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:

- the VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the
currently bound pipeline or
- the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included
  VK_IMAGE_ASPECT_DEPTH_BIT and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with
    VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT it must not be accessed in
    any way other than as an attachment by this command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-09002
  If a stencil attachment is written by any prior command in this subpass or by the load,
  store, or resolve operations for this subpass, it is not in the
  VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:

  - the VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the
currently bound pipeline or
  - the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included
    VK_IMAGE_ASPECT_STENCIL_BIT and
    - there is no currently bound graphics pipeline or
    - the currently bound graphics pipeline was created with
      VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT it must not be accessed in
      any way other than as an attachment by this command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-09003
  If an attachment is written by any prior command in this subpass or by the load,
  store, or resolve operations for this subpass, it must not be accessed in any way other than as an
  attachment, storage image, or sampled image by this command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-06539
  If any previously recorded command in the current subpass accessed an image
  subresource used as an attachment in this subpass in any way other than as an
  attachment, this command must not write to that image subresource as an attachment

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only
  layout for the depth aspect, depth writes must be disabled

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only
  layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is
  enabled, all stencil ops must be VK_STENCIL_OP_KEEP

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07831
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT
  dynamic state enabled then vkCmdSetViewport must have been called and not
  subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07832
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR` dynamic state enabled then `vkCmdSetScissor` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07833
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state enabled then `vkCmdSetLineWidth` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08617
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, `vkCmdSetLineWidth` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08618
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, `vkCmdSetLineWidth` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08619
  If a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, `vkCmdSetLineWidth` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07834
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state enabled then `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08620
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBiasEnable` in the current command buffer set `depthBiasEnable` to `VK_TRUE`, `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07835
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled then `vkCmdSetBlendConstants` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command
• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08621
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to 
\texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and the most recent call to 
\texttt{vkCmdSetColorBlendEnableEXT} in the current command buffer set any element of \texttt{pColorBlendEnables} to \texttt{VK_TRUE}, and the most recent call to 
\texttt{vkCmdSetColorBlendEquationEXT} in the current command buffer set the same element of \texttt{pColorBlendEquations} to a \texttt{VkColorBlendEquationEXT} structure with any \texttt{VkBlendFactor} member with a value of \texttt{VK_BLEND_FACTOR_CONSTANT_COLOR}, \texttt{VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR}, \texttt{VK_BLEND_FACTOR_CONSTANT_ALPHA}, or \texttt{VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA}, \texttt{vkCmdSetBlendConstants} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07836
If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_DEPTH_BOUNDS} dynamic state enabled, and if the current \texttt{depthBoundsTestEnable} state is \texttt{VK_TRUE}, then \texttt{vkCmdSetDepthBounds} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08622
If a shader object is bound to any graphics stage, and the most recent call to 
\texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and the most recent call to 
\texttt{vkCmdSetDepthBoundsTestEnable} in the current command buffer set \texttt{depthBoundsTestEnable} to \texttt{VK_TRUE}, then \texttt{vkCmdSetDepthBounds} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07837
If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK} dynamic state enabled, and if the current \texttt{stencilTestEnable} state is \texttt{VK_TRUE}, then \texttt{vkCmdSetStencilCompareMask} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08623
If a shader object is bound to any graphics stage, and the most recent call to 
\texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and the most recent call to 
\texttt{vkCmdSetStencilTestEnable} in the current command buffer set \texttt{stencilTestEnable} to \texttt{VK_TRUE}, \texttt{vkCmdSetStencilCompareMask} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07838
If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_STENCIL_WRITE_MASK} dynamic state enabled, and if the current \texttt{stencilTestEnable} state is \texttt{VK_TRUE}, then \texttt{vkCmdSetStencilWriteMask} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08624
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilWriteMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07839
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilReference` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08625
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilReference` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-maxMultiviewInstanceIndex-02688
If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.

• VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-02689
If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-06666
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08626
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetSampleLocationsEnableEXT` in the current command buffer set `sampleLocationsEnable` to `VK_TRUE`, then `vkCmdSetSampleLocationsEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07840
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled then `vkCmdSetCullMode` must have been called and not...
subsequently \textit{invalidated} in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08627
  If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetCullMode} \textbf{must} have been called and not subsequently \textit{invalidated} in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07841
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_FRONT_FACE} dynamic state enabled then \texttt{vkCmdSetFrontFace} \textbf{must} have been called and not subsequently \textit{invalidated} in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08628
  If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetFrontFace} \textbf{must} have been called and not subsequently \textit{invalidated} in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07843
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE} dynamic state enabled then \texttt{vkCmdSetDepthTestEnable} \textbf{must} have been called and not subsequently \textit{invalidated} in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08629
  If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetDepthTestEnable} \textbf{must} have been called and not subsequently \textit{invalidated} in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07844
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE} dynamic state enabled then \texttt{vkCmdSetDepthWriteEnable} \textbf{must} have been called and not subsequently \textit{invalidated} in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08630
  If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetDepthWriteEnable} \textbf{must} have been called and not subsequently \textit{invalidated} in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07845
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_DEPTH_COMPARE_OP} dynamic state enabled then \texttt{vkCmdSetDepthCompareOp} \textbf{must} have been called and not subsequently \textit{invalidated} in the current command buffer prior to this drawing command
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthTestEnable` in the current command buffer set `depthTestEnable` to `VK_TRUE`, then `vkCmdSetDepthCompareOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthBoundsTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the `depthBounds` feature is enabled, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `vkCmdSetDepthBoundsTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then `vkCmdSetStencilTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetStencilTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled then `vkCmdSetStencilOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, then `vkCmdSetStencilOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` must have been called in the current command buffer.
prior to this drawing command, and the viewportCount parameter of 
 vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawClusterIndirectHUAWEI-scissorCount-03418
  If the bound graphics pipeline state was created with the 
  VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the 
  VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then 
  vkCmdSetScissorWithCount must have been called in the current command buffer prior 
  to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount 
  must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-03419
  If the bound graphics pipeline state was created with both the 
  VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic 
  states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount 
  must have been called in the current command buffer prior to this drawing command, and the 
  viewportCount parameter of vkCmdSetViewportWithCount must match the 
  scissorCount parameter of vkCmdSetScissorWithCount

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08635
  If a shader object is bound to any graphics stage, then both 
  vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer 
  prior to this drawing command, and the viewportCount parameter of 
  vkCmdSetViewportWithCount must match the scissorCount parameter of 
  vkCmdSetScissorWithCount

- VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-04137
  If the bound graphics pipeline state was created with the 
  VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the 
  VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics 
  pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount 
  greater or equal to the viewportCount parameter in the last call to 
  vkCmdSetViewportWithCount

- VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-04138
  If the bound graphics pipeline state was created with the 
  VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic 
  states enabled then the viewportCount parameter in the last call to 
  vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount 
  parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-09232
  If the VK_NV_clip_space_w_scaling extension is enabled, and a shader object is bound to 
  any graphics stage, and the most recent call to vkCmdSetViewportWScalingEnableNV in 
  the current command buffer set viewportWScalingEnable to VK_TRUE, then 
  vkCmdSetViewportWScalingNV must have been called and not subsequently invalidated 
  in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08636
  If the VK_NV_clip_space_w_scaling extension is enabled, and a shader object is bound to 
  any graphics stage, and the most recent call to vkCmdSetViewportWScalingEnableNV in
the current command buffer set `viewportWScalingEnable` to `VK_TRUE`, then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-04139**
  
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-04140**
  
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-shadingRateImage-09233**
  
  If the `shadingRateImage` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoarseSampleOrderNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-shadingRateImage-09234**
  
  If the `shadingRateImage` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetShadingRateImageEnableNV` in the current command buffer set `shadingRateImageEnable` to `VK_TRUE`, then `vkCmdSetViewportShadingRatePaletteNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08637**
  
  If the `shadingRateImage` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetShadingRateImageEnableNV` in the current command buffer set `shadingRateImageEnable` to `VK_TRUE`, then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-VkPipelineViewportCreateInfo-04141**
  
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or
equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}

- **VUID-vkCmdDrawClusterIndirectHUAWEI-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT} dynamic state enabled and a \texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV} structure chained from \texttt{VkPipelineViewportStateCreateInfo}, then the bound graphics pipeline must have been created with \texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07878**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV} dynamic state enabled then \texttt{vkCmdSetExclusiveScissorEnableNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07879**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV} dynamic state enabled then \texttt{vkCmdSetExclusiveScissorNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-exclusiveScissor-09235**
  If the \texttt{exclusiveScissor} feature is enabled, and a shader object is bound to any graphics stage, then \texttt{vkCmdSetExclusiveScissorEnableNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08638**
  If the \texttt{exclusiveScissor} feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetExclusiveScissorEnableNV} in the current command buffer set any element of \texttt{pExclusiveScissorEnables} to \texttt{VK_TRUE}, then \texttt{vkCmdSetExclusiveScissorNV} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-04876**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE} dynamic state enabled then \texttt{vkCmdSetRasterizerDiscardEnable} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08639**
  If a shader object is bound to any graphics stage, then \texttt{vkCmdSetRasterizerDiscardEnable} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-04877**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE} dynamic state enabled then \texttt{vkCmdSetDepthBiasEnable} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08640**
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthBiasEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08641**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetLogicOpEnableEXT` set `logicOpEnable` to `VK_TRUE`, then `vkCmdSetLogicOpEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-primitiveFragmentShadingRateWithMultipleViewports-08642**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08643**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then for each color attachment in the render pass, if the corresponding image view’s format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding member of `pColorBlendEnables` in the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer that affected that attachment index must have been `VK_FALSE`.
If rasterization is not disabled in the bound graphics pipeline, and none of the following is enabled:

- the `VK_AMD_mixed_attachment_samples` extension
- the `VK_NV_framebuffer_mixed_samples` extension
- the `multisampledRenderToSingleSampled` feature

then `rasterizationSamples` for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and none of the following is enabled:

- the `VK_AMD_mixed_attachment_samples` extension
- the `VK_NV_framebuffer_mixed_samples` extension
- the `multisampledRenderToSingleSampled` feature

then the most recent call to `vkCmdSetRasterizationSamplesEXT` in the current command buffer must have set `rasterizationSamples` to be the same as the number of samples for the current render pass color and/or depth/stencil attachments.

If a shader object is bound to any graphics stage, the current render pass instance must have been begun with `vkCmdBeginRendering`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`viewMask` equal to `VkRenderingInfo`::`viewMask`.

If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`colorAttachmentCount` equal to `VkRenderingInfo`::`colorAttachmentCount`.

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline.

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` equal to `VK_NULL_HANDLE` must have the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` equal to `VK_FORMAT_UNDEFINED`.

If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats`, if it exists, must be `VK_FORMAT_UNDEFINED`.

If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats`, if it exists, must be `VK_FORMAT_UNDEFINED`.

If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats`, if it exists, must be `VK_FORMAT_UNDEFINED`. 

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pColorAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pColorAttachment` is `VK_IMAGE_LAYOUT_COLOR_READ_ONLY_OPTIMAL`, this command must not write any values to the color attachment.
If the current render pass instance was begun with `vkCmdBeginRendering`, with a `VkRenderingInfo::colorAttachmentCount` equal to 1, there is no shader object bound to any graphics stage, and a color attachment with a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, each element of the `VkRenderingInfo::pColorAttachments` array with a `resolveImageView` not equal to `VK_NULL_HANDLE` must have been created with an image created with a `VkExternalFormatANDROID::externalFormat` value equal to the `VkExternalFormatANDROID::externalFormat` value used to create the currently bound graphics pipeline.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-09363
  If there is no shader object bound to any graphics stage, the current render pass instance was begun with `vkCmdBeginRendering` and a `VkRenderingInfo::colorAttachmentCount` equal to 1, and a color attachment with a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with an image created with a `VkExternalFormatANDROID::externalFormat` value equal to the `VkExternalFormatANDROID::externalFormat` value used to create the currently bound graphics pipeline.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-09364
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, then `vkCmdSetColorBlendEnableEXT` must have set the blend enable to `VK_FALSE` prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-09365
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled, then `vkCmdSetRasterizationSamplesEXT` must have set `rasterizationSamples` to `VK_SAMPLE_COUNT_1_BIT` prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-09366
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` resolve mode, then `vkCmdSetColorBlendEnableEXT` must have set blend enable to `VK_FALSE` prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizationSamples-09367
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` resolve mode, then `vkCmdSetRasterizationSamplesEXT` must have set `rasterizationSamples` to `VK_SAMPLE_COUNT_1_BIT` prior to this drawing command.
If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` dynamic state enabled, then `vkCmdSetFragmentShadingRateKHR` must have set `pFragmentSize->width` to 1 prior to this drawing command.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` dynamic state enabled, then `vkCmdSetFragmentShadingRateKHR` must have set `pFragmentSize->height` to 1 prior to this drawing command.

If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` resolve mode, then `vkCmdSetFragmentShadingRateKHR` must have set `pFragmentSize->width` to 1 prior to this drawing command.

If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` resolve mode, then `vkCmdSetFragmentShadingRateKHR` must have set `pFragmentSize->height` to 1 prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `colorWriteEnable` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` dynamic state enabled, then `vkCmdSetFragmentShadingRateKHR` must have set `pFragmentSize->width` to 1 prior to this drawing command.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` dynamic state enabled, then `vkCmdSetFragmentShadingRateKHR` must have set `pFragmentSize->height` to 1 prior to this drawing command.
If the colorWriteEnable feature is enabled on the device, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to 

\text{vkCmdSetRasterizerDiscardEnable} \text{ in the current command buffer set rasterizerDiscardEnable to VK_FALSE}, then the attachmentCount parameter of most recent call to \text{vkCmdSetColorWriteEnableEXT} \text{ in the current command buffer must be greater than or equal to the number of color attachments in the current render pass instance}

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07751**
  If the bound graphics pipeline state was created with the 
  
  \text{VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT} \text{ dynamic state enabled then \text{vkCmdSetDiscardRectangleEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command for each discard rectangle in \text{VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount}}

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07880**
  If the bound graphics pipeline state was created with the 
  
  \text{VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT} \text{ dynamic state enabled then \text{vkCmdSetDiscardRectangleEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command}

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08648**
  If the \text{VK_EXT_discard_rectangles} extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to \text{vkCmdSetRasterizerDiscardEnable} \text{ in the current command buffer set rasterizerDiscardEnable to VK_FALSE}, then \text{vkCmdSetDiscardRectangleEnableEXT} \text{ must have been called and not subsequently invalidated in the current command buffer prior to this drawing command}

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07881**
  If the \text{VK_EXT_discard_rectangles} extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to \text{vkCmdSetRasterizerDiscardEnable} \text{ in the current command buffer set rasterizerDiscardEnable to VK_FALSE}, and the most recent call 
  
  \text{vkCmdSetDiscardRectangleEnableEXT} \text{ in the current command buffer set discardRectangleEnable to VK_TRUE}, then \text{vkCmdSetDiscardRectangleEnableEXT} \text{ must have been called and not subsequently invalidated in the current command buffer prior to this drawing command}

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08649**
  If the \text{VK_EXT_discard_rectangles} extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to \text{vkCmdSetRasterizerDiscardEnable} \text{ in the current command buffer set rasterizerDiscardEnable to VK_FALSE}, and the most recent call 
  
  \text{vkCmdSetDiscardRectangleEnableEXT} \text{ in the current command buffer set discardRectangleEnable to VK_TRUE}, then \text{vkCmdSetDiscardRectangleEnableEXT} \text{ must have been called and not subsequently invalidated in the current command buffer prior to this drawing command}

- **VUID-vkCmdDrawClusterIndirectHUAWEI-dynamicRenderingUnusedAttachments-08913**

2575
If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-dynamicRenderingUnusedAttachments-08914` If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-dynamicRenderingUnusedAttachments-08915` If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-dynamicRenderingUnusedAttachments-08916` If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-dynamicRenderingUnusedAttachments-08917` If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-dynamicRenderingUnusedAttachments-08918` If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06183` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06184` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06185` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06186` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06187` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06188` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06189` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL.Handle`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06190` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06191` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06192` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06193` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06194` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06195` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06196` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06197` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06198` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06199` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06200` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- `VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06201` If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL.Handle`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.
If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-colorAttachmentCount-06185**
  If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-pDepthAttachment-06186**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-pStencilAttachment-06187**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-multisampledRenderToSingleSampled-07285**
  If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `rasterizationSamples` for the currently bound graphics pipeline.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-multisampledRenderToSingleSampled-07286**
  If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.
If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

If this command has been called inside a render pass instance started with `vkCmdBeginRendering`, and the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the
VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, the bound graphics pipeline must not have been created with a non-zero value in VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07619
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT dynamic state enabled then vkCmdSetTessellationDomainOriginEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07620
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT dynamic state enabled then vkCmdSetDepthClampEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-09237
  If a shader object is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage, then vkCmdSetTessellationDomainOriginEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08650
  If the depthClamp feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthClampEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07621
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_POLYGON_MODE_EXT dynamic state enabled then vkCmdSetPolygonModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08651
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetPolygonModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07622
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT dynamic state enabled then vkCmdSetRasterizationSamplesEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08652
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetRasterizationSamplesEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07623
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08653
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07624
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-alphaToCoverageEnable-08919
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08654
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-alphaToCoverageEnable-08920
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07625
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08655
  If the `alphaToOne` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07626
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled then `vkCmdSetLogicOpEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08656**
  If the logicOp feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07627**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08657**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and there are color attachments bound, then `vkCmdSetColorBlendEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07628**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08658**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` for any attachment set that attachment's value in `pColorBlendEnables` to `VK_TRUE`, then `vkCmdSetColorBlendEquationEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07629**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08659**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorWriteMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07630**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` dynamic state enabled then `vkCmdSetRasterizationStreamEXT` _must_ have been called and not subsequently _invalidated_ in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08660**
  If the `geometryStreams` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, then `vkCmdSetRasterizationStreamEXT` _must_ have been called and not subsequently _invalidated_ in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07631**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetConservativeRasterizationModeEXT` _must_ have been called and not subsequently _invalidated_ in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08661**
  If the `VK_EXT_conservative_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetConservativeRasterizationModeEXT` _must_ have been called and not subsequently _invalidated_ in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07632**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT` dynamic state enabled then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` _must_ have been called and not subsequently _invalidated_ in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08662**
  If the `VK_EXT_conservative_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetConservativeRasterizationModeEXT` in the current command buffer set `conservativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` _must_ have been called and not subsequently _invalidated_ in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07633**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClipEnableEXT` _must_ have been called and not subsequently _invalidated_ in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08663**
  If the `depthClipEnable` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetDepthClipEnableEXT` _must_ have been called and not subsequently _invalidated_ in the current command buffer prior to this drawing command
invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07634
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT dynamic state enabled then
vkCmdSetSampleLocationsEnableEXT must have been called and not subsequently
invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08664
If the VK_EXT_sample_locations extension is enabled, and a shader object is bound to any
graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the
current command buffer set rasterizerDiscardEnable to VK_FALSE, then
vkCmdSetSampleLocationsEnableEXT must have been called and not subsequently
invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07635
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT dynamic state enabled then
vkCmdSetColorBlendAdvancedEXT must have been called and not subsequently
invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizerDiscardEnable-09416
If the VK_EXT_blend_operation_advanced extension is enabled, and a shader object is bound
to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, then at least one of
vkCmdSetColorBlendEquationEXT and vkCmdSetColorBlendAdvancedEXT must have
been called and not subsequently invalidated in the current command buffer prior to this
drawing command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07636
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT dynamic state enabled then
vkCmdSetProvokingVertexModeEXT must have been called and not subsequently
invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08665
If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a
shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, then vkCmdSetProvokingVertexModeEXT must have
been called and not subsequently invalidated in the current command buffer prior to this
drawing command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07637
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic state enabled then
vkCmdSetLineRasterizationModeEXT must have been called and not subsequently
invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08666
If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a
shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, then vkCmdSetLineRasterizationModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08667
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, then vkCmdSetLineRasterizationModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08668
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineRasterizationModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07638
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT dynamic state enabled then vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08669
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, then vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08670
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, then vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08671
If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07849
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_KHR dynamic state enabled then vkCmdSetLineStippleKHR must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08672
If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetLineStippleEnableEXT in the current command buffer set stippledLineEnable to VK_TRUE, then vkCmdSetLineStippleEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07639
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT dynamic state enabled then vkCmdSetDepthClipNegativeOneToOneEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08673
If the depthClipControl feature is enabled, and a shader object is bound to any graphics stage, then vkCmdSetDepthClipNegativeOneToOneEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07640
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV dynamic state enabled then vkCmdSetViewportWScalingEnableNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08674
If the VK_NV_clip_space_w_scaling extension is enabled, and a shader object is bound to any graphics stage, then vkCmdSetViewportWScalingEnableNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07641
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV dynamic state enabled then vkCmdSetViewportSwizzleNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08675
If the `VK_NV_viewport_swizzle` extension is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetViewportSwizzleNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07642**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` dynamic state enabled then `vkCmdSetCoverageToColorEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08676**
  If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageToColorEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07643**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV` dynamic state enabled then `vkCmdSetCoverageToColorLocationNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08677**
  If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetCoverageToColorEnableNV` in the current command buffer set `coverageToColorEnable` to `VK_TRUE`, then `vkCmdSetCoverageToColorLocationNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07644**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV` dynamic state enabled then `vkCmdSetCoverageModulationModeNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08678**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageModulationModeNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07645**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` dynamic state enabled then `vkCmdSetCoverageModulationTableEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command
• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08679
If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetCoverageModulationModeNV` in the current command buffer set `coverageModulationMode` to any value other than `VK_COVERAGE_MODULATION_MODE_NONE_NV`, then `vkCmdSetCoverageModulationTableEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07646
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV` dynamic state enabled then `vkCmdSetCoverageModulationTableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08680
If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetCoverageModulationTableEnableNV` in the current command buffer set `coverageModulationTableEnable` to `VK_TRUE`, then `vkCmdSetCoverageModulationTableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07647
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV` dynamic state enabled then `vkCmdSetShadingRateImageEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-pipelineFragmentShadingRate-09238
If the `pipelineFragmentShadingRate` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetFragmentShadingRateKHR` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08681
If the `shadingRateImage` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetShadingRateImageEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07648
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV` dynamic state enabled then `vkCmdSetRepresentativeFragmentTestEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08682
If the `representativeFragmentTest` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRepresentativeFragmentTestEnableNV` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07649**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV` dynamic state enabled then `vkCmdSetCoverageReductionModeNV` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08683**
  If the `coverageReductionMode` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageReductionModeNV` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-pColorBlendEnables-07470**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last call to `vkCmdSetColorBlendEnableEXT` set `pColorBlendEnables` for any attachment to `VK_TRUE`, then for those attachments in the subpass the corresponding image view’s format features **must** contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizationSamples-07471**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` **must** follow the rules for a zero-attachment subpass.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-samples-07472**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` **must** be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-samples-07473**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` **must** be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizationSamples-07474**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are...
enabled, then the \texttt{rasterizationSamples} in the last call to \texttt{vkCmdSetRasterizationSamplesEXT} must be the same as the current subpass color and/or depth/stencil attachments

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-09211**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT} state enabled, or a shader object is bound to any graphics stage, and the current render pass instance includes a \texttt{VkMultisampledRenderToSingleSampledInfoEXT} structure with \texttt{multisampledRenderToSingleSampledEnable} equal to \texttt{VK_TRUE}, then the \texttt{rasterizationSamples} in the last call to \texttt{vkCmdSetRasterizationSamplesEXT} must be the same as the \texttt{rasterizationSamples} member of that structure

- **VUID-vkCmdDrawClusterIndirectHUAWEI-firstAttachment-07476**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT} dynamic state enabled then \texttt{vkCmdSetColorBlendEnableEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorBlendEnableEXT} calls must specify an enable for all active color attachments in the current subpass

- **VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizerDiscardEnable-09417**
  If a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetColorBlendEnableEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorBlendEnableEXT} calls must specify an enable for all active color attachments in the current subpass

- **VUID-vkCmdDrawClusterIndirectHUAWEI-firstAttachment-07477**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT} dynamic state enabled then \texttt{vkCmdSetColorBlendEquationEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorBlendEquationEXT} calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled

- **VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizerDiscardEnable-09418**
  If a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and both the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE} and there are color attachments bound, then \texttt{vkCmdSetColorBlendEquationEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorBlendEquationEXT} calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled

- **VUID-vkCmdDrawClusterIndirectHUAWEI-firstAttachment-07478**
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic state enabled then
vkCmdSetColorWriteMaskEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorWriteMaskEXT calls must specify the color write mask for all active color attachments in the current subpass.

• VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizerDiscardEnable-09419
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorWriteMaskEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorWriteMaskEXT calls must specify the color write mask for all active color attachments in the current subpass.

• VUID-vkCmdDrawClusterIndirectHUAWEI-firstAttachment-07479
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT dynamic state enabled then
  vkCmdSetColorBlendAdvancedEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendAdvancedEXT calls must specify the advanced blend equations for all active color attachments in the current subpass where blending is enabled.

• VUID-vkCmdDrawClusterIndirectHUAWEI-advancedBlendMaxColorAttachments-07480
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT and VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic states enabled and the last calls to vkCmdSetColorBlendEnableEXT and vkCmdSetColorBlendAdvancedEXT have enabled advanced blending, then the number of active color attachments in the current subpass must not exceed advancedBlendMaxColorAttachments.

• VUID-vkCmdDrawClusterIndirectHUAWEI-primitivesGeneratedQueryWithNonZeroStreams-07481
  If the primitivesGeneratedQueryWithNonZeroStreams feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, and the bound graphics pipeline was created with VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT state enabled, the last call to
  vkCmdSetRasterizationStreamEXT must have set the rasterizationStream to zero.

• VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsPerPixel-07482
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the
  VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state disabled, then the sampleLocationsPerPixel member of pSampleLocationsInfo in the last call to
  vkCmdSetSampleLocationsEXT must equal the rasterizationSamples member of the
  VkPipelineMultisampleStateCreateInfo structure the bound graphics pipeline has been created with.

• VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsPerPixel-07483
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the
VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, then the sampleLocationsPerPixel member of pSampleLocationsInfo in the last call to vkCmdSetSampleLocationsEXT must equal the rasterizationSamples parameter of the last call to vkCmdSetRasterizationSamplesEXT

- VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-07484
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-07485
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, then the sampleLocationsInfo.sampleLocationGridSize.width in the last call to vkCmdSetSampleLocationsEnableEXT must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.width as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

- VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-07486
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, then the sampleLocationsInfo.sampleLocationGridSize.height in the last call to vkCmdSetSampleLocationsEnableEXT must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.height as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

- VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-07487
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, the fragment shader code must not statically use the extended instruction InterpolateAtSample

- VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-07936
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable in the bound graphics pipeline is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, then, sampleLocationsInfo.sampleLocationGridSize.width must evenly divide
VkMultisamplePropertiesEXT::sampleLocationGridSize.width as returned by 
vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling the 
value of rasterizationSamples in the last call to 
vkCmdSetRasterizationSamplesEXT

• VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-07937
  If the bound graphics pipeline state was created with the 
  VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the 
  VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, the sampleLocationsEnable 
  member of a VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable in the 
  bound graphics pipeline is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state 
  enabled, then, sampleLocationsInfo.sampleLocationGridSize.height must evenly divide 
  VkMultisamplePropertiesEXT::sampleLocationGridSize.height as returned by 
vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling the 
value of rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT

• VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-07938
  If the bound graphics pipeline state was created with the 
  VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the 
  VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, the sampleLocationsEnable 
  member of a VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable in the 
  bound graphics pipeline is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state 
  enabled, then, sampleLocationsInfo.sampleLocationsPerPixel must equal 
rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT

• VUID-vkCmdDrawClusterIndirectHUAWEI-coverageModulationTableEnable-07488
  If a shader object is bound to any graphics stage or the bound graphics pipeline state was 
  created with the VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV state enabled, and the last call to 
vkCmdSetCoverageModulationTableEnableNV set coverageModulationTableEnable to VK_TRUE, then the 
coverageModulationTableCount parameter in the last call to vkCmdSetCoverageModulationTableNV must equal 
the current rasterizationSamples divided by the number of color samples in the current 
subpass

• VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizationSamples-07489
  If the VK_NV_framebuffer_mixed_samples extension is enabled, and if current subpass has a 
depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled in 
the currently bound pipeline state, then the current rasterizationSamples must be the 
same as the sample count of the depth/stencil attachment

• VUID-vkCmdDrawClusterIndirectHUAWEI-coverageToColorEnable-07490
  If the bound graphics pipeline state was created with the 
  VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV state enabled and the last call to 
vkCmdSetCoverageToColorEnableNV set coverageToColorEnable to VK_TRUE, then the 
current subpass must have a color attachment at the location selected by the last call to 
vkCmdSetCoverageToColorLocationNV coverageToColorLocation, with a VkFormat of 
VK_FORMAT_R8_UINT, VK_FORMAT_R8_SINT, VK_FORMAT_R16_UINT, VK_FORMAT_R16_SINT, 
VK_FORMAT_R32_UINT, or VK_FORMAT_R32_SINT

• VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizerDiscardEnable-09420
  If the VK_NV_fragment_coverage_to_color extension is enabled, and a shader object is 
bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the last call to vkCmdSetCoverageToColorEnableNV set the coverageToColorEnable to VK_TRUE, then the current subpass must have a color attachment at the location selected by the last call to vkCmdSetCoverageToColorLocationNV coverageToColorLocation, with a VkFormat of VK_FORMAT_R8_UINT, VK_FORMAT_R8_SINT, VK_FORMAT_R16_UINT, VK_FORMAT_R16_SINT, VK_FORMAT_R32_UINT, or VK_FORMAT_R32_SINT

• VUID-vkCmdDrawClusterIndirectHUAWEI-coverageReductionMode-07491
  If this VK_NV_coverage_reduction_mode extension is enabled, the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV and VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT states enabled, the current coverage reduction mode coverageReductionMode, then the current rasterizationSamples, and the sample counts for the color and depth/stencil attachments (if the subpass has them) must be a valid combination returned by vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV

• VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-07492
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV ::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-07493
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportSwizzleNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-09421
  If the VK_NV_viewport_swizzle extension is enabled, and a shader object is bound to any graphics stage, then the viewportCount parameter in the last call to vkCmdSetViewportSwizzleNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizationSamples-07494
  If the VK_NV_framebuffer_mixed_samples extension is enabled, and if the current subpass has any color attachments and rasterizationSamples of the last call to vkCmdSetRasterizationSamplesEXT is greater than the number of color samples, then the pipeline sampleShadingEnable must be VK_FALSE

• VUID-vkCmdDrawClusterIndirectHUAWEI-stippledLineEnable-07495
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR, then the stippledRectangularLines feature must be enabled
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR`, then the `stippledBresenhamLines` feature must be enabled.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR`, then the `stippledSmoothLines` feature must be enabled.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR`, then the `stippledRectangularLines` feature must be enabled and `VkPhysicalDeviceLimits::strictLines` must be `VK_TRUE`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled, `conservativePointAndLineRasterization` is not supported, and the effective primitive topology output by the last pre-rasterization shader stage is a line or point, then the `conservativeRasterizationMode` set by the last call to `vkCmdSetConservativeRasterizationModeEXT` must be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`.

If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then Mesh Shader Queries must not be active.

If dynamic state was inherited from `VkCommandBufferInheritanceViewportScissorInfoNV`, it must be set in the current command buffer prior to this drawing command.

If dynamic state was inherited from `VkCmdSetAttachmentFeedbackLoopEnableEXT`, it must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08685**
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08686**
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08687**

Chapter 22. Fixed-Function Vertex Processing

Vertex fetching is controlled via configurable state, as a logically distinct graphics pipeline stage.

22.1. Vertex Attributes

Vertex shaders can define input variables, which receive vertex attribute data transferred from one or more VkBuffer(s) by drawing commands. Vertex shader input variables are bound to buffers via an indirect binding where the vertex shader associates a vertex input attribute number with each variable, vertex input attributes are associated to vertex input bindings on a per-pipeline basis, and vertex input bindings are associated with specific buffers on a per-draw basis via the vkCmdBindVertexBuffers command. Vertex input attribute and vertex input binding descriptions also contain format information controlling how data is extracted from buffer memory and converted to the format expected by the vertex shader.

There are VkPhysicalDeviceLimits::maxVertexInputAttributes number of vertex input attributes and VkPhysicalDeviceLimits::maxVertexInputBindings number of vertex input bindings (each referred to by zero-based indices), where there are at least as many vertex input attributes as there are vertex input bindings. Applications can store multiple vertex input attributes interleaved in a single buffer, and use a single vertex input binding to access those attributes.

In GLSL, vertex shaders associate input variables with a vertex input attribute number using the location layout qualifier. The Component layout qualifier associates components of a vertex shader input variable with components of a vertex input attribute.

GLSL example

```glsl
// Assign location M to variableName
layout (location=M, component=2) in vec2 variableName;

// Assign locations [N, N+L) to the array elements of variableNameArray
layout (location=N) in vec4 variableNameArray[L];
```

In SPIR-V, vertex shaders associate input variables with a vertex input attribute number using the Location decoration. The Component decoration associates components of a vertex shader input variable with components of a vertex input attribute. The Location and Component decorations are specified via the OpDecorate instruction.

SPIR-V example

```spir-v
...%1 = OpExtInstImport "GLSL.std.450"
...
OpName %9 "variableName"
OpName %15 "variableNameArray"
OpDecorate %18 BuiltIn VertexIndex
```
22.1.1. Attribute Location and Component Assignment

The Location decoration specifies which vertex input attribute is used to read and interpret the data that a variable will consume.

When a vertex shader input variable declared using a 16- or 32-bit scalar or vector data type is assigned a Location, its value(s) are taken from the components of the input attribute specified with the corresponding VkVertexInputAttributeDescription:location. The components used depend on the type of variable and the Component decoration specified in the variable declaration, as identified in Input attribute components accessed by 16-bit and 32-bit input variables. Any 16-bit or 32-bit scalar or vector input will consume a single Location. For 16-bit and 32-bit data types, missing components are filled in with default values as described below.

If an implementation supports storageInputOutput16, vertex shader input variables can have a width of 16 bits.

Table 32. Input attribute components accessed by 16-bit and 32-bit input variables

<table>
<thead>
<tr>
<th>16-bit or 32-bit data type</th>
<th>Component decoration</th>
<th>Components consumed</th>
</tr>
</thead>
<tbody>
<tr>
<td>scalar</td>
<td>0 or unspecified</td>
<td>(x, o, o, o)</td>
</tr>
<tr>
<td>scalar</td>
<td>1</td>
<td>(o, y, o, o)</td>

<td>2</td>
<td>(o, o, z, o)</td>
</tr>
<tr>
<td>scalar</td>
<td>3</td>
<td>(o, o, o, w)</td>
</tr>
<tr>
<td>two-component vector</td>
<td>0 or unspecified</td>
<td>(x, y, o, o)</td>
</tr>
<tr>
<td>two-component vector</td>
<td>1</td>
<td>(o, y, z, o)</td>
</tr>
<tr>
<td>two-component vector</td>
<td>2</td>
<td>(o, o, z, w)</td>
</tr>
</tbody>
</table>
Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a 32-bit floating point matrix type is assigned a Location i, its values are taken from consecutive input attributes starting with the corresponding VkVertexInputAttributeDescription::location. Such matrices are treated as an array of column vectors with values taken from the input attributes identified in Input attributes accessed by 32-bit input matrix variables. The VkVertexInputAttributeDescription::format must be specified with a VkFormat that corresponds to the appropriate type of column vector. The Component decoration must not be used with matrix types.

</tbody>
</table>

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a scalar or vector 64-bit data type is assigned a Location i, its values are taken from consecutive input attributes starting with the corresponding
VkVertexInputAttributeDescription::location. The Location slots and Component words used depend on the type of variable and the Component decoration specified in the variable declaration, as identified in Input attribute locations and components accessed by 64-bit input variables. For 64-bit data types, no default attribute values are provided. Input variables must not use more components than provided by the attribute.

</table>
Components indicated by “o” are available for use by other input variables which are sourced from the same attribute. Components indicated by “-” are not available for input variables as there are no default values provided for 64-bit data types, and there is no data provided by the input format.

When a vertex shader input variable declared using a 64-bit floating-point matrix type is assigned a Location \( i \), its values are taken from consecutive input attribute locations. Such matrices are treated as an array of column vectors with values taken from the input attributes as shown in Input attribute locations and components accessed by 64-bit input variables. Each column vector starts at the Location immediately following the last Location of the previous column vector. The number of attributes and components assigned to each matrix is determined by the matrix dimensions and ranges from two to eight locations.

When a vertex shader input variable declared using an array type is assigned a location, its values are taken from consecutive input attributes starting with the corresponding VkVertexInputAttributeDescription::location. The number of attributes and components assigned to each element are determined according to the data type of the array elements and Component decoration (if any) specified in the declaration of the array, as described above. Each element of the array, in order, is assigned to consecutive locations, but all at the same specified component within each location.

Only input variables declared with the data types and component decorations as specified above are supported. Two variables are allowed to share the same Location slot only if their Component words do not overlap. If multiple variables share the same Location slot, they must all have the same SPIR-V floating-point component type or all have the same width scalar type components.

### 22.2. Vertex Input Description

Applications specify vertex input attribute and vertex input binding descriptions as part of graphics pipeline creation by setting the VkGraphicsPipelineCreateInfo::pVertexInputState pointer to a VkPipelineVertexInputStateCreateInfo structure. Alternatively, if the graphics pipeline is created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then the vertex input attribute and vertex input binding descriptions are specified dynamically with vkCmdSetVertexInputEXT, and the VkGraphicsPipelineCreateInfo::pVertexInputState pointer is ignored.

The VkPipelineVertexInputStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineVertexInputStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineVertexInputStateCreateFlags flags;
    uint32_t vertexBindingDescriptionCount;
    const VkVertexInputBindingDescription* pVertexBindingDescriptions;
    uint32_t vertexAttributeDescriptionCount;
    const VkVertexInputAttributeDescription* pVertexAttributeDescriptions;
} VkPipelineVertexInputStateCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is reserved for future use.

• **vertexBindingDescriptionCount** is the number of vertex binding descriptions provided in **pVertexBindingDescriptions**.

• **pVertexBindingDescriptions** is a pointer to an array of **VkVertexInputBindingDescription** structures.

• **vertexAttributeDescriptionCount** is the number of vertex attribute descriptions provided in **pVertexAttributeDescriptions**.

• **pVertexAttributeDescriptions** is a pointer to an array of **VkVertexInputAttributeDescription** structures.

### Valid Usage

• VUID-VkPipelineVertexInputStateCreateInfo-vertexBindingDescriptionCount-00613
  
  **vertexBindingDescriptionCount** must be less than or equal to **VkPhysicalDeviceLimits::maxVertexInputBindings**

• VUID-VkPipelineVertexInputStateCreateInfo-vertexAttributeDescriptionCount-00614
  
  **vertexAttributeDescriptionCount** must be less than or equal to **VkPhysicalDeviceLimits::maxVertexInputAttributes**

• VUID-VkPipelineVertexInputStateCreateInfo-binding-00615
  
  For every binding specified by each element of **pVertexAttributeDescriptions**, a **VkVertexInputBindingDescription** must exist in **pVertexBindingDescriptions** with the same value of binding.

• VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-00616
  
  All elements of **pVertexBindingDescriptions** must describe distinct binding numbers.

• VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-00617
  
  All elements of **pVertexAttributeDescriptions** must describe distinct attribute locations.

### Valid Usage (Implicit)

• VUID-VkPipelineVertexInputStateCreateInfo-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO**

• VUID-VkPipelineVertexInputStateCreateInfo-pNext-pNext
  
  **pNext** must be NULL or a pointer to a valid instance of **VkPipelineVertexInputDivisorStateCreateInfoKHR**

• VUID-VkPipelineVertexInputStateCreateInfo-sType-unique
  
  The **sType** value of each struct in the **pNext** chain must be unique.

• VUID-VkPipelineVertexInputStateCreateInfo-flags-zerobitmask
  
  **flags** must be 0.

• VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-parameter
  
  If **vertexBindingDescriptionCount** is not 0, **pVertexBindingDescriptions** must be a valid
pointer to an array of vertexBindingDescriptionCount valid VkVertexInputBindingDescription structures

- VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-parameter
  If vertexAttributeDescriptionCount is not 0, pVertexAttributeDescriptions must be a valid pointer to an array of vertexAttributeDescriptionCount valid VkVertexInputAttributeDescription structures

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineVertexInputStateCreateFlags;

VkPipelineVertexInputStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

Each vertex input binding is specified by the VkVertexInputBindingDescription structure, defined as:

// Provided by VK_VERSION_1_0
typedef struct VkVertexInputBindingDescription {
  uint32_t binding;
  uint32_t stride;
  VkVertexInputRate inputRate;
} VkVertexInputBindingDescription;

- binding is the binding number that this structure describes.
- stride is the byte stride between consecutive elements within the buffer.
- inputRate is a VkVertexInputRate value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.

Valid Usage

- VUID-VkVertexInputBindingDescription-binding-00618
  binding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-VkVertexInputBindingDescription-stride-00619
  stride must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputBindingStride

- VUID-VkVertexInputBindingDescription-stride-04456
  If the VK_KHR_portability_subset extension is enabled, stride must be a multiple of, and at least as large as, VkPhysicalDevicePortabilitySubsetPropertiesKHR::minVertexInputBindingStrideAlignment

Valid Usage (Implicit)

- VUID-VkVertexInputBindingDescription-inputRate-parameter
  inputRate must be a valid VkVertexInputRate value
Possible values of `VkVertexInputBindingDescription::inputRate`, specifying the rate at which vertex attributes are pulled from buffers, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkVertexInputRate {
    VK_VERTEX_INPUT_RATE_VERTEX = 0,
    VK_VERTEX_INPUT_RATE_INSTANCE = 1,
} VkVertexInputRate;
```

- `VK_VERTEX_INPUT_RATE_VERTEX` specifies that vertex attribute addressing is a function of the vertex index.
- `VK_VERTEX_INPUT_RATE_INSTANCE` specifies that vertex attribute addressing is a function of the instance index.

Each vertex input attribute is specified by the `VkVertexInputAttributeDescription` structure, defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputAttributeDescription {
    uint32_t location;
    uint32_t binding;
    VkFormat format;
    uint32_t offset;
} VkVertexInputAttributeDescription;
```

- `location` is the shader input location number for this attribute.
- `binding` is the binding number which this attribute takes its data from.
- `format` is the size and type of the vertex attribute data.
- `offset` is a byte offset of this attribute relative to the start of an element in the vertex input binding.

**Valid Usage**

- VUID-VkVertexInputAttributeDescription-location-00620  
  `location must be less than VkPhysicalDeviceLimits::maxVertexInputAttributes`

- VUID-VkVertexInputAttributeDescription-binding-00621  
  `binding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkVertexInputAttributeDescription-offset-00622  
  `offset must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputAttributeOffset`

- VUID-VkVertexInputAttributeDescription-format-00623  
  The `format features of format must contain VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT`

- VUID-VkVertexInputAttributeDescription-vertexAttributeAccessBeyondStride-04457
If the `VK_KHR_portability_subset` extension is enabled, and
`VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride` is
`VK_FALSE`, the sum of `offset` plus the size of the vertex attribute data described by `format`
must not be greater than `stride` in the `VkVertexInputBindingDescription` referenced in
binding.

**Valid Usage (Implicit)**

- VUID-VkVertexInputAttributeDescription-format-parameter
  
  `format` must be a valid `VkFormat` value.

To **dynamically set** the vertex input attribute and vertex input binding descriptions, call:

```c
// Provided by VK_EXT_shader_object, VK_EXT_vertex_input_dynamic_state
void vkCmdSetVertexInputEXT(   
    VkCommandBuffer commandBuffer,   
    uint32_t vertexBindingDescriptionCount,   
    const VkVertexInputBindingDescription2EXT* pVertexBindingDescriptions,   
    uint32_t vertexAttributeDescriptionCount,   
    const VkVertexInputAttributeDescription2EXT* pVertexAttributeDescriptions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `vertexBindingDescriptionCount` is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.
- `pVertexBindingDescriptions` is a pointer to an array of `VkVertexInputBindingDescription2EXT` structures.
- `vertexAttributeDescriptionCount` is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.
- `pVertexAttributeDescriptions` is a pointer to an array of `VkVertexInputAttributeDescription2EXT` structures.

This command sets the vertex input attribute and vertex input binding descriptions state for
subsequent drawing commands when drawing using shader objects, or when the graphics pipeline
is created with `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` set in `VkPipelineDynamicStateCreateInfo`:
`pDynamicStates`. Otherwise, this state is specified by the `VkGraphicsPipelineCreateInfo`:
`pVertexInputState` values used to create the currently active pipeline.

If drawing using shader objects, or if the bound pipeline state object was also created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` dynamic state enabled, then `vkCmdBind VertexBuffers2` can be used instead of `vkCmdSetVertexInputEXT` to dynamically set the stride.
Valid Usage

- VUID-vkCmdSetVertexInputEXT-None-08546
  Either the `vertexInputDynamicState` feature or the `shaderObject` feature or both must be enabled

- VUID-vkCmdSetVertexInputEXT-vertexBindingDescriptionCount-04791
  `vertexBindingDescriptionCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdSetVertexInputEXT-vertexAttributeDescriptionCount-04792
  `vertexAttributeDescriptionCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- VUID-vkCmdSetVertexInputEXT-binding-04793
  For every binding specified by each element of `pVertexAttributeDescriptions`, a `VkVertexInputBindingDescription2EXT` must exist in `pVertexBindingDescriptions` with the same value of binding

- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-04794
  All elements of `pVertexBindingDescriptions` must describe distinct binding numbers

- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-04795
  All elements of `pVertexAttributeDescriptions` must describe distinct attribute locations

Valid Usage (Implicit)

- VUID-vkCmdSetVertexInputEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-parameter
  If `vertexBindingDescriptionCount` is not 0, `pVertexBindingDescriptions` must be a valid pointer to an array of `vertexBindingDescriptionCount` valid `VkVertexInputBindingDescription2EXT` structures

- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-parameter
  If `vertexAttributeDescriptionCount` is not 0, `pVertexAttributeDescriptions` must be a valid pointer to an array of `vertexAttributeDescriptionCount` valid `VkVertexInputAttributeDescription2EXT` structures

- VUID-vkCmdSetVertexInputEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetVertexInputEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetVertexInputEXT-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkVertexInputBindingDescription2EXT` structure is defined as:

```c
// Provided by VK_EXT_shader_object, VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputBindingDescription2EXT {
    VkStructureType   sType;
    void*              pNext;
    uint32_t           binding;
    uint32_t           stride;
    VkVertexInputRate  inputRate;
    uint32_t           divisor;
} VkVertexInputBindingDescription2EXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `binding` is the binding number that this structure describes.
- `stride` is the byte stride between consecutive elements within the buffer.
- `inputRate` is a `VkVertexInputRate` value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.
- `divisor` is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. This member can be set to a value other than 1 if the `vertexAttributeInstanceRateDivisor` feature is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of `divisor` is implementation-dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`. A value of 0 can be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.
Valid Usage

- VUID-VkVertexInputBindingDescription2EXT-binding-04796
  binding **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkVertexInputBindingDescription2EXT-stride-04797
  stride **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`

- VUID-VkVertexInputBindingDescription2EXT-divisor-04798
  If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, divisor **must** not be 0

- VUID-VkVertexInputBindingDescription2EXT-divisor-04799
  If the `vertexAttributeInstanceRateDivisor` feature is not enabled, divisor **must** be 1

- VUID-VkVertexInputBindingDescription2EXT-divisor-06226
  divisor **must** be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`, inclusive

- VUID-VkVertexInputBindingDescription2EXT-divisor-06227
  If divisor is not 1 then inputRate **must** be of type `VK_VERTEX_INPUT_RATE_INSTANCE`

Valid Usage (Implicit)

- VUID-VkVertexInputBindingDescription2EXT-sType-sType
  sType **must** be `VK_STRUCTURE_TYPE_VERTEX_INPUT_BINDING_DESCRIPTION_2_EXT`

- VUID-VkVertexInputBindingDescription2EXT-inputRate-parameter
  inputRate **must** be a valid `VkVertexInputRate` value

The `VkVertexInputAttributeDescription2EXT` structure is defined as:

```c
// Provided by VK_EXT_shader_object, VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputAttributeDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t location;
    uint32_t binding;
    VkFormat format;
    uint32_t offset;
} VkVertexInputAttributeDescription2EXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `location` is the shader input location number for this attribute.
- `binding` is the binding number which this attribute takes its data from.
- `format` is the size and type of the vertex attribute data.
• **offset** is a byte offset of this attribute relative to the start of an element in the vertex input binding.

### Valid Usage

- VUID-VkVertexInputAttributeDescription2EXT-location-06228
  
  location **must** be less than VkPhysicalDeviceLimits::maxVertexInputAttributes

- VUID-VkVertexInputAttributeDescription2EXT-binding-06229
  
  binding **must** be less than VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-VkVertexInputAttributeDescription2EXT-offset-06230
  
  offset **must** be less than or equal to VkPhysicalDeviceLimits::maxVertexInputAttributeOffset

- VUID-VkVertexInputAttributeDescription2EXT-format-04805
  
  The format features of format **must** contain VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT

- VUID-VkVertexInputAttributeDescription2EXT-vertexAttributeAccessBeyondStride-04806
  
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride is VK_FALSE, the sum of offset plus the size of the vertex attribute data described by format **must** not be greater than stride in the VkVertexInputBindingDescription2EXT referenced in binding

### Valid Usage (Implicit)

- VUID-VkVertexInputAttributeDescription2EXT-sType-sType
  
  sType **must** be VK_STRUCTURE_TYPE_VERTEX_INPUT_ATTRIBUTE_DESCRIPTION_2_EXT

- VUID-VkVertexInputAttributeDescription2EXT-format-parameter
  
  format **must** be a valid VkFormat value

To bind vertex buffers to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindVertexBuffers(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **firstBinding** is the index of the first vertex input binding whose state is updated by the command.
- **bindingCount** is the number of vertex input bindings whose state is updated by the command.
• \( pBuffers \) is a pointer to an array of buffer handles.
• \( pOffsets \) is a pointer to an array of buffer offsets.

The values taken from elements \( i \) of \( pBuffers \) and \( pOffsets \) replace the current state for the vertex input binding \( firstBinding + i \), for \( i \) in \([0, bindingCount]\). The vertex input binding is updated to start at the offset indicated by \( pOffsets[i] \) from the start of the buffer \( pBuffers[i] \). All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the nullDescriptor feature is enabled, elements of \( pBuffers \) can be \( VK_NULL_HANDLE \), and can be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is \( VK_NULL_HANDLE \), the values taken from memory are considered to be zero, and missing G, B, or A components are filled with \((0,0,1)\).

### Valid Usage

- VUID-vkCmdBindVertexBuffers-firstBinding-00624
  \( firstBinding \) must be less than \( VkPhysicalDeviceLimits::maxVertexInputBindings \)
- VUID-vkCmdBindVertexBuffers-firstBinding-00625
  The sum of \( firstBinding \) and \( bindingCount \) must be less than or equal to \( VkPhysicalDeviceLimits::maxVertexInputBindings \)
- VUID-vkCmdBindVertexBuffers-pOffsets-00626
  All elements of \( pOffsets \) must be less than the size of the corresponding element in \( pBuffers \)
- VUID-vkCmdBindVertexBuffers-pBuffers-00627
  All elements of \( pBuffers \) must have been created with the \( VK_BUFFER_USAGE_VERTEX_BUFFER_BIT \) flag
- VUID-vkCmdBindVertexBuffers-pBuffers-00628
  Each element of \( pBuffers \) that is non-sparse must be bound completely and contiguously to a single \( VkDeviceMemory \) object
- VUID-vkCmdBindVertexBuffers-pBuffers-04001
  If the nullDescriptor feature is not enabled, all elements of \( pBuffers \) must not be \( VK_NULL_HANDLE \)
- VUID-vkCmdBindVertexBuffers-pBuffers-04002
  If an element of \( pBuffers \) is \( VK_NULL_HANDLE \), then the corresponding element of \( pOffsets \) must be zero

### Valid Usage (Implicit)

- VUID-vkCmdBindVertexBuffers-commandBuffer-parameter
  \( commandBuffer \) must be a valid \( VkCommandBuffer \) handle
- VUID-vkCmdBindVertexBuffers-pBuffers-parameter
  \( pBuffers \) must be a valid pointer to an array of \( bindingCount \) valid or \( VK_NULL_HANDLE \) \( VkBuffer \) handles
- VUID-vkCmdBindVertexBuffers-pOffsets-parameter
Alternatively, to bind vertex buffers, along with their sizes and strides, to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBindVertexBuffers2(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes,
    const VkDeviceSize* pStrides);
```
void vkCmdBindVertexBuffers2EXT(
    VkCommandBuffer commandBuffer,  
    uint32_t firstBinding,  
    uint32_t bindingCount,  
    const VkBuffer* pBuffers,  
    const VkDeviceSize* pOffsets,  
    constVkDeviceSize* pSizes,  
    constVkDeviceSize* pStrides);

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first vertex input binding whose state is updated by the command.
- `bindingCount` is the number of vertex input bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is `NULL` or a pointer to an array of the size in bytes of vertex data bound from `pBuffers`.
- `pStrides` is `NULL` or a pointer to an array of buffer strides.

The values taken from elements `i` of `pBuffers` and `pOffsets` replace the current state for the vertex input binding `firstBinding + i`, for `i` in `[0, bindingCount)`. The vertex input binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. If `pSizes` is not `NULL` then `pSizes[i]` specifies the bound size of the vertex buffer starting from the corresponding elements of `pBuffers[i]` plus `pOffsets[i]`. If `pSizes[i]` is `VK_WHOLE_SIZE` then the bound size is from `pBuffers[i]` plus `pOffsets[i]` to the end of the buffer `pBuffers[i]`. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the `nullDescriptor` feature is enabled, elements of `pBuffers` can be `VK_NULL_HANDLE`, and can be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is `VK_NULL_HANDLE`, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with `(0,0,1)`.

This command also dynamically sets the byte strides between consecutive elements within buffer `pBuffers[i]` to the corresponding `pStrides[i]` value when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, strides are specified by the `VkVertexInputBindingDescription::stride` values used to create the currently active pipeline.

If drawing using shader objects or if the bound pipeline state object was also created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then `vkCmdSetVertexInputEXT` can be used instead of `vkCmdBindVertexBuffers2` to set the stride.

**Note**

Unlike the static state to set the same, `pStrides` must be between 0 and the maximum extent of the attributes in the binding. `vkCmdSetVertexInputEXT` does not have this restriction so can be used if other stride values are desired.
Valid Usage

- VUID-vkCmdBindVertexBuffers2-firstBinding-03355
  `firstBinding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdBindVertexBuffers2-firstBinding-03356
  The sum of `firstBinding` and `bindingCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdBindVertexBuffers2-pOffsets-03357
  If `pSizes` is not `NULL`, all elements of `pOffsets` must be less than the size of the corresponding element in `pBuffers`

- VUID-vkCmdBindVertexBuffers2-pSizes-03358
  If `pSizes` is not `NULL`, all elements of `pOffsets` plus `pSizes`, where `pSizes` is not `VK_WHOLE_SIZE`, must be less than or equal to the size of the corresponding element in `pBuffers`

- VUID-vkCmdBindVertexBuffers2-pBuffers-03359
  All elements of `pBuffers` must have been created with the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` flag

- VUID-vkCmdBindVertexBuffers2-pBuffers-03360
  Each element of `pBuffers` that is non-sparse must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdBindVertexBuffers2-pBuffers-04111
  If the `nullDescriptor` feature is not enabled, all elements of `pBuffers` must not be `VK_NULL_HANDLE`

- VUID-vkCmdBindVertexBuffers2-pBuffers-04112
  If an element of `pBuffers` is `VK_NULL_HANDLE`, then the corresponding element of `pOffsets` must be zero

- VUID-vkCmdBindVertexBuffers2-pStrides-03362
  If `pStrides` is not `NULL` each element of `pStrides` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`

- VUID-vkCmdBindVertexBuffers2-pStrides-06209
  If `pStrides` is not `NULL` each element of `pStrides` must be either 0 or greater than or equal to the maximum extent of all vertex input attributes fetched from the corresponding binding, where the extent is calculated as the `VkVertexInputAttributeDescription::offset` plus `VkVertexInputAttributeDescription::format` size

Valid Usage (Implicit)

- VUID-vkCmdBindVertexBuffers2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindVertexBuffers2-pBuffers-parameter
  `pBuffers` must be a valid pointer to an array of `bindingCount` valid or `VK_NULL_HANDLE` `VkBuffer` handles
• VUID-vkCmdBindVertexBuffers2-pOffsets-parameter
  pOffsets must be a valid pointer to an array of bindingCount VkDeviceSize values

• VUID-vkCmdBindVertexBuffers2-pSizes-parameter
  If pSizes is not NULL, pSizes must be a valid pointer to an array of bindingCount VkDeviceSize values

• VUID-vkCmdBindVertexBuffers2-pStrides-parameter
  If pStrides is not NULL, pStrides must be a valid pointer to an array of bindingCount VkDeviceSize values

• VUID-vkCmdBindVertexBuffers2-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdBindVertexBuffers2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdBindVertexBuffers2-vidoeCoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdBindVertexBuffers2-bindingCount-arrayLength
  If any of pSizes, or pStrides are not NULL, bindingCount must be greater than 0

• VUID-vkCmdBindVertexBuffers2-commonParent
  Both of commandBuffer, and the elements of pBuffers that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**22.3. Vertex Attribute Divisor in Instanced Rendering**

If the vertexAttributeInstanceRateDivisor feature is enabled and the pNext chain of VkPipelineVertexInputStateCreateInfo includes a VkPipelineVertexInputDivisorStateCreateInfoKHR structure, then that structure controls how vertex attributes are assigned to an instance when instanced rendering is enabled.
The `VkPipelineVertexInputDivisorStateCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_vertex_attribute_divisor
typedef struct VkPipelineVertexInputDivisorStateCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t vertexBindingDivisorCount;
    const VkVertexInputBindingDivisorDescriptionKHR* pVertexBindingDivisors;
} VkPipelineVertexInputDivisorStateCreateInfoKHR;
```

or the equivalent

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef VkPipelineVertexInputDivisorStateCreateInfoKHR
VkPipelineVertexInputDivisorStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexBindingDivisorCount` is the number of elements in the `pVertexBindingDivisors` array.
- `pVertexBindingDivisors` is a pointer to an array of `VkVertexInputBindingDivisorDescriptionKHR` structures specifying the divisor value for each binding.

### Valid Usage (Implicit)

- VUID-VkPipelineVertexInputDivisorStateCreateInfoKHR-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_KHR`
- VUID-VkPipelineVertexInputDivisorStateCreateInfoKHR-pVertexBindingDivisors-parameter `pVertexBindingDivisors` must be a valid pointer to an array of `vertexBindingDivisorCount` `VkVertexInputBindingDivisorDescriptionKHR` structures
- VUID-VkPipelineVertexInputDivisorStateCreateInfoKHR-vertexBindingDivisorCount-arraylength `vertexBindingDivisorCount` must be greater than 0

The individual divisor values per binding are specified using the `VkVertexInputBindingDivisorDescriptionKHR` structure which is defined as:

```c
// Provided by VK_KHR_vertex_attribute_divisor
typedef struct VkVertexInputBindingDivisorDescriptionKHR {
    uint32_t binding;
    uint32_t divisor;
} VkVertexInputBindingDivisorDescriptionKHR;
```
or the equivalent

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef VkVertexInputBindingDivisorDescriptionKHR
    VkVertexInputBindingDivisorDescriptionEXT;
```

- **binding** is the binding number for which the divisor is specified.
- **divisor** is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of **divisor** is implementation-dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::maxVertexAttribDivisor`. A value of 0 can be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.

If this structure is not used to define a divisor value for an attribute, then the divisor has a logical default value of 1.

### Valid Usage

- VUID-VkVertexInputBindingDivisorDescriptionKHR-binding-01869
  binding must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkVertexInputBindingDivisorDescriptionKHR-vertexAttributeInstanceRateZeroDivisor-02228
  If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, divisor must not be 0

- VUID-VkVertexInputBindingDivisorDescriptionKHR-vertexAttributeInstanceRateDivisor-02229
  If the `vertexAttributeInstanceRateDivisor` feature is not enabled, divisor must be 1

- VUID-VkVertexInputBindingDivisorDescriptionKHR-divisor-01870
  divisor must be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::maxVertexAttribDivisor`, inclusive

- VUID-VkVertexInputBindingDivisorDescriptionKHR-inputRate-01871
  `VkVertexInputBindingDescription::inputRate` must be of type `VK_VERTEX_INPUT_RATE_INSTANCE` for this binding

### 22.4. Vertex Input Address Calculation

The address of each attribute for each `vertexIndex` and `instanceIndex` is calculated as follows:

- Let `attribDesc` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexAttributeDescriptions` with `VkVertexInputAttributeDescription::location` equal to the vertex input attribute number.
- Let `bindingDesc` be the member of `VkPipelineVertexInputStateCreateInfo::bindingDescs` with `VkVertexInputBindingDescription::inputRate` equal to `VK_VERTEX_INPUT_RATE_VERTEX` for this binding.
Let `attribDesc` be the member of `VkVertexInputAttributeDescription::binding` equal to `attribDesc.binding`.

- Let `vertexIndex` be the index of the vertex within the draw (a value between `firstVertex` and `firstVertex + vertexCount` for `vkCmdDraw`, or a value taken from the index buffer plus `vertexOffset` for `vkCmdDrawIndexed`), and let `instanceIndex` be the instance number of the draw (a value between `firstInstance` and `firstInstance + instanceCount`).

- Let `offset` be an array of offsets into the currently bound vertex buffers specified during `vkCmdBindVertexBuffers` or `vkCmdBindVertexBuffers2` with `pOffsets`.

- Let `divisor` be the member of `VkPipelineVertexInputDivisorStateCreateInfoKHR::pVertexBindingDivisors` with `VkVertexInputBindingDivisorDescriptionKHR::binding` equal to `attribDesc.binding`. If the vertex binding state is dynamically set, instead let `divisor` be the member of the `pVertexBindingDescriptions` parameter to the `vkCmdSetVertexInputEXT` call with `VkVertexInputBindingDescription2EXT::binding` equal to `attribDesc.binding`.

- Let `stride` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexBindingDescriptions->stride` unless there is dynamic state causing the value to be ignored. In this case the value is set from the last value from one of the following:
  - `vkCmdSetVertexInputEXT::pVertexBindingDescriptions->stride`
  - `vkCmdBindVertexBuffers2EXT::pStride`, if not `NULL`

```cpp
bufferBindingAddress = buffer[binding].baseAddress + offset[binding];

if (bindingDesc.inputRate == VK_VERTEX_INPUT_RATE_VERTEX)
    effectiveVertexOffset = vertexIndex * stride;
else
    if (divisor == 0)
        effectiveVertexOffset = firstInstance * stride;
    else
        effectiveVertexOffset = (firstInstance + ((instanceIndex - firstInstance) / divisor)) * stride;

attribAddress = bufferBindingAddress + effectiveVertexOffset + attribDesc.offset;
```

### 22.4.1. Vertex Input Extraction

For each attribute, raw data is extracted starting at `attribAddress` and is converted from the `VkVertexInputAttributeDescription::format` to either floating-point, unsigned integer, or signed integer based on the numeric type of `format`. The numeric type of `format` must match the numeric type of the input variable in the shader. The input variable in the shader must be declared as a 64-bit data type if and only if `format` is a 64-bit data type. If either `format` is a 64-bit format or `legacyVertexAttributes` is not enabled, and `format` is a packed format, `attribAddress` must be a multiple of the size in bytes of the whole attribute data type as described in Packed Formats. Otherwise, if either `format` is a 64-bit format or `legacyVertexAttributes` is not enabled, `attribAddress` must be a multiple of the size in bytes of the component type indicated by `format` (see Formats). For attributes that are not 64-bit data types, each component is converted to the format of the input variable based on its type and size (as defined in the Format Definition section for each `VkFormat`).

2620
using the appropriate equations in *16-Bit Floating-Point Numbers, Unsigned 11-Bit Floating-Point Numbers, Unsigned 10-Bit Floating-Point Numbers, Fixed-Point Data Conversion, and Shared Exponent to RGB*. Signed integer components smaller than 32 bits are sign-extended. Attributes that are not 64-bit data types are expanded to four components in the same way as described in conversion to RGBA. The number of components in the vertex shader input variable need not exactly match the number of components in the format. If the vertex shader has fewer components, the extra components are discarded.
Chapter 23. Tessellation

Tessellation involves three pipeline stages. First, a tessellation control shader transforms control points of a patch and can produce per-patch data. Second, a fixed-function tessellator generates multiple primitives corresponding to a tessellation of the patch in \((u,v)\) or \((u,v,w)\) parameter space. Third, a tessellation evaluation shader transforms the vertices of the tessellated patch, for example to compute their positions and attributes as part of the tessellated surface. The tessellator is enabled when the pipeline contains both a tessellation control shader and a tessellation evaluation shader.

23.1. Tessellator

If a pipeline includes both tessellation shaders (control and evaluation), the tessellator consumes each input patch (after vertex shading) and produces a new set of independent primitives (points, lines, or triangles). These primitives are logically produced by subdividing a geometric primitive (rectangle or triangle) according to the per-patch outer and inner tessellation levels written by the tessellation control shader. These levels are specified using the built-in variables \text{TessLevelOuter} and \text{TessLevelInner}, respectively. This subdivision is performed in an implementation-dependent manner. If no tessellation shaders are present in the pipeline, the tessellator is disabled and incoming primitives are passed through without modification.

The type of subdivision performed by the tessellator is specified by an \text{OpExecutionMode} instruction using one of the \text{Triangles}, \text{Quads}, or \text{IsoLines} execution modes. When using shader objects, this instruction must be specified in the tessellation evaluation shader, and may also be specified in the tessellation control shader. When using pipelines, this instruction may be specified in either the tessellation evaluation or tessellation control shader. When using shader objects, tessellation-related modes that are required must be specified in the tessellation evaluation shader, and may also be specified in the tessellation control shader. Other tessellation-related modes may be specified in the tessellation evaluation shader. When using pipelines, other tessellation-related execution modes can also be specified in either the tessellation control or tessellation evaluation shaders.

Any tessellation-related modes specified in both the tessellation control and tessellation evaluation shaders must be the same.

Tessellation execution modes include:

- \text{Triangles}, \text{Quads}, and \text{IsoLines}. These control the type of subdivision and topology of the output primitives. When using shader objects, one mode must be set in at least the tessellation evaluation stage. When using pipelines, one mode must be set in at least one of the tessellation shader stages. If the \text{VK_KHR_portability_subset} extension is enabled, and \text{VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines} is \text{VK_FALSE}, then isoline tessellation is not supported by the implementation, and \text{IsoLines} must not be used in either tessellation shader stage.

- \text{VertexOrderCw} and \text{VertexOrderCcw}. These control the orientation of triangles generated by the tessellator. When using shader objects, one mode must be set in at least the tessellation evaluation stage. When using pipelines, one mode must be set in at least one of the tessellation
shader stages.

- **PointMode**. Controls generation of points rather than triangles or lines. This functionality defaults to disabled, and is enabled if either shader stage includes the execution mode. When using shader objects, if **PointMode** is set in the tessellation control stage, it **must** be identically set in the tessellation evaluation stage. If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode is VK_FALSE, then point mode tessellation is not supported by the implementation, and **PointMode** **must** not be used in either tessellation shader stage.

- **SpacingEqual**, **SpacingFractionalEven**, and **SpacingFractionalOdd**. Controls the spacing of segments on the edges of tessellated primitives. When using shader objects, one mode **must** be set in at least the tessellation evaluation stage. When using pipelines, one mode **must** be set in at least one of the tessellation shader stages.

- **OutputVertices**. Controls the size of the output patch of the tessellation control shader. When using shader objects, one value **must** be set in at least the tessellation control stage. When using pipelines, one value **must** be set in at least one of the tessellation shader stages.

For triangles, the tessellator subdivides a triangle primitive into smaller triangles. For quads, the tessellator subdivides a rectangle primitive into smaller triangles. For isolines, the tessellator subdivides a rectangle primitive into a collection of line segments arranged in strips stretching across the rectangle in the u dimension (i.e. the coordinates in TessCoord are of the form (0,x) through (1,x) for all tessellation evaluation shader invocations that share a line).

Each vertex produced by the tessellator has an associated (u,v,w) or (u,v) position in a normalized parameter space, with parameter values in the range [0,1], as illustrated in figures **Domain parameterization for tessellation primitive modes (upper-left origin)** and **Domain parameterization for tessellation primitive modes (lower-left origin)**. The domain space **can** have either an upper-left or lower-left origin, selected by the **domainOrigin** member of VkPipelineTessellationDomainOriginStateCreateInfo.
Figure 15. Domain parameterization for tessellation primitive modes (upper-left origin)
In the domain parameterization diagrams, the coordinates illustrate the value of \texttt{TessCoord} at the corners of the domain. The labels on the edges indicate the inner (IL0 and IL1) and outer (OL0 through OL3) tessellation level values used to control the number of subdivisions along each edge of the domain.

For triangles, the vertex’s position is a barycentric coordinate \((u,v,w)\), where \(u + v + w = 1.0\), and indicates the relative influence of the three vertices of the triangle on the position of the vertex. For quads and isolines, the position is a \((u,v)\) coordinate indicating the relative horizontal and vertical position of the vertex relative to the subdivided rectangle. The subdivision process is explained in more detail in subsequent sections.

### 23.2. Tessellator Patch Discard

A patch is discarded by the tessellator if any relevant outer tessellation level is less than or equal to zero.

Patches will also be discarded if any relevant outer tessellation level corresponds to a floating-point
NaN (not a number) in implementations supporting NaN.

No new primitives are generated and the tessellation evaluation shader is not executed for patches that are discarded. For Quads, all four outer levels are relevant. For Triangles and IsoLines, only the first three or two outer levels, respectively, are relevant. Negative inner levels will not cause a patch to be discarded; they will be clamped as described below.

### 23.3. Tessellator Spacing

Each of the tessellation levels is used to determine the number and spacing of segments used to subdivide a corresponding edge. The method used to derive the number and spacing of segments is specified by an OpExecutionMode in the tessellation control or tessellation evaluation shader using one of the identifiers SpacingEqual, SpacingFractionalEven, or SpacingFractionalOdd.

If SpacingEqual is used, the floating-point tessellation level is first clamped to \([1, \text{maxLevel}]\), where \text{maxLevel} is the implementation-dependent maximum tessellation level (VkPhysicalDeviceLimits::maxTessellationGenerationLevel). The result is rounded up to the nearest integer \(n\), and the corresponding edge is divided into \(n\) segments of equal length in \((u,v)\) space.

If SpacingFractionalEven is used, the tessellation level is first clamped to \([2, \text{maxLevel}]\) and then rounded up to the nearest even integer \(n\). If SpacingFractionalOdd is used, the tessellation level is clamped to \([1, \text{maxLevel}-1]\) and then rounded up to the nearest odd integer \(n\). If \(n\) is one, the edge will not be subdivided. Otherwise, the corresponding edge will be divided into \(n - 2\) segments of equal length, and two additional segments of equal length that are typically shorter than the other segments. The length of the two additional segments relative to the others will decrease monotonically with \(n - f\), where \(f\) is the clamped floating-point tessellation level. When \(n - f\) is zero, the additional segments will have equal length to the other segments. As \(n - f\) approaches 2.0, the relative length of the additional segments approaches zero. The two additional segments must be placed symmetrically on opposite sides of the subdivided edge. The relative location of these two segments is implementation-dependent, but must be identical for any pair of subdivided edges with identical values of \(f\).

When tessellating triangles or quads using point mode with fractional odd spacing, the tessellator may produce interior vertices that are positioned on the edge of the patch if an inner tessellation level is less than or equal to one. Such vertices are considered distinct from vertices produced by subdividing the outer edge of the patch, even if there are pairs of vertices with identical coordinates.

### 23.4. Tessellation Primitive Ordering

Few guarantees are provided for the relative ordering of primitives produced by tessellation, as they pertain to primitive order.

- The output primitives generated from each input primitive are passed to subsequent pipeline stages in an implementation-dependent order.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.
23.5. Tessellator Vertex Winding Order

When the tessellator produces triangles (in the Triangles or Quads modes), the orientation of all triangles is specified with an OpExecutionMode of VertexOrderCw or VertexOrderCcw in the tessellation control or tessellation evaluation shaders. If the order is VertexOrderCw, the vertices of all generated triangles will have clockwise ordering in (u,v) or (u,v,w) space. If the order is VertexOrderCcw, the vertices will have counter-clockwise ordering in that space.

If the tessellation domain has an upper-left origin, the vertices of a triangle have counter-clockwise ordering if

\[ a = u_0 v_1 - u_1 v_0 + u_1 v_2 - u_2 v_1 + u_2 v_0 - u_0 v_2 \]

is negative, and clockwise ordering if \( a \) is positive. \( u_i \) and \( v_i \) are the \( u \) and \( v \) coordinates in normalized parameter space of the \( i \)th vertex of the triangle. If the tessellation domain has a lower-left origin, the vertices of a triangle have counter-clockwise ordering if \( a \) is positive, and clockwise ordering if \( a \) is negative.

\[ \text{Note} \]

The value \( a \) is proportional (with a positive factor) to the signed area of the triangle.

In Triangles mode, even though the vertex coordinates have a \( w \) value, it does not participate directly in the computation of \( a \), being an affine combination of \( u \) and \( v \).

23.6. Triangle Tessellation

If the tessellation primitive mode is Triangles, an equilateral triangle is subdivided into a collection of triangles covering the area of the original triangle. First, the original triangle is subdivided into a collection of concentric equilateral triangles. The edges of each of these triangles are subdivided, and the area between each triangle pair is filled by triangles produced by joining the vertices on the subdivided edges. The number of concentric triangles and the number of subdivisions along each triangle except the outermost is derived from the first inner tessellation level. The edges of the outermost triangle are subdivided independently, using the first, second, and third outer tessellation levels to control the number of subdivisions of the \( u = 0 \) (left), \( v = 0 \) (bottom), and \( w = 0 \) (right) edges, respectively. The second inner tessellation level and the fourth outer tessellation level have no effect in this mode.

If the first inner tessellation level and all three outer tessellation levels are exactly one after clamping and rounding, only a single triangle with \((u,v,w)\) coordinates of \((0,0,1)\), \((1,0,0)\), and \((0,1,0)\) is generated. If the inner tessellation level is one and any of the outer tessellation levels is greater than one, the inner tessellation level is treated as though it were originally specified as \( 1 + \varepsilon \) and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the triangle.
If any tessellation level is greater than one, tessellation begins by producing a set of concentric inner triangles and subdividing their edges. First, the three outer edges are temporarily subdivided using the clamped and rounded first inner tessellation level and the specified tessellation spacing, generating \( n \) segments. For the outermost inner triangle, the inner triangle is degenerate—a single point at the center of the triangle—if \( n \) is two. Otherwise, for each corner of the outer triangle, an inner triangle corner is produced at the intersection of two lines extended perpendicular to the corner’s two adjacent edges running through the vertex of the subdivided outer edge nearest that corner. If \( n \) is three, the edges of the inner triangle are not subdivided and it is the final triangle in the set of concentric triangles. Otherwise, each edge of the inner triangle is divided into \( n - 2 \) segments, with the \( n - 1 \) vertices of this subdivision produced by intersecting the inner edge with lines perpendicular to the edge running through the \( n - 1 \) innermost vertices of the subdivision of the outer edge. Once the outermost inner triangle is subdivided, the previous subdivision process repeats itself, using the generated triangle as an outer triangle. This subdivision process is illustrated in Inner Triangle Tessellation.

![Inner Triangle Tessellation](image)

**Caption**

In the Inner Triangle Tessellation diagram, inner tessellation levels of (a) four and (b) five are shown (not to scale). Solid black circles depict vertices along the edges of the concentric triangles. The edges of inner triangles are subdivided by intersecting the edge with segments perpendicular to the edge running through the \( n - 1 \) innermost vertices of the subdivision of the outer edge. Dotted lines depict edges connecting corresponding vertices on the inner and outer triangle edges.

Once all the concentric triangles are produced and their edges are subdivided, the area between each pair of adjacent inner triangles is filled completely with a set of non-overlapping triangles. In this subdivision, two of the three vertices of each triangle are taken from adjacent vertices on a subdivided edge of one triangle; the third is one of the vertices on the corresponding edge of the other triangle. If the innermost triangle is degenerate (i.e., a point), the triangle containing it is subdivided into six triangles by connecting each of the six vertices on that triangle with the center point. If the innermost triangle is not degenerate, that triangle is added to the set of generated triangles as-is.
After the area corresponding to any inner triangles is filled, the tessellator generates triangles to cover the area between the outermost triangle and the outermost inner triangle. To do this, the temporary subdivision of the outer triangle edge above is discarded. Instead, the $u = 0$, $v = 0$, and $w = 0$ edges are subdivided according to the first, second, and third outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the first inner triangle is retained. The area between the outer and first inner triangles is completely filled by non-overlapping triangles as described above. If the first (and only) inner triangle is degenerate, a set of triangles is produced by connecting each vertex on the outer triangle edges with the center point.

After all triangles are generated, each vertex in the subdivided triangle is assigned a barycentric $(u,v,w)$ coordinate based on its location relative to the three vertices of the outer triangle.

The algorithm used to subdivide the triangular domain in $(u,v,w)$ space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is consistent across the domain as described in Tessellator Vertex Winding Order.

### 23.7. Quad Tessellation

If the tessellation primitive mode is Quads, a rectangle is subdivided into a collection of triangles covering the area of the original rectangle. First, the original rectangle is subdivided into a regular mesh of rectangles, where the number of rectangles along the $u = 0$ and $u = 1$ (vertical) and $v = 0$ and $v = 1$ (horizontal) edges are derived from the first and second inner tessellation levels, respectively. All rectangles, except those adjacent to one of the outer rectangle edges, are decomposed into triangle pairs. The outermost rectangle edges are subdivided independently, using the first, second, third, and fourth outer tessellation levels to control the number of subdivisions of the $u = 0$ (left), $v = 0$ (bottom), $u = 1$ (right), and $v = 1$ (top) edges, respectively. The area between the inner rectangles of the mesh and the outer rectangle edges are filled by triangles produced by joining the vertices on the subdivided outer edges to the vertices on the edge of the inner rectangle mesh.

If both clamped inner tessellation levels and all four clamped outer tessellation levels are exactly one, only a single triangle pair covering the outer rectangle is generated. Otherwise, if either clamped inner tessellation level is one, that tessellation level is treated as though it was originally specified as $1 + \epsilon$ and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the rectangle.

If any tessellation level is greater than one, tessellation begins by subdividing the $u = 0$ and $u = 1$ edges of the outer rectangle into $m$ segments using the clamped and rounded first inner tessellation level and the tessellation spacing. The $v = 0$ and $v = 1$ edges are subdivided into $n$ segments using the second inner tessellation level. Each vertex on the $u = 0$ and $v = 0$ edges are joined with the corresponding vertex on the $u = 1$ and $v = 1$ edges to produce a set of vertical and horizontal lines that divide the rectangle into a grid of smaller rectangles. The primitive generator emits a pair of
non-overlapping triangles covering each such rectangle not adjacent to an edge of the outer rectangle. The boundary of the region covered by these triangles forms an inner rectangle, the edges of which are subdivided by the grid vertices that lie on the edge. If either \( m \) or \( n \) is two, the inner rectangle is degenerate, and one or both of the rectangle's edges consist of a single point. This subdivision is illustrated in Figure Inner Quad Tessellation.

![Inner Quad Tessellation](image)

**Figure 18. Inner Quad Tessellation**

In the Inner Quad Tessellation diagram, inner quad tessellation levels of (a) (4,2) and (b) (7,4) are shown. The regions highlighted in red in figure (b) depict the 10 inner rectangles, each of which will be subdivided into two triangles. Solid black circles depict vertices on the boundary of the outer and inner rectangles, where the inner rectangle of figure (a) is degenerate (a single line segment). Dotted lines depict the horizontal and vertical edges connecting corresponding vertices on the inner and outer rectangle edges.

After the area corresponding to the inner rectangle is filled, the tessellator **must** produce triangles to cover the area between the inner and outer rectangles. To do this, the subdivision of the outer rectangle edge above is discarded. Instead, the \( u = 0 \), \( v = 0 \), \( u = 1 \), and \( v = 1 \) edges are subdivided according to the first, second, third, and fourth outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the inner rectangle is retained. The area between the outer and inner rectangles is completely filled by non-overlapping triangles. Two of the three vertices of each triangle are adjacent vertices on a subdivided edge of one rectangle; the third is one of the vertices on the corresponding edge of the other rectangle. If either edge of the innermost rectangle is degenerate, the area near the corresponding outer edges is filled by connecting each vertex on the outer edge with the single vertex making up the inner edge.

The algorithm used to subdivide the rectangular domain in \((u,v)\) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is
consistent across the domain as described in Tessellator Vertex Winding Order.

23.8. Isoline Tessellation

If the tessellation primitive mode is IsoLines, a set of independent horizontal line segments is drawn. The segments are arranged into connected strips called isolines, where the vertices of each isoline have a constant v coordinate and u coordinates covering the full range [0,1]. The number of isolines generated is derived from the first outer tessellation level; the number of segments in each isoline is derived from the second outer tessellation level. Both inner tessellation levels and the third and fourth outer tessellation levels have no effect in this mode.

As with quad tessellation above, isoline tessellation begins with a rectangle. The u = 0 and u = 1 edges of the rectangle are subdivided according to the first outer tessellation level. For the purposes of this subdivision, the tessellation spacing mode is ignored and treated as equal_spacing. An isoline is drawn connecting each vertex on the u = 0 rectangle edge to the corresponding vertex on the u = 1 rectangle edge, except that no line is drawn between (0,1) and (1,1). If the number of isolines on the subdivided u = 0 and u = 1 edges is n, this process will result in n equally spaced lines with constant v coordinates of 0, \frac{1}{n}, \frac{2}{n}, ..., \frac{n-1}{n}.

Each of the n isolines is then subdivided according to the second outer tessellation level and the tessellation spacing, resulting in m line segments. Each segment of each line is emitted by the tessellator. These line segments are generated with a topology similar to line lists, except that the order in which each line is generated, and the order in which the vertices are generated for each line segment, are implementation-dependent.

Note

If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines is VK_FALSE, then isoline tessellation is not supported by the implementation.

23.9. Tessellation Point Mode

For all primitive modes, the tessellator is capable of generating points instead of lines or triangles. If the tessellation control or tessellation evaluation shader specifies the OpExecutionMode PointMode, the primitive generator will generate one point for each distinct vertex produced by tessellation, rather than emitting triangles or lines. Otherwise, the tessellator will produce a collection of line segments or triangles according to the primitive mode. These points are generated with a topology similar to point lists, except the order in which the points are generated for each input primitive is undefined.

Note

If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode is VK_FALSE, then tessellation point mode is not supported by the implementation.
23.10. Tessellation Pipeline State

The `pTessellationState` member of `VkGraphicsPipelineCreateInfo` is a pointer to a `VkPipelineTessellationStateCreateInfo` structure.

The `VkPipelineTessellationStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineTessellationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineTessellationStateCreateFlags flags;
    uint32_t patchControlPoints;
} VkPipelineTessellationStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `patchControlPoints` is the number of control points per patch.

Valid Usage

- VUID-VkPipelineTessellationStateCreateInfo-patchControlPoints-01214
  `patchControlPoints` must be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

Valid Usage (Implicit)

- VUID-VkPipelineTessellationStateCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO`

- VUID-VkPipelineTessellationStateCreateInfo-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkPipelineTessellationDomainOriginStateCreateInfo`

- VUID-VkPipelineTessellationStateCreateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkPipelineTessellationStateCreateInfo-flags-zerobitmask
  `flags` must be `0`

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineTessellationStateCreateFlags;
```

`VkPipelineTessellationStateCreateFlags` is a bitmask type for setting a mask, but is currently
reserved for future use.

The VkPipelineTessellationDomainOriginStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPipelineTessellationDomainOriginStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkTessellationDomainOrigin domainOrigin;
} VkPipelineTessellationDomainOriginStateCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkPipelineTessellationDomainOriginStateCreateInfo
    VkPipelineTessellationDomainOriginStateCreateInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **domainOrigin** is a VkTessellationDomainOrigin value controlling the origin of the tessellation domain space.

If the VkPipelineTessellationDomainOriginStateCreateInfo structure is included in the pNext chain of VkPipelineTessellationStateCreateInfo, it controls the origin of the tessellation domain. If this structure is not present, it is as if domainOrigin was VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT.

**Valid Usage (Implicit)**

- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_DOMAIN_ORIGIN_STATE_CREATE_INFO
- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-domainOrigin-parameter
  domainOrigin must be a valid VkTessellationDomainOrigin value

The possible tessellation domain origins are specified by the VkTessellationDomainOrigin enumeration:
// Provided by VK_VERSION_1_1
typedef enum VkTessellationDomainOrigin {
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT = 0,
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT = 1,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT_KHR = VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT_KHR = VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT,
} VkTessellationDomainOrigin;

or the equivalent

// Provided by VK_KHR_maintenance2
typedef VkTessellationDomainOrigin VkTessellationDomainOriginKHR;

• VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT specifies that the origin of the domain space is in the upper left corner, as shown in figure Domain parameterization for tessellation primitive modes (upper-left origin).

• VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT specifies that the origin of the domain space is in the lower left corner, as shown in figure Domain parameterization for tessellation primitive modes (lower-left origin).

This enum affects how the VertexOrderCw and VertexOrderCcw tessellation execution modes are interpreted, since the winding is defined relative to the orientation of the domain.

To dynamically set the origin of the tessellation domain space, call:

// Provided by VK_EXT_extended_dynamic_state3 with VK_KHR_maintenance2 or VK_VERSION_1_1, VK_EXT_shader_object
void vkCmdSetTessellationDomainOriginEXT(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    VkTessellationDomainOrigin domainOrigin);  // domainOrigin specifies the origin of the tessellation domain space.

This command sets the origin of the tessellation domain space for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineTessellationDomainOriginStateCreateInfo::domainOrigin value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetTessellationDomainOriginEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3TessellationDomainOrigin` feature is enabled
  - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetTessellationDomainOriginEXT-domainOrigin-parameter
  `domainOrigin` must be a valid `VkTessellationDomainOrigin` value
- VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-recording
  `commandBuffer` must be in the `recording state`
- VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetTessellationDomainOriginEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Chapter 24. Geometry Shading

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive. Geometry shading is enabled when a geometry shader is included in the pipeline.

24.1. Geometry Shader Input Primitives

Each geometry shader invocation has access to all vertices in the primitive (and their associated data), which are presented to the shader as an array of inputs.

The input primitive type expected by the geometry shader is specified with an OpExecutionMode instruction in the geometry shader, and must match the incoming primitive type specified by either the pipeline’s primitive topology if tessellation is inactive, or the tessellation mode if tessellation is active, as follows:

- An input primitive type of InputPoints must only be used with a pipeline topology of VK_PRIMITIVE_TOPOLOGY_POINT_LIST, or with a tessellation shader specifying PointMode. The input arrays always contain one element, as described by the point list topology or tessellation in point mode.

- An input primitive type of InputLines must only be used with a pipeline topology of VK_PRIMITIVE_TOPOLOGY_LINE_LIST or VK_PRIMITIVE_TOPOLOGY_LINE_STRIP, or with a tessellation shader specifyingIsoLines that does not specify PointMode. The input arrays always contain two elements, as described by the line list topology or line strip topology, or by isoline tessellation.

- An input primitive type of InputLinesAdjacency must only be used when tessellation is inactive, with a pipeline topology of VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY or VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY. The input arrays always contain four elements, as described by the line list with adjacency topology or line strip with adjacency topology.

- An input primitive type of Triangles must only be used with a pipeline topology of VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP, or VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN; or with a tessellation shader specifyingQuads or Triangles that does not specify PointMode. The input arrays always contain three elements, as described by the triangle list topology, triangle strip topology, or triangle fan topology, or by triangle or quad tessellation. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order.

- An input primitive type of InputTrianglesAdjacency must only be used when tessellation is inactive, with a pipeline topology of VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY or VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY. The input arrays always contain six elements, as described by the triangle list with adjacency topology or triangle strip with adjacency topology. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order, and the vertices making up the main primitive must still occur at the first, third, and fifth index.
24.2. Geometry Shader Output Primitives

A geometry shader generates primitives in one of three output modes: points, line strips, or triangle strips. The primitive mode is specified in the shader using an `OpExecutionMode` instruction with the `OutputPoints`, `OutputLineStrip` or `OutputTriangleStrip` modes, respectively. Each geometry shader must include exactly one output primitive mode.

The vertices output by the geometry shader are assembled into points, lines, or triangles based on the output primitive type and the resulting primitives are then further processed as described in Rasterization. If the number of vertices emitted by the geometry shader is not sufficient to produce a single primitive, vertices corresponding to incomplete primitives are not processed by subsequent pipeline stages. The number of vertices output by the geometry shader is limited to a maximum count specified in the shader.

The maximum output vertex count is specified in the shader using an `OpExecutionMode` instruction with the mode set to `OutputVertices` and the maximum number of vertices that will be produced by the geometry shader specified as a literal. Each geometry shader must specify a maximum output vertex count.

24.3. Multiple Invocations of Geometry Shaders

Geometry shaders can be invoked more than one time for each input primitive. This is known as geometry shader instancing and is requested by including an `OpExecutionMode` instruction with `Invocations` specified as a literal.

In this mode, the geometry shader will execute at least n times for each input primitive, where n is the number of invocations specified in the `OpExecutionMode` instruction. The instance number is available to each invocation as a built-in input using `InvocationId`.

24.4. Geometry Shader Primitive Ordering

Limited guarantees are provided for the relative ordering of primitives produced by a geometry shader, as they pertain to primitive order.

- For instanced geometry shaders, the output primitives generated from each input primitive are passed to subsequent pipeline stages using the invocation number to order the primitives, from least to greatest.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.

24.5. Geometry Shader Passthrough

A geometry shader that uses the `PassthroughNV` decoration on a variable in its input interface is considered a passthrough geometry shader. Output primitives in a passthrough geometry shader must have the same topology as the input primitive and are not produced by emitting vertices. The vertices of the output primitive have two different types of attributes, per-vertex and per-primitive. Geometry shader input variables with `PassthroughNV` decoration are considered to produce per-
vertex outputs, where values for each output vertex are copied from the corresponding input vertex. Any built-in or user-defined geometry shader outputs are considered per-primitive in a passthrough geometry shader, where a single output value is copied to all output vertices.

The remainder of this section details the usage of the PassthroughNV decoration and modifications to the interface matching rules when using passthrough geometry shaders.

### 24.5.1. PassthroughNV Decoration

Decorating a geometry shader input variable with the PassthroughNV decoration indicates that values of this input are copied through to the corresponding vertex of the output primitive. Input variables and block members which do not have the PassthroughNV decoration are consumed by the geometry shader without being passed through to subsequent stages.

The PassthroughNV decoration must only be used within a geometry shader.

Any variable decorated with PassthroughNV must be declared using the Input storage class.

The PassthroughNV decoration must not be used with any of:

- an input primitive type other than InputPoints, InputLines, or Triangles, as specified by the mode for OpExecutionMode.
- an invocation count other than one, as specified by the Invocations mode for OpExecutionMode.
- an OpEntryPoint which statically uses the OpEmitVertex or OpEndPrimitive instructions.
- a variable decorated with the InvocationId built-in decoration.
- a variable decorated with the PrimitiveId built-in decoration that is declared using the Input storage class.

### 24.5.2. Passthrough Interface Matching

When a passthrough geometry shader is in use, the Interface Matching rules involving the geometry shader input and output interfaces operate as described in this section.

For the purposes of matching passthrough geometry shader inputs with outputs of the previous pipeline stages, the PassthroughNV decoration is ignored.

For the purposes of matching the outputs of the geometry shader with subsequent pipeline stages, each input variable with the PassthroughNV decoration is considered to add an equivalent output variable with the same type, decoration (other than PassthroughNV), number, and declaration order on the output interface. The output variable declaration corresponding to an input variable decorated with PassthroughNV will be identical to the input declaration, except that the outermost array dimension of such variables is removed. The output block declaration corresponding to an input block decorated with PassthroughNV or having members decorated with PassthroughNV will be identical to the input declaration, except that the outermost array dimension of such declaration is removed.

If an input block is decorated with PassthroughNV, the equivalent output block contains all the members of the input block. Otherwise, the equivalent output block contains only those input block
members decorated with `PassthroughNV`. All members of the corresponding output block are assigned `Location` and `Component` decorations identical to those assigned to the corresponding input block members.

Output variables and blocks generated from inputs decorated with `PassthroughNV` will only exist for the purposes of interface matching; these declarations are not available to geometry shader code or listed in the module interface.

For the purposes of component counting, passthrough geometry shaders count all statically used input variable components declared with the `PassthroughNV` decoration as output components as well, since their values will be copied to the output primitive produced by the geometry shader.
Chapter 25. Mesh Shading

Task and mesh shaders operate in workgroups to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline.

Work on the mesh pipeline is initiated by the application drawing a set of mesh tasks organized in global workgroups. If the optional task shader is active, each workgroup triggers the execution of task shader invocations that will create a new set of mesh workgroups upon completion. Each of these created workgroups, or each of the original workgroups if no task shader is present, triggers the execution of mesh shader invocations.

Each mesh shader workgroup emits zero or more output primitives along with the group of vertices and their associated data required for each output primitive.

25.1. Task Shader Input

For every workgroup issued via the drawing commands a group of task shader invocations is executed. There are no inputs other than the builtin workgroup identifiers.

25.2. Task Shader Output

The task shader can emit zero or more mesh workgroups to be generated. Shaders using the TaskNV Execution Model can do so using the built-in variable TaskCountNV. This value must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV::maxTaskOutputCount. Shaders using the TaskEXT Execution Model can do so using the OpEmitMeshTasksEXT instruction. The groupCountX, groupCountY and groupCountZ arguments passed to this instruction must be less than or equal to the respective dimension within VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount. The product of these arguments must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupTotalCount.

The task shader can also pass user-defined data to all mesh shader invocations that it creates. Shaders using the TaskNV Execution Model can do so by writing to output variables that are decorated with PerTaskNV. They are available as inputs in mesh shaders. Shaders using the TaskEXT Execution Model can do so by writing to a payload variable with TaskPayloadWorkgroupEXT storage class that is passed to the OpEmitMeshTasksEXT instruction.

25.3. Mesh Generation

If a task shader exists, the mesh assembler creates a variable amount of mesh workgroups depending on each task's output. If there is no task shader, the drawing commands emit the mesh shader invocations directly.

25.4. Mesh Shader Input

The only inputs available to the mesh shader are variables identifying the specific workgroup and invocation and, if applicable, any outputs written as PerTaskNV or the payload variable passed to the
OpEmitMeshTasksEXT instruction by the task shader that spawned the mesh shader's workgroup. The mesh shader can operate without a task shader as well.

25.5. Mesh Shader Output

A mesh shader generates primitives in one of three output modes: points, lines, or triangles. For shaders using the MeshNV Execution Model the primitive mode is specified in the shader using an OpExecutionMode instruction with the OutputPoints, OutputLinesNV, or OutputTrianglesNV modes, respectively. For shaders using the MeshEXT Execution Model the primitive mode is specified in the shader using an OpExecutionMode instruction with the OutputPoints, OutputLinesEXT, or OutputTrianglesEXT modes, respectively. Each mesh shader must include exactly one output primitive mode.

For shaders using the MeshNV Execution Model the maximum output vertex count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputVertices and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputVertices. For shaders using the MeshEXT Execution Model the maximum output vertex count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputVertices and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshOutputVertices.

For shaders using the MeshNV Execution Model the maximum output primitive count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputPrimitivesNV and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputPrimitives. For shaders using the MeshEXT Execution Model the maximum output primitive count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputPrimitivesEXT, and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshOutputPrimitives.

For shaders using the MeshNV Execution Model the number of primitives output by the mesh shader is provided via writing to the built-in variable PrimitiveCountNV and must be less than or equal to the maximum output primitive count specified in the shader. A variable decorated with PrimitiveIndicesNV is an output array of local index values into the vertex output arrays from which primitives are assembled according to the output primitive type. For shaders using the MeshEXT Execution Model the number of vertices and primitives output by the mesh shader is provided via calling the OpSetMeshOutputsEXT instruction. The vertexCount argument must be less than or equal to the maximum output vertex count specified in the shader. The primitiveCount argument must be less than or equal to the maximum output primitive count specified in the shader.

Depending on the output primitive mode an appropriately-decorated variable is the output array of local index values into the vertex output arrays from which primitives are assembled according to the output primitive type:

- OutputPoints uses the PrimitivePointIndicesEXT decoration.
- OutputLinesEXT uses the PrimitiveLineIndicesEXT decoration.
- OutputTrianglesEXT uses the PrimitiveTriangleIndicesEXT decoration.

These resulting primitives are then further processed as described in Rasterization.
With the exception of primitive indices, all output built-ins and custom attributes count towards the total storage size occupied by output variables in mesh shaders. This size can be calculated as follows, taking into account the fact that the number of effective scalar attributes is 4 times the number of effective locations used according to the location assignment rules. Let $v$ be the number of views, $n_v$ be the number of effective scalar per-vertex attributes not dependent on ViewIndex, $n_{vpv}$ be the number of effective scalar per-vertex attributes dependent on ViewIndex, $m_v$ be the maximum number of vertices specified by the OutputVertices Execution Mode, $g_v$ be meshOutputPerVertexGranularity, $n_p$ be the number of effective scalar per-primitive attributes not dependent on ViewIndex, $n_{ppv}$ be the number of effective scalar per-primitive attributes dependent on ViewIndex, $m_p$ be the maximum number of primitives specified by the OutputPrimitivesEXT Execution Mode and $g_p$ be meshOutputPerPrimitiveGranularity:

$$(n_v + (n_{vpv} \times v)) \times 4 \times \text{align}(m_v, g_v) + (n_p + (n_{ppv} \times v)) \times 4 \times \text{align}(m_p, g_p)$$

25.6. Mesh Shader Per-View Outputs

The mesh shader outputs decorated with the PositionPerViewNV, ClipDistancePerViewNV, CullDistancePerViewNV, LayerPerViewNV, and ViewportMaskPerViewNV built-in decorations are the per-view versions of the single-view variables with equivalent names (that is Position, ClipDistance, CullDistance, Layer, and ViewportMaskNV, respectively). If a shader statically assigns a value to any element of a per-view array it must not statically assign a value to the equivalent single-view variable.

Each of these outputs is considered arrayed, with separate values for each view. The view number is used to index the first dimension of these arrays.

The second dimension of the ClipDistancePerViewNV, and CullDistancePerViewNV arrays have the same requirements as the ClipDistance, and CullDistance arrays.

If a mesh shader output is per-view, the corresponding fragment shader input is taken from the element of the per-view output array that corresponds to the view that is currently being processed by the fragment shader.

These per-view outputs are available only in shaders using the MeshNV Execution Model. They are not available in shaders using the MeshEXT Execution Model.

25.7. Mesh Shader Primitive Ordering

Following guarantees are provided for the relative ordering of primitives produced by a mesh shader, as they pertain to primitive order.

- When a task shader is used, mesh workgroups spawned from lower tasks will be ordered prior those workgroups from subsequent tasks.
- All output primitives generated from a given mesh workgroup are passed to subsequent pipeline stages before any output primitives generated from subsequent input workgroups.
- All output primitives within a mesh workgroup, will be generated in the ordering provided by the builtin primitive indexbuffer (from low address to high address).
Chapter 26. Cluster Culling Shading

This shader type has an execution environment similar to that of a compute shader, where a collection of shader invocations form a workgroup and cooperate to perform coarse level geometry culling and LOD selection. A shader invocation can emit a set of built-in output variables via a new built-in function. The cluster culling shader organizes these emitted variables into a drawing command used by the subsequent rendering pipeline.

26.1. Cluster Culling Shader Input

The only inputs available to the cluster culling shader are variables identifying the specific workgroup and invocation.

26.2. Cluster Culling Shader Output

If a cluster survives after culling in a cluster culling shader invocation, a drawing command to draw this cluster should be emitted by this shader invocation for further rendering processing. There are two types of drawing command, indexed mode and non-indexed mode. Both type of drawing commands consist of a set of built-in output variables which have a similar definition to VkDrawIndexedIndirectCommand and VkDrawIndirectCommand members.

Cluster culling shaders have the following built-in output variables:

- **built-in variable IndexCountHUAWEI** is the number of vertices to draw.
- **built-in variable VertexCountHUAWEI** is the number of vertices to draw.
- **built-in variable InstanceCountHUAWEI** is the number of instances to draw.
- **built-in variable FirstIndexHUAWEI** is the base index within the index buffer.
- **built-in variable FirstVertexHUAWEI** is the index of the first vertex to draw
- **built-in variable VertexOffsetHUAWEI** is the value added to the vertex index before indexing into the vertex buffer.
- **built-in variable FirstInstanceHUAWEI** is the instance ID of the first instance to draw.
- **built-in variable ClusterIDHUAWEI** is the index of cluster being rendered by this drawing command. When cluster culling shader is enabled, ClusterIDHUAWEI will replace gl_DrawID pass to vertex shader.
- **built-in variable ClusterShadingRate** is the shading rate of cluster being rendered by this drawing command.

26.3. Cluster Culling Shader Cluster Ordering

- When a cluster culling shader is used, all output clusters generated by DispatchClusterHUAWEI() in a given workgroup are passed to subsequent pipeline stage before any cluster generated from subsequent workgroup.
- In a workgroup, the order of output clusters generated by DispatchClusterHUAWEI() is specified by
the local invocation id, from lower to higher values.

- If any cluster culling invocation in the workgroup does not call `DispatchClusterHUAWEI()`, no cluster will be sent to the subsequent rendering pipeline.
- Any cluster culling shader invocation may also call `DispatchClusterHUAWEI()` many times as shown below:

```
// Cluster Culling Shader sample code:
......
DispatchClusterHUAWEI(); // dispatch 0
......
DispatchClusterHUAWEI(); // dispatch 1
......
DispatchClusterHUAWEI(); // dispatch 2
......
```

In this case, the output sequence of clusters in a workgroup are specified as shown below (in case of 32 shader invocations in a workgroup):

```
1. shader invocation0.dispatch0
2. shader invocation1.dispatch0,
   ...........
32. shader invocation31.dispatch0
33. shader invocation0.dispatch1
34. shader invocation1.dispatch1
   ...........
64. shader invocation31.dispatch1
65. shader invocation0.dispatch2
66. shader invocation1.dispatch2
   ...........
96. shader Invocation31.dispatch2
```

### 26.4. Cluster Culling Shader Primitive Ordering

Following guarantees are provided for the relative ordering of primitives produced by a cluster culling shader, as they pertain to **primitive order**.

- Limited guarantees are provided for the relative ordering of primitives produced by a cluster culling shader, as they pertain to primitive order.
- The order of primitives in a given cluster is specified by the content of
  - `DispatchClusterHUAWEI()` with indexed output built-in variables, vertices sourced from a lower index buffer addresses to higher addresses.
  - `DispatchClusterHUAWEI()` with non-indexed output built-in variables, from vertices with a lower numbered `vertexIndex` to a higher numbered `vertexIndex`. 
Chapter 27. Fixed-Function Vertex Post-Processing

After pre-rasterization shader stages, the following fixed-function operations are applied to vertices of the resulting primitives:

- Transform feedback (see Transform Feedback)
- Viewport swizzle (see Viewport Swizzle)
- Flat shading (see Flat Shading).
- Primitive clipping, including client-defined half-spaces (see Primitive Clipping).
- Shader output attribute clipping (see Clipping Shader Outputs).
- Clip space W scaling (see Controlling Viewport W Scaling).
- Perspective division on clip coordinates (see Coordinate Transformations).
- Viewport mapping, including depth range scaling (see Controlling the Viewport).
- Front face determination for polygon primitives (see Basic Polygon Rasterization).

Next, rasterization is performed on primitives as described in chapter Rasterization.

27.1. Transform Feedback

Before any other fixed-function vertex post-processing, vertex outputs from the last shader in the pre-rasterization shader stage can be written out to one or more transform feedback buffers bound to the command buffer. To capture vertex outputs the last pre-rasterization shader stage shader must be declared with the Xfb execution mode. Outputs decorated with XfbBuffer will be written out to the corresponding transform feedback buffers bound to the command buffer when transform feedback is active. Transform feedback buffers are bound to the command buffer by using vkCmdBindTransformFeedbackBuffersEXT. Transform feedback is made active by calling vkCmdBeginTransformFeedbackEXT and made inactive by calling vkCmdEndTransformFeedbackEXT. After vertex data is written it is possible to use vkCmdDrawIndirectByteCountEXT to start a new draw where the vertexCount is derived from the number of bytes written by a previous transform feedback.

When an individual point, line, or triangle primitive reaches the transform feedback stage while transform feedback is active, the values of the specified output variables are assembled into primitives and appended to the bound transform feedback buffers. After activating transform feedback, the values of the first assembled primitive are written at the starting offsets of the bound transform feedback buffers, and subsequent primitives are appended to the buffer. If the optional pCounterBuffers and pCounterBufferOffsets parameters are specified, the starting points within the transform feedback buffers are adjusted so data is appended to the previously written values indicated by the value stored by the implementation in the counter buffer.

For multi-vertex primitives, all values for a given vertex are written before writing values for any other vertex. When transformFeedbackPreservesProvokingVertex is not enabled, implementations may write out any vertex within the primitive first, but all subsequent vertices for that primitive
must be written out in a consistent winding order defined as follows:

- If neither geometry or tessellation shading is active, vertices within a primitive are appended according to the winding order described by the primitive topology defined by the `VkPipelineInputAssemblyStateCreateInfo::topology` used to execute the drawing command.

- If geometry shading is active, vertices within a primitive are appended according to the winding order described by the primitive topology defined by the `OutputPoints`, `OutputLineStrip`, or `OutputTriangleStrip` execution mode.

- If tessellation shading is active but geometry shading is not, vertices within a primitive are appended according to the winding order defined by triangle tessellation, quad tessellation, and isoline tessellation.

When `transformFeedbackPreservesProvokingVertex` is enabled, then in addition to writing vertices with a consistent winding order, the vertex order must preserve the provoking vertex of each primitive:

- When the pipeline's provoking vertex mode is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the primitive's provoking vertex must be the first vertex written.

- When the pipeline's provoking vertex mode is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the primitive's provoking vertex must be the last vertex written.

If `transformFeedbackPreservesTriangleFanProvokingVertex` is `VK_FALSE`, neither geometry nor tessellation shading is active, and the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`, then the first vertex written from each primitive is implementation-defined even when `transformFeedbackPreservesProvokingVertex` is enabled.

When capturing vertices, the stride associated with each transform feedback buffer, as indicated by the `XfbStride` decoration, indicates the number of bytes of storage reserved for each vertex in the transform feedback buffer. For every vertex captured, each output attribute with a `Offset` decoration will be written to the storage reserved for the vertex at the associated transform feedback buffer. When writing output variables that are arrays or structures, individual array elements or structure members are written tightly packed in order. For vector types, individual components are written in order. For matrix types, outputs are written as an array of column vectors.

If any component of an output with an assigned transform feedback offset was not written to by its shader, the value recorded for that component is undefined. All components of an output variable must be written at an offset aligned to the size of the component. The size of each component of an output variable must be at least 32-bits. When capturing a vertex, any portion of the reserved storage not associated with an output variable with an assigned transform feedback offset will be unmodified.

When transform feedback is inactive, no vertices are recorded. If there is a valid counter buffer handle and counter buffer offset in the `pCounterBuffers` and `pCounterBufferOffsets` arrays, writes to the corresponding transform feedback buffer will start at the byte offset represented by the value stored in the counter buffer location.

Individual lines or triangles of a strip or fan primitive will be extracted and recorded separately.
Incomplete primitives are not recorded.

When using a geometry shader that emits vertices to multiple vertex streams, a primitive will be assembled and output for each stream when there are enough vertices emitted for the output primitive type. All outputs assigned to a given transform feedback buffer are required to come from a single vertex stream.

The sizes of the transform feedback buffers are defined by the `vkCmdBindTransformFeedbackBuffersEXT pSizes` parameter for each of the bound buffers, or the size of the bound buffer, whichever is the lesser. If there is less space remaining in any of the transform feedback buffers than the size of all of the vertex data for that primitive based on the `XfbStride` for that `XfbBuffer` then no vertex data of that primitive is recorded in any transform feedback buffer, and the value for the number of primitives written in the corresponding `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` query for all transform feedback buffers is no longer incremented.

Any outputs made to a `XfbBuffer` that is not bound to a transform feedback buffer is ignored.

To bind transform feedback buffers to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBindTransformFeedbackBuffersEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first transform feedback binding whose state is updated by the command.
- `bindingCount` is the number of transform feedback bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is `NULL` or a pointer to an array of `VkDeviceSize` buffer sizes, specifying the maximum number of bytes to capture to the corresponding transform feedback buffer. If `pSizes` is `NULL`, or the value of the `pSizes` array element is `VK_WHOLE_SIZE`, then the maximum number of bytes captured will be the size of the corresponding buffer minus the buffer offset.

The values taken from elements i of `pBuffers`, `pOffsets` and `pSizes` replace the current state for the transform feedback binding `firstBinding + i`, for i in [0, `bindingCount`). The transform feedback binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. 
**Valid Usage**

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-transformFeedback-02355**
  
  *VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback must be enabled*

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02356**
  
  *firstBinding must be less than *VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers*

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02357**
  
  *The sum of firstBinding and bindingCount must be less than or equal to*VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02358**
  
  *All elements of pOffsets must be less than the size of the corresponding element in pBuffers*

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02359**
  
  *All elements of pOffsets must be a multiple of 4*

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02360**
  
  *All elements of pBuffers must have been created with the VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT flag*

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-pSize-02361**
  
  *If the optional pSize array is specified, each element of pSizes must either be VK_WHOLE_SIZE, or be less than or equal to*VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferSize

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-pSizes-02362**
  
  *All elements of pSizes must be either VK_WHOLE_SIZE, or less than or equal to the size of the corresponding buffer in pBuffers*

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02363**
  
  *All elements of pOffsets plus pSizes, where the pSizes element is not VK_WHOLE_SIZE, must be less than or equal to the size of the corresponding buffer in pBuffers*

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02364**
  
  *Each element of pBuffers that is non-sparse must be bound completely and contiguously to a single VkDeviceMemory object*

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-None-02365**
  
  *Transform feedback must not be active when the vkCmdBindTransformFeedbackBuffersEXT command is recorded*

---

**Valid Usage (Implicit)**

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-parameter**
  
  *commandBuffer must be a valid VkCommandBuffer handle*

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-parameter**
  
  *pBuffers must be a valid pointer to an array of bindingCount valid VkBuffer handles*
- **VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-parameter**
  - `pOffsets` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values.

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-recording**
  - `commandBuffer` must be in the `recording` state.

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-vidoeCoding**
  - This command must only be called outside of a video coding scope.

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-bindingCount-arrayLength**
  - `bindingCount` must be greater than 0.

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-commonParent**
  - Both of `commandBuffer`, and the elements of `pBuffers` must have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<td></td>
</tr>
</tbody>
</table>

Transform feedback for specific transform feedback buffers is made active by calling:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBeginTransformFeedbackEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstCounterBuffer,
    uint32_t counterBufferCount,
    const VkBuffer* pCounterBuffers,
    const VkDeviceSize* pCounterBufferOffsets);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstCounterBuffer` is the index of the first transform feedback buffer corresponding to `pCounterBuffers[0]` and `pCounterBufferOffsets[0]`. 

---

2649
• `counterBufferCount` is the size of the `pCounterBuffers` and `pCounterBufferOffsets` arrays.

• `pCounterBuffers` is `NULL` or a pointer to an array of `VkBuffer` handles to counter buffers. Each buffer contains a 4 byte integer value representing the byte offset from the start of the corresponding transform feedback buffer from where to start capturing vertex data. If the byte offset stored to the counter buffer location was done using `vkCmdEndTransformFeedbackEXT` it can be used to resume transform feedback from the previous location. If `pCounterBuffers` is `NULL`, then transform feedback will start capturing vertex data to byte offset zero in all bound transform feedback buffers. For each element of `pCounterBuffers` that is `VK_NULL_HANDLE`, transform feedback will start capturing vertex data to byte zero in the corresponding bound transform feedback buffer.

• `pCounterBufferOffsets` is `NULL` or a pointer to an array of `VkDeviceSize` values specifying offsets within each of the `pCounterBuffers` where the counter values were previously written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. This data is the number of bytes captured by the previous transform feedback to this buffer. If `pCounterBufferOffsets` is `NULL`, then it is assumed the offsets are zero.

The active transform feedback buffers will capture primitives emitted from the corresponding `XfbBuffer` in the bound graphics pipeline. Any `XfbBuffer` emitted that does not output to an active transform feedback buffer will not be captured.

### Valid Usage

- **VUID-vkCmdBeginTransformFeedbackEXT-transformFeedback-02366**
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback must be enabled

- **VUID-vkCmdBeginTransformFeedbackEXT-None-02367**
  Transform feedback must not be active

- **VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02368**
  firstCounterBuffer must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

- **VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02369**
  The sum of firstCounterBuffer and counterBufferCount must be less than or equal to VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

- **VUID-vkCmdBeginTransformFeedbackEXT-counterBufferCount-02607**
  If `counterBufferCount` is not 0, and `pCounterBuffers` is not `NULL`, `pCounterBuffers` must be a valid pointer to an array of `counterBufferCount` `VkBuffer` handles that are either valid or `VK_NULL_HANDLE`

- **VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-02370**
  For each buffer handle in the array, if it is not `VK_NULL_HANDLE` it must reference a buffer large enough to hold 4 bytes at the corresponding offset from the `pCounterBufferOffsets` array

- **VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffer-02371**
  If `pCounterBuffer` is `NULL`, then `pCounterBufferOffsets` must also be `NULL`

- **VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffers-02372**
  For each buffer handle in the `pCounterBuffers` array that is not `VK_NULL_HANDLE` it must
have been created with a usage value containing VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT

• VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-09630
  The sum of firstCounterBuffer and counterBufferCount must be less than or equal to the number of transform feedback buffers currently bound by vkCmdBindTransformFeedbackBuffersEXT

• VUID-vkCmdBeginTransformFeedbackEXT-None-06233
  If the shaderObject feature is not enabled, a valid graphics pipeline must be bound to VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdBeginTransformFeedbackEXT-None-04128
  The last pre-rasterization shader stage of the bound graphics pipeline must have been declared with the Xfb execution mode

• VUID-vkCmdBeginTransformFeedbackEXT-None-02373
  Transform feedback must not be made active in a render pass instance with multiview enabled

Valid Usage (Implicit)

• VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-parameter
  If counterBufferCount is not 0, and pCounterBufferOffsets is not NULL, pCounterBufferOffsets must be a valid pointer to an array of counterBufferCount VkDeviceSize values

• VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdBeginTransformFeedbackEXT-renderpass
  This command must only be called inside of a render pass instance

• VUID-vkCmdBeginTransformFeedbackEXT-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdBeginTransformFeedbackEXT-commonparent
  Both of commandBuffer, and the elements of pCounterBuffers that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally
Transform feedback for specific transform feedback buffers is made inactive by calling:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdEndTransformFeedbackEXT(
    VkCommandBuffer commandBuffer, 
    uint32_t firstCounterBuffer, 
    uint32_t counterBufferCount, 
    const VkBuffer* pCounterBuffers, 
    const VkDeviceSize* pCounterBufferOffsets);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstCounterBuffer` is the index of the first transform feedback buffer corresponding to `pCounterBuffers[0]` and `pCounterBufferOffsets[0].`
- `counterBufferCount` is the size of the `pCounterBuffers` and `pCounterBufferOffsets` arrays.
- `pCounterBuffers` is `NULL` or a pointer to an array of `VkBuffer` handles to counter buffers. The counter buffers are used to record the current byte positions of each transform feedback buffer where the next vertex output data would be captured. This can be used by a subsequent `vkCmdBeginTransformFeedbackEXT` call to resume transform feedback capture from this position. It can also be used by `vkCmdDrawIndirectByteCountEXT` to determine the vertex count of the draw call.
- `pCounterBufferOffsets` is `NULL` or a pointer to an array of `VkDeviceSize` values specifying offsets within each of the `pCounterBuffers` where the counter values can be written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. The data stored at this location is the byte offset from the start of the transform feedback buffer binding where the next vertex data would be written. If `pCounterBufferOffsets` is `NULL`, then it is assumed the offsets are zero.

**Valid Usage**

- `VUID-vkCmdEndTransformFeedbackEXT-transformFeedback-02374` `VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` must be enabled
- `VUID-vkCmdEndTransformFeedbackEXT-None-02375` Transform feedback must be active
firstCounterBuffer must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

The sum of firstCounterBuffer and counterBufferCount must be less than or equal to VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

If counterBufferCount is not 0, and pCounterBuffers is not NULL, pCounterBuffers must be a valid pointer to an array of counterBufferCount VkBuffer handles that are either valid or VK_NULL_HANDLE

For each buffer handle in the array, if it is not VK_NULL_HANDLE it must reference a buffer large enough to hold 4 bytes at the corresponding offset from the pCounterBufferOffsets array

If pCounterBuffer is NULL, then pCounterBufferOffsets must also be NULL

For each buffer handle in the pCounterBuffers array that is not VK_NULL_HANDLE it must have been created with a usage value containing VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT

Valid Usage (Implicit)

commandBuffer must be a valid VkCommandBuffer handle

If counterBufferCount is not 0, and pCounterBufferOffsets is not NULL, pCounterBufferOffsets must be a valid pointer to an array of counterBufferCount VkDeviceSize values

commandBuffer must be in the recording state

The VkCommandPool that commandBuffer was allocated from must support graphics operations

This command must only be called inside of a render pass instance

This command must only be called outside of a video coding scope

Both of commandBuffer, and the elements of pCounterBuffers that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

27.2. Viewport Swizzle

Each primitive sent to a given viewport has a swizzle and optional negation applied to its clip coordinates. The swizzle that is applied depends on the viewport index, and is controlled by the `VkPipelineViewportSwizzleStateCreateInfoNV` pipeline state:

```c
// Provided by VK_NV_viewport_swizzle
typedef struct VkPipelineViewportSwizzleStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportSwizzleStateCreateFlagsNV flags;
    uint32_t viewportCount;
    const VkViewportSwizzleNV* pViewportSwizzles;
} VkPipelineViewportSwizzleStateCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `viewportCount` is the number of viewport swizzles used by the pipeline.
- `pViewportSwizzles` is a pointer to an array of `VkViewportSwizzleNV` structures, defining the viewport swizzles.

Valid Usage

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-viewportCount-01215
  `viewportCount` must be greater than or equal to the `viewportCount` set in `VkPipelineViewportStateCreateInfo`
Valid Usage (Implicit)

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_SWIZZLE_STATE_CREATE_INFO_NV
- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-flags-zerobitmask
  flags must be 0
- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-pViewportSwizzles-parameter
  pViewportSwizzles must be a valid pointer to an array of viewportCount valid
  VkViewportSwizzleNV structures
- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-viewportCount-arraylength
  viewportCount must be greater than 0

// Provided by VK_NV_viewport_swizzle
typedef VkFlags VkPipelineViewportSwizzleStateCreateFlagsNV;

VkPipelineViewportSwizzleStateCreateFlagsNV is a bitmask type for setting a mask, but is currently
reserved for future use.

The VkPipelineViewportSwizzleStateCreateInfoNV state is set by adding this structure to the pNext
chain of a VkPipelineViewportStateCreateInfo structure and setting the graphics pipeline state with
vkCreateGraphicsPipelines.

To dynamically set the viewport swizzle state, call:

// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_viewport_swizzle,
VK_EXT_shader_object with VK_NV_viewport_swizzle
void vkCmdSetViewportSwizzleNV(
  VkCommandBuffer commandBuffer,
  uint32_t firstViewport,
  uint32_t viewportCount,
  const VkViewportSwizzleNV* pViewportSwizzles);

- commandBuffer is the command buffer into which the command will be recorded.
- firstViewport is the index of the first viewport whose parameters are updated by the command.
- viewportCount is the number of viewports whose parameters are updated by the command.
- pViewportSwizzles is a pointer to an array of VkViewportSwizzleNV structures specifying
  viewport swizzles.

This command sets the viewport swizzle state for subsequent drawing commands when drawing
using shader objects, or when the graphics pipeline is created with
VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV set in VkPipelineDynamicStateCreateInfo::pDynamicStates.
Otherwise, this state is specified by the VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount, and
VkPipelineViewportSwizzleStateCreateInfoNV::pViewportSwizzles values used
to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetViewportSwizzleNV-None-09423
  At least one of the following must be true:
  - The extendedDynamicState3ViewportSwizzle feature is enabled
  - The shaderObject feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetViewportSwizzleNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetViewportSwizzleNV-pViewportSwizzles-parameter
  pViewportSwizzles must be a valid pointer to an array of viewportCount valid VkViewportSwizzleNV structures
- VUID-vkCmdSetViewportSwizzleNV-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetViewportSwizzleNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetViewportSwizzleNV-viewportCount-arraylength
  viewportCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Each viewport specified from 0 to viewportCount - 1 has its x,y,z,w swizzle state set to the...
corresponding \( x, y, z \) and \( w \) in the \( \text{VkViewportSwizzleNV} \) structure. Each component is of type \( \text{VkViewportCoordinateSwizzleNV} \), which determines the type of swizzle for that component. The value of \( x \) computes the new \( x \) component of the position as:

\[
\begin{align*}
& \text{if } (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV}) x' = x; \\
& \text{if } (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_X_NV}) x' = -x; \\
& \text{if } (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV}) x' = y; \\
& \text{if } (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Y_NV}) x' = -y; \\
& \text{if } (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV}) x' = z; \\
& \text{if } (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Z_NV}) x' = -z; \\
& \text{if } (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV}) x' = w; \\
& \text{if } (x == \text{VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_W_NV}) x' = -w;
\end{align*}
\]

Similar selections are performed for the \( y, z, \) and \( w \) coordinates. This swizzling is applied before clipping and perspective divide. If the swizzle for an active viewport index is not specified, the swizzle for \( x \) is \( \text{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV} \), \( y \) is \( \text{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV} \), \( z \) is \( \text{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV} \) and \( w \) is \( \text{VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV} \).

Viewport swizzle parameters are specified by setting the \( \text{pNext} \) pointer of \( \text{VkGraphicsPipelineCreateInfo} \) to point to a \( \text{VkPipelineViewportSwizzleStateCreateInfoNV} \) structure. \( \text{VkPipelineViewportSwizzleStateCreateInfoNV} \) uses \( \text{VkViewportSwizzleNV} \) to set the viewport swizzle parameters.

The \( \text{VkViewportSwizzleNV} \) structure is defined as:

\[
\begin{verbatim}
// Provided by VK_NV_viewport_swizzle
typedef struct VkViewportSwizzleNV {
    VkViewportCoordinateSwizzleNV x;
    VkViewportCoordinateSwizzleNV y;
    VkViewportCoordinateSwizzleNV z;
    VkViewportCoordinateSwizzleNV w;
} VkViewportSwizzleNV;
\end{verbatim}
\]

- \( x \) is a \( \text{VkViewportCoordinateSwizzleNV} \) value specifying the swizzle operation to apply to the \( x \) component of the primitive
- \( y \) is a \( \text{VkViewportCoordinateSwizzleNV} \) value specifying the swizzle operation to apply to the \( y \) component of the primitive
- \( z \) is a \( \text{VkViewportCoordinateSwizzleNV} \) value specifying the swizzle operation to apply to the \( z \) component of the primitive
- \( w \) is a \( \text{VkViewportCoordinateSwizzleNV} \) value specifying the swizzle operation to apply to the \( w \) component of the primitive

**Valid Usage (Implicit)**

- VUID-VkViewportSwizzleNV-x-parameter
Possible values of the `VkViewportSwizzleNV::x, y, z, and w` members, specifying swizzling of the corresponding components of primitives, are:

```plaintext
// Provided by VK_NV_viewport_swizzle
typedef enum VkViewportCoordinateSwizzleNV {
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV = 0,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_X_NV = 1,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV = 2,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Y_NV = 3,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV = 4,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Z_NV = 5,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV = 6,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_W_NV = 7,
} VkViewportCoordinateSwizzleNV;
```

These values are described in detail in Viewport Swizzle.

### 27.3. Flat Shading

*Flat shading* a vertex output attribute means to assign all vertices of the primitive the same value for that output. The output values assigned are those of the *proving vertex* of the primitive. Flat shading is applied to those vertex attributes that match fragment input attributes which are decorated as *Flat*.

If neither *mesh, geometry* nor *tessellation shading* is active, the provoking vertex is determined by the *primitive topology* defined by `VkPipelineInputAssemblyStateCreateInfo:topology` used to execute the *drawing command*.

If a shader using *MeshNV Execution Model* is active, the provoking vertex is determined by the *primitive topology* defined by the `OutputPoints, OutputLinesNV`, or `OutputTrianglesNV` execution mode.

If a shader using *MeshEXT Execution Model* is active, the provoking vertex is determined by the *primitive topology* defined by the `OutputPoints, OutputLinesEXT`, or `OutputTrianglesEXT` execution mode.

If *geometry shading* is active, the provoking vertex is determined by the *primitive topology* defined by the `OutputPoints, OutputLineStrip`, or `OutputTriangleStrip` execution mode.
If tessellation shading is active but geometry shading is not, the provoking vertex may be any of the vertices in each primitive.

For a given primitive topology, the pipeline’s provoking vertex mode determines which vertex is the provoking vertex. To specify the provoking vertex mode, include a VkPipelineRasterizationProvokingVertexStateCreateInfoEXT structure in the VkPipelineRasterizationStateCreateInfo::pNext chain when creating the pipeline.

The VkPipelineRasterizationProvokingVertexStateCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_provoking_vertex
typedef struct VkPipelineRasterizationProvokingVertexStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkProvokingVertexModeEXT provokeVertexMode;
} VkPipelineRasterizationProvokingVertexStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `provokingVertexMode` is a `VkProvokingVertexModeEXT` value selecting the provoking vertex mode.

If this struct is not provided when creating the pipeline, the pipeline will use the `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT` mode.

If the `provokingVertexModePerPipeline` limit is `VK_FALSE`, then all pipelines bound within a render pass instance must have the same `provokingVertexMode`.

**Valid Usage**

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-04883
  If `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, then the `provokingVertexLast` feature must be enabled.

**Valid Usage (Implicit)**

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-sType-sType must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_PROVOKING_VERTEX_STATE_CREATE_INFO_EXT`
- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-parameter `provokingVertexMode` must be a valid `VkProvokingVertexModeEXT` value

Possible values of `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode`
are:

```c
// Provided by VK_EXT_provoking_vertex
typedef enum VkProvokingVertexModeEXT {
    VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT = 0,
    VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT = 1,
} VkProvokingVertexModeEXT;
```

- `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT` specifies that the provoking vertex is the first non-adjacency vertex in the list of vertices used by a primitive.
- `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT` specifies that the provoking vertex is the last non-adjacency vertex in the list of vertices used by a primitive.

These modes are described more precisely in Primitive Topologies.

To dynamically set the `provokingVertexMode` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_EXT_provoking_vertex,
// VK_EXT_provoking_vertex with VK_EXT_shader_object
void vkCmdSetProvokingVertexModeEXT(
    VkCommandBuffer commandBuffer,
    VkProvokingVertexModeEXT provokingVertexMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `provokingVertexMode` specifies the `provokingVertexMode` state.

This command sets the `provokingVertexMode` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetProvokingVertexModeEXT-None-09423**
  At least one of the following must be true:
  - The `extendedDynamicState3ProvokingVertexMode` feature is enabled
  - The `shaderObject` feature is enabled

- **VUID-vkCmdSetProvokingVertexModeEXT-provokingVertexMode-07447**
  If `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, then the `provokingVertexLast` feature must be enabled

2660
Valid Usage (Implicit)

- VUID-vkCmdSetProvokingVertexModeEXT-commandBuffer-parameter
  
  **commandBuffer** must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetProvokingVertexModeEXT-provokingVertexMode-parameter
  
  **provokingVertexMode** must be a valid `VkProvokingVertexModeEXT` value

- VUID-vkCmdSetProvokingVertexModeEXT-commandBuffer-recording
  
  **commandBuffer** must be in the recording state

- VUID-vkCmdSetProvokingVertexModeEXT-commandBuffer-cmdpool
  
  The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations

- VUID-vkCmdSetProvokingVertexModeEXT-videocoding
  
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to **commandBuffer** must be externally synchronized

- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

Command Properties

27.4. Primitive Clipping

Primitives are culled against the *cull volume* and then clipped to the *clip volume*. In clip coordinates, the *view volume* is defined by:

\[-w_c \leq x_c \leq w_c\]
\[-w_c \leq y_c \leq w_c\]
\[z_m \leq z_c \leq w_c\]

where if `VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne` is `VK_TRUE` $z_m$ is equal to $-w_c$; otherwise $z_m$ is equal to zero.

This view volume can be further restricted by as many as `VkPhysicalDeviceLimits::maxClipDistances` client-defined half-spaces.
The cull volume is the intersection of up to \texttt{VkPhysicalDeviceLimits::maxCullDistances} client-defined half-spaces (if no client-defined cull half-spaces are enabled, culling against the cull volume is skipped).

A shader \textbf{must} write a single cull distance for each enabled cull half-space to elements of the \texttt{CullDistance} array. If the cull distance for any enabled cull half-space is negative for all of the vertices of the primitive under consideration, the primitive is discarded. Otherwise the primitive is clipped against the clip volume as defined below.

The clip volume is the intersection of up to \texttt{VkPhysicalDeviceLimits::maxClipDistances} client-defined half-spaces with the view volume (if no client-defined clip half-spaces are enabled, the clip volume is the view volume).

A shader \textbf{must} write a single clip distance for each enabled clip half-space to elements of the \texttt{ClipDistance} array. Clip half-space \( i \) is then given by the set of points satisfying the inequality

\[ c_i(P) \geq 0 \]

where \( c_i(P) \) is the clip distance \( i \) at point \( P \). For point primitives, \( c_i(P) \) is simply the clip distance for the vertex in question. For line and triangle primitives, per-vertex clip distances are interpolated using a weighted mean, with weights derived according to the algorithms described in sections \textit{Basic Line Segment Rasterization} and \textit{Basic Polygon Rasterization}, using the perspective interpolation equations.

The number of client-defined clip and cull half-spaces that are enabled is determined by the explicit size of the built-in arrays \texttt{ClipDistance} and \texttt{CullDistance}, respectively, declared as an output in the interface of the entry point of the final shader stage before clipping.

If \texttt{VkPipelineRasterizationDepthClipStateCreateInfoEXT} is present in the graphics pipeline state then depth clipping is disabled if \texttt{VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable} is \texttt{VK_FALSE}. Otherwise, if \texttt{VkPipelineRasterizationDepthClipStateCreateInfoEXT} is not present, depth clipping is disabled when \texttt{VkPipelineRasterizationStateCreateInfo::depthClampEnable} is \texttt{VK_TRUE}.

To \textbf{dynamically set} enable or disable depth clamping, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetDepthClampEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthClampEnable);
```

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.
- \texttt{depthClampEnable} specifies whether depth clamping is enabled.

This command sets whether depth clamping is enabled or disabled for subsequent drawing commands when drawing using \textit{shader objects}, or when the graphics pipeline is created with \texttt{VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. 

2662
Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::depthClampEnable` value used to create the currently active pipeline.

If the depth clamping state is changed dynamically, and the pipeline was not created with `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` enabled, then depth clipping is enabled when depth clamping is disabled and vice versa.

**Valid Usage**

- `VUID-vkCmdSetDepthClampEnableEXT-None-09423`
  At least one of the following **must** be true:
  - The `extendedDynamicState3DepthClampEnable` feature is enabled
  - The `shaderObject` feature is enabled
- `VUID-vkCmdSetDepthClampEnableEXT-depthClamp-07449`
  If the `depthClamp` feature is not enabled, `depthClampEnable` must be `VK_FALSE`

**Valid Usage (Implicit)**

- `VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-parameter`
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- `VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-recording`
  `commandBuffer` must be in the **recording state**
- `VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-cmdpool`
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- `VUID-vkCmdSetDepthClampEnableEXT-videocoding`
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
To dynamically set enable or disable depth clipping, call:

```c
void vkCmdSetDepthClipEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthClipEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthClipEnable` specifies whether depth clipping is enabled.

This command sets whether depth clipping is enabled or disabled for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable` value used to create the currently active pipeline, or is set to the inverse of `VkPipelineRasterizationStateCreateInfo::depthClampEnable` if `VkPipelineRasterizationDepthClipStateCreateInfoEXT` is not specified.

**Valid Usage**

- VUID-vkCmdSetDepthClipEnableEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3DepthClipEnable` feature is enabled
  - The `shaderObject` feature is enabled

- VUID-vkCmdSetDepthClipEnableEXT-depthClipEnable-07451
  The `depthClipEnable` feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetDepthClipEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDepthClipEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetDepthClipEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetDepthClipEnableEXT-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

</tbody>
</table>

When depth clipping is disabled, the plane equation

\[ z_m \leq z_c \leq w_c \]

(see the clip volume definition above) is ignored by view volume clipping (effectively, there is no near or far plane clipping).

If the primitive under consideration is a point or line segment, then clipping passes it unchanged if its vertices lie entirely within the clip volume.

Possible values of `VkPhysicalDevicePointClippingProperties::pointClippingBehavior`, specifying clipping behavior of a point primitive whose vertex lies outside the clip volume, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkPointClippingBehavior {
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES = 0,
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY = 1,
    // Provided by VK_KHR_maintenance2
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES_KHR = VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES,
    // Provided by VK_KHR_maintenance2
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY_KHR = VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY,
} VkPointClippingBehavior;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkPointClippingBehavior VkPointClippingBehaviorKHR;
```
• **VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES** specifies that the primitive is discarded if the vertex lies outside any clip plane, including the planes bounding the view volume.

• **VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY** specifies that the primitive is discarded only if the vertex lies outside any user clip plane.

If either of a line segment’s vertices lie outside of the clip volume, the line segment may be clipped, with new vertex coordinates computed for each vertex that lies outside the clip volume. A clipped line segment endpoint lies on both the original line segment and the boundary of the clip volume.

This clipping produces a value, \(0 \leq t \leq 1\), for each clipped vertex. If the coordinates of a clipped vertex are \(P\) and the unclipped line segment’s vertex coordinates are \(P_1\) and \(P_2\), then \(t\) satisfies the following equation

\[
P = tP_1 + (1-t)P_2.
\]

\(t\) is used to clip vertex output attributes as described in Clipping Shader Outputs.

If the primitive is a polygon, it passes unchanged if every one of its edges lies entirely inside the clip volume, and is either clipped or discarded otherwise. If the edges of the polygon intersect the boundary of the clip volume, the intersecting edges are reconnected by new edges that lie along the boundary of the clip volume - in some cases requiring the introduction of new vertices into a polygon.

If a polygon intersects an edge of the clip volume’s boundary, the clipped polygon must include a point on this boundary edge.

Primitives rendered with user-defined half-spaces must satisfy a complementarity criterion. Suppose a series of primitives is drawn where each vertex \(i\) has a single specified clip distance \(d_i\) (or a number of similarly specified clip distances, if multiple half-spaces are enabled). Next, suppose that the same series of primitives are drawn again with each such clip distance replaced by \(-d_i\) (and the graphics pipeline is otherwise the same). In this case, primitives must not be missing any pixels, and pixels must not be drawn twice in regions where those primitives are cut by the clip planes.

The **VkPipelineViewportDepthClipControlCreateInfoEXT** structure is defined as:

```c
// Provided by VK_EXT_depth_clip_control
typedef struct VkPipelineViewportDepthClipControlCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 negativeOneToOne;
} VkPipelineViewportDepthClipControlCreateInfoEXT;
```

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **negativeOneToOne** sets the \(z_{\text{min}}\) in the view volume to \(-w\).
Valid Usage

- VUID-VkPipelineViewportDepthClipControlCreateInfoEXT-negativeOneToOne-06470
  If \texttt{depthClipControl} is not enabled, \texttt{negativeOneToOne} must be \texttt{VK_FALSE}

Valid Usage (Implicit)

- VUID-VkPipelineViewportDepthClipControlCreateInfoEXT-sType-sType
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_DEPTH_CLIP_CONTROL_CREATE_INFO_EXT}

To dynamically set \texttt{negativeOneToOne}, call:

```c
// Provided by VK_EXT_depth_clip_control with VK_EXT_extended_dynamic_state3,
// VK_EXT_depth_clip_control with VK_EXT_shader_object
void vkCmdSetDepthClipNegativeOneToOneEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 negativeOneToOne);
```

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.
- \texttt{negativeOneToOne} specifies the \texttt{negativeOneToOne} state.

This command sets the \texttt{negativeOneToOne} state for subsequent drawing commands when drawing using \texttt{shader objects}, or when the graphics pipeline is created with \texttt{VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. Otherwise, this state is specified by the \texttt{VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne} value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-None-09423
  At least one of the following must be true:
  - The \texttt{extendedDynamicState3DepthClipNegativeOneToOne} feature is enabled
  - The \texttt{shaderObject} feature is enabled
- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-depthClipControl-07453
  The \texttt{depthClipControl} feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-commandBuffer-parameter
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle
- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-commandBuffer-recording
  2667
commandBuffer must be in the recording state

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

27.5. Clipping Shader Outputs

Next, vertex output attributes are clipped. The output values associated with a vertex that lies within the clip volume are unaffected by clipping. If a primitive is clipped, however, the output values assigned to vertices produced by clipping are clipped.

Let the output values assigned to the two vertices \( P_1 \) and \( P_2 \) of an unclipped edge be \( c_1 \) and \( c_2 \). The value of \( t \) (see Primitive Clipping) for a clipped point \( P \) is used to obtain the output value associated with \( P \) as

\[
    c = t \cdot c_1 + (1-t) \cdot c_2.
\]

(Multiplying an output value by a scalar means multiplying each of \( x, y, z \), and \( w \) by the scalar.)

Since this computation is performed in clip space before division by \( w \), clipped output values are perspective-correct.

Polygon clipping creates a clipped vertex along an edge of the clip volume’s boundary. This situation is handled by noting that polygon clipping proceeds by clipping against one half-space at a time. Output value clipping is done in the same way, so that clipped points always occur at the intersection of polygon edges (possibly already clipped) with the clip volume’s boundary.

For vertex output attributes whose matching fragment input attributes are decorated with
NoPerspective, the value of $t$ used to obtain the output value associated with $P$ will be adjusted to produce results that vary linearly in framebuffer space.

Output attributes of integer or unsigned integer type must always be flat shaded. Flat shaded attributes are constant over the primitive being rasterized (see Basic Line Segment Rasterization and Basic Polygon Rasterization), and no interpolation is performed. The output value $c$ is taken from either $c_1$ or $c_2$, since flat shading has already occurred and the two values are identical.

### 27.6. Controlling Viewport W Scaling

If viewport $W$ scaling is enabled, the $W$ component of the clip coordinate is modified by the provided coefficients from the corresponding viewport as follows.

$$w_c' = x_{coeff} x_c + y_{coeff} y_c + w_c$$

The `VkPipelineViewportWScalingStateCreateInfoNV` structure is defined as:

```c
typedef struct VkPipelineViewportWScalingStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 viewportWScalingEnable;
    uint32_t viewportCount;
    const VkViewportWScalingNV* pViewportWScalings;
} VkPipelineViewportWScalingStateCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `viewportWScalingEnable` controls whether viewport $W$ scaling is enabled.
- `viewportCount` is the number of viewports used by $W$ scaling, and must match the number of viewports in the pipeline if viewport $W$ scaling is enabled.
- `pViewportWScalings` is a pointer to an array of `VkViewportWScalingNV` structures defining the $W$ scaling parameters for the corresponding viewports. If the viewport $W$ scaling state is dynamic, this member is ignored.

**Valid Usage (Implicit)**

- `VUID-VkPipelineViewportWScalingStateCreateInfoNV-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_W_SCALING_STATE_CREATE_INFO_NV`
- `VUID-VkPipelineViewportWScalingStateCreateInfoNV-viewportCount-arraylength` `viewportCount` must be greater than 0

The `VkPipelineViewportWScalingStateCreateInfoNV` state is set by adding this structure to the `pNext` chain of a `VkPipelineViewportStateCreateInfo` structure and setting the graphics pipeline state with
vkCreateGraphicsPipelines.

To **dynamically set** the `viewportWScalingEnable` state, call:

```c
void vkCmdSetViewportWScalingEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 viewportWScalingEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `viewportWScalingEnable` specifies the `viewportWScalingEnable` state.

This command sets the `viewportWScalingEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportWScalingStateCreateInfoNV::viewportWScalingEnable` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetViewportWScalingEnableNV-None-09423**
  At least one of the following must be true:
  - The `extendedDynamicState3ViewportWScalingEnable` feature is enabled
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetViewportWScalingEnableNV-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetViewportWScalingEnableNV-commandBuffer-recording**
  `commandBuffer` must be in the recording state
- **VUID-vkCmdSetViewportWScalingEnableNV-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- **VUID-vkCmdSetViewportWScalingEnableNV-videoencoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the viewport \(W\) scaling parameters, call:

```c
// Provided by VK_NV_clip_space_w_scaling
void vkCmdSetViewportWScalingNV(
    VkCommandBuffer commandBuffer,  // Provided by VK_NV_clip_space_w_scaling
    uint32_t firstViewport,         // Provided by VK_NV_clip_space_w_scaling
    uint32_t viewportCount,         // Provided by VK_NV_clip_space_w_scaling
    const VkViewportWScalingNV* pViewportWScalings);  // Provided by VK_NV_clip_space_w_scaling
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstViewport` is the index of the first viewport whose parameters are updated by the command.
- `viewportCount` is the number of viewports whose parameters are updated by the command.
- `pViewportWScalings` is a pointer to an array of `VkViewportWScalingNV` structures specifying viewport parameters.

The viewport parameters taken from element \(i\) of `pViewportWScalings` replace the current state for the viewport index \(firstViewport + i\), for \(i\) in \([0, \text{viewportCount})\).

This command sets the viewport \(W\) scaling for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportWScalingStateCreateInfoNV::pViewportWScalings` values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetViewportWScalingNV-firstViewport-01324
  The sum of `firstViewport` and `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive.

### Valid Usage (Implicit)

- VUID-vkCmdSetViewportWScalingNV-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetViewportWScalingNV-pViewportWScalings-parameter
  pViewportWScalings must be a valid pointer to an array of viewportCount VkViewportWScalingNV structures

- VUID-vkCmdSetViewportWScalingNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetViewportWScalingNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetViewportWScalingNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetViewportWScalingNV-viewportCount-arraylength
  viewportCount must be greater than 0

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Both VkPipelineViewportWScalingStateCreateInfoNV and vkCmdSetViewportWScalingNV use VkViewportWScalingNV to set the viewport transformation parameters.

The VkViewportWScalingNV structure is defined as:

```c
// Provided by VK_NV_clip_space_w_scaling
typedef struct VkViewportWScalingNV {
    float xcoeff;
    float ycoeff;
} VkViewportWScalingNV;
```

- xcoeff and ycoeff are the viewport’s W scaling factor for x and y respectively.
27.7. Coordinate Transformations

Clip coordinates for a vertex result from shader execution, which yields a vertex coordinate Position.

Perspective division on clip coordinates yields normalized device coordinates, followed by a viewport transformation (see Controlling the Viewport) to convert these coordinates into framebuffer coordinates.

If a vertex in clip coordinates has a position given by

\[
\begin{pmatrix}
  x_c \\
  y_c \\
  z_c \\
  w_c 
\end{pmatrix}
\]

then the vertex's normalized device coordinates are

\[
\begin{pmatrix}
  x_d \\
  y_d \\
  z_d 
\end{pmatrix} = \begin{pmatrix}
  \frac{x_c}{w_c} \\
  \frac{y_c}{w_c} \\
  \frac{z_c}{w_c}
\end{pmatrix}
\]

27.8. Render Pass Transform

A render pass transform can be enabled for render pass instances. The clip coordinates \((x_c, y_c)\) that result from vertex shader execution are transformed by a rotation of 0, 90, 180, or 270 degrees in the XY plane, centered at the origin.

When Render pass transform is enabled, the transform applies to all primitives for all subpasses of the render pass. The transformed vertex in clip coordinates has a position given by

\[
\begin{pmatrix}
  x_{c,\text{trans}} \\
  y_{c,\text{trans}} \\
  z_{c,\text{trans}} 
\end{pmatrix} = \begin{pmatrix}
  x_c \cos \theta - y_c \sin \theta \\
  x_c \sin \theta + y_c \cos \theta \\
  z_c 
\end{pmatrix}
\]

where

- \(\theta\) is 0 degrees for VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR
- \(\theta\) is 90 degrees for VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR
- \(\theta\) is 180 degrees for VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR
- \(\theta\) is 270 degrees for VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR

The transformed vertex's normalized device coordinates are
When render pass transform is enabled for a render pass instance, the following additional features are enabled:

- Each `VkViewport` specified by either `VkPipelineViewportStateCreateInfo::pViewports` or `vkCmdSetViewport` will have its width/height \((p_x, p_y)\) and its center \((o_x, o_y)\) similarly transformed by the implementation.

- Each scissor specified by `VkPipelineViewportStateCreateInfo::pScissors` or `vkCmdSetScissor` will have its \((\text{offset}_x, \text{offset}_y)\) and \((\text{extent}_x, \text{extent}_y)\) similarly transformed by the implementation.

- The `renderArea` specified in `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` and `VkRenderPassBeginInfo` will be similarly transformed by the implementation.

- The \((x, y)\) components of shader variables with built-in decorations `FragCoord`, `SamplePosition`, or `PointCoord` will be similarly transformed by the implementation.

- The \((x, y)\) components of the `offset` operand of the `InterpolateAtOffset` extended instruction will be similarly transformed by the implementation.

- The values returned by SPIR-V derivative instructions `OpDPdx`, `OpDPdy`, `OpDPdxCourse`, `OpDPdyCourse`, `OpDPdxFine`, `OpDPdyFine` will be similarly transformed by the implementation.

The net result of the above, is that applications can act as if rendering to a framebuffer oriented with the `VkSurfaceCapabilitiesKHR::currentTransform`. In other words, applications can act as if the presentation engine will be performing the transformation of the swapchain image after rendering and prior to presentation to the user. In fact, the transformation of the various items cited above are being handled by the implementation as the rendering takes place.

### 27.9. Controlling the Viewport

The viewport transformation is determined by the selected viewport's width and height in pixels, \(p_x\) and \(p_y\), respectively, and its center \((o_x, o_y)\) (also in pixels), as well as its depth range min and max determining a depth range scale value \(p_z\) and a depth range bias value \(o_z\) (defined below). The vertex's framebuffer coordinates \((x_f, y_f, z_f)\) are given by

\[
\begin{pmatrix}
  x_d \\
  y_d \\
  z_d
\end{pmatrix} = \begin{pmatrix}
  x_{\text{trans}} \\
  y_{\text{trans}} \\
  z_{\text{trans}} \\
  w_c
\end{pmatrix}
\]

\[
x_f = \left(\frac{p_x}{2}\right) x_d + o_x
\]

\[
y_f = \left(\frac{p_y}{2}\right) y_d + o_y
\]

\[
z_f = p_z \times z_d + o_z
\]
Multiple viewports are available, numbered zero up to \texttt{VkPhysicalDeviceLimits::maxViewports} minus one. The number of viewports used by a pipeline is controlled by the \texttt{viewportCount} member of the \texttt{VkPipelineViewportStateCreateInfo} structure used in pipeline creation.

\(x\) and \(y\) have limited precision, where the number of fractional bits retained is specified by \texttt{VkPhysicalDeviceLimits::subPixelPrecisionBits}. When rasterizing line segments, the number of fractional bits is specified by \texttt{VkPhysicalDeviceLineRasterizationPropertiesKHR::lineSubPixelPrecisionBits}.

The \texttt{VkPipelineViewportStateCreateInfo} structure is defined as:

\[
\begin{array}{l}
\text{// Provided by VK_VERSION_1_0}
\text{typedef struct VkPipelineViewportStateCreateInfo} \\
\text{\{}
\begin{array}{l}
\text{VkStructureType} \quad \text{sType}; \\
\text{const void*} \quad \text{pNext}; \\
\text{VkPipelineViewportStateCreateFlags} \quad \text{flags}; \\
\text{uint32_t} \quad \text{viewportCount}; \\
\text{const VkViewport*} \quad \text{pViewports}; \\
\text{uint32_t} \quad \text{scissorCount}; \\
\text{const VkRect2D*} \quad \text{pScissors}; \\
\end{array}
\end{array}
\}
\text{VkPipelineViewportStateCreateInfo};
\]

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{flags} is reserved for future use.
- \texttt{viewportCount} is the number of viewports used by the pipeline.
- \texttt{pViewports} is a pointer to an array of \texttt{VkViewport} structures, defining the viewport transforms. If the viewport state is dynamic, this member is ignored.
- \texttt{scissorCount} is the number of \texttt{scissors} and \texttt{must} match the number of viewports.
- \texttt{pScissors} is a pointer to an array of \texttt{VkRect2D} structures defining the rectangular bounds of the scissor for the corresponding viewport. If the scissor state is dynamic, this member is ignored.

**Valid Usage**

- VUID-VkPipelineViewportStateCreateInfo-viewportCount-01216
  If the \texttt{multiViewport} feature is not enabled, \texttt{viewportCount} \texttt{must} not be greater than \texttt{1}

- VUID-VkPipelineViewportStateCreateInfo-scissorCount-01217
  If the \texttt{multiViewport} feature is not enabled, \texttt{scissorCount} \texttt{must} not be greater than \texttt{1}

- VUID-VkPipelineViewportStateCreateInfo-viewportCount-01218
  \texttt{viewportCount} \texttt{must} be less than or equal to \texttt{VkPhysicalDeviceLimits::maxViewports}

- VUID-VkPipelineViewportStateCreateInfo-scissorCount-01219
  \texttt{scissorCount} \texttt{must} be less than or equal to \texttt{VkPhysicalDeviceLimits::maxViewports}

- VUID-VkPipelineViewportStateCreateInfo-x-02821
  The \(x\) and \(y\) members of \texttt{offset} member of any element of \texttt{pScissors} \texttt{must} be greater than
or equal to 0

- **VUID-VkPipelineViewportStateCreateInfo-offset-02822**
  Evaluation of \((\text{offset.x} + \text{extent.width})\) must not cause a signed integer addition overflow for any element of \(p\text{Scissors}\)

- **VUID-VkPipelineViewportStateCreateInfo-offset-02823**
  Evaluation of \((\text{offset.y} + \text{extent.height})\) must not cause a signed integer addition overflow for any element of \(p\text{Scissors}\)

- **VUID-VkPipelineViewportStateCreateInfo-scissorCount-04134**
  If \(\text{scissorCount}\) and \(\text{viewportCount}\) are both not dynamic, then \(\text{scissorCount}\) and \(\text{viewportCount}\) must be identical

- **VUID-VkPipelineViewportStateCreateInfo-viewportCount-04135**
  If the graphics pipeline is being created with \(\text{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT}\) set then \(\text{viewportCount}\) must be 0, otherwise \(\text{viewportCount}\) must be greater than 0

- **VUID-VkPipelineViewportStateCreateInfo-scissorCount-04136**
  If the graphics pipeline is being created with \(\text{VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT}\) set then \(\text{scissorCount}\) must be 0, otherwise \(\text{scissorCount}\) must be greater than 0

- **VUID-VkPipelineViewportStateCreateInfo-viewportWScalingEnable-01726**
  If the \(\text{viewportWScalingEnable}\) member of a \(\text{VkPipelineViewportWScalingStateCreateInfoNV}\) structure included in the \(\text{pNext}\) chain is \(\text{VK_TRUE}\), the \(\text{viewportCount}\) member of the \(\text{VkPipelineViewportWScalingStateCreateInfoNV}\) structure must be greater than or equal to \(\text{VkPipelineViewportStateCreateInfo::viewportCount}\)

---

**Valid Usage (Implicit)**

- **VUID-VkPipelineViewportStateCreateInfo-sType-sType**
  \(s\text{Type}\) must be \(\text{VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO}\)

- **VUID-VkPipelineViewportStateCreateInfo-pNext-pNext**
  Each \(\text{pNext}\) member of any structure (including this one) in the \(\text{pNext}\) chain must be either \(\text{NULL}\) or a pointer to a valid instance of \(\text{VkPipelineViewportCoarseSampleOrderStateCreateInfoNV}, \text{VkPipelineViewportDepthClipControlCreateInfoEXT}, \text{VkPipelineViewportExclusiveScissorStateCreateInfoNV}, \text{VkPipelineViewportShadingRateImageStateCreateInfoNV}, \text{VkPipelineViewportSwizzleStateCreateInfoNV}, \text{VkPipelineViewportWScalingStateCreateInfoNV}\)

- **VUID-VkPipelineViewportStateCreateInfo-sType-unique**
  The \(s\text{Type}\) value of each struct in the \(\text{pNext}\) chain must be unique

- **VUID-VkPipelineViewportStateCreateInfo-flags-zerobitmask**
  \(\text{flags}\) must be 0

To dynamically set the viewport count and viewports, call:
This command sets the viewport count and viewports state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::viewportCount` and `pViewports` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetViewportWithCount-None-08971**
  At least one of the following must be true:
  - the `extendedDynamicState` feature is enabled
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

- **VUID-vkCmdSetViewportWithCount-viewportCount-03394**
  `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- **VUID-vkCmdSetViewportWithCount-viewportCount-03395**
  If the `multiViewport` feature is not enabled, `viewportCount` must be 1

- **VUID-vkCmdSetViewportWithCount-commandBuffer-04819**
  `commandBuffer` must not have `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled
Valid Usage (Implicit)

- VUID-vkCmdSetViewportWithCount-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetViewportWithCount-pViewports-parameter
  pViewports must be a valid pointer to an array of viewportCount valid VkViewport structures

- VUID-vkCmdSetViewportWithCount-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetViewportWithCount-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetViewportWithCount-vidcoiding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetViewportWithCount-viewportCount-arraylength
  viewportCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>

To dynamically set the scissor count and scissor rectangular bounds, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetScissorWithCount(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```
or the equivalent command
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetScissorWithCountEXT(
    VkCommandBuffer          commandBuffer,  
    uint32_t                 scissorCount,   
    const VkRect2D*          pScissors); 

• commandBuffer is the command buffer into which the command will be recorded.
• scissorCount specifies the scissor count.
• pScissors specifies the scissors to use for drawing.

This command sets the scissor count and scissor rectangular bounds state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the corresponding VkPipelineViewportStateCreateInfo::scissorCount and pScissors values used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetScissorWithCount-None-08971
  At least one of the following must be true:
  ◦ the extendedDynamicState feature is enabled
  ◦ the shaderObject feature is enabled
  ◦ the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3

• VUID-vkCmdSetScissorWithCount-scissorCount-03397
  scissorCount must be between 1 and VkPhysicalDeviceLimits::maxViewports, inclusive

• VUID-vkCmdSetScissorWithCount-scissorCount-03398
  If the multiViewport feature is not enabled, scissorCount must be 1

• VUID-vkCmdSetScissorWithCount-x-03399
  The x and y members of offset member of any element of pScissors must be greater than or equal to 0

• VUID-vkCmdSetScissorWithCount-offset-03400
  Evaluation of (offset.x + extent.width) must not cause a signed integer addition overflow for any element of pScissors

• VUID-vkCmdSetScissorWithCount-offset-03401
  Evaluation of (offset.y + extent.height) must not cause a signed integer addition overflow for any element of pScissors

• VUID-vkCmdSetScissorWithCount-commandBuffer-04820
  commandBuffer must not have VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D enabled
Valid Usage (Implicit)

- VUID-vkCmdSetScissorWithCount-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetScissorWithCount-pScissors-parameter
  pScissors must be a valid pointer to an array of scissorCount VkRect2D structures

- VUID-vkCmdSetScissorWithCount-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetScissorWithCount-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetScissorWithCount-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetScissorWithCount-scissorCount-arraylength
  scissorCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineViewportStateCreateFlags;

VkPipelineViewportStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

A pre-rasterization shader stage can direct each primitive to zero or more viewports. The destination viewports for a primitive are selected by the last active pre-rasterization shader stage that has an output variable decorated with ViewportIndex (selecting a single viewport) or ViewportMaskNV (selecting multiple viewports). The viewport transform uses the viewport corresponding to either the value assigned to ViewportIndex or one of the bits set in ViewportMaskNV,
and taken from an implementation-dependent vertex of each primitive. If ViewportIndex or any of the bits in ViewportMaskNV are outside the range zero to viewportCount minus one for a primitive, or if the last active pre-rasterization shader stage did not assign a value to either ViewportIndex or ViewportMaskNV for all vertices of a primitive due to flow control, the values resulting from the viewport transformation of the vertices of such primitives are undefined. If the last pre-rasterization shader stage does not have an output decorated with ViewportIndex or ViewportMaskNV, the viewport numbered zero is used by the viewport transformation.

A single vertex can be used in more than one individual primitive, in primitives such as VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP. In this case, the viewport transformation is applied separately for each primitive.

To dynamically set the viewport transformation parameters, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetViewport(
    VkCommandBuffer commandBuffer,  // Required
    uint32_t firstViewport,          // Required
    uint32_t viewportCount,          // Required
    const VkViewport* pViewports     // Required
);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstViewport` is the index of the first viewport whose parameters are updated by the command.
- `viewportCount` is the number of viewports whose parameters are updated by the command.
- `pViewports` is a pointer to an array of `VkViewport` structures specifying viewport parameters.

This command sets the viewport transformation parameters state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_VIEWPORT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineViewportStateCreateInfo::pViewports values used to create the currently active pipeline.

The viewport parameters taken from element i of `pViewports` replace the current state for the viewport index `firstViewport + i`, for i in [0, viewportCount).

---

**Valid Usage**

- VUID-vkCmdSetViewport-firstViewport-01223
  The sum of `firstViewport` and `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive.

- VUID-vkCmdSetViewport-firstViewport-01224
  If the multiViewport feature is not enabled, `firstViewport` must be 0.

- VUID-vkCmdSetViewport-viewportCount-01225
  If the multiViewport feature is not enabled, `viewportCount` must be 1.

- VUID-vkCmdSetViewport-commandBuffer-04821
**Valid Usage (Implicit)**

- VUID-vkCmdSetViewport-commandBuffer-parameter
  
  `commandBuffer must` be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetViewport-pViewports-parameter
  
  `pViewports must` be a valid pointer to an array of `viewportCount` valid `VkViewport` structures

- VUID-vkCmdSetViewport-commandBuffer-recording
  
  `commandBuffer must` be in the `recording state`

- VUID-vkCmdSetViewport-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from `must` support graphics operations

- VUID-vkCmdSetViewport-videocoding
  
  This command `must` only be called outside of a video coding scope

- VUID-vkCmdSetViewport-viewportCount-arraylength
  
  `viewportCount must` be greater than 0

**Host Synchronization**

- Host access to `commandBuffer must` be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from `must` be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

Both `VkPipelineViewportStateCreateInfo` and `vkCmdSetViewport` use `VkViewport` to set the viewport transformation parameters.

The `VkViewport` structure is defined as:
typedef struct VkViewport {
    float x;
    float y;
    float width;
    float height;
    float minDepth;
    float maxDepth;
} VkViewport;

• x and y are the viewport’s upper left corner (x, y).
• width and height are the viewport’s width and height, respectively.
• minDepth and maxDepth are the depth range for the viewport.

Note
Despite their names, minDepth can be less than, equal to, or greater than maxDepth.

The framebuffer depth coordinate \( z_f \) may be represented using either a fixed-point or floating-point representation. However, a floating-point representation must be used if the depth/stencil attachment has a floating-point depth component. If an \( m \)-bit fixed-point representation is used, we assume that it represents each value \( \frac{k}{2^m-1} \), where \( k \in \{ 0, 1, ..., 2^m-1 \} \), as \( k \) (e.g. 1.0 is represented in binary as a string of all ones).

The viewport parameters shown in the above equations are found from these values as

\[
o_x = x + \frac{width}{2}
\]

\[
o_y = y + \frac{height}{2}
\]

\[
o_z = \text{minDepth} \text{ (or (maxDepth + minDepth) / 2 if VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne is VK_TRUE)}
\]

\[
p_x = width
\]

\[
p_y = height
\]

\[
p_z = \text{maxDepth} - \text{minDepth} \text{ (or (maxDepth - minDepth) / 2 if VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne is VK_TRUE)}
\]

If a render pass transform is enabled, the values \((p_x, p_y)\) and \((o_x, o_y)\) defining the viewport are transformed as described in render pass transform before participating in the viewport transform.
The application can specify a negative term for `height`, which has the effect of negating the y coordinate in clip space before performing the transform. When using a negative `height`, the application should also adjust the y value to point to the lower left corner of the viewport instead of the upper left corner. Using the negative `height` allows the application to avoid having to negate the y component of the `Position` output from the last pre-rasterization shader stage.

The width and height of the implementation-dependent maximum viewport dimensions must be greater than or equal to the width and height of the largest image which can be created and attached to a framebuffer.

The floating-point viewport bounds are represented with an implementation-dependent precision.

### Valid Usage

- **VUID-VkViewport-width-01770**
  - *width* must be greater than 0.0

- **VUID-VkViewport-width-01771**
  - *width* must be less than or equal to `VkPhysicalDeviceLimits::maxViewportDimensions[0]`

- **VUID-VkViewport-apiVersion-07917**
  - If the `VK_KHR_maintenance1` extension is not enabled, the `VK_AMD_negative_viewport_height` extension is not enabled, and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, *height* must be greater than 0.0

- **VUID-VkViewport-height-01773**
  - The absolute value of *height* must be less than or equal to `VkPhysicalDeviceLimits::maxViewportDimensions[1]`

- **VUID-VkViewport-x-01774**
  - *x* must be greater than or equal to `viewportBoundsRange[0]`

- **VUID-VkViewport-x-01232**
  - *(x + width)* must be less than or equal to `viewportBoundsRange[1]`

- **VUID-VkViewport-y-01775**
  - *y* must be greater than or equal to `viewportBoundsRange[0]`

- **VUID-VkViewport-y-01776**
  - *y* must be less than or equal to `viewportBoundsRange[1]`

- **VUID-VkViewport-y-01777**
  - *(y + height)* must be greater than or equal to `viewportBoundsRange[0]`

- **VUID-VkViewport-y-01233**
  - *(y + height)* must be less than or equal to `viewportBoundsRange[1]`

- **VUID-VkViewport-minDepth-01234**
  - If the `VK_EXT_depth_range_unrestricted` extension is not enabled, *minDepth* must be between 0.0 and 1.0, inclusive

- **VUID-VkViewport-maxDepth-01235**
  - If the `VK_EXT_depth_range_unrestricted` extension is not enabled, *maxDepth* must be between 0.0 and 1.0, inclusive
Chapter 28. Rasterization

Rasterization is the process by which a primitive is converted to a two-dimensional image. Each discrete location of this image contains associated data such as depth, color, or other attributes.

Rasterizing a primitive begins by determining which squares of an integer grid in framebuffer coordinates are occupied by the primitive, and assigning one or more depth values to each such square. This process is described below for points, lines, and polygons.

A grid square, including its (x,y) framebuffer coordinates, z (depth), and associated data added by fragment shaders, is called a fragment. A fragment is located by its upper left corner, which lies on integer grid coordinates.

Rasterization operations also refer to a fragment’s sample locations, which are offset by fractional values from its upper left corner. The rasterization rules for points, lines, and triangles involve testing whether each sample location is inside the primitive. Fragments need not actually be square, and rasterization rules are not affected by the aspect ratio of fragments. Display of non-square grids, however, will cause rasterized points and line segments to appear fatter in one direction than the other.

We assume that fragments are square, since it simplifies antialiasing and texturing. After rasterization, fragments are processed by fragment operations.

Several factors affect rasterization, including the members of VkPipelineRasterizationStateCreateInfo and VkPipelineMultisampleStateCreateInfo.

The VkPipelineRasterizationStateCreateInfo structure is defined as:

```c
typedef struct VkPipelineRasterizationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateCreateFlags flags;
    VkBool32 depthClampEnable;
    VkBool32 rasterizerDiscardEnable;
    VkPolygonMode polygonMode;
    VkCullModeFlags cullMode;
    VkFrontFace frontFace;
    float depthBiasEnable;
    float depthBiasConstantFactor;
    float depthBiasClamp;
    float depthBiasSlopeFactor;
    float lineWidth;
} VkPipelineRasterizationStateCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
depthClampEnable controls whether to clamp the fragment’s depth values as described in Depth Test. If the pipeline is not created with VkPipelineRasterizationDepthClipStateCreateInfoEXT present then enabling depth clamp will also disable clipping primitives to the z planes of the frustum as described in Primitive Clipping. Otherwise depth clipping is controlled by the state set in VkPipelineRasterizationDepthClipStateCreateInfoEXT.

rasterizerDiscardEnable controls whether primitives are discarded immediately before the rasterization stage.

polygonMode is the triangle rendering mode. See VkPolygonMode.

cullMode is the triangle facing direction used for primitive culling. See VkCullModeFlagBits.

frontFace is a VkFrontFace value specifying the front-facing triangle orientation to be used for culling.

depthBiasEnable controls whether to bias fragment depth values.

depthBiasConstantFactor is a scalar factor controlling the constant depth value added to each fragment.

depthBiasClamp is the maximum (or minimum) depth bias of a fragment.

depthBiasSlopeFactor is a scalar factor applied to a fragment’s slope in depth bias calculations.

lineWidth is the width of rasterized line segments.

The application can also add a VkPipelineRasterizationStateRasterizationOrderAMD structure to the pNext chain of a VkPipelineRasterizationStateCreateInfo structure. This structure enables selecting the rasterization order to use when rendering with the corresponding graphics pipeline as described in Rasterization Order.

### Valid Usage

- **VUID-VkPipelineRasterizationStateCreateInfo-depthClampEnable-00782**
  If the depthClamp feature is not enabled, depthClampEnable must be VK_FALSE

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01507**
  If the fillModeNonSolid feature is not enabled, polygonMode must be VK_POLYGON_MODE_FILL or VK_POLYGON_MODE_FILL_RECTANGLE_NV

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01414**
  If the VK_NV_fill_rectangle extension is not enabled, polygonMode must not be VK_POLYGON_MODE_FILL_RECTANGLE_NV

- **VUID-VkPipelineRasterizationStateCreateInfo-pointPolygons-04458**
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::pointPolygons is VK_FALSE, and rasterizerDiscardEnable is VK_FALSE, polygonMode must not be VK_POLYGON_MODE_POINT

### Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationStateCreateInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO
Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of \( \text{VkDepthBiasRepresentationInfoEXT} \), \( \text{VkPipelineRasterizationConservativeStateCreateInfoEXT} \), \( \text{VkPipelineRasterizationDepthClipStateCreateInfoEXT} \), \( \text{VkPipelineRasterizationLineStateCreateInfoKHR} \), \( \text{VkPipelineRasterizationProvokingVertexStateCreateInfoEXT} \), \( \text{VkPipelineRasterizationStateRasterizationOrderAMD} \), or \( \text{VkPipelineRasterizationStateStreamCreateInfoEXT} \).

The sType value of each struct in the pNext chain must be unique.

flags must be 0

polygonMode must be a valid VkPolygonMode value

cullMode must be a valid combination of VkCullModeFlagBits values

frontFace must be a valid VkFrontFace value

\[ \text{typedef VkPipelineRasterizationStateCreateFlags;} \]
• **depthClipEnable** controls whether depth clipping is enabled as described in **Primitive Clipping**.

### Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-sType-sType**
  
  Must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_DEPTH_CLIP_STATE_CREATE_INFO_EXT`

- **VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-flags-zerobitmask**
  
  Flags must be 0

```c
// Provided by VK_EXT_depth_clip_enable
typedef VkFlags VkPipelineRasterizationDepthClipStateCreateFlagsEXT;
```

**VkPipelineRasterizationDepthClipStateCreateFlagsEXT** is a bitmask type for setting a mask, but is currently reserved for future use.

The **VkPipelineMultisampleStateCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineMultisampleStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineMultisampleStateCreateFlags flags;
    VkSampleCountFlagBits rasterizationSamples;
    VkBool32 sampleShadingEnable;
    float minSampleShading;
    const VkSampleMask* pSampleMask;
    VkBool32 alphaToCoverageEnable;
    VkBool32 alphaToOneEnable;
} VkPipelineMultisampleStateCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **rasterizationSamples** is a **VkSampleCountFlagBits** value specifying the number of samples used in rasterization. This value is ignored for the purposes of setting the number of samples used in rasterization if the pipeline is created with the **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** dynamic state set, but if **VK_DYNAMIC_STATE_SAMPLE_MASK_EXT** dynamic state is not set, it is still used to define the size of the **pSampleMask** array as described below.
- **sampleShadingEnable** can be used to enable **Sample Shading**.
- **minSampleShading** specifies a minimum fraction of sample shading if **sampleShadingEnable** is set to **VK_TRUE**.
- **pSampleMask** is a pointer to an array of **VkSampleMask** values used in the **sample mask test**.
• **alphaToCoverageEnable** controls whether a temporary coverage value is generated based on the alpha component of the fragment’s first color output as specified in the Multisample Coverage section.

• **alphaToOneEnable** controls whether the alpha component of the fragment’s first color output is replaced with one as described in Multisample Coverage.

Each bit in the sample mask is associated with a unique sample index as defined for the coverage mask. Each bit \(b\) for mask word \(w\) in the sample mask corresponds to sample index \(i\), where \(i = 32 \times w + b\). \(pSampleMask\) has a length equal to \(\lceil \frac{\text{rasterizationSamples}}{32} \rceil\) words.

If \(pSampleMask\) is NULL, it is treated as if the mask has all bits set to 1.

### Valid Usage

- **VUID-VkPipelineMultisampleStateCreateInfo-sampleShadingEnable-00784**
  If the \(\text{sampleRateShading}\) feature is not enabled, \(\text{sampleShadingEnable} \) must be \(\text{VK_FALSE}\)

- **VUID-VkPipelineMultisampleStateCreateInfo-alphaToOneEnable-00785**
  If the \(\text{alphaToOne}\) feature is not enabled, \(\text{alphaToOneEnable} \) must be \(\text{VK_FALSE}\)

- **VUID-VkPipelineMultisampleStateCreateInfo-minSampleShading-00786**
  \(\text{minSampleShading} \) must be in the range \([0,1]\)

- **VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-01415**
  If the \(\text{VK_NV_framebuffer_mixed_samples}\) extension is enabled, and if the subpass has any color attachments and \(\text{rasterizationSamples}\) is greater than the number of color samples, then \(\text{sampleShadingEnable} \) must be \(\text{VK_FALSE}\)

### Valid Usage (Implicit)

- **VUID-VkPipelineMultisampleStateCreateInfo-sType-sType**
  \(\text{sType} \) must be \(\text{VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO}\)

- **VUID-VkPipelineMultisampleStateCreateInfo-pNext-pNext**
  Each \(\text{pNext}\) member of any structure (including this one) in the \(\text{pNext}\) chain must be either \(\text{NULL}\) or a pointer to a valid instance of \(\text{VkPipelineCoverageModulationStateCreateInfoNV}\), \(\text{VkPipelineCoverageReductionStateCreateInfoNV}\), \(\text{VkPipelineCoverageToColorStateCreateInfoNV}\), or \(\text{VkPipelineSampleLocationsStateCreateInfoEXT}\)

- **VUID-VkPipelineMultisampleStateCreateInfo-sType-unique**
  The \(\text{sType} \) value of each struct in the \(\text{pNext}\) chain must be unique

- **VUID-VkPipelineMultisampleStateCreateInfo-flags-zerobitmask**
  \(\text{flags} \) must be 0

- **VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-parameter**
  \(\text{rasterizationSamples} \) must be a valid \(\text{VkSampleCountFlagBits}\) value

- **VUID-VkPipelineMultisampleStateCreateInfo-pSampleMask-parameter**
  If \(pSampleMask\) is not \(\text{NULL}\), \(pSampleMask\) must be a valid pointer to an array of
VkPipelineMultisampleStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The elements of the sample mask array are of type VkSampleMask, each representing 32 bits of coverage information:

Rasterization only generates fragments which cover one or more pixels inside the framebuffer. Pixels outside the framebuffer are never considered covered in the fragment. Fragments which would be produced by application of any of the primitive rasterization rules described below but which lie outside the framebuffer are not produced, nor are they processed by any later stage of the pipeline, including any of the fragment operations.

Surviving fragments are processed by fragment shaders. Fragment shaders determine associated data for fragments, and can also modify or replace their assigned depth values.

28.1. Discarding Primitives Before Rasterization

Primitives are discarded before rasterization if the rasterizerDiscardEnable member of VkPipelineRasterizationStateCreateInfo is enabled. When enabled, primitives are discarded after they are processed by the last active shader stage in the pipeline before rasterization.

To dynamically enable whether primitives are discarded before the rasterization stage, call:

```
void vkCmdSetRasterizerDiscardEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 rasterizerDiscardEnable);
```

or the equivalent command

```
void vkCmdSetRasterizerDiscardEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 rasterizerDiscardEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
• `rasterizerDiscardEnable` controls whether primitives are discarded immediately before the rasterization stage.

This command sets the discard enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::rasterizerDiscardEnable` value used to create the currently active pipeline.

### Valid Usage

• VUID-vkCmdSetRasterizerDiscardEnable-None-08970
  At least one of the following must be true:
  ◦ the `extendedDynamicState2` feature is enabled
  ◦ the `shaderObject` feature is enabled
  ◦ the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

• VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

• VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-recording
  `commandBuffer` must be in the recording state

• VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

• VUID-vkCmdSetRasterizerDiscardEnable-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

• Host access to `commandBuffer` must be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
28.2. Controlling the Vertex Stream Used for Rasterization

By default vertex data output from the last pre-rasterization shader stage are directed to vertex stream zero. Geometry shaders can emit primitives to multiple independent vertex streams. Each vertex emitted by the geometry shader is directed at one of the vertex streams. As vertices are received on each vertex stream, they are arranged into primitives of the type specified by the geometry shader output primitive type. The shading language instructions `OpEndPrimitive` and `OpEndStreamPrimitive` can be used to end the primitive being assembled on a given vertex stream and start a new empty primitive of the same type. An implementation supports up to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams` streams, which is at least 1. The individual streams are numbered 0 through `maxTransformFeedbackStreams` minus 1. There is no requirement on the order of the streams to which vertices are emitted, and the number of vertices emitted to each vertex stream can be completely independent, subject only to the `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreamDataSize` and `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferDataSize` limits. The primitives output from all vertex streams are passed to the transform feedback stage to be captured to transform feedback buffers in the manner specified by the last pre-rasterization shader stage's `XfbBuffer`, `XfbStride`, and `Offsets` decorations on the output interface variables in the graphics pipeline. To use a vertex stream other than zero, or to use multiple streams, the `GeometryStreams` capability must be specified.

By default, the primitives output from vertex stream zero are rasterized. If the implementation supports the `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect` property it is possible to rasterize a vertex stream other than zero.

By default, geometry shaders that emit vertices to multiple vertex streams are limited to using only the `OutputPoints` output primitive type. If the implementation supports the `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackStreamsLinesTriangles` property it is possible to emit `OutputLineStrip` or `OutputTriangleStrip` in addition to `OutputPoints`.

The vertex stream used for rasterization is specified by adding a `VkPipelineRasterizationStateStreamCreateInfoEXT` structure to the `pNext` chain of a `VkPipelineRasterizationStateCreateInfo` structure.

The `VkPipelineRasterizationStateStreamCreateInfoEXT` structure is defined as:
typedef struct VkPipelineRasterizationStateStreamCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateStreamCreateFlagsEXT flags;
    uint32_t rasterizationStream;
} VkPipelineRasterizationStateStreamCreateInfoEXT;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **rasterizationStream** is the vertex stream selected for rasterization.

If this structure is not present, `rasterizationStream` is assumed to be zero.

### Valid Usage

- **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-geometryStreams-02324**
  `VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams` must be enabled

- **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02325**
  `rasterizationStream` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`

- **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02326**
  `rasterizationStream` must be zero if `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect` is `VK_FALSE`

### Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_STREAM_CREATE_INFO_EXT`

- **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-flags-zerobitmask**
  `flags` must be `0`

// Provided by VK_EXT_transform_feedback
typedef VkFlags VkPipelineRasterizationStateStreamCreateFlagsEXT;

`VkPipelineRasterizationStateStreamCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

To **dynamically set** the `rasterizationStream` state, call:
```c
void vkCmdSetRasterizationStreamEXT(
    VkCommandBuffer commandBuffer,
    uint32_t rasterizationStream);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizationStream` specifies the `rasterizationStream` state.

This command sets the `rasterizationStream` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetRasterizationStreamEXT-None-09423**
  At least one of the following must be true:
  - The `extendedDynamicState3RasterizationStream` feature is enabled
  - The `shaderObject` feature is enabled

- **VUID-vkCmdSetRasterizationStreamEXT-transformFeedback-07411**
  The `transformFeedback` feature must be enabled

- **VUID-vkCmdSetRasterizationStreamEXT-rasterizationStream-07412**
  `rasterizationStream` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`

- **VUID-vkCmdSetRasterizationStreamEXT-rasterizationStream-07413**
  `rasterizationStream` must be zero if `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect` is `VK_FALSE`

### Valid Usage (Implicit)

- **VUID-vkCmdSetRasterizationStreamEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetRasterizationStreamEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetRasterizationStreamEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetRasterizationStreamEXT-videocoding**
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

28.3. Rasterization Order

Within a subpass of a `render pass instance`, for a given (x,y,layer,sample) sample location, the following operations are guaranteed to execute in `rasterization order`, for each separate primitive that includes that sample location:

1. Fragment operations, in the order defined
2. Blending, logic operations, and color writes

Execution of these operations for each primitive in a subpass occurs in an order determined by the application.

The rasterization order to use for a graphics pipeline is specified by adding a `VkPipelineRasterizationStateRasterizationOrderAMD` structure to the `pNext` chain of a `VkPipelineRasterizationStateCreateInfo` structure.

The `VkPipelineRasterizationStateRasterizationOrderAMD` structure is defined as:

```c
// Provided by VK_AMD_rasterization_order
typedef struct VkPipelineRasterizationStateRasterizationOrderAMD {
    VkStructureType sType;
    const void* pNext;
    VkRasterizationOrderAMD rasterizationOrder;
} VkPipelineRasterizationStateRasterizationOrderAMD;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `rasterizationOrder` is a `VkRasterizationOrderAMD` value specifying the primitive rasterization order to use.
Valid Usage (Implicit)

- VUID-VkPipelineRasterizationStateRasterizationOrderAMD-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_RASTERIZATION_ORDER_AMD

- VUID-VkPipelineRasterizationStateRasterizationOrderAMD-rasterizationOrder-parameter
  rasterizationOrder must be a valid VkRasterizationOrderAMD value

If the VK_AMD_rasterization_order device extension is not enabled or the application does not request a particular rasterization order through specifying a VkPipelineRasterizationStateRasterizationOrderAMD structure then the rasterization order used by the graphics pipeline defaults to VK_RASTERIZATION_ORDER_STRICT_AMD.

Possible values of VkPipelineRasterizationStateRasterizationOrderAMD::rasterizationOrder, specifying the primitive rasterization order, are:

```c
// Provided by VK_AMD_rasterization_order
typedef enum VkRasterizationOrderAMD {
    VK_RASTERIZATION_ORDER_STRICT_AMD = 0,
    VK_RASTERIZATION_ORDER_RELAXED_AMD = 1,
} VkRasterizationOrderAMD;
```

- VK_RASTERIZATION_ORDER_STRICT_AMD specifies that operations for each primitive in a subpass must occur in primitive order.
- VK_RASTERIZATION_ORDER_RELAXED_AMD specifies that operations for each primitive in a subpass may not occur in primitive order.

### 28.4. Multisampling

Multisampling is a mechanism to antialias all Vulkan primitives: points, lines, and polygons. The technique is to sample all primitives multiple times at each pixel. Each sample in each framebuffer attachment has storage for a color, depth, and/or stencil value, such that per-fragment operations apply to each sample independently. The color sample values can be later resolved to a single color (see Resolving Multisample Images and the Render Pass chapter for more details on how to resolve multisample images to non-multisample images).

Vulkan defines rasterization rules for single-sample modes in a way that is equivalent to a multisample mode with a single sample in the center of each fragment.

Each fragment includes a coverage mask with a single bit for each sample in the fragment, and a number of depth values and associated data for each sample.

It is understood that each pixel has rasterizationSamples locations associated with it. These locations are exact positions, rather than regions or areas, and each is referred to as a sample point. The sample points associated with a pixel must be located inside or on the boundary of the unit square that is considered to bound the pixel. Furthermore, the relative locations of sample points may be identical for each pixel in the framebuffer, or they may differ.
If the render pass has a fragment density map attachment, each fragment only has \texttt{rasterizationSamples} locations associated with it regardless of how many pixels are covered in the fragment area. Fragment sample locations are defined as if the fragment had an area of (1,1) and its sample points \textbf{must} be located within these bounds. Their actual location in the framebuffer is calculated by scaling the sample location by the fragment area. Attachments with storage for multiple samples per pixel are located at the pixel sample locations. Otherwise, the fragment’s sample locations are generally used for evaluation of associated data and fragment operations.

If the current pipeline includes a fragment shader with one or more variables in its interface decorated with \texttt{Sample} and \texttt{Input}, the data associated with those variables will be assigned independently for each sample. The values for each sample \textbf{must} be evaluated at the location of the sample. The data associated with any other variables not decorated with \texttt{Sample} and \texttt{Input} need not be evaluated independently for each sample.

A \textit{coverage mask} is generated for each fragment, based on which samples within that fragment are determined to be within the area of the primitive that generated the fragment.

Single pixel fragments and multi-pixel fragments defined by a \textit{fragment density map} have one set of samples. Multi-pixel fragments defined by a \textit{shading rate image} have one set of samples per pixel. Multi-pixel fragments defined by setting the \textit{fragment shading rate} have one set of samples per pixel. Each set of samples has a number of samples determined by \texttt{VkPipelineMultisampleStateCreateInfo::rasterizationSamples}. Each sample in a set is assigned a unique \textit{sample index} \(i\) in the range \([0, \text{rasterizationSamples})\).

To \textbf{dynamically set} the \texttt{rasterizationSamples}, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetRasterizationSamplesEXT(
    VkCommandBuffer commandBuffer,
    VkSampleCountFlagBits rasterizationSamples);
```

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.
- \texttt{rasterizationSamples} specifies \texttt{rasterizationSamples}.

This command sets the \texttt{rasterizationSamples} for subsequent drawing commands when drawing using \textit{shader objects}, or when the graphics pipeline is created with \texttt{VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. Otherwise, this state is specified by the \texttt{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetRasterizationSamplesEXT-None-09423
  At least one of the following \textbf{must} be true:
  - The \texttt{extendedDynamicState3RasterizationSamples} feature is enabled
  - The \texttt{shaderObject} feature is enabled
Valid Usage (Implicit)

- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-parameter
  \textit{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdSetRasterizationSamplesEXT-rasterizationSamples-parameter
  \textit{rasterizationSamples} \textbf{must} be a valid \texttt{VkSampleCountFlagBits} value

- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-recording
  \textit{commandBuffer} \textbf{must} be in the \textit{recording} state

- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \textit{commandBuffer} was allocated from \textbf{must} support graphics operations

- VUID-vkCmdSetRasterizationSamplesEXT-videocoding
  This command \textbf{must} only be called outside of a video coding scope

Host Synchronization

- Host access to \textit{commandBuffer} \textbf{must} be externally synchronized

- Host access to the \texttt{VkCommandPool} that \textit{commandBuffer} was allocated from \textbf{must} be externally synchronized

Command Properties

</tr>
</tbody>
</table>

Each sample in a fragment is also assigned a unique \textit{coverage index} \textit{j} in the range \([0, n \times \textit{rasterizationSamples})\), where \(n\) is the number of sets in the fragment. If the fragment contains a single set of samples, the \textit{coverage index} is always equal to the \textit{sample index}. If a shading rate image is used and a fragment covers multiple pixels, the coverage index is determined as defined by \texttt{VkPipelineViewportCoarseSampleOrderStateCreateInfoNV} or \texttt{vkCmdSetCoarseSampleOrderNV}.

If the \textit{fragment shading rate} is set, the coverage index \textit{j} is determined as a function of the \textit{pixel index} \textit{p}, the \textit{sample index} \textit{i}, and the number of rasterization samples \textit{r} as:

\[ j = i + r \times ((f_w \times f_h) - 1 - p) \]

where the pixel index \textit{p} is determined as a function of the pixel's framebuffer location \((x,y)\) and the fragment size \((f_w,f_h)\):
\[ p_x = x \mod f_w \]

\[ p_y = y \mod f_h \]

\[ p = p_x + (p_y \times f_w) \]

The table below illustrates the pixel index for multi-pixel fragments:

**Table 35. Pixel indices - 1 wide**

</table>
The coverage mask includes \( B \) bits packed into \( W \) words, defined as:

\[
B = n \times \text{rasterizationSamples}
\]

\[
W = \lceil B/32 \rceil
\]

Bit \( b \) in coverage mask word \( w \) is 1 if the sample with coverage index \( j = 32 \times w + b \) is covered, and 0 otherwise.

If the `standardSampleLocations` member of `VkPhysicalDeviceLimits` is `VK_TRUE`, then the sample counts `VK_SAMPLE_COUNT_1_BIT`, `VK_SAMPLE_COUNT_2_BIT`, `VK_SAMPLE_COUNT_4_BIT`, `VK_SAMPLE_COUNT_8_BIT`, and `VK_SAMPLE_COUNT_16_BIT` have sample locations as listed in the following table, with the \( i \)th entry in the table corresponding to sample index \( i \). `VK_SAMPLE_COUNT_32_BIT` and `VK_SAMPLE_COUNT_64_BIT` do not have standard sample locations. Locations are defined relative to an origin in the upper left corner of the fragment.

Color images created with multiple samples per pixel use a compression technique where there are
two arrays of data associated with each pixel. The first array contains one element per sample where each element stores an index to the second array defining the fragment mask of the pixel. The second array contains one element per color fragment and each element stores a unique color value in the format of the image. With this compression technique it is not always necessary to actually use unique storage locations for each color sample: when multiple samples share the same color value the fragment mask may have two samples referring to the same color fragment. The number of color fragments is determined by the samples member of the VkImageCreateInfo structure used to create the image. The VK_AMD_shader_fragment_mask device extension provides shader instructions enabling the application to get direct access to the fragment mask and the individual color fragment values.

Figure 19. Fragment Mask

28.5. Custom Sample Locations

Applications can also control the sample locations used for rasterization.

If the pNext chain of the VkPipelineMultisampleStateCreateInfo structure specified at pipeline creation time includes a VkPipelineSampleLocationsStateCreateInfoEXT structure, then that structure controls the sample locations used when rasterizing primitives with the pipeline.

The VkPipelineSampleLocationsStateCreateInfoEXT structure is defined as:

```c
typedef struct VkPipelineSampleLocationsStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 sampleLocationsEnable;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkPipelineSampleLocationsStateCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- sampleLocationsEnable controls whether custom sample locations are used. If sampleLocationsEnable is VK_FALSE, the default sample locations are used and the values specified in sampleLocationsInfo are ignored.
- sampleLocationsInfo is the sample locations to use during rasterization if sampleLocationsEnable is VK_TRUE and the graphics pipeline is not created with VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT.
Valid Usage (Implicit)

• VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_SAMPLE_LOCATIONS_STATE_CREATE_INFO_EXT

• VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sampleLocationsInfo-parameter
  sampleLocationsInfo must be a valid VkSampleLocationsInfoEXT structure

The VkSampleLocationsInfoEXT structure is defined as:

```c
typedef struct VkSampleLocationsInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSampleCountFlagBits sampleLocationsPerPixel;
    VkExtent2D sampleLocationGridSize;
    uint32_t sampleLocationsCount;
    const VkSampleLocationEXT* pSampleLocations;
} VkSampleLocationsInfoEXT;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• sampleLocationsPerPixel is a VkSampleCountFlagBits value specifying the number of sample locations per pixel.
• sampleLocationGridSize is the size of the sample location grid to select custom sample locations for.
• sampleLocationsCount is the number of sample locations in pSampleLocations.
• pSampleLocations is a pointer to an array of sampleLocationsCount VkSampleLocationEXT structures.

This structure can be used either to specify the sample locations to be used for rendering or to specify the set of sample locations an image subresource has been last rendered with for the purposes of layout transitions of depth/stencil images created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT.

The sample locations in pSampleLocations specify sampleLocationsPerPixel number of sample locations for each pixel in the grid of the size specified in sampleLocationGridSize. The sample location for sample i at the pixel grid location (x,y) is taken from pSampleLocations[(x + y × sampleLocationGridSize.width) × sampleLocationsPerPixel + i].

If the render pass has a fragment density map, the implementation will choose the sample locations for the fragment and the contents of pSampleLocations may be ignored.
Valid Usage

- VUID-VkSampleLocationsInfoEXT-sampleLocationsPerPixel-01526
da location SampleCounts

- VUID-VkSampleLocationsInfoEXT-sampleLocationsCount-01527

Valid Usage (Implicit)

- VUID-VkSampleLocationsInfoEXT-sType-sType

- VUID-VkSampleLocationsInfoEXT-pSampleLocations-parameter

The `VkSampleLocationEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationEXT {
    float x;
    float y;
} VkSampleLocationEXT;
```

- `x` is the horizontal coordinate of the sample's location.
- `y` is the vertical coordinate of the sample's location.

The domain space of the sample location coordinates has an upper-left origin within the pixel in framebuffer space.

The values specified in a `VkSampleLocationEXT` structure are always clamped to the implementation-dependent sample location coordinate range `[sampleLocationCoordinateRange[0], sampleLocationCoordinateRange[1]]` that can be queried using `VkPhysicalDeviceSampleLocationsPropertiesEXT`.

To dynamically set the `sampleLocationsEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_EXT_sample_locations,
VkEXT_sample_locations with VK_EXT_shader_object
void vkCmdSetSampleLocationsEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 sampleLocationsEnable);
```
- **commandBuffer** is the command buffer into which the command will be recorded.
- **sampleLocationsEnable** specifies the **sampleLocationsEnable** state.

This command sets the **sampleLocationsEnable** state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable** value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetSampleLocationsEnableEXT-None-09423
  At least one of the following must be true:
  - The **extendedDynamicState3SampleLocationsEnable** feature is enabled
  - The **shaderObject** feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetSampleLocationsEnableEXT-commandBuffer-parameter
  CommandBuffer must be a valid **VkCommandBuffer** handle
- VUID-vkCmdSetSampleLocationsEnableEXT-commandBuffer-recording
  CommandBuffer must be in the recording state
- VUID-vkCmdSetSampleLocationsEnableEXT-commandBuffer-cmdpool
  The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations
- VUID-vkCmdSetSampleLocationsEnableEXT-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to **commandBuffer** must be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>
To **dynamically set** the sample locations used for rasterization, call:

```cpp
// Provided by VK_EXT_sample_locations
void vkCmdSetSampleLocationsEXT(
    VkCommandBuffer commandBuffer, 
    const VkSampleLocationsInfoEXT* pSampleLocationsInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pSampleLocationsInfo` is the sample locations state to set.

This command sets the custom sample locations for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and when the `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` property of the bound graphics pipeline is `VK_TRUE`. Otherwise, this state is specified by the `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsInfo` values used to create the currently active pipeline.

---

**Valid Usage**

- VUID-vkCmdSetSampleLocationsEXT-variableSampleLocations-01530
  If `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE` then the current render pass **must** have been begun by specifying a `VkRenderPassSampleLocationsBeginInfoEXT` structure whose `pPostSubpassSampleLocations` member contains an element with a `subpassIndex` matching the current subpass index and the `sampleLocationsInfo` member of that element **must** match the sample locations state pointed to by `pSampleLocationsInfo`

---

**Valid Usage (Implicit)**

- VUID-vkCmdSetSampleLocationsEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetSampleLocationsEXT-pSampleLocationsInfo-parameter
  `pSampleLocationsInfo` **must** be a valid pointer to a valid `VkSampleLocationsInfoEXT` structure

- VUID-vkCmdSetSampleLocationsEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdSetSampleLocationsEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetSampleLocationsEXT-videocoding
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

command Buffer Levels  | Render Pass Scope | Video Coding Scope | Supported Queue Types | Command Type
---|---|---|---|---
Primary  | Both  | Outside  | Graphics  | State
Secondary  |  |  |  |  

Command Properties

28.6. Fragment Shading Rates

The features advertised by `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` allow an application to control the shading rate of a given fragment shader invocation.

The fragment shading rate strongly interacts with Multisampling, and the set of available rates for an implementation may be restricted by sample rate.

To query available shading rates, call:

```c
// Provided by VK_KHR_fragment_shading_rate
VkResult vkGetPhysicalDeviceFragmentShadingRatesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pFragmentShadingRateCount,  
    VkPhysicalDeviceFragmentShadingRateKHR* pFragmentShadingRates);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pFragmentShadingRateCount` is a pointer to an integer related to the number of fragment shading rates available or queried, as described below.
- `pFragmentShadingRates` is either `NULL` or a pointer to an array of `VkPhysicalDeviceFragmentShadingRateKHR` structures.

If `pFragmentShadingRates` is `NULL`, then the number of fragment shading rates available is returned in `pFragmentShadingRateCount`. Otherwise, `pFragmentShadingRateCount` must point to a variable set by the user to the number of elements in the `pFragmentShadingRates` array, and on return the variable is overwritten with the number of structures actually written to `pFragmentShadingRates`. If `pFragmentShadingRateCount` is less than the number of fragment shading rates available, at most `pFragmentShadingRateCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available fragment shading rates were returned.
The returned array of fragment shading rates **must** be ordered from largest `fragmentSize.width` value to smallest, and each set of fragment shading rates with the same `fragmentSize.width` value **must** be ordered from largest `fragmentSize.height` to smallest. Any two entries in the array **must** not have the same `fragmentSize` values.

For any entry in the array, the following rules also apply:

- The value of `fragmentSize.width` **must** be less than or equal to `maxFragmentSize.width`.
- The value of `fragmentSize.width` **must** be greater than or equal to 1.
- The value of `fragmentSize.width` **must** be a power-of-two.
- The value of `fragmentSize.height` **must** be less than or equal to `maxFragmentSize.height`.
- The value of `fragmentSize.height` **must** be greater than or equal to 1.
- The value of `fragmentSize.height` **must** be a power-of-two.
- The highest sample count in `sampleCounts` **must** be less than or equal to `maxFragmentShadingRateRasterizationSamples`.
- The product of `fragmentSize.width`, `fragmentSize.height`, and the highest sample count in `sampleCounts` **must** be less than or equal to `maxFragmentShadingRateCoverageSamples`.

Implementations **must** support at least the following shading rates:

<table>
<thead>
<tr>
<th><code>sampleCounts</code></th>
<th><code>fragmentSize</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SAMPLE_COUNT_1_BIT</td>
<td>(2,2)</td>
</tr>
<tr>
<td>VK_SAMPLE_COUNT_1_BIT</td>
<td>(2,1)</td>
</tr>
<tr>
<td>~0</td>
<td>(1,1)</td>
</tr>
</tbody>
</table>

If `framebufferColorSampleCounts` includes `VK_SAMPLE_COUNT_2_BIT`, the required rates **must** also include `VK_SAMPLE_COUNT_2_BIT`.

**Note**
Including the (1,1) fragment size is done for completeness; it has no actual effect on the support of rendering without setting the fragment size. All sample counts and render pass transforms are supported for this rate.

The returned set of fragment shading rates **must** be returned in the native (rotated) coordinate system. For rasterization using render pass transform not equal to `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, the application **must** transform the returned fragment shading rates into the current (unrotated) coordinate system to get the supported rates for that transform.

**Note**
For example, consider an implementation returning support for 4x2, but not 2x4 in the set of supported fragment shading rates. This means that for transforms `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR` and `VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR`, 2x4 is a supported rate, but 4x2 is an
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-physicalDevice-parameter
  `physicalDevice` **must** be a valid `VkPhysicalDevice` handle.
- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRateCount-parameter
  `pFragmentShadingRateCount` **must** be a valid pointer to a `uint32_t` value.
- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRates-parameter
  If the value referenced by `pFragmentShadingRateCount` is not 0, and `pFragmentShadingRates` is not NULL, `pFragmentShadingRates` **must** be a valid pointer to an array of `pFragmentShadingRateCount` `VkPhysicalDeviceFragmentShadingRateKHR` structures.

Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkPhysicalDeviceFragmentShadingRateKHR` structure is defined as

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateKHR {
    VkStructureType sType;
    void* pNext;
    VkSampleCountFlags sampleCounts;
    VkExtent2D fragmentSize;
} VkPhysicalDeviceFragmentShadingRateKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `sampleCounts` is a bitmask of sample counts for which the shading rate described by `fragmentSize` is supported.
- `fragmentSize` is a `VkExtent2D` describing the width and height of a supported shading rate.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShadingRateKHR-sType-sType
Fragment shading rates **can** be set at three points, with the three rates combined to determine the final shading rate.

### 28.6.1. Pipeline Fragment Shading Rate

The **pipeline fragment shading rate** **can** be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via `vkCmdSetFragmentShadingRateKHR`.

The `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure is defined as:

```c
typedef struct VkPipelineFragmentShadingRateStateCreateInfoKHR {
    VkStructureType     sType;
    const void* const   pNext;
    VkExtent2D          fragmentSize;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateStateCreateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **fragmentSize** specifies a `VkExtent2D` structure containing the fragment size used to define the pipeline fragment shading rate for drawing commands using this pipeline.
- **combinerOps** specifies a `VkFragmentShadingRateCombinerOpKHR` value determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the **pNext** chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure, then that structure includes parameters controlling the pipeline fragment shading rate.

If this structure is not present, **fragmentSize** is considered to be equal to (1,1), and both elements of **combinerOps** are considered to be equal to `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

**Valid Usage (Implicit)**

- VUID-VkPipelineFragmentShadingRateStateCreateInfoKHR-sType-sType
  - **sType** **must** be `VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_STATE_CREATE_INFO_KHR`

To **dynamically set** the pipeline fragment shading rate and combiner operation, call:

```c
2710```
Provided by VK_KHR_fragment_shading_rate

```c
void vkCmdSetFragmentShadingRateKHR(
    VkCommandBuffer commandBuffer,
    const VkExtent2D* pFragmentSize,
    const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pFragmentSize` specifies the pipeline fragment shading rate for subsequent drawing commands.
- `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by subsequent drawing commands.

This command sets the pipeline fragment shading rate and combiner operation for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineFragmentShadingRateStateCreateInfoKHR` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04507**
  If `pipelineFragmentShadingRate` is not enabled, `pFragmentSize->width` must be 1

- **VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04508**
  If `pipelineFragmentShadingRate` is not enabled, `pFragmentSize->height` must be 1

- **VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04509**
  One of `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or `attachmentFragmentShadingRate` must be enabled

- **VUID-vkCmdSetFragmentShadingRateKHR-primitiveFragmentShadingRate-04510**
  If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- **VUID-vkCmdSetFragmentShadingRateKHR-attachmentFragmentShadingRate-04511**
  If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- **VUID-vkCmdSetFragmentShadingRateKHR-fragmentSizeNonTrivialCombinerOps-04512**
  If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps` must be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`

- **VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04513**
  `pFragmentSize->width` must be greater than or equal to 1

- **VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04514**
  `pFragmentSize->height` must be greater than or equal to 1

- **VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04515**
pFragmentSize->width must be a power-of-two value

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04516
  pFragmentSize->height must be a power-of-two value

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04517
  pFragmentSize->width must be less than or equal to 4

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04518
  pFragmentSize->height must be less than or equal to 4

Valid Usage (Implicit)

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-parameter
  pFragmentSize must be a valid pointer to a valid VkExtent2D structure

- VUID-vkCmdSetFragmentShadingRateKHR-combinerOps-parameter
  Each element of combinerOps must be a valid VkFragmentShadingRateCombinerOpKHR value

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetFragmentShadingRateKHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

28.6.2. Primitive Fragment Shading Rate

The primitive fragment shading rate can be set via the `PrimitiveShadingRateKHR` built-in in the last active pre-rasterization shader stage. If the last pre-rasterization shader stage is using the MeshEXT Execution Model, the rate associated with a given primitive is sourced from the value written to the per-primitive `PrimitiveShadingRateKHR`. Otherwise the rate associated with a given primitive is sourced from the value written to `PrimitiveShadingRateKHR` by that primitive’s provoking vertex.

28.6.3. Attachment Fragment Shading Rate

The attachment shading rate can be set by including `VkFragmentShadingRateAttachmentInfoKHR` in a subpass to define a fragment shading rate attachment. Each pixel in the framebuffer is assigned an attachment fragment shading rate by the corresponding texel in the fragment shading rate attachment, according to:

\[
x' = \text{floor}(x / \text{region}_x)
\]

\[
y' = \text{floor}(y / \text{region}_y)
\]

where \( x' \) and \( y' \) are the coordinates of a texel in the fragment shading rate attachment, \( x \) and \( y \) are the coordinates of the pixel in the framebuffer, and \( \text{region}_x \) and \( \text{region}_y \) are the size of the region each texel corresponds to, as defined by the `shadingRateAttachmentTexelSize` member of `VkFragmentShadingRateAttachmentInfoKHR`.

If multiview is enabled and the shading rate attachment has multiple layers, the shading rate attachment texel is selected from the layer determined by the `ViewIndex` built-in. If multiview is disabled, and both the shading rate attachment and the framebuffer have multiple layers, the shading rate attachment texel is selected from the layer determined by the `Layer` built-in. Otherwise, the texel is unconditionally selected from the first layer of the attachment.

The fragment size is encoded into the first component of the identified texel as follows:

\[
\text{size}_w = 2^{(1) \text{txel} / 4 \text{txel} / 3)
\]

\[
\text{size}_h = 2^{(1) \text{txel} / 3)
\]

where `txel` is the value in the first component of the identified texel, and `size_w` and `size_h` are the width and height of the fragment size, decoded from the texel.

If no fragment shading rate attachment is specified, this size is calculated as `size_w = size_h = 1`. Applications must not specify a width or height greater than 4 by this method.

The Fragment Shading Rate enumeration in SPIR-V adheres to the above encoding.
28.6.4. Combining the Fragment Shading Rates

The final rate ($C'_{xy}$) used for fragment shading must be one of the rates returned by `vkGetPhysicalDeviceFragmentShadingRatesKHR` for the sample count and render pass transform used by rasterization.

If any of the following conditions are met, $C'_{xy}$ must be set to $\{1,1\}$:

- If Sample Shading is enabled.
- The `fragmentShadingRateWithSampleMask` limit is not supported, and `VkPipelineMultisampleStateCreateInfo::pSampleMask` contains a zero value in any bit used by fragment operations.
- The `fragmentShadingRateWithShaderSampleMask` is not supported, and the fragment shader has `SampleMask` in the input or output interface.
- The `fragmentShadingRateWithShaderDepthStencilWrites` limit is not supported, and the fragment shader declares the `FragDepth` or `FragStencilRefEXT` built-in.
- The `fragmentShadingRateWithConservativeRasterization` limit is not supported, and `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode` is not `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`.
- The `fragmentShadingRateWithFragmentShaderInterlock` limit is not supported, and the fragment shader declares any of the `fragment shader interlock` execution modes.
- The `fragmentShadingRateWithCustomSampleLocations` limit is not supported, and `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` is `VK_TRUE`.
- The fragment shader declares any of the `TileImageColorReadAccessEXT`, `TileImageDepthReadAccessEXT`, or `TileImageStencilReadAccessEXT` capabilities.

Otherwise, each of the specified shading rates are combined and then used to derive the value of $C'_{xy}$. As there are three ways to specify shading rates, two combiner operations are specified - between the pipeline and primitive shading rates, and between the result of that and the attachment shading rate.

The equation used for each combiner operation is defined by `VkFragmentShadingRateCombinerOpKHR`:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef enum VkFragmentShadingRateCombinerOpKHR {
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR = 0,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR = 1,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR = 2,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR = 3,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR = 4,
} VkFragmentShadingRateCombinerOpKHR;
```

- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = A_{xy}$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR` specifies a combiner operation of $\...
\[ \text{combine}(A_{xy}, B_{xy}) = B_{xy}. \]

- \text{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR} specifies a combiner operation of \[ \text{combine}(A_{xy}, B_{xy}) = \min(A_{xy}, B_{xy}). \]
- \text{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR} specifies a combiner operation of \[ \text{combine}(A_{xy}, B_{xy}) = \max(A_{xy}, B_{xy}). \]
- \text{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR} specifies a combiner operation of \[ \text{combine}(A_{xy}, B_{xy}) = A_{xy} \times B_{xy}. \]

where \( \text{combine}(A_{xy}, B_{xy}) \) is the combine operation, and \( A_{xy} \) and \( B_{xy} \) are the inputs to the operation.

If the \text{fragmentShadingRateStrictMultiplyCombiner} is \text{VK_FALSE}, using \text{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR} with values of 1 for both A and B in the same dimension results in the value 2 being produced for that dimension. See the definition of \text{fragmentShadingRateStrictMultiplyCombiner} for more information.

These operations are performed in a component-wise fashion.

This is used to generate a combined fragment area using the equation:

\[ C_{xy} = \text{combine}(A_{xy}, B_{xy}) \]

where \( C_{xy} \) is the combined fragment area result, and \( A_{xy} \) and \( B_{xy} \) are the fragment areas of the fragment shading rates being combined.

Two combine operations are performed, first with \( A_{xy} \) equal to the pipeline fragment shading rate and \( B_{xy} \) equal to the primitive fragment shading rate, with the combine() operation selected by combinerOps[0]. A second combination is then performed, with \( A_{xy} \) equal to the result of the first combination and \( B_{xy} \) equal to the attachment fragment shading rate, with the combine() operation selected by combinerOps[1]. The result of the second combination is used as the final fragment shading rate, reported via the \text{ShadingRateKHR built-in}.

Implementations \textbf{should} clamp the inputs to the combiner operations \( A_{xy} \) and \( B_{xy} \), and \textbf{must} do so if \text{VkPhysicalDeviceMaintenance6PropertiesKHR::fragmentShadingRateClampCombinerInputs} is set to \text{VK_TRUE}. All implementations \textbf{must} clamp the result of the second combiner operation.

A fragment shading rate \( R_{xy} \) representing any of \( A_{xy}, B_{xy} \) or \( C_{xy} \) is clamped as follows. If \( R_{xy} \) is one of the rates returned by \text{vkGetPhysicalDeviceFragmentShadingRatesKHR} for the sample count and render pass transform used by rasterization, the clamped shading rate \( R_{xy}' \) is \( R_{xy} \). Otherwise, the clamped shading rate is selected from the rates returned by \text{vkGetPhysicalDeviceFragmentShadingRatesKHR} for the sample count and render pass transform used by rasterization. From this list of supported rates, the following steps are applied in order, to select a single value:

1. Keep only rates where \( R_x' \leq R_x \) and \( R_y' \leq R_y \).
   - Implementations \textbf{may} also keep rates where \( R_x' \leq R_y \) and \( R_y' \leq R_x \).
2. Keep only rates with the highest area (\( R_x' \times R_y' \)).
3. Keep only rates with the lowest aspect ratio \((R_x' + R_y')\).

4. In cases where a wide (e.g. 4x1) and tall (e.g. 1x4) rate remain, the implementation may choose either rate. However, it must choose this rate consistently for the same shading rates, render pass transform, and combiner operations for the lifetime of the VkDevice.

28.6.5. Extended Fragment Shading Rates

The features advertised by VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV provide support for additional fragment shading rates beyond those specifying one fragment shader invocation covering all pixels in a fragment whose size is indicated by the fragment shading rate.

If the fragmentShadingRateEnums feature is enabled, fragment shading rates may be specified using the VkFragmentShadingRateNV enumerated type defined as:

```c
typedef enum VkFragmentShadingRateNV {
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV = 0,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_1X2_PIXELS_NV = 1,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X1_PIXELS_NV = 4,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X2_PIXELS_NV = 5,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X4_PIXELS_NV = 6,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X2_PIXELS_NV = 9,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X4_PIXELS_NV = 10,
    VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV = 11,
    VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV = 12,
    VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV = 13,
    VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV = 14,
    VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV = 15,
} VkFragmentShadingRateNV;
```

- **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV** specifies a fragment size of 1x1 pixels.
- **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_1X2_PIXELS_NV** specifies a fragment size of 1x2 pixels.
- **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X1_PIXELS_NV** specifies a fragment size of 2x1 pixels.
- **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X2_PIXELS_NV** specifies a fragment size of 2x2 pixels.
- **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X4_PIXELS_NV** specifies a fragment size of 2x4 pixels.
- **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X2_PIXELS_NV** specifies a fragment size of 4x2 pixels.
- **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X4_PIXELS_NV** specifies a fragment size of 4x4 pixels.
- **VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV** specifies a fragment size of 1x1 pixels, with two fragment shader invocations per fragment.
• **VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV** specifies a fragment size of 1x1 pixels, with four fragment shader invocations per fragment.

• **VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV** specifies a fragment size of 1x1 pixels, with eight fragment shader invocations per fragment.

• **VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV** specifies a fragment size of 1x1 pixels, with sixteen fragment shader invocations per fragment.

• **VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV** specifies that any portions of a primitive that use that shading rate should be discarded without invoking any fragment shader.

To use the shading rates **VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV**, **VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV**, and **VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV** as a pipeline, primitive, or attachment shading rate, the **supersampleFragmentShadingRates** feature must be enabled. To use the shading rate **VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV** as a pipeline, primitive, or attachment shading rate, the **noInvocationFragmentShadingRates** feature must be enabled.

When using fragment shading rate enums, the pipeline fragment shading rate can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via **vkCmdSetFragmentShadingRateEnumNV**.

The **VkPipelineFragmentShadingRateEnumStateCreateInfoNV** structure is defined as:

```c
// Provided by VK_NV_fragment_shading_rate Enums
typedef struct VkPipelineFragmentShadingRateEnumStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkFragmentShadingRateTypeNV shadingRateType;
    VkFragmentShadingRateNV shadingRate;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateEnumStateCreateInfoNV;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **shadingRateType** specifies a **VkFragmentShadingRateTypeNV** value indicating whether fragment shading rates are specified using fragment sizes or **VkFragmentShadingRateNV** enums.
- **shadingRate** specifies a **VkFragmentShadingRateNV** value indicating the pipeline fragment shading rate.
- **combinerOps** specifies **VkFragmentShadingRateCombinerOpKHR** values determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the **pNext** chain of **VkGraphicsPipelineCreateInfo** includes a **VkPipelineFragmentShadingRateEnumStateCreateInfoNV** structure, then that structure includes parameters controlling the pipeline fragment shading rate.
If this structure is not present, `shadingRateType` is considered to be equal to `VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV`, `shadingRate` is considered to be equal to `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV`, and both elements of `combinerOps` are considered to be equal to `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

### Valid Usage (Implicit)

- VUID-VkPipelineFragmentShadingRateEnumStateCreateInfoNV-sType-sType

  ```
  must be
  VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_ENUM_STATE_CREATE_INFO_NV
  ```

The `VkFragmentShadingRateTypeNV` enumerated type specifies whether a graphics pipeline gets its pipeline fragment shading rates and combiners from the `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` structure or the `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure.

```c
// Provided by VK_NV_fragment_shading_rateEnums
typedef enum VkFragmentShadingRateTypeNV {
    VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV = 0,
    VK_FRAGMENT_SHADING_RATE_TYPE_ENUMS_NV = 1,
} VkFragmentShadingRateTypeNV;
```

- `VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV` specifies that a graphics pipeline should obtain its pipeline fragment shading rate and shading rate combiner state from the `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure and that any state specified by the `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` structure should be ignored.

- `VK_FRAGMENT_SHADING_RATE_TYPE_ENUMS_NV` specifies that a graphics pipeline should obtain its pipeline fragment shading rate and shading rate combiner state from the `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` structure and that any state specified by the `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure should be ignored.

To dynamically set the pipeline fragment shading rate and combiner operation, call:

```c
// Provided by VK_NV_fragment_shading_rateEnums
void vkCmdSetFragmentShadingRateEnumNV(
    VkCommandBuffer commandBuffer,
    VkFragmentShadingRateNV shadingRate,
    const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `shadingRate` specifies a `VkFragmentShadingRateNV` enum indicating the pipeline fragment shading rate for subsequent drawing commands.
- `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by subsequent drawing commands.
This command sets the pipeline fragment shading rate and combiner operation for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` values used to create the currently active pipeline.

**Note**

This command allows specifying additional shading rates beyond those supported by `vkCmdSetFragmentShadingRateKHR`. For more information, refer to the `VK_NV_fragment_shading_rate Enums` appendix.

### Valid Usage

- **VUID-vkCmdSetFragmentShadingRateEnumNV-pipelineFragmentShadingRate-04576**
  If `pipelineFragmentShadingRate` is not enabled, `shadingRate` must be `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV`

- **VUID-vkCmdSetFragmentShadingRateEnumNV-supersampleFragmentShadingRates-04577**
  If `supersampleFragmentShadingRates` is not enabled, `shadingRate` must not be `VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV`, `VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV`, `VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV`, or `VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV`

- **VUID-vkCmdSetFragmentShadingRateEnumNV-noInvocationFragmentShadingRates-04578**
  If `noInvocationFragmentShadingRates` is not enabled, `shadingRate` must not be `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`

- **VUID-vkCmdSetFragmentShadingRateEnumNV-fragmentShadingRateEnums-04579**
  The `fragmentShadingRateEnums` feature must be enabled

- **VUID-vkCmdSetFragmentShadingRateEnumNV-pipelineFragmentShadingRate-04580**
  One of the `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or `attachmentFragmentShadingRate` features must be enabled

- **VUID-vkCmdSetFragmentShadingRateEnumNV-primitiveFragmentShadingRate-04581**
  If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- **VUID-vkCmdSetFragmentShadingRateEnumNV-attachmentFragmentShadingRate-04582**
  If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- **VUID-vkCmdSetFragmentShadingRateEnumNV-fragmentSizeNonTrivialCombinerOps-04583**
  If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps` must be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`
Valid Usage (Implicit)

- VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetFragmentShadingRateEnumNV-shadingRate-parameter
  shadingRate must be a valid VkFragmentShadingRateNV value
- VUID-vkCmdSetFragmentShadingRateEnumNV-combinerOps-parameter
  Each element of combinerOps must be a valid VkFragmentShadingRateCombinerOpKHR value
- VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetFragmentShadingRateEnumNV-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

When the supersampleFragmentShadingRates or noInvocationFragmentShadingRates features are enabled, the behavior of the shading rate combiner operations is extended to support the shading rates enabled by those features. Primitive and attachment shading rate values are interpreted as VkFragmentShadingRateNV values and the behavior of the combiners is modified as follows:

- For VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR, VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR, and VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR, if either A_xy or B_xy is VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV, combine(A_xy,B_xy) produces a shading rate of VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV, regardless of the other input shading rate.
- For VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR, combine(A_xy,B_xy) produces a shading rate
whose fragment size is the smaller of the fragment sizes of $A_{xy}$ and $B_{xy}$ and whose invocation count is the larger of the invocation counts of $A_{xy}$ and $B_{xy}$.

- For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR`, combine($A_{xy}, B_{xy}$) produces a shading rate whose fragment size is the larger of the fragment sizes of $A_{xy}$ and $B_{xy}$ and whose invocation count is the smaller of the invocation counts of $A_{xy}$ and $B_{xy}$.

- For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR`, combine($A_{xy}, B_{xy}$) produces a shading rate whose fragment size and invocation count is the product of the fragment sizes and invocation counts, respectively, of $A_{xy}$ and $B_{xy}$. If the resulting shading rate has both multiple pixels and multiple invocations per fragment, an implementation may adjust the shading rate by reducing both the pixel and invocation counts.

If the final shading rate from the combiners is `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`, no fragments will be generated for any portion of a primitive using that shading rate.

If the final shading rate from the combiners specifies multiple fragment shader invocations per fragment, the fragment will be processed with multiple unique samples as in sample shading, where the total number the total number of invocations is taken from the shading rate and then clamped to `rasterizationSamples` and `maxFragmentShadingRateInvocationCount`.

### 28.7. Shading Rate Image

The `shadingRateImage` feature allows pipelines to use a shading rate image to control the fragment area and the minimum number of fragment shader invocations launched for each fragment. When the shading rate image is enabled, the rasterizer determines a base shading rate for each region of the framebuffer covered by a primitive by fetching a value from the shading rate image and translating it to a shading rate using a per-viewport shading rate palette. This base shading rate is then adjusted to derive a final shading rate. The final shading rate specifies the fragment area and fragment shader invocation count to use for fragments generated in the region.

If the `pNext` chain of `VkPipelineViewportStateCreateInfo` includes a `VkPipelineViewportShadingRateImageStateCreateInfoNV` structure, then that structure includes parameters controlling the shading rate.

The `VkPipelineViewportShadingRateImageStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkPipelineViewportShadingRateImageStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 shadingRateImageEnable;
    uint32_t viewportCount;
    const VkShadingRatePaletteNV* pShadingRatePalettes;
} VkPipelineViewportShadingRateImageStateCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• **shadingRateImageEnable** specifies whether shading rate image and palettes are used during rasterization.

• **viewportCount** specifies the number of per-viewport palettes used to translate values stored in shading rate images.

• **pShadingRatePalettes** is a pointer to an array of **VkShadingRatePaletteNV** structures defining the palette for each viewport. If the shading rate palette state is dynamic, this member is ignored.

If this structure is not present, **shadingRateImageEnable** is considered to be **VK_FALSE**, and the shading rate image and palettes are not used.

### Valid Usage

- **VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-viewportCount-02054**
  If the **multiViewport** feature is not enabled, **viewportCount** must be 0 or 1

- **VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-viewportCount-02055**
  **viewportCount** must be less than or equal to **VkPhysicalDeviceLimits::maxViewports**

- **VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-shadingRateImageEnable-02056**
  If **shadingRateImageEnable** is **VK_TRUE**, **viewportCount** must be greater or equal to the **viewportCount** member of **VkPipelineViewportStateCreateInfo**

### Valid Usage (Implicit)

- **VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-sType-sType**
  **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_SHADING_RATE_IMAGE_STATE_CREATE_INFO_NV**

When shading rate image usage is enabled in the bound pipeline, the pipeline uses a shading rate image specified by the command:

```c
// Provided by VK_NV_shading_rate_image
void vkCmdBindShadingRateImageNV(
    VkCommandBuffer commandBuffer,
    VkImageView imageView,
    VkImageLayout imageLayout);
```

- **commandBuffer** is the command buffer into which the command will be recorded.

- **imageView** is an image view handle specifying the shading rate image. **imageView may** be set to **VK_NULL_HANDLE**, which is equivalent to specifying a view of an image filled with zero values.

- **imageLayout** is the layout that the image subresources accessible from **imageView** will be in when the shading rate image is accessed.
Valid Usage

- VUID-vkCmdBindShadingRateImageNV-None-02058
  The `shadingRateImage` feature must be enabled

- VUID-vkCmdBindShadingRateImageNV-imageView-02059
  If `imageView` is not `VK_NULL_HANDLE`, it must be a valid `VkImageView` handle of type `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`

- VUID-vkCmdBindShadingRateImageNV-imageView-02060
  If `imageView` is not `VK_NULL_HANDLE`, it must be a valid `VkImageView` handle of type `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`

- VUID-vkCmdBindShadingRateImageNV-imageView-02061
  If `imageView` is not `VK_NULL_HANDLE`, it must have a format of `VK_FORMAT_R8_UINT`

- VUID-vkCmdBindShadingRateImageNV-imageView-02062
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must match the actual `VkImageLayout` of each subresource accessible from `imageView` at the time the subresource is accessed

- VUID-vkCmdBindShadingRateImageNV-imageView-02063
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must be `VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV` or `VK_IMAGE_LAYOUT_GENERAL`

Valid Usage (Implicit)

- VUID-vkCmdBindShadingRateImageNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindShadingRateImageNV-imageView-parameter
  If `imageView` is not `VK_NULL_HANDLE`, `imageView` must be a valid `VkImageView` handle

- VUID-vkCmdBindShadingRateImageNV-imageLayout-parameter
  `imageLayout` must be a valid `VkImageLayout` value

- VUID-vkCmdBindShadingRateImageNV-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdBindShadingRateImageNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdBindShadingRateImageNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBindShadingRateImageNV-commonparent
  Both of `commandBuffer`, and `imageView` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When the shading rate image is enabled in the current pipeline, rasterizing a primitive covering the pixel with coordinates \((x, y)\) will fetch a shading rate index value from the shading rate image bound by `vkCmdBindShadingRateImageNV`. If the shading rate image view has a type of `VK_IMAGE_VIEW_TYPE_2D`, the lookup will use texel coordinates \((u, v)\) where \(u = \lfloor \frac{x}{\text{twidth}} \rfloor\), \(v = \lfloor \frac{y}{\text{theight}} \rfloor\), and `twidth` and `theight` are the width and height of the implementation-dependent shading rate texel size. If the shading rate image view has a type of `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, the lookup will use texel coordinates \((u, v)\) to extract a texel from the layer \(l\), where \(l\) is the layer of the framebuffer being rendered to. If \(l\) is greater than or equal to the number of layers in the image view, layer zero will be used.

If the bound shading rate image view is not `VK_NULL_HANDLE` and contains a texel with coordinates \((u, v)\) in layer \(l\) (if applicable), the single unsigned integer component for that texel will be used as the shading rate index. If the \((u, v)\) coordinate is outside the extents of the subresource used by the shading rate image view, or if the image view is `VK_NULL_HANDLE`, the shading rate index is zero. If the shading rate image view has multiple mipmap levels, the base level identified by `VkImageSubresourceRange::baseMipLevel` will be used.

A shading rate index is mapped to a base shading rate using a lookup table called the shading rate image palette. There is a separate palette for each viewport. The number of entries in each palette is given by the implementation-dependent shading rate image palette size.

To dynamically set the `shadingRateImageEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_shading_rate_image,
// VK_EXT_shader_object with VK_NV_shading_rate_image
void vkCmdSetShadingRateImageEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 shadingRateImageEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `shadingRateImageEnable` specifies the `shadingRateImageEnable` state.

This command sets the `shadingRateImageEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo`. 2724
Otherwise, this state is specified by the `VkPipelineViewportShadingRateImageStateCreateInfoNV::shadingRateImageEnable` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetShadingRateImageEnableNV-None-09423**
  At least one of the following **must** be true:
  - The `extendedDynamicState3ShadingRateImageEnable` feature is enabled
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetShadingRateImageEnableNV-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetShadingRateImageEnableNV-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state
- **VUID-vkCmdSetShadingRateImageEnableNV-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- **VUID-vkCmdSetShadingRateImageEnableNV-videocoding**
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

To **dynamically set** the per-viewport shading rate image palettes, call:
// Provided by VK_NV_shading_rate_image

void vkCmdSetViewportShadingRatePaletteNV(
    VkCommandBuffer commandBuffer,
    uint32_t firstViewport,
    uint32_t viewportCount,
    const VkShadingRatePaletteNV* pShadingRatePalettes);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstViewport` is the index of the first viewport whose shading rate palette is updated by the command.
- `viewportCount` is the number of viewports whose shading rate palettes are updated by the command.
- `pShadingRatePalettes` is a pointer to an array of `VkShadingRatePaletteNV` structures defining the palette for each viewport.

This command sets the per-viewport shading rate image palettes for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` set in `VkPipelineDynamicStateCreateInfo`::pDynamicStates. Otherwise, this state is specified by the `VkPipelineViewportShadingRateImageStateCreateInfoNV`::pShadingRatePalettes values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetViewportShadingRatePaletteNV-None-02064
  The shadingRateImage feature must be enabled

- VUID-vkCmdSetViewportShadingRatePaletteNV-firstViewport-02067
  The sum of `firstViewport` and `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- VUID-vkCmdSetViewportShadingRatePaletteNV-firstViewport-02068
  If the multiViewport feature is not enabled, `firstViewport` must be 0

- VUID-vkCmdSetViewportShadingRatePaletteNV-viewportCount-02069
  If the multiViewport feature is not enabled, `viewportCount` must be 1

### Valid Usage (Implicit)

- VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetViewportShadingRatePaletteNV-pShadingRatePalettes-parameter
  `pShadingRatePalettes` must be a valid pointer to an array of `viewportCount` valid `VkShadingRatePaletteNV` structures

- VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-recording
  `commandBuffer` must be in the recording state
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

This command must only be called outside of a video coding scope.

`viewportCount` must be greater than 0.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

</table>

The `VkShadingRatePaletteNV` structure specifies the contents of a single shading rate image palette and is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkShadingRatePaletteNV {
  uint32_t shadingRatePaletteEntryCount;
  const VkShadingRatePaletteEntryNV* pShadingRatePaletteEntries;
} VkShadingRatePaletteNV;
```

- `shadingRatePaletteEntryCount` specifies the number of entries in the shading rate image palette.
- `pShadingRatePaletteEntries` is a pointer to an array of `VkShadingRatePaletteEntryNV` enums defining the shading rate for each palette entry.

### Valid Usage

- VUID-VkShadingRatePaletteNV-shadingRatePaletteEntryCount-02071
  `shadingRatePaletteEntryCount` must be between 1 and `VkPhysicalDeviceShadingRateImagePropertiesNV::shadingRatePaletteSize`, inclusive.
Valid Usage (Implicit)

- VUID-VkShadingRatePaletteNV-pShadingRatePaletteEntries-parameter
  \n  pShadingRatePaletteEntries must be a valid pointer to an array of
  shadingRatePaletteEntryCount valid VkShadingRatePaletteEntryNV values

- VUID-VkShadingRatePaletteNV-shadingRatePaletteEntryCount-arraylength
  shadingRatePaletteEntryCount must be greater than 0

To determine the base shading rate image, a shading rate index \( i \) is mapped to array element \( i \) in
the array pShadingRatePaletteEntries for the palette corresponding to the viewport used for the
fragment. If \( i \) is greater than or equal to the palette size shadingRatePaletteEntryCount, the base
shading rate is undefined.

The supported shading rate image palette entries are defined by VkShadingRatePaletteEntryNV:

```c
// Provided by VK_NV_shading_rate_image
typedef enum VkShadingRatePaletteEntryNV {
    VK_SHADING_RATE_PALETTE_ENTRY_NO_INVOCATIONS_NV = 0,
    VK_SHADING_RATE_PALETTE_ENTRY_16_INVOCATIONS_PER_PIXEL_NV = 1,
    VK_SHADING_RATE_PALETTE_ENTRY_8_INVOCATIONS_PER_PIXEL_NV = 2,
    VK_SHADING_RATE_PALETTE_ENTRY_4_INVOCATIONS_PER_PIXEL_NV = 3,
    VK_SHADING_RATE_PALETTE_ENTRY_2_INVOCATIONS_PER_PIXEL_NV = 4,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_PIXEL_NV = 5,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X1_PIXELS_NV = 6,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_1X2_PIXELS_NV = 7,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X2_PIXELS_NV = 8,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_4X2_PIXELS_NV = 9,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X4_PIXELS_NV = 10,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_4X4_PIXELS_NV = 11,
} VkShadingRatePaletteEntryNV;
```

The following table indicates the width and height (in pixels) of each fragment generated using the
indicated shading rate, as well as the maximum number of fragment shader invocations launched
for each fragment. When processing regions of a primitive that have a shading rate of
VK_SHADING_RATE_PALETTE_ENTRY_NO_INVOCATIONS_NV, no fragments will be generated in that region.

</tbody>
</table>

When the shading rate image is disabled, a shading rate of `VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_PIXEL_NV` will be used as the base shading rate.

Once a base shading rate has been established, it is adjusted to produce a final shading rate. First, if the base shading rate uses multiple pixels for each fragment, the implementation may reduce the fragment area to ensure that the total number of coverage samples for all pixels in a fragment does not exceed an implementation-dependent maximum.

If sample shading is active in the current pipeline and would result in processing \( n \) \((n > 1)\) unique samples per fragment when the shading rate image is disabled, the shading rate is adjusted in an implementation-dependent manner to increase the number of fragment shader invocations spawned by the primitive. If the shading rate indicates \( fs \) pixels per fragment and \( fs \) is greater than \( n \), the fragment area is adjusted so each fragment has approximately \( fs^n \) pixels. Otherwise, if the shading rate indicates \( ipf \) invocations per fragment, the fragment area will be adjusted to a single pixel with approximately \( ipf \times \frac{fs}{2} \) invocations per fragment.

If sample shading occurs due to the use of a fragment shader input variable decorated with `SampleId` or `SamplePosition`, the shading rate is ignored. Each fragment will have a single pixel and will spawn up to `rasterizationSamples` fragment shader invocations, as when using sample shading without a shading rate image.
Finally, if the shading rate specifies multiple fragment shader invocations per fragment, the total number of invocations in the shading rate is clamped to be no larger than \( \text{rasterizationSamples} \).

When the final shading rate for a primitive covering pixel \((x,y)\) has a fragment area of \( \text{fw} \times \text{fh} \), the fragment for that pixel will cover all pixels with coordinates \((x',y')\) that satisfy the equations:

\[
\left\lfloor \frac{x}{\text{fw}} \right\rfloor = \left\lfloor \frac{x'}{\text{fw}} \right\rfloor \\
\left\lfloor \frac{y}{\text{fh}} \right\rfloor = \left\lfloor \frac{y'}{\text{fh}} \right\rfloor
\]

This combined fragment is considered to have multiple coverage samples; the total number of samples in this fragment is given by \( \text{samples} = \text{fw} \times \text{fh} \times \text{rs} \) where \( \text{rs} \) indicates the value of \( \text{ VkPipelineMultisampleStateCreateInfo::rasterizationSamples } \) specified at pipeline creation time. The set of coverage samples in the fragment is the union of the per-pixel coverage samples in each of the fragment's pixels. The location and order of coverage samples within each pixel in the combined fragment are assigned as described in \text{Multisampling} and \text{Custom Sample Locations}. Each coverage sample in the set of pixels belonging to the combined fragment is assigned a unique coverage index in the range \([0, \text{samples}-1]\). If the \text{shadingRateCoarseSampleOrder} feature is supported, the order of coverage samples can be specified for each combination of fragment area and coverage sample count. If this feature is not supported, the sample order is implementation-dependent.

If the \text{pNext} chain of \text{VkPipelineViewportStateCreateInfo} includes a \text{VkPipelineViewportCoarseSampleOrderStateCreateInfoNV} structure, then that structure includes parameters controlling the order of coverage samples in fragments larger than one pixel.

The \text{VkPipelineViewportCoarseSampleOrderStateCreateInfoNV} structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkPipelineViewportCoarseSampleOrderStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkCoarseSampleOrderTypeNV sampleOrderType;
    uint32_t customSampleOrderCount;
    const VkCoarseSampleOrderCustomNV* pCustomSampleOrders;
} VkPipelineViewportCoarseSampleOrderStateCreateInfoNV;
```

- \text{sType} is a \text{VkStructureType} value identifying this structure.
- \text{pNext} is NULL or a pointer to a structure extending this structure.
- \text{sampleOrderType} specifies the mechanism used to order coverage samples in fragments larger than one pixel.
- \text{customSampleOrderCount} specifies the number of custom sample orderings to use when ordering coverage samples.
- \text{pCustomSampleOrders} is a pointer to an array of \text{customSampleOrderCount} \text{VkCoarseSampleOrderCustomNV} structures, each structure specifying the coverage sample
order for a single combination of fragment area and coverage sample count.

If this structure is not present, \texttt{sampleOrderType} is considered to be \texttt{VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV}.

If \texttt{sampleOrderType} is \texttt{VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV}, the coverage sample order used for any combination of fragment area and coverage sample count not enumerated in \texttt{pCustomSampleOrders} will be identical to that used for \texttt{VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV}.

If the pipeline was created with \texttt{VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV}, the contents of this structure (if present) are ignored, and the coverage sample order is instead specified by \texttt{vkCmdSetCoarseSampleOrderNV}.

\begin{table}[h]
\centering
\begin{tabular}{|l|}
\hline
\textbf{Valid Usage} \\
\hline
- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sampleOrderType-02072 \\
  If \texttt{sampleOrderType} is not \texttt{VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV}, \texttt{customSamplerOrderCount} must be 0 \\
- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-pCustomSampleOrders-02234 \\
  The array \texttt{pCustomSampleOrders} must not contain two structures with matching values for both the \texttt{shadingRate} and \texttt{sampleCount} members \\
\hline
\end{tabular}
\end{table}

\begin{table}[h]
\centering
\begin{tabular}{|l|}
\hline
\textbf{Valid Usage (Implicit)} \\
\hline
- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sType-sType must be \texttt{VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_COARSE_SAMPLE_ORDER_STATE_CREATE_INFO_NV} \\
- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sampleOrderType-parameter \texttt{sampleOrderType} must be a valid \texttt{VkCoarseSampleOrderTypeNV} value \\
- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-pCustomSampleOrders-parameter If \texttt{customSampleOrderCount} is not 0, \texttt{pCustomSampleOrders} must be a valid pointer to an array of \texttt{customSampleOrderCount} valid \texttt{VkCoarseSampleOrderCustomNV} structures \\
\hline
\end{tabular}
\end{table}

The type \texttt{VkCoarseSampleOrderTypeNV} specifies the technique used to order coverage samples in fragments larger than one pixel, and is defined as:
typedef enum VkCoarseSampleOrderTypeNV {
    VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV = 0,
    VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV = 1,
    VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV = 2,
    VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV = 3,
} VkCoarseSampleOrderTypeNV;

- **VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV** specifies that coverage samples will be ordered in an implementation-dependent manner.
- **VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV** specifies that coverage samples will be ordered according to the array of custom orderings provided in either the pCustomSampleOrders member of VkPipelineViewportCoarseSampleOrderStateCreateInfoNV or the pCustomSampleOrders member of vkCmdSetCoarseSampleOrderNV.
- **VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV** specifies that coverage samples will be ordered sequentially, sorted first by pixel coordinate (in row-major order) and then by sample index.
- **VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV** specifies that coverage samples will be ordered sequentially, sorted first by sample index and then by pixel coordinate (in row-major order).

When using a coarse sample order of **VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV** for a fragment with an upper-left corner of \((f_x, f_y)\) with a width of \(f_w \times f_h\) and \(f_{sc}\) samples per pixel, coverage index \(cs\) of the fragment will be assigned to sample index \(fs\) of pixel \((px, py)\) as follows:

\[
px = f_x + \lfloor\frac{cs}{f_{sc}}\rfloor f_w \\
py = f_y + \lfloor\frac{s}{f_{sc} \times f_w}\rfloor \\
fs = cs \% f_{sc}
\]

When using a coarse sample order of **VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV**, coverage index \(cs\) will be assigned as follows:

\[
px = f_x + cs \% f_w \\
py = (f_y + \lfloor\frac{s}{f_w}\rfloor \% f_h) \\
fs = \lfloor\frac{s}{f_w \times f_h}\rfloor
\]

The VkCoarseSampleOrderCustomNV structure is defined as:
typedef struct VkCoarseSampleOrderCustomNV {
    VkShadingRatePaletteEntryNV shadingRate;
    uint32_t sampleCount;
    uint32_t sampleLocationCount;
    const VkCoarseSampleLocationNV* pSampleLocations;
} VkCoarseSampleOrderCustomNV;

• shadingRate is a shading rate palette entry that identifies the fragment width and height for the combination of fragment area and per-pixel coverage sample count to control.

• sampleCount identifies the per-pixel coverage sample count for the combination of fragment area and coverage sample count to control.

• sampleLocationCount specifies the number of sample locations in the custom ordering.

• pSampleLocations is a pointer to an array of VkCoarseSampleLocationNV structures specifying the location of each sample in the custom ordering.

TheVkCoarseSampleOrderCustomNVstructure is used with a coverage sample ordering type ofVK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NVto specify the order of coverage samples for one combination of fragment width, fragment height, and coverage sample count.

When using a custom sample ordering, element j in pSampleLocations specifies a specific pixel location and sample index that corresponds to coverage index j in the multi-pixel fragment.

Valid Usage

• VUID-VkCoarseSampleOrderCustomNV-shadingRate-02073 shadingRate must be a shading rate that generates fragments with more than one pixel

• VUID-VkCoarseSampleOrderCustomNV-sampleCount-02074 sampleCount must correspond to a sample count enumerated in VkSampleCountFlags whose corresponding bit is set in VkPhysicalDeviceLimits::framebufferNoAttachmentsSampleCounts

• VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-02075 sampleLocationCount must be equal to the product of sampleCount, the fragment width for shadingRate, and the fragment height for shadingRate

• VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-02076 sampleLocationCount must be less than or equal to the value of VkPhysicalDeviceShadingRateImagePropertiesNV::shadingRateMaxCoarseSamples

• VUID-VkCoarseSampleOrderCustomNV-pSampleLocations-02077 The array pSampleLocations must contain exactly one entry for every combination of valid values for pixelX, pixelY, and sample in the structure VkCoarseSampleOrderCustomNV
Valid Usage (Implicit)

- VUID-VkCoarseSampleOrderCustomNV-shadingRate-parameter
  shadingRate must be a valid VkShadingRatePaletteEntryNV value

- VUID-VkCoarseSampleOrderCustomNV-pSampleLocations-parameter
  pSampleLocations must be a valid pointer to an array of sampleLocationCount
  VkCoarseSampleLocationNV structures

- VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-arraylength
  sampleLocationCount must be greater than 0

The VkCoarseSampleLocationNV structure identifies a specific pixel and sample index for one of the coverage samples in a fragment that is larger than one pixel. This structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkCoarseSampleLocationNV {
    uint32_t pixelX;
    uint32_t pixelY;
    uint32_t sample;
} VkCoarseSampleLocationNV;
```

- pixelX is added to the x coordinate of the upper-leftmost pixel of each fragment to identify the pixel containing the coverage sample.
- pixelY is added to the y coordinate of the upper-leftmost pixel of each fragment to identify the pixel containing the coverage sample.
- sample is the number of the coverage sample in the pixel identified by pixelX and pixelY.

Valid Usage

- VUID-VkCoarseSampleLocationNV-pixelX-02078
  pixelX must be less than the width (in pixels) of the fragment

- VUID-VkCoarseSampleLocationNV-pixelY-02079
  pixelY must be less than the height (in pixels) of the fragment

- VUID-VkCoarseSampleLocationNV-sample-02080
  sample must be less than the number of coverage samples in each pixel belonging to the fragment

To dynamically set the order of coverage samples in fragments larger than one pixel, call:
void vkCmdSetCoarseSampleOrderNV(
    VkCommandBuffer commandBuffer,
    VkCoarseSampleOrderTypeNV sampleOrderType,
    uint32_t customSampleOrderCount,
    const VkCoarseSampleOrderCustomNV* pCustomSampleOrders);

• commandBuffer is the command buffer into which the command will be recorded.

• sampleOrderType specifies the mechanism used to order coverage samples in fragments larger than one pixel.

• customSampleOrderCount specifies the number of custom sample orderings to use when ordering coverage samples.

• pCustomSampleOrders is a pointer to an array of VkCoarseSampleOrderCustomNV structures, each structure specifying the coverage sample order for a single combination of fragment area and coverage sample count.

If sampleOrderType is VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV, the coverage sample order used for any combination of fragment area and coverage sample count not enumerated in pCustomSampleOrders will be identical to that used for VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV.

This command sets the order of coverage samples for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineViewportCoarseSampleOrderStateCreateInfoNV values used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetCoarseSampleOrderNV-sampleOrderType-02081
  If sampleOrderType is not VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV, customSamplerOrderCount must be 0

• VUID-vkCmdSetCoarseSampleOrderNV-pCustomSampleOrders-02235
  The array pCustomSampleOrders must not contain two structures with matching values for both the shadingRate and sampleCount members

Valid Usage (Implicit)

• VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetCoarseSampleOrderNV-sampleOrderType-parameter
  sampleOrderType must be a valid VkCoarseSampleOrderTypeNV value

• VUID-vkCmdSetCoarseSampleOrderNV-pCustomSampleOrders-parameter
  If customSampleOrderCount is not 0, pCustomSampleOrders must be a valid pointer to an array
of `customSampleOrderCount` valid `VkCoarseSampleOrderCustomNV` structures

- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetCoarseSampleOrderNV-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

If the final shading rate for a primitive covering pixel \((x,y)\) results in \(n\) invocations per pixel \((n > 1)\), \(n\) separate fragment shader invocations will be generated for the fragment. Each coverage sample in the fragment will be assigned to one of the \(n\) fragment shader invocations in an implementation-dependent manner. The outputs from the fragment output interface of each shader invocation will be broadcast to all of the framebuffer samples associated with the invocation. If none of the coverage samples associated with a fragment shader invocation is covered by a primitive, the implementation may discard the fragment shader invocation for those samples.

If the final shading rate for a primitive covering pixel \((x,y)\) results in a fragment containing multiple pixels, a single set of fragment shader invocations will be generated for all pixels in the combined fragment. Outputs from the fragment output interface will be broadcast to all covered framebuffer samples belonging to the fragment. If the fragment shader executes code discarding the fragment, none of the samples of the fragment will be updated.

### 28.8. Sample Shading

Sample shading can be used to specify a minimum number of unique samples to process for each fragment. If sample shading is enabled, an implementation must invoke the fragment shader at least \(\max(\lceil \text{VkPipelineMultisampleStateCreateInfo}::\text{minSampleShading} \times \text{VkPipelineMultisampleStateCreateInfo}::\text{rasterizationSamples} \rceil, 1)\) times per fragment. If `VkPipelineMultisampleStateCreateInfo::sampleShadingEnable` is set to `VK_TRUE`, sample shading is
enabled.

If a fragment shader entry point statically uses an input variable decorated with a BuiltIn of SampleId or SamplePosition, sample shading is enabled and a value of 1.0 is used instead of minSampleShading. If a fragment shader entry point statically uses an input variable decorated with Sample, sample shading may be enabled and a value of 1.0 will be used instead of minSampleShading if it is. If the VK_AMD_mixed_attachment_samples extension is enabled and the subpass uses color attachments, the samples value used to create each color attachment is used instead of rasterizationSamples.

Note

If a shader decorates an input variable with Sample and that value meaningfully impacts the output of a shader, sample shading will be enabled to ensure that the input is in fact interpolated per-sample. This is inherent to the specification and not spelled out here - if an application simply declares such a variable it is implementation-defined whether sample shading is enabled or not. It is possible to see the effects of this by using atomics in the shader or using a pipeline statistics query to query the number of fragment invocations, even if the shader itself does not use any per-sample variables.

If there are fewer fragment invocations than covered samples, implementations may include those samples in fragment shader invocations in any manner as long as covered samples are all shaded at least once, and each invocation that is not a helper invocation covers at least one sample.

28.9. Barycentric Interpolation

When the fragmentShaderBarycentric feature is enabled, the PerVertexKHR interpolation decoration can be used with fragment shader inputs to indicate that the decorated inputs do not have associated data in the fragment. Such inputs can only be accessed in a fragment shader using an array index whose value (0, 1, or 2) identifies one of the vertices of the primitive that produced the fragment. Reads of per-vertex values for missing vertices, such as the third vertex of a line primitive, will return values from the valid vertex with the highest index. This means that the per-vertex values of indices 1 and 2 for point primitives will be equal to those of index 0, and the per-vertex values of index 2 for line primitives will be equal to those of index 1.

When tessellation, geometry shading, and mesh shading are not active, fragment shader inputs decorated with PerVertexKHR will take values from one of the vertices of the primitive that produced the fragment, identified by the extra index provided in SPIR-V code accessing the input. If the \( n \) vertices passed to a draw call are numbered 0 through \( n-1 \), and the point, line, and triangle primitives produced by the draw call are numbered with consecutive integers beginning with zero, the following table indicates the original vertex numbers used when the provoking vertex mode is VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT for index values of 0, 1, and 2. If an input decorated with PerVertexKHR is accessed with any other vertex index value, or is accessed while rasterizing a polygon when the VkPipelineRasterizationStateCreateInfo::polygonMode property of the currently active pipeline is not VK_POLYGON_MODE_FILL, an undefined value is returned.
<table>

</table>
When geometry or mesh shading is active, primitives processed by fragment shaders are assembled from the vertices emitted by the geometry or mesh shader. In this case, the vertices used for fragment shader inputs decorated with `PerVertexKHR` are derived by treating the primitives produced by the shader as though they were specified by a draw call and consulting the table above.

When using tessellation without geometry shading, the tessellator produces primitives in an implementation-dependent manner. While there is no defined vertex ordering for inputs decorated with `PerVertexKHR`, the vertex ordering used in this case will be consistent with the ordering used to derive the values of inputs decorated with `BaryCoordKHR` or `BaryCoordNoPerspKHR`.

Fragment shader inputs decorated with `BaryCoordKHR` or `BaryCoordNoPerspKHR` hold three-component vectors with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive. For point primitives, such variables are always assigned the value (1,0,0). For line primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0 and 1 are (1,0,0) and (0,1,0), respectively. For polygon primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0, 1, and 2 are (1,0,0), (0,1,0), and (0,0,1), respectively. For `BaryCoordKHR`, the values are obtained using perspective interpolation. For `BaryCoordNoPerspKHR`, the values are obtained using linear interpolation. The values of `BaryCoordKHR` and `BaryCoordNoPerspKHR` are undefined while rasterizing a polygon when the `VkPipelineRasterizationStateCreateInfo::polygonMode` property of the currently active pipeline is not `VK_POLYGON_MODE_FILL`.

### 28.10. Points

A point is drawn by generating a set of fragments in the shape of a square centered around the vertex of the point. Each vertex has an associated point size controlling the width/height of that square. The point size is taken from the (potentially clipped) shader built-in `PointSize` written by:

- the geometry shader, if active;
- the tessellation evaluation shader, if active and no geometry shader is active;
- the vertex shader, otherwise

and clamped to the implementation-dependent point size range `[pointSizeRange[0], pointSizeRange[1]]`. The value written to `PointSize` must be greater than zero. If `maintenance5` is enabled, and a value is not written to `PointSize`, the point size takes a default value of 1.0.

Not all point sizes need be supported, but the size 1.0 must be supported. The range of supported sizes and the size of evenly-spaced gradations within that range are implementation-dependent. The range and gradations are obtained from the `pointSizeRange` and `pointSizeGranularity` members of `VkPhysicalDeviceLimits`. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional point sizes may also be supported.
There is no requirement that these sizes be equally spaced. If an unsupported size is requested, the nearest supported size is used instead.

Further, if the render pass has a fragment density map attachment, point size may be rounded by the implementation to a multiple of the fragment’s width or height.

**28.10.1. Basic Point Rasterization**

Point rasterization produces a fragment for each fragment area group of framebuffer pixels with one or more sample points that intersect a region centered at the point’s \((x_f, y_f)\). This region is a square with side equal to the current point size. Coverage bits that correspond to sample points that intersect the region are 1, other coverage bits are 0. All fragments produced in rasterizing a point are assigned the same associated data, which are those of the vertex corresponding to the point. However, the fragment shader built-in `PointCoord` contains point sprite texture coordinates. The \(s\) and \(t\) point sprite texture coordinates vary from zero to one across the point horizontally left-to-right and vertically top-to-bottom, respectively. The following formulas are used to evaluate \(s\) and \(t\):

\[
s = \frac{1}{2} + \frac{(x_p - x_f)}{\text{size}}
\]

\[
t = \frac{1}{2} + \frac{(y_p - y_f)}{\text{size}}
\]

where `size` is the point’s size; \((x_p, y_p)\) is the location at which the point sprite coordinates are evaluated - this may be the framebuffer coordinates of the fragment center, or the location of a sample; and \((x_f, y_f)\) is the exact, unrounded framebuffer coordinate of the vertex for the point.

**28.11. Line Segments**

Line segment rasterization options are controlled by the `VkPipelineRasterizationLineStateCreateInfoKHR` structure.

The `VkPipelineRasterizationLineStateCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_line_rasterization
typedef struct VkPipelineRasterizationLineStateCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkLineRasterizationModeKHR lineRasterizationMode;
    VkBool32 stippledLineEnable;
    uint32_t lineStippleFactor;
    uint16_t lineStipplePattern;
} VkPipelineRasterizationLineStateCreateInfoKHR;
```

or the equivalent
typedef VkPipelineRasterizationLineStateCreateInfoKHR
    VkPipelineRasterizationLineStateCreateInfoEXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• lineRasterizationMode is a VkLineRasterizationModeKHR value selecting the style of line rasterization.
• stippledLineEnable enables stippled line rasterization.
• lineStippleFactor is the repeat factor used in stippled line rasterization.
• lineStipplePattern is the bit pattern used in stippled line rasterization.

If stippledLineEnable is VK_FALSE, the values of lineStippleFactor and lineStipplePattern are ignored.

Valid Usage

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-lineRasterizationMode-02768
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR, then the rectangularLines feature must be enabled

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-lineRasterizationMode-02769
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR, then the bresenhamLines feature must be enabled

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-lineRasterizationMode-02770
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR, then the smoothLines feature must be enabled

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-stippledLineEnable-02771
  If stippledLineEnable is VK_TRUE and lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR, then the stippledRectangularLines feature must be enabled

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-stippledLineEnable-02772
  If stippledLineEnable is VK_TRUE and lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR, then the stippledBresenhamLines feature must be enabled

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-stippledLineEnable-02773
  If stippledLineEnable is VK_TRUE and lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR, then the stippledSmoothLines feature must be enabled

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-stippledLineEnable-02774
  If stippledLineEnable is VK_TRUE and lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR, then the stippledRectangularLines feature must be enabled and VkPhysicalDeviceLimits::strictLines must be VK_TRUE
Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationLineStateCreateInfoKHR-sType-sType**  
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_KHR`.

- **VUID-VkPipelineRasterizationLineStateCreateInfoKHR-lineRasterizationMode-parameter**  
  `lineRasterizationMode` **must** be a valid `VkLineRasterizationModeKHR` value.

Possible values of `VkPipelineRasterizationLineStateCreateInfoKHR::lineRasterizationMode` are:

```c
// Provided by VK_KHR_line_rasterization
typedef enum VkLineRasterizationModeKHR {
    VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR = 0,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR = 1,
    VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR = 2,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR = 3,
    VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT = VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT = VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR,
    VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT = VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT = VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR,
} VkLineRasterizationModeKHR;
```

or the equivalent

```c
// Provided by VK_EXT_line_rasterization
typedef VkLineRasterizationModeKHR VkLineRasterizationModeEXT;
```

- `VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR` **is equivalent to** `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR` if `VkPhysicalDeviceLimits::strictLines` is `VK_TRUE`, otherwise lines are drawn as non-`strictLines` parallelograms. Both of these modes are defined in Basic Line Segment Rasterization.

- `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR` specifies lines drawn as if they were rectangles extruded from the line.

- `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR` specifies lines drawn by determining which pixel diamonds the line intersects and exits, as defined in Bresenham Line Segment Rasterization.

- `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR` specifies lines drawn if they were rectangles extruded from the line, with alpha falloff, as defined in Smooth Lines.

To **dynamically set** the `lineRasterizationMode` state, call:
// Provided by VK_EXT_extended_dynamic_state3 with VK_EXT_line_rasterization,
// VK_EXT_line_rasterization with VK_EXT_shader_object

void vkCmdSetLineRasterizationModeEXT(
    VkCommandBuffer commandBuffer, 
    VkLineRasterizationModeEXT lineRasterizationMode);

• commandBuffer is the command buffer into which the command will be recorded.
• lineRasterizationMode specifies the lineRasterizationMode state.

This command sets the lineRasterizationMode state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with 
VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the 
VkPipelineRasterizationLineStateCreateInfoKHR::lineRasterizationMode value used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetLineRasterizationModeEXT-None-09423
  At least one of the following must be true:
  ◦ The extendedDynamicState3LineRasterizationMode feature is enabled
  ◦ The shaderObject feature is enabled

• VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-07418
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR, then the 
  rectangularLines feature must be enabled

• VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-07419
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR, then the 
  bresenhamLines feature must be enabled

• VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-07420
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR, then the 
  smoothLines feature must be enabled

Valid Usage (Implicit)

• VUID-vkCmdSetLineRasterizationModeEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-parameter
  lineRasterizationMode must be a valid VkLineRasterizationModeEXT value

• VUID-vkCmdSetLineRasterizationModeEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetLineRasterizationModeEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics
operations

- VUID-vkCmdSetLineRasterizationModeEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>

To dynamically set the stippledLineEnable state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_EXT_line_rasterization,
// VK_EXT_line_rasterization with VK_EXT_shader_object
void vkCmdSetLineStippleEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 stippledLineEnable);
```

- commandBuffer is the command buffer into which the command will be recorded.
- stippledLineEnable specifies the stippledLineEnable state.

This command sets the stippledLineEnable state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineRasterizationLineStateCreateInfoKHR::stippledLineEnable value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetLineStippleEnableEXT-None-09423
  At least one of the following must be true:
  - The extendedDynamicState3LineStippleEnable feature is enabled
  - The shaderObject feature is enabled
Valid Usage (Implicit)

- VUID-vkCmdSetLineStippleEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLineStippleEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the `recording` state
- VUID-vkCmdSetLineStippleEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetLineStippleEnableEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

</table>

To dynamically set the line width, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetLineWidth(
    VkCommandBuffer commandBuffer,
    float lineWidth);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `lineWidth` is the width of rasterized line segments.

This command sets the line width for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_WIDTH` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::lineWidth` value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetLineWidth-lineWidth-00788
  If the `widelines` feature is not enabled, `lineWidth` must be 1.0

Valid Usage (Implicit)

- VUID-vkCmdSetLineWidth-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLineWidth-commandBuffer-recording
  `commandBuffer` must be in the `recording state`
- VUID-vkCmdSetLineWidth-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetLineWidth-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

</table>

Not all line widths need be supported for line segment rasterization, but width 1.0 antialiased segments must be provided. The range and gradations are obtained from the `lineWidthRange` and `lineWidthGranularity` members of `VkPhysicalDeviceLimits`. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional line widths may also be supported. There is no requirement that these widths be equally spaced. If an unsupported width is requested, the nearest supported width is used instead.

Further, if the render pass has a fragment density map attachment, line width may be rounded by the implementation to a multiple of the fragment’s width or height.
28.11.1. Basic Line Segment Rasterization

If the `lineRasterizationMode` member of `VkPipelineRasterizationLineStateCreateInfoKHR` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR`, rasterized line segments produce fragments which intersect a rectangle centered on the line segment. Two of the edges are parallel to the specified line segment; each is at a distance of one-half the current width from that segment in directions perpendicular to the direction of the line. The other two edges pass through the line endpoints and are perpendicular to the direction of the specified line segment. Coverage bits that correspond to sample points that intersect the rectangle are 1, other coverage bits are 0.

Next we specify how the data associated with each rasterized fragment are obtained. Let $p_r = (x_d, y_d)$ be the framebuffer coordinates at which associated data are evaluated. This may be the center of a fragment or the location of a sample within the fragment. When `rasterizationSamples` is `VK_SAMPLE_COUNT_1_BIT`, the fragment center must be used. Let $p_a = (x_a, y_a)$ and $p_b = (x_b, y_b)$ be initial and final endpoints of the line segment, respectively. Set

$$ t = \frac{(p_r - p_a) \cdot (p_b - p_a)}{\| p_b - p_a \|^2} $$

(Note that $t = 0$ at $p_a$ and $t = 1$ at $p_b$. Also note that this calculation projects the vector from $p_a$ to $p_r$ onto the line, and thus computes the normalized distance of the fragment along the line.)

If `strictLines` is `VK_TRUE`, line segments are rasterized using perspective or linear interpolation.

**Perspective interpolation** for a line segment interpolates two values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the line segment’s clip coordinates. An interpolated value $f$ can be determined by

$$ f = \frac{(1 - t)f_a / w_a + t f_b / w_b}{(1 - t) / w_a + t / w_b} $$

where $f_a$ and $f_b$ are the data associated with the starting and ending endpoints of the segment, respectively; $w_a$ and $w_b$ are the clip w coordinates of the starting and ending endpoints of the segment, respectively.

**Linear interpolation** for a line segment directly interpolates two values, and an interpolated value $f$ can be determined by

$$ f = (1 - t)f_a + t f_b $$

where $f_a$ and $f_b$ are the data associated with the starting and ending endpoints of the segment, respectively.

The clip coordinate $w$ for a sample is determined using perspective interpolation. The depth value $z$ for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by **Interpolation decorations**.

The above description documents the preferred method of line rasterization, and must be used when `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR`. 
By default, when strictLines is VK_FALSE, or the relaxedLineRasterization feature is enabled, and when the lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR, the edges of the lines are generated as a parallelogram surrounding the original line. The major axis is chosen by noting the axis in which there is the greatest distance between the line start and end points. If the difference is equal in both directions then the X axis is chosen as the major axis. Edges 2 and 3 are aligned to the minor axis and are centered on the endpoints of the line as in Non strict lines, and each is lineWidth long. Edges 0 and 1 are parallel to the line and connect the endpoints of edges 2 and 3. Coverage bits that correspond to sample points that intersect the parallelogram are 1, other coverage bits are 0.

Samples that fall exactly on the edge of the parallelogram follow the polygon rasterization rules.

Interpolation occurs as if the parallelogram was decomposed into two triangles where each pair of vertices at each end of the line has identical attributes.

Figure 20. Non strict lines

When strictLines is VK_FALSE or when the relaxedLineRasterization feature is enabled, and lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT implementations may deviate from the non-strict line algorithm described above in the following ways:

- Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization using the original line segment endpoints.
- Rasterization of non-antialiased non-strict line segments may be performed using the rules defined in Bresenham Line Segment Rasterization.

If VkPhysicalDeviceMaintenance5PropertiesKHR::nonStrictSinglePixelWideLinesUseParallelogram is VK_TRUE, the lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT, and strictLines is VK_FALSE, non-strict lines of width 1.0 are rasterized as parallelograms, otherwise they are rasterized using Bresenham's algorithm.

If VkPhysicalDeviceMaintenance5PropertiesKHR::nonStrictWideLinesUseParallelogram is VK_TRUE, the lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT, and strictLines is VK_FALSE, non-strict lines of width greater than 1.0 are rasterized as parallelograms, otherwise they are rasterized
using Bresenham’s algorithm.

### 28.11.2. Bresenham Line Segment Rasterization

If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR`, then the following rules replace the line rasterization rules defined in Basic Line Segment Rasterization.

Non-strict lines may also follow these rasterization rules for non-antialiased lines.

If the `relaxedLineRasterization` feature is enabled, and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT` implementations must follow these rasterization rules for non-antialiased lines of width 1.0.

Line segment rasterization begins by characterizing the segment as either x-major or y-major. x-major line segments have slope in the closed interval [-1,1]; all other line segments are y-major (slope is determined by the segment’s endpoints). We specify rasterization only for x-major segments except in cases where the modifications for y-major segments are not self-evident.

Ideally, Vulkan uses a diamond-exit rule to determine those fragments that are produced by rasterizing a line segment. For each fragment \( f \) with center at framebuffer coordinates \( x_f \) and \( y_f \), define a diamond-shaped region that is the intersection of four half planes:

\[
R_f = \{(x, y) \mid |x - x_f| + |y - y_f| \leq \frac{1}{2}\}
\]

Essentially, a line segment starting at \( p_a \) and ending at \( p_b \) produces those fragments \( f \) for which the segment intersects \( R_f \) except if \( p_b \) is contained in \( R_f \).
To avoid difficulties when an endpoint lies on a boundary of $R_f$, we (in principle) perturb the supplied endpoints by a tiny amount. Let $p_a$ and $p_b$ have framebuffer coordinates $(x_a, y_a)$ and $(x_b, y_b)$, respectively. Obtain the perturbed endpoints $p_a'$ given by $(x_a, y_a) - (\varepsilon, \varepsilon^2)$ and $p_b'$ given by $(x_b, y_b) - (\varepsilon, \varepsilon^2)$. Rasterizing the line segment starting at $p_a$ and ending at $p_b$ produces those fragments $f$ for which the segment starting at $p_a'$ and ending on $p_b'$ intersects $R_f$, except if $p_b'$ is contained in $R_f$. $\varepsilon$ is chosen to be so small that rasterizing the line segment produces the same fragments when $\delta$ is substituted for $\varepsilon$ for any $0 < \delta \leq \varepsilon$.

When $p_a$ and $p_b$ lie on fragment centers, this characterization of fragments reduces to Bresenham’s algorithm with one modification: lines produced in this description are “half-open”, meaning that the final fragment (corresponding to $p_b$) is not drawn. This means that when rasterizing a series of connected line segments, shared endpoints will be produced only once rather than twice (as would occur with Bresenham’s algorithm).

Implementations may use other line segment rasterization algorithms, subject to the following rules:

- The coordinates of a fragment produced by the algorithm must not deviate by more than one unit in either $x$ or $y$ framebuffer coordinates from a corresponding fragment produced by the diamond-exit rule.
- The total number of fragments produced by the algorithm must not differ from that produced by the diamond-exit rule by more than one.
- For an $x$-major line, two fragments that lie in the same framebuffer-coordinate column must not be produced (for a $y$-major line, two fragments that lie in the same framebuffer-coordinate row must not be produced).
- If two line segments share a common endpoint, and both segments are either $x$-major (both left-to-right or both right-to-left) or $y$-major (both bottom-to-top or both top-to-bottom), then rasterizing both segments must not produce duplicate fragments. Fragments also must not be omitted so as to interrupt continuity of the connected segments.

The actual width $w$ of Bresenham lines is determined by rounding the line width to the nearest integer, clamping it to the implementation-dependent $\text{lineWidthRange}$ (with both values rounded to the nearest integer), then clamping it to be no less than 1.

Bresenham line segments of width other than one are rasterized by offsetting them in the minor direction (for an $x$-major line, the minor direction is $y$, and for a $y$-major line, the minor direction is $x$) and producing a row or column of fragments in the minor direction. If the line segment has endpoints given by $(x_0, y_0)$ and $(x_1, y_1)$ in framebuffer coordinates, the segment with endpoints $(x_0, y_0 - \frac{w-1}{2})$ and $(x_1, y_1 - \frac{w-1}{2})$ is rasterized, but instead of a single fragment, a column of fragments of height $w$ (a row of fragments of length $w$ for a $y$-major segment) is produced at each $x$ ($y$ for $y$-major) location. The lowest fragment of this column is the fragment that would be produced by rasterizing the segment of width 1 with the modified coordinates.

The preferred method of attribute interpolation for a wide line is to generate the same attribute values for all fragments in the row or column described above, as if the adjusted line was used for interpolation and those values replicated to the other fragments, except for $\text{FragCoord}$ which is interpolated as usual. Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization, using the original line segment endpoints.
When Bresenham lines are being rasterized, sample locations may all be treated as being at the pixel center (this may affect attribute and depth interpolation).

Note
The sample locations described above are not used for determining coverage, they are only used for things like attribute interpolation. The rasterization rules that determine coverage are defined in terms of whether the line intersects pixels, as opposed to the point sampling rules used for other primitive types. So these rules are independent of the sample locations. One consequence of this is that Bresenham lines cover the same pixels regardless of the number of rasterization samples, and cover all samples in those pixels (unless masked out or killed).

28.11.3. Line Stipple

If the stippledLineEnable member of VkPipelineRasterizationLineStateCreateInfoKHR is VK_TRUE, then lines are rasterized with a line stipple determined by lineStippleFactor and lineStipplePattern. lineStipplePattern is an unsigned 16-bit integer that determines which fragments are to be drawn or discarded when the line is rasterized. lineStippleFactor is a count that is used to modify the effective line stipple by causing each bit in lineStipplePattern to be used lineStippleFactor times.

Line stippling discards certain fragments that are produced by rasterization. The masking is achieved using three parameters: the 16-bit line stipple pattern p, the line stipple factor r, and an integer stipple counter s. Let

\[ b = \left\lfloor \frac{s}{r} \right\rfloor \mod 16 \]

Then a fragment is produced if the b'th bit of p is 1, and discarded otherwise. The bits of p are numbered with 0 being the least significant and 15 being the most significant.

The initial value of s is zero. For VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR lines, s is incremented after production of each fragment of a line segment (fragments are produced in order, beginning at the starting point and working towards the ending point). For VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR and VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR lines, the rectangular region is subdivided into adjacent unit-length rectangles, and s is incremented once for each rectangle. Rectangles with a value of s such that the b'th bit of p is zero are discarded. If the last rectangle in a line segment is shorter than unit-length, then the remainder may carry over to the next line segment in the line strip using the same value of s (this is the preferred behavior, for the stipple pattern to appear more consistent through the strip).

s is reset to 0 at the start of each strip (for line strips), and before every line segment in a group of independent segments.

If the line segment has been clipped, then the value of s at the beginning of the line segment is implementation-dependent.

To dynamically set the line stipple state, call:
// Provided by VK_KHR_line_rasterization

```c
void vkCmdSetLineStippleKHR(
    VkCommandBuffer commandBuffer,
    uint32_t lineStippleFactor,
    uint16_t lineStipplePattern);
```

or the equivalent command

```c
// Provided by VK_EXT_line_rasterization

void vkCmdSetLineStippleEXT(
    VkCommandBuffer commandBuffer,
    uint32_t lineStippleFactor,
    uint16_t lineStipplePattern);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `lineStippleFactor` is the repeat factor used in stippled line rasterization.
- `lineStipplePattern` is the bit pattern used in stippled line rasterization.

This command sets the line stipple state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_STIPPLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationLineStateCreateInfoKHR::lineStippleFactor` and `VkPipelineRasterizationLineStateCreateInfoKHR::lineStipplePattern` values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLineStippleKHR-lineStippleFactor-02776
  - `lineStippleFactor` must be in the range [1,256]

### Valid Usage (Implicit)

- VUID-vkCmdSetLineStippleKHR-commandBuffer-parameter
  - `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLineStippleKHR-commandBuffer-recording
  - `commandBuffer` must be in the recording state
- VUID-vkCmdSetLineStippleKHR-commandBuffer-cmdpool
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetLineStippleKHR-videocoding
  - This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

28.11.4. Smooth Lines

If the `lineRasterizationMode` member of `VkPipelineRasterizationLineStateCreateInfoKHR` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR`, then lines are considered to be rectangles using the same geometry as for `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR` lines. The rules for determining which pixels are covered are implementation-dependent, and may include nearby pixels where no sample locations are covered or where the rectangle does not intersect the pixel at all. For each pixel that is considered covered, the fragment computes a coverage value that approximates the area of the intersection of the rectangle with the pixel square, and this coverage value is multiplied into the color location 0's alpha value after fragment shading, as described in Multisample Coverage.

Note

The details of the rasterization rules and area calculation are left intentionally vague, to allow implementations to generate coverage and values that are aesthetically pleasing.

28.12. Polygons

A polygon results from the decomposition of a triangle strip, triangle fan or a series of independent triangles. Like points and line segments, polygon rasterization is controlled by several variables in the `VkPipelineRasterizationStateCreateInfo` structure.

28.12.1. Basic Polygon Rasterization

The first step of polygon rasterization is to determine whether the triangle is back-facing or front-facing. This determination is made based on the sign of the (clipped or unclipped) polygon's area computed in framebuffer coordinates. One way to compute this area is:
where $x_f$ and $y_f$ are the x and y framebuffer coordinates of the $i$th vertex of the $n$-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and $i \oplus 1$ is $(i + 1) \mod n$.

The interpretation of the sign of $a$ is determined by the `VkPipelineRasterizationStateCreateInfo::frontFace` property of the currently active pipeline. Possible values are:

```
// Provided by VK_VERSION_1_0
typedef enum VkFrontFace {
    VK_FRONT_FACE_COUNTER_CLOCKWISE = 0,
    VK_FRONT_FACE_CLOCKWISE = 1,
} VkFrontFace;
```

- `VK_FRONT_FACE_COUNTER_CLOCKWISE` specifies that a triangle with positive area is considered front-facing.
- `VK_FRONT_FACE_CLOCKWISE` specifies that a triangle with negative area is considered front-facing.

Any triangle which is not front-facing is back-facing, including zero-area triangles.

To dynamically set the front face orientation, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetFrontFace(
    VkCommandBuffer commandBuffer,
    VkFrontFace frontFace);
```

or the equivalent command

```
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetFrontFaceEXT(
    VkCommandBuffer commandBuffer,
    VkFrontFace frontFace);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `frontFace` is a `VkFrontFace` value specifying the front-facing triangle orientation to be used for culling.

This command sets the front face orientation for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_FRONT_FACE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::frontFace` value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetFrontFace-None-08971
  At least one of the following must be true:
  - the extendedDynamicState feature is enabled
  - the shaderObject feature is enabled
  - the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetFrontFace-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetFrontFace-frontFace-parameter
  frontFace must be a valid VkFrontFace value

- VUID-vkCmdSetFrontFace-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetFrontFace-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetFrontFace-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Once the orientation of triangles is determined, they are culled according to the VkPipelineRasterizationStateCreateInfo::cullMode property of the currently active pipeline. Possible values are:
typedef enum VkCullModeFlagBits {
    VK_CULL_MODE_NONE = 0,
    VK_CULL_MODE_FRONT_BIT = 0x00000001,
    VK_CULL_MODE_BACK_BIT = 0x00000002,
    VK_CULL_MODE_FRONT_AND_BACK = 0x00000003,
} VkCullModeFlagBits;

- **VK_CULL_MODE_NONE** specifies that no triangles are discarded
- **VK_CULL_MODE_FRONT_BIT** specifies that front-facing triangles are discarded
- **VK_CULL_MODE_BACK_BIT** specifies that back-facing triangles are discarded
- **VK_CULL_MODE_FRONT_AND_BACK** specifies that all triangles are discarded.

Following culling, fragments are produced for any triangles which have not been discarded.

typedef VkFlags VkCullModeFlags;

**VkCullModeFlags** is a bitmask type for setting a mask of zero or more **VkCullModeFlagBits**.

To **dynamically set** the cull mode, call:

```c
void vkCmdSetCullMode(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);
```

or the equivalent command

```c
void vkCmdSetCullModeEXT(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **cullMode** specifies the cull mode property to use for drawing.

This command sets the cull mode for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_CULL_MODE** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineRasterizationStateCreateInfo::cullMode** value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetCullMode-None-08971
  At least one of the following must be true:
  - the extendedDynamicState feature is enabled
  - the shaderObject feature is enabled
  - the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetCullMode-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetCullMode-cullMode-parameter
  cullMode must be a valid combination of VkCullModeFlagBits values
- VUID-vkCmdSetCullMode-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetCullMode-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetCullMode-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>

The rule for determining which fragments are produced by polygon rasterization is called point sampling. The two-dimensional projection obtained by taking the x and y framebuffer coordinates of the polygon’s vertices is formed. Fragments are produced for any fragment area groups of pixels...
for which any sample points lie inside of this polygon. Coverage bits that correspond to sample points that satisfy the point sampling criteria are 1, other coverage bits are 0. Special treatment is given to a sample whose sample location lies on a polygon edge. In such a case, if two polygons lie on either side of a common edge (with identical endpoints) on which a sample point lies, then exactly one of the polygons must result in a covered sample for that fragment during rasterization. As for the data associated with each fragment produced by rasterizing a polygon, we begin by specifying how these values are produced for fragments in a triangle.

Barycentric coordinates are a set of three numbers, a, b, and c, each in the range [0,1], with \(a + b + c = 1\). These coordinates uniquely specify any point \(p\) within the triangle or on the triangle’s boundary as

\[p = a p_a + b p_b + c p_c\]

where \(p_a\), \(p_b\), and \(p_c\) are the vertices of the triangle. \(a\), \(b\), and \(c\) are determined by:

\[a = \frac{A(p p_b p_c)}{A(p_a p_b p_c)}, \quad b = \frac{A(p p_d p_c)}{A(p_a p_d p_c)}, \quad c = \frac{A(p p_d p_b)}{A(p_a p_d p_b)},\]

where \(A(\text{lmn})\) denotes the area in framebuffer coordinates of the triangle with vertices \(l\), \(m\), and \(n\).

Denote an associated datum at \(p_a\), \(p_b\), or \(p_c\) as \(f_a\), \(f_b\), or \(f_c\), respectively.

**Perspective interpolation** for a triangle interpolates three values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the triangle’s clip coordinates. An interpolated value \(f\) can be determined by

\[f = \frac{af_a / w_a + bf_b / w_b + cf_c / w_c}{a / w_a + b / w_b + c / w_c}\]

where \(w_a\), \(w_b\), and \(w_c\) are the clip \(w\) coordinates of \(p_a\), \(p_b\), and \(p_c\) respectively. \(a\), \(b\), and \(c\) are the barycentric coordinates of the location at which the data are produced.

**Linear interpolation** for a triangle directly interpolates three values, and an interpolated value \(f\) can be determined by

\[f = a f_a + b f_b + c f_c\]

where \(f_a\), \(f_b\), and \(f_c\) are the data associated with \(p_a\), \(p_b\), and \(p_c\) respectively.

The clip coordinate \(w\) for a sample is determined using perspective interpolation. The depth value \(z\) for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by **Interpolation decorations**.

For a polygon with more than three edges, such as are produced by clipping a triangle, a convex combination of the values of the datum at the polygon’s vertices must be used to obtain the value assigned to each fragment produced by the rasterization algorithm. That is, it must be the case that at every fragment...
where \( n \) is the number of vertices in the polygon and \( f_i \) is the value of \( f \) at vertex \( i \). For each \( i \), \( 0 \leq a_i \leq 1 \) and \( \sum_{i=1}^{n} a_i = 1 \). The values of \( a_i \) may differ from fragment to fragment, but at vertex \( i \), \( a_i = 1 \) and \( a_j = 0 \) for \( j \neq i \).

**Note**

One algorithm that achieves the required behavior is to triangulate a polygon (without adding any vertices) and then treat each triangle individually as already discussed. A scan-line rasterizer that linearly interpolates data along each edge and then linearly interpolates data across each horizontal span from edge to edge also satisfies the restrictions (in this case the numerator and denominator of perspective interpolation are iterated independently, and a division is performed for each fragment).

### 28.12.2. Polygon Mode

Possible values of the `VkPipelineRasterizationStateCreateInfo::polygonMode` property of the currently active pipeline, specifying the method of rasterization for polygons, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPolygonMode {
    VK_POLYGON_MODE_FILL = 0,
    VK_POLYGON_MODE_LINE = 1,
    VK_POLYGON_MODE_POINT = 2,
    // Provided by VK_NV_fill_rectangle
    VK_POLYGON_MODE_FILL_RECTANGLE_NV = 1000153000,
} VkPolygonMode;
```

- **VK_POLYGON_MODE_POINT** specifies that polygon vertices are drawn as points.
- **VK_POLYGON_MODE_LINE** specifies that polygon edges are drawn as line segments.
- **VK_POLYGON_MODE_FILL** specifies that polygons are rendered using the polygon rasterization rules in this section.
- **VK_POLYGON_MODE_FILL_RECTANGLE_NV** specifies that polygons are rendered using polygon rasterization rules, modified to consider a sample within the primitive if the sample location is inside the axis-aligned bounding box of the triangle after projection. Note that the barycentric weights used in attribute interpolation can extend outside the range [0,1] when these primitives are shaded. Special treatment is given to a sample position on the boundary edge of the bounding box. In such a case, if two rectangles lie on either side of a common edge (with identical endpoints) on which a sample position lies, then exactly one of the triangles must produce a fragment that covers that sample during rasterization.

Polygons rendered in **VK_POLYGON_MODE_FILL_RECTANGLE_NV** mode may be clipped by the frustum or by user clip planes. If clipping is applied, the triangle is culled rather than clipped.
Area calculation and facingness are determined for `VK_POLYGON_MODE_FILL_RECTANGLE_NV` mode using the triangle’s vertices.

These modes affect only the final rasterization of polygons: in particular, a polygon’s vertices are shaded and the polygon is clipped and possibly culled before these modes are applied.

If `VkPhysicalDeviceMaintenance5PropertiesKHR::polygonModePointSize` is set to `VK_TRUE`, the point size of the final rasterization of polygons is taken from `PointSize` when `polygon mode` is `VK_POLYGON_MODE_POINT`.

Otherwise, if `VkPhysicalDeviceMaintenance5PropertiesKHR::polygonModePointSize` is set to `VK_FALSE`, the point size of the final rasterization of polygons is 1.0 when `polygon mode` is `VK_POLYGON_MODE_POINT`.

To **dynamically set** the polygon mode, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetPolygonModeEXT(
    VkCommandBuffer commandBuffer,
    VkPolygonMode polygonMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `polygonMode` specifies polygon mode.

This command sets the polygon mode for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::polygonMode` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetPolygonModeEXT-None-09423**
  At least one of the following must be true:
  - The `extendedDynamicState3PolygonMode` feature is enabled
  - The `shaderObject` feature is enabled

- **VUID-vkCmdSetPolygonModeEXT-fillModeNonSolid-07424**
  If the `fillModeNonSolid` feature is not enabled, `polygonMode` must be `VK_POLYGON_MODE_FILL` or `VK_POLYGON_MODE_FILL_RECTANGLE_NV`

- **VUID-vkCmdSetPolygonModeEXT-polygonMode-07425**
  If the `VK_NV_fill_rectangle` extension is not enabled, `polygonMode` must not be `VK_POLYGON_MODE_FILL_RECTANGLE_NV`
Valid Usage (Implicit)

- VUID-vkCmdSetPolygonModeEXT-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetPolygonModeEXT-polygonMode-parameter
  polygonMode **must** be a valid VkPolygonMode value
- VUID-vkCmdSetPolygonModeEXT-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdSetPolygonModeEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations
- VUID-vkCmdSetPolygonModeEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

<table>

</tr>
</tbody>
</table>

28.12.3. Depth Bias

The depth values of all fragments generated by the rasterization of a polygon **can** be biased (offset) by a single depth bias value \( \sigma \) that is computed for that polygon.

Depth Bias Enable

The depth bias computation is enabled by the depthBiasEnable set with vkCmdSetDepthBiasEnable and vkCmdSetDepthBiasEnableEXT, or the corresponding VkPipelineRasterizationStateCreateInfo::depthBiasEnable value used to create the currently active pipeline. If the depth bias enable is VK_FALSE, no bias is applied and the fragment’s depth values are unchanged.

To **dynamically enable** whether to bias fragment depth values, call:
```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthBiasEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBiasEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
void vkCmdSetDepthBiasEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBiasEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasEnable` controls whether to bias fragment depth values.

This command sets the depth bias enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetDepthBiasEnable-None-08970
  At least one of the following must be true:
  - the `extendedDynamicState2` feature is enabled
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthBiasEnable-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBiasEnable-commandBuffer-recording `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthBiasEnable-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthBiasEnable-videocoding This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Depth Bias Computation

The depth bias depends on three parameters:

- `depthBiasSlopeFactor` scales the maximum depth slope \( m \) of the polygon
- `depthBiasConstantFactor` scales the parameter \( r \) of the depth attachment
- the scaled terms are summed to produce a value which is then clamped to a minimum or maximum value specified by `depthBiasClamp`

`depthBiasSlopeFactor`, `depthBiasConstantFactor`, and `depthBiasClamp` can each be positive, negative, or zero. These parameters are set as described for `vkCmdSetDepthBias` and `vkCmdSetDepthBias2EXT` below.

The maximum depth slope \( m \) of a triangle is

\[
    m = \sqrt{\left(\frac{\partial z_f}{\partial x_f}\right)^2 + \left(\frac{\partial z_f}{\partial y_f}\right)^2}
\]

where \((x_0, y_0, z_0)\) is a point on the triangle. \( m \) may be approximated as

\[
    m = \max\left(\frac{\partial z_f}{\partial x_f}, \frac{\partial z_f}{\partial y_f}\right).
\]

In a pipeline with a depth bias representation of `VK DEPTH_BIAS_REPRESENTATION_FLOAT_EXT`, \( r \), for the given primitive is defined as

\[
    r = 1
\]

Otherwise \( r \) is the minimum resolvable difference that depends on the depth attachment representation. If `VkDepthBiasRepresentationInfoEXT::depthBiasExact` is `VK_FALSE` it is the smallest difference in framebuffer coordinate \( z \) values that is guaranteed to remain distinct throughout
polygon rasterization and in the depth attachment. All pairs of fragments generated by the rasterization of two polygons with otherwise identical vertices, but \( z \) values that differ by \( r \), will have distinct depth values.

For fixed-point depth attachment representations, or in a pipeline with a depth bias representation of `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT`, \( r \) is constant throughout the range of the entire depth attachment. If `VkDepthBiasRepresentationInfoEXT::depthBiasExact` is `VK_TRUE`, then its value **must** be

\[ r = 2^n \]

Otherwise its value is implementation-dependent but **must** be at most

\[ r = 2 \times 2^n \]

where \( n \) is the number of bits used for the depth aspect when using a fixed-point attachment, or the number of mantissa bits plus one when using a floating-point attachment.

Otherwise for floating-point depth attachment, there is no single minimum resolvable difference. In this case, the minimum resolvable difference for a given polygon is dependent on the maximum exponent, \( e \), in the range of \( z \) values spanned by the primitive. If \( n \) is the number of bits in the floating-point mantissa, the minimum resolvable difference, \( r \), for the given primitive is defined as

\[ r = 2^e \]

If a triangle is rasterized using the `VK_POLYGON_MODE_FILL_RECTANGLE_NV` polygon mode, then this minimum resolvable difference **may** not be resolvable for samples outside of the triangle, where the depth is extrapolated.

If no depth attachment is present, \( r \) is undefined.

The bias value \( o \) for a polygon is

\[ o = \text{dbclamp}(m \times \text{depthBiasSlopeFactor} + r \times \text{depthBiasConstantFactor}) \]

where \( \text{dbclamp}(x) = \begin{cases} x & \text{depthBiasClamp} = 0 \text{ or } NaN \\ \min(x, \text{depthBiasClamp}) & \text{depthBiasClamp} > 0 \\ \max(x, \text{depthBiasClamp}) & \text{depthBiasClamp} < 0 \end{cases} \)

\( m \) is computed as described above. If the depth attachment uses a fixed-point representation, \( m \) is a function of depth values in the range \([0,1]\), and \( o \) is applied to depth values in the same range.

Depth bias is applied to triangle topology primitives received by the rasterizer regardless of polygon mode. Depth bias **may** also be applied to line and point topology primitives received by the rasterizer.

To **dynamically set** the depth bias parameters, call:
void vkCmdSetDepthBias(
    VkCommandBuffer commandBuffer,
    float depthBiasConstantFactor,
    float depthBiasClamp,
    float depthBiasSlopeFactor);

• `commandBuffer` is the command buffer into which the command will be recorded.
• `depthBiasConstantFactor` is a scalar factor controlling the constant depth value added to each fragment.
• `depthBiasClamp` is the maximum (or minimum) depth bias of a fragment.
• `depthBiasSlopeFactor` is a scalar factor applied to a fragment’s slope in depth bias calculations.

This command sets the depth bias parameters for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineRasterizationStateCreateInfo::depthBiasConstantFactor`, `depthBiasClamp`, and `depthBiasSlopeFactor` values used to create the currently active pipeline.

Calling this function is equivalent to calling `vkCmdSetDepthBias2EXT` without a `VkDepthBiasRepresentationInfoEXT` in the pNext chain of `VkDepthBiasInfoEXT`.

### Valid Usage

- **VUID-vkCmdSetDepthBias-depthBiasClamp-00790**
  If the `depthBiasClamp` feature is not enabled, `depthBiasClamp` must be 0.0

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthBias-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetDepthBias-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetDepthBias-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetDepthBias-videocoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkDepthBiasRepresentationInfoEXT structure is defined as:

```c
// Provided by VK_EXT_depth_bias_control
typedef struct VkDepthBiasRepresentationInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDepthBiasRepresentationEXT depthBiasRepresentation;
    VkBool32 depthBiasExact;
} VkDepthBiasRepresentationInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `depthBiasRepresentation` is a VkDepthBiasRepresentationEXT value specifying the depth bias representation.
- `depthBiasExact` specifies that the implementation is not allowed to scale the depth bias value to ensure a minimum resolvable distance.

## Valid Usage

- VUID-VkDepthBiasRepresentationInfoEXT-leastRepresentableValueForceUnormRepresentation-08947
  If the leastRepresentableValueForceUnormRepresentation feature is not enabled, `depthBiasRepresentation` must not be `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT`

- VUID-VkDepthBiasRepresentationInfoEXT-floatRepresentation-08948
  If the floatRepresentation feature is not enabled, `depthBiasRepresentation` must not be `VKDEPTH_BIAS_REPRESENTATION_FLOAT_EXT`

- VUID-VkDepthBiasRepresentationInfoEXT-depthBiasExact-08949
  If the depthBiasExact feature is not enabled, `depthBiasExact` must be `VK_FALSE`
Valid Usage (Implicit)

- **VUID-VkDepthBiasRepresentationInfoEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_DEPTH_BIAS_REPRESENTATION_INFO_EXT`

- **VUID-VkDepthBiasRepresentationInfoEXT-depthBiasRepresentation-parameter**
  
  `depthBiasRepresentation` must be a valid `VkDepthBiasRepresentationEXT` value

Possible values of `VkDepthBiasRepresentationInfoEXT::depthBiasRepresentation`, specifying the depth bias representation are:

```c
// Provided by VK_EXT_depth_bias_control
typedef enum VkDepthBiasRepresentationEXT {
    VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT = 0,
    VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT = 1,
    VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT = 2,
} VkDepthBiasRepresentationEXT;
```

- `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT` specifies that the depth bias representation is a factor of the format’s `r` as described in Depth Bias Computation.

- `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT` specifies that the depth bias representation is a factor of a constant `r` defined by the bit-size or mantissa of the format as described in Depth Bias Computation.

- `VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT` specifies that the depth bias representation is a factor of constant `r` equal to 1.

The `VkDepthBiasInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_depth_bias_control
typedef struct VkDepthBiasInfoEXT {
    VkStructureType sType;
    const void* pNext;
    float depthBiasConstantFactor;
    float depthBiasClamp;
    float depthBiasSlopeFactor;
} VkDepthBiasInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `depthBiasConstantFactor` is a scalar factor controlling the constant depth value added to each fragment.

- `depthBiasClamp` is the maximum (or minimum) depth bias of a fragment.

- `depthBiasSlopeFactor` is a scalar factor applied to a fragment’s slope in depth bias calculations.
If `pNext` does not contain a `VkDepthBiasRepresentationInfoEXT` structure, then this command is equivalent to including a `VkDepthBiasRepresentationInfoEXT` with `depthBiasExact` set to `VK_FALSE` and `depthBiasRepresentation` set to `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT`.

Valid Usage

- VUID-VkDepthBiasInfoEXT-depthBiasClamp-08950
  If the `depthBiasClamp` feature is not enabled, `depthBiasClamp` must be 0.0

Valid Usage (Implicit)

- VUID-VkDepthBiasInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DEPTH_BIAS_INFO_EXT`
- VUID-VkDepthBiasInfoEXT-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkDepthBiasRepresentationInfoEXT`
- VUID-VkDepthBiasInfoEXT-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

To dynamically set the depth bias parameters, call:

```c
// Provided by VK_EXT_depth_bias_control
void vkCmdSetDepthBias2EXT(
    VkCommandBuffer commandBuffer, 
    const VkDepthBiasInfoEXT* pDepthBiasInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pDepthBiasInfo` is a pointer to a `VkDepthBiasInfoEXT` structure specifying depth bias parameters.

This command is functionally identical to `vkCmdSetDepthBias`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBias2EXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBias2EXT-pDepthBiasInfo-parameter
  `pDepthBiasInfo` must be a valid pointer to a valid `VkDepthBiasInfoEXT` structure
- VUID-vkCmdSetDepthBias2EXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthBias2EXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics
28.12.4. Conservative Rasterization

If the `pNext` chain of `VkPipelineRasterizationStateCreateInfo` includes a `VkPipelineRasterizationConservativeStateCreateInfoEXT` structure, then that structure includes parameters controlling conservative rasterization.

`VkPipelineRasterizationConservativeStateCreateInfoEXT` is defined as:

```c
// Provided by VK_EXT_conservative_rasterization
typedef struct VkPipelineRasterizationConservativeStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationConservativeStateCreateFlagsEXT flags;
    VkConservativeRasterizationModeEXT conservativeRasterizationMode;
    float extraPrimitiveOverestimationSize;
} VkPipelineRasterizationConservativeStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `conservativeRasterizationMode` is the conservative rasterization mode to use.
- `extraPrimitiveOverestimationSize` is the extra size in pixels to increase the generating primitive during conservative rasterization at each of its edges in X and Y equally in screen space beyond
the base overestimation specified in `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize`. If `conservativeRasterizationMode` is not `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, this value is ignored.

If this structure is not included in the `pNext` chain, `conservativeRasterizationMode` is considered to be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`, and conservative rasterization is disabled.

Polygon rasterization can be made conservative by setting `conservativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` or `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` in `VkPipelineRasterizationConservativeStateCreateInfoEXT`.

**Note**

If `conservativePointAndLineRasterization` is supported, conservative rasterization can be applied to line and point primitives, otherwise it must be disabled.

**Valid Usage**

- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-extraPrimitiveOverestimationSize-01769
  
  `extraPrimitiveOverestimationSize` must be in the range of 0.0 to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT:maxExtraPrimitiveOverestimationSize` inclusive.

**Valid Usage (Implicit)**

- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-sType-sType must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_CONSERVATIVE_STATE_CREATE_INFO_EXT`
- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-flags-zerobitmask `flags` must be 0
- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-conservativeRasterizationMode-parameter `conservativeRasterizationMode` must be a valid `VkConservativeRasterizationModeEXT` value

```c
// Provided by VK_EXT_conservative_rasterization
typedef VkFlags VkPipelineRasterizationConservativeStateCreateFlagsEXT;
```

`VkPipelineRasterizationConservativeStateCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode`, specifying the conservative rasterization mode are:
// Provided by VK_EXT_conservative_rasterization
typedef enum VkConservativeRasterizationModeEXT {
    VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT = 0,
    VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT = 1,
    VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT = 2,
} VkConservativeRasterizationModeEXT;

• VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT specifies that conservative rasterization is disabled and rasterization proceeds as normal.

• VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT specifies that conservative rasterization is enabled in overestimation mode.

• VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT specifies that conservative rasterization is enabled in underestimation mode.

To dynamically set the conservativeRasterizationMode, call:

// Provided by VK_EXT_conservative_rasterization with VK_EXT_extended_dynamic_state3,
VK_EXT_conservative_rasterization with VK_EXT_shader_object
void vkCmdSetConservativeRasterizationModeEXT(
    VkCommandBuffer commandBuffer,
    VkConservativeRasterizationModeEXT conservativeRasterizationMode);

• commandBuffer is the command buffer into which the command will be recorded.

• conservativeRasterizationMode specifies the conservativeRasterizationMode state.

This command sets the conservativeRasterizationMode state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode value used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetConservativeRasterizationModeEXT-None-09423
At least one of the following must be true:

  ◦ The extendedDynamicState3ConservativeRasterizationMode feature is enabled
  ◦ The shaderObject feature is enabled

Valid Usage (Implicit)

• VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle
• VUID-vkCmdSetConservativeRasterizationModeEXT-conservativeRasterizationMode-parameter
  conservativeRasterizationMode must be a valid VkConservativeRasterizationModeEXT value

• VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetConservativeRasterizationModeEXT-videoencoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To **dynamically set** the extraPrimitiveOverestimationSize, call:

```c
// Provided by VK_EXT_conservative_rasterization with VK_EXT_extended_dynamic_state3,
// VK_EXT_conservative_rasterization with VK_EXT_shader_object
void vkCmdSetExtraPrimitiveOverestimationSizeEXT(
  VkCommandBuffer commandBuffer,
  float extraPrimitiveOverestimationSize);
```

• commandBuffer is the command buffer into which the command will be recorded.

• extraPrimitiveOverestimationSize specifies the extraPrimitiveOverestimationSize.

This command sets the extraPrimitiveOverestimationSize for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineRasterizationConservativeStateCreateInfoEXT::extraPrimitiveOverestimationSize value used to create the currently active pipeline.
Valid Usage

• VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-None-09423
  At least one of the following must be true:
  ◦ The extendedDynamicState3ExtraPrimitiveOverestimationSize feature is enabled
  ◦ The shaderObject feature is enabled

• VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-extraPrimitiveOverestimationSize-07428
  extraPrimitiveOverestimationSize must be in the range of 0.0 to
  VkPhysicalDeviceConservativeRasterizationPropertiesEXT::maxExtraPrimitiveOverestimationSize inclusive

Valid Usage (Implicit)

• VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

When overestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made whether any portion of the pixel (including its edges and corners) is covered by the primitive. If any portion of the pixel is covered, then all bits of
the coverage mask for the fragment corresponding to that pixel are enabled. If the render pass has a fragment density map attachment and any bit of the coverage mask for the fragment is enabled, then all bits of the coverage mask for the fragment are enabled.

For the purposes of evaluating which pixels are covered by the primitive, implementations can increase the size of the primitive by up to \( \text{VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize} \) pixels at each of the primitive edges. This may increase the number of fragments generated by this primitive and represents an overestimation of the pixel coverage.

This overestimation size can be increased further by setting the extraPrimitiveOverestimationSize value above \( 0.0 \) in steps of \( \text{VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSizeGranularity} \) up to and including \( \text{VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSize} \). This may further increase the number of fragments generated by this primitive.

The actual precision of the overestimation size used for conservative rasterization may vary between implementations and produce results that only approximate the primitiveOverestimationSize and extraPrimitiveOverestimationSizeGranularity properties. Implementations may especially vary these approximations when the render pass has a fragment density map and the fragment area covers multiple pixels.

For triangles if \( \text{VkCONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT} \) is enabled, fragments will be generated if the primitive area covers any portion of any pixel inside the fragment area, including their edges or corners. The tie-breaking rule described in Basic Polygon Rasterization does not apply during conservative rasterization and coverage is set for all fragments generated from shared edges of polygons. Degenerate triangles that evaluate to zero area after rasterization, even for pixels containing a vertex or edge of the zero-area polygon, will be culled if \( \text{VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateTrianglesRasterized} \) is \( \text{VK_FALSE} \) or will generate fragments if \( \text{degenerateTrianglesRasterized} \) is \( \text{VK_TRUE} \). The fragment input values for these degenerate triangles take their attribute and depth values from the provoking vertex. Degenerate triangles are considered backfacing and the application can enable backface culling if desired. Triangles that are zero area before rasterization may be culled regardless.

For lines if \( \text{VkCONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT} \) is enabled, and the implementation sets \( \text{VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization} \) to \( \text{VK_TRUE} \), fragments will be generated if the line covers any portion of any pixel inside the fragment area, including their edges or corners. Degenerate lines that evaluate to zero length after rasterization will be culled if \( \text{VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateLinesRasterized} \) is \( \text{VK_FALSE} \) or will generate fragments if \( \text{degenerateLinesRasterized} \) is \( \text{VK_TRUE} \). The fragments input values for these degenerate lines take their attribute and depth values from the provoking vertex. Lines that are zero length before rasterization may be culled regardless.

For points if \( \text{VkCONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT} \) is enabled, and the implementation sets \( \text{VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization} \) to \( \text{VK_TRUE} \), fragments will be generated if the point square covers any portion of any pixel inside the fragment area, including their edges or corners.

When underestimate conservative rasterization is enabled, rather than evaluating coverage at
individual sample locations, a determination is made whether all of the pixel (including its edges and corners) is covered by the primitive. If the entire pixel is covered, then a fragment is generated with all bits of its coverage mask corresponding to the pixel enabled, otherwise the pixel is not considered covered even if some portion of the pixel is covered. The fragment is discarded if no pixels inside the fragment area are considered covered. If the render pass has a fragment density map attachment and any pixel inside the fragment area is not considered covered, then the fragment is discarded even if some pixels are considered covered.

For triangles, if VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT is enabled, fragments will only be generated if any pixel inside the fragment area is fully covered by the generating primitive, including its edges and corners.

For lines, if VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT is enabled, fragments will be generated if any pixel inside the fragment area, including its edges and corners, are entirely covered by the line.

For points, if VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT is enabled, fragments will only be generated if the point square covers the entirety of any pixel square inside the fragment area, including its edges or corners.

If the render pass has a fragment density map and VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT is enabled, fragments will only be generated if the entirety of all pixels inside the fragment area are covered by the generating primitive, line, or point.

For both overestimate and underestimate conservative rasterization modes a fragment has all of its pixel squares fully covered by the generating primitive must set FullyCoveredEXT to VK_TRUE if the implementation enables the VkPhysicalDeviceConservativeRasterizationPropertiesEXT::fullyCoveredFragmentShaderInputVariable feature.

When the use of a shading rate image or setting the fragment shading rate results in fragments covering multiple pixels, coverage for conservative rasterization is still evaluated on a per-pixel basis and may result in fragments with partial coverage. For fragment shader inputs decorated with FullyCoveredEXT, a fragment is considered fully covered if and only if all pixels in the fragment are fully covered by the generating primitive.
Chapter 29. Fragment Operations

Fragments produced by rasterization go through a number of operations to determine whether or how values produced by fragment shading are written to the framebuffer.

The following fragment operations adhere to rasterization order, and are typically performed in this order:

1. Discard rectangles test
2. Scissor test
3. Exclusive scissor test
4. Sample mask test
5. Certain Fragment shading operations:
   ◦ Sample Mask Accesses
   ◦ Tile Image Reads
   ◦ Depth Replacement
   ◦ Stencil Reference Replacement
   ◦ Interlocked Operations
6. Multisample coverage
7. Depth bounds test
8. Stencil test
9. Depth test
10. Representative fragment test
11. Sample counting
12. Coverage to color
13. Coverage reduction
14. Coverage modulation

The coverage mask generated by rasterization describes the initial coverage of each sample covered by the fragment. Fragment operations will update the coverage mask to add or subtract coverage where appropriate. If a fragment operation results in all bits of the coverage mask being 0, the fragment is discarded, and no further operations are performed. Fragments can also be programmatically discarded in a fragment shader by executing one of

- OpTerminateInvocation
- OpDemoteToHelperInvocationEXT
- OpKill.

When one of the fragment operations in this chapter is described as “replacing” a fragment shader output, that output is replaced unconditionally, even if no fragment shader previously wrote to that output.
If there is a **fragment shader** and it declares the `PostDepthCoverage` execution mode, the sample mask test is instead performed after the depth test.

If `VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentMultisampleCoverageAfterSampleCounting` is set to `VK_TRUE` and there is a **fragment shader** which declares the `EarlyFragmentTests` execution mode, **fragment shading** and **multisample coverage** operations **must** be performed after **sample counting**.

Otherwise, if `VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentMultisampleCoverageAfterSampleCounting` is set to `VK_FALSE` and there is a **fragment shader** which declares the `EarlyFragmentTests` execution mode, **fragment shading** and **multisample coverage** operations **should** instead be performed after **sample counting**, but **may** be performed before **sample counting**.

If `VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentSampleMaskTestBeforeSampleCounting` is set to `VK_TRUE` and there is a **fragment shader** which declares the `EarlyFragmentTests` execution mode **sample mask test** operations **must** follow the order of fragment operations from above.

Otherwise, if `VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentSampleMaskTestBeforeSampleCounting` is set to `VK_FALSE` and there is a **fragment shader** which declares the `EarlyFragmentTests` execution mode, **sample mask test** operations **should** follow the order of fragment operations from above but **may** instead be performed after **sample counting**.

If there is a **fragment shader** which declares the `EarlyAndLateFragmentTestsAMD` execution mode, and it does not declare the `DepthReplacing` or `StencilRefReplacingEXT` execution mode, **fragment shading** and **multisample coverage** operations are instead be performed after **sample counting**.

For a pipeline with the following properties:

- a fragment shader is specified
- the fragment shader either specifies `EarlyAndLateFragmentTestsAMD` or does not write to storage resources;
- the fragment shader specifies the `StencilRefReplacext` execution mode;
- either
  - the fragment shader specifies the `StencilRefUnchangedFrontAMD` execution mode;
  - the fragment shader specifies the `StencilRefLessFrontAMD` execution mode and the pipeline uses a `VkPipelineDepthStencilStateCreateInfo::front.compareOp` of `VK_COMPARE_OP_GREATER` or `VK_COMPARE_OP_GREATER_OR_EQUAL`; or
  - the fragment shader specifies the `StencilRefGreaterFrontAMD` execution mode and the pipeline uses a `VkPipelineDepthStencilStateCreateInfo::front.compareOp` of `VK_COMPARE_OP_LESS` or `VK_COMPARE_OP_LESS_OR_EQUAL`; and
- either
  - the fragment shader specifies the `StencilRefUnchangedBackAMD` execution mode;
  - the fragment shader specifies the `StencilRefLessBackAMD` execution mode and the pipeline uses a `VkPipelineDepthStencilStateCreateInfo::back.compareOp` of `VK_COMPARE_OP_GREATER` or `VK_COMPARE_OP_GREATER_OR_EQUAL`; or
the fragment shader specifies the StencilRefGreaterBackAMD execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::back.compareOp of VK_COMPARE_OP_LESS or VK_COMPARE_OP_LESS_OR_EQUAL

an additional stencil test may be performed before fragment shading, using the stencil reference value specified by VkPipelineDepthStencilStateCreateInfo::front.reference or VkPipelineDepthStencilStateCreateInfo::back.reference.

For a pipeline with the following properties:

- a fragment shader is specified
- the fragment shader either specifies EarlyAndLateFragmentTestsAMD or does not write to storage resources;
- the fragment shader specifies the DepthReplacing execution mode; and
- either
  - the fragment shader specifies the DepthUnchanged execution mode;
  - the fragment shader specifies the DepthLess execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::depthCompareOp of VK_COMPARE_OP_GREATER or VK_COMPARE_OP_GREATER_OR_EQUAL; or
  - the fragment shader specifies the DepthGreater execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::depthCompareOp of VK_COMPARE_OP_LESS or VK_COMPARE_OP_LESS_OR_EQUAL

the implementation may perform depth bounds test before fragment shading and perform an additional depth test immediately after that using the interpolated depth value generated by rasterization.

Once all fragment operations have completed, fragment shader outputs for covered color attachment samples pass through framebuffer operations.

29.1. Discard Rectangles Test

The discard rectangle test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a set of discard rectangles.

Each discard rectangle is defined by a VkRect2D. These values are either set by the VkPipelineDiscardRectangleStateCreateInfoEXT structure during pipeline creation, or dynamically by the vkCmdSetDiscardRectangleEXT command.

A given sample is considered inside a discard rectangle if the \(x_i\) is in the range \([VkRect2D::offset.x, VkRect2D::offset.x + VkRect2D::extent.x]\), and \(y_i\) is in the range \([VkRect2D::offset.y, VkRect2D::offset.y + VkRect2D::extent.y]\). If the test is set to be inclusive, samples that are not inside any of the discard rectangles will have their coverage set to 0. If the test is set to be exclusive, samples that are inside any of the discard rectangles will have their coverage set to 0.

If no discard rectangles are specified, the coverage mask is unmodified by this operation.
The `VkPipelineDiscardRectangleStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_discard_rectangles
typedef struct VkPipelineDiscardRectangleStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDiscardRectangleStateCreateFlagsEXT flags;
    VkDiscardRectangleModeEXT discardRectangleMode;
    uint32_t discardRectangleCount;
    const VkRect2D* pDiscardRectangles;
} VkPipelineDiscardRectangleStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `discardRectangleMode` is a `VkDiscardRectangleModeEXT` value determining whether the discard rectangle test is inclusive or exclusive.
- `discardRectangleCount` is the number of discard rectangles to use.
- `pDiscardRectangles` is a pointer to an array of `VkRect2D` structures defining discard rectangles.

If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is enabled for a pipeline, the `pDiscardRectangles` member is ignored. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state is not enabled for the pipeline the presence of this structure in the `VkGraphicsPipelineCreateInfo` chain, and a `discardRectangleCount` greater than zero, implicitly enables discard rectangles in the pipeline, otherwise discard rectangles must enabled or disabled by `vkCmdSetDiscardRectangleEnableEXT`. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state is enabled for the pipeline, the `discardRectangleMode` member is ignored, and the discard rectangle mode must be set by `vkCmdSetDiscardRectangleModeEXT`.

When this structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it defines parameters of the discard rectangle test. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is not enabled, and this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with a `discardRectangleCount` of 0.

### Valid Usage

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleCount-00582
discardRectangleCount must be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`

### Valid Usage (Implicit)

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_DISCARD_RECTANGLE_STATE_CREATE_INFO_EXT`
VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-flags-zerobitmask
flags must be 0

VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleMode-parameter
discardRectangleMode must be a valid VkDiscardRectangleModeEXT value

// Provided by VK_EXT_discard_rectangles
typedef VkFlags VkPipelineDiscardRectangleStateCreateFlagsEXT;

VkPipelineDiscardRectangleStateCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

VkDiscardRectangleModeEXT values are:

// Provided by VK_EXT_discard_rectangles
typedef enum VkDiscardRectangleModeEXT {
    VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT = 0,
    VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT = 1,
} VkDiscardRectangleModeEXT;

• VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT specifies that the discard rectangle test is inclusive.
• VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT specifies that the discard rectangle test is exclusive.

To dynamically set the discard rectangles, call:

// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEXT(
    VkCommandBuffer commandBuffer,             commandBuffer,
    uint32_t firstDiscardRectangle,            firstDiscardRectangle,
    uint32_t discardRectangleCount,            discardRectangleCount,
    const VkRect2D* pDiscardRectangles);        pDiscardRectangles);

• commandBuffer is the command buffer into which the command will be recorded.
• firstDiscardRectangle is the index of the first discard rectangle whose state is updated by the command.
• discardRectangleCount is the number of discard rectangles whose state are updated by the command.
• pDiscardRectangles is a pointer to an array of VkRect2D structures specifying discard rectangles.

The discard rectangle taken from element i of pDiscardRectangles replace the current state for the discard rectangle at index firstDiscardRectangle + i, for i in [0, discardRectangleCount).

This command sets the discard rectangles for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates.
Otherwise, this state is specified by the `VkPipelineDiscardRectangleStateCreateInfoEXT`::pDiscardRectangles values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDiscardRectangleEXT-firstDiscardRectangle-00585**
  The sum of firstDiscardRectangle and discardRectangleCount must be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT`::maxDiscardRectangles.

- **VUID-vkCmdSetDiscardRectangleEXT-x-00587**
  The x and y member of offset in each `VkRect2D` element of pDiscardRectangles must be greater than or equal to 0.

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00588**
  Evaluation of (offset.x + extent.width) in each `VkRect2D` element of pDiscardRectangles must not cause a signed integer addition overflow.

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00589**
  Evaluation of (offset.y + extent.height) in each `VkRect2D` element of pDiscardRectangles must not cause a signed integer addition overflow.

- **VUID-vkCmdSetDiscardRectangleEXT-viewportScissor2D-04788**
  If this command is recorded in a secondary command buffer with `VkCommandBufferInheritanceViewportScissorInfoNV`::viewportScissor2D enabled, then this function must not be called.

### Valid Usage (Implicit)

- **VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-parameter**
  commandBuffer must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetDiscardRectangleEXT-pDiscardRectangles-parameter**
  pDiscardRectangles must be a valid pointer to an array of discardRectangleCount `VkRect2D` structures.

- **VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-recording**
  commandBuffer must be in the recording state.

- **VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that commandBuffer was allocated from must support graphics operations.

- **VUID-vkCmdSetDiscardRectangleEXT-videocoding**
  This command must only be called outside of a video coding scope.

- **VUID-vkCmdSetDiscardRectangleEXT-discardRectangleCount-arraylength**
  discardRectangleCount must be greater than 0.

### Host Synchronization

- Host access to commandBuffer must be externally synchronized.
Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set whether discard rectangles are enabled, call:

```c
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 discardRectangleEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `discardRectangleEnable` specifies whether discard rectangles are enabled or not.

This command sets the discard rectangle enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is implied by the `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount` value used to create the currently active pipeline, where a non-zero `discardRectangleCount` implicitly enables discard rectangles, otherwise they are disabled.

### Valid Usage

- VUID-vkCmdSetDiscardRectangleEnableEXT-specVersion-07851
  The `VK_EXT_discard_rectangles` extension must be enabled, and the implementation must support at least `specVersion` 2 of this extension.

### Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics
operations

- VUID-vkCmdSetDiscardRectangleEnableEXT-videocoding
  This command **must** only be called outside of a video coding scope

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To **dynamically set** the discard rectangle mode, call:

```cpp
// Provided by VK_EXT_discard_rectangles
typedef void vkCmdSetDiscardRectangleModeEXT
( VkCommandBuffer commandBuffer,
  VkDiscardRectangleModeEXT discardRectangleMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `discardRectangleMode` specifies the discard rectangle mode for all discard rectangles, either inclusive or exclusive.

This command sets the discard rectangle mode for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleMode` value used to create the currently active pipeline.

## Valid Usage

- VUID-vkCmdSetDiscardRectangleModeEXT-specVersion-07852
  The **VK_EXT_discard_rectangles** extension **must** be enabled, and the implementation **must** support at least specVersion 2 of this extension
Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDiscardRectangleModeEXT-discardRectangleMode-parameter
  `discardRectangleMode` must be a valid `VkDiscardRectangleModeEXT` value

- VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetDiscardRectangleModeEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>

29.2. Scissor Test

The scissor test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a scissor rectangle at the index equal to the fragment's ViewportIndex.

Each scissor rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineViewportStateCreateInfo` structure during pipeline creation, or dynamically by the `vkCmdSetScissor` command.

A given sample is considered inside a scissor rectangle if \(x_f\) is in the range \([VkRect2D::offset.x, VkRect2D::offset.x + VkRect2D::extent.x)\), and \(y_f\) is in the range \([VkRect2D::offset.y, VkRect2D::offset.y + VkRect2D::extent.y)\). Samples with coordinates outside the scissor rectangle at the corresponding ViewportIndex will have their coverage set to 0.

If a render pass transform is enabled, the \((offset.x \text{ and } offset.y)\) and \((extent.width \text{ and } extent.height)\) must be internally synchronized.
extent.height) values are transformed as described in render pass transform before participating in the scissor test.

To dynamically set the scissor rectangles, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetScissor(
    VkCommandBuffer commandBuffer,        // commandBuffer is the command buffer into which the command will be recorded.
    uint32_t firstScissor,                 // firstScissor is the index of the first scissor whose state is updated by the command.
    uint32_t scissorCount,                 // scissorCount is the number of scissors whose rectangles are updated by the command.
    const VkRect2D* pScissors);           // pScissors is a pointer to an array of VkRect2D structures defining scissor rectangles.
```

The scissor rectangles taken from element i of pScissors replace the current state for the scissor index firstScissor + i, for i in [0, scissorCount).

This command sets the scissor rectangles for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_SCISSOR set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineViewportStateCreateInfo::pScissors values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetScissor-firstScissor-00592**
  The sum of firstScissor and scissorCount must be between 1 and VkPhysicalDeviceLimits::maxViewports, inclusive

- **VUID-vkCmdSetScissor-firstScissor-00593**
  If the multiViewport feature is not enabled, firstScissor must be 0

- **VUID-vkCmdSetScissor-scissorCount-00594**
  If the multiViewport feature is not enabled, scissorCount must be 1

- **VUID-vkCmdSetScissor-x-00595**
  The x and y members of offset member of any element of pScissors must be greater than or equal to 0

- **VUID-vkCmdSetScissor-offset-00596**
  Evaluation of (offset.x + extent.width) must not cause a signed integer addition overflow for any element of pScissors

- **VUID-vkCmdSetScissor-offset-00597**
  Evaluation of (offset.y + extent.height) must not cause a signed integer addition overflow for any element of pScissors

- **VUID-vkCmdSetScissor-viewportScissor2D-04789**
If this command is recorded in a secondary command buffer with VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D enabled, then this function must not be called.

Valid Usage (Implicit)

- VUID-vkCmdSetScissor-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetScissor-pScissors-parameter
  pScissors must be a valid pointer to an array of scissorCount VkRect2D structures
- VUID-vkCmdSetScissor-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetScissor-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetScissor-vidocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdSetScissor-scissorCount-arraylength
  scissorCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

29.3. Exclusive Scissor Test

The exclusive scissor test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against an exclusive scissor rectangle at the index equal to the fragment’s ViewportIndex.

Each exclusive scissor rectangle is defined by a VkRect2D. These values are either set by the VkPipelineViewportExclusiveScissorStateCreateInfoNV structure during pipeline creation, or
A given sample is considered inside an exclusive scissor rectangle if $x_i$ is in the range $[\text{VkRect2D}::\text{offset}.x, \text{VkRect2D}::\text{offset}.x + \text{VkRect2D}::\text{extent}.x)$, and $y_i$ is in the range $[\text{VkRect2D}::\text{offset}.y, \text{VkRect2D}::\text{offset}.y + \text{VkRect2D}::\text{extent}.y)$. Samples with coordinates inside the exclusive scissor rectangle at the corresponding $\text{ViewportIndex}$ will have their coverage set to 0.

If no exclusive scissor rectangles are specified, the coverage mask is unmodified by this operation.

The `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_scissor_exclusive
typedef struct VkPipelineViewportExclusiveScissorStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t exclusiveScissorCount;
    const VkRect2D* pExclusiveScissors;
} VkPipelineViewportExclusiveScissorStateCreateInfoNV;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **exclusiveScissorCount** is the number of exclusive scissor rectangles.
- **pExclusiveScissors** is a pointer to an array of `VkRect2D` structures defining exclusive scissor rectangles.

If the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` dynamic state is enabled for a pipeline, the **pExclusiveScissors** member is ignored.

When this structure is included in the **pNext** chain of `VkGraphicsPipelineCreateInfo`, it defines parameters of the exclusive scissor test. If this structure is not included in the **pNext** chain, it is equivalent to specifying this structure with an **exclusiveScissorCount** of 0.

### Valid Usage

- **VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02027**
  If the **multiViewport** feature is not enabled, **exclusiveScissorCount** must be 0 or 1

- **VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02028**
  **exclusiveScissorCount** must be less than or equal to `VkPhysicalDeviceLimits::maxViewports`

- **VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02029**
  **exclusiveScissorCount** must be 0 or greater than or equal to the **viewportCount** member of `VkPipelineViewportStateCreateInfo`
Valid Usage (Implicit)

• VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-sType-sType must be
  VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_EXCLUSIVE_SCISSOR_STATE_CREATE_INFO_NV

To dynamically set the exclusive scissor rectangles, call:

```c
// Provided by VK_NV_scissor_exclusive
void vkCmdSetExclusiveScissorNV(
    VkCommandBuffer commandBuffer,
    uint32_t firstExclusiveScissor,
    uint32_t exclusiveScissorCount,
    const VkRect2D* pExclusiveScissors);
```

• `commandBuffer` is the command buffer into which the command will be recorded.
• `firstExclusiveScissor` is the index of the first exclusive scissor rectangle whose state is updated by the command.
• `exclusiveScissorCount` is the number of exclusive scissor rectangles updated by the command.
• `pExclusiveScissors` is a pointer to an array of `VkRect2D` structures defining exclusive scissor rectangles.

The scissor rectangles taken from element `i` of `pExclusiveScissors` replace the current state for the scissor index `firstExclusiveScissor + i`, for `i` in `[0, exclusiveScissorCount)`.`

This command sets the exclusive scissor rectangles for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportExclusiveScissorStateCreateInfoNV ::pExclusiveScissors` values used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetExclusiveScissorNV-None-02031
  The exclusiveScissor feature must be enabled

• VUID-vkCmdSetExclusiveScissorNV-firstExclusiveScissor-02034
  The sum of `firstExclusiveScissor` and `exclusiveScissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

• VUID-vkCmdSetExclusiveScissorNV-firstExclusiveScissor-02035
  If the multiViewport feature is not enabled, `firstExclusiveScissor` must be 0

• VUID-vkCmdSetExclusiveScissorNV-exclusiveScissorCount-02036
  If the multiViewport feature is not enabled, `exclusiveScissorCount` must be 1

• VUID-vkCmdSetExclusiveScissorNV-x-02037
The \( x \) and \( y \) members of \( \text{offset} \) in each member of \( \text{pExclusiveScissors} \) must be greater than or equal to 0.

- VUID-vkCmdSetExclusiveScissorNV-offset-02038
  Evaluation of \( (\text{offset}.x + \text{extent}.\text{width}) \) for each member of \( \text{pExclusiveScissors} \) must not cause a signed integer addition overflow.

- VUID-vkCmdSetExclusiveScissorNV-offset-02039
  Evaluation of \( (\text{offset}.y + \text{extent}.\text{height}) \) for each member of \( \text{pExclusiveScissors} \) must not cause a signed integer addition overflow.

**Valid Usage (Implicit)**

- VUID-vkCmdSetExclusiveScissorNV-commandBuffer-parameter
  \( \text{commandBuffer} \) must be a valid \( \text{VkCommandBuffer} \) handle.

- VUID-vkCmdSetExclusiveScissorNV-pExclusiveScissors-parameter
  \( \text{pExclusiveScissors} \) must be a valid pointer to an array of \( \text{exclusiveScissorCount} \) \( \text{VkRect2D} \) structures.

- VUID-vkCmdSetExclusiveScissorNV-commandBuffer-recording
  \( \text{commandBuffer} \) must be in the recording state.

- VUID-vkCmdSetExclusiveScissorNV-commandBuffer-cmdpool
  The \( \text{VkCommandPool} \) that \( \text{commandBuffer} \) was allocated from must support graphics operations.

- VUID-vkCmdSetExclusiveScissorNV-videocoding
  This command must only be called outside of a video coding scope.

- VUID-vkCmdSetExclusiveScissorNV-exclusiveScissorCount-arraylength
  \( \text{exclusiveScissorCount} \) must be greater than 0.

**Host Synchronization**

- Host access to \( \text{commandBuffer} \) must be externally synchronized.

- Host access to the \( \text{VkCommandPool} \) that \( \text{commandBuffer} \) was allocated from must be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

To dynamically set whether an exclusive scissor is enabled or not, call:
void vkCmdSetExclusiveScissorEnableNV(
  VkCommandBuffer commandBuffer, 
  uint32_t firstExclusiveScissor, 
  uint32_t exclusiveScissorCount, 
  const VkBool32* pExclusiveScissorEnables);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **firstExclusiveScissor** is the index of the first exclusive scissor rectangle whose state is updated by the command.
- **exclusiveScissorCount** is the number of exclusive scissor rectangles updated by the command.
- **pExclusiveScissorEnables** is a pointer to an array of **VkBool32** values defining whether the exclusive scissor is enabled.

The exclusive scissor enables taken from element \( i \) of **pExclusiveScissorEnables** replace the current state for the scissor index \( \text{firstExclusiveScissor} + i \), for \( i \) in \([0, \text{exclusiveScissorCount})\).

This command sets the exclusive scissor enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is implied by the `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` value used to create the currently active pipeline, where all `exclusiveScissorCount` exclusive scissors are implicitly enabled and the remainder up to `VkPhysicalDeviceLimits::maxViewports` are implicitly disabled.

**Valid Usage**

- VUID-vkCmdSetExclusiveScissorEnableNV-exclusiveScissor-07853
  The exclusiveScissor feature **must** be enabled, and the implementation **must** support at least specVersion 2 of the **VK_NV_scissor_exclusive** extension

**Valid Usage (Implicit)**

- VUID-vkCmdSetExclusiveScissorEnableNV-commandBuffer-parameter
  **commandBuffer** **must** be a valid **VkCommandBuffer** handle

- VUID-vkCmdSetExclusiveScissorEnableNV-pExclusiveScissorEnables-parameter
  **pExclusiveScissorEnables** **must** be a valid pointer to an array of **exclusiveScissorCount VkBool32** values

- VUID-vkCmdSetExclusiveScissorEnableNV-commandBuffer-recording
  **commandBuffer** **must** be in the **recording state**

- VUID-vkCmdSetExclusiveScissorEnableNV-commandBuffer-cmdpool
  The **VkCommandPool** that **commandBuffer** was allocated from **must** support graphics operations
• VUID-vkCmdSetExclusiveScissorEnableNV-videocoding
  This command must only be called outside of a video coding scope
• VUID-vkCmdSetExclusiveScissorEnableNV-exclusiveScissorCount-arraylength
  exclusiveScissorCount must be greater than 0

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

</tbody>
</table>

29.4. Sample Mask Test

The sample mask test compares the coverage mask for a fragment with the sample mask defined by VkPipelineMultisampleStateCreateInfo::pSampleMask.

To dynamically set the sample mask, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetSampleMaskEXT(
    VkCommandBuffer commandBuffer,  
    VkSampleCountFlagBits samples,  
    const VkSampleMask* pSampleMask);
```

• commandBuffer is the command buffer into which the command will be recorded.
• samples specifies the number of sample bits in the pSampleMask.
• pSampleMask is a pointer to an array of VkSampleMask values, where the array size is based on the samples parameter.

This command sets the sample mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_SAMPLE_MASK_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineMultisampleStateCreateInfo::pSampleMask value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetSampleMaskEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3SampleMask` feature is enabled
  - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetSampleMaskEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetSampleMaskEXT-samples-parameter
  `samples` must be a valid `VkSampleCountFlagBits` value

- VUID-vkCmdSetSampleMaskEXT-pSampleMask-parameter
  `pSampleMask` must be a valid pointer to an array of \(\frac{\text{samples}}{32}\) `VkSampleMask` values

- VUID-vkCmdSetSampleMaskEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetSampleMaskEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetSampleMaskEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

Each bit of the coverage mask is associated with a sample index as described in the [rasterization chapter](#). If the bit in `VkPipelineMultisampleStateCreateInfo::pSampleMask` which is associated with that same sample index is set to 0, the coverage mask bit is set to 0.
29.5. Fragment Shading

Fragment shaders are invoked for each fragment, or as helper invocations.

Most operations in the fragment shader are not performed in rasterization order, with exceptions called out in the following sections.

For fragment shaders invoked by fragments, the following rules apply:

- A fragment shader must not be executed if a fragment operation that executes before fragment shading discards the fragment.

- A fragment shader may not be executed if:
  - An implementation determines that another fragment shader, invoked by a subsequent primitive in primitive order, overwrites all results computed by the shader (including writes to storage resources).
  - Any other fragment operation discards the fragment, and the shader does not write to any storage resources.
  - If a fragment shader statically computes the same values for different framebuffer locations, and does not write to any storage resources, multiple fragments may be shaded by one fragment shader invocation. This may affect VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS results, but must otherwise not be visible behavior to applications.

- Otherwise, at least one fragment shader must be executed.
  - If sample shading is enabled and multiple invocations per fragment are required, additional invocations must be executed as specified.
  - If a shading rate image is used and multiple invocations per fragment are required, additional invocations must be executed as specified.
  - Each covered sample must be included in at least one fragment shader invocation.

If no fragment shader is included in the pipeline, no fragment shader is executed, and undefined values may be written to all color attachment outputs during this fragment operation.

Note

Multiple fragment shader invocations may be executed for the same fragment for any number of implementation-dependent reasons. When there is more than one fragment shader invocation per fragment, the association of samples to invocations is implementation-dependent. Stores and atomics performed by these additional invocations have the normal effect.

For example, if the subpass includes multiple views in its view mask, a fragment shader may be invoked separately for each view.

Similarly, if the render pass has a fragment density map attachment, more than one fragment shader invocation may be invoked for each covered sample. Such additional invocations are only produced if VkPhysicalDeviceFragmentDensityMapPropertiesEXT::fragmentDensityInvocations is
VK_TRUE. Implementations may generate these additional fragment shader invocations in order to make transitions between fragment areas with different fragment densities more smooth.

29.5.1. Sample Mask

Reading from the SampleMask built-in in the Input storage class will return the coverage mask for the current fragment as calculated by fragment operations that executed prior to fragment shading.

If sample shading is enabled, fragment shaders will only see values of 1 for samples being shaded - other bits will be 0.

Each bit of the coverage mask is associated with a sample index as described in the rasterization chapter. If the bit in SampleMask which is associated with that same sample index is set to 0, that coverage mask bit is set to 0.

Values written to the SampleMask built-in in the Output storage class will be used by the multisample coverage operation, with the same encoding as the input built-in.

29.5.2. Fragment Shader Tile Image Reads

If the VK_EXT_shader_tile_image extension is enabled, implementations divide the framebuffer into a grid of tiles. A tile image is a view of a framebuffer attachment tile for fragments with locations within the tile.

Within a render pass instance initiated by vkCmdBeginRenderingKHR, fragment shader invocations can read the framebuffer color, depth, and stencil values at the fragment location via tile images.

Note

Even though fragment shader invocation can only read from the corresponding fragment location, the abstraction of a tile image is introduced for the following reasons:

• Tile dimensions will be exposed in a future extension
• Future functionality such as executing compute dispatches within render passes via tile shaders can leverage tile images.

Enabling shaderTileImageColorReadAccess, shaderTileImageDepthReadAccess, shaderTileImageStencilReadAccess enables fragment shader invocations to read from color, depth, and stencil, respectively.

Color values are read from tile image variables with OpColorAttachmentReadEXT. Tile image variables are linked to specific color attachments using Location decoration. See Fragment Tile Image Interface for more details.

Depth values are read with OpDepthAttachmentReadEXT.

Stencil values are read with OpStencilAttachmentReadEXT.
The sample to read is specified by a sample index value specified as the Sample operand to OpColorAttachmentReadEXT, OpDepthAttachmentReadEXT, or OpStencilAttachmentReadEXT.

If sample shading is disabled, a fragment invocation can read from all sample locations associated with the fragment regardless of the fragment’s coverage. This functionality is supported for VkPipelineMultisampleStateCreateInfo::rasterizationSamples > 1 when VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageReadSampleFromPixelRateInvocation is VK_TRUE.

If sample shading is enabled, and minSampleShading is 1.0, a fragment invocation must only read from the coverage index sample. Tile image access must not be used if the value of minSampleShading is not 1.0.

If the fragment shader declares the EarlyFragmentTests execution mode, depth reads are allowed only if depth writes are disabled and stencil reads are allowed only if stencil writes are disabled.

If VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageReadFromHelperInvocation is VK_FALSE, values read from helper invocations are undefined otherwise the values read are subject to the coherency guarantees described below.

OpDepthAttachmentReadEXT returns an undefined value if no depth attachment is present. OpStencilAttachmentReadEXT returns an undefined value if no stencil attachment is present.

Tile image reads from color, depth and stencil attachments are said to be coherent when the accesses happen in raster order and without data race with respect to accesses to the attachments from framebuffer-space pipeline stages. The samples which qualify for coherent access and the enabling conditions are described below.

- Let Rc be the set of components being read from an attachment A in a draw call
- Let Wc be the set of components being written to A by the draw call

The samples which qualify for coherent tile image reads from an attachment A are:

- All samples in a pixel when Rc is disjoint with Wc.
- The samples with coverage in a fragment when Rc is not disjoint with Wc. The samples with coverage are determined by the coverage mask for the fragment as calculated by fragment operations that executed prior to fragment shading, including early fragment tests if enabled for the draw call.

A fragment shader can declare NonCoherentColorAttachmentReadEXT, NonCoherentDepthAttachmentReadEXT, or NonCoherentStencilAttachmentReadEXT execution modes to enable non-coherent tile image reads which require an explicit vkCmdPipelineBarrier2 call for the writes to an attachment to be made visible via tile image reads.

When VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageCoherentReadAccelerated is VK_TRUE, the implementation prefers that coherent tile image reads are used, otherwise the implementation prefers that non-coherent tile image reads are used.
In practice, the most common tile image reads usage patterns fall under one of the following:

- **Programmable blending** - each fragment reads from a single sample (SampleID) at its location. Per-sample shading is typically enabled when multisampled rendertargets are used.

- **G-buffer generation and shading in one render pass** - in the shading phase a fragment reads from a single sample at its location.

- **Programmable resolve** - a fragment reads from all samples at its location (per-sample shading is disabled). This requires the use of a "full-screen triangle" instead of a rectangle composed of two triangles in order to avoid data races along the shared edge of the triangles.

- **1:1 texturing with LOD** - in use cases such a deferred screen space decals a fragment reads a single sample (SampleID) from depth buffer, but requires being able to read from helper threads to derive the texture LOD. This use case is supported as long as the attachment components being read are not overwritten by color, depth, or stencil attachment writes.

All of the above use cases are supported by coherent tile image reads, but only the latter three are supported when non-coherent reads are used as there is no mechanism to synchronize non-coherent reads with writes within a draw call.

### 29.5.3. Depth Replacement

Writing to the \texttt{FragDepth} built-in will replace the fragment’s calculated depth values for each sample in the input \texttt{SampleMask}. Depth testing performed after the fragment shader for this fragment will use this new value as \( z_f \).

### 29.5.4. Stencil Reference Replacement

Writing to the \texttt{FragStencilRefEXT} built-in will replace the fragment’s stencil reference value for each sample in the input \texttt{SampleMask}. Stencil testing performed after the fragment shader for this fragment will use this new value as \( s_r \).

### 29.5.5. Interlocked Operations

\texttt{OpBeginInvocationInterlockEXT} and \texttt{OpEndInvocationInterlockEXT} define a section of a fragment shader which imposes additional ordering constraints on operations performed within them. These operations are defined as \textit{interlocked operations}. How interlocked operations are ordered against other fragment shader invocations depends on the specified execution modes.

If the \texttt{ShadingRateInterlockOrderedEXT} execution mode is specified, any interlocked operations in a fragment shader \textbf{must} happen before interlocked operations in fragment shader invocations that execute later in \textit{rasterization order} and cover at least one sample in the same fragment area, and \textbf{must} happen after interlocked operations in a fragment shader that executes earlier in \textit{rasterization order} and cover at least one sample in the same fragment area.

If the \texttt{ShadingRateInterlockUnorderedEXT} execution mode is specified, any interlocked operations in a
fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in *rasterization order* and cover at least one sample in the same fragment area.

If the `PixelInterlockOrderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in *rasterization order* and cover at least one sample in the same pixel, and **must** happen after interlocked operations in a fragment shader that executes earlier in *rasterization order* and cover at least one sample in the same pixel.

If the `PixelInterlockUnorderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in *rasterization order* and cover at least one sample in the same pixel.

If the `SampleInterlockOrderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in *rasterization order* and cover at least one of the same samples, and **must** happen after interlocked operations in a fragment shader that executes earlier in *rasterization order* and cover at least one of the same samples.

If the `SampleInterlockUnorderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in *rasterization order* and cover at least one of the same samples.

### 29.6. Multisample Coverage

If a fragment shader is active and its entry point's interface includes a built-in output variable decorated with `SampleMask`, but not `OverrideCoverageNV`, the coverage mask is **ANDed** with the bits of the `SampleMask` built-in to generate a new coverage mask. If the `SampleMask` built-in is also decorated with `OverrideCoverageNV`, the coverage mask is replaced with the mask bits set in the shader. If *sample shading* is enabled, bits written to `SampleMask` corresponding to samples that are not being shaded by the fragment shader invocation are ignored. If no fragment shader is active, or if the active fragment shader does not include `SampleMask` in its interface, the coverage mask is not modified.

Next, the fragment alpha value and coverage mask are modified based on the line coverage factor if the `lineRasterizationMode` member of the `VkPipelineRasterizationStateCreateInfo` structure is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR`, and the `alphaToCoverageEnable` and `alphaToOneEnable` members of the `VkPipelineMultisampleStateCreateInfo` structure.

To dynamically set the `alphaToCoverageEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetAlphaToCoverageEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 alphaToCoverageEnable);
```
• commandBuffer is the command buffer into which the command will be recorded.
• alphaToCoverageEnable specifies the alphaToCoverageEnable state.

This command sets the alphaToCoverageEnable state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineMultisampleStateCreateInfo::alphaToCoverageEnable value used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetAlphaToCoverageEnableEXT-None-09423
  At least one of the following must be true:
  ◦ The extendedDynamicState3AlphaToCoverageEnable feature is enabled
  ◦ The shaderObject feature is enabled

Valid Usage (Implicit)

• VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
• VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state
• VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
• VUID-vkCmdSetAlphaToCoverageEnableEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
To dynamically set the alphaToOneEnable state, call:

```cpp
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetAlphaToOneEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 alphaToOneEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `alphaToOneEnable` specifies the alphaToOneEnable state.

This command sets the alphaToOneEnable state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::alphaToOneEnable` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetAlphaToOneEnableEXT-None-09423**
  At least one of the following must be true:
  - The `extendedDynamicState3AlphaToOneEnable` feature is enabled
  - The `shaderObject` feature is enabled

- **VUID-vkCmdSetAlphaToOneEnableEXT-alphaToOne-07607**
  If the `alphaToOne` feature is not enabled, `alphaToOneEnable` must be `VK_FALSE`

### Valid Usage (Implicit)

- **VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetAlphaToOneEnableEXT-videocoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
All alpha values in this section refer only to the alpha component of the fragment shader output that has a Location and Index decoration of zero (see the Fragment Output Interface section). If that shader output has an integer or unsigned integer type, then these operations are skipped.

If the lineRasterizationMode member of the VkPipelineRasterizationStateCreateInfo structure is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR and the fragment came from a line segment, then the alpha value is replaced by multiplying it by the coverage factor for the fragment computed during smooth line rasterization.

If alphaToCoverageEnable is enabled, a temporary coverage mask is generated where each bit is determined by the fragment's alpha value, which is ANDed with the fragment coverage mask.

No specific algorithm is specified for converting the alpha value to a temporary coverage mask. It is intended that the number of 1's in this value be proportional to the alpha value (clamped to [0,1]), with all 1's corresponding to a value of 1.0 and all 0's corresponding to 0.0. The algorithm may be different at different framebuffer coordinates.

No specific algorithm is specified for converting the alpha value to a temporary coverage mask. It is intended that the number of 1's in this value be proportional to the alpha value (clamped to [0,1]), with all 1's corresponding to a value of 1.0 and all 0's corresponding to 0.0. The algorithm may be different at different framebuffer coordinates.

Finally, if alphaToOneEnable is enabled, each alpha value is replaced by the maximum representable alpha value for fixed-point color attachments, or by 1.0 for floating-point attachments. Otherwise, the alpha values are not changed.

### 29.7. Depth and Stencil Operations

Pipeline state controlling the depth bounds tests, stencil test, and depth test is specified through the members of the VkPipelineDepthStencilStateCreateInfo structure.

The VkPipelineDepthStencilStateCreateInfo structure is defined as:
typedef struct VkPipelineDepthStencilStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDepthStencilStateCreateFlags flags;
    VkBool32 depthTestEnable;
    VkBool32 depthWriteEnable;
    VkCompareOp depthCompareOp;
    VkBool32 depthBoundsTestEnable;
    VkBool32 stencilTestEnable;
    VkStencilOpState front;
    VkStencilOpState back;
    float minDepthBounds;
    float maxDepthBounds;
} VkPipelineDepthStencilStateCreateInfo;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkPipelineDepthStencilStateCreateFlagBits specifying additional depth/stencil state information.
- **depthTestEnable** controls whether depth testing is enabled.
- **depthWriteEnable** controls whether depth writes are enabled when depthTestEnable is VK_TRUE. Depth writes are always disabled when depthTestEnable is VK_FALSE.
- **depthCompareOp** is a VkCompareOp value specifying the comparison operator to use in the Depth Comparison step of the depth test.
- **depthBoundsTestEnable** controls whether depth bounds testing is enabled.
- **stencilTestEnable** controls whether stencil testing is enabled.
- **front** and **back** are VkStencilOpState values controlling the corresponding parameters of the stencil test.
- **minDepthBounds** is the minimum depth bound used in the depth bounds test.
- **maxDepthBounds** is the maximum depth bound used in the depth bounds test.

### Valid Usage

- **VUID-VkPipelineDepthStencilStateCreateInfo-depthBoundsTestEnable-00598**
  If the depthBounds feature is not enabled, depthBoundsTestEnable must be VK_FALSE.

- **VUID-VkPipelineDepthStencilStateCreateInfo-separateStencilMaskRef-04453**
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::separateStencilMaskRef is VK_FALSE, and the value of VkPipelineDepthStencilStateCreateInfo::stencilTestEnable is VK_TRUE, and the value of VkPipelineRasterizationStateCreateInfo::cullMode is VK_CULL_MODE_NONE, the value of reference in each of the VkStencilOpState structs in front and back must be the same.

- **VUID-VkPipelineDepthStencilStateCreateInfo-rasterizationOrderDepthAttachmentAccess-**

2801
If the `rasterizationOrderDepthAttachmentAccess` feature is not enabled, **flags must not** include `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT`.

- **VUID-VkPipelineDepthStencilStateCreateInfo-rasterizationOrderStencilAttachmentAccess-06464**

  If the `rasterizationOrderStencilAttachmentAccess` feature is not enabled, **flags must not** include `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`.

---

### Valid Usage (Implicit)

- **VUID-VkPipelineDepthStencilStateCreateInfo-sType-sType**
  
  * **sType** must be `VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO`.

- **VUID-VkPipelineDepthStencilStateCreateInfo-pNext-pNext**
  
  * **pNext** must be `NULL`.

- **VUID-VkPipelineDepthStencilStateCreateInfo-flags-parameter**
  
  * **flags** must be a valid combination of `VkPipelineDepthStencilStateCreateFlagBits` values.

- **VUID-VkPipelineDepthStencilStateCreateInfo-depthCompareOp-parameter**
  
  * **depthCompareOp** must be a valid `VkCompareOp` value.

- **VUID-VkPipelineDepthStencilStateCreateInfo-front-parameter**
  
  * **front** must be a valid `VkStencilOpState` structure.

- **VUID-VkPipelineDepthStencilStateCreateInfo-back-parameter**
  
  * **back** must be a valid `VkStencilOpState` structure.

---

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDepthStencilStateCreateFlags;
```

**VkPipelineDepthStencilStateCreateFlags** is a bitmask type for setting a mask of zero or more `VkPipelineDepthStencilStateCreateFlagBits` values.

Bits which **can** be set in the `VkPipelineDepthStencilStateCreateInfo::flags` parameter are:
// Provided by VK_EXT_rasterization_order_attachment_access

typedef enum VkPipelineDepthStencilStateCreateFlagBits {

    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_rasterization_order_attachment_access

    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT = 0x00000002,
    // Provided by VK_EXT_rasterization_order_attachment_access

    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_ARM =
    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT,
    // Provided by VK_ARM_rasterization_order_attachment_access

   VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM =
    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT,
} VkPipelineDepthStencilStateCreateFlagBits;

• VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT
  indicates that access to the depth aspects of depth/stencil and input attachments will have
  implicit framebuffer-local memory dependencies.

• VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT
  indicates that access to the stencil aspects of depth/stencil and input attachments will have
  implicit framebuffer-local memory dependencies.

When
VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT is
included in a pipeline, it forms a framebuffer-local memory dependency for each fragment
generated by draw commands for that pipeline with the following scopes:

• The first synchronization scope includes VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT and
  VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT pipeline stages executed by all previous fragments
  (as defined by primitive order) in the corresponding framebuffer regions including those
  generated by the same draw command.

• The second synchronization scope includes VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT stage
  executed by the generated fragment.

• The first access scope includes all writes to the depth aspect of depth/stencil attachments.

• The second access scope includes all reads from the depth aspect of input attachments.

When
VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT is
included in a pipeline, it forms a framebuffer-local memory dependency for each fragment generated by draw commands for that pipeline with the following scopes:

- The first synchronization scope includes `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` and `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stages executed by all previous fragments (as defined by primitive order) in the corresponding framebuffer regions including those generated by the same draw command.
- The second synchronization scope includes `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` and `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stages executed by the generated fragment.
- The first access scope includes all writes to the stencil aspect of depth/stencil attachments.
- The second access scope includes all reads from the stencil aspect of input attachments.

### 29.8. Depth Bounds Test

The depth bounds test compares the depth value $z_i$ in the depth/stencil attachment at each sample’s framebuffer coordinates $(x_f, y_f)$ and sample index $i$ against a set of depth bounds. The depth bounds are determined by two floating point values defining a minimum (minDepthBounds) and maximum (maxDepthBounds) depth value. These values are either set by the `VkPipelineDepthStencilStateCreateInfo` structure during pipeline creation, or dynamically by `vkCmdSetDepthBoundsTestEnable` and `vkCmdSetDepthBounds`.

A given sample is considered within the depth bounds if $z_i$ is in the range $[\text{minDepthBounds}, \text{maxDepthBounds}]$. Samples with depth attachment values outside of the depth bounds will have their coverage set to 0.

If the depth bounds test is disabled, or if there is no depth attachment, the coverage mask is unmodified by this operation.

To dynamically enable or disable the depth bounds test, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthBoundsTestEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBoundsTestEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetDepthBoundsTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBoundsTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBoundsTestEnable` specifies if the depth bounds test is enabled.
This command sets the depth bounds enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with \texttt{VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE} set in \texttt{VkPipelineDynamicStateCreateInfo} ::\texttt{pDynamicStates}. Otherwise, this state is specified by the \texttt{VkPipelineDepthStencilStateCreateInfo} ::\texttt{depthBoundsTestEnable} value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDepthBoundsTestEnable-None-08971**
  At least one of the following must be true:
  - the \texttt{extendedDynamicState} feature is enabled
  - the \texttt{shaderObject} feature is enabled
  - the value of \texttt{VkApplicationInfo::apiVersion} used to create the \texttt{VkInstance} parent of \texttt{commandBuffer} is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-parameter**
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- **VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-recording**
  \texttt{commandBuffer} must be in the recording state

- **VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-cmdpool**
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics operations

- **VUID-vkCmdSetDepthBoundsTestEnable-videocoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized
- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>
To **dynamically set** the depth bounds range, call:

```cpp
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBounds(
    VkCommandBuffer commandBuffer,
    float minDepthBounds,
    float maxDepthBounds);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **minDepthBounds** is the minimum depth bound.
- **maxDepthBounds** is the maximum depth bound.

This command sets the depth bounds range for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BOUNDS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::minDepthBounds` and `VkPipelineDepthStencilStateCreateInfo::maxDepthBounds` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDepthBounds-minDepthBounds-00600**
  If the `VK_EXT_depth_range_unrestricted` extension is not enabled, **minDepthBounds** must be between 0.0 and 1.0, inclusive.

- **VUID-vkCmdSetDepthBounds-maxDepthBounds-00601**
  If the `VK_EXT_depth_range_unrestricted` extension is not enabled, **maxDepthBounds** must be between 0.0 and 1.0, inclusive.

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthBounds-commandBuffer-parameter**
  commandBuffer must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetDepthBounds-commandBuffer-recording**
  commandBuffer must be in the recording state.

- **VUID-vkCmdSetDepth Bounds-commandBuffer-cmdpool**
  The `VkCommandPool` that commandBuffer was allocated from must support graphics operations.

- **VUID-vkCmdSetDepthBounds-videocoding**
  This command must only be called outside of a video coding scope.
Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

29.9. Stencil Test

The stencil test compares the stencil attachment value $s_a$ in the depth/stencil attachment at each sample’s framebuffer coordinates $(x_f, y_f)$ and sample index $i$ against a *stencil reference value*.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of coverage samples to stencil attachment samples within the fragment. However, if all samples in the fragment are covered, and the stencil attachment value is updated as a result of this test, all stencil attachment samples will be updated.

If the stencil test is not enabled, as specified by `vkCmdSetStencilTestEnable` or `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable`, or if there is no stencil attachment, the coverage mask is unmodified by this operation.

The stencil test is controlled by one of two sets of stencil-related state, the front stencil state and the back stencil state. Stencil tests and writes use the back stencil state when processing fragments generated by back-facing polygons, and the front stencil state when processing fragments generated by front-facing polygons or any other primitives.

The comparison operation performed is determined by the `VkCompareOp` value set by `vkCmdSetStencilOp::compareOp`, or by `VkStencilOpState::compareOp` during pipeline creation.

The compare mask $s_c$ and stencil reference value $s_r$ of the front or the back stencil state set determine arguments of the comparison operation. $s_c$ is set by the `VkPipelineDepthStencilStateCreateInfo` structure during pipeline creation, or by the `vkCmdSetStencilCompareMask` command. $s_r$ is set by `VkPipelineDepthStencilStateCreateInfo` or by `vkCmdSetStencilReference`.

$s_r$ and $s_a$ are each independently combined with $s_c$ using a bitwise **AND** operation to create masked reference and attachment values $s'_r$ and $s'_a$. $s'_r$ and $s'_a$ are used as the *reference* and *test* values, respectively, in the operation specified by the `VkCompareOp`. 
If the comparison evaluates to false, the coverage for the sample is set to 0.

A new stencil value $s_g$ is generated according to a stencil operation defined by `VkStencilOp` parameters set by `vkCmdSetStencilOp` or `VkPipelineDepthStencilStateCreateInfo`. If the stencil test fails, `failOp` defines the stencil operation used. If the stencil test passes however, the stencil op used is based on the depth test - if it passes, `VkPipelineDepthStencilStateCreateInfo::passOp` is used, otherwise `VkPipelineDepthStencilStateCreateInfo::depthFailOp` is used.

The stencil attachment value $s_a$ is then updated with the generated stencil value $s_g$ according to the write mask $s_w$ defined by `writeMask` in `VkPipelineDepthStencilStateCreateInfo::front` and `VkPipelineDepthStencilStateCreateInfo::back` as:

$$s_a = (s_a \& \neg s_w) \mid (s_g \& s_w)$$

To dynamically enable or disable the stencil test, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetStencilTestEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 stencilTestEnable);
```

or the equivalent command:

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetStencilTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 stencilTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stencilTestEnable` specifies if the stencil test is enabled.

This command sets the stencil test enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetStencilTestEnable-None-08971

At least one of the following must be true:

- the `extendedDynamicState` feature is enabled
- the `shaderObject` feature is enabled
- the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of
Valid Usage (Implicit)

- VUID-vkCmdSetStencilTestEnable-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetStencilTestEnable-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetStencilTestEnable-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetStencilTestEnable-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

To dynamically set the stencil operation, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetStencilOp(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    VkStencilOp failOp,
    VkStencilOp passOp,
    VkStencilOp depthFailOp,
    VkCompareOp compareOp);
```

or the equivalent command
void vkCmdSetStencilOpEXT(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    VkStencilOp failOp,
    VkStencilOp passOp,
    VkStencilOp depthFailOp,
    VkCompareOp compareOp);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the stencil operation.
- `failOp` is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- `passOp` is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
- `depthFailOp` is a `VkStencilOp` value specifying the action performed on samples that pass the stencil test and fail the depth test.
- `compareOp` is a `VkCompareOp` value specifying the comparison operator used in the stencil test.

This command sets the stencil operation for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineDepthStencilStateCreateInfo::failOp`, `passOp`, `depthFailOp`, and `compareOp` values used to create the currently active pipeline, for both front and back faces.

### Valid Usage

- **VUID-vkCmdSetStencilOp-None-08971**
  At least one of the following must be true:
  - the `extendedDynamicState` feature is enabled
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- **VUID-vkCmdSetStencilOp-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetStencilOp-faceMask-parameter**
  `faceMask` must be a valid combination of `VkStencilFaceFlagBits` values

- **VUID-vkCmdSetStencilOp-faceMask-requiredbitmapmask**
faceMask must not be 0

- VUID-vkCmdSetStencilOp-failOp-parameter
  failOp must be a valid VkStencilOp value

- VUID-vkCmdSetStencilOp-passOp-parameter
  passOp must be a valid VkStencilOp value

- VUID-vkCmdSetStencilOp-depthFailOp-parameter
  depthFailOp must be a valid VkStencilOp value

- VUID-vkCmdSetStencilOp-compareOp-parameter
  compareOp must be a valid VkCompareOp value

- VUID-vkCmdSetStencilOp-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetStencilOp-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetStencilOp-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

</tbody>
</table>

The VkStencilOpState structure is defined as:
typedef struct VkStencilOpState {
    VkStencilOp failOp;
    VkStencilOp passOp;
    VkStencilOp depthFailOp;
    VkCompareOp compareOp;
    uint32_t compareMask;
    uint32_t writeMask;
    uint32_t reference;
} VkStencilOpState;

• failOp is a VkStencilOp value specifying the action performed on samples that fail the stencil test.

• passOp is a VkStencilOp value specifying the action performed on samples that pass both the depth and stencil tests.

• depthFailOp is a VkStencilOp value specifying the action performed on samples that pass the stencil test and fail the depth test.

• compareOp is a VkCompareOp value specifying the comparison operator used in the stencil test.

• compareMask selects the bits of the unsigned integer stencil values participating in the stencil test.

• writeMask selects the bits of the unsigned integer stencil values updated by the stencil test in the stencil framebuffer attachment.

• reference is an integer stencil reference value that is used in the unsigned stencil comparison.

Valid Usage (Implicit)

• VUID-VkStencilOpState-failOp-parameter failOp must be a valid VkStencilOp value

• VUID-VkStencilOpState-passOp-parameter passOp must be a valid VkStencilOp value

• VUID-VkStencilOpState-depthFailOp-parameter depthFailOp must be a valid VkStencilOp value

• VUID-VkStencilOpState-compareOp-parameter compareOp must be a valid VkCompareOp value

To dynamically set the stencil compare mask, call:

// Provided by VK_VERSION_1_0
void vkCmdSetStencilCompareMask(
    VkCommandBuffer commandBuffer, 
    VkStencilFaceFlags faceMask, 
    uint32_t compareMask);
• `commandBuffer` is the command buffer into which the command will be recorded.

• `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the compare mask.

• `compareMask` is the new value to use as the stencil compare mask.

This command sets the stencil compare mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkStencilOpState::compareMask` value used to create the currently active pipeline, for both front and back faces.

### Valid Usage (Implicit)

- `VUID-vkCmdSetStencilCompareMask-commandBuffer-parameter`  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- `VUID-vkCmdSetStencilCompareMask-faceMask-parameter`  
  `faceMask` must be a valid combination of `VkStencilFaceFlagBits` values

- `VUID-vkCmdSetStencilCompareMask-faceMask-requiredbitmask`  
  `faceMask` must not be 0

- `VUID-vkCmdSetStencilCompareMask-commandBuffer-recording`  
  `commandBuffer` must be in the recording state

- `VUID-vkCmdSetStencilCompareMask-commandBuffer-cmdpool`  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- `VUID-vkCmdSetStencilCompareMask-videocoding`  
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

`VkStencilFaceFlagBits` values are:
typedef enum VkStencilFaceFlagBits {
    VK_STENCIL_FACE_FRONT_BIT = 0x00000001,
    VK_STENCIL_FACE_BACK_BIT = 0x00000002,
    VK_STENCIL_FACE_FRONT_AND_BACK = 0x00000003,
    VK_STENCIL_FRONT_AND_BACK = VK_STENCIL_FACE_FRONT_AND_BACK,
} VkStencilFaceFlagBits;

- VK_STENCIL_FACE_FRONT_BIT specifies that only the front set of stencil state is updated.
- VK_STENCIL_FACE_BACK_BIT specifies that only the back set of stencil state is updated.
- VK_STENCIL_FACE_FRONT_AND_BACK is the combination of VK_STENCIL_FACE_FRONT_BIT and VK_STENCIL_FACE_BACK_BIT, and specifies that both sets of stencil state are updated.

// Provided by VK_VERSION_1_0
typedef VkFlags VkStencilFaceFlags;

VkStencilFaceFlags is a bitmask type for setting a mask of zero or more VkStencilFaceFlagBits.

To dynamically set the stencil write mask, call:

void vkCmdSetStencilWriteMask(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t writeMask);

- commandBuffer is the command buffer into which the command will be recorded.
- faceMask is a bitmask of VkStencilFaceFlagBits specifying the set of stencil state for which to update the write mask, as described above for vkCmdSetStencilCompareMask.
- writeMask is the new value to use as the stencil write mask.

This command sets the stencil write mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_STENCIL_WRITE_MASK set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the writeMask value used to create the currently active pipeline, for both VkPipelineDepthStencilStateCreateInfo::front and VkPipelineDepthStencilStateCreateInfo::back faces.

Valid Usage (Implicit)

- VUID-vkCmdSetStencilWriteMask-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetStencilWriteMask-faceMask-parameter faceMask must be a valid combination of VkStencilFaceFlagBits values
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

This command must only be called outside of a video coding scope.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>

</tr>
</tbody>
</table>

To dynamically set the stencil reference value, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilReference(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t reference);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the reference value, as described above for `vkCmdSetStencilCompareMask`.
- `reference` is the new value to use as the stencil reference value.

This command sets the stencil reference value for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_REFERENCE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::reference` value used to create the currently active pipeline, for both front and back faces.
Valid Usage (Implicit)

- VUID-vkCmdSetStencilReference-commandBuffer-parameter
  The `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdSetStencilReference-faceMask-parameter
  The `faceMask` must be a valid combination of `VkStencilFaceFlagBits` values.

- VUID-vkCmdSetStencilReference-faceMask-required bitmask
  The `faceMask` must not be 0.

- VUID-vkCmdSetStencilReference-commandBuffer-recording
  The `commandBuffer` must be in the recording state.

- VUID-vkCmdSetStencilReference-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdSetStencilReference-videocoding
  This command must only be called outside of a video coding scope.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

Possible values of the `failOp`, `passOp`, and `depthFailOp` members of `VkStencilOpState`, specifying what happens to the stored stencil value if this or certain subsequent tests fail or pass, are:
// Provided by VK_VERSION_1_0

typedef enum VkStencilOp {
    VK_STENCIL_OP_KEEP = 0,
    VK_STENCIL_OP_ZERO = 1,
    VK_STENCIL_OP_REPLACE = 2,
    VK_STENCIL_OP_INCREMENT_AND_CLAMP = 3,
    VK_STENCIL_OP_DECREMENT_AND_CLAMP = 4,
    VK_STENCIL_OP_INVERT = 5,
    VK_STENCIL_OP_INCREMENT_AND_WRAP = 6,
    VK_STENCIL_OP_DECREMENT_AND_WRAP = 7,
} VkStencilOp;

- **VK_STENCIL_OP_KEEP** keeps the current value.
- **VK_STENCIL_OP_ZERO** sets the value to 0.
- **VK_STENCIL_OP_REPLACE** sets the value to reference.
- **VK_STENCIL_OP_INCREMENT_AND_CLAMP** increments the current value and clamps to the maximum representable unsigned value.
- **VK_STENCIL_OP_DECREMENT_AND_CLAMP** decrements the current value and clamps to 0.
- **VK_STENCIL_OP_INVERT** bitwise-inverts the current value.
- **VK_STENCIL_OP_INCREMENT_AND_WRAP** increments the current value and wraps to 0 when the maximum value would have been exceeded.
- **VK_STENCIL_OP_DECREMENT_AND_WRAP** decrements the current value and wraps to the maximum possible value when the value would go below 0.

For purposes of increment and decrement, the stencil bits are considered as an unsigned integer.

## 29.10. Depth Test

The depth test compares the depth value $z_a$ in the depth/stencil attachment at each sample’s framebuffer coordinates $(x_f, y_f)$ and sample index $i$ against the sample’s depth value $z_f$. If there is no depth attachment then the depth test is skipped.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of rasterization samples to depth attachment samples within the fragment. However, if all samples in the fragment are covered, and the depth attachment value is updated as a result of this test, all depth attachment samples will be updated.

The depth test occurs in three stages, as detailed in the following sections.

### 29.10.1. Depth Clamping and Range Adjustment

If `VkPipelineRasterizationStateCreateInfo::depthClampEnable` is enabled, $z_i$ is clamped to $[z_{min}, z_{max}]$, where $z_{min} = \text{min}(n, f)$, $z_{max} = \text{max}(n, f)$, and $n$ and $f$ are the `minDepth` and `maxDepth` depth range values of the viewport used by this fragment, respectively.
If `VkPhysicalDeviceDepthClampZeroOneFeaturesEXT::depthClampZeroOne` is enabled:

- If the depth attachment has a floating-point format and `VK_EXT_depth_range_unrestricted` is enabled then \( z_f \) is unchanged.
- Otherwise, \( z_f \) is clamped to the range \([0, 1]\).

Otherwise:

- If \( z_f \) is not in the range \([z_{\text{min}}, z_{\text{max}}]\), then \( z_f \) is undefined following this step.
- If the depth attachment has a fixed-point format and \( z_f \) is not in the range \([0, 1]\), then \( z_f \) is undefined following this step.

### 29.10.2. Depth Comparison

If the depth test is not enabled, as specified by `vkCmdSetDepthTestEnable` or `VkPipelineDepthStencilStateCreateInfo::depthTestEnable`, then this step is skipped.

The comparison operation performed is determined by the `VkCompareOp` value set by `vkCmdSetDepthCompareOp`, or by `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` during pipeline creation. \( z_f \) and \( z_a \) are used as the reference and test values, respectively, in the operation specified by the `VkCompareOp`.

If the comparison evaluates to false, the coverage for the sample is set to 0.

### 29.10.3. Depth Attachment Writes

If depth writes are enabled, as specified by `vkCmdSetDepthWriteEnable` or `VkPipelineDepthStencilStateCreateInfo::depthWriteEnable`, and the comparison evaluated to true, the depth attachment value \( z_a \) is set to the sample’s depth value \( z_f \). If there is no depth attachment, no value is written.

To dynamically enable or disable the depth test, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthTestEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthTestEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetDepthTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthTestEnable` specifies if the depth test is enabled.
This command sets the depth test enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo::depthTestEnable value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetDepthTestEnable-None-08971
  At least one of the following **must** be true:
  - the extendedDynamicState feature is enabled
  - the shaderObject feature is enabled
  - the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthTestEnable-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle

- VUID-vkCmdSetDepthTestEnable-commandBuffer-recording
  commandBuffer **must** be in the recording state

- VUID-vkCmdSetDepthTestEnable-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations

- VUID-vkCmdSetDepthTestEnable-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to commandBuffer **must** be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

</tbody>
</table>
To **dynamically set** the depth compare operator, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthCompareOp(
    VkCommandBuffer commandBuffer,
    VkCompareOp depthCompareOp);
```
or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetDepthCompareOpEXT(
    VkCommandBuffer commandBuffer,
    VkCompareOp depthCompareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthCompareOp` is a `VkCompareOp` value specifying the comparison operator used for the **Depth Comparison** step of the **depth test**.

This command sets the depth comparison operator for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDepthCompareOp-None-08971**
  At least one of the following **must** be true:
  - the `extendedDynamicState` feature is enabled
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthCompareOp-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetDepthCompareOp-depthCompareOp-parameter**
  `depthCompareOp` **must** be a valid `VkCompareOp` value
- **VUID-vkCmdSetDepthCompareOp-commandBuffer-recording**
  `commandBuffer` **must** be in the **recording state**
- **VUID-vkCmdSetDepthCompareOp-commandBuffer-cmdpool**
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations:

- VUID-vkCmdSetDepthCompareOp-videocoding

This command must only be called outside of a video coding scope.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the depth write enable, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthWriteEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthWriteEnable);
```

or the equivalent command:

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetDepthWriteEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthWriteEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthWriteEnable` specifies if depth writes are enabled.

This command sets the depth write enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthWriteEnable` value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetDepthWriteEnable-None-08971
  At least one of the following must be true:
  - the extendedDynamicState feature is enabled
  - the shaderObject feature is enabled
  - the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetDepthWriteEnable-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthWriteEnable-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetDepthWriteEnable-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetDepthWriteEnable-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

29.11. Representative Fragment Test

The representative fragment test allows implementations to reduce the amount of rasterization and fragment processing work performed for each point, line, or triangle primitive. For any primitive that produces one or more fragments that pass all prior early fragment tests, the implementation
may choose one or more “representative” fragments for processing and discard all other fragments. For draw calls rendering multiple points, lines, or triangles arranged in lists, strips, or fans, the representative fragment test is performed independently for each of those primitives. The set of fragments discarded by the representative fragment test is implementation-dependent. In some cases, the representative fragment test may not discard any fragments for a given primitive.

If the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineRepresentativeFragmentTestStateCreateInfoNV` structure, then that structure includes parameters controlling the representative fragment test.

The `VkPipelineRepresentativeFragmentTestStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_representative_fragment_test
typedef struct VkPipelineRepresentativeFragmentTestStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 representativeFragmentTestEnable;
} VkPipelineRepresentativeFragmentTestStateCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `representativeFragmentTestEnable` controls whether the representative fragment test is enabled.

If this structure is not included in the `pNext` chain, `representativeFragmentTestEnable` is considered to be `VK_FALSE`, and the representative fragment test is disabled.

If the active fragment shader does not specify the `EarlyFragmentTests` execution mode, the representative fragment shader test has no effect, even if enabled.

**Valid Usage (Implicit)**

- VUID-VkPipelineRepresentativeFragmentTestStateCreateInfoNV-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_REPRESENTATIVE_FRAGMENT_TEST_STATE_CREATE_INFO_NV`

To dynamically set the `representativeFragmentTestEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_representative_fragment_test,
// VK_EXT_shader_object with VK_NV_representative_fragment_test
void vkCmdSetRepresentativeFragmentTestEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 representativeFragmentTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `representativeFragmentTestEnable` specifies the `representativeFragmentTestEnable` state.
This command sets the `representativeFragmentTestEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRepresentativeFragmentTestStateCreateInfoNV::representativeFragmentTestEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3RepresentativeFragmentTestEnable` feature is enabled
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>
29.12. Sample Counting

Occlusion queries use query pool entries to track the number of samples that pass all the per-fragment tests. The mechanism of collecting an occlusion query value is described in Occlusion Queries.

The occlusion query sample counter increments by one for each sample with a coverage value of 1 in each fragment that survives all the per-fragment tests, including scissor, exclusive scissor, sample mask, alpha to coverage, stencil, and depth tests.

29.13. Fragment Coverage to Color

The VkPipelineCoverageToColorStateCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_fragment_coverage_to_color
typedef struct VkPipelineCoverageToColorStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageToColorStateCreateFlagsNV flags;
    VkBool32 coverageToColorEnable;
    uint32_t coverageToColorLocation;
} VkPipelineCoverageToColorStateCreateInfoNV;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **coverageToColorEnable** controls whether the fragment coverage value replaces a fragment color output.
- **coverageToColorLocation** controls which fragment shader color output value is replaced.

If the pNext chain of VkPipelineMultisampleStateCreateInfo includes a VkPipelineCoverageToColorStateCreateInfoNV structure, then that structure controls whether the fragment coverage is substituted for a fragment color output and, if so, which output is replaced.

If **coverageToColorEnable** is VK_TRUE, the coverage mask replaces the first component of the color value corresponding to the fragment shader output location with Location equal to coverageToColorLocation and Index equal to zero. If the color attachment format has fewer bits than the coverage mask, the low bits of the sample coverage mask are taken without any clamping. If the color attachment format has more bits than the coverage mask, the high bits of the sample coverage mask are filled with zeros.

If **coverageToColorEnable** is VK_FALSE, these operations are skipped. If this structure is not included in the pNext chain, it is as if **coverageToColorEnable** is VK_FALSE.
Valid Usage

- VUID-VkPipelineCoverageToColorStateCreateInfoNV-coverageToColorEnable-01404
  If `coverageToColorEnable` is `VK_TRUE`, then the render pass subpass indicated by `VkGraphicsPipelineCreateInfo::renderPass` and `VkGraphicsPipelineCreateInfo::subpass` must have a color attachment at the location selected by `coverageToColorLocation`, with a `VkFormat` of `VK_FORMAT_R8_UINT`, `VK_FORMAT_R8_SINT`, `VK_FORMAT_R16_UINT`, `VK_FORMAT_R16_SINT`, `VK_FORMAT_R32_UINT`, or `VK_FORMAT_R32_SINT`.

Valid Usage (Implicit)

- VUID-VkPipelineCoverageToColorStateCreateInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_TO_COLOR_STATE_CREATE_INFO_NV`.
- VUID-VkPipelineCoverageToColorStateCreateInfoNV-flags-zerobitmask
  `flags` must be `0`.

```c
typedef VkFlags VkPipelineCoverageToColorStateCreateFlagsNV;
```

`VkPipelineCoverageToColorStateCreateFlagsNV` is a bitmask type for setting a mask, but is currently reserved for future use.

To dynamically set the `coverageToColorEnable` state, call:

```c
void vkCmdSetCoverageToColorEnableNV(
    VkCommandBuffer commandBuffer,       
    VkBool32 coverageToColorEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageToColorEnable` specifies the `coverageToColorEnable` state.

This command sets the `coverageToColorEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageToColorStateCreateInfoNV::coverageToColorEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetCoverageToColorEnableNV-None-09423
At least one of the following must be true:

- The `extendedDynamicState3CoverageToColorEnable` feature is enabled
- The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetCoverageToColorEnableNV-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetCoverageToColorEnableNV-commandBuffer-recording
  
  `commandBuffer` must be in the `recording state`

- VUID-vkCmdSetCoverageToColorEnableNV-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetCoverageToColorEnableNV-videocoding
  
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the `coverageToColorLocation` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_fragment_coverage_to_color, VK_EXT_shader_object with VK_NV_fragment_coverage_to_color
void vkCmdSetCoverageToColorLocationNV(
    VkCommandBuffer commandBuffer,
    uint32_t coverageToColorLocation);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageToColorLocation` specifies the `coverageToColorLocation` state.
This command sets the `coverageToColorLocation` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageToColorStateCreateInfoNV::coverageToColorLocation` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetCoverageToColorLocationNV-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3CoverageToColorLocation` feature is enabled
  - The `shaderObject` feature is enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetCoverageToColorLocationNV-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetCoverageToColorLocationNV-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetCoverageToColorLocationNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetCoverageToColorLocationNV-videocoding
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

**Command Properties**

Coverage reduction takes the coverage information for a fragment and converts that to a boolean coverage value for each color sample in each pixel covered by the fragment.

29.14.1. Pixel Coverage

Coverage for each pixel is first extracted from the total fragment coverage mask. This consists of \texttt{rasterizationSamples} unique coverage samples for each pixel in the fragment area, each with a unique \texttt{sample index}. If the fragment only contains a single pixel, coverage for the pixel is equivalent to the fragment coverage.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, pixel coverage is generated in an implementation-dependent manner. If all samples in the fragment are covered, all samples will be covered in each pixel coverage.

If a shading rate image is used, and the fragment covers multiple pixels, each pixel’s coverage consists of the coverage samples corresponding to that pixel, and each sample retains its unique \texttt{sample index} \texttt{i}.

If the fragment shading rate is set, and the fragment covers multiple pixels, each pixel’s coverage consists of the coverage samples with a \texttt{pixel index} matching that pixel, and each sample retains its unique \texttt{sample index} \texttt{i}.

29.14.2. Color Sample Coverage

Once pixel coverage is determined, coverage for each individual color sample corresponding to that pixel is determined.

If the number of \texttt{rasterizationSamples} is identical to the number of samples in the color attachments, a color sample is covered if the pixel coverage sample with the same \texttt{sample index} \texttt{i} is covered.

Otherwise, the coverage for each color sample is computed from the pixel coverage as follows.

If the \texttt{VK_AMD_mixed_attachment_samples} extension is enabled, for color samples present in the color attachments, a color sample is covered if the pixel coverage sample with the same \texttt{sample index} \texttt{i} is covered; additional pixel coverage samples are discarded.

If the \texttt{pNext} chain of \texttt{VkSubpassDescription2} or \texttt{VkRenderingInfo} includes a \texttt{VkMultisampledRenderToSingleSampledInfoEXT} structure with the \texttt{multisampledRenderToSingleSampledEnable} field equal to \texttt{VK_TRUE}, sample coverage is calculated as if the attachment has \texttt{VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples} samples.

When the \texttt{VK_NV_coverage_reduction_mode} extension is enabled, the pipeline state controlling coverage reduction is specified through the members of the \texttt{VkPipelineCoverageReductionStateCreateInfoNV} structure.

The \texttt{VkPipelineCoverageReductionStateCreateInfoNV} structure is defined as:
typedef struct VkPipelineCoverageReductionStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageReductionStateCreateFlagsNV flags;
    VkCoverageReductionModeNV coverageReductionMode;
} VkPipelineCoverageReductionStateCreateInfoNV;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **coverageReductionMode** is a VkCoverageReductionModeNV value controlling how color sample coverage is generated from pixel coverage.

If this structure is not included in the **pNext** chain, or if the extension is not enabled, the default coverage reduction mode is inferred as follows:

- If the **VK_NV_framebuffer_mixed_samples** extension is enabled, then it is as if the **coverageReductionMode** is VK_COVERAGE_REDUCTION_MODE_MERGE_NV.
- If the **VK_AMD_mixed_attachment_samples** extension is enabled, then it is as if the **coverageReductionMode** is VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV.
- If both **VK_NV_framebuffer_mixed_samples** and **VK_AMD_mixed_attachment_samples** are enabled, then the default coverage reduction mode is implementation-dependent.

### Valid Usage (Implicit)

- VUID-VkPipelineCoverageReductionStateCreateInfoNV-sType-sType **sType** must be VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_REDUCTION_STATE_CREATE_INFO_NV
- VUID-VkPipelineCoverageReductionStateCreateInfoNV-flags-zerobitmask **flags** must be 0
- VUID-VkPipelineCoverageReductionStateCreateInfoNV-coverageReductionMode-parameter **coverageReductionMode** must be a valid VkCoverageReductionModeNV value

// Provided by VK_NV_coverage_reduction_mode
typedef VkFlags VkPipelineCoverageReductionStateCreateFlagsNV;

VkPipelineCoverageReductionStateCreateFlagsNV is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode, specifying how color sample coverage is generated from pixel coverage, are:
typedef enum VkCoverageReductionModeNV {
    VK_COVERAGE_REDUCTION_MODE_MERGE_NV = 0,
    VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV = 1,
} VkCoverageReductionModeNV;

- **VK_COVERAGE_REDUCTION_MODE_MERGE_NV** specifies that each color sample will be associated with an implementation-dependent subset of samples in the pixel coverage. If any of those associated samples are covered, the color sample is covered.

- **VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV** specifies that for color samples present in the color attachments, a color sample is covered if the pixel coverage sample with the same sample index is covered; other pixel coverage samples are discarded.

To **dynamically set** the `coverageReductionMode` state, call:

```c
void vkCmdSetCoverageReductionModeNV(
    VkCommandBuffer commandBuffer,
    VkCoverageReductionModeNV coverageReductionMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageReductionMode` specifies the `coverageReductionMode` state.

This command sets the `coverageReductionMode` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetCoverageReductionModeNV-None-09423**
  At least one of the following **must** be true:
  - The `extendedDynamicState3CoverageReductionMode` feature is enabled
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetCoverageReductionModeNV-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetCoverageReductionModeNV-coverageReductionMode-parameter**
coverageReductionMode must be a valid VkCoverageReductionModeNV value

- VUID-vkCmdSetCoverageReductionModeNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetCoverageReductionModeNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetCoverageReductionModeNV-videoencoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>

</tbody>
</table>

To query the set of mixed sample combinations of coverage reduction mode, rasterization samples and color, depth, stencil attachment sample counts that are supported by a physical device, call:

```c
// Provided by VK_NV_coverage_reduction_mode
VkResult vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV(
    VkPhysicalDevice physicalDevice,
    uint32_t* pCombinationCount,
    VkFramebufferMixedSamplesCombinationNV* pCombinations);
```

- physicalDevice is the physical device from which to query the set of combinations.
- pCombinationCount is a pointer to an integer related to the number of combinations available or queried, as described below.
- pCombinations is either NULL or a pointer to an array of VkFramebufferMixedSamplesCombinationNV values, indicating the supported combinations of coverage reduction mode, rasterization samples, and color, depth, stencil attachment sample counts.

If pCombinations is NULL, then the number of supported combinations for the given physicalDevice is returned in pCombinationCount. Otherwise, pCombinationCount must point to a variable set by the
user to the number of elements in the `pCombinations` array, and on return the variable is overwritten with the number of values actually written to `pCombinations`. If the value of `pCombinationCount` is less than the number of combinations supported for the given `physicalDevice`, at most `pCombinationCount` values will be written to `pCombinations`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the supported values were returned.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-pCombinationCount-parameter**
  - `pCombinationCount` must be a valid pointer to a `uint32_t` value

- **VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-pCombinations-parameter**
  - If the value referenced by `pCombinationCount` is not 0, and `pCombinations` is not NULL, `pCombinations` must be a valid pointer to an array of `pCombinationCount` `VkFramebufferMixedSamplesCombinationNV` structures

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkFramebufferMixedSamplesCombinationNV` structure is defined as:

```c
// Provided by VK_NV_coverage_reduction_mode
typedef struct VkFramebufferMixedSamplesCombinationNV {
    VkStructureType sType;
    void* pNext;
    VkCoverageReductionModeNV coverageReductionMode;
    VkSampleCountFlagBits rasterizationSamples;
    VkSampleCountFlagBits depthStencilSamples;
    VkSampleCountFlagBits colorSamples;
} VkFramebufferMixedSamplesCombinationNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• **coverageReductionMode** is a **VkCoverageReductionModeNV** value specifying the coverage reduction mode.

• **rasterizationSamples** is a **VkSampleCountFlagBits** specifying the number of rasterization samples in the supported combination.

• **depthStencilSamples** specifies the number of samples in the depth stencil attachment in the supported combination. A value of 0 indicates the combination does not have a depth stencil attachment.

• **colorSamples** specifies the number of color samples in a color attachment in the supported combination. A value of 0 indicates the combination does not have a color attachment.

---

**Valid Usage (Implicit)**

- **VUID-VkFramebufferMixedSamplesCombinationNV-sType-sType**
  - sType must be **VK_STRUCTURE_TYPE_FRAMEBUFFER_MIXED_SAMPLES_COMBINATION_NV**

- **VUID-VkFramebufferMixedSamplesCombinationNV-pNext-pNext**
  - pNext must be **NULL**

---

29.14.3. Coverage Modulation

As part of coverage reduction, fragment color values can also be modulated (multiplied) by a value that is a function of fraction of covered rasterization samples associated with that color sample.

Pipeline state controlling coverage modulation is specified through the members of the **VkPipelineCoverageModulationStateCreateInfoNV** structure.

The **VkPipelineCoverageModulationStateCreateInfoNV** structure is defined as:

```c
// Provided by VK_NV_framebuffer_mixed_samples
typedef struct VkPipelineCoverageModulationStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageModulationStateCreateFlagsNV flags;
    VkCoverageModulationModeNV coverageModulationMode;
    VkBool32 coverageModulationTableEnable;
    uint32_t coverageModulationTableCount;
    const float* pCoverageModulationTable;
} VkPipelineCoverageModulationStateCreateInfoNV;
```

- **sType** is a **VkStructureType** value identifying this structure.

- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **flags** is reserved for future use.

- **coverageModulationMode** is a **VkCoverageModulationModeNV** value controlling which color components are modulated.

- **coverageModulationTableEnable** controls whether the modulation factor is looked up from a table
• coverageModulationTableCount is the number of elements in pCoverageModulationTable.

• pCoverageModulationTable is a table of modulation factors containing a value for each number of covered samples.

If coverageModulationTableEnable is VK_FALSE, then for each color sample the associated bits of the pixel coverage are counted and divided by the number of associated bits to produce a modulation factor R in the range (0,1] (a value of zero would have been killed due to a color coverage of 0). Specifically:

- \( N = \text{value of } \text{rasterizationSamples} \)
- \( M = \text{value of } \text{VkAttachmentDescription::samples} \) for any color attachments
- \( R = \frac{\text{popcount(associated coverage bits)}}{(N / M)} \)

If coverageModulationTableEnable is VK_TRUE, the value R is computed using a programmable lookup table. The lookup table has \( N / M \) elements, and the element of the table is selected by:

- \( R = pCoverageModulationTable[\text{popcount(associated coverage bits)}-1] \)

Note that the table does not have an entry for \( \text{popcount(associated coverage bits)} = 0 \), because such samples would have been killed.

The values of pCoverageModulationTable may be rounded to an implementation-dependent precision, which is at least as fine as \( 1 / N \), and clamped to \([0,1]\).

For each color attachment with a floating point or normalized color format, each fragment output color value is replicated to \( M \) values which can each be modulated (multiplied) by that color sample’s associated value of R. Which components are modulated is controlled by coverageModulationMode.

If this structure is not included in the pNext chain, it is as if coverageModulationMode is VK_COVERAGE_MODULATION_MODE_NONE_NV.

If the coverage reduction mode is VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV, each color sample is associated with only a single coverage sample. In this case, it is as if coverageModulationMode is VK_COVERAGE_MODULATION_MODE_NONE_NV.

**Valid Usage**

- VUID-VkPipelineCoverageModulationStateCreateInfoNV-coverageModulationTableEnable-01405
  If coverageModulationTableEnable is VK_TRUE, coverageModulationTableCount must be equal to the number of rasterization samples divided by the number of color samples in the subpass
Valid Usage (Implicit)

- VUID-VkPipelineCoverageModulationStateCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_MODULATION_STATE_CREATE_INFO_NV

- VUID-VkPipelineCoverageModulationStateCreateInfoNV-flags-zerobitmask
  flags must be 0

- VUID-VkPipelineCoverageModulationStateCreateInfoNV-coverageModulationMode-parameter
  coverageModulationMode must be a valid VkCoverageModulationModeNV value

// Provided by VK_NV_framebuffer_mixed_samples
typedef VkFlags VkPipelineCoverageModulationStateCreateFlagsNV;

VkPipelineCoverageModulationStateCreateFlagsNV is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationMode, specifying which color components are modulated, are:

// Provided by VK_NV_framebuffer_mixed_samples
typedef enum VkCoverageModulationModeNV {
    VK_COVERAGE_MODULATION_MODE_NONE_NV = 0,
    VK_COVERAGE_MODULATION_MODE_RGB_NV = 1,
    VK_COVERAGE_MODULATION_MODE_ALPHA_NV = 2,
    VK_COVERAGE_MODULATION_MODE_RGBA_NV = 3,
} VkCoverageModulationModeNV;

- VK_COVERAGE_MODULATION_MODE_NONE_NV specifies that no components are multiplied by the modulation factor.
- VK_COVERAGE_MODULATION_MODE_RGB_NV specifies that the red, green, and blue components are multiplied by the modulation factor.
- VK_COVERAGE_MODULATION_MODE_ALPHA_NV specifies that the alpha component is multiplied by the modulation factor.
- VK_COVERAGE_MODULATION_MODE_RGBA_NV specifies that all components are multiplied by the modulation factor.

To dynamically set the coverageModulationMode state, call:

// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_framebuffer_mixed_samples,
VK_EXT_shader_object with VK_NV_framebuffer_mixed_samples
void vkCmdSetCoverageModulationModeNV(
    VkCommandBuffer commandBuffer,
    VkCoverageModulationModeNV coverageModulationMode);
• **commandBuffer** is the command buffer into which the command will be recorded.

• **coverageModulationMode** specifies the **coverageModulationMode** state.

This command sets the **coverageModulationMode** state for subsequent drawing commands when drawing using **shader objects**, or the graphics pipeline is created with **VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV** set in **VkPipelineDynamicStateCreateInfo**::pDynamicStates. Otherwise, this state is specified by the **VkPipelineCoverageModulationStateCreateInfoNV**::coverageModulationMode value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetCoverageModulationModeNV-None-09423**
  At least one of the following **must** be true:
  - The **extendedDynamicState3CoverageModulationMode** feature is enabled
  - The **shaderObject** feature is enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetCoverageModulationModeNV-commandBuffer-parameter**
  **commandBuffer** **must** be a valid **VkCommandBuffer** handle

- **VUID-vkCmdSetCoverageModulationModeNV-coverageModulationMode-parameter**
  **coverageModulationMode** **must** be a valid **VkCoverageModulationModeNV** value

- **VUID-vkCmdSetCoverageModulationModeNV-commandBuffer-recording**
  **commandBuffer** **must** be in the **recording state**

- **VUID-vkCmdSetCoverageModulationModeNV-commandBuffer-cmdpool**
  The **VkCommandPool** that **commandBuffer** was allocated from **must** support graphics operations

- **VUID-vkCmdSetCoverageModulationModeNV-videocoding**
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized

- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized
**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>

To **dynamically set** the `coverageModulationTableEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_framebuffer_mixed_samples,
// VK_EXT_shader_object with VK_NV_framebuffer_mixed_samples
void vkCmdSetCoverageModulationTableEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 coverageModulationTableEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageModulationTableEnable` specifies the `coverageModulationTableEnable` state.

This command sets the `coverageModulationTableEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationTableEnable` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetCoverageModulationTableEnableNV-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3CoverageModulationTableEnable` feature is enabled
  - The `shaderObject` feature is enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetCoverageModulationTableEnableNV-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetCoverageModulationTableEnableNV-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetCoverageModulationTableEnableNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetCoverageModulationTableEnableNV-videocoding
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

To dynamically set the `pCoverageModulationTable` state, call:

```c
void vkCmdSetCoverageModulationTableNV(
    VkCommandBuffer commandBuffer,
    uint32_t coverageModulationTableCount,
    const float* pCoverageModulationTable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageModulationTableCount` specifies the number of elements in `pCoverageModulationTable`.
- `pCoverageModulationTable` specifies the table of modulation factors containing a value for each number of covered samples.

This command sets the table of modulation factors for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationTableCount`, and `VkPipelineCoverageModulationStateCreateInfoNV::pCoverageModulationTable` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetCoverageModulationTableNV-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3CoverageModulationTable` feature is enabled
The shaderObject feature is enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetCoverageModulationTableNV-commandBuffer-parameter**
  
  The `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetCoverageModulationTableNV-pCoverageModulationTable-parameter**
  
  The `pCoverageModulationTable` must be a valid pointer to an array of `coverageModulationTableCount float` values.

- **VUID-vkCmdSetCoverageModulationTableNV-commandBuffer-recording**
  
  The `commandBuffer` must be in the recording state.

- **VUID-vkCmdSetCoverageModulationTableNV-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdSetCoverageModulationTableNV-coverageModulationTableCount-arraylength**

  `coverageModulationTableCount` must be greater than 0.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Chapter 30. The Framebuffer

30.1. Blending

Blending combines the incoming source fragment’s R, G, B, and A values with the destination R, G, B, and A values of each sample stored in the framebuffer at the fragment’s \((x_f, y_f)\) location. Blending is performed for each color sample covered by the fragment, rather than just once for each fragment.

Source and destination values are combined according to the blend operation, quadruplets of source and destination weighting factors determined by the blend factors, and a blend constant, to obtain a new set of R, G, B, and A values, as described below.

Blending is computed and applied separately to each color attachment used by the subpass, with separate controls for each attachment.

Prior to performing the blend operation, signed and unsigned normalized fixed-point color components undergo an implied conversion to floating-point as specified by Conversion from Normalized Fixed-Point to Floating-Point. Blending computations are treated as if carried out in floating-point, and basic blend operations are performed with a precision and dynamic range no lower than that used to represent destination components. Advanced blending operations are performed with a precision and dynamic range no lower than the smaller of that used to represent destination components or that used to represent 16-bit floating-point values.

Note

Blending is only defined for floating-point, UNORM, SNORM, and sRGB formats. Within those formats, the implementation may only support blending on some subset of them. Which formats support blending is indicated by \(VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT\).

The pipeline blend state is included in the \(VkPipelineColorBlendStateCreateInfo\) structure during graphics pipeline creation:

The \(VkPipelineColorBlendStateCreateInfo\) structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineColorBlendStateCreateFlags flags;
    VkBool32 logicOpEnable;
    VkLogicOp logicOp;
    uint32_t attachmentCount;
    const VkPipelineColorBlendAttachmentState* pAttachments;
    float blendConstants[4];
} VkPipelineColorBlendStateCreateInfo;
```

- \(sType\) is a \(VkStructureType\) value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `flags` is a bitmask of `VkPipelineColorBlendStateCreateFlagBits` specifying additional color blending information.

• `logicOpEnable` controls whether to apply **Logical Operations**.

• `logicOp` selects which logical operation to apply.

• `attachmentCount` is the number of `VkPipelineColorBlendAttachmentState` elements in `pAttachments`. It is ignored if the pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, and `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states set, and either `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` set or `advancedBlendCoherentOperations` is not enabled on the device.

• `pAttachments` is a pointer to an array of `VkPipelineColorBlendAttachmentState` structures defining blend state for each color attachment. It is ignored if the pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, and `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states set, and either `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` set or `advancedBlendCoherentOperations` is not enabled on the device.

• `blendConstants` is a pointer to an array of four values used as the R, G, B, and A components of the blend constant that are used in blending, depending on the **blend factor**.

---

**Valid Usage**

- VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-00605
  If the `independentBlend` feature is not enabled, all elements of `pAttachments` **must** be identical

- VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00606
  If the `logicOp` feature is not enabled, `logicOpEnable` **must** be `VK_FALSE`

- VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00607
  If `logicOpEnable` is `VK_TRUE`, `logicOp` **must** be a valid `VkLogicOp` value

- VUID-VkPipelineColorBlendStateCreateInfo-rasterizationOrderColorAttachmentAccess-06465
  If the `rasterizationOrderColorAttachmentAccess` feature is not enabled, `flags` **must** not include `VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT`

- VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-07353
  If `attachmentCount` is not 0, and any of `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, or `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` are not set, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkPipelineColorBlendAttachmentState` structures
Valid Usage (Implicit)

- **VUID-VkPipelineColorBlendStateCreateInfo-sType-sType**
  
  The `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO`.

- **VUID-VkPipelineColorBlendStateCreateInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineColorBlendAdvancedStateCreateInfoEXT` or `VkPipelineColorWriteCreateInfoEXT`.

- **VUID-VkPipelineColorBlendStateCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkPipelineColorBlendStateCreateInfo-flags-parameter**
  
  The `flags` must be a valid combination of `VkPipelineColorBlendStateCreateFlagBits` values.

- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-parameter**
  
  If `attachmentCount` is not 0, and `pAttachments` is not `NULL`, `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkPipelineColorBlendAttachmentState` structures.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineColorBlendStateCreateFlags;
```

**VkPipelineColorBlendStateCreateFlags** is a bitmask type for setting a mask of zero or more `VkPipelineColorBlendStateCreateFlagBits`.

Bits which can be set in the `VkPipelineColorBlendStateCreateInfo::flags` parameter are:

```c
// Provided by VK_EXT_rasterization_order_attachment_access
typedef enum VkPipelineColorBlendStateCreateFlagBits {
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_PIPELINE_COLOR_BLEND_STATE_CREATE RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT = 0x00000001,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_PIPELINE_COLOR_BLEND_STATE_CREATE RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_ARM = VK_PIPELINE_COLOR_BLEND_STATE_CREATE RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT,
} VkPipelineColorBlendStateCreateFlagBits;
```

- **VK_PIPELINE_COLOR_BLEND_STATE_CREATE RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT** indicates that access to color and input attachments will have implicit framebuffer-local memory dependencies, allowing applications to express custom blending operations in a fragment shader.

When **VK_PIPELINE_COLOR_BLEND_STATE_CREATE RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT** is included in a pipeline, it forms a framebuffer-local memory dependency for each fragment generated by draw commands for that pipeline with the following scopes:
The first synchronization scope includes the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage executed by all previous fragments (as defined by primitive order) in the corresponding framebuffer regions including those generated by the same draw command.

The second synchronization scope includes the VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT pipeline stage executed by the generated fragment.

The first access scope includes all writes to color attachments.

The second access scope includes all reads from input attachments.

The VkPipelineColorBlendAttachmentState structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendAttachmentState {
    bool32 blendEnable;
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
    VkColorComponentFlags colorWriteMask;
} VkPipelineColorBlendAttachmentState;
```

- `blendEnable` controls whether blending is enabled for the corresponding color attachment. If blending is not enabled, the source fragment’s color for that attachment is passed through unmodified.

- `srcColorBlendFactor` selects which blend factor is used to determine the source factors \((S_r, S_g, S_b)\).

- `dstColorBlendFactor` selects which blend factor is used to determine the destination factors \((D_r, D_g, D_b)\).

- `colorBlendOp` selects which blend operation is used to calculate the RGB values to write to the color attachment.

- `srcAlphaBlendFactor` selects which blend factor is used to determine the source factor \(S_a\).

- `dstAlphaBlendFactor` selects which blend factor is used to determine the destination factor \(D_a\).

- `alphaBlendOp` selects which blend operation is used to calculate the alpha values to write to the color attachment.

- `colorWriteMask` is a bitmask of VkColorComponentFlagBits specifying which of the R, G, B, and/or A components are enabled for writing, as described for the Color Write Mask.

### Valid Usage

- VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-00608

  If the dualSrcBlend feature is not enabled, `srcColorBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.
• VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-00609
  If the dualSrcBlend feature is not enabled, dstColorBlendFactor must not be
  VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR,
  VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA.

• VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-00610
  If the dualSrcBlend feature is not enabled, srcAlphaBlendFactor must not be
  VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR,
  VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA.

• VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-00611
  If the dualSrcBlend feature is not enabled, dstAlphaBlendFactor must not be
  VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR,
  VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA.

• VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-01406
  If either of colorBlendOp or alphaBlendOp is an advanced blend operation, then

• VUID-VkPipelineColorBlendAttachmentState-advancedBlendIndependentBlend-01407
  If VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend is VK_FALSE and colorBlendOp is an advanced blend operation, then colorBlendOp must be the same for all attachments.

• VUID-VkPipelineColorBlendAttachmentState-advancedBlendIndependentBlend-01408
  If VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend is VK_FALSE and alphaBlendOp is an advanced blend operation, then alphaBlendOp must be the same for all attachments.

• VUID-VkPipelineColorBlendAttachmentState-advancedBlendAllOperations-01409

• VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-01410
  If colorBlendOp or alphaBlendOp is an advanced blend operation, then colorAttachmentCount of the subpass this pipeline is compiled against must be less than or equal to VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendMaxColorAttachments.

• VUID-VkPipelineColorBlendAttachmentState-constantAlphaColorBlendFactors-04454
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors is VK_FALSE, srcColorBlendFactor must not be VK_BLEND_FACTOR_CONSTANT_ALPHA or
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is `VK_FALSE`, `dstColorBlendFactor` must not be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`.

Valid Usage (Implicit)

- `srcColorBlendFactor` must be a valid `VkBlendFactor` value
- `dstColorBlendFactor` must be a valid `VkBlendFactor` value
- `colorBlendOp` must be a valid `VkBlendOp` value
- `srcAlphaBlendFactor` must be a valid `VkBlendFactor` value
- `dstAlphaBlendFactor` must be a valid `VkBlendFactor` value
- `alphaBlendOp` must be a valid `VkBlendOp` value
- `colorWriteMask` must be a valid combination of `VkColorComponentFlagBits` values

To dynamically set `blendEnable`, call:

```c
void vkCmdSetColorBlendEnableEXT(
  VkCommandBuffer commandBuffer,
  uint32_t firstAttachment,
  uint32_t attachmentCount,
  const VkBool32* pColorBlendEnables);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the color blending enable applies.
- `attachmentCount` the number of color blending enables in the `pColorBlendEnables` array.
- `pColorBlendEnables` an array of booleans to indicate whether color blending is enabled for the corresponding attachment.

This command sets the color blending enable of the specified color attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo`.
Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::blendEnable` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetColorBlendEnableEXT-None-09423**
  At least one of the following **must** be true:
  - The `extendedDynamicState3ColorBlendEnable` feature is enabled
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetColorBlendEnableEXT-pColorBlendEnables-parameter**
  `pColorBlendEnables` **must** be a valid pointer to an array of `attachmentCount` `VkBool32` values

- **VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdSetColorBlendEnableEXT-videocoding**
  This command **must** only be called outside of a video coding scope

- **VUID-vkCmdSetColorBlendEnableEXT-attachmentCount-arraylength**
  `attachmentCount` **must** be greater than 0

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
To **dynamically set** color blend factors and operations, call:

```cpp
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorBlendEquationEXT(
    VkCommandBuffer commandBuffer,  
    uint32_t firstAttachment,  
    uint32_t attachmentCount,  
    const VkColorBlendEquationEXT* pColorBlendEquations);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **firstAttachment** the first color attachment the color blend factors and operations apply to.
- **attachmentCount** the number of `VkColorBlendEquationEXT` elements in the `pColorBlendEquations` array.
- **pColorBlendEquations** an array of `VkColorBlendEquationEXT` structs that specify the color blend factors and operations for the corresponding attachments.

This command sets the color blending factors and operations of the specified attachments for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::srcColorBlendFactor`, `VkPipelineColorBlendAttachmentState::dstColorBlendFactor`, `VkPipelineColorBlendAttachmentState::colorBlendOp`, `VkPipelineColorBlendAttachmentState::srcAlphaBlendFactor`, `VkPipelineColorBlendAttachmentState::dstAlphaBlendFactor`, and `VkPipelineColorBlendAttachmentState::alphaBlendOp` values used to create the currently active pipeline.

---

**Valid Usage**

- VUID-vkCmdSetColorBlendEquationEXT-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3ColorBlendEquation` feature is enabled
  - The `shaderObject` feature is enabled

---

**Valid Usage (Implicit)**

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-parameter
  **commandBuffer** **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetColorBlendEquationEXT-pColorBlendEquations-parameter
  `pColorBlendEquations` **must** be a valid pointer to an array of `attachmentCount` valid `VkColorBlendEquationEXT` structures

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-recording
  **commandBuffer** **must** be in the **recording state**
The *VkCommandPool* that *commandBuffer* was allocated from must support graphics operations.

This command must only be called outside of a video coding scope.

*attachmentCount* must be greater than 0.

### Host Synchronization

- Host access to *commandBuffer* must be externally synchronized.
- Host access to the *VkCommandPool* that *commandBuffer* was allocated from must be externally synchronized.

### Command Properties

The *VkColorBlendEquationEXT* structure is defined as:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
typedef struct VkColorBlendEquationEXT {
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
} VkColorBlendEquationEXT;
```

- *srcColorBlendFactor* selects which blend factor is used to determine the source factors ($S_r, S_g, S_b$).
- *dstColorBlendFactor* selects which blend factor is used to determine the destination factors ($D_r, D_g, D_b$).
- *colorBlendOp* selects which blend operation is used to calculate the RGB values to write to the color attachment.
- *srcAlphaBlendFactor* selects which blend factor is used to determine the source factor $S_a$.
- *dstAlphaBlendFactor* selects which blend factor is used to determine the destination factor $D_a$.
- *alphaBlendOp* selects which blend operation is use to calculate the alpha values to write to the...
Valid Usage

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07357**
  If the `dualSrcBlend` feature is not enabled, `srcColorBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07358**
  If the `dualSrcBlend` feature is not enabled, `dstColorBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07359**
  If the `dualSrcBlend` feature is not enabled, `srcAlphaBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07360**
  If the `dualSrcBlend` feature is not enabled, `dstAlphaBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

- **VUID-VkColorBlendEquationEXT-colorBlendOp-07361**
VK_FALSE, dstColorBlendFactor must not be VK_BLEND_FACTOR_CONSTANT_ALPHA or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA

Valid Usage (Implicit)

- VUID-VkColorBlendEquationEXT-srcColorBlendFactor-parameter srcColorBlendFactor must be a valid VkBlendFactor value
- VUID-VkColorBlendEquationEXT-dstColorBlendFactor-parameter dstColorBlendFactor must be a valid VkBlendFactor value
- VUID-VkColorBlendEquationEXT-colorBlendOp-parameter colorBlendOp must be a valid VkBlendOp value
- VUID-VkColorBlendEquationEXT-srcAlphaBlendFactor-parameter srcAlphaBlendFactor must be a valid VkBlendFactor value
- VUID-VkColorBlendEquationEXT-dstAlphaBlendFactor-parameter dstAlphaBlendFactor must be a valid VkBlendFactor value
- VUID-VkColorBlendEquationEXT-alphaBlendOp-parameter alphaBlendOp must be a valid VkBlendOp value

To dynamically set the color write masks, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorWriteMaskEXT(
    VkCommandBuffer commandBuffer,        // Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
    uint32_t firstAttachment,             // Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
    uint32_t attachmentCount,             // Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
    const VkColorComponentFlags* pColorWriteMasks); // Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the color write masks apply to.
- `attachmentCount` the number of VkColorComponentFlags values in the `pColorWriteMasks` array.
- `pColorWriteMasks` an array of VkColorComponentFlags values that specify the color write masks of the corresponding attachments.

This command sets the color write masks of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::colorWriteMask` values used to create the currently active pipeline.

*Note*

Formats with bits that are shared between components specified by VkColorComponentFlagBits, such as `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, cannot
have their channels individually masked by this functionality; either all
components that share bits have to be enabled, or none of them.

Valid Usage

- VUID-vkCmdSetColorWriteMaskEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3ColorWriteMask` feature is enabled
  - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-parameter
  commandBuffer must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetColorWriteMaskEXT-pColorWriteMasks-parameter
  pColorWriteMasks must be a valid pointer to an array of `attachmentCount` valid combinations of `VkColorComponentFlagBits` values
- VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-cmdpool
  The `VkCommandPool` that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetColorWriteMaskEXT-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdSetColorWriteMaskEXT-attachmentCount-arraylength
  attachmentCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the `VkCommandPool` that commandBuffer was allocated from must be externally synchronized

## 30.1.1. Blend Factors

The source and destination color and alpha blending factors are selected from the enum:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBlendFactor {
    VK_BLEND_FACTOR_ZERO = 0,
    VK_BLEND_FACTOR_ONE = 1,
    VK_BLEND_FACTOR_SRC_COLOR = 2,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR = 3,
    VK_BLEND_FACTOR_DST_COLOR = 4,
    VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR = 5,
    VK_BLEND_FACTOR_SRC_ALPHA = 6,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA = 7,
    VK_BLEND_FACTOR_DST_ALPHA = 8,
    VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA = 9,
    VK_BLEND_FACTOR_CONSTANT_COLOR = 10,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR = 11,
    VK_BLEND_FACTOR_CONSTANT_ALPHA = 12,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA = 13,
    VK_BLEND_FACTOR_SRC_ALPHA_SATURATE = 14,
    VK_BLEND_FACTOR_SRC1_COLOR = 15,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR = 16,
    VK_BLEND_FACTOR_SRC1_ALPHA = 17,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA = 18,
} VkBlendFactor;
```

The semantics of the enum values are described in the table below:

<table>
<thead>
<tr>
<th>VkBlendFactor</th>
<th>RGB Blend Factors ((S_r,S_g,S_b)) or ((D_r,D_g,D_b))</th>
<th>Alpha Blend Factor ((S_a) or (D_a))</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BLEND_FACTOR_ZERO</td>
<td>((0,0,0))</td>
<td>0</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE</td>
<td>((1,1,1))</td>
<td>1</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC_COLOR</td>
<td>((R_{s0},G_{s0},B_{s0}))</td>
<td>(A_{s0})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR</td>
<td>((1-R_{s0},1-G_{s0},1-B_{s0}))</td>
<td>1-(A_{s0})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_DST_COLOR</td>
<td>((R_{d0},G_{d0},B_{d0}))</td>
<td>(A_{d})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR</td>
<td>((1-R_{d0},1-G_{d0},1-B_{d0}))</td>
<td>1-(A_{d})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC_ALPHA</td>
<td>((A_{s0},A_{s0},A_{s0}))</td>
<td>(A_{s0})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA</td>
<td>((1-A_{s0},1-A_{s0},1-A_{s0}))</td>
<td>1-(A_{s0})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_DST_ALPHA</td>
<td>((A_{d},A_{d},A_{d}))</td>
<td>(A_{d})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA</td>
<td>((1-A_{d},1-A_{d},1-A_{d}))</td>
<td>1-(A_{d})</td>
</tr>
</tbody>
</table>
In this table, the following conventions are used:

- \( R_{s0}, G_{s0}, B_{s0} \) and \( A_{s0} \) represent the first source color \( R, G, B, \) and \( A \) components, respectively, for the fragment output location corresponding to the color attachment being blended.

- \( R_{s1}, G_{s1}, B_{s1} \) and \( A_{s1} \) represent the second source color \( R, G, B, \) and \( A \) components, respectively, used in dual source blending modes, for the fragment output location corresponding to the color attachment being blended.

- \( R_{d}, G_{d}, B_{d} \) and \( A_{d} \) represent the \( R, G, B, \) and \( A \) components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.

- \( R_{c}, G_{c}, B_{c} \) and \( A_{c} \) represent the blend constant \( R, G, B, \) and \( A \) components, respectively.

To dynamically set and change the blend constants, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetBlendConstants(
    VkCommandBuffer commandBuffer,
    const float blendConstants[4]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

- `blendConstants` is a pointer to an array of four values specifying the \( R_{c}, G_{c}, B_{c}, \) and \( A_{c} \) components of the blend constant color used in blending, depending on the blend factor.

This command sets blend constants for subsequent drawing commands when drawing using shader objects, or the graphics pipeline is created with `VK_DYNAMIC_STATE_BLEND_CONSTANTS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::blendConstants` values used to create the currently active pipeline.
Valid Usage (Implicit)

- VUID-vkCmdSetBlendConstants-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetBlendConstants-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetBlendConstants-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetBlendConstants-videscoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

</tbody>
</table>

### 30.1.2. Dual-Source Blending

Blend factors that use the secondary color input \((R_{s1},G_{s1},B_{s1},A_{s1})\) \((\text{VK\_BLEND\_FACTOR\_SRC1\_COLOR},\text{VK\_BLEND\_FACTOR\_ONE\_MINUS\_SRC1\_COLOR},\text{VK\_BLEND\_FACTOR\_SRC1\_ALPHA},\text{and VK\_BLEND\_FACTOR\_ONE\_MINUS\_SRC1\_ALPHA})\) may consume implementation resources that could otherwise be used for rendering to multiple color attachments. Therefore, the number of color attachments that can be used in a framebuffer may be lower when using dual-source blending.

Dual-source blending is only supported if the dualSrcBlend feature is enabled.

The maximum number of color attachments that can be used in a subpass when using dual-source blending functions is implementation-dependent and is reported as the maxFragmentDualSrcAttachments member of VkPhysicalDeviceLimits.

Color outputs can be bound to the first and second inputs of the blender using the Index decoration, as described in Fragment Output Interface. If the second color input to the blender is not written in the shader, or if no output is bound to the second input of a blender, the value of the second input is undefined.
30.1.3. Blend Operations

Once the source and destination blend factors have been selected, they along with the source and destination components are passed to the blending operations. RGB and alpha components can use different operations. Possible values of VkBlendOp, specifying the operations, are:

```c
typedef enum VkBlendOp {
    VK_BLEND_OP_ADD = 0,
    VK_BLEND_OP_SUBTRACT = 1,
    VK_BLEND_OP_REVERSE_SUBTRACT = 2,
    VK_BLEND_OP_MIN = 3,
    VK_BLEND_OP_MAX = 4,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_ZERO_EXT = 1000148000,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_EXT = 1000148001,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_EXT = 1000148002,
    // Provided by VK_EXT_blend_operation_advanced

<td>[ A = A_s0 \times S_a - A_d \times D_a ]</td>
</tr>
<tr>
<td></td>
<td>[ G = G_s0 \times S_g - G_d \times D_g ]</td>
<td></td>
</tr>
<tr>
<td></td>
<td>[ B = B_s0 \times S_b - B_d \times D_b ]</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_REVERSE_SUBTRACT</td>
<td>[ R = R_d \times D_r - R_s0 \times S_r ]</td>
<td>[ A = A_d \times D_a - A_s0 \times S_a ]</td>
</tr>
<tr>
<td></td>
<td>[ G = G_d \times D_g - G_s0 \times S_g ]</td>
<td></td>
</tr>
<tr>
<td></td>
<td>[ B = B_d \times D_b - B_s0 \times S_b ]</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_MIN</td>
<td>[ R = \min(R_s0,R_d) ]</td>
<td>[ A = \min(A_s0,A_d) ]</td>
</tr>
<tr>
<td></td>
<td>[ G = \min(G_s0,G_d) ]</td>
<td></td>
</tr>
<tr>
<td></td>
<td>[ B = \min(B_s0,B_d) ]</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_MAX</td>
<td>[ R = \max(R_s0,R_d) ]</td>
<td>[ A = \max(A_s0,A_d) ]</td>
</tr>
<tr>
<td></td>
<td>[ G = \max(G_s0,G_d) ]</td>
<td></td>
</tr>
<tr>
<td></td>
<td>[ B = \max(B_s0,B_d) ]</td>
<td></td>
</tr>
</tbody>
</table>

In this table, the following conventions are used:

- \( R_{s0}, G_{s0}, B_{s0} \) and \( A_{s0} \) represent the first source color R, G, B, and A components, respectively.
- \( R_d, G_d, B_d \) and \( A_d \) represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- \( S_r, S_g, S_b \) and \( S_a \) represent the source blend factor R, G, B, and A components, respectively.
- \( D_r, D_g, D_b \) and \( D_a \) represent the destination blend factor R, G, B, and A components, respectively.

The blending operation produces a new set of values R, G, B and A, which are written to the framebuffer attachment. If blending is not enabled for this attachment, then R, G, B and A are assigned \( R_{s0}, G_{s0}, B_{s0} \) and \( A_{s0} \), respectively.

If the color attachment is fixed-point, the components of the source and destination values and blend factors are each clamped to \([0,1]\) or \([-1,1]\) respectively for an unsigned normalized or signed normalized color attachment prior to evaluating the blend operations. If the color attachment is floating-point, no clamping occurs.

If the numeric format of a framebuffer attachment uses sRGB encoding, the R, G, and B destination color values (after conversion from fixed-point to floating-point) are considered to be encoded for the sRGB color space and hence are linearized prior to their use in blending. Each R, G, and B component is converted from nonlinear to linear as described in the “sRGB EOTF” section of the Khronos Data Format Specification. If the format is not sRGB, no linearization is performed.

If the numeric format of a framebuffer attachment uses sRGB encoding, then the final R, G and B values are converted into the nonlinear sRGB representation before being written to the framebuffer attachment as described in the “sRGB EOTF” section of the Khronos Data Format Specification.
Specification.

If the numeric format of a framebuffer color attachment is not sRGB encoded then the resulting \(c\) values for R, G and B are unmodified. The value of A is never sRGB encoded. That is, the alpha component is always stored in memory as linear.

If the framebuffer color attachment is \texttt{VK_ATTACHMENT_UNUSED}, no writes are performed through that attachment. Writes are not performed to framebuffer color attachments greater than or equal to the \texttt{VkSubpassDescription::colorAttachmentCount} or \texttt{VkSubpassDescription2::colorAttachmentCount} value.

### 30.1.4. Advanced Blend Operations

The \textit{advanced blend operations} are those listed in tables \texttt{f/X/Y/Z Advanced Blend Operations}, \texttt{Hue-Saturation-Luminosity Advanced Blend Operations}, and \texttt{Additional RGB Blend Operations}.

If the \texttt{pNext} chain of \texttt{VkPipelineColorBlendStateCreateInfo} includes a \texttt{VkPipelineColorBlendAdvancedStateCreateInfoEXT} structure, then that structure includes parameters that affect advanced blend operations.

The \texttt{VkPipelineColorBlendAdvancedStateCreateInfoEXT} structure is defined as:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPipelineColorBlendAdvancedStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 srcPremultiplied;
    VkBool32 dstPremultiplied;
    VkBlendOverlapEXT blendOverlap;
} VkPipelineColorBlendAdvancedStateCreateInfoEXT;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{srcPremultiplied} specifies whether the source color of the blend operation is treated as premultiplied.
- \texttt{dstPremultiplied} specifies whether the destination color of the blend operation is treated as premultiplied.
- \texttt{blendOverlap} is a \texttt{VkBlendOverlapEXT} value specifying how the source and destination sample's coverage is correlated.

If this structure is not present, \texttt{srcPremultiplied} and \texttt{dstPremultiplied} are both considered to be \texttt{VK_TRUE}, and \texttt{blendOverlap} is considered to be \texttt{VK_BLEND_OVERLAP_UNCORRELATED_EXT}.

### Valid Usage

- \texttt{VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-srcPremultiplied-01424}
  If the \textit{non-premultiplied source color} property is not supported, \texttt{srcPremultiplied} must be
If the non-premultiplied destination color property is not supported, `dstPremultiplied` must be `VK_TRUE`.

If the correlated overlap property is not supported, `blendOverlap` must be `VK_BLEND_OVERLAP_UNCORRELATED_EXT`.

To dynamically set the advanced blend state, call:

```c
void vkCmdSetColorBlendAdvancedEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,
    uint32_t attachmentCount,
    const VkColorBlendAdvancedEXT* pColorBlendAdvanced);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` is the first color attachment the advanced blend parameters apply to.
- `attachmentCount` is the number of `VkColorBlendAdvancedEXT` elements in the `pColorBlendAdvanced` array.
- `pColorBlendAdvanced` is an array of `VkColorBlendAdvancedEXT` structs that specify the advanced color blend parameters for the corresponding attachments.

This command sets the advanced blend operation parameters of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAdvancedStateCreateInfoEXT::srcPremultiplied`, `VkPipelineColorBlendAdvancedStateCreateInfoEXT::dstPremultiplied`, and `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap` values used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetColorBlendAdvancedEXT-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3ColorBlendAdvanced` feature is enabled
  - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetColorBlendAdvancedEXT-pColorBlendAdvanced-parameter
  `pColorBlendAdvanced` **must** be a valid pointer to an array of `attachmentCount` valid `VkColorBlendAdvancedEXT` structures

- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-recording
  `commandBuffer` **must** be in the `recording state`

- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetColorBlendAdvancedEXT-videocoding
  This command **must** only be called outside of a video coding scope

- VUID-vkCmdSetColorBlendAdvancedEXT-attachmentCount-arraylength
  `attachmentCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

The `VkColorBlendAdvancedEXT` structure is defined as:
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object

typedef struct VkColorBlendAdvancedEXT {
    VkBlendOp advancedBlendOp;
    VkBool32 srcPremultiplied;
    VkBool32 dstPremultiplied;
    VkBlendOverlapEXT blendOverlap;
    VkBool32 clampResults;
} VkColorBlendAdvancedEXT;

• **advancedBlendOp** selects which blend operation is used to calculate the RGB values to write to the color attachment.

• **srcPremultiplied** specifies whether the source color of the blend operation is treated as premultiplied.

• **dstPremultiplied** specifies whether the destination color of the blend operation is treated as premultiplied.

• **blendOverlap** is a VkBlendOverlapEXT value specifying how the source and destination sample’s coverage is correlated.

• **clampResults** specifies the results must be clamped to the [0,1] range before writing to the attachment, which is useful when the attachment format is not normalized fixed-point.

---

### Valid Usage

- **VUID-VkColorBlendAdvancedEXT-srcPremultiplied-07505**
    
    If the **non-premultiplied source color** property is not supported, **srcPremultiplied must be VK_TRUE**

- **VUID-VkColorBlendAdvancedEXT-dstPremultiplied-07506**
    
    If the **non-premultiplied destination color** property is not supported, **dstPremultiplied must be VK_TRUE**

- **VUID-VkColorBlendAdvancedEXT-blendOverlap-07507**
    
    If the **correlated overlap** property is not supported, **blendOverlap must be VK_BLEND_OVERLAP_UNCORRELATED_EXT**

---

### Valid Usage (Implicit)

- **VUID-VkColorBlendAdvancedEXT-advancedBlendOp-parameter**
    
    **advancedBlendOp** must be a valid VkBlendOp value

- **VUID-VkColorBlendAdvancedEXT-blendOverlap-parameter**
    
    **blendOverlap** must be a valid VkBlendOverlapEXT value

---

When using one of the operations in table **fX/Y/Z Advanced Blend Operations** or **Hue-Saturation-Luminosity Advanced Blend Operations**, blending is performed according to the following equations:
where the function $f$ and terms $X$, $Y$, and $Z$ are specified in the table. The $R$, $G$, and $B$ components of the source color used for blending are derived according to $\text{srcPremultiplied}$. If $\text{srcPremultiplied}$ is set to $\text{VK_TRUE}$, the fragment color components are considered to have been premultiplied by the A component prior to blending. The base source color ($R_s', G_s', B_s'$) is obtained by dividing through by the A component:

$$
(R_s', G_s', B_s') = \begin{cases} 
(0, 0, 0) & \text{if } A_s = 0 \\
\left(\frac{R_s}{A_s}, \frac{G_s}{A_s}, \frac{B_s}{A_s}\right) & \text{otherwise}
\end{cases}
$$

If $\text{srcPremultiplied}$ is $\text{VK_FALSE}$, the fragment color components are used as the base color:

$$(R_s', G_s', B_s') = (R_s, G_s, B_s)$$

The $R$, $G$, and $B$ components of the destination color used for blending are derived according to $\text{dstPremultiplied}$. If $\text{dstPremultiplied}$ is set to $\text{VK_TRUE}$, the destination components are considered to have been premultiplied by the A component prior to blending. The base destination color ($R_d', G_d', B_d'$) is obtained by dividing through by the A component:

$$
(R_d', G_d', B_d') = \begin{cases} 
(0, 0, 0) & \text{if } A_d = 0 \\
\left(\frac{R_d}{A_d}, \frac{G_d}{A_d}, \frac{B_d}{A_d}\right) & \text{otherwise}
\end{cases}
$$

If $\text{dstPremultiplied}$ is $\text{VK_FALSE}$, the destination color components are used as the base color:

$$(R_d', G_d', B_d') = (R_d, G_d, B_d)$$

When blending using advanced blend operations, we expect that the $R$, $G$, and $B$ components of premultiplied source and destination color inputs be stored as the product of non-premultiplied $R$, $G$, and $B$ component values and the A component of the color. If any $R$, $G$, or $B$ component of a premultiplied input color is non-zero and the A component is zero, the color is considered ill-formed, and the corresponding component of the blend result is undefined.

All of the advanced blend operation formulas in this chapter compute the result as a premultiplied color. If $\text{dstPremultiplied}$ is $\text{VK_FALSE}$, that result color’s $R$, $G$, and $B$ components are divided by the A component before being written to the framebuffer. If any $R$, $G$, or $B$ component of the color is non-zero and the A component is zero, the result is considered ill-formed, and the corresponding component of the blend result is undefined. If all components are zero, that value is unchanged.

If the A component of any input or result color is less than zero, the color is considered ill-formed, and all components of the blend result are undefined.

The weighting functions $p_0$, $p_1$, and $p_2$ are defined in table Advanced Blend Overlap Modes. In these
functions, the A components of the source and destination colors are taken to indicate the portion of the pixel covered by the fragment (source) and the fragments previously accumulated in the pixel (destination). The functions \( p_0, p_1, \) and \( p_2 \) approximate the relative portion of the pixel covered by the intersection of the source and destination, covered only by the source, and covered only by the destination, respectively.

Possible values of `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap`, specifying the blend overlap functions, are:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef enum VkBlendOverlapEXT {
    VK_BLEND_OVERLAP_UNCORRELATED_EXT = 0,
    VK_BLEND_OVERLAP_DISJOINT_EXT = 1,
    VK_BLEND_OVERLAP_CONJOINT_EXT = 2,
} VkBlendOverlapEXT;
```

- `VK_BLEND_OVERLAP_UNCORRELATED_EXT` specifies that there is no correlation between the source and destination coverage.
- `VK_BLEND_OVERLAP_CONJOINT_EXT` specifies that the source and destination coverage are considered to have maximal overlap.
- `VK_BLEND_OVERLAP_DISJOINT_EXT` specifies that the source and destination coverage are considered to have minimal overlap.

When using one of the HSL blend operations in table Hue-Saturation-Luminosity Advanced Blend
Operations as the blend operation, the RGB color components produced by the function f are effectively obtained by converting both the non-premultiplied source and destination colors to the HSL (hue, saturation, luminosity) color space, generating a new HSL color by selecting H, S, and L components from the source or destination according to the blend operation, and then converting the result back to RGB. In the equations below, a blended RGB color is produced according to the following pseudocode:

```c
float minv3(vec3 c) {
    return min(min(c.r, c.g), c.b);
}
float maxv3(vec3 c) {
    return max(max(c.r, c.g), c.b);
}
float lumv3(vec3 c) {
    return dot(c, vec3(0.30, 0.59, 0.11));
}
float satv3(vec3 c) {
    return maxv3(c) - minv3(c);
}

// If any color components are outside [0,1], adjust the color to get the components in range.
vec3 ClipColor(vec3 color) {
    float lum = lumv3(color);
    float mincol = minv3(color);
    float maxcol = maxv3(color);
    if (mincol < 0.0) {
        color = lum + ((color-lum)*lum) / (lum-mincol);
    }
    if (maxcol > 1.0) {
        color = lum + ((color-lum)*(1-lum)) / (maxcol-lum);
    }
    return color;
}

// Take the base RGB color <cbase> and override its luminosity with that of the RGB color <clum>.
vec3 SetLum(vec3 cbase, vec3 clum) {
    float lbase = lumv3(cbase);
    float llum = lumv3(clum);
    float ldiff = llum - lbase;
    vec3 color = cbase + vec3(ldiff);
    return ClipColor(color);
}

// Take the base RGB color <cbase> and override its saturation with that of the RGB color <csat>. The override the luminosity of the result with that of the RGB color <clum>.
vec3 SetLumSat(vec3 cbase, vec3 csat, vec3 clum) {
}
```
```cpp
float minbase = minv3(cbase);
float sbase = satv3(cbase);
float ssat = satv3(csat);
vec3 color;
if (sbase > 0) {
    // Equivalent (modulo rounding errors) to setting the
    // smallest (R,G,B) component to 0, the largest to <ssat>,
    // and interpolating the "middle" component based on its
    // original value relative to the smallest/largest.
    color = (cbase - minbase) * ssat / sbase;
} else {
    color = vec3(0.0);
}
return SetLum(color, clum);
```

When using one of the operations in table Additional RGB Blend Operations as the blend operation, the source and destination colors used by these blending operations are interpreted according to srcPremultiplied and dstPremultiplied. The blending operations below are evaluated where the RGB source and destination color components are both considered to have been premultiplied by the corresponding A component.

\[
(R_s', G_s', B_s') = \begin{cases} 
(R_s, G_s, B_s) & \text{if srcPremultiplied is VK_TRUE} \\
(R_sA_s, G_sA_s, B_sA_s) & \text{if srcPremultiplied is VK_FALSE} 
\end{cases}
\]

\[
(R_d', G_d', B_d') = \begin{cases} 
(R_d, G_d, B_d) & \text{if dstPremultiplied is VK_TRUE} \\
(R_dA_d, G_dA_d, B_dA_d) & \text{if dstPremultiplied is VK_FALSE} 
\end{cases}
\]

Table 44. Additional RGB Blend Operations
30.2. Logical Operations

The application can enable a logical operation between the fragment's color values and the existing value in the framebuffer attachment. This logical operation is applied prior to updating the framebuffer attachment. Logical operations are applied only for signed and unsigned integer and normalized integer framebuffers. Logical operations are not applied to floating-point or sRGB format color attachments.
Logical operations are controlled by the `logicOpEnable` and `logicOp` members of `VkPipelineColorBlendStateCreateInfo`. The `logicOpEnable` state can also be controlled by `vkCmdSetLogicOpEnableEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. The `logicOp` state can also be controlled by `vkCmdSetLogicOpEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. If `logicOpEnable` is `VK_TRUE`, then a logical operation selected by `logicOp` is applied between each color attachment and the fragment's corresponding output value, and blending of all attachments is treated as if it were disabled. Any attachments using color formats for which logical operations are not supported simply pass through the color values unmodified. The logical operation is applied independently for each of the red, green, blue, and alpha components. The `logicOp` is selected from the following operations:

```c
// Provided by VK_VERSION_1_0
typedef enum VkLogicOp {
    VK_LOGIC_OP_CLEAR = 0,
    VK_LOGIC_OP_AND = 1,
    VK_LOGIC_OP_AND_REVERSE = 2,
    VK_LOGIC_OP_COPY = 3,
    VK_LOGIC_OP_AND_INVERTED = 4,
    VK_LOGIC_OP_NO_OP = 5,
    VK_LOGIC_OP_XOR = 6,
    VK_LOGIC_OP_OR = 7,
    VK_LOGIC_OP_NOR = 8,
    VK_LOGIC_OP_EQUIVALENT = 9,
    VK_LOGIC_OP_INVERT = 10,
    VK_LOGIC_OP_OR_REVERSE = 11,
    VK_LOGIC_OP_COPY_INVERTED = 12,
    VK_LOGIC_OP_OR_INVERTED = 13,
    VK_LOGIC_OP_NAND = 14,
    VK_LOGIC_OP_SET = 15,
} VkLogicOp;
```
The logical operations supported by Vulkan are summarized in the following table in which

- \( \neg \) is bitwise invert,
- \( \& \) is bitwise and,
- \( \lor \) is bitwise or,
- \( \oplus \) is bitwise exclusive or,
- \( s \) is the fragment's \( R_{s0}, G_{s0}, B_{s0} \) or \( A_{s0} \) component value for the fragment output corresponding to the color attachment being updated, and
- \( d \) is the color attachment's \( R, G, B \) or \( A \) component value:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_LOGIC_OP_CLEAR</td>
<td>0</td>
</tr>
<tr>
<td>VK_LOGIC_OP_AND</td>
<td>( s &amp; d )</td>
</tr>

</tr>
<tr>
<td>VK_LOGIC_OP_NAND</td>
<td>( \neg (s &amp; d) )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_SET</td>
<td>all 1s</td>
</tr>
</tbody>
</table>

The result of the logical operation is then written to the color attachment as controlled by the component write mask, described in Blend Operations.

To dynamically set whether logical operations are enabled, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetLogicOpEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 logicOpEnable);
```
- **commandBuffer** is the command buffer into which the command will be recorded.
- **logicOpEnable** specifies whether logical operations are enabled.

This command sets whether logical operations are enabled for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOpEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLogicOpEnableEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3LogicOpEnable` feature is enabled
  - The `shaderObject` feature is enabled
- VUID-vkCmdSetLogicOpEnableEXT-logicOp-07366
  If the `logicOp` feature is not enabled, `logicOpEnable` must be `VK_FALSE`

### Valid Usage (Implicit)

- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetLogicOpEnableEXT-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
To **dynamically set** the logical operation to apply for blend state, call:

```c
void vkCmdSetLogicOpEXT(
    VkCommandBuffer commandBuffer,
    VkLogicOp logicOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `logicOp` specifies the logical operation to apply for blend state.

This command sets the logical operation for blend state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOp` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetLogicOpEXT-None-09422
  At least one of the following must be true:
  - The `extendedDynamicState2LogicOp` feature is enabled
  - The `shaderObject` feature is enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetLogicOpEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetLogicOpEXT-logicOp-parameter
  `logicOp` must be a valid `VkLogicOp` value

- VUID-vkCmdSetLogicOpEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetLogicOpEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

</tbody>
</table>

30.3. Color Write Mask

Bits which can be set in `VkPipelineColorBlendAttachmentState::colorWriteMask`, determining whether the final color values R, G, B and A are written to the framebuffer attachment, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkColorComponentFlagBits {
    VK_COLOR_COMPONENT_R_BIT = 0x00000001,
    VK_COLOR_COMPONENT_G_BIT = 0x00000002,
    VK_COLOR_COMPONENT_B_BIT = 0x00000004,
    VK_COLOR_COMPONENT_A_BIT = 0x00000008,
} VkColorComponentFlagBits;
```

- `VK_COLOR_COMPONENT_R_BIT` specifies that the R value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_G_BIT` specifies that the G value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_B_BIT` specifies that the B value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_A_BIT` specifies that the A value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.

The color write mask operation is applied regardless of whether blending is enabled.

The color write mask operation is applied only if Color Write Enable is enabled for the respective attachment. Otherwise the color write mask is ignored and writes to all components of the
attachment are disabled.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkColorComponentFlags;
```

`VkColorComponentFlags` is a bitmask type for setting a mask of zero or more `VkColorComponentFlagBits`.

### 30.4. Color Write Enable

The `VkPipelineColorWriteCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_color_write_enable
typedef struct VkPipelineColorWriteCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentCount;
    const VkBool32* pColorWriteEnables;
} VkPipelineColorWriteCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentCount` is the number of `VkBool32` elements in `pColorWriteEnables`.
- `pColorWriteEnables` is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

When this structure is included in the `pNext` chain of `VkPipelineColorBlendStateCreateInfo`, it defines per-attachment color write state. If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with `attachmentCount` equal to the `attachmentCount` member of `VkPipelineColorBlendStateCreateInfo`, and `pColorWriteEnables` pointing to an array of as many `VK_TRUE` values.

If the `colorWriteEnable` feature is not enabled on the device, all `VkBool32` elements in the `pColorWriteEnables` array **must** be `VK_TRUE`.

Color Write Enable interacts with the Color Write Mask as follows:

- If `colorWriteEnable` is `VK_TRUE`, writes to the attachment are determined by the `colorWriteMask`.
- If `colorWriteEnable` is `VK_FALSE`, the `colorWriteMask` is ignored and writes to all components of the attachment are disabled. This is equivalent to specifying a `colorWriteMask` of 0.

#### Valid Usage

- VUID-VkPipelineColorWriteCreateInfoEXT-pAttachments-04801
  If the `colorWriteEnable` feature is not enabled, all elements of `pColorWriteEnables` **must** be
If the pipeline is being created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, or `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states not set, `attachmentCount` must be equal to the `attachmentCount` member of the `VkPipelineColorBlendStateCreateInfo` structure specified during pipeline creation.

`attachmentCount` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

### Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_WRITE_CREATE_INFO_EXT`.
- If `attachmentCount` is not 0, `pColorWriteEnables` must be a valid pointer to an array of `attachmentCount` `VkBool32` values.

To dynamically enable or disable writes to a color attachment, call:

```c
void vkCmdSetColorWriteEnableEXT(
    VkCommandBuffer commandBuffer,
    uint32_t attachmentCount,
    const VkBool32* pColorWriteEnables);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `attachmentCount` is the number of `VkBool32` elements in `pColorWriteEnables`.
- `pColorWriteEnables` is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

This command sets the color write enables for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorWriteCreateInfoEXT::pColorWriteEnables` values used to create the currently active pipeline.

### Valid Usage

- The `colorWriteEnable` feature must be enabled.
- `attachmentCount` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.
attachmentCount must be less than or equal to the maxColorAttachments member of VkPhysicalDeviceLimits

Valid Usage (Implicit)

- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetColorWriteEnableEXT-pColorWriteEnables-parameter pColorWriteEnables must be a valid pointer to an array of attachmentCount VkBool32 values
- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-recording commandBuffer must be in the recording state
- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetColorWriteEnableEXT-videocoding This command must only be called outside of a video coding scope
- VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-arraylength attachmentCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tr>
</tbody>
</table>

30.5. Framebuffer Query Instructions

To query the tile properties from the attachments in framebuffer, call:
// Provided by VK_QCOM_tile_properties

VkResult vkGetFramebufferTilePropertiesQCOM(
    VkDevice device, 
    VkFramebuffer framebuffer, 
    uint32_t* pPropertiesCount, 
    VkTilePropertiesQCOM* pProperties);

• device is a logical device associated with the framebuffer.

• framebuffer is a handle of the framebuffer to query.

• pPropertiesCount is a pointer to an integer related to the number of tile properties available or queried, as described below.

• pProperties is either NULL or a pointer to an array of VkTilePropertiesQCOM structures.

If pProperties is NULL, then the number of tile properties available is returned in pPropertiesCount. Otherwise, pPropertiesCount must point to a variable set by the user to the number of elements in the pProperties array, and on return the variable is overwritten with the number of properties actually written to pProperties. If pPropertiesCount is less than the number of tile properties available, at most pPropertiesCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available properties were returned.

The number of tile properties available is determined by the number of merged subpasses, and each tile property is associated with a merged subpass. There will be at most as many properties as there are subpasses within the render pass. To obtain the tile properties for a given merged subpass, the pProperties array can be indexed using the postMergeIndex value provided in VkRenderPassSubpassFeedbackInfoEXT.

Valid Usage (Implicit)

• VUID-vkGetFramebufferTilePropertiesQCOM-device-parameter
    device must be a valid VkDevice handle

• VUID-vkGetFramebufferTilePropertiesQCOM-framebuffer-parameter
    framebuffer must be a valid VkFramebuffer handle

• VUID-vkGetFramebufferTilePropertiesQCOM-pPropertiesCount-parameter
    pPropertiesCount must be a valid pointer to a uint32_t value

• VUID-vkGetFramebufferTilePropertiesQCOM-pProperties-parameter
    If the value referenced by pPropertiesCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertiesCount VkTilePropertiesQCOM structures

• VUID-vkGetFramebufferTilePropertiesQCOM-framebuffer-parent
    framebuffer must have been created, allocated, or retrieved from device
Return Codes

Success
  • VK_SUCCESS
  • VK_INCOMPLETE

Failure
  None
Chapter 31. Dispatching Commands

Dispatching commands (commands with Dispatch in the name) provoke work in a compute pipeline. Dispatching commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound compute pipeline. A compute pipeline must be bound to a command buffer before any dispatching commands are recorded in that command buffer.

To record a dispatch, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatch(
    VkCommandBuffer commandBuffer,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of $\text{groupCountX} \times \text{groupCountY} \times \text{groupCountZ}$ local workgroups is assembled.

Valid Usage

- VUID-vkCmdDispatch-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatch-magFilter-09598
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDispatch-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_LINEAR_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`.

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` must be 1.

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` must be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`.

If a `VkImageView` is accessed using atomic operations as a result of this command, then the storage texel buffer's `format features` must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and `format` that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and `format` that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by...
If the $\text{cubicRangeClamp}$ feature is not enabled, then any $\text{VkImageView}$ being sampled with $\text{VK_FILTER_CUBIC_EXT}$ as a result of this command must not have a $\text{VkSamplerReductionModeCreateInfo}$. :

- $\text{reductionMode} = \text{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM}$

If the $\text{selectableCubicWeights}$ feature is not enabled, then any $\text{VkImageView}$ being sampled with $\text{VK_FILTER_CUBIC_EXT}$ as a result of this command must have $\text{VkSamplerCubicWeightsCreateInfoQCOM}$. :

- $\text{cubicWeights} = \text{VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM}$

Any $\text{VkImageView}$ created with a $\text{VkImageCreateInfo}$. :

- $\text{flags} = \text{VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV}$ sampled as a result of this command must only be sampled using a $\text{VkSamplerAddressMode}$ of $\text{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE}$

For any $\text{VkImageView}$ being written as a storage image where the image format field of the $\text{OpTypeImage}$ is $\text{Unknown}$, the view’s format features must contain $\text{VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT}$

For any $\text{VkBufferView}$ being written as a storage texel buffer where the image format field of the $\text{OpTypeImage}$ is $\text{Unknown}$, the view’s buffer features must contain $\text{VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT}$

For each set $n$ that is statically used by a bound shader, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a $\text{VkPipelineLayout}$ that is compatible for set $n$, with the $\text{VkPipelineLayout}$ used to create the current $\text{VkPipeline}$ or the $\text{VkDescriptorSetLayout}$ array used to create the current $\text{VkShaderEXT}$, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a $\text{VkPipelineLayout}$ that is...
compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- VUID-vkCmdDispatch-maintenance4-08602
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- VUID-vkCmdDispatch-None-08114
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- VUID-vkCmdDispatch-None-08115
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` must have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- VUID-vkCmdDispatch-None-08116
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- VUID-vkCmdDispatch-None-08604
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command.

- VUID-vkCmdDispatch-None-08117
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` must have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- VUID-vkCmdDispatch-None-08119
  If a descriptor is dynamically used with a `VkPipeline` created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident.

- VUID-vkCmdDispatch-None-08605
  If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident.

- VUID-vkCmdDispatch-None-08606
  If the `shaderObject` feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.
If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either
VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or
VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers,
and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatch-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatch-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

- VUID-vkCmdDispatch-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C aC conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- VUID-vkCmdDispatch-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C aC conversion, that object must not use the ConstOffset and Offset operands

- VUID-vkCmdDispatch-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

- VUID-vkCmdDispatch-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match

- VUID-vkCmdDispatch-OpImageWrite-08795
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

- VUID-vkCmdDispatch-OpImageWrite-08796
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components

- VUID-vkCmdDispatch-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

- VUID-vkCmdDispatch-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64
• VUID-vkCmdDispatch-SampledType-04471
If a \textit{VkImageView} with a \textit{VkFormat} that has a component width less than 64-bit is accessed as a result of this command, the \textit{SampledType} of the \textit{OpTypeImage} operand of that instruction \textbf{must} have a \textbf{Width} of 32

• VUID-vkCmdDispatch-SampledType-04472
If a \textit{VkBufferView} with a \textit{VkFormat} that has a 64-bit component width is accessed as a result of this command, the \textit{SampledType} of the \textit{OpTypeImage} operand of that instruction \textbf{must} have a \textbf{Width} of 64

• VUID-vkCmdDispatch-SampledType-04473
If a \textit{VkBufferView} with a \textit{VkFormat} that has a component width less than 64-bit is accessed as a result of this command, the \textit{SampledType} of the \textit{OpTypeImage} operand of that instruction \textbf{must} have a \textbf{Width} of 32

• VUID-vkCmdDispatch-sparseImageInt64Atomics-04474
If the \textit{sparseImageInt64Atomics} feature is not enabled, \textit{VkImage} objects created with the \textit{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT} flag \textbf{must} not be accessed by atomic instructions through an \textit{OpTypeImage} with a \textit{SampledType} with a \textbf{Width} of 64 by this command

• VUID-vkCmdDispatch-sparseImageInt64Atomics-04475
If the \textit{sparseImageInt64Atomics} feature is not enabled, \textit{VkBuffer} objects created with the \textit{VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT} flag \textbf{must} not be accessed by atomic instructions through an \textit{OpTypeImage} with a \textit{SampledType} with a \textbf{Width} of 64 by this command

• VUID-vkCmdDispatch-OpImageWeightedSampleQCOM-06971
If \textit{OpImageWeightedSampleQCOM} is used to sample a \textit{VkImageView} as a result of this command, then the image view's \textit{format features} \textbf{must} contain \textit{VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM}

• VUID-vkCmdDispatch-OpImageWeightedSampleQCOM-06972
If \textit{OpImageWeightedSampleQCOM} uses a \textit{VkImageView} as a sample weight image as a result of this command, then the image view's \textit{format features} \textbf{must} contain \textit{VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM}

• VUID-vkCmdDispatch-OpImageBoxFilterQCOM-06973
If \textit{OpImageBoxFilterQCOM} is used to sample a \textit{VkImageView} as a result of this command, then the image view's \textit{format features} \textbf{must} contain \textit{VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM}

• VUID-vkCmdDispatch-OpImageBlockMatchSSDQCOM-06974
If \textit{OpImageBlockMatchSSDQCOM} is used to read from a \textit{reference image} as result of this command, then the specified reference coordinates \textbf{must} not fail \textit{integer texel coordinate validation}
If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, or `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, or `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s format must be a single-component format.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

Any shader invocation executed by this command must terminate.

If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM`, `VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written.

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command must not be an unprotected resource.

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command must not write to any resource.

If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this
command uses the RayQueryKHR capability, then commandBuffer must not be a protected command buffer

- VUID-vkCmdDispatch-groupCountX-00386
groupCountX must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]

- VUID-vkCmdDispatch-groupCountY-00387
groupCountY must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]

- VUID-vkCmdDispatch-groupCountZ-00388
groupCountZ must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]

Valid Usage (Implicit)

- VUID-vkCmdDispatch-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDispatch-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdDispatch-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdDispatch-renderpass
This command must only be called outside of a render pass instance

- VUID-vkCmdDispatch-videocoding
This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

To record an indirect dispatching command, call:
void vkCmdDispatchIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `buffer` is the buffer containing dispatch parameters.
- `offset` is the byte offset into `buffer` where parameters begin.

`vkCmdDispatchIndirect` behaves similarly to `vkCmdDispatch` except that the parameters are read by the device from a buffer during execution. The parameters of the dispatch are encoded in a `VkDispatchIndirectCommand` structure taken from `buffer` starting at `offset`.

**Valid Usage**

- **VUID-vkCmdDispatchIndirect-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatchIndirect-magFilter-09598**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- **VUID-vkCmdDispatchIndirect-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatchIndirect-mipmapMode-09599**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- **VUID-vkCmdDispatchIndirect-unnormalizedCoordinates-09635**
  If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` must be 1
• VUID-vkCmdDispatchIndirect-unnormalizedCoordinates-09636
  If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` must be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`.

• VUID-vkCmdDispatchIndirect-None-06479
  If a `VkImageView` is sampled with depth comparison, the image view's `format features` must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

• VUID-vkCmdDispatchIndirect-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

• VUID-vkCmdDispatchIndirect-None-07888
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

• VUID-vkCmdDispatchIndirect-None-02692
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

• VUID-vkCmdDispatchIndirect-None-02693
  If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

• VUID-vkCmdDispatchIndirect-filterCubic-02694
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

• VUID-vkCmdDispatchIndirect-filterCubicMinmax-02695
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

• VUID-vkCmdDispatchIndirect-cubicRangeClamp-09212
  If the `cubicRangeClamp` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM`.

• VUID-vkCmdDispatchIndirect-reductionMode-09213
  Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.
If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have `VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights` equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

Any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, then the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorsetLayout` array used to create the current `VkShaderEXT`, as described in `Pipeline Layout Compatibility`.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorsetLayout` array used to create the current `VkShaderEXT`, as described in `Pipeline Layout Compatibility`.

If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorsetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in `Pipeline Layout Compatibility`.
Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` must have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command.

If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` must have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

If a descriptor is dynamically used with a `VkPipeline` created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident.

If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident.

If the `shaderObject` feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type...
VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdDispatchIndirect-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- VUID-vkCmdDispatchIndirect-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdDispatchIndirect-None-08607
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdDispatchIndirect-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchIndirect-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchIndirect-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchIndirect-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by bound shaders must not be a protected resource.

If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler Y’C yC conversion, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler Y’C yC conversion, that object must not use the `ConstOffset` and `Offset` operands.

If a `VkImageView` is accessed as a result of this command, then the image view’s `viewType` must match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation.

If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view’s `format` and the `SampledType` operand of the `OpTypeImage` must match.

If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view’s format.

If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have four components.

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view’s format.

If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is
accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32

- **VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04474**
  If the **sparseImageInt64Atomics** feature is not enabled, **VkImage** objects created with the **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** flag **must** not be accessed by atomic instructions through an **OpTypeImage** with a **SampledType** with a **Width** of 64 by this command

- **VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04475**
  If the **sparseImageInt64Atomics** feature is not enabled, **VkBuffer** objects created with the **VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT** flag **must** not be accessed by atomic instructions through an **OpTypeImage** with a **SampledType** with a **Width** of 64 by this command

- **VUID-vkCmdDispatchIndirect-OpImageWeightedSampleQCOM-06971**
  If **OpImageWeightedSampleQCOM** is used to sample a **VkImageView** as a result of this command, then the image view’s **format features** **must** contain **VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM**

- **VUID-vkCmdDispatchIndirect-OpImageWeightedSampleQCOM-06972**
  If **OpImageWeightedSampleQCOM** uses a **VkImageView** as a sample weight image as a result of this command, then the image view’s **format features** **must** contain **VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM**

- **VUID-vkCmdDispatchIndirect-OpImageBoxFilterQCOM-06973**
  If **OpImageBoxFilterQCOM** is used to sample a **VkImageView** as a result of this command, then the image view’s **format features** **must** contain **VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM**

- **VUID-vkCmdDispatchIndirect-OpImageBlockMatchSSDQCOM-06974**
  If **OpImageBlockMatchSSDQCOM** is used to read from an **VkImageView** as a result of this command, then the image view’s **format features** **must** contain **VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM**

- **VUID-vkCmdDispatchIndirect-OpImageBlockMatchSADQCOM-06975**
  If **OpImageBlockMatchSADQCOM** or **OpImageBlockMatchSSDQCOM** is used to read from a reference image as result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation

- **VUID-vkCmdDispatchIndirect-OpImageWeightedSampleQCOM-06977**
  If **OpImageWeightedSampleQCOM**, **OpImageBoxFilterQCOM**, **OpImageBlockMatchWindowSSDQCOM**, **OpImageBlockMatchWindowSADQCOM**, **OpImageBlockMatchGatherSSDQCOM**, **OpImageBlockMatchGatherSADQCOM**, or **OpImageBlockMatchSSDQCOM** uses a **VkSampler** as a result of this command, then the sampler **must** have been created with **VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM**

- **VUID-vkCmdDispatchIndirect-OpImageWeightedSampleQCOM-06978**
  If any command other than **OpImageWeightedSampleQCOM**, **OpImageBoxFilterQCOM**, **OpImageBlockMatchWindowSSDQCOM**, **OpImageBlockMatchWindowSADQCOM**, **OpImageBlockMatchGatherSSDQCOM**, or **OpImageBlockMatchGatherSADQCOM**, **OpImageBlockMatchSSDQCOM** uses a **VkSampler** as a result of this command, then the sampler **must** have been created with **VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM**
OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

- VUID-vkCmdDispatchIndirect-OpImageBlockMatchWindow-09215
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdDispatchIndirect-OpImageBlockMatchWindow-09216
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view's format must be a single-component format

- VUID-vkCmdDispatchIndirect-OpImageBlockMatchWindow-09217
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- VUID-vkCmdDispatchIndirect-None-07288
  Any shader invocation executed by this command must terminate

- VUID-vkCmdDispatchIndirect-None-09600
  If a descriptor with type equal to any of VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written

- VUID-vkCmdDispatchIndirect-buffer-02708
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdDispatchIndirect-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDispatchIndirect-offset-02710
  offset must be a multiple of 4

- VUID-vkCmdDispatchIndirect-commandBuffer-02711
  commandBuffer must not be a protected command buffer

- VUID-vkCmdDispatchIndirect-offset-00407
  The sum of offset and the size of VkDispatchIndirectCommand must be less than or equal to the size of buffer

Valid Usage (Implicit)

- VUID-vkCmdDispatchIndirect-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDispatchIndirect-buffer-parameter
  buffer must be a valid VkBuffer handle
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>

The `VkDispatchIndirectCommand` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDispatchIndirectCommand {
    uint32_t x;
    uint32_t y;
    uint32_t z;
} VkDispatchIndirectCommand;
```

- `x` is the number of local workgroups to dispatch in the X dimension.
- `y` is the number of local workgroups to dispatch in the Y dimension.
- `z` is the number of local workgroups to dispatch in the Z dimension.

The members of `VkDispatchIndirectCommand` have the same meaning as the corresponding parameters of `vkCmdDispatch`. 
Valid Usage

- VUID-VkDispatchIndirectCommand-x-00417
  \( x \) must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxComputeWorkGroupCount}[0] \)

- VUID-VkDispatchIndirectCommand-y-00418
  \( y \) must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxComputeWorkGroupCount}[1] \)

- VUID-VkDispatchIndirectCommand-z-00419
  \( z \) must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxComputeWorkGroupCount}[2] \)

To record a dispatch using non-zero base values for the components of \text{WorkgroupId}, call:

```c
// Provided by VK_VERSION_1_1
void vkCmdDispatchBase(
    VkCommandBuffer commandBuffer, 
    uint32_t baseGroupX, 
    uint32_t baseGroupY, 
    uint32_t baseGroupZ, 
    uint32_t groupCountX, 
    uint32_t groupCountY, 
    uint32_t groupCountZ);
```
or the equivalent command

```c
// Provided by VK_KHR_device_group
void vkCmdDispatchBaseKHR(
    VkCommandBuffer commandBuffer, 
    uint32_t baseGroupX, 
    uint32_t baseGroupY, 
    uint32_t baseGroupZ, 
    uint32_t groupCountX, 
    uint32_t groupCountY, 
    uint32_t groupCountZ);
```

- \text{commandBuffer} is the command buffer into which the command will be recorded.
- baseGroupX is the start value for the X component of \text{WorkgroupId}.
- baseGroupY is the start value for the Y component of \text{WorkgroupId}.
- baseGroupZ is the start value for the Z component of \text{WorkgroupId}.
- groupCountX is the number of local workgroups to dispatch in the X dimension.
- groupCountY is the number of local workgroups to dispatch in the Y dimension.
- groupCountZ is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of \( \text{groupCountX} \times \text{groupCountY} \times \text{groupCountZ} \) local workgroups is assembled, with \text{WorkgroupId} values ranging from [baseGroup*,
baseGroup* + groupCount*) in each component. \texttt{vkCmdDispatch} is equivalent to \texttt{vkCmdDispatchBase(0,0,0,\texttt{groupCountX},\texttt{groupCountY},\texttt{groupCountZ})}.

### Valid Usage

- **VUID-vkCmdDispatchBase-magFilter-04553**
  If a \texttt{VkSampler} created with \texttt{magFilter} or \texttt{minFilter} equal to \texttt{VK_FILTER_LINEAR}, \texttt{reductionMode} equal to \texttt{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE}, and \texttt{compareEnable} equal to \texttt{VK_FALSE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT}.

- **VUID-vkCmdDispatchBase-magFilter-09598**
  If a \texttt{VkSampler} created with \texttt{magFilter} or \texttt{minFilter} equal to \texttt{VK_FILTER_LINEAR} and \texttt{reductionMode} equal to either \texttt{VK_SAMPLER_REDUCTION_MODE_MIN} or \texttt{VK_SAMPLER_REDUCTION_MODE_MAX} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT}.

- **VUID-vkCmdDispatchBase-mipmapMode-04770**
  If a \texttt{VkSampler} created with \texttt{mipmapMode} equal to \texttt{VK_SAMPLER_MIPMAP_MODE_LINEAR}, \texttt{reductionMode} equal to \texttt{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE}, and \texttt{compareEnable} equal to \texttt{VK_FALSE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT}.

- **VUID-vkCmdDispatchBase-mipmapMode-09599**
  If a \texttt{VkSampler} created with \texttt{mipmapMode} equal to \texttt{VK_SAMPLER_MIPMAP_MODE_LINEAR} and \texttt{reductionMode} equal to either \texttt{VK_SAMPLER_REDUCTION_MODE_MIN} or \texttt{VK_SAMPLER_REDUCTION_MODE_MAX} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT}.

- **VUID-vkCmdDispatchBase-unnormalizedCoordinates-09635**
  If a \texttt{VkSampler} created with \texttt{unnormalizedCoordinates} equal to \texttt{VK_TRUE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's \texttt{levelCount} and \texttt{layerCount} must be 1.

- **VUID-vkCmdDispatchBase-unnormalizedCoordinates-09636**
  If a \texttt{VkSampler} created with \texttt{unnormalizedCoordinates} equal to \texttt{VK_TRUE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's \texttt{viewType} must be \texttt{VK_IMAGE_VIEW_TYPE_1D} or \texttt{VK_IMAGE_VIEW_TYPE_2D}.

- **VUID-vkCmdDispatchBase-None-06479**
  If a \texttt{VkImageView} is sampled with depth comparison, the image view's format features must contain \texttt{VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT}.

- **VUID-vkCmdDispatchBase-None-02691**
  If a \texttt{VkImageView} is accessed using atomic operations as a result of this command, then the image view's format features must contain \texttt{VK_FORMATFEATURE_STORAGE_IMAGE_ATOMIC_BIT}.
• VUID-vkCmdDispatchBase-None-07888
  If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

• VUID-vkCmdDispatchBase-None-02692
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

• VUID-vkCmdDispatchBase-None-02693
  If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

• VUID-vkCmdDispatchBase-filterCubic-02694
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

• VUID-vkCmdDispatchBase-filterCubicMinmax-02695
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

• VUID-vkCmdDispatchBase-cubicRangeClamp-09212
  If the `cubicRangeClamp` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM`.

• VUID-vkCmdDispatchBase-reductionMode-09213
  Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.

• VUID-vkCmdDispatchBase-selectableCubicWeights-09214
  If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have `VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights` equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`.

• VUID-vkCmdDispatchBase-flags-02696
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

• VUID-vkCmdDispatchBase-OpTypeImage-07027
  For any `VkImageView` being written as a storage image where the image format field of...
the `OpTypeImage` is `Unknown`, the view's format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdDispatchBase-OpTypeImage-07028**
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdDispatchBase-OpTypeImage-07029**
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdDispatchBase-OpTypeImage-07030**
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdDispatchBase-None-08600**
  For each set `n` that is statically used by a **bound shader**, a descriptor set **must** have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDispatchBase-None-08601**
  For each push constant that is statically used by a **bound shader**, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDispatchBase-maintenance4-08602**
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a **bound shader**, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDispatchBase-None-08114**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid as described by descriptor validity if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdDispatchBase-None-08115**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` **must** have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdDispatchBase-None-08116**
  Descriptors in bound descriptor buffers, specified via
vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatchBase-None-08604
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdDispatchBase-None-08117
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatchBase-None-08119
  If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdDispatchBase-None-08605
  If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdDispatchBase-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdDispatchBase-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDispatchBase-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdDispatchBase-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- VUID-vkCmdDispatchBase-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this...
command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDispatchBase-None-08607**
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDispatchBase-uniformBuffers-06935**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-None-08612**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-None-08613**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

- **VUID-vkCmdDispatchBase-None-06550**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler YC \_\_C\_R conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- **VUID-vkCmdDispatchBase-ConstOffset-06551**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler YC \_\_C\_R conversion, that object must not use the ConstOffset and Offset operands
If a `VkImageView` is accessed as a result of this command, then the image view’s `viewType` must match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation.

If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view's `format` and the Sampled Type operand of the `OpTypeImage` must match.

If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view's format.

If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have four components.

If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.
If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

If `OpImageBlockMatchSSDQCOM` is used to read from a `VkImageView` as a result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.
**must** be a single-component format

- **VUID-vkCmdDispatchBase-OpImageBlockMatchWindow-09217**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation

- **VUID-vkCmdDispatchBase-None-07288**
  Any shader invocation executed by this command **must** terminate

- **VUID-vkCmdDispatchBase-None-09600**
  If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM`, `VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, the image subresource identified by that descriptor **must** be in the image layout identified when the descriptor was written

- **VUID-vkCmdDispatchBase-commandBuffer-02712**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be an unprotected resource

- **VUID-vkCmdDispatchBase-commandBuffer-02713**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command **must** not write to any resource

- **VUID-vkCmdDispatchBase-commandBuffer-04617**
  If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this command uses the `RayQueryKHR` capability, then `commandBuffer` **must** not be a protected command buffer

- **VUID-vkCmdDispatchBase-baseGroupX-00421**
  `baseGroupX` **must** be less than `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`

- **VUID-vkCmdDispatchBase-baseGroupX-00422**
  `baseGroupY` **must** be less than `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`

- **VUID-vkCmdDispatchBase-baseGroupX-00423**
  `baseGroupZ` **must** be less than `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]`

- **VUID-vkCmdDispatchBase-groupCountX-00424**
  `groupCountX` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]` minus `baseGroupX`

- **VUID-vkCmdDispatchBase-groupCountY-00425**
  `groupCountY` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]` minus `baseGroupY`

- **VUID-vkCmdDispatchBase-groupCountZ-00426**
  `groupCountZ` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]` minus `baseGroupZ`

- **VUID-vkCmdDispatchBase-baseGroupX-00427**
  2907
If any of `baseGroupX`, `baseGroupY`, or `baseGroupZ` are not zero, then the bound compute pipeline **must** have been created with the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag or the bound compute shader object **must** have been created with the `VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT` flag.

**Valid Usage (Implicit)**

- VUID-vkCmdDispatchBase-commandBuffer-parameter
  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdDispatchBase-commandBuffer-recording
  
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdDispatchBase-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

- VUID-vkCmdDispatchBase-renderpass
  
  This command **must** only be called outside of a render pass instance

- VUID-vkCmdDispatchBase-vidcoding
  
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

**Command Properties**

<table>

A subpass shading dispatches a compute pipeline work with the work dimension of render area of the calling subpass and work groups are partitioned by specified work group size. Subpass operations like `subpassLoad` are allowed to be used.

To record a subpass shading, call:
void vkCmdSubpassShadingHUAWEI(VkCommandBuffer commandBuffer);

- `commandBuffer` is the command buffer into which the command will be recorded.

When the command is executed, a global workgroup consisting of ceil (render area size / local workgroup size) local workgroups is assembled.

**Valid Usage**

- **VUID-vkCmdSubpassShadingHUAWEI-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdSubpassShadingHUAWEI-magFilter-09598**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`.

- **VUID-vkCmdSubpassShadingHUAWEI-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdSubpassShadingHUAWEI-mipmapMode-09599**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`.

- **VUID-vkCmdSubpassShadingHUAWEI-unnormalizedCoordinates-09635**
  If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` must be 1.

- **VUID-vkCmdSubpassShadingHUAWEI-unnormalizedCoordinates-09636**
  If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` must be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`.

- **VUID-vkCmdSubpassShadingHUAWEI-None-06479**
If a `VkImageView` is sampled with *depth comparison*, the image view's *format features* must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdSubpassShadingHUAWEI-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's *format features* must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdSubpassShadingHUAWEI-None-07888**
  If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's *format features* must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- **VUID-vkCmdSubpassShadingHUAWEI-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's *format features* must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdSubpassShadingHUAWEI-filterCubic-02693**
  If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`

- **VUID-vkCmdSubpassShadingHUAWEI-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdSubpassShadingHUAWEI-cubicRangeClamp-09212**
  If the `cubicRangeClamp` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM`

- **VUID-vkCmdSubpassShadingHUAWEI-reductionMode-09213**
  Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`

- **VUID-vkCmdSubpassShadingHUAWEI-selectableCubicWeights-09214**
  If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have `VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights` equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`
Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorsetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorsetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorsetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.
If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command.

If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident.

If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident.

If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1DARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.
command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- **VUID-vkCmdSubpassShadingHUAWEI-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdSubpassShadingHUAWEI-None-08607**
  If the `shaderObject` is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdSubpassShadingHUAWEI-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER BEHAVIOR ROBUST BUFFER ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER BEHAVIOR ROBUST BUFFER ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdSubpassShadingHUAWEI-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdSubpassShadingHUAWEI-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER BEHAVIOR ROBUST BUFFER ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER BEHAVIOR ROBUST BUFFER ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdSubpassShadingHUAWEI-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` must not be a protected resource

- **VUID-vkCmdSubpassShadingHUAWEI-None-06550**
  If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'C`
conversion, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdSubpassShadingHUAWEI-ConstOffset-06551**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler Y’C conversion, that object must not use the `ConstOffset` and `Offset` operands

- **VUID-vkCmdSubpassShadingHUAWEI-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view’s `viewType` must match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdSubpassShadingHUAWEI-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view’s `format` and the `Sampled Type` operand of the `OpTypeImage` must match

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view's format

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have four components

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view's format

- **VUID-vkCmdSubpassShadingHUAWEI-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64

- **VUID-vkCmdSubpassShadingHUAWEI-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32

- **VUID-vkCmdSubpassShadingHUAWEI-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64

- **VUID-vkCmdSubpassShadingHUAWEI-SampledType-04473**
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32

- **VUID-vkCmdSubpassShadingHUAWEI-sparseImageInt64Atomics-04474**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions
through an OpTypeImage with a SampledType with a Width of 64 by this command

- **VUID-vkCmdSubpassShadingHUAWEI-sparseImageInt64Atomics-04475**
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageWeightedSampleQCOM-06971**
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageWeightedSampleQCOM-06972**
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageBoxFilterQCOM-06973**
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchSSDQCOM-06974**
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BOX_MATCHING_BIT_QCOM

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchSADQCOM-06975**
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageWeightedSampleQCOM-06977**
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchWindow-09215**
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to
read from an \texttt{VkImageView} as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM}

- VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchWindow-09216  
If a \texttt{OpImageBlockMatchWindow*QCOM} or \texttt{OpImageBlockMatchGather*QCOM} instruction is used to read from an \texttt{VkImageView} as a result of this command, then the image view's format \textbf{must} be a single-component format

- VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchWindow-09217  
If a \texttt{OpImageBlockMatchWindow*QCOM} or \texttt{OpImageBlockMatchGather*QCOM} read from a reference image as result of this command, then the specified reference coordinates \textbf{must} not fail integer texel coordinate validation

- VUID-vkCmdSubpassShadingHUAWEI-None-07288  
Any shader invocation executed by this command \textbf{must} terminate

- VUID-vkCmdSubpassShadingHUAWEI-None-09600  
If a descriptor with type equal to any of \texttt{VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM}, \texttt{VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM}, \texttt{VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE}, \texttt{VK_DESCRIPTOR_TYPE_STORAGE_IMAGE}, or \texttt{VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT} is accessed as a result of this command, the image subresource identified by that descriptor \textbf{must} be in the image layout identified when the descriptor was written

- VUID-vkCmdSubpassShadingHUAWEI-None-04931  
This command must be called in a subpass with bind point \texttt{VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI}. No draw commands can be called in the same subpass. Only one \texttt{vkCmdSubpassShadingHUAWEI} command can be called in a subpass

---

**Valid Usage (Implicit)**

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-parameter  
\texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-recording  
\texttt{commandBuffer} \textbf{must} be in the \texttt{recording} state

- VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-cmdpool  
The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support graphics operations

- VUID-vkCmdSubpassShadingHUAWEI-renderpass  
This command \textbf{must} only be called inside of a render pass instance

- VUID-vkCmdSubpassShadingHUAWEI-videocoding  
This command \textbf{must} only be called outside of a video coding scope

---

**Host Synchronization**

- Host access to \texttt{commandBuffer} \textbf{must} be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} be externally
31.1. Dispatch Command for CUDA PTX Kernels

Compute kernels can be provided in SPIR-V or PTX code. When using PTX kernels the dispatch mechanism is different than with regular compute pipelines.

The way to create a PTX assembly file is beyond the scope of this documentation. For more information, please refer to the CUDA toolkit documentation at https://docs.nvidia.com/cuda/.

Prior to using this command, you must initialize a CUDA module, and create a function handle that will serve as the entry point of the kernel to dispatch. See CUDA Modules.

The dispatching of a CUDA kernel is recorded into a command buffer, and when executed by a queue submit, will produce work which executes according to the bound compute pipeline.

To record a CUDA kernel launch, call:

```c
// Provided by VK_NV CUDA kernel launch
void vkCmdCudaLaunchKernelNV(
    VkCommandBuffer commandBuffer,
    const VkCudaLaunchInfoNV* pLaunchInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pLaunchInfo` is a pointer to a `VkCudaLaunchInfoNV` structure in which the grid (similar to workgroup) dimension, function handle and related arguments are defined.

When the command is executed, a global workgroup consisting of `gridDimX × gridDimY × gridDimZ` local workgroups is assembled.

Valid Usage (Implicit)

- VUID-vkCmdCudaLaunchKernelNV-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdCudaLaunchKernelNV-pLaunchInfo-parameter `pLaunchInfo` must be a valid pointer to a valid `VkCudaLaunchInfoNV` structure
- VUID-vkCmdCudaLaunchKernelNV-commandBuffer-recording

Table: Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

31.1.1. Passing Dispatch Parameters and Arguments

The VkCudaLaunchInfoNV structure is very close to the parameters of the CUDA-Driver function cuLaunchKernel documented in section 6.19 Execution Control of CUDA Driver API.

The structure is defined as:

```c
// Provided by VK_NV_cudas_device_launch
typedef struct VkCudaLaunchInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkCudaFunctionNV function;
    uint32_t gridDimX;
    uint32_t gridDimY;
    uint32_t gridDimZ;
    uint32_t blockDimX;
    uint32_t blockDimY;
    uint32_t blockDimZ;
    uint32_t sharedMemBytes;
    size_t paramCount;
    const void* const* pParams;
    size_t extraCount;
    const void* const* pExtras;
} VkCudaLaunchInfoNV;
```
• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **function** is the CUDA-Driver handle to the function being launched.
• **gridDimX** is the number of local workgroups to dispatch in the X dimension. It must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`
• **gridDimY** is the number of local workgroups to dispatch in the Y dimension. It must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`
• **gridDimZ** is the number of local workgroups to dispatch in the Z dimension. It must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]`
• **blockDimX** is block size in the X dimension.
• **blockDimY** is block size in the Y dimension.
• **blockDimZ** is block size in the Z dimension.
• **sharedMemBytes** is the dynamic shared-memory size per thread block in bytes.
• **paramCount** is the length of the `pParams` table.
• **pParams** is a pointer to an array of `paramCount` pointers, corresponding to the arguments of `function`.
• **extraCount** is reserved for future use.
• **pExtras** is reserved for future use.

Kernel parameters of `function` are specified via `pParams`, very much the same way as described in `cuLaunchKernel`.

If `function` has N parameters, then `pParams` must be an array of N pointers and `paramCount` must be set to N. Each of `kernelParams[0]` through `kernelParams[N-1]` must point to a region of memory from which the actual kernel parameter will be copied. The number of kernel parameters and their offsets and sizes are not specified here as that information is stored in the `VkCudaFunctionNV` object.

The application-owned memory pointed to by `pParams` and `kernelParams[0]` through `kernelParams[N-1]` are consumed immediately, and may be altered or freed after `vkCmdCudaLaunchKernelNV` has returned.

### Valid Usage

- **VUID-VkCudaLaunchInfoNV-gridDimX-09406**
  
  `gridDimX` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`

- **VUID-VkCudaLaunchInfoNV-gridDimY-09407**
  
  `gridDimY` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`

- **VUID-VkCudaLaunchInfoNV-gridDimZ-09408**
  
  `gridDimZ` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]`
maxComputeWorkGroupCount[2]

- VUID-VkCudaLaunchInfoNV-paramCount-09409
  paramCount must be the total amount of parameters listed in the pParams table
- VUID-VkCudaLaunchInfoNV-pParams-09410
  pParams must be a pointer to a table of paramCount parameters, corresponding to the arguments of function
- VUID-VkCudaLaunchInfoNV-extraCount-09411
  extraCount must be 0
- VUID-VkCudaLaunchInfoNV-pExtras-09412
  pExtras must be NULL

Valid Usage (Implicit)

- VUID-VkCudaLaunchInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_CUDA_LAUNCH_INFO_NV
- VUID-VkCudaLaunchInfoNV-pNext-pNext
  pNext must be NULL
- VUID-VkCudaLaunchInfoNV-function-parameter
  function must be a valid VkCudaFunctionNV handle

31.1.2. Resource Sharing from Vulkan to the CUDA Kernel

Given that one key limitation of this extension is that Vulkan cannot access, nor bind any global resource of CUDA modules, the only way to exchange data with the kernel must be to pass resources via the arguments of the function.

You can use VK_KHR_buffer_device_address to write/read to/from a VkBuffer object. VK_KHR_buffer_device_address allows you to get the device address of the buffer to pass it as an argument into pParams. Application-side pointer arithmetic on the device address is legal, but will not be bounds-checked on the device.

The corresponding argument of the CUDA function should be declared as a pointer of the same type as the referenced buffer. CUDA code may simply read or write to this buffer in the typical C way.

You may also use VK_NVX_image_view_handle as another convenient way to read/write from/to a VkImage.

The corresponding argument of the CUDA function must be typed as cudaSurfaceObject_t.

- You may read from it by using CUDA surface-read functions such as surf3Dread, surf2Dread, and surf1Dread
- You may write to it by using CUDA surface-write functions such as surf3Dwrite, surf2Dwrite, and surf1Dwrite
Please refer to CUDA surface object documentation for more details

On Vulkan side, here is an example on how to setup `VkImageViewHandleInfoNVX` to query the handle for `cudaSurfaceObject_t`:

```cpp
VkImageViewHandleInfoNVX imageViewHandleInfo = 
{VK_STRUCTURE_TYPE_IMAGE_VIEWHANDLE_INFO_NVX};
imageViewHandleInfo.sampler = VK_NULL_HANDLE;
imageViewHandleInfo.descriptorType = VK_DESCRIPTOR_TYPE_STORAGE_IMAGE;
imageViewHandleInfo.imageView = imageViewIn; // the VkImageView we want to access
uint32_t myViewHandleIn = vkGetImageViewHandleNVX(m_device, &imageViewHandleInfo);
imageViewHandleInfoimageView = imageViewOut; // the VkImageView we want to access
uint32_t myViewHandleOut = vkGetImageViewHandleNVX(m_device, &imageViewHandleInfo);
```

Here is an example of how to declare parameters for `pParams`:

```cpp
VkCudaLaunchInfoNV launchInfo = { VK_STRUCTURE_TYPE_CUDA_LAUNCH_INFO_NV };

int block_size = 8;
float dt = 1.0f / 60.0f;

const void* params[] =
{
    &dt,
    &uint32_t myViewHandleIn,
    &uint32_t myViewHandleOut
};

launchInfo.function = cudaFunction; // CUDA function previously created
launchInfo.gridDimX = (volumeTexDimensionNonBoundary / block_size);
launchInfo.gridDimY = (volumeTexDimensionNonBoundary / block_size);
launchInfo.gridDimZ = (volumeTexDimensionNonBoundary / block_size);
launchInfo.blockDimX = block_size;
launchInfo.blockDimY = block_size;
launchInfo.blockDimZ = block_size;
launchInfo.sharedMemBytes = 0;
launchInfo.paramCount = 3;
launchInfo.pParams = &params[0];
launchInfo.extraCount = 0;
launchInfo.pExtras = nullptr;

vkCmdCudaLaunchKernelNV(commandBuffer, &launchInfo);
```

In the CUDA kernel source code, here is an example on how arguments match `pParams` and how we can use Surface object:

```c
extern "C" __global__ void cudaFunction(
    float dt,
    // ...)
```
cudaSurfaceObject_t volumeTexIn,
cudaSurfaceObject_t volumeTexOut

{
  int i = 1 + blockIdx.x * blockDim.x + threadIdx.x;
  int j = 1 + blockIdx.y * blockDim.y + threadIdx.y;
  int k = 1 + blockIdx.z * blockDim.z + threadIdx.z;

  float val;
  surf3Dread(&val, volumeTexIn, i * sizeof(float), j, k);
  ...
  float result = ...;
  // write result
  surf3Dwrite(result, volumeTexOut, i * sizeof(float), j, k);
}
Chapter 32. Device-Generated Commands

This chapter discusses the generation of command buffer content on the device, for which these principle steps are to be taken:

- Define via VkIndirectCommandsLayoutNV the sequence of commands which should be generated.
- Optionally make use of device-bindable Shader Groups for graphics pipelines.
- Retrieve device addresses by vkGetBufferDeviceAddressEXT for setting buffers on the device.
- Retrieve device addresses of compute pipelines by vkGetPipelineIndirectDeviceAddressNV to be able to bind it in device generated rendering.
- Fill one or more VkBuffer with the appropriate content that gets interpreted by VkIndirectCommandsLayoutNV.
- Create a preprocess VkBuffer using the allocation information from vkGetGeneratedCommandsMemoryRequirementsNV.
- Optionally preprocess the input data using vkCmdPreprocessGeneratedCommandsNV in a separate action.
- Generate and execute the actual commands via vkCmdExecuteGeneratedCommandsNV passing all required data.

vkCmdPreprocessGeneratedCommandsNV executes in a separate logical pipeline from either graphics or compute. When preprocessing commands in a separate step they must be explicitly synchronized against the command execution. When not preprocessing, the preprocessing is automatically synchronized against the command execution.

32.1. Indirect Commands Layout

The device-side command generation happens through an iterative processing of an atomic sequence comprised of command tokens, which are represented by:

```c
// Provided by VK_NV_device_generated_commands
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkIndirectCommandsLayoutNV)
```

Each indirect command layout must have exactly one action command token and it must be the last token in the sequence.

32.1.1. Creation and Deletion

Indirect command layouts are created by:
// Provided by VK_NV_device_generated_commands

VkResult vkCreateIndirectCommandsLayoutNV(
    VkDevice device,
    const VkIndirectCommandsLayoutCreateInfoNV* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkIndirectCommandsLayoutNV* pIndirectCommandsLayout);

• device is the logical device that creates the indirect command layout.
• pCreateInfo is a pointer to a VkIndirectCommandsLayoutCreateInfoNV structure containing parameters affecting creation of the indirect command layout.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.
• pIndirectCommandsLayout is a pointer to a VkIndirectCommandsLayoutNV handle in which the resulting indirect command layout is returned.

**Valid Usage**
- VUID-vkCreateIndirectCommandsLayoutNV-deviceGeneratedCommands-02929
  The VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands feature must be enabled

**Valid Usage (Implicit)**
- VUID-vkCreateIndirectCommandsLayoutNV-device-parameter
device must be a valid VkDevice handle
- VUID-vkCreateIndirectCommandsLayoutNV-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkIndirectCommandsLayoutCreateInfoNV structure
- VUID-vkCreateIndirectCommandsLayoutNV-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateIndirectCommandsLayoutNV-pIndirectCommandsLayout-parameter
  pIndirectCommandsLayout must be a valid pointer to a VkIndirectCommandsLayoutNV handle

**Return Codes**

**Success**
• VK_SUCCESS

**Failure**
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
The VkIndirectCommandsLayoutCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsLayoutCreateInfoNV {
  VkStructureType sType;
  const void* pNext;
  VkIndirectCommandsLayoutUsageFlagsNV flags;
  VkPipelineBindPoint pipelineBindPoint;
  uint32_t tokenCount;
  const VkIndirectCommandsLayoutTokenNV* pTokens;
  uint32_t streamCount;
  const uint32_t* pStreamStrides;
} VkIndirectCommandsLayoutCreateInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pipelineBindPoint` is the VkPipelineBindPoint that this layout targets.
- `flags` is a bitmask of VkIndirectCommandsLayoutUsageFlagBitsNV specifying usage hints of this layout.
- `tokenCount` is the length of the individual command sequence.
- `pTokens` is an array describing each command token in detail. See VkIndirectCommandsTokenTypeNV and VkIndirectCommandsLayoutTokenNV below for details.
- `streamCount` is the number of streams used to provide the token inputs.
- `pStreamStrides` is an array defining the byte stride for each input stream.

The following code illustrates some of the flags:

```c
void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout,
  pIndirectCommandsTokens, sequencesCount, indexbuffer, indexbufferOffset)
{
  for (s = 0; s < sequencesCount; s++)
  {
    sUsed = s;

    if (indirectCommandsLayout.flags & VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED SEQUENCES_BIT_NV) {
      sUsed = indexbuffer.load_uint32( sUsed * sizeof(uint32_t) + indexbufferOffset);
    }

    if (indirectCommandsLayout.flags & VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED SEQUENCES_BIT_NV) {
      sUsed = incoherent_implementation_dependent_permutation[ sUsed ];
    }

    cmdProcessSequence( cmd, pipeline, indirectCommandsLayout,
```
When tokens are consumed, an offset is computed based on token offset and stream stride. The resulting offset is required to be aligned. The alignment for a specific token is equal to the scalar alignment of the data type as defined in Alignment Requirements, or VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment, whichever is lower.

Note
A minIndirectCommandsBufferOffsetAlignment of 4 allows VkDeviceAddress to be packed as uvec2 with scalar layout instead of uint64_t with 8 byte alignment. This enables direct compatibility with D3D12 command signature layouts.

Valid Usage
- VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-02930
  The pipelineBindPoint must be VK_PIPELINE_BIND_POINT_GRAPHICS or VK_PIPELINE_BIND_POINT_COMPUTE
- VUID-VkIndirectCommandsLayoutCreateInfoNV-tokenCount-02931
  tokenCount must be greater than 0 and less than or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenCount
- VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02932
  If pTokens contains an entry of VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV it must be the first element of the array and there must be only a single element of such token type
- VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-09585
  If pTokens contains an entry of VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV it must be the first element of the array and there must be only a single element of such token type
- VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02933
  If pTokens contains an entry of VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV there must be only a single element of such token type
- VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02934
  All state tokens in pTokens must occur before any action command tokens (VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV, VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV, VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV, VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV, VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_NV)
- VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02935
  The content of pTokens must include one single action command token that is compatible with the pipelineBindPoint
- VUID-VkIndirectCommandsLayoutCreateInfoNV-streamCount-02936
streamCount must be greater than 0 and less or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStreamCount.

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pStreamStrides-02937
  each element of pStreamStrides must be greater than 0 and less than or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStreamStride. Furthermore the alignment of each token input must be ensured.

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-09088
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_COMPUTE then the VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedCompute feature must be enabled.

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-09089
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_COMPUTE then the state tokens in pTokens must only include VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_NV, VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV, or VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV.

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-09090
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_COMPUTE and pTokens includes VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV, then the VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines feature must be enabled.

Valid Usage (Implicit)

- VUID-VkIndirectCommandsLayoutCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_CREATE_INFO_NV.

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pNext-pNext
  pNext must be NULL.

- VUID-VkIndirectCommandsLayoutCreateInfoNV-flags-parameter
  flags must be a valid combination of VkIndirectCommandsLayoutUsageFlagBitsNV values.

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value.

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-parameter
  pTokens must be a valid pointer to an array of tokenCount valid VkIndirectCommandsLayoutTokenNV structures.

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pStreamStrides-parameter
  pStreamStrides must be a valid pointer to an array of streamCount uint32_t values.

- VUID-VkIndirectCommandsLayoutCreateInfoNV-tokenCount-arraylength
  tokenCount must be greater than 0.

- VUID-VkIndirectCommandsLayoutCreateInfoNV-streamCount-arraylength
  streamCount must be greater than 0.
Bits which **can** be set in `VkIndirectCommandsLayoutCreateInfoNV::flags`, specifying usage hints of an indirect command layout, are:

```c
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectCommandsLayoutUsageFlagBitsNV {
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV = 0x00000001,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV = 0x00000002,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV = 0x00000004,
} VkIndirectCommandsLayoutUsageFlagBitsNV;
```

- **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV** specifies that the layout is always used with the manual preprocessing step through calling `vkCmdPreprocessGeneratedCommandsNV` and executed by `vkCmdExecuteGeneratedCommandsNV` with `isPreprocessed` set to `VK_TRUE`.

- **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV** specifies that the input data for the sequences is not implicitly indexed from `0..sequencesUsed` but a user provided `VkBuffer` encoding the index is provided.

- **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV** specifies that the processing of sequences can happen at an implementation-dependent order, which is not guaranteed to be coherent using the same input data. This flag is ignored when the `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE` as it is implied that the dispatch sequence is always unordered.

```c
// Provided by VK_NV_device_generated_commands
typedef VkFlags VkIndirectCommandsLayoutUsageFlagsNV;
```

`VkIndirectCommandsLayoutUsageFlagsNV` is a bitmask type for setting a mask of zero or more `VkIndirectCommandsLayoutUsageFlagBitsNV`.

Indirect command layouts are destroyed by:

```c
// Provided by VK_NV_device_generated_commands
void vkDestroyIndirectCommandsLayoutNV(
    VkDevice device,
    VkIndirectCommandsLayoutNV indirectCommandsLayout,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the layout.
- **indirectCommandsLayout** is the layout to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02938
  All submitted commands that refer to `indirectCommandsLayout` must have completed
**Valid Usage (Implicit)**

- VUID-vkDestroyIndirectCommandsLayoutNV-device-parameter
device **must** be a valid VkDevice handle
- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-parameter
If indirectCommandsLayout is not VK_NULL_HANDLE, indirectCommandsLayout **must** be a valid VkIndirectCommandsLayoutNV handle
- VUID-vkDestroyIndirectCommandsLayoutNV-pAllocator-parameter
If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-parent
If indirectCommandsLayout is a valid handle, it **must** have been created, allocated, or retrieved from device

**Host Synchronization**

- Host access to indirectCommandsLayout **must** be externally synchronized

### 32.1.2. Token Input Streams

The VkIndirectCommandsStreamNV structure specifies the input data for one or more tokens at processing time.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsStreamNV {
    VkBuffer buffer;
    VkDeviceSize offset;
} VkIndirectCommandsStreamNV;
```

- **buffer** specifies the VkBuffer storing the functional arguments for each sequence. These arguments **can** be written by the device.
• offset specified an offset into buffer where the arguments start.

### Valid Usage

- **VUID-VkIndirectCommandsStreamNV-buffer-02942**
  The buffer’s usage flag must have the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- **VUID-VkIndirectCommandsStreamNV-offset-02943**
  The offset must be aligned to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment

- **VUID-VkIndirectCommandsStreamNV-buffer-02975**
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

### Valid Usage (Implicit)

- **VUID-VkIndirectCommandsStreamNV-buffer-parameter**
  buffer must be a valid VkBuffer handle

The input streams can contain raw uint32_t values, existing indirect commands such as:

- VkDrawIndirectCommand
- VkDrawIndexedIndirectCommand
- VkDrawMeshTasksIndirectCommandNV
- VkDrawMeshTasksIndirectCommandEXT
- VkDispatchIndirectCommand

or additional commands as listed below. How the data is used is described in the next section.

The VkBindShaderGroupIndirectCommandNV structure specifies the input data for the VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindShaderGroupIndirectCommandNV {
    uint32_t groupIndex;
} VkBindShaderGroupIndirectCommandNV;
```

• groupIndex specifies which shader group of the current bound graphics pipeline is used.

### Valid Usage

- **VUID-VkBindShaderGroupIndirectCommandNV-None-02944**
  The current bound graphics pipeline, as well as the pipelines it may reference, must have been created with VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV
The `VkBindIndexBufferIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV` token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindIndexBufferIndirectCommandNV {
    VkDeviceAddress bufferAddress;
    uint32_t size;
    VkIndexType indexType;
} VkBindIndexBufferIndirectCommandNV;
```

- `bufferAddress` specifies a physical address of the `VkBuffer` used as index buffer.
- `size` is the byte size range which is available for this operation from the provided address.
- `indexType` is a `VkIndexType` value specifying how indices are treated. Instead of the Vulkan enum values, a custom `uint32_t` value can be mapped to an `VkIndexType` by specifying the `VkIndirectCommandsLayoutTokenNV::pIndexTypes` and `VkIndirectCommandsLayoutTokenNV::pIndexTypeValues` arrays.

### Valid Usage

- **VUID-VkBindIndexBufferIndirectCommandNV-None-02946**
  The buffer’s usage flag from which the address was acquired must have the `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` bit set.

- **VUID-VkBindIndexBufferIndirectCommandNV-bufferAddress-02947**
  The `bufferAddress` must be aligned to the `indexType` used.

- **VUID-VkBindIndexBufferIndirectCommandNV-None-02948**
  Each element of the buffer from which the address was acquired and that is non-sparse must be bound completely and contiguously to a single `VkDeviceMemory` object.

### Valid Usage (Implicit)

- **VUID-VkBindIndexBufferIndirectCommandNV-indexType-parameter**
  `indexType` must be a valid `VkIndexType` value.

The `VkBindVertexBufferIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV` token.
typedef struct VkBindVertexBufferIndirectCommandNV {
    VkDeviceAddress bufferAddress;
    uint32_t size;
    uint32_t stride;
} VkBindVertexBufferIndirectCommandNV;

- `bufferAddress` specifies a physical address of the `VkBuffer` used as vertex input binding.
- `size` is the byte size range which is available for this operation from the provided address.
- `stride` is the byte size stride for this vertex input binding as in `VkVertexInputBindingDescription::stride`. It is only used if `VkIndirectCommandsLayoutTokenNV::vertexDynamicStride` was set, otherwise the stride is inherited from the current bound graphics pipeline.

### Valid Usage

- VUID-VkBindVertexBufferIndirectCommandNV-None-02949
  The buffer's usage flag from which the address was acquired **must** have the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` bit set
- VUID-VkBindVertexBufferIndirectCommandNV-None-02950
  Each element of the buffer from which the address was acquired and that is non-sparse **must** be bound completely and contiguously to a single `VkDeviceMemory` object

The `VkSetStateFlagsIndirectCommandNV` structure specifies the input data for the `VK间接命令令牌类型状态标志_NV` token. Which state is changed depends on the `VkIndirectStateFlagBitsNV` specified at `VkIndirectCommandsLayoutNV` creation time.

typedef struct VkSetStateFlagsIndirectCommandNV {
    uint32_t data;
} VkSetStateFlagsIndirectCommandNV;

- `data` encodes packed state that this command alters.
  - Bit 0: If set represents `VK_FRONT_FACE_CLOCKWISE`, otherwise `VK_FRONT_FACE_COUNTER_CLOCKWISE`

A subset of the graphics pipeline state **can** be altered using indirect state flags:

typedef enum VkIndirectStateFlagBitsNV {
    VK间接命令令牌类型状态标志_NV = 0x00000001,
} VkIndirectStateFlagBitsNV;

- `VK间接命令令牌类型状态标志_NV` allows to toggle the `VkFrontFace` rasterization state for subsequent drawing commands.
typedef VkFlags VkIndirectStateFlagsNV;

VkIndirectStateFlagsNV is a bitmask type for setting a mask of zero or more VkIndirectStateFlagBitsNV.

The VkBindPipelineIndirectCommandNV structure specifies the input data for the VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV token.

typedef struct VkBindPipelineIndirectCommandNV {
    VkDeviceAddress pipelineAddress;
} VkBindPipelineIndirectCommandNV;

- pipelineAddress specifies the pipeline address of the compute pipeline that will be used in device generated rendering.

Valid Usage

- VUID-VkBindPipelineIndirectCommandNV-deviceGeneratedComputePipelines-09091
  The VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines feature must be enabled
- VUID-VkBindPipelineIndirectCommandNV-None-09092
  The referenced pipeline must have been created with VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV
- VUID-VkBindPipelineIndirectCommandNV-None-09093
  The referenced pipeline must have been updated with vkCmdUpdatePipelineIndirectBufferNV
- VUID-VkBindPipelineIndirectCommandNV-None-09094
  The referenced pipeline's address must have been queried with vkGetPipelineIndirectDeviceAddressNV

32.1.3. Tokenized Command Processing

The processing is in principle illustrated below:

void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s)
{
    for (t = 0; t < indirectCommandsLayout.tokenCount; t++)
    {
        uint32_t stream  = indirectCommandsLayout.pTokens[t].stream;
        uint32_t offset  = indirectCommandsLayout.pTokens[t].offset;
        uint32_t stride  = indirectCommandsLayout.pStreamStrides[stream];
        
        // Process the token at the specified offset for the current stream
    }
stream = pIndirectCommandsStreams[stream];
const void* input = stream.buffer.pointer( stream.offset + stride * s + offset )

// further details later
indirectCommandsLayout.pTokens[t].command (cmd, pipeline, input, s);

void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, sequencesCount)
{
  for (s = 0; s < sequencesCount; s++)
  {
    cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s);
  }
}

The processing of each sequence is considered stateless, therefore all state changes must occur before any action command tokens within the sequence. A single sequence is strictly targeting the VkPipelineBindPoint it was created with.

The primary input data for each token is provided through VkBuffer content at preprocessing using vkCmdPreprocessGeneratedCommandsNV or execution time using vkCmdExecuteGeneratedCommandsNV, however some functional arguments, for example binding sets, are specified at layout creation time. The input size is different for each token.

Possible values of those elements of the VkIndirectCommandsLayoutCreateInfoNV::pTokens array specifying command tokens (other elements of the array specify command parameters) are:

```c
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectCommandsTokenTypeNV {
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV = 0,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV = 1,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV = 2,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV = 3,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV = 4,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV = 5,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV = 6,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV = 7,
    // Provided by VK_EXT_mesh_shader with VK_NV_device_generated_commands
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV = 1000328000,
    // Provided by VK_NV_device_generated_commands_compute
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV = 1000428003,
    // Provided by VK_NV_device_generated_commands_compute
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_NV = 1000428004,
} VkIndirectCommandsTokenTypeNV;
```

Table 46. Supported indirect command tokens
<table>
<thead>
<tr>
<th>Token type</th>

</table>

The `VkIndirectCommandsLayoutTokenNV` structure specifies details to the function arguments that need to be known at layout creation time:

```c
typedef struct VkIndirectCommandsLayoutTokenNV {
    VkStructureType              sType;
    const void*                  pNext;
    VkIndirectCommandsTokenTypeNV tokenType;
    uint32_t                     stream;
    uint32_t                     offset;
    uint32_t                     vertexBindingUnit;
    VkBool32                     vertexDynamicStride;
    VkPipelineLayout             pushconstantPipelineLayout;
    VkShaderStageFlags           pushconstantShaderStageFlags;
    uint32_t                     pushconstantOffset;
    uint32_t                     pushconstantSize;
    VkIndirectStateFlagsNV      indirectStateFlags;
    uint32_t                     indexTypeCount;
    const VkIndexType*           pIndexTypes;
    const uint32_t*              pIndexTypeValues;
} VkIndirectCommandsLayoutTokenNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `tokenType` is a `VkIndirectCommandsTokenTypeNV` specifying the token command type.
- **stream** is the index of the input stream containing the token argument data.
- **offset** is a relative starting offset within the input stream memory for the token argument data.
- **vertexBindingUnit** is used for the vertex buffer binding command.
- **vertexDynamicStride** sets if the vertex buffer stride is provided by the binding command rather than the current bound graphics pipeline state.
- **pushconstantPipelineLayout** is the `VkPipelineLayout` used for the push constant command.
- **pushconstantShaderStageFlags** are the shader stage flags used for the push constant command.
- **pushconstantOffset** is the offset used for the push constant command.
- **pushconstantSize** is the size used for the push constant command.
- **indirectStateFlags** is a `VkIndirectStateFlagsNV` bitfield indicating the active states for the state flag command.
- **indexTypeCount** is the optional size of the `pIndexTypes` and `pIndexTypeValues` array pairings. If not zero, it allows to register a custom `uint32_t` value to be treated as specific `VkIndexType`.
- **pIndexTypes** is the used `VkIndexType` for the corresponding `uint32_t` value entry in `pIndexTypeValues`.

### Valid Usage

- VUID-VkIndirectCommandsLayoutTokenNV-stream-02951
  
  *stream* **must** be smaller than `VkIndirectCommandsLayoutCreateInfoNV::streamCount`

- VUID-VkIndirectCommandsLayoutTokenNV-offset-02952
  
  *offset** **must** be less than or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenOffset`

- VUID-VkIndirectCommandsLayoutTokenNV-offset-06888
  
  *offset** **must** be aligned to the scalar alignment of `tokenType` or `minIndirectCommandsBufferOffsetAlignment`, whichever is lower

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02976
  
  If `tokenType` is `VK_INDIRRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV`, `vertexBindingUnit** must** stay within device supported limits for the appropriate commands

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02977
  
  If `tokenType` is `VK_INDIRRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, `pushconstantPipelineLayout** must** be valid

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02978
  
  If `tokenType` is `VK_INDIRRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, `pushconstantOffset** must** be a multiple of 4

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02979
  
  If `tokenType` is `VK_INDIRRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, `pushconstantSize** must** be a multiple of 4

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02980
  
  If `tokenType` is `VK_INDIRRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, `pushconstantOffset** must** be less than `VkPhysicalDeviceLimits::maxPushConstantsSize`
If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, `pushconstantSize` must be less than or equal to `VkPhysicalDeviceLimits::maxPushConstantsSize` minus `pushconstantOffset`.

If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, for each byte in the range specified by `pushconstantOffset` and `pushconstantSize` and for each shader stage in `pushconstantShaderStageFlags`, there must be a push constant range in `pushconstantPipelineLayout` that includes that byte and that stage.

If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, for each byte in the range specified by `pushconstantOffset` and `pushconstantSize` and for each push constant range that overlaps that byte, `pushconstantShaderStageFlags` must include all stages in that push constant range's `VkPushConstantRange::stageFlags`.

If `tokenType` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV`, `indirectStateFlags` must not be 0.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_TOKEN_NV`.
- `pNext` must be `NULL`.
- `tokenType` must be a valid `VkIndirectCommandsTokenTypeNV` value.
- `pushconstantPipelineLayout` must be a valid `VkPipelineLayout` handle.
- `pushconstantShaderStageFlags` must be a valid combination of `VkShaderStageFlagBits` values.
- `indirectStateFlags` must be a valid combination of `VkIndirectStateFlagBitsNV` values.
- If `indexTypeCount` is not 0, `pIndexTypes` must be a valid pointer to an array of `indexTypeCount` `VkIndexType` values.
- If `indexTypeCount` is not 0, `pIndexTypeValues` must be a valid pointer to an array of `indexTypeCount uint32_t` values.

The following code provides detailed information on how an individual sequence is processed. For
void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s)
{
    for (uint32_t t = 0; t < indirectCommandsLayout.tokenCount; t++){
        token = indirectCommandsLayout.pTokens[t];

        uint32_t stride  = indirectCommandsLayout.pStreamStrides[token.stream];
        stream         = pIndirectCommandsStreams[token.stream];
        uint32_t offset  = stream.offset + stride * s + token.offset;
        const void* input = stream.buffer.pointer( offset )

        switch(input.type){
            case VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV:
                VkBindShaderGroupIndirectCommandNV* bind = input;

                vkCmdBindPipelineShaderGroupNV(cmd, indirectCommandsLayout.pipelineBindPoint, pipeline, bind->groupIndex);
                break;

            case VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV:
                VkSetStateFlagsIndirectCommandNV* state = input;

                if (token.indirectStateFlags & VK_INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV){
                    if (state.data & (1 << 0)){
                        set VK_FRONT_FACE_CLOCKWISE;
                    } else {
                        set VK_FRONT_FACE_COUNTER_CLOCKWISE;
                    }
                }
                break;

            case VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV:
                uint32_t* data = input;

                vkCmdPushConstants(cmd, token.pushconstantPipelineLayout
                                    token.pushconstantStageFlags,
                                    token.pushconstantOffset,
                                    token.pushconstantSize, data);
                break;

            case VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV:
                VkBindIndexBufferIndirectCommandNV* data = input;

                // the indexType may optionally be remapped
                // from a custom uint32_t value, via
                // VkIndirectCommandsLayoutTokenNV::pIndexTypeValues
        }
    }
}
vkCmdBindIndexBuffer(cmd, 
    deriveBuffer(data->bufferAddress), 
    deriveOffset(data->bufferAddress), 
    data->indexType);
break;

case VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV:
    VkBindVertexBufferIndirectCommandNV* data = input;

    // if token.vertexDynamicStride is VK_TRUE
    // then the stride for this binding is set
    // using data->stride as well

    vkCmdBindVertexBuffer(cmd, 
        token.vertexBindingUnit, 1,
        &deriveBuffer(data->bufferAddress),
        &deriveOffset(data->bufferAddress));
break;

case VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV:
    vkCmdDrawIndexedIndirect(cmd, 
        stream.buffer, offset, 1, 0);
break;

case VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV:
    vkCmdDrawIndirect(cmd, 
        stream.buffer, 
        offset, 1, 0);
break;

// only available if VK_NV_mesh_shader is supported

case VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV:
    vkCmdDrawMeshTasksIndirectNV(cmd, 
        stream.buffer, offset, 1, 0);
break;

// only available if VK_EXT_mesh_shader is supported

case VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV:
    vkCmdDrawMeshTasksIndirectEXT(cmd, 
        stream.buffer, offset, 1, 0);
break;

case VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV:
    VkBindPipelineIndirectCommandNV *data = input;
    VkPipeline computePipeline = deriveFromDeviceAddress(data->pipelineAddress);
    vkCmdBindPipeline(cmd, VK_PIPELINE_BIND_POINT_COMPUTE, computePipeline);
break;

case VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_NV:
    vkCmdDispatchIndirect(cmd, stream.buffer, offset);
break;
32.2. Indirect Commands Generation and Execution

The generation of commands on the device requires a preprocess buffer. To retrieve the memory size and alignment requirements of a particular execution state call:

```c
// Provided by VK_NV_device_generated_commands
void vkGetGeneratedCommandsMemoryRequirementsNV(
    VkDevice device,
    const VkGeneratedCommandsMemoryRequirementsInfoNV* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- **device** is the logical device that owns the buffer.
- **pInfo** is a pointer to a `VkGeneratedCommandsMemoryRequirementsInfoNV` structure containing parameters required for the memory requirements query.
- **pMemoryRequirements** is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

### Valid Usage

- **VUID-vkGetGeneratedCommandsMemoryRequirementsNV-deviceGeneratedCommands-02906**
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled

- **VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pInfo-09074**
  If `pInfo->pipelineBindPoint` is of type `VK_PIPELINE_BIND_POINT_COMPUTE`, then the `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedCompute` feature must be enabled

### Valid Usage (Implicit)

- **VUID-vkGetGeneratedCommandsMemoryRequirementsNV-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pInfo-parameter**
  `pInfo` must be a valid pointer to a valid `VkGeneratedCommandsMemoryRequirementsInfoNV` structure

- **VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pMemoryRequirements-parameter**
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure
typedef struct VkGeneratedCommandsMemoryRequirementsInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipeline pipeline;
    VkIndirectCommandsLayoutNV indirectCommandsLayout;
    uint32_t maxSequencesCount;
} VkGeneratedCommandsMemoryRequirementsInfoNV;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pipelineBindPoint is the VkPipelineBindPoint of the pipeline that this buffer memory is intended to be used with during the execution.
- pipeline is the VkPipeline that this buffer memory is intended to be used with during the execution.
- indirectCommandsLayout is the VkIndirectCommandsLayoutNV that this buffer memory is intended to be used with.
- maxSequencesCount is the maximum number of sequences that this buffer memory in combination with the other state provided can be used with.

### Valid Usage

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-maxSequencesCount-02907
  maxSequencesCount must be less or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-09075
  If pipelineBindPoint is of type VK_PIPELINE_BIND_POINT_GRAPHICS, then pipeline must be a valid VkPipeline handle

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-09076
  If pipelineBindPoint is of type VK_PIPELINE_BIND_POINT_COMPUTE, and the indirectCommandsLayout was not created with a VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV token, then the pipeline must be a valid VkPipeline handle

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-09077
  If pipelineBindPoint is of type VK_PIPELINE_BIND_POINT_COMPUTE, and the indirectCommandsLayout contains a VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV token, then the pipeline must be VK_NULL_HANDLE

### Valid Usage (Implicit)

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_GENERATED_COMMANDS_MEMORY_REQUIREMENTS_INFO_NV
• VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pNext-pNext
  pNext must be NULL

• VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

• VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipeline-parameter
  If pipeline is not VK_NULL_HANDLE, pipeline must be a valid VkPipeline handle

• VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-indirectCommandsLayout-parameter
  indirectCommandsLayout must be a valid VkIndirectCommandsLayoutNV handle

• VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-commonparent
  Both of indirectCommandsLayout, and pipeline that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

To bind a compute pipeline in Device-Generated Commands, an application must query the pipeline’s device address.

To query a compute pipeline’s 64-bit device address, call:

```cpp
// Provided by VK_NV_device_generated_commands_compute
VkDeviceAddress vkGetPipelineIndirectDeviceAddressNV(
  VkDevice device,
  const VkPipelineIndirectDeviceAddressInfoNV*pInfo);
```

• device is the logical device on which the pipeline was created.

• pInfo is a pointer to a VkPipelineIndirectDeviceAddressInfoNV structure specifying the pipeline to retrieve the address for.

### Valid Usage

• VUID-vkGetPipelineIndirectDeviceAddressNV-deviceGeneratedComputePipelines-09078
  The VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines feature must be enabled

### Valid Usage (Implicit)

• VUID-vkGetPipelineIndirectDeviceAddressNV-device-parameter
  device must be a valid VkDevice handle

• VUID-vkGetPipelineIndirectDeviceAddressNV-pInfo-parameter
  pInfo must be a valid pointer to a valid VkPipelineIndirectDeviceAddressInfoNV structure

The VkPipelineIndirectDeviceAddressInfoNV structure is defined as:
```c
typedef struct VkPipelineIndirectDeviceAddressInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipeline pipeline;
} VkPipelineIndirectDeviceAddressInfoNV;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pipelineBindPoint** is a `VkPipelineBindPoint` value specifying the type of pipeline whose device address is being queried.
- **pipeline** specifies the pipeline whose device address is being queried.

### Valid Usage

- **VUID-VkPipelineIndirectDeviceAddressInfoNV-pipelineBindPoint-09079**
  The provided `pipelineBindPoint` must be of type `VK_PIPELINE_BIND_POINT_COMPUTE`

- **VUID-VkPipelineIndirectDeviceAddressInfoNV-pipeline-09080**
  `pipeline` must have been created with flag `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV` set

- **VUID-VkPipelineIndirectDeviceAddressInfoNV-pipeline-09081**
  `pipeline` must have been created with a `VkComputePipelineIndirectBufferInfoNV` structure specifying a valid address where its metadata will be saved

### Valid Usage (Implicit)

- **VUID-VkPipelineIndirectDeviceAddressInfoNV-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_INDIRECT_DEVICE_ADDRESS_INFO_NV`

- **VUID-VkPipelineIndirectDeviceAddressInfoNV-pNext-pNext**
  `pNext` must be `NULL`

- **VUID-VkPipelineIndirectDeviceAddressInfoNV-pipelineBindPoint-parameter**
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value

- **VUID-VkPipelineIndirectDeviceAddressInfoNV-pipeline-parameter**
  `pipeline` must be a valid `VkPipeline` handle

To determine the memory requirements for a compute pipeline’s metadata, call:
void vkGetPipelineIndirectMemoryRequirementsNV(VkDevice device, const VkComputePipelineCreateInfo* pCreateInfo, VkMemoryRequirements2* pMemoryRequirements);

- `device` is the logical device that owns the buffer.
- `pCreateInfo` is a `VkComputePipelineCreateInfo` structure specifying the creation parameters of the compute pipeline whose memory requirements are being queried.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the requested pipeline's memory requirements are returned.

If `pCreateInfo->pNext` chain includes a pointer to a `VkComputePipelineIndirectBufferInfoNV` structure, then the contents of that structure are ignored.

Valid Usage

- VUID-vkGetPipelineIndirectMemoryRequirementsNV-deviceGeneratedComputePipelines-09082
  The `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines` feature must be enabled
- VUID-vkGetPipelineIndirectMemoryRequirementsNV-pCreateInfo-09083
  `pCreateInfo->flags` must include `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`

Valid Usage (Implicit)

- VUID-vkGetPipelineIndirectMemoryRequirementsNV-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetPipelineIndirectMemoryRequirementsNV-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkComputePipelineCreateInfo` structure
- VUID-vkGetPipelineIndirectMemoryRequirementsNV-pMemoryRequirements-parameter
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure

The actual generation of commands as well as their execution on the device is handled as single action with:

void vkCmdExecuteGeneratedCommandsNV(VkCommandBuffer commandBuffer, VkBool32 isPreprocessed, const VkGeneratedCommandsInfoNV* pGeneratedCommandsInfo);
• **isPreprocessed** represents whether the input data has already been preprocessed on the device. If it is `VK_FALSE` this command will implicitly trigger the preprocessing step, otherwise not.

• **pGeneratedCommandsInfo** is a pointer to a `VkGeneratedCommandsInfoNV` structure containing parameters affecting the generation of commands.

If the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV` flag was used to create the `VkGeneratedCommandsInfoNV::indirectCommandsLayout` then the order of execution of individual draws through this command **may** execute in any order, and **may** not necessarily be in the same order as specified in `VkGeneratedCommandsInfoNV::pStreams`.

The order of execution of individual dispatches through this command **may** execute in any order and **may** not necessarily be in the same order as specified in `VkGeneratedCommandsInfoNV::pStreams`.

---

### Valid Usage

- **VUID-vkCmdExecuteGeneratedCommandsNV-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-magFilter-09598**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-mipmapMode-09599**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-unnormalizedCoordinates-09635**
  If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be `1`

- **VUID-vkCmdExecuteGeneratedCommandsNV-unnormalizedCoordinates-09636**
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` must be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-06479**
  If a `VkImageView` is sampled with `depth comparison`, the image view's `format features` must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07888**
  If a `VkImageView` is sampled with `depth comparison`, the image view's `format features` must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02692**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02693**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02694**
  If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-filterCubic-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-cubicRangeClamp-09212**
  If the `cubicRangeClamp` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-selectableCubicWeights-09214**
  Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.
If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have `VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights` equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`.

- VUID-vkCmdExecuteGeneratedCommandsNV-flags-02696
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07027
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07028
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07029
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07030
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08600
  For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in `Pipeline Layout Compatibility`.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in `Pipeline Push Constant Compatibility`.

- VUID-vkCmdExecuteGeneratedCommandsNV-maintenance4-08602
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in `Pipeline Push Constant Compatibility`.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08114
Descriptors in each bound descriptor set, specified via \texttt{vkCmdBindDescriptorSets}, \textbf{must} be valid as described by descriptor validity if they are statically used by the \texttt{VkPipeline} bound to the pipeline bind point used by this command and the bound \texttt{VkPipeline} was not created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08115}
  If the descriptors used by the \texttt{VkPipeline} bound to the pipeline bind point were specified via \texttt{vkCmdBindDescriptorSets}, the bound \texttt{VkPipeline} \textbf{must} have been created without \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08116}
  Descriptors in bound descriptor buffers, specified via \texttt{vkCmdSetDescriptorBufferOffsetsEXT}, \textbf{must} be valid if they are dynamically used by the \texttt{VkPipeline} bound to the pipeline bind point used by this command and the bound \texttt{VkPipeline} was created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08604}
  Descriptors in bound descriptor buffers, specified via \texttt{vkCmdSetDescriptorBufferOffsetsEXT}, \textbf{must} be valid if they are dynamically used by any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08117}
  If the descriptors used by the \texttt{VkPipeline} bound to the pipeline bind point were specified via \texttt{vkCmdSetDescriptorBufferOffsetsEXT}, the bound \texttt{VkPipeline} \textbf{must} have been created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08119}
  If a descriptor is dynamically used with a \texttt{VkPipeline} created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}, the descriptor memory \textbf{must} be resident

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08605}
  If a descriptor is dynamically used with a \texttt{VkShaderEXT} created with a \texttt{VkDescriptorSetLayout} that was created with \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}, the descriptor memory \textbf{must} be resident

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08606}
  If the \texttt{shaderObject} feature is not enabled, a valid pipeline \textbf{must} be bound to the pipeline bind point used by this command

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08608}
  If a pipeline is bound to the pipeline bind point used by this command, there \textbf{must} not have been any calls to dynamic state setting commands for any state not specified as dynamic in the \texttt{VkPipeline} object bound to the pipeline bind point used by this command, since that pipeline was bound

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08609}
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command or any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used to sample from any \texttt{VkImage} with a \texttt{VkImageView} of the type \texttt{VK_IMAGE_VIEW_TYPE_3D}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE}, \texttt{VK_IMAGE_VIEW_TYPE_1D_ARRAY}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY}, \texttt{VK_IMAGE_VIEW_TYPE_2D_MS_ARRAY}, \texttt{VK_IMAGE_VIEW_TYPE_1D_MS_ARRAY}, \texttt{VK_IMAGE_VIEW_TYPE_3D_MS_ARRAY}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE_MS_ARRAY}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE_RECT}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY_MULTISAMPLE}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY_MULTISAMPLE_BC1}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY_MULTISAMPLE_BC3}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY_MULTISAMPLE_BC7}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY_MULTISAMPLE_S3TFBC}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY_MULTISAMPLE_I7NBFBC}, or \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY_MULTISAMPLE_S7NBFBC}.  

2948
VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08607
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdExecuteGeneratedCommandsNV-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdExecuteGeneratedCommandsNV-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-02707
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` must not be a protected resource.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-06550**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler Y'CbCr conversion, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

- **VUID-vkCmdExecuteGeneratedCommandsNV-ConstOffset-06551**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler Y'CbCr conversion, that object must not use the `ConstOffset` and `Offset` operands.

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view's `viewType` must match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation.

- **VUID-vkCmdExecuteGeneratedCommandsNV-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` must match.

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view's format.

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have four components.

- **VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04470**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

- **VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04471**
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

- **VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

- **VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04473**
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that
### VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04474
If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a **Width** of 64 by this command.

### VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04475
If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a **Width** of 64 by this command.

### VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06971
If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

### VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06972
If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

### VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBoxFilterQCOM-06973
If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

### VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchSSDQCOM-06974
If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

### VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchSADQCOM-06975
If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

### VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06977
If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

### VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06978
If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation.
If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2 BLOCK_MATCHING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from a `VkImageView` as a result of this command, then the image view's format must be a single-component format.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

Any shader invocation executed by this command must terminate.

If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM`, `VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written.

The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set.

If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it must be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

Input attachment views accessed in a subpass must be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.
• **VUID-vkCmdExecuteGeneratedCommandsNV-pDepthInputAttachmentIndex-09595**
  Input attachment views accessed in a dynamic render pass with a `InputAttachmentIndex` referenced by `VkRenderingInputAttachmentIndexInfoKHR`, or no `InputAttachmentIndex` if `VkRenderingInputAttachmentIndexInfoKHR:pDepthInputAttachmentIndex` or `VkRenderingInputAttachmentIndexInfoKHR:pStencilInputAttachmentIndex` are null, must be created with a `VkImageView` that is compatible with the corresponding color, depth, or stencil attachment in `VkRenderingInfo`.

• **VUID-vkCmdExecuteGeneratedCommandsNV-pDepthInputAttachmentIndex-09596**
  Input attachment views accessed in a dynamic render pass via a shader object must have an `InputAttachmentIndex` if both `VkRenderingInputAttachmentIndexInfoKHR:pDepthInputAttachmentIndex` and `VkRenderingInputAttachmentIndexInfoKHR:pStencilInputAttachmentIndex` are non-null.

• **VUID-vkCmdExecuteGeneratedCommandsNV-InputAttachmentIndex-09597**
  If an input attachment view accessed in a dynamic render pass via a shader object has an `InputAttachmentIndex`, the `InputAttachmentIndex` must match an index in `VkRenderingInputAttachmentIndexInfoKHR`.

• **VUID-vkCmdExecuteGeneratedCommandsNV-None-06537**
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

• **VUID-vkCmdExecuteGeneratedCommandsNV-None-09000**
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
  
  ◦ the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
  ◦ the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_COLOR_BIT` and
     - there is no currently bound graphics pipeline or
     - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command.

• **VUID-vkCmdExecuteGeneratedCommandsNV-None-09001**
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
  
  ◦ the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
  ◦ the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_DEPTH_BIT` and
     - there is no currently bound graphics pipeline or
     - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command.
If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:

- the VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the currently bound pipeline or
- the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included VK_IMAGE_ASPECT_STENCIL_BIT and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT it must not be accessed in any way other than as an attachment by this command

If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment, storage image, or sampled image by this command.

If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command must not write to that image subresource as an attachment.

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled.

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT dynamic state enabled then vkCmdSetViewport must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR dynamic state enabled then vkCmdSetScissor must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state enabled then vkCmdSetLineWidth must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, vkCmdSetLineWidth must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08618
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, vkCmdSetLineWidth must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08619
  If a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, vkCmdSetLineWidth must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07834
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state enabled then vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08620
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBiasEnable in the current command buffer set depthBiasEnable to VK_TRUE, vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07835
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic state enabled then vkCmdSetBlendConstants must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08621
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer set any element of pColorBlendEnables to VK_TRUE, and the most recent call to vkCmdSetColorBlendEquationEXT in the current command buffer set the same element of pColorBlendEquations to a VkColorBlendEquationEXT structure with any VkBlendFactor member with a value of VK_BLEND_FACTOR_CONSTANT_COLOR, VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR, VK_BLEND_FACTOR_CONSTANT_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA, vkCmdSetBlendConstants must have been
called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07836
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic state enabled, and if the current depthBoundsTestEnable state is VK_TRUE, then vkCmdSetDepthBounds must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08622
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBoundsTestEnable in the current command buffer set depthBoundsTestEnable to VK_TRUE, then vkCmdSetDepthBounds must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07837
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilCompareMask must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08623
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, then vkCmdSetStencilCompareMask must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07838
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_WRITE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilWriteMask must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08624
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, then vkCmdSetStencilWriteMask must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07839
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_REFERENCE dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilReference must have been called...
and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08625**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to **VK_FALSE**, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to **VK_TRUE**, `vkCmdSetStencilReference` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to **VK_TRUE** and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-06666**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08626**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to **VK_FALSE**, then `vkCmdSetCullMode` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07840**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled then `vkCmdSetCullMode` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08627**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to **VK_FALSE**, then `vkCmdSetCullMode` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07841**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled then `vkCmdSetFrontFace` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetFrontFace` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled then `vkCmdSetDepthWriteEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthWriteEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled then `vkCmdSetDepthCompareOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthTestEnable` in the current command buffer set `depthTestEnable` to `VK_TRUE`, then `vkCmdSetDepthCompareOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthBoundsTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If a shader object is bound to any graphics stage, and the \texttt{depthBounds} feature is enabled, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then the \texttt{vkCmdSetDepthBoundsTestEnable} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE} dynamic state enabled then \texttt{vkCmdSetStencilTestEnable} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with both the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT} and \texttt{VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT} dynamic state enabled, but not the \texttt{VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT} dynamic state enabled, then \texttt{vkCmdSetViewportWithCount} must have been called in the current command buffer prior to this drawing command, and the \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCount} must match the \texttt{VkPipelineViewportStateCreateInfo} ::\texttt{scissorCount} of the pipeline.

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT} dynamic state enabled, but not the \texttt{VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT} dynamic state enabled, then \texttt{vkCmdSetScissorWithCount} must have been called in the current command buffer prior to this drawing command, and the \texttt{scissorCount} parameter of \texttt{vkCmdSetScissorWithCount} must match the \texttt{VkPipelineViewportStateCreateInfo} ::\texttt{viewportCount} of the pipeline.
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08635
  If a shader object is bound to any graphics stage, then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount.

- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV : viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04138
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-09232
  If the VK_NV_clip_space_w_scaling extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetViewportWScalingEnableNV in the current command buffer set viewportWScalingEnable to VK_TRUE, then vkCmdSetViewportWScalingNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08636
  If the VK_NV_clip_space_w_scaling extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetViewportWScalingEnableNV in the current command buffer set viewportWScalingEnable to VK_TRUE, then the viewportCount parameter in the last call to vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04139
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewShadingRateImageStateCreateInfoNV : viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04140
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdExecuteGeneratedCommandsNV-shadingRateImage-09233
  If the shadingRateImage feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetCoarseSampleOrderNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-shadingRateImage-09234
  If the shadingRateImage feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetShadingRateImageEnableNV in the current command buffer set shadingRateImageEnable to VK_TRUE, then vkCmdSetViewportShadingRatePaletteNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08637
  If the shadingRateImage feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetShadingRateImageEnableNV in the current command buffer set shadingRateImageEnable to VK_TRUE, then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdExecuteGeneratedCommandsNV-VkPipelineViewportCreateInfo-04141
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportSwizzleStateCreateInfoNV structure chained from VkPipelineViewportStateCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdExecuteGeneratedCommandsNV-VkPipelineViewportCreateInfo-04142
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportExclusiveScissorStateCreateInfoNV structure chained from VkPipelineViewportStateCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07878
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV dynamic state enabled then...
vkCmdSetExclusiveScissorEnableNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07879
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV dynamic state enabled then vkCmdSetExclusiveScissorNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-exclusiveScissor-09235
  If the exclusiveScissor feature is enabled, and a shader object is bound to any graphics stage, then vkCmdSetExclusiveScissorEnableNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08638
  If the exclusiveScissor feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetExclusiveScissorEnableNV in the current command buffer set any element of pExclusiveScissorEnables to VK_TRUE, then vkCmdSetExclusiveScissorNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-04876
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then vkCmdSetRasterizerDiscardEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08639
  If a shader object is bound to any graphics stage, then vkCmdSetRasterizerDiscardEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-04877
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then vkCmdSetDepthBiasEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08640
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthBiasEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-logicOp-04878
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then vkCmdSetLogicOpEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08641
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set...
rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetLogicOpEnableEXT set logicOpEnable to VK_TRUE, then vkCmdSetLogicOpEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must be 1.

- VUID-vkCmdExecuteGeneratedCommandsNV-primitiveFragmentShadingRateWithMultipleViewports-08642
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, and any shader object bound to a graphics stage writes to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must be 1.

- VUID-vkCmdExecuteGeneratedCommandsNV-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the pAttachments member of pColorBlendState must be VK_FALSE.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08643
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then for each color attachment in the render pass, if the corresponding image view’s format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the corresponding member of pColorBlendEnables in the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer that affected that attachment index must have been VK_FALSE.

- VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline, and none of the following is enabled:
  
  - the VK_AMD_mixed_attachment_samples extension
  - the VK_NV_framebuffer_mixed_samples extension
  - the multisampledRenderToSingleSampled feature

  then rasterizationSamples for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08644
If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and none of the following is enabled:

- the VK_AMD_mixed_attachment_samples extension
- the VK_NV_framebuffer_mixed_samples extension
- the multisampledRenderToSingleSampled feature

then the most recent call to vkCmdSetRasterizationSamplesEXT in the current command
buffer must have set rasterizationSamples to be the same as the number of samples for
the current render pass color and/or depth/stencil attachments.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08876
If a shader object is bound to any graphics stage, the current render pass instance must
have been begun with vkCmdBeginRendering.

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06172
If the current render pass instance was begun with vkCmdBeginRendering, the imageView
member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of
pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must
not write any values to the depth attachment.

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06173
If the current render pass instance was begun with vkCmdBeginRendering, the imageView
member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of
pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must
not write any values to the stencil attachment.

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06174
If the current render pass instance was begun with vkCmdBeginRendering, the imageView
member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of
pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, this
command must not write any values to the depth attachment.

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06175
If the current render pass instance was begun with vkCmdBeginRendering, the imageView
member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of
pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must
not write any values to the stencil attachment.

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06176
If the current render pass instance was begun with vkCmdBeginRendering, the imageView
member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of
pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, this command must not
write any values to the depth attachment.

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06177
If the current render pass instance was begun with vkCmdBeginRendering, the imageView
member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of
pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must not
write any values to the stencil attachment.
• **VUID-vkCmdExecuteGeneratedCommandsNV-viewMask-06178**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`.

• **VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-06179**
  If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`.

• **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08910**
  If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.

• **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08912**
  If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` equal to `VK_NULL_HANDLE` must have the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound pipeline equal to `VK_FORMAT_UNDEFINED`.

• **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08911**
  If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats`, if it exists, must be `VK_FORMAT_UNDEFINED`.

• **VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-09362**
  If the current render pass instance was begun with `vkCmdBeginRendering`, with a `VkRenderingInfo::colorAttachmentCount` equal to 1, there is no shader object bound to any graphics stage, and a color attachment with a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, each element of the `VkRenderingInfo::pColorAttachments` array with a `resolveImageView` not equal to `VK_NULL_HANDLE` must have been created with an image created with a `VkExternalFormatANDROID::externalFormat` value equal to the `VkExternalFormatANDROID::externalFormat` value used to create the currently bound...
If there is no shader object bound to any graphics stage, the current render pass instance was begun with `vkCmdBeginRendering` and a `VkRenderingInfo::colorAttachmentCount` equal to 1, and a color attachment with a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with an image created with a `VkExternalFormatANDROID::externalFormat` value equal to the `VkExternalFormatANDROID::externalFormat` value used to create the currently bound graphics pipeline

If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, then `vkCmdSetColorBlendEnableEXT` must have set the blend enable to `VK_FALSE` prior to this drawing command

If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled, then `vkCmdSetRasterizationSamplesEXT` must have set `rasterizationSamples` to `VK_SAMPLE_COUNT_1_BIT` prior to this drawing command

If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` resolve mode, then `vkCmdSetColorBlendEnableEXT` must have set blend enable to `VK_FALSE` prior to this drawing command

If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` resolve mode, then `vkCmdSetRasterizationSamplesEXT` must have set `rasterizationSamples` to `VK_SAMPLE_COUNT_1_BIT` prior to this drawing command

If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` dynamic state enabled, then `vkCmdSetFragmentShadingRateKHR` must have set `pFragmentSize->width` to 1 prior to this drawing command

If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` resolve mode, then `vkCmdSetRasterizationSamplesEXT` must have set `rasterizationSamples` to `VK_SAMPLE_COUNT_1_BIT` prior to this drawing command

If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` dynamic state enabled, then `vkCmdSetFragmentShadingRateKHR` must have set `pFragmentSize->width` to 1 prior to this drawing command
If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` dynamic state enabled, then `vkCmdSetFragmentShadingRateKHR` must have set `pFragmentSize->height` to 1 prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-pFragmentSize-09370**
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` resolve mode, then `vkCmdSetFragmentShadingRateKHR` must have set `pFragmentSize->width` to 1 prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-pFragmentSize-09371**
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` resolve mode, then `vkCmdSetFragmentShadingRateKHR` must have set `pFragmentSize->height` to 1 prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-attachmentCount-07750**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline

- **VUID-vkCmdExecuteGeneratedCommandsNV-attachmentCount-07751**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then the `attachmentCount` parameter of most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-attachmentCount-07752**
  If the colorWriteEnable feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `attachmentCount` parameter of most recent call to `vkCmdSetColorWriteEnableEXT` in the current command buffer must be greater than or equal to the number of color attachments in the current render pass instance
The document provides guidelines for using the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT dynamic state in Vulkan. It includes several bullet points, each detailing specific conditions and requirements:

1. For dynamic state enabled for discard rectangles, `vkCmdSetDiscardRectangleEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`.

2. If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT dynamic state enabled, then `vkCmdSetDiscardRectangleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

3. If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

4. If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

5. If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

6. If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

These guidelines ensure that the Vulkan API is used correctly when manipulating discard rectangles, maintaining state consistency across command buffers.
If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08915**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08916**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08917**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`

- **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08918**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06183**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06184**
  If current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not...
VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with 
VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT

• VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-06185
  If the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or 
  VkAttachmentSampleCountInfoNV structure, and the current render pass instance was 
  begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount 
  parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments 
  array with a imageView not equal to VK_NULL_HANDLE must have been created with a 
  sample count equal to the corresponding element of the pColorAttachmentSamples member 
  of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to 
  create the currently bound graphics pipeline

• VUID-vkCmdExecuteGeneratedCommandsNV-pDepthAttachment-06186
  If the current render pass instance was begun with vkCmdBeginRendering, the currently 
  bound pipeline was created with a VkAttachmentSampleCountInfoAMD or 
  VkAttachmentSampleCountInfoNV structure, and 
  VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of the 
  depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or 
  VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must 
  be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

• VUID-vkCmdExecuteGeneratedCommandsNV-pStencilAttachment-06187
  If the current render pass instance was begun with vkCmdBeginRendering, the currently 
  bound pipeline was created with a VkAttachmentSampleCountInfoAMD or 
  VkAttachmentSampleCountInfoNV structure, and 
  VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of the 
  depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or 
  VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must 
  be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

• VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-07285
  If the currently bound pipeline was created without a 
  VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the 
  multisampledRenderToSingleSampled feature is not enabled, and the current render pass 
  instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount 
  parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments 
  array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of 
  rasterizationSamples for the currently bound graphics pipeline

• VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-07286
  If the currently bound pipeline was created without a 
  VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the 
  multisampledRenderToSingleSampled feature is not enabled, and 
  VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of 
  rasterizationSamples for the currently bound graphics pipeline must be equal to the 
  sample count used to create VkRenderingInfo::pDepthAttachment->imageView
If the currently bound pipeline was created without a
VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

If this command has been called inside a render pass instance started with vkCmdBeginRendering, and the pNext chain of VkRenderingInfo includes a VkMultisampledRenderToSingleSampledInfoEXT structure with multisampledRenderToSingleSampledEnable equal to VK_TRUE, then the value of rasterizationSamples for the currently bound graphics pipeline must be equal to VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples

If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE

If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the VkRenderingInfo::pColorAttachments->imageView was not VK_NULL_HANDLE, then the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the pipeline must not be VK_FORMAT_UNDEFINED

If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the pipeline must not be VK_FORMAT_UNDEFINED

If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, stencil test is enabled and the VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the pipeline must not be VK_FORMAT_UNDEFINED

If the primitivesGeneratedQueryWithRasterizerDiscard feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, rasterization discard must not be enabled

If the primitivesGeneratedQueryWithNonZeroStreams feature is not enabled and the query is active, rasterization discard must not be enabled
If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07619**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` dynamic state enabled then `vkCmdSetTessellationDomainOriginEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07620**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClampEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-09237**
  If a shader object is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, then `vkCmdSetTessellationDomainOriginEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08650**
  If the `depthClamp` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07621**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled then `vkCmdSetPolygonModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08651**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetPolygonModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07622**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then `vkCmdSetRasterizationSamplesEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08652**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07623**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08653**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07624**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-alphaToCoverageEnable-08919**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08654**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-alphaToCoverageEnable-08920**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07625**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08655**
  If the `alphaToOne` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT dynamic state enabled then
vkCmdSetLogicOpEnableEXT must have been called and not subsequently invalidated in
the current command buffer prior to this drawing command.

If the logicOp feature is enabled, and a shader object is bound to the
VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLogicOpEnableEXT must have been
called and not subsequently invalidated in the current command buffer prior to this
drawing command.

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then
vkCmdSetColorBlendEnableEXT must have been called and not subsequently invalidated in
the current command buffer prior to this drawing command.

If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and both the most
recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE and there are color attachments bound, then
vkCmdSetColorBlendEnableEXT must have been called and not subsequently invalidated in
the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then
vkCmdSetColorBlendEquationEXT must have been called and not subsequently invalidated in
the current command buffer prior to this drawing command.

If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and both the most
recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE and there are color attachments bound, then
vkCmdSetColorBlendEquationEXT must have been called and not subsequently invalidated in
the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic state enabled then
vkCmdSetColorWriteMaskEXT must have been called and not subsequently invalidated in
the current command buffer prior to this drawing command.

If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and both the most
recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE and there are color attachments bound, then
vkCmdSetColorWriteMaskEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07630
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT dynamic state enabled then vkCmdSetRasterizationStreamEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08660
  If the geometryStreams feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_GEOMETRY_BIT stage, then vkCmdSetRasterizationStreamEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07631
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT dynamic state enabled then vkCmdSetConservativeRasterizationModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08661
  If the VK_EXT_conservative_rasterization extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetConservativeRasterizationModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07632
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT dynamic state enabled then vkCmdSetExtraPrimitiveOverestimationSizeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08662
  If the VK_EXT_conservative_rasterization extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetConservativeRasterizationModeEXT in the current command buffer set conservativeRasterizationMode to VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT, then vkCmdSetExtraPrimitiveOverestimationSizeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07633
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT dynamic state enabled then vkCmdSetDepthClipEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08663
  If the depthClipEnable feature is enabled, and a shader object is bound to any graphics
stage, then `vkCmdSetDepthClipEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07634**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08664**
  If the `VK_EXT_sample_locations` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleLocationsEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07635**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled then `vkCmdSetColorBlendAdvancedEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-rasterizerDiscardEnable-09416**
  If the `VK_EXT_blend_operation_advanced` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then at least one of `vkCmdSetColorBlendEquationEXT` and `vkCmdSetColorBlendAdvancedEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07636**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled then `vkCmdSetProvokingVertexModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08665**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetProvokingVertexModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07637**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08666**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a
shader object is bound to any graphics stage, and the most recent call to
\texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set
\texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and the most recent call to
\texttt{vkCmdSetPolygonModeEXT} in the current command buffer set \texttt{polygonMode} to
\texttt{VK\_POLYGON\_MODE\_LINE}, then \texttt{vkCmdSetLineRasterizationModeEXT} \textbf{must} have been called
and not subsequently \textit{invalidated} in the current command buffer prior to this drawing command.

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08667}
  If the \texttt{VK\_KHR\_line\_rasterization} or \texttt{VK\_EXT\_line\_rasterization} extension is enabled, and a
  shader object is bound to the \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage, and the most recent call to
  \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set
  \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and the most recent call to
  \texttt{vkCmdSetPrimitiveTopology} in the current command buffer set \texttt{primitiveTopology} to any
  line topology, then \texttt{vkCmdSetLineRasterizationModeEXT} \textbf{must} have been called and not
  subsequently \textit{invalidated} in the current command buffer prior to this drawing command.

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08668}
  If the \texttt{VK\_KHR\_line\_rasterization} or \texttt{VK\_EXT\_line\_rasterization} extension is enabled, and a
  shader object that outputs line primitives is bound to the \texttt{VK\_SHADER\_STAGE\_TESSELLATION\_EVALUATION\_BIT} or \texttt{VK\_SHADER\_STAGE\_GEOMETRY\_BIT} stage, and
  the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set
  \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetLineRasterizationModeEXT} \textbf{must}
  have been called and not subsequently \textit{invalidated} in the current command buffer prior to this drawing command.

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-07638}
  If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_LINE\_STIPPLE\_ENABLE\_EXT} dynamic state enabled then
  \texttt{vkCmdSetLineStippleEnableEXT} \textbf{must} have been called and not subsequently \textit{invalidated}
  in the current command buffer prior to this drawing command.

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08669}
  If the \texttt{VK\_KHR\_line\_rasterization} or \texttt{VK\_EXT\_line\_rasterization} extension is enabled, and a
  shader object is bound to any graphics stage, and the most recent call to
  \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set
  \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and the most recent call to
  \texttt{vkCmdSetPolygonModeEXT} in the current command buffer set \texttt{polygonMode} to
  \texttt{VK\_POLYGON\_MODE\_LINE}, then \texttt{vkCmdSetLineStippleEnableEXT} \textbf{must} have been called and not
  subsequently \textit{invalidated} in the current command buffer prior to this drawing command.

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08670}
  If the \texttt{VK\_KHR\_line\_rasterization} or \texttt{VK\_EXT\_line\_rasterization} extension is enabled, and a
  shader object is bound to the \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage, and the most recent call to
  \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set
  \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and the most recent call to
  \texttt{vkCmdSetPrimitiveTopology} in the current command buffer set \texttt{primitiveTopology} to any
  line topology, then \texttt{vkCmdSetLineStippleEnableEXT} \textbf{must} have been called and not
  subsequently \textit{invalidated} in the current command buffer prior to this drawing command.
If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_KHR` dynamic state enabled then `vkCmdSetLineStippleKHR` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetLineStippleEnableEXT` in the current command buffer set `stippledLineEnable` to `VK_TRUE`, then `vkCmdSetLineStippleEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT` dynamic state enabled then `vkCmdSetDepthClipNegativeOneToOneEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `depthClipControl` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetDepthClipNegativeOneToOneEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV` dynamic state enabled then `vkCmdSetViewportWScalingEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_NV_clip_space_w_scaling` extension is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetViewportWScalingEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic state enabled then `vkCmdSetViewportSwizzleNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If the `VK_NV_viewport_swizzle` extension is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetViewportSwizzleNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` dynamic state enabled then `vkCmdSetCoverageToColorEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageToColorEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV` dynamic state enabled then `vkCmdSetCoverageModulationModeNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageModulationModeNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` dynamic state enabled then `vkCmdSetCoverageModulationTableEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08679
  If the VK_NV_framebuffer_mixed_samples extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetCoverageModulationModeNV in the current command buffer set coverageModulationMode to any value other than VK_COVERAGE_MODULATION_MODE_NONE_NV, then vkCmdSetCoverageModulationTableEnableNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07646
  If the VK_NV_framebuffer_mixed_samples extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetCoverageModulationTableEnableNV in the current command buffer set coverageModulationTableEnable to VK_TRUE, then vkCmdSetCoverageModulationTableNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08680
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV dynamic state enabled then vkCmdSetCoverageModulationTableNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07647
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV dynamic state enabled then vkCmdSetShadingRateImageEnableNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-pipelineFragmentShadingRate-09238
  If the pipelineFragmentShadingRate feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetFragmentShadingRateKHR must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08681
  If the shadingRateImage feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetShadingRateImageEnableNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07648
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV dynamic state enabled then vkCmdSetRepresentativeFragmentTestEnableNV must have been called and not subsequently invalidated in the current command buffer prior to this drawing command
If the `representativeFragmentTest` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRepresentativeFragmentTestEnableNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV` dynamic state enabled then `vkCmdSetCoverageReductionModeNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `coverageReductionMode` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageReductionModeNV` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last call to `vkCmdSetColorBlendEnableEXT` set `pColorBlendEnables` for any attachment to `VK_TRUE`, then for those attachments in the subpass the corresponding image view's format features must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must follow the rules for a zero-attachment subpass.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and neither the
VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are enabled, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdExecuteGeneratedCommandsNV-None-09211
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, or a shader object is bound to any graphics stage, and the current render pass instance includes a VkMultisampledRenderToSingleSampledInfoEXT structure with multisampledRenderToSingleSampledEnable equal to VK_TRUE, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT must be the same as the rasterizationSamples member of that structure

- VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07476
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls must specify an enable for all active color attachments in the current subpass

- VUID-vkCmdExecuteGeneratedCommandsNV-rasterizerDiscardEnable-09417
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls must specify an enable for all active color attachments in the current subpass

- VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07477
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then vkCmdSetColorBlendEquationEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEquationEXT calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled

- VUID-vkCmdExecuteGeneratedCommandsNV-rasterizerDiscardEnable-09418
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and both the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE and there are color attachments bound, then vkCmdSetColorBlendEquationEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEquationEXT calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled

- VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07478
If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT} dynamic state enabled then \texttt{vkCmdSetColorWriteMaskEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorWriteMaskEXT} calls must specify the color write mask for all active color attachments in the current subpass

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-rasterizerDiscardEnable-09419}
  If a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetColorWriteMaskEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorWriteMaskEXT} calls must specify the color write mask for all active color attachments in the current subpass

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07479}
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT} dynamic state enabled then \texttt{vkCmdSetColorBlendAdvancedEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorBlendAdvancedEXT} calls must specify the advanced blend equations for all active color attachments in the current subpass where blending is enabled

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-advancedBlendMaxColorAttachments-07480}
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT} and \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT} dynamic states enabled and the last calls to \texttt{vkCmdSetColorBlendEnableEXT} and \texttt{vkCmdSetColorBlendAdvancedEXT} have enabled advanced blending, then the number of active color attachments in the current subpass must not exceed \texttt{advancedBlendMaxColorAttachments}

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-primitivesGeneratedQueryWithNonZeroStreams-07481}
  If the \texttt{primitivesGeneratedQueryWithNonZeroStreams} feature is not enabled and the \texttt{VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT} query is active, and the bound graphics pipeline was created with \texttt{VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT} state enabled, the last call to \texttt{vkCmdSetRasterizationStreamEXT} must have set the \texttt{rasterizationStream} to zero

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsPerPixel-07482}
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT} state enabled and the \texttt{VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT} state disabled, then the \texttt{sampleLocationsPerPixel} member of \texttt{pSampleLocationsInfo} in the last call to \texttt{vkCmdSetSampleLocationsEXT} must equal the \texttt{rasterizationSamples} member of the \texttt{VkPipelineMultisampleStateCreateInfo} structure the bound graphics pipeline has been created with

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsPerPixel-07483}
If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the 
VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, then the 
sampleLocationsPerPixel member of pSampleLocationsInfo in the last call to 
vkCmdSetSampleLocationsEXT must equal the rasterizationSamples parameter of the last 
call to vkCmdSetRasterizationSamplesEXT

- VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07484
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound 
  graphics pipeline was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and sampleLocationsEnable was VK_TRUE in the last call to 
vkCmdSetSampleLocationsEnableEXT, and the current subpass has a depth/stencil 
attachment, then that attachment must have been created with the 
VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07485
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound 
  graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled and the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if 
sampleLocationsEnable was VK_TRUE in the last call to 
vkCmdSetSampleLocationsEnableEXT, then the sampleLocationsInfo.sampleLocationGridSize.width in the last call to 
vkCmdSetSampleLocationsEXT must evenly divide VkMultisamplePropertiesEXT 
::sampleLocationGridSize.width as returned by 
vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling 
rasterizationSamples

- VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07486
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound 
  graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled and the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if 
sampleLocationsEnable was VK_TRUE in the last call to 
vkCmdSetSampleLocationsEnableEXT, then the sampleLocationsInfo.sampleLocationGridSize.height in the last call to 
vkCmdSetSampleLocationsEXT must evenly divide VkMultisamplePropertiesEXT 
::sampleLocationGridSize.height as returned by 
vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling 
rasterizationSamples

- VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07487
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound 
  graphics pipeline state was created with the 
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if 
sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, the fragment shader 
code must not statically use the extended instruction InterpolateAtSample

- VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07936
  If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the 
VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, the sampleLocationsEnable 
member of a VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable in the
The bound graphics pipeline is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, then, sampleLocationsInfo.sampleLocationGridSize.width must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.width as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling the value of rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07937**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable in the bound graphics pipeline is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, then, sampleLocationsInfo.sampleLocationGridSize.height must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.height as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling the value of rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07938**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable in the bound graphics pipeline is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, then, sampleLocationsInfo.sampleLocationsPerPixel must equal rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT.

- **VUID-vkCmdExecuteGeneratedCommandsNV-coverageModulationTableEnable-07488**
  If a shader object is bound to any graphics stage or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV state enabled, and the last call to vkCmdSetCoverageModulationTableEnableNV set coverageModulationTableEnable to VK_TRUE, then the coverageModulationTableCount parameter in the last call to vkCmdSetCoverageModulationTableNV must equal the current rasterizationSamples divided by the number of color samples in the current subpass.

- **VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-07489**
  If the VK_NV_framebuffer_mixed_samples extension is enabled, and if current subpass has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled in the currently bound pipeline state, then the current rasterizationSamples must be the same as the sample count of the depth/stencil attachment.

- **VUID-vkCmdExecuteGeneratedCommandsNV-coverageToColorEnable-07490**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV state enabled and the last call to vkCmdSetCoverageToColorEnableNV set the coverageToColorEnable to VK_TRUE, then the current subpass must have a color attachment at the location selected by the last call to vkCmdSetCoverageToColorLocationNV coverageToColorLocation, with a VkFormat of VK_FORMAT_R8_UINT, VK_FORMAT_R8_SINT, VK_FORMAT_R16_UINT, VK_FORMAT_R16_SINT, VK_FORMAT_R32_UINT, or VK_FORMAT_R32_SINT.

- **VUID-vkCmdExecuteGeneratedCommandsNV-rasterizerDiscardEnable-09420**
If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the last call to `vkCmdSetCoverageToColorEnableNV` set the `coverageToColorEnable` to `VK_TRUE`, then the current subpass must have a color attachment at the location selected by the last call to `vkCmdSetCoverageToColorLocationNV` `coverageToColorLocation`, with a `VkFormat` of `VK_FORMAT_R8_UINT`, `VK_FORMAT_R8_SINT`, `VK_FORMAT_R16_UINT`, `VK_FORMAT_R16_SINT`, `VK_FORMAT_R32_UINT`, or `VK_FORMAT_R32_SINT`.

• VUID-vkCmdExecuteGeneratedCommandsNV-coverageReductionMode-07491
If this `VK_NV_coverage_reduction_mode` extension is enabled, the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, the current coverage reduction mode `coverageReductionMode`, the current `rasterizationSamples`, and the sample counts for the color and depth/stencil attachments (if the subpass has them) must be a valid combination returned by `vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV`.

• VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-07492
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV` `viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-07493
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportSwizzleNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-09421
If the `VK_NV_viewport_swizzle` extension is enabled, and a shader object is bound to any graphics stage, then the `viewportCount` parameter in the last call to `vkCmdSetViewportSwizzleNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-07494
If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if the current subpass has any color attachments and `rasterizationSamples` of the last call to `vkCmdSetRasterizationSamplesEXT` is greater than the number of color samples, then the pipeline `sampleShadingEnable` must be `VK_FALSE`.

• VUID-vkCmdExecuteGeneratedCommandsNV-stippledLineEnable-07495
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is...
VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR, then the stippledRectangularLines feature must be enabled

- VUID-vkCmdExecuteGeneratedCommandsNV-stippledLineEnable-07496
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR, then the stippledBresenhamLines feature must be enabled

- VUID-vkCmdExecuteGeneratedCommandsNV-stippledLineEnable-07497
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR, then the stippledSmoothLines feature must be enabled

- VUID-vkCmdExecuteGeneratedCommandsNV-stippledLineEnable-07498
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR, then the stippledRectangularLines feature must be enabled and VkPhysicalDeviceLimits::strictLines must be VK_TRUE

- VUID-vkCmdExecuteGeneratedCommandsNV-conservativePointAndLineRasterization-07499
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT dynamic state enabled, conservativePointAndLineRasterization is not supported, and the effective primitive topology output by the last pre-rasterization shader stage is a line or point, then the conservativeRasterizationMode set by the last call to vkCmdSetConservativeRasterizationModeEXT must be VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT

- VUID-vkCmdExecuteGeneratedCommandsNV-stage-07073
  If the currently bound pipeline was created with the VkPipelineShaderStageCreateInfo::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT, then Mesh Shader Queries must not be active

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08877
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT dynamic state vkCmdSetAttachmentFeedbackLoopEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07850
  If dynamic state was inherited from
VkCommandBufferInheritanceViewportScissorInfoNV, it must be set in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08684**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08685**
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08686**
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08687**
  If there is no bound graphics pipeline, and the `geometryShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08688**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08689**
  If there is no bound graphics pipeline, and the `taskShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TASK_BIT_EXT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08690**
  If there is no bound graphics pipeline, and the `meshShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_MESH_BIT_EXT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08693**
  If there is no bound graphics pipeline, and at least one of the `taskShader` and `meshShader` features is enabled, one of the `VK_SHADER_STAGE_VERTEX_BIT` or `VK_SHADER_STAGE_MESH_BIT_EXT` stages must have a valid `VkShaderEXT` bound, and the other must have no `VkShaderEXT` bound

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08694**
  If there is no bound graphics pipeline, and both the `taskShader` and `meshShader` features are enabled, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created without the `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, a valid `VkShaderEXT` must be bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08695**
  If there is no bound graphics pipeline, and both the `taskShader` and `meshShader` features are enabled, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created with the `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, there must be no `VkShaderEXT` bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage
If there is no bound graphics pipeline, and a valid \texttt{VkShaderEXT} is bound to the \texttt{VK_SHADER_STAGE_VERTEX_BIT} stage, there \textbf{must} be no \texttt{VkShaderEXT} bound to either the \texttt{VK_SHADER_STAGE_TASK_BIT_EXT} stage or the \texttt{VK_SHADER_STAGE_MESH_BIT_EXT} stage.

If any graphics shader is bound which was created with the \texttt{VK_SHADER_CREATE_LINK_STAGE_BIT_EXT} flag, then all shaders created with the \texttt{VK_SHADER_CREATE_LINK_STAGE_BIT_EXT} flag in the same \texttt{vkCreateShadersEXT} call \textbf{must} also be bound.

If any graphics shader is bound which was created with the \texttt{VK_SHADER_CREATE_LINK_STAGE_BIT_EXT} flag, any stages in between stages whose shaders which did not create a shader with the \texttt{VK_SHADER_CREATE_LINK_STAGE_BIT_EXT} flag as part of the same \texttt{vkCreateShadersEXT} call \textbf{must} not have any \texttt{VkShaderEXT} bound.

All bound graphics shader objects \textbf{must} have been created with identical or identically defined push constant ranges.

All bound graphics shader objects \textbf{must} have been created with identical or identically defined arrays of descriptor set layouts.

If the current render pass instance was begun with \texttt{vkCmdBeginRendering} and a \texttt{VkRenderingInfo::colorAttachmentCount} equal to 1, a color attachment with a resolve mode of \texttt{VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID}, and a fragment shader is bound, it \textbf{must} not declare the \texttt{DepthReplacing} or \texttt{StencilRefReplacingEXT} execution modes.

If the \texttt{attachmentFeedbackLoopDynamicState} feature is enabled on the device, and a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetAttachmentFeedbackLoopEnableEXT} \textbf{must} have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state includes a fragment shader stage, was created with \texttt{VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}, and the fragment shader declares the \texttt{EarlyFragmentTests} execution mode and uses \texttt{OpDepthAttachmentReadEXT}, the \texttt{depthWriteEnable} parameter in the last call to \texttt{vkCmdSetDepthWriteEnable} \textbf{must} be \texttt{VK_FALSE}.

If the bound graphics pipeline state includes a fragment shader stage, was created with \texttt{VK_DYNAMIC_STATE_STENCIL_WRITE_MASK} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}, and the fragment shader declares the \texttt{EarlyFragmentTests} execution mode and uses \texttt{OpStencilAttachmentReadEXT}, the \texttt{writeMask} parameter in the last call to \texttt{vkCmdSetStencilWriteMask} \textbf{must} be 0.
If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the corresponding element of the `pColorWriteMasks` parameter of `vkCmdSetColorWriteMaskEXT` must either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, and `VK_COLOR_COMPONENT_B_BIT`, or none of them.

If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than `maxFragmentDualSrcAttachments`.

If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, the value of each element of `VkRenderingAttachmentLocationInfoKHR::pColorAttachmentLocations` set by `vkCmdSetRenderingAttachmentLocationsKHR` must match the value set for the corresponding element in the currently bound pipeline.

If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, input attachment index mappings in the currently bound pipeline must match those set for the current render pass instance via `VkRenderingInputAttachmentIndexInfoKHR`.

If the bound graphics pipeline was created with `VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT`, the current render pass must have begun with `vkCmdBeginRendering` with the `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT` flag.

All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must have either valid or `VK_NULL_HANDLE` buffers bound.

If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be `VK_NULL_HANDLE`.

If `robustBufferAccess` is not enabled, and that pipeline was created without enabling `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` for `vertexInputs`, then for a given vertex buffer binding, any attribute data fetched must be entirely contained.
within the corresponding vertex buffer binding, as described in Vertex Input Description

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07842
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled then vkCmdSetPrimitiveTopology must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-dynamicPrimitiveTopologyUnrestricted-07500
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled and the dynamicPrimitiveTopologyUnrestricted is VK_FALSE, then the primitiveTopology parameter of vkCmdSetPrimitiveTopology must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state

- VUID-vkCmdExecuteGeneratedCommandsNV-pStrides-04913
  If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, but without the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdBindVertexBuffers2EXT must have been called and not subsequently invalidated in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL

- VUID-vkCmdExecuteGeneratedCommandsNV-None-04914
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then all variables with the Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint must contain a location in VkVertexInputAttributeDescription2EXT::location

- VUID-vkCmdExecuteGeneratedCommandsNV-Input-07939
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then all variables with the Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint must contain a location in VkVertexInputAttributeDescription2EXT::location

- VUID-vkCmdExecuteGeneratedCommandsNV-Input-08734
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and either legacyVertexAttributes is not enabled or the SPIR-V Type associated with a given Input variable of the corresponding Location in the Vertex Execution Model OpEntryPoint is 64-bit, then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription2EXT::format

- VUID-vkCmdExecuteGeneratedCommandsNV-format-08936
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled and either legacyVertexAttributes is not enabled or the SPIR-V Type associated with a given Input variable of the corresponding Location in the Vertex Execution Model OpEntryPoint is 64-bit, then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription2EXT::format
If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and the scalar width associated with a `Location` decorated `Input` variable in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription2EXT::format` must have a 64-bit component.

If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must not use components that are not present in the format.

If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `primitiveTopologyListRestart` feature is not enabled, the topology is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnable` must be set to `VK_FALSE`.

If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`.

There must be no shader object bound to either of the `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT` stages.

`commandBuffer` must not be a protected command buffer.

If `isPreprocessed` is `VK_TRUE` then `vkCmdPreprocessGeneratedCommandsNV` must have
already been executed on the device, using the same `pGeneratedCommandsInfo` content as well as the content of the input buffers it references (all except `VkGeneratedCommandsInfoNV::preprocessBuffer`). Furthermore `pGeneratedCommandsInfo`'s `indirectCommandsLayout` must have been created with the `VK INDIRECT COMMANDS LAYOUT USAGE EXPLICIT PREPROCESS_BIT_NV` bit set.

- VUID-vkCmdExecuteGeneratedCommandsNV-pipeline-02909
  `VkGeneratedCommandsInfoNV::pipeline` must match the current bound pipeline at `VkGeneratedCommandsInfoNV::pipelineBindPoint`

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02910
  Transform feedback must not be active

- VUID-vkCmdExecuteGeneratedCommandsNV-deviceGeneratedCommands-02911
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdExecuteGeneratedCommandsNV-pGeneratedCommandsInfo-parameter
  `pGeneratedCommandsInfo` must be a valid pointer to a valid `VkGeneratedCommandsInfoNV` structure

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdExecuteGeneratedCommandsNV-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdExecuteGeneratedCommandsNV-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
The `VkGeneratedCommandsInfoNV` is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkGeneratedCommandsInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipeline pipeline;
    VkIndirectCommandsLayoutNV indirectCommandsLayout;
    uint32_t streamCount;
    const VkIndirectCommandsStreamNV* pStreams;
    uint32_t sequencesCount;
    VkBuffer preprocessBuffer;
    VkDeviceSize preprocessOffset;
    VkDeviceSize preprocessSize;
    VkBuffer sequencesCountBuffer;
    VkDeviceSize sequencesCountOffset;
    VkBuffer sequencesIndexBuffer;
    VkDeviceSize sequencesIndexOffset;
} VkGeneratedCommandsInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipelineBindPoint` is the `VkPipelineBindPoint` used for the `pipeline`.
- `pipeline` is the `VkPipeline` used in the generation and execution process.
- `indirectCommandsLayout` is the `VkIndirectCommandsLayoutNV` that provides the command sequence to generate.
- `streamCount` defines the number of input streams
- `pStreams` is a pointer to an array of `streamCount` `VkIndirectCommandsStreamNV` structures providing the input data for the tokens used in `indirectCommandsLayout`.
- `sequencesCount` is the maximum number of sequences to reserve. If `sequencesCountBuffer` is `VK_NULL_HANDLE`, this is also the actual number of sequences generated.
- `preprocessBuffer` is the `VkBuffer` that is used for preprocessing the input data for execution. If this structure is used with `vkCmdExecuteGeneratedCommandsNV` with its `isPreprocessed` set to `VK_TRUE`, then the preprocessing step is skipped and data in this buffer will not be modified. The contents and the layout of this buffer are opaque to applications and must not be modified.
outside functions related to device-generated commands or copied to another buffer for reuse.

- **preprocessOffset** is the byte offset into **preprocessBuffer** where the preprocessed data is stored.
- **preprocessSize** is the maximum byte size within the **preprocessBuffer** after the **preprocessOffset** that is available for preprocessing.
- **sequencesCountBuffer** is a **VkBuffer** in which the actual number of sequences is provided as single **uint32_t** value.
- **sequencesCountOffset** is the byte offset into **sequencesCountBuffer** where the count value is stored.
- **sequencesIndexBuffer** is a **VkBuffer** that encodes the used sequence indices as **uint32_t** array.
- **sequencesIndexOffset** is the byte offset into **sequencesIndexBuffer** where the index values start.

### Valid Usage

- **VUID-VkGeneratedCommandsInfoNV-pipeline-02912**
  The provided **pipeline must** match the pipeline bound at execution time

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02913**
  If the **indirectCommandsLayout** uses a token of **VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV**, then the **pipeline must** have been created with multiple shader groups

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02914**
  If the **indirectCommandsLayout** uses a token of **VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV**, then the **pipeline must** have been created with **VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV** set in **VkGraphicsPipelineCreateInfo::flags**

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02915**
  If the **indirectCommandsLayout** uses a token of **VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV**, then the **pipeline's VkPipelineLayout must** match the **VkIndirectCommandsLayoutTokenNV::pushconstantPipelineLayout**

- **VUID-VkGeneratedCommandsInfoNV-streamCount-02916**
  **streamCount must** match the **indirectCommandsLayout's streamCount**

- **VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-09084**
  If **pipelineBindPoint** is of type **VK_PIPELINE_BIND_POINT_COMPUTE**, then the **pipeline must** have been created with the flag **VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV**

- **VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-09085**
  If **pipelineBindPoint** is of type **VK_PIPELINE_BIND_POINT_COMPUTE**, then the **pipeline must** have been created with a **VkComputePipelineIndirectBufferInfoNV** structure specifying a valid address where its metadata will be saved

- **VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-09086**
  If **pipelineBindPoint** is of type **VK_PIPELINE_BIND_POINT_COMPUTE**, then **vkCmdUpdatePipelineIndirectBufferNV must** have been called on that pipeline to save its metadata to a device address

- **VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-09087**
If `pipelineBindPoint` is of type `VK_PIPELINE_BIND_POINT_COMPUTE`, and if `VK间接命令令牌类型_pipeline_NV` is used, then `pipeline` must be `VK_NULL_HANDLE`.

- **VUID-VkGeneratedCommandsInfoNV-sequencesCount-02917**
  sequencesCount must be less or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount` and `VkGeneratedCommandsMemoryRequirementsInfoNV::maxSequencesCount` that was used to determine the `preprocessSize`.

- **VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-02918**
  preprocessBuffer must have the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set in its usage flag.

- **VUID-VkGeneratedCommandsInfoNV-preprocessOffset-02919**
  preprocessOffset must be aligned to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment`.

- **VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-02971**
  If preprocessBuffer is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkGeneratedCommandsInfoNV-preprocessSize-02920**
  preprocessSize must be at least equal to the memory requirement’s size returned by `vkGetGeneratedCommandsMemoryRequirementsNV` using the matching inputs (indirectCommandsLayout, ...) as within this structure.

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02921**
  sequencesCountBuffer can be set if the actual used count of sequences is sourced from the provided buffer. In that case the sequencesCount serves as upper bound.

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02922**
  If sequencesCountBuffer is not `VK_NULL_HANDLE`, its usage flag must have the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02923**
  If sequencesCountBuffer is not `VK_NULL_HANDLE`, sequencesCountOffset must be aligned to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minSequencesCountBufferOffsetAlignment`.

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02972**
  If sequencesCountBuffer is not `VK_NULL_HANDLE` and is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02924**
  If indirectCommandsLayout’s `VK间接命令布局使用的间接序列模式_INDEXEDSEQUENCES_BIT_NV` is set, sequencesIndexBuffer must be set otherwise it must be `VK_NULL_HANDLE`.

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02925**
  If sequencesIndexBuffer is not `VK_NULL_HANDLE`, its usage flag must have the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02926**
  If sequencesIndexBuffer is not `VK_NULL_HANDLE`, sequencesIndexOffset must be aligned.
Valid Usage (Implicit)

- VUID-VkGeneratedCommandsInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_GENERATED_COMMANDS_INFO_NV

- VUID-VkGeneratedCommandsInfoNV-pNext-pNext
  pNext must be NULL

- VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-VkGeneratedCommandsInfoNV-pipeline-parameter
  If pipeline is not VK_NULL_HANDLE, pipeline must be a valid VkPipeline handle

- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-parameter
  indirectCommandsLayout must be a valid VkIndirectCommandsLayoutNV handle

- VUID-VkGeneratedCommandsInfoNV-pStreams-parameter
  pStreams must be a valid pointer to an array of streamCount valid VkIndirectCommandsStreamNV structures

- VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-parameter
  preprocessBuffer must be a valid VkBuffer handle

- VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-parameter
  If sequencesCountBuffer is not VK_NULL_HANDLE, sequencesCountBuffer must be a valid VkBuffer handle

- VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-parameter
  If sequencesIndexBuffer is not VK_NULL_HANDLE, sequencesIndexBuffer must be a valid VkBuffer handle

- VUID-VkGeneratedCommandsInfoNV-streamCount-arraylength
  streamCount must be greater than 0

- VUID-VkGeneratedCommandsInfoNV-commonparent
  Each of indirectCommandsLayout, pipeline, preprocessBuffer, sequencesCountBuffer, and sequencesIndexBuffer that are valid handles of non-ignored parameters must have been
Referencing the functions defined in Indirect Commands Layout, `vkCmdExecuteGeneratedCommandsNV` behaves as:

```c
uint32_t sequencesCount = sequencesCountBuffer ??
min(maxSequencesCount, sequencesCountBuffer.load_uint32(sequencesCountOffset)) :
maxSequencesCount;

cmdProcessAllSequences(commandBuffer, pipeline,
indirectCommandsLayout, pIndirectCommandsStreams,
sequencesCount,
sequencesIndexBuffer, sequencesIndexOffset);
```

// The stateful commands within indirectCommandsLayout will not
// affect the state of subsequent commands in the target
// command buffer (cmd)

**Note**

It is important to note that the values of all state related to the `pipelineBindPoint` used are undefined after this command.

Commands can be preprocessed prior execution using the following command:

```c
// Provided by VK_NV_device_generated_commands
void vkCmdPreprocessGeneratedCommandsNV(
  VkCommandBuffer commandBuffer,
  const VkGeneratedCommandsInfoNV* pGeneratedCommandsInfo);
```

- **commandBuffer** is the command buffer which does the preprocessing.
- **pGeneratedCommandsInfo** is a pointer to a `VkGeneratedCommandsInfoNV` structure containing parameters affecting the preprocessing step.

**Valid Usage**

- **VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-02974**
  `commandBuffer` must not be a protected command buffer

- **VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-02927**
  `pGeneratedCommandsInfo`'s `indirectCommandsLayout` must have been created with the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV` bit set

- **VUID-vkCmdPreprocessGeneratedCommandsNV-deviceGeneratedCommands-02928**
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled
Valid Usage (Implicit)

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-parameter
  pGeneratedCommandsInfo must be a valid pointer to a valid VkGeneratedCommandsInfoNV structure

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdPreprocessGeneratedCommandsNV-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdPreprocessGeneratedCommandsNV-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The bound descriptor sets and push constants that will be used with indirect command generation for the compute pipelines must already be specified at the time of preprocessing commands with vkCmdPreprocessGeneratedCommandsNV. They must not change until the execution of indirect commands is submitted with vkCmdExecuteGeneratedCommandsNV.

If push constants for the compute pipeline are also specified in the VkGeneratedCommandsInfoNV::indirectCommandsLayout with VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV token, then those values override the push constants that were previously pushed for the compute pipeline.
Chapter 33. Sparse Resources

As documented in Resource Memory Association, VkBuffer and VkImage resources in Vulkan must be bound completely and contiguously to a single VkDeviceMemory object. This binding must be done before the resource is used, and the binding is immutable for the lifetime of the resource.

Sparse resources relax these restrictions and provide these additional features:

- Sparse resources can be bound non-contiguously to one or more VkDeviceMemory allocations.
- Sparse resources can be re-bound to different memory allocations over the lifetime of the resource.
- Sparse resources can have descriptors generated and used orthogonally with memory binding commands.

33.1. Sparse Resource Features

Sparse resources have several features that must be enabled explicitly at resource creation time. The features are enabled by including bits in the flags parameter of VkImageCreateInfo or VkBufferCreateInfo. Each feature also has one or more corresponding feature enables specified in VkPhysicalDeviceFeatures.

- The sparseBinding feature is the base, and provides the following capabilities:
  - Resources can be bound at some defined (sparse block) granularity.
  - The entire resource must be bound to memory before use regardless of regions actually accessed.
  - No specific mapping of image region to memory offset is defined, i.e. the location that each texel corresponds to in memory is implementation-dependent.
  - Sparse buffers have a well-defined mapping of buffer range to memory range, where an offset into a range of the buffer that is bound to a single contiguous range of memory corresponds to an identical offset within that range of memory.
  - Requested via the VK_IMAGE_CREATE_SPARSE_BINDING_BIT and VK_BUFFER_CREATE_SPARSE_BINDING_BIT bits.
  - A sparse image created using VK_IMAGE_CREATE_SPARSE_BINDING_BIT (but not VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT) supports all formats that non-sparse usage supports, and supports both VK_IMAGE_TILING_OPTIMAL and VK_IMAGE_TILING_LINEAR tiling.

- Sparse Residency builds on (and requires) the sparseBinding feature. It includes the following capabilities:
  - Resources do not have to be completely bound to memory before use on the device.
  - Images have a prescribed sparse image block layout, allowing specific rectangular regions of the image to be bound to specific offsets in memory allocations.
  - Consistency of access to unbound regions of the resource is defined by the absence or presence of VkPhysicalDeviceSparseProperties::residencyNon ResidentStrict. If this property is present, accesses to unbound regions of the resource are well defined and behave as if the
data bound is populated with all zeros; writes are discarded. When this property is absent, accesses are considered safe, but reads will return undefined values.

- Requested via the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` and `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bits.

- Sparse residency support is advertised on a finer grain via the following features:
  - The `sparseResidencyBuffer` feature provides support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidencyImage2D` feature provides support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidencyImage3D` feature provides support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency2Samples` feature provides support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency4Samples` feature provides support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency8Samples` feature provides support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency16Samples` feature provides support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

Implementations supporting `sparseResidencyImage2D` are only required to support sparse 2D, single-sampled images. Support for sparse 3D and MSAA images is optional and can be enabled via `sparseResidencyImage3D`, `sparseResidency2Samples`, `sparseResidency4Samples`, `sparseResidency8Samples`, and `sparseResidency16Samples`.

- A sparse image created using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` supports all non-compressed color formats with power-of-two element size that non-sparse usage supports. Additional formats may also be supported and can be queried via `vkGetPhysicalDeviceSparseImageFormatProperties`. `VK_IMAGE_TILING_LINEAR` tiling is not supported.

- The `sparseResidencyAliased` feature provides the following capability that can be enabled per resource:

  Allows physical memory ranges to be shared between multiple locations in the same sparse resource or between multiple sparse resources, with each binding of a memory location observing a consistent interpretation of the memory contents.

  See Sparse Memory Aliasing for more information.

### 33.2. Sparse Buffers and Fully-Resident Images

Both `VkBuffer` and `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` or `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bits can be thought of as a linear region of address space. In the `VkImage` case if `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` is not used, this linear region is entirely
opaque, meaning that there is no application-visible mapping between texel location and memory offset.

Unless VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT or VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT are also used, the entire resource must be bound to one or more VkDeviceMemory objects before use.

33.2.1. Sparse Buffer and Fully-Resident Image Block Size

The sparse block size in bytes for sparse buffers and fully-resident images is reported as VkMemoryRequirements::alignment. alignment represents both the memory alignment requirement and the binding granularity (in bytes) for sparse resources.

33.3. Sparse Partially-Resident Buffers

VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT bit allow the buffer to be made only partially resident. Partially resident VkBuffer objects are allocated and bound identically to VkBuffer objects using only the VK_BUFFER_CREATE_SPARSE_BINDING_BIT feature. The only difference is the ability for some regions of the buffer to be unbound during device use.

33.4. Sparse Partially-Resident Images

VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT bit allow specific rectangular regions of the image called sparse image blocks to be bound to specific ranges of memory. This allows the application to manage residency at either image subresource or sparse image block granularity. Each image subresource (outside of the mip tail) starts on a sparse block boundary and has dimensions that are integer multiples of the corresponding dimensions of the sparse image block.

Note

Applications can use these types of images to control LOD based on total memory consumption. If memory pressure becomes an issue the application can unbind and disable specific mipmap levels of images without having to recreate resources or modify texel data of unaffected levels.

The application can also use this functionality to access subregions of the image in a “megatexture” fashion. The application can create a large image and only populate the region of the image that is currently being used in the scene.

33.4.1. Accessing Unbound Regions

The following member of VkPhysicalDeviceSparseProperties affects how data in unbound regions of sparse resources are handled by the implementation:

- residencyNonResidentStrict

If this property is not present, reads of unbound regions of the image will return undefined values. Both reads and writes are still considered safe and will not affect other resources or populated regions of the image.
If this property is present, all reads of unbound regions of the image will behave as if the region was bound to memory populated with all zeros; writes will be discarded.

**Image operations** performed on unbound memory may still alter some component values in the natural way for those accesses, e.g. substituting a value of one for alpha in formats that do not have an alpha component.

Example: Reading the alpha component of an unbacked **VK_FORMAT_R8_UNORM** image will return a value of 1.0f.

See **Physical Device Enumeration** for instructions for retrieving physical device properties.

### Implementor’s Note

For implementations that cannot natively handle access to unbound regions of a resource, the implementation may allocate and bind memory to the unbound regions. Reads and writes to unbound regions will access the implementation-managed memory instead.

Given that the values resulting from reads of unbound regions are undefined in this scenario, implementations may use the same physical memory for all unbound regions of multiple resources within the same process.

### 33.4.2. Mip Tail Regions

Sparse images created using **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** (without also using **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT**) have no specific mapping of image region or image subresource to memory offset defined, so the entire image can be thought of as a linear opaque address region. However, images created with **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** do have a prescribed sparse image block layout, and hence each image subresource must start on a sparse block boundary. Within each array layer, the set of mip levels that have a smaller size than the sparse block size in bytes are grouped together into a mip tail region.

If the **VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT** flag is present in the flags member of VkSparseImageFormatProperties, for the image’s format, then any mip level which has dimensions that are not integer multiples of the corresponding dimensions of the sparse image block, and all subsequent mip levels, are also included in the mip tail region.

The following member of VkPhysicalDeviceSparseProperties may affect how the implementation places mip levels in the mip tail region:

- residencyAlignedMipSize

Each mip tail region is bound to memory as an opaque region (i.e. must be bound using a VkSparseImageOpaqueMemoryBindInfo structure) and may be of a size greater than or equal to the sparse block size in bytes. This size is guaranteed to be an integer multiple of the sparse block size in bytes.
An implementation may choose to allow each array-layer's mip tail region to be bound to memory independently or require that all array-layer's mip tail regions be treated as one. This is dictated by VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT in VkSparseImageMemoryRequirements::flags.

The following diagrams depict how VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT and VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT alter memory usage and requirements.

![Diagram of sparse image layers](image.png)

Figure 22. Sparse Image

In the absence of VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT and VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT, each array layer contains a mip tail region containing texel data for all mip levels smaller than the sparse image block in any dimension.

Mip levels that are as large or larger than a sparse image block in all dimensions can be bound individually. Right-edges and bottom-edges of each level are allowed to have partially used sparse blocks. Any bound partially-used-sparse-blocks must still have their full sparse block size in bytes allocated in memory.
When `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` is present all array layers will share a single mip tail region.

![Sparse Image with Single Mip Tail](image1)

> Figure 23. Sparse Image with Single Mip Tail

![Sparse Image with Aligned Mip Size](image2)

> Figure 24. Sparse Image with Aligned Mip Size
The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` is present the first mip level that would contain partially used sparse blocks begins the mip tail region. This level and all subsequent levels are placed in the mip tail. Only the first \( N \) mip levels whose dimensions are an exact multiple of the sparse image block dimensions can be bound and unbound on a sparse block basis.

![Figure 25. Sparse Image with Aligned Mip Size and Single Mip Tail](image)

### 33.4.3. Standard Sparse Image Block Shapes

Standard sparse image block shapes define a standard set of dimensions for sparse image blocks that depend on the format of the image. Layout of texels or compressed texel blocks within a sparse image block is implementation-dependent. All currently defined standard sparse image block shapes are 64 KB in size.

For block-compressed formats (e.g. `VK_FORMAT_BC5_UNORM_BLOCK`), the texel size is the size of the compressed texel block (e.g. 128-bit for BC5) thus the dimensions of the standard sparse image block
shapes apply in terms of compressed texel blocks.

Note

For block-compressed formats, the dimensions of a sparse image block in terms of texels can be calculated by multiplying the sparse image block dimensions by the compressed texel block dimensions.
Table 47. Standard Sparse Image Block Shapes (Single Sample)

<td>64 × 64 × 1</td>
<td>32 × 64 × 1</td>
<td>32 × 32 × 1</td>
</tr>
<tr>
<td>64-Bit</td>
<td>64 × 64 × 1</td>
<td>64 × 32 × 1</td>
<td>32 × 32 × 1</td>
<td>32 × 16 × 1</td>
</tr>
<tr>
<td>128-Bit</td>
<td>32 × 64 × 1</td>
<td>32 × 32 × 1</td>
<td>16 × 32 × 1</td>
<td>16 × 16 × 1</td>
</tr>
</tbody>
</table>

Implementations that support the standard sparse image block shape for all formats listed in the Standard Sparse Image Block Shapes (Single Sample) and Standard Sparse Image Block Shapes (MSAA) tables may advertise the following VkPhysicalDeviceSparseProperties:

- residencyStandard2DBlockShape
- residencyStandard2DMultisampleBlockShape
- residencyStandard3DBlockShape

Reporting each of these features does *not* imply that all possible image types are supported as sparse. Instead, this indicates that no supported sparse image of the corresponding type will use custom sparse image block dimensions for any formats that have a corresponding standard sparse image block shape.

### 33.4.4. Custom Sparse Image Block Shapes

An implementation that does not support a standard image block shape for a particular sparse partially-resident image may choose to support a custom sparse image block shape for it instead. The dimensions of such a custom sparse image block shape are reported in VkSparseImageFormatProperties::imageGranularity. As with standard sparse image block shapes, the size in bytes of the custom sparse image block shape will be reported in VkMemoryRequirements::alignment.

Custom sparse image block dimensions are reported through vkGetPhysicalDeviceSparseImageFormatProperties and vkGetImageSparseMemoryRequirements.

An implementation must not support both the standard sparse image block shape and a custom
sparse image block shape for the same image. The standard sparse image block shape must be used if it is supported.

### 33.4.5. Multiple Aspects

Partially resident images are allowed to report separate sparse properties for different aspects of the image. One example is for depth/stencil images where the implementation separates the depth and stencil data into separate planes. Another reason for multiple aspects is to allow the application to manage memory allocation for implementation-private metadata associated with the image. See the figure below:

![Multiple Aspect Sparse Image](image)

*Figure 26. Multiple Aspect Sparse Image*

**Note**

The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

In the figure above the depth, stencil, and metadata aspects all have unique sparse properties. The
per-texel stencil data is $\frac{1}{4}$ the size of the depth data, hence the stencil sparse blocks include $4 \times$ the number of texels. The sparse block size in bytes for all of the aspects is identical and defined by `VkMemoryRequirements::alignment`.

**Metadata**

The metadata aspect of an image has the following constraints:

- All metadata is reported in the mip tail region of the metadata aspect.
- All metadata **must** be bound prior to device use of the sparse image.

### 33.5. Sparse Memory Aliasing

By default sparse resources have the same aliasing rules as non-sparse resources. See [Memory Aliasing](#) for more information.

`VkDevice` objects that have the `sparseResidencyAliased` feature enabled are able to use the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flags for resource creation. These flags allow resources to access physical memory bound into multiple locations within one or more sparse resources in a *data consistent* fashion. This means that reading physical memory from multiple aliased locations will return the same value.

Care **must** be taken when performing a write operation to aliased physical memory. Memory dependencies **must** be used to separate writes to one alias from reads or writes to another alias. Writes to aliased memory that are not properly guarded against accesses to different aliases will have undefined results for all accesses to the aliased memory.

Applications that wish to make use of data consistent sparse memory aliasing **must** abide by the following guidelines:

- All sparse resources that are bound to aliased physical memory **must** be created with the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` / `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flag.
- All resources that access aliased physical memory **must** interpret the memory in the same way. This implies the following:
  - Buffers and images **cannot** alias the same physical memory in a data consistent fashion. The physical memory ranges **must** be used exclusively by buffers or used exclusively by images for data consistency to be guaranteed.
  - Memory in sparse image mip tail regions **cannot** access aliased memory in a data consistent fashion.
  - Sparse images that alias the same physical memory **must** have compatible formats and be using the same sparse image block shape in order to access aliased memory in a data consistent fashion.

Failure to follow any of the above guidelines will require the application to abide by the normal, non-sparse resource aliasing rules. In this case memory **cannot** be accessed in a data consistent fashion.
Note

Enabling sparse resource memory aliasing can be a way to lower physical memory use, but it may reduce performance on some implementations. An application developer can test on their target HW and balance the memory / performance trade-offs measured.

33.6. Sparse Resource Implementation Guidelines (Informative)

This section is Informative. It is included to aid in implementors’ understanding of sparse resources.

Device Virtual Address

The basic sparseBinding feature allows the resource to reserve its own device virtual address range at resource creation time rather than relying on a bind operation to set this. Without any other creation flags, no other constraints are relaxed compared to normal resources. All pages must be bound to physical memory before the device accesses the resource.

The sparseResidency features allow sparse resources to be used even when not all pages are bound to memory. Implementations that support access to unbound pages without causing a fault may support residencyNonResidentStrict.

Not faulting on access to unbound pages is not enough to support residencyNonResidentStrict. An implementation must also guarantee that reads after writes to unbound regions of the resource always return data for the read as if the memory contains zeros. Depending on any caching hierarchy of the implementation this may not always be possible.

Any implementation that does not fault, but does not guarantee correct read values must not support residencyNonResidentStrict.

Any implementation that cannot access unbound pages without causing a fault will require the implementation to bind the entire device virtual address range to physical memory. Any pages that the application does not bind to memory may be bound to one (or more) "placeholder" physical page(s) allocated by the implementation. Given the following properties:

• A process must not access memory from another process
• Reads return undefined values

It is sufficient for each host process to allocate these placeholder pages and use them for all resources in that process. Implementations may allocate more often (per instance, per device, or per resource).

Binding Memory

The byte size reported in VkMemoryRequirements::size must be greater than or equal to the amount of physical memory required to fully populate the resource. Some implementations
require “holes” in the device virtual address range that are never accessed. These holes may be included in the size reported for the resource.

Including or not including the device virtual address holes in the resource size will alter how the implementation provides support for VkSparseImageOpaqueMemoryBindInfo. This operation must be supported for all sparse images, even ones created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.

- If the holes are included in the size, this bind function becomes very easy. In most cases the resourceOffset is simply a device virtual address offset and the implementation can easily determine what device virtual address to bind. The cost is that the application may allocate more physical memory for the resource than it needs.

- If the holes are not included in the size, the application can allocate less physical memory than otherwise for the resource. However, in this case the implementation must account for the holes when mapping resourceOffset to the actual device virtual address intended to be mapped.

**Note**

If the application always uses VkSparseImageMemoryBindInfo to bind memory for the non-tail mip levels, any holes that are present in the resource size may never be bound.

Since VkSparseImageMemoryBindInfo uses texel locations to determine which device virtual addresses to bind, it is impossible to bind device virtual address holes with this operation.

**Binding Metadata Memory**

All metadata for sparse images have their own sparse properties and are embedded in the mip tail region for said properties. See the Multiaspect section for details.

Given that metadata is in a mip tail region, and the mip tail region must be reported as contiguous (either globally or per-array-layer), some implementations will have to resort to complicated offset → device virtual address mapping for handling VkSparseImageOpaqueMemoryBindInfo.

To make this easier on the implementation, the VK_SPARSE_MEMORY_BIND_METADATA_BIT explicitly specifies when metadata is bound with VkSparseImageOpaqueMemoryBindInfo. When this flag is not present, the resourceOffset may be treated as a strict device virtual address offset.

When VK_SPARSE_MEMORY_BIND_METADATA_BIT is present, the resourceOffset must have been derived explicitly from the imageMipTailOffset in the sparse resource properties returned for the metadata aspect. By manipulating the value returned for imageMipTailOffset, the resourceOffset does not have to correlate directly to a device virtual address offset, and may instead be whatever value makes it easiest for the implementation to derive the correct device virtual address.
33.7. Sparse Resource API

The APIs related to sparse resources are grouped into the following categories:

- Physical Device Features
- Physical Device Sparse Properties
- Sparse Image Format Properties
- Sparse Resource Creation
- Sparse Resource Memory Requirements
- Binding Resource Memory

33.7.1. Physical Device Features

Some sparse-resource related features are reported and enabled in VkPhysicalDeviceFeatures. These features must be supported and enabled on the VkDevice object before applications can use them. See Physical Device Features for information on how to get and set enabled device features, and for more detailed explanations of these features.

Sparse Physical Device Features

- **sparseBinding**: Support for creating VkBuffer and VkImage objects with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT and VK_IMAGE_CREATE_SPARSE_BINDING_BIT flags, respectively.
- **sparseResidencyBuffer**: Support for creating VkBuffer objects with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag.
- **sparseResidencyImage2D**: Support for creating 2D single-sampled VkImage objects with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidencyImage3D**: Support for creating 3D VkImage objects with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency2Samples**: Support for creating 2D VkImage objects with 2 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency4Samples**: Support for creating 2D VkImage objects with 4 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency8Samples**: Support for creating 2D VkImage objects with 8 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency16Samples**: Support for creating 2D VkImage objects with 16 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidencyAliased**: Support for creating VkBuffer and VkImage objects with the VK_BUFFER_CREATE_SPARSE_ALIASED_BIT and VK_IMAGE_CREATE_SPARSE_ALIASED_BIT flags, respectively.

33.7.2. Physical Device Sparse Properties

Some features of the implementation are not possible to disable, and are reported to allow applications to alter their sparse resource usage accordingly. These read-only capabilities are
reported in the `VkPhysicalDeviceProperties::sparseProperties` member, which is a `VkPhysicalDeviceSparseProperties` structure.

The `VkPhysicalDeviceSparseProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceSparseProperties {
    VkBool32 residencyStandard2DBlockShape;
    VkBool32 residencyStandard2DMultisampleBlockShape;
    VkBool32 residencyStandard3DBlockShape;
    VkBool32 residencyAlignedMipSize;
    VkBool32 residencyNonResidentStrict;
} VkPhysicalDeviceSparseProperties;
```

- **residencyStandard2DBlockShape** is `VK_TRUE` if the physical device will access all single-sample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for single-sample 2D images is not required to match the standard sparse image block dimensions listed in the table.

- **residencyStandard2DMultisampleBlockShape** is `VK_TRUE` if the physical device will access all multisample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (MSAA) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for multisample 2D images is not required to match the standard sparse image block dimensions listed in the table.

- **residencyStandard3DBlockShape** is `VK_TRUE` if the physical device will access all 3D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for 3D images is not required to match the standard sparse image block dimensions listed in the table.

- **residencyAlignedMipSize** is `VK_TRUE` if images with mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block may be placed in the mip tail. If this property is not reported, only mip levels with dimensions smaller than the `imageGranularity` member of the `VkSparseImageFormatProperties` structure will be placed in the mip tail. If this property is reported the implementation is allowed to return `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` in the `flags` member of `VkSparseImageFormatProperties`, indicating that mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block will be placed in the mip tail.

- **residencyNonResidentStrict** specifies whether the physical device can consistently access non-resident regions of a resource. If this property is `VK_TRUE`, access to non-resident regions of resources will be guaranteed to return values as if the resource was populated with 0; writes to non-resident regions will be discarded.
33.7.3. Sparse Image Format Properties

Given that certain aspects of sparse image support, including the sparse image block dimensions, may be implementation-dependent, `vkGetPhysicalDeviceSparseImageFormatProperties` can be used to query for sparse image format properties prior to resource creation. This command is used to check whether a given set of sparse image parameters is supported and what the sparse image block shape will be.

Sparse Image Format Properties API

The `VkSparseImageFormatProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageFormatProperties {
    VkImageAspectFlags aspectMask;
    VkExtent3D imageGranularity;
    VkSparseImageFormatFlags flags;
} VkSparseImageFormatProperties;
```

- `aspectMask` is a bitmask `VkImageAspectFlagBits` specifying which aspects of the image the properties apply to.
- `imageGranularity` is the width, height, and depth of the sparse image block in texels or compressed texel blocks.
- `flags` is a bitmask of `VkSparseImageFormatFlagBits` specifying additional information about the sparse resource.

Bits which may be set in `VkSparseImageFormatProperties::flags`, specifying additional information about the sparse resource, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSparseImageFormatFlagBits {
    VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT = 0x00000001,
    VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT = 0x00000002,
    VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT = 0x00000004,
} VkSparseImageFormatFlagBits;
```

- `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` specifies that the image uses a single mip tail region for all array layers.
- `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` specifies that the first mip level whose dimensions are not integer multiples of the corresponding dimensions of the sparse image block begins the mip tail region.
- `VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT` specifies that the image uses non-standard sparse image block dimensions, and the `imageGranularity` values do not match the standard sparse image block dimensions for the given format.
VkSparseImageFormatFlags is a bitmask type for setting a mask of zero or more VkSparseImageFormatFlagBits.

vkGetPhysicalDeviceSparseImageFormatProperties returns an array of VkSparseImageFormatProperties. Each element describes properties for one set of image aspects that are bound simultaneously for a VkImage created with the provided image creation parameters. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.

```c
void vkGetPhysicalDeviceSparseImageFormatProperties(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkImageType type,
    VkSampleCountFlagBits samples,
    VkImageUsageFlags usage,
    VkImageTiling tiling,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties* pProperties);
```

- `physicalDevice` is the physical device from which to query the sparse image format properties.
- `format` is the image format.
- `type` is the dimensionality of the image.
- `samples` is a VkSampleCountFlagBits value specifying the number of samples per texel.
- `usage` is a bitmask describing the intended usage of the image.
- `tiling` is the tiling arrangement of the texel blocks in memory.
- `pPropertyCount` is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- `pProperties` is either NULL or a pointer to an array of VkSparseImageFormatProperties structures.

If `pProperties` is NULL, then the number of sparse format properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of sparse format properties available, at most `pPropertyCount` structures will be written.

If VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT is not supported for the given arguments, `pPropertyCount` will be set to zero upon return, and no data will be written to `pProperties`.

Multiple aspects are returned for depth/stencil images that are implemented as separate planes by the implementation. The depth and stencil data planes each have unique
Depth/stencil images with depth and stencil data interleaved into a single plane will return a single `VkSparseImageFormatProperties` structure with the `aspectMask` set to `VK_IMAGE_ASPECT_DEPTH_BIT | VK_IMAGE_ASPECT_STENCIL_BIT`.

**Valid Usage**

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-01094
  * samples **must** be a valid `VkSampleCountFlagBits` value that is set in `VkImageFormatProperties::sampleCounts` returned by `vkGetPhysicalDeviceImageFormatProperties` with `format`, `type`, `tiling`, and `usage` equal to those in this command

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-physicalDevice-parameter
  * physicalDevice **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-format-parameter
  * format **must** be a valid `VkFormat` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-type-parameter
  * type **must** be a valid `VkImageType` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-parameter
  * samples **must** be a valid `VkSampleCountFlagBits` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-parameter
  * usage **must** be a valid combination of `VkImageUsageFlagBits` values
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-requiredbitset
  * usage **must** not be 0
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-tiling-parameter
  * tiling **must** be a valid `VkImageTiling` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pPropertyCount-parameter
  * pPropertyCount **must** be a valid pointer to a `uint32_t` value
  * If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` **must** be a valid pointer to an array of `VkSparseImageFormatProperties` structures

`vkGetPhysicalDeviceSparseImageFormatProperties2` returns an array of `VkSparseImageFormatProperties2`. Each element describes properties for one set of image aspects that are bound simultaneously for a `VkImage` created with the provided image creation parameters. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceSparseImageFormatProperties2(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties2* pProperties);

or the equivalent command

// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceSparseImageFormatProperties2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties2* pProperties);

• physicalDevice is the physical device from which to query the sparse image format properties.

• pFormatInfo is a pointer to a VkPhysicalDeviceSparseImageFormatInfo2 structure containing input parameters to the command.

• pPropertyCount is a pointer to an integer related to the number of sparse format properties available or queried, as described below.

• pProperties is either NULL or a pointer to an array of VkSparseImageFormatProperties2 structures.

vkGetPhysicalDeviceSparseImageFormatProperties2 behaves identically to vkGetPhysicalDeviceSparseImageFormatProperties, with the ability to return extended information by adding extending structures to the pNext chain of its pProperties parameter.

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pFormatInfo-parameter pFormatInfo must be a valid pointer to a valid VkPhysicalDeviceSparseImageFormatInfo2 structure

• VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value

• VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pProperties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkSparseImageFormatProperties2 structures

The VkPhysicalDeviceSparseImageFormatInfo2 structure is defined as:
typedef struct VkPhysicalDeviceSparseImageFormatInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
    VkImageType type;
    VkSampleCountFlagBits samples;
    VkImageUsageFlags usage;
    VkImageTiling tiling;
} VkPhysicalDeviceSparseImageFormatInfo2;

or the equivalent

typedef VkPhysicalDeviceSparseImageFormatInfo2 VkPhysicalDeviceSparseImageFormatInfo2KHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **format** is the image format.
- **type** is the dimensionality of the image.
- **samples** is a VkSampleCountFlagBits value specifying the number of samples per texel.
- **usage** is a bitmask describing the intended usage of the image.
- **tiling** is the tiling arrangement of the texel blocks in memory.

### Valid Usage

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-01095

  samples must be a valid VkSampleCountFlagBits value that is set in VkImageFormatProperties::sampleCounts returned by vkGetPhysicalDeviceImageFormatProperties with format, type, tiling, and usage equal to those in this command

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-sType-sType

  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SPARSE_IMAGE_FORMAT_INFO_2

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-pNext-pNext

  pNext must be NULL

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-format-parameter

  format must be a valid VkFormat value

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-type-parameter

  type must be a valid VkImageType value
**33.7.4. Sparse Resource Creation**

Sparse resources require that one or more sparse feature flags be specified (as part of the `VkPhysicalDeviceFeatures` structure described previously in the Physical Device Features section) when calling `vkCreateDevice`. When the appropriate device features are enabled, the `VK_BUFFER_CREATE_SPARSE_*` and `VK_IMAGE_CREATE_SPARSE_*` flags can be used. See `vkCreateBuffer` and
vkCreateImage for details of the resource creation APIs.

Note
Specifying VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT or VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT requires specifying VK_BUFFER_CREATE_SPARSE_BINDING_BIT or VK_IMAGE_CREATE_SPARSE_BINDING_BIT, respectively, as well. This means that resources must be created with the appropriate *_SPARSE_BINDING_BIT to be used with the sparse binding command (vkQueueBindSparse).

33.7.5. Sparse Resource Memory Requirements

Sparse resources have specific memory requirements related to binding sparse memory. These memory requirements are reported differently for VkBuffer objects and VkImage objects.

Buffer and Fully-Resident Images

Buffers (both fully and partially resident) and fully-resident images can be bound to memory using only the data from VkMemoryRequirements. For all sparse resources the VkMemoryRequirements::alignment member specifies both the binding granularity in bytes and the required alignment of VkDeviceMemory.

Partially Resident Images

Partially resident images have a different method for binding memory. As with buffers and fully resident images, the VkMemoryRequirements::alignment field specifies the binding granularity in bytes for the image.

Requesting sparse memory requirements for VkImage objects using vkGetImageSparseMemoryRequirements will return an array of one or more VkSparseImageMemoryRequirements structures. Each structure describes the sparse memory requirements for a group of aspects of the image.

The sparse image must have been created using the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag to retrieve valid sparse image memory requirements.

Sparse Image Memory Requirements

The VkSparseImageMemoryRequirements structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryRequirements {
    VkSparseImageFormatProperties formatProperties;
    uint32_t imageMipTailFirstLod;
    VkDeviceSize imageMipTailSize;
    VkDeviceSize imageMipTailOffset;
    VkDeviceSize imageMipTailStride;
} VkSparseImageMemoryRequirements;
```
• **formatProperties** is a **VkSparseImageFormatProperties** structure specifying properties of the image format.

• **imageMipTailFirstLod** is the first mip level at which image subresources are included in the mip tail region.

• **imageMipTailSize** is the memory size (in bytes) of the mip tail region. If **formatProperties.flags** contains **VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT**, this is the size of the whole mip tail, otherwise this is the size of the mip tail of a single array layer. This value is guaranteed to be a multiple of the sparse block size in bytes.

• **imageMipTailOffset** is the opaque memory offset used with **VkSparseImageOpaqueMemoryBindInfo** to bind the mip tail region(s).

• **imageMipTailStride** is the offset stride between each array-layer’s mip tail, if **formatProperties.flags** does not contain **VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT** (otherwise the value is undefined).

To query sparse memory requirements for an image, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageSparseMemoryRequirements(
    VkDevice device,
    VkImage image,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements* pSparseMemoryRequirements);
```

• **device** is the logical device that owns the image.

• **image** is the **VkImage** object to get the memory requirements for.

• **pSparseMemoryRequirementCount** is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.

• **pSparseMemoryRequirements** is either **NULL** or a pointer to an array of **VkSparseImageMemoryRequirements** structures.

If **pSparseMemoryRequirements** is NULL, then the number of sparse memory requirements available is returned in **pSparseMemoryRequirementCount**. Otherwise, **pSparseMemoryRequirementCount** must point to a variable set by the user to the number of elements in the **pSparseMemoryRequirements** array, and on return the variable is overwritten with the number of structures actually written to **pSparseMemoryRequirements**. If **pSparseMemoryRequirementCount** is less than the number of sparse memory requirements available, at most **pSparseMemoryRequirementCount** structures will be written.

If the image was not created with **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** then **pSparseMemoryRequirementCount** will be set to zero and **pSparseMemoryRequirements** will not be written to.

**Note**

It is legal for an implementation to report a larger value in **VkMemoryRequirements::size** than would be obtained by adding together memory sizes for all **VkSparseImageMemoryRequirements** returned by **vkGetImageSparseMemoryRequirements**.
This may occur when the implementation requires unused padding in the address range describing the resource.

**Valid Usage (Implicit)**

- VUID-vkGetImageSparseMemoryRequirements-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetImageSparseMemoryRequirements-image-parameter
  image must be a valid VkImage handle

- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter
  pSparseMemoryRequirementCount must be a valid pointer to a uint32_t value

- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter
  If the value referenced by pSparseMemoryRequirementCount is not 0, and pSparseMemoryRequirements is not NULL, pSparseMemoryRequirements must be a valid pointer to an array of pSparseMemoryRequirementCount VkSparseImageMemoryRequirements structures

- VUID-vkGetImageSparseMemoryRequirements-image-parent
  image must have been created, allocated, or retrieved from device

To query sparse memory requirements for an image, call:

```c
void vkGetImageSparseMemoryRequirements2(
    VkDevice device, 
    const VkImageSparseMemoryRequirementsInfo2* pInfo, 
    uint32_t* pSparseMemoryRequirementCount, 
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

or the equivalent command

```c
void vkGetImageSparseMemoryRequirements2KHR(
    VkDevice device, 
    const VkImageSparseMemoryRequirementsInfo2* pInfo, 
    uint32_t* pSparseMemoryRequirementCount, 
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- device is the logical device that owns the image.
- pInfo is a pointer to a VkImageSparseMemoryRequirementsInfo2 structure containing parameters required for the memory requirements query.
- pSparseMemoryRequirementCount is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
• `pSparseMemoryRequirements` is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements2` structures.

---

### Valid Usage (Implicit)

- VUID-vkGetImageSparseMemoryRequirements2-device-parameter
  - `device` must be a valid `VkDevice` handle

- VUID-vkGetImageSparseMemoryRequirements2-pInfo-parameter
  - `pInfo` must be a valid pointer to a valid `VkImageSparseMemoryRequirementsInfo2` structure

- VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirementCount-parameter
  - `pSparseMemoryRequirementCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirements-parameter
  - If the value referenced by `pSparseMemoryRequirementCount` is not 0, and `pSparseMemoryRequirements` is not `NULL`, `pSparseMemoryRequirements` must be a valid pointer to an array of `pSparseMemoryRequirementCount` `VkSparseImageMemoryRequirements2` structures

To determine the sparse memory requirements for an image resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceImageSparseMemoryRequirements(
  VkDevice device,
  const VkDeviceImageMemoryRequirements* pInfo,
  uint32_t* pSparseMemoryRequirementCount,
  VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceImageSparseMemoryRequirementsKHR(
  VkDevice device,
  const VkDeviceImageMemoryRequirements* pInfo,
  uint32_t* pSparseMemoryRequirementCount,
  VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

• `device` is the logical device intended to own the image.

• `pInfo` is a pointer to a `VkDeviceImageMemoryRequirements` structure containing parameters required for the memory requirements query.

• `pSparseMemoryRequirementCount` is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
• pSparseMemoryRequirements is either NULL or a pointer to an array of VkSparseImageMemoryRequirements2 structures.

Valid Usage (Implicit)

• VUID-vkGetDeviceImageSparseMemoryRequirements-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetDeviceImageSparseMemoryRequirements-pInfo-parameter
pInfo must be a valid pointer to a valid VkDeviceImageMemoryRequirements structure

• VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter
pSparseMemoryRequirementCount must be a valid pointer to a uint32_t value

• VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter
If the value referenced by pSparseMemoryRequirementCount is not 0, and pSparseMemoryRequirements is not NULL, pSparseMemoryRequirements must be a valid pointer to an array of pSparseMemoryRequirementCount VkSparseImageMemoryRequirements2 structures

The VkImageSparseMemoryRequirementsInfo2 structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageSparseMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageSparseMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageSparseMemoryRequirementsInfo2 VkImageSparseMemoryRequirementsInfo2KHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• image is the image to query.

Valid Usage (Implicit)

• VUID-VkImageSparseMemoryRequirementsInfo2-sType-sType
sType must be VK_STRUCTURE_TYPE_IMAGE_SPARSE_MEMORY_REQUIREMENTS_INFO_2

• VUID-VkImageSparseMemoryRequirementsInfo2-pNext-pNext
pNext must be NULL
The `VkSparseImageMemoryRequirements2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageMemoryRequirements2 {
    VkStructureType sType;
    void* pNext;
    VkSparseImageMemoryRequirements memoryRequirements;
} VkSparseImageMemoryRequirements2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkSparseImageMemoryRequirements2 VkSparseImageMemoryRequirements2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryRequirements` is a `VkSparseImageMemoryRequirements2KHR` structure describing the memory requirements of the sparse image.

### Valid Usage (Implicit)

- `VUID-VkSparseImageMemoryRequirements2-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_SPARSE_IMAGE_MEMORY_REQUIREMENTS_2`
- `VUID-VkSparseImageMemoryRequirements2-pNext-pNext`  
  `pNext` must be `NULL`

### 33.7.6. Binding Resource Memory

Non-sparse resources are backed by a single physical allocation prior to device use (via `vkBindImageMemory` or `vkBindBufferMemory`), and their backing must not be changed. On the other hand, sparse resources can be bound to memory non-contiguously and these bindings can be altered during the lifetime of the resource.

**Note**

It is important to note that freeing a `VkDeviceMemory` object with `vkFreeMemory` will not cause resources (or resource regions) bound to the memory object to become unbound. Applications must not access resources bound to memory that has been freed.

Sparse memory bindings execute on a queue that includes the `VK_QUEUE_SPARSE_BINDING_BIT` bit.
Applications **must** use **synchronization primitives** to guarantee that other queues do not access ranges of memory concurrently with a binding change. Applications **can** access other ranges of the same resource while a bind operation is executing.

**Note**

Implementations **must** provide a guarantee that simultaneously binding sparse blocks while another queue accesses those same sparse blocks via a sparse resource **must** not access memory owned by another process or otherwise corrupt the system.

While some implementations **may** include VK_QUEUE_SPARSE_BINDING_BIT support in queue families that also include graphics and compute support, other implementations **may** only expose a VK_QUEUE_SPARSE_BINDING_BIT-only queue family. In either case, applications **must** use synchronization primitives to explicitly request any ordering dependencies between sparse memory binding operations and other graphics/compute/transfer operations, as sparse binding operations are not automatically ordered against command buffer execution, even within a single queue.

When binding memory explicitly for the VK_IMAGE_ASPECT_METADATA_BIT the application **must** use the VK_SPARSE_MEMORY_BIND_METADATA_BIT in the VkSparseMemoryBind::flags field when binding memory. Binding memory for metadata is done the same way as binding memory for the mip tail, with the addition of the VK_SPARSE_MEMORY_BIND_METADATA_BIT flag.

Binding the mip tail for any aspect **must** only be performed using VkSparseImageOpaqueMemoryBindInfo. If formatProperties.flags contains VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT, then it **can** be bound with a single VkSparseMemoryBind structure, with resourceOffset = imageMipTailOffset and size = imageMipTailSize.

If formatProperties.flags does not contain VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT then the offset for the mip tail in each array layer is given as:

```
arrayMipTailOffset = imageMipTailOffset + arrayLayer * imageMipTailStride;
```

and the mip tail **can** be bound with layerCount VkSparseMemoryBind structures, each using size = imageMipTailSize and resourceOffset = arrayMipTailOffset as defined above.

Sparse memory binding is handled by the following APIs and related data structures.

**Sparse Memory Binding Functions**

The VkSparseMemoryBind structure is defined as:
// Provided by VK_VERSION_1_0

typedef struct VkSparseMemoryBind {
    VkDeviceSize resourceOffset;
    VkDeviceSize size;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    VkSparseMemoryBindFlags flags;
} VkSparseMemoryBind;

- resourceOffset is the offset into the resource.
- size is the size of the memory region to be bound.
- memory is the VkDeviceMemory object that the range of the resource is bound to. If memory is VK_NULL_HANDLE, the range is unbound.
- memoryOffset is the offset into the VkDeviceMemory object to bind the resource range to. If memory is VK_NULL_HANDLE, this value is ignored.
- flags is a bitmask of VkSparseMemoryBindFlagBits specifying usage of the binding operation.

The binding range $[resourceOffset, resourceOffset + size)$ has different constraints based on flags. If flags contains VK_SPARSE_MEMORY_BIND_METADATA_BIT, the binding range must be within the mip tail region of the metadata aspect. This metadata region is defined by:

$$\text{metadataRegion} = [\text{base}, \text{base} + \text{imageMipTailSize})$$

$$\text{base} = \text{imageMipTailOffset} + \text{imageMipTailStride} \times n$$

and imageMipTailOffset, imageMipTailSize, and imageMipTailStride values are from the VkSparseImageMemoryRequirements corresponding to the metadata aspect of the image, and n is a valid array layer index for the image,

imageMipTailStride is considered to be zero for aspects where VkSparseImageMemoryRequirements::formatProperties.flags contains VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT.

If flags does not contain VK_SPARSE_MEMORY_BIND_METADATA_BIT, the binding range must be within the range $[0, \text{VkMemoryRequirements::size})$.

**Valid Usage**

- VUID-VkSparseMemoryBind-memory-01096
  If memory is not VK_NULL_HANDLE, memory and memoryOffset must match the memory requirements of the resource, as described in section Resource Memory Association

- VUID-VkSparseMemoryBind-resourceOffset-09491
  If the resource being bound is a VkBuffer, resourceOffset, memoryOffset and size must be an integer multiple of the alignment of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with the buffer resource
If the resource being bound is a `VkImage`, `resourceOffset` and `memoryOffset` must be an integer multiple of the alignment of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with the image resource.

If `memory` is not `VK_NULL_HANDLE`, `memory` must not have been created with a memory type that reports `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set.

`size` must be greater than 0.

`resourceOffset` must be less than the size of the resource.

`size` must be less than or equal to the size of the resource minus `resourceOffset`.

`memoryOffset` must be less than the size of `memory`.

`size` must be less than or equal to the size of `memory` minus `memoryOffset`.

If `memory` was created with `VkExportMemoryAllocateInfo::handleTypes` not equal to 0, at least one handle type it contained must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created.

If `memory` was created by a memory import operation, the external handle type of the imported memory must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created.

Valid Usage (Implicit)

If `memory` is not `VK_NULL_HANDLE`, `memory` must be a valid `VkDeviceMemory` handle.

`flags` must be a valid combination of `VkSparseMemoryBindFlagBits` values.

Bits which can be set in `VkSparseMemoryBind::flags`, specifying usage of a sparse memory binding operation, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSparseMemoryBindFlagBits {
    VK_SPARSE_MEMORY_BIND_METADATA_BIT = 0x00000001,
    } VkSparseMemoryBindFlagBits;
```
• **VK_SPARSE_MEMORY_BIND_METADATA_BIT** specifies that the memory being bound is only for the metadata aspect.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSparseMemoryBindFlags;
```

**VkSparseMemoryBindFlags** is a bitmask type for setting a mask of zero or more **VkSparseMemoryBindFlagBits**.

Memory is bound to **VkBuffer** objects created with the **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** flag using the following structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseBufferMemoryBindInfo {
    VkBuffer buffer;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseBufferMemoryBindInfo;
```

- **buffer** is the **VkBuffer** object to be bound.
- **bindCount** is the number of **VkSparseMemoryBind** structures in the **pBinds** array.
- **pBinds** is a pointer to an array of **VkSparseMemoryBind** structures.

**Valid Usage (Implicit)**

- VUID-VkSparseBufferMemoryBindInfo-buffer-parameter
  **buffer** must be a valid **VkBuffer** handle
- VUID-VkSparseBufferMemoryBindInfo-pBinds-parameter
  **pBinds** must be a valid pointer to an array of **bindCount** valid **VkSparseMemoryBind** structures
- VUID-VkSparseBufferMemoryBindInfo-bindCount-arraylength
  **bindCount** must be greater than **0**

Memory is bound to opaque regions of **VkImage** objects created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag using the following structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageOpaqueMemoryBindInfo {
    VkImage image;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseImageOpaqueMemoryBindInfo;
```

- **image** is the **VkImage** object to be bound.
**Valid Usage**

- **VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-01103**
  If the *flags* member of any element of *pBinds* contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range defined must be within the mip tail region of the metadata aspect of *image*.

**Valid Usage (Implicit)**

- **VUID-VkSparseImageOpaqueMemoryBindInfo-image-parameter**
  *image* must be a valid `VkImage` handle.

- **VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-parameter**
  *pBinds* must be a valid pointer to an array of *bindCount* valid `VkSparseMemoryBind` structures.

- **VUID-VkSparseImageOpaqueMemoryBindInfo-bindCount-arraylength**
  *bindCount* must be greater than 0.

**Note**

This operation is normally used to bind memory to fully-resident sparse images or for mip tail regions of partially resident images. However, it can also be used to bind memory for the entire binding range of partially resident images.

In case *flags* does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the *resourceOffset* is in the range `[0, VkMemoryRequirements::size)`. This range includes data from all aspects of the image, including metadata. For most implementations this will probably mean that the *resourceOffset* is a simple device address offset within the resource. It is possible for an application to bind a range of memory that includes both resource data and metadata. However, the application would not know what part of the image the memory is used for, or if any range is being used for metadata.

When *flags* contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range specified must be within the mip tail region of the metadata aspect. In this case the *resourceOffset* is not required to be a simple device address offset within the resource. However, it is defined to be within `[imageMipTailOffset, imageMipTailOffset + imageMipTailSize)` for the metadata aspect. See `VkSparseMemoryBind` for the full constraints on binding region with this flag present.

Memory can be bound to sparse image blocks of `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag using the following structure:
typedef struct VkSparseImageMemoryBindInfo {
    VkImage image;
    uint32_t bindCount;
    const VkSparseImageMemoryBind* pBinds;
} VkSparseImageMemoryBindInfo;

- `image` is the `VkImage` object to be bound
- `bindCount` is the number of `VkSparseImageMemoryBind` structures in `pBinds` array
- `pBinds` is a pointer to an array of `VkSparseImageMemoryBind` structures

### Valid Usage

- **VUID-VkSparseImageMemoryBindInfo-subresource-01722**
  The `subresource.mipLevel` member of each element of `pBinds` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- **VUID-VkSparseImageMemoryBindInfo-subresource-01723**
  The `subresource.arrayLayer` member of each element of `pBinds` must be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- **VUID-VkSparseImageMemoryBindInfo-subresource-01106**
  The `subresource.aspectMask` member of each element of `pBinds` must be valid for the `format` specified in `VkImageCreateInfo` when `image` was created
- **VUID-VkSparseImageMemoryBindInfo-image-02901**
  `image` must have been created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set

### Valid Usage (Implicit)

- **VUID-VkSparseImageMemoryBindInfo-image-parameter**
  `image` must be a valid `VkImage` handle
- **VUID-VkSparseImageMemoryBindInfo-pBinds-parameter**
  `pBinds` must be a valid pointer to an array of `bindCount` valid `VkSparseImageMemoryBind` structures
- **VUID-VkSparseImageMemoryBindInfo-bindCount-arraylength**
  `bindCount` must be greater than 0

The `VkSparseImageMemoryBind` structure is defined as:
typedef struct VkSparseImageMemoryBind {
    VkImageSubresource subresource;
    VkOffset3D offset;
    VkExtent3D extent;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    VkSparseMemoryBindFlags flags;
} VkSparseImageMemoryBind;

- **subresource** is the image *aspect* and region of interest in the image.
- **offset** are the coordinates of the first texel within the image subresource to bind.
- **extent** is the size in texels of the region within the image subresource to bind. The extent **must** be a multiple of the sparse image block dimensions, except when binding sparse image blocks along the edge of an image subresource it **can** instead be such that any coordinate of **offset + extent** equals the corresponding dimensions of the image subresource.
- **memory** is the **VkDeviceMemory** object that the sparse image blocks of the image are bound to. If **memory** is **VK_NULL_HANDLE**, the sparse image blocks are unbound.
- **memoryOffset** is an offset into **VkDeviceMemory** object. If **memory** is **VK_NULL_HANDLE**, this value is ignored.
- **flags** are sparse memory binding flags.

### Valid Usage

- **VUID-VkSparseImageMemoryBind-memory-01104**
  If the **sparseResidencyAliased** feature is not enabled, and if any other resources are bound to ranges of **memory**, the range of **memory** being bound **must** not overlap with those bound ranges.

- **VUID-VkSparseImageMemoryBind-memory-01105**
  **memory** and **memoryOffset** **must** match the memory requirements of the calling command's **image**, as described in section **Resource Memory Association**.

- **VUID-VkSparseImageMemoryBind-offset-01107**
  **offset.x** **must** be a multiple of the sparse image block width (**VkSparseImageFormatProperties::imageGranularity.width**) of the image.

- **VUID-VkSparseImageMemoryBind-extent-09388**
  **extent.width** **must** be greater than 0.

- **VUID-VkSparseImageMemoryBind-extent-01108**
  **extent.width** **must** either be a multiple of the sparse image block width of the image, or else (**extent.width + offset.x**) **must** equal the width of the image subresource.

- **VUID-VkSparseImageMemoryBind-offset-01109**
  **offset.y** **must** be a multiple of the sparse image block height (**VkSparseImageFormatProperties::imageGranularity.height**) of the image.
• VUID-VkSparseImageMemoryBind-extent-09389
  \texttt{extent.height} \textbf{must} be greater than 0

• VUID-VkSparseImageMemoryBind-extent-01110
  \texttt{extent.height} \textbf{must} either be a multiple of the sparse image block height of the image, or else \((\texttt{extent.height} + \texttt{offset.y})\) \textbf{must} equal the height of the image subresource

• VUID-VkSparseImageMemoryBind-offset-01111
  \texttt{offset.z} \textbf{must} be a multiple of the sparse image block depth \((\texttt{VkSparseImageFormatProperties::imageGranularity.depth})\) of the image

• VUID-VkSparseImageMemoryBind-extent-09390
  \texttt{extent.depth} \textbf{must} be greater than 0

• VUID-VkSparseImageMemoryBind-extent-01112
  \texttt{extent.depth} \textbf{must} either be a multiple of the sparse image block depth of the image, or else \((\texttt{extent.depth} + \texttt{offset.z})\) \textbf{must} equal the depth of the image subresource

• VUID-VkSparseImageMemoryBind-memory-02732
  If \texttt{memory} was created with \texttt{VkExportMemoryAllocateInfo::handleTypes} not equal to 0, at least one handle type it contained \textbf{must} also have been set in \texttt{VkExternalMemoryImageCreateInfo::handleTypes} when the image was created

• VUID-VkSparseImageMemoryBind-memory-02733
  If \texttt{memory} was created by a memory import operation, the external handle type of the imported memory \textbf{must} also have been set in \texttt{VkExternalMemoryImageCreateInfo::handleTypes} when \texttt{image} was created

\textbf{Valid Usage (Implicit)}

• VUID-VkSparseImageMemoryBind-subresource-parameter
  \texttt{subresource} \textbf{must} be a valid \texttt{VkImageSubresource} structure

• VUID-VkSparseImageMemoryBind-memory-parameter
  If \texttt{memory} is not \texttt{VK_NULL_HANDLE}, \texttt{memory} \textbf{must} be a valid \texttt{VkDeviceMemory} handle

• VUID-VkSparseImageMemoryBind-flags-parameter
  \texttt{flags} \textbf{must} be a valid combination of \texttt{VkSparseMemoryBindFlagBits} values

To submit sparse binding operations to a queue, call:

\begin{verbatim}
// Provided by VK_VERSION_1_0
VkResult vkQueueBindSparse(
  VkQueue queue,
  uint32_t bindInfoCount,
  const VkBindSparseInfo* pBindInfo,
  VkFence fence);
\end{verbatim}

• \texttt{queue} is the queue that the sparse binding operations will be submitted to.

• \texttt{bindInfoCount} is the number of elements in the \texttt{pBindInfo} array.
• pBindInfo is a pointer to an array of VkBindSparseInfo structures, each specifying a sparse binding submission batch.

• fence is an optional handle to a fence to be signaled. If fence is not VK_NULL_HANDLE, it defines a fence signal operation.

vkQueueBindSparse is a queue submission command, with each batch defined by an element of pBindInfo as a VkBindSparseInfo structure. Batches begin execution in the order they appear in pBindInfo, but may complete out of order.

Within a batch, a given range of a resource must not be bound more than once. Across batches, if a range is to be bound to one allocation and offset and then to another allocation and offset, then the application must guarantee (usually using semaphores) that the binding operations are executed in the correct order, as well as to order binding operations against the execution of command buffer submissions.

As no operation to vkQueueBindSparse causes any pipeline stage to access memory, synchronization primitives used in this command effectively only define execution dependencies.

Additional information about fence and semaphore operation is described in the synchronization chapter.

Valid Usage

• VUID-vkQueueBindSparse-fence-01113
  If fence is not VK_NULL_HANDLE, fence must be unsignaled

• VUID-vkQueueBindSparse-fence-01114
  If fence is not VK_NULL_HANDLE, fence must not be associated with any other queue command that has not yet completed execution on that queue

• VUID-vkQueueBindSparse-pSignalSemaphores-01115
  Each element of the pSignalSemaphores member of each element of pBindInfo must be unsignaled when the semaphore signal operation it defines is executed on the device

• VUID-vkQueueBindSparse-pWaitSemaphores-01116
  When a semaphore wait operation referring to a binary semaphore defined by any element of the pWaitSemaphores member of any element of pBindInfo executes on queue, there must be no other queues waiting on the same semaphore

• VUID-vkQueueBindSparse-pWaitSemaphores-03245
  All elements of the pWaitSemaphores member of all elements of pBindInfo referring to a semaphore created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends must have also been submitted for execution

Valid Usage (Implicit)

• VUID-vkQueueBindSparse-queue-parameter
  queue must be a valid VkQueue handle
• **VUID-vkQueueBindSparse-pBindInfo-parameter**
  If `bindInfoCount` is not 0, `pBindInfo` must be a valid pointer to an array of `bindInfoCount` valid `VkBindSparseInfo` structures.

• **VUID-vkQueueBindSparse-fence-parameter**
  If `fence` is not `VK_NULL_HANDLE`, `fence` must be a valid `VkFence` handle.

• **VUID-vkQueueBindSparse-queuetype**
  The `queue` must support sparse binding operations.

• **VUID-vkQueueBindSparse-commonparent**
  Both of `fence` and `queue` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

---

**Host Synchronization**

• Host access to `queue` must be externally synchronized.

• Host access to `fence` must be externally synchronized.

---

**Command Properties**

<table>
<thead>
<tr>

</tbody>
</table>

---

**Return Codes**

**Success**

• `VK_SUCCESS`

**Failure**

• `VK_ERROR_OUT_OF_HOST_MEMORY`

• `VK_ERROR_OUT_OF_DEVICE_MEMORY`

• `VK_ERROR_DEVICE_LOST`

---

The `VkBindSparseInfo` structure is defined as:
typedef struct VkBindSparseInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t bufferBindCount;
    const VkSparseBufferMemoryBindInfo* pBufferBinds;
    uint32_t imageOpaqueBindCount;
    const VkSparseImageOpaqueMemoryBindInfo* pImageOpaqueBinds;
    uint32_t imageBindCount;
    const VkSparseImageMemoryBindInfo* pImageBinds;
    uint32_t signalSemaphoreCount;
    const VkSemaphore* pSignalSemaphores;
} VkBindSparseInfo;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **waitSemaphoreCount** is the number of semaphores upon which to wait before executing the sparse binding operations for the batch.
• **pWaitSemaphores** is a pointer to an array of semaphores upon which to wait on before the sparse binding operations for this batch begin execution. If semaphores to wait on are provided, they define a semaphore wait operation.
• **bufferBindCount** is the number of sparse buffer bindings to perform in the batch.
• **pBufferBinds** is a pointer to an array of VkSparseBufferMemoryBindInfo structures.
• **imageOpaqueBindCount** is the number of opaque sparse image bindings to perform.
• **pImageOpaqueBinds** is a pointer to an array of VkSparseImageOpaqueMemoryBindInfo structures, indicating opaque sparse image bindings to perform.
• **imageBindCount** is the number of sparse image bindings to perform.
• **pImageBinds** is a pointer to an array of VkSparseImageMemoryBindInfo structures, indicating sparse image bindings to perform.
• **signalSemaphoreCount** is the number of semaphores to be signaled once the sparse binding operations specified by the structure have completed execution.
• **pSignalSemaphores** is a pointer to an array of semaphores which will be signaled when the sparse binding operations for this batch have completed execution. If semaphores to be signaled are provided, they define a semaphore signal operation.

**Valid Usage**

• VUID-VkBindSparseInfo-pWaitSemaphores-03246
  If any element of pWaitSemaphores or pSignalSemaphores was created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE then the pNext chain must include a VkTimelineSemaphoreSubmitInfo structure
• VUID-VkBindSparseInfo-pNext-03247
  If the pNext chain of this structure includes a VkTimelineSemaphoreSubmitInfo structure and any element of pWaitSemaphores was created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE then its waitSemaphoreValueCount member must equal waitSemaphoreCount

• VUID-VkBindSparseInfo-pNext-03248
  If the pNext chain of this structure includes a VkTimelineSemaphoreSubmitInfo structure and any element of pSignalSemaphores was created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE then its signalSemaphoreValueCount member must equal signalSemaphoreCount

• VUID-VkBindSparseInfo-pSignalSemaphores-03249
  For each element of pSignalSemaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE the corresponding element of VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues must have a value greater than the current value of the semaphore when the semaphore signal operation is executed

• VUID-VkBindSparseInfo-pWaitSemaphores-03250
  For each element of pWaitSemaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE the corresponding element of VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than maxTimelineSemaphoreValueDifference

• VUID-VkBindSparseInfo-pSignalSemaphores-03251
  For each element of pSignalSemaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE the corresponding element of VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than maxTimelineSemaphoreValueDifference

### Valid Usage (Implicit)

• VUID-VkBindSparseInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BIND_SPARSE_INFO

• VUID-VkBindSparseInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceGroupBindSparseInfo, VkFrameBoundaryEXT, or VkTimelineSemaphoreSubmitInfo

• VUID-VkBindSparseInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkBindSparseInfo-pWaitSemaphores-parameter
  If waitSemaphoreCount is not 0, pWaitSemaphores must be a valid pointer to an array of waitSemaphoreCount valid VkSemaphore handles
If `bufferBindCount` is not 0, `pBufferBinds` must be a valid pointer to an array of `bufferBindCount` valid `VkSparseBufferMemoryBindInfo` structures.

If `imageOpaqueBindCount` is not 0, `pImageOpaqueBinds` must be a valid pointer to an array of `imageOpaqueBindCount` valid `VkSparseImageOpaqueMemoryBindInfo` structures.

If `imageBindCount` is not 0, `pImageBinds` must be a valid pointer to an array of `imageBindCount` valid `VkSparseImageMemoryBindInfo` structures.

If `signalSemaphoreCount` is not 0, `pSignalSemaphores` must be a valid pointer to an array of `signalSemaphoreCount` valid `VkSemaphore` handles.

Both of the elements of `pSignalSemaphores`, and the elements of `pWaitSemaphores` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

To specify the values to use when waiting for and signaling semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, add a `VkTimelineSemaphoreSubmitInfo` structure to the `pNext` chain of the `VkBindSparseInfo` structure.

If the `pNext` chain of `VkBindSparseInfo` includes a ` VkDeviceGroupBindSparseInfo` structure, then that structure includes device indices specifying which instance of the resources and memory are bound.

The `VkDeviceGroupBindSparseInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupBindSparseInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t resourceDeviceIndex;
    uint32_t memoryDeviceIndex;
} VkDeviceGroupBindSparseInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupBindSparseInfo VkDeviceGroupBindSparseInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `resourceDeviceIndex` is a device index indicating which instance of the resource is bound.
- `memoryDeviceIndex` is a device index indicating which instance of the memory the resource
instance is bound to.

These device indices apply to all buffer and image memory binds included in the batch pointing to this structure. The semaphore waits and signals for the batch are executed only by the physical device specified by the `resourceDeviceIndex`.

If this structure is not present, `resourceDeviceIndex` and `memoryDeviceIndex` are assumed to be zero.

### Valid Usage

- VUID-VkDeviceGroupBindSparseInfo-resourceDeviceIndex-01118
  
  `resourceDeviceIndex` and `memoryDeviceIndex` **must** both be valid device indices

- VUID-VkDeviceGroupBindSparseInfo-memoryDeviceIndex-01119
  
  Each memory allocation bound in this batch **must** have allocated an instance for `memoryDeviceIndex`

### Valid Usage (Implicit)

- VUID-VkDeviceGroupBindSparseInfo-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPEDEVICE_GROUP_BIND_SPARSE_INFO`
Chapter 34. Window System Integration (WSI)

This chapter discusses the window system integration (WSI) between the Vulkan API and the various forms of displaying the results of rendering to a user. Since the Vulkan API can be used without displaying results, WSI is provided through the use of optional Vulkan extensions. This chapter provides an overview of WSI. See the appendix for additional details of each WSI extension, including which extensions must be enabled in order to use each of the functions described in this chapter.

34.1. WSI Platform

A platform is an abstraction for a window system, OS, etc. Some examples include MS Windows, Android, and Wayland. The Vulkan API may be integrated in a unique manner for each platform.

The Vulkan API does not define any type of platform object. Platform-specific WSI extensions are defined, each containing platform-specific functions for using WSI. Use of these extensions is guarded by preprocessor symbols as defined in the Window System-Specific Header Control appendix.

In order for an application to be compiled to use WSI with a given platform, it must either:

- #define the appropriate preprocessor symbol prior to including the vulkan.h header file, or
- include vulkan_core.h and any native platform headers, followed by the appropriate platform-specific header.

The preprocessor symbols and platform-specific headers are defined in the Window System Extensions and Headers table.

Each platform-specific extension is an instance extension. The application must enable instance extensions with vkCreateInstance before using them.

34.2. WSI Surface

Native platform surface or window objects are abstracted by surface objects, which are represented by VkSurfaceKHR handles:

```c
// Provided by VK_KHR_surface
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSurfaceKHR)
```

The VK_KHR_surface extension declares the VkSurfaceKHR object, and provides a function for destroying VkSurfaceKHR objects. Separate platform-specific extensions each provide a function for creating a VkSurfaceKHR object for the respective platform. From the application's perspective this is an opaque handle, just like the handles of other Vulkan objects.

Note
On certain platforms, the Vulkan loader and ICDs may have conventions that treat the handle as a pointer to a structure containing the platform-specific information about the surface. This will be described in the documentation for the loader-ICD interface, and in the `vk_icd.h` header file of the LoaderAndTools source-code repository. This does not affect the loader-layer interface; layers may wrap VkSurfaceKHR objects.

### 34.2.1. Android Platform

To create a VkSurfaceKHR object for an Android native window, call:

```c
// Provided by VK_KHR_android_surface
VkResult vkCreateAndroidSurfaceKHR(
    VkInstance instance,
    const VkAndroidSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a VkAndroidSurfaceCreateInfoKHR structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

During the lifetime of a surface created using a particular ANativeWindow handle any attempts to create another surface for the same ANativeWindow and any attempts to connect to the same ANativeWindow through other platform mechanisms will fail.

**Note**

In particular, only one VkSurfaceKHR can exist at a time for a given window. Similarly, a native window cannot be used by both a VkSurfaceKHR and EGLSurface simultaneously.

If successful, vkCreateAndroidSurfaceKHR increments the ANativeWindow's reference count, and vkDestroySurfaceKHR will decrement it.

On Android, when a swapchain's imageExtent does not match the surface's currentExtent, the presentable images will be scaled to the surface's dimensions during presentation. minImageExtent is (1,1), and maxImageExtent is the maximum image size supported by the consumer. For the system compositor, currentExtent is the window size (i.e. the consumer's preferred size).

**Valid Usage (Implicit)**

- VUID-vkCreateAndroidSurfaceKHR-instance-parameter
  instance must be a valid VkInstance handle
• VUID-vkCreateAndroidSurfaceKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkAndroidSurfaceCreateInfoKHR structure

• VUID-vkCreateAndroidSurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateAndroidSurfaceKHR-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkAndroidSurfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_android_surface
typedef struct VkAndroidSurfaceCreateInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkAndroidSurfaceCreateFlagsKHR flags;
  struct ANativeWindow* window;
} VkAndroidSurfaceCreateInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• window is a pointer to the ANativeWindow to associate the surface with.

Valid Usage

• VUID-VkAndroidSurfaceCreateInfoKHR-window-01248
  window must point to a valid Android ANativeWindow

Valid Usage (Implicit)

• VUID-VkAndroidSurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ANDROID_SURFACE_CREATE_INFO_KHR
To remove an unnecessary compile time dependency, an incomplete type definition of `ANativeWindow` is provided in the Vulkan headers:

```c
// Provided by VK_KHR_android_surface
struct ANativeWindow;
```

The actual `ANativeWindow` type is defined in Android NDK headers:

```c
// Provided by VK_KHR_android_surface
typedef VkFlags VkAndroidSurfaceCreateFlagsKHR;
```

`VkAndroidSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.2. Wayland Platform

To create a `VkSurfaceKHR` object for a Wayland surface, call:

```c
// Provided by VK_KHR_wayland_surface
VkResult vkCreateWaylandSurfaceKHR(
    VkInstance           instance,      // instance
    const VkWaylandSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR*        pSurface);    // pSurface
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkWaylandSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

#### Valid Usage (Implicit)

- VUID-vkCreateWaylandSurfaceKHR-instance-parameter `instance` must be a valid `VkInstance` handle
- VUID-vkCreateWaylandSurfaceKHR-pCreateInfo-parameter `pCreateInfo` must be a valid pointer to a valid `VkWaylandSurfaceCreateInfoKHR` structure
If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

`pSurface` must be a valid pointer to a `VkSurfaceKHR` handle.

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkWaylandSurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_wayland_surface
typedef struct VkWaylandSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWaylandSurfaceCreateFlagsKHR flags;
    struct wl_display* display;
    struct wl_surface* surface;
} VkWaylandSurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `display` and `surface` are pointers to the Wayland `wl_display` and `wl_surface` to associate the surface with.

### Valid Usage

- VUID-VkWaylandSurfaceCreateInfoKHR-display-01304
  `display` must point to a valid Wayland `wl_display`

- VUID-VkWaylandSurfaceCreateInfoKHR-surface-01305
  `surface` must point to a valid Wayland `wl_surface`

### Valid Usage (Implicit)

- VUID-VkWaylandSurfaceCreateInfoKHR-sType-sType
**(1)**

sType **must** be `VK_STRUCTURE_TYPE_WAYLAND_SURFACE_CREATE_INFO_KHR`

- VUID-VkWaylandSurfaceCreateInfoKHR-pNext-pNext
  pNext **must** be NULL
- VUID-VkWaylandSurfaceCreateInfoKHR-flags-zerobitmask
  flags **must** be 0

On Wayland, currentExtent is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface. Whatever the application sets a swapchain’s imageExtent to will be the size of the window, after the first image is presented. minImageExtent is (1,1), and maxImageExtent is the maximum supported surface size. Any calls to `vkGetPhysicalDeviceSurfacePresentModesKHR` on a surface created with `vkCreateWaylandSurfaceKHR` are **required** to return `VK_PRESENT_MODE_MAILBOX_KHR` as one of the valid present modes.

Some Vulkan functions may send protocol over the specified `wl_display` connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to a `wl_surface`. Applications **must** therefore ensure that both the `wl_display` and the `wl_surface` remain valid for the lifetime of any `VkSwapchainKHR` objects created from a particular `wl_display` and `wl_surface`. Also, calling `vkQueuePresentKHR` will result in Vulkan sending `wl_surface.commit` requests to the underlying `wl_surface` of each. The `wl_surface.attach`, `wl_surface.damage`, and `wl_surface.commit` requests must be issued by the implementation during the call to `vkQueuePresentKHR` and **must** not be issued by the implementation outside of `vkQueuePresentKHR`. This ensures that any Wayland requests sent by the client after the call to `vkQueuePresentKHR` returns will be received by the compositor after the `wl_surface.commit`. Regardless of the mode of swapchain creation, a new `wl_event_queue` **must** be created for each successful `vkCreateWaylandSurfaceKHR` call, and every Wayland object created by the implementation **must** be assigned to this event queue. If the platform provides Wayland 1.11 or greater, this **must** be implemented by the use of Wayland proxy object wrappers, to avoid race conditions.

If the application wishes to synchronize any window changes with a particular frame, such requests **must** be sent to the Wayland display server prior to calling `vkQueuePresentKHR`.

```c
// Provided by VK_KHR_wayland_surface
typedef VkFlags VkWaylandSurfaceCreateFlagsKHR;
```

`VkWaylandSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.3. Win32 Platform

To create a `VkSurfaceKHR` object for a Win32 window, call:
// Provided by VK_KHR_win32_surface

VkResult vkCreateWin32SurfaceKHR(
    VkInstance instance,
    const VkWin32SurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);

• instance is the instance to associate the surface with.

• pCreateInfo is a pointer to a VkWin32SurfaceCreateInfoKHR structure containing parameters affecting the creation of the surface object.

• pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

• pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

Valid Usage (Implicit)

• VUID-vkCreateWin32SurfaceKHR-instance-parameter
  instance must be a valid VkInstance handle

• VUID-vkCreateWin32SurfaceKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkWin32SurfaceCreateInfoKHR structure

• VUID-vkCreateWin32SurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateWin32SurfaceKHR-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

Some Vulkan functions may call the SendMessage system API when interacting with a VkSurfaceKHR through a VkSwapchainKHR. In a multithreaded environment, calling SendMessage from a thread that is not the thread associated with pCreateInfo::hwnd will block until the application has processed the window message. Thus, applications should either call these Vulkan functions on the message pump thread, or make sure their message pump is actively running. Failing to do so may result in deadlocks.

The functions subject to this requirement are:
The `VkWin32SurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_win32_surface
typedef struct VkWin32SurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWin32SurfaceCreateFlagsKHR flags;
    HINSTANCE hinstance;
    HWND hwnd;
} VkWin32SurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `hinstance` is the Win32 `HINSTANCE` for the window to associate the surface with.
- `hwnd` is the Win32 `HWND` for the window to associate the surface with.

**Valid Usage**

- VUID-VkWin32SurfaceCreateInfoKHR-hinstance-01307
  `hinstance` must be a valid Win32 `HINSTANCE`

- VUID-VkWin32SurfaceCreateInfoKHR-hwnd-01308
  `hwnd` must be a valid Win32 `HWND`

**Valid Usage (Implicit)**

- VUID-VkWin32SurfaceCreateInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_WIN32_SURFACE_CREATE_INFO_KHR`

- VUID-VkWin32SurfaceCreateInfoKHR-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkWin32SurfaceCreateInfoKHR-flags-zerobitmask
  `flags` must be `0`
With Win32, `minImageExtent`, `maxImageExtent`, and `currentExtent` must always equal the window size.

The `currentExtent` of a Win32 surface must have both width and height greater than 0, or both of them 0.

**Note**
Due to above restrictions, unless `VkSwapchainPresentScalingCreateInfoEXT` is used to specify handling of disparities between surface and swapchain dimensions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in `VkSurfaceCapabilitiesKHR::currentExtent`.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.

```c
// Provided by VK_KHR_win32_surface
typedef VkFlags VkWin32SurfaceCreateFlagsKHR;
```

`VkWin32SurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.4. XCB Platform

To create a `VkSurfaceKHR` object for an X11 window, using the XCB client-side library, call:

```c
// Provided by VK_KHR_xcb_surface
VkResult vkCreateXcbSurfaceKHR(
    VkInstance instance,
    const VkXcbSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a `VkXcbSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

**Valid Usage (Implicit)**

- VUID-vkCreateXcbSurfaceKHR-instance-parameter `instance` must be a valid `VkInstance` handle
- VUID-vkCreateXcbSurfaceKHR-pCreateInfo-parameter `pCreateInfo` must be a valid pointer to a valid `VkXcbSurfaceCreateInfoKHR` structure
If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

`pSurface` must be a valid pointer to a `VkSurfaceKHR` handle.

### Return Codes

#### Success
- `VK_SUCCESS`

#### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkXcbSurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_xcb_surface

typedef struct VkXcbSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkXcbSurfaceCreateFlagsKHR flags;
    xcb_connection_t* connection;
    xcb_window_t window;
} VkXcbSurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `connection` is a pointer to an `xcb_connection_t` to the X server.
- `window` is the `xcb_window_t` for the X11 window to associate the surface with.

### Valid Usage

- **VUID-VkXcbSurfaceCreateInfoKHR-connection-01310**
  - `connection` must point to a valid X11 `xcb_connection_t`

- **VUID-VkXcbSurfaceCreateInfoKHR-window-01311**
  - `window` must be a valid X11 `xcb_window_t`

### Valid Usage (Implicit)

- **VUID-VkXcbSurfaceCreateInfoKHR-sType-sType**
sType must be VK_STRUCTURE_TYPE_XCB_SURFACE_CREATE_INFO_KHR

- VUID-VkXcbSurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL
- VUID-VkXcbSurfaceCreateInfoKHR-flags-zerobitmask
  flags must be 0

With Xcb, `minImageExtent`, `maxImageExtent`, and `currentExtent` must always equal the window size.

The `currentExtent` of an Xcb surface must have both width and height greater than 0, or both of them 0.

**Note**
Due to above restrictions, unless `VkSwapchainPresentScalingCreateInfoEXT` is used to specify handling of disparities between surface and swapchain dimensions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in `VkSurfaceCapabilitiesKHR::currentExtent`.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.

Some Vulkan functions may send protocol over the specified xcb connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to an xcb window. Applications must therefore ensure the xcb connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with xcb-based swapchains must

- Avoid holding a server grab on an xcb connection while waiting for Vulkan operations to complete using a swapchain derived from a different xcb connection referring to the same X server instance. Failing to do so may result in deadlock.

```c
// Provided by VK_KHR_xcb_surface
typedef VkFlags VkXcbSurfaceCreateFlagsKHR;
```

`VkXcbSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.5. Xlib Platform

To create a `VkSurfaceKHR` object for an X11 window, using the Xlib client-side library, call:
// Provided by VK_KHR_xlib_surface
VkResult vkCreateXlibSurfaceKHR(
    VkInstance instance,
    const VkXlibSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);

• instance is the instance to associate the surface with.

• pCreateInfo is a pointer to a VkXlibSurfaceCreateInfoKHR structure containing the parameters affecting the creation of the surface object.

• pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

• pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

Valid Usage (Implicit)

• VUID-vkCreateXlibSurfaceKHR-instance-parameter instance must be a valid VkInstance handle

• VUID-vkCreateXlibSurfaceKHR-pCreateInfo-parameter pCreateInfo must be a valid pointer to a valid VkXlibSurfaceCreateInfoKHR structure

• VUID-vkCreateXlibSurfaceKHR-pAllocator-parameter If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateXlibSurfaceKHR-pSurface-parameter pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkXlibSurfaceCreateInfoKHR structure is defined as:
typedef struct VkXlibSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkXlibSurfaceCreateFlagsKHR flags;
    Display* dpy;
    Window window;
} VkXlibSurfaceCreateInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **dpy** is a pointer to an Xlib `Display` connection to the X server.
- **window** is an Xlib `Window` to associate the surface with.

### Valid Usage

- VUID-VkXlibSurfaceCreateInfoKHR-dpy-01313
  - `dpy` *must* point to a valid Xlib `Display`
- VUID-VkXlibSurfaceCreateInfoKHR-window-01314
  - `window` *must* be a valid Xlib `Window`

### Valid Usage (Implicit)

- VUID-VkXlibSurfaceCreateInfoKHR-sType-sType
  - `sType` *must* be `VK_STRUCTURE_TYPE_XLIB_SURFACE_CREATE_INFO_KHR`
- VUID-VkXlibSurfaceCreateInfoKHR-pNext-pNext
  - `pNext` *must* be `NULL`
- VUID-VkXlibSurfaceCreateInfoKHR-flags-zero bitmask
  - `flags` *must* be `0`

With Xlib, `minImageExtent`, `maxImageExtent`, and `currentExtent` *must* always equal the window size.

The `currentExtent` of an Xlib surface *must* have both `width` and `height` greater than 0, or both of them 0.

**Note**

Due to above restrictions, unless `VkSwapchainPresentScalingCreateInfoEXT` is used to specify handling of disparities between surface and swapchain dimensions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in `VkSurfaceCapabilitiesKHR::currentExtent`.
The window size **may** become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

Some Vulkan functions **may** send protocol over the specified Xlib **Display** connection when using a swapchain or presentable images created from a **VkSurfaceKHR** referring to an Xlib window. Applications **must** therefore ensure the display connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with Xlib-based swapchains **must**

- Avoid holding a server grab on a display connection while waiting for Vulkan operations to complete using a swapchain derived from a different display connection referring to the same X server instance. Failing to do so **may** result in deadlock.

Some implementations may require threads to implement some presentation modes so applications **must** call `XInitThreads()` before calling any other Xlib functions.

```c
// Provided by VK_KHR_xlib_surface
typedef VkFlags VkXlibSurfaceCreateFlagsKHR;

VkXlibSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.
```

### 34.2.6. DirectFB Platform

To create a **VkSurfaceKHR** object for a DirectFB surface, call:

```c
// Provided by VK_EXT_directfb_surface
VkResult vkCreateDirectFBSurfaceEXT(
    VkInstance instance,
    const VkDirectFBSurfaceCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a **VkDirectFBSurfaceCreateInfoEXT** structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a **VkSurfaceKHR** handle in which the created surface object is returned.

**Valid Usage (Implicit)**

- VUID-vkCreateDirectFBSurfaceEXT-instance-parameter
  
  **instance** **must** be a valid **VkInstance** handle

3054
• VUID-vkCreateDirectFBSurfaceEXT-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkDirectFBSurfaceCreateInfoEXT structure

• VUID-vkCreateDirectFBSurfaceEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateDirectFBSurfaceEXT-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

---

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDirectFBSurfaceCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_directfb_surface
typedef struct VkDirectFBSurfaceCreateInfoEXT {
    VkStructureType       sType;
    const void*           pNext;
    VkDirectFBSurfaceCreateFlagsEXT flags;
    IDirectFB*            dfb;
    IDirectFBSurface*     surface;
} VkDirectFBSurfaceCreateInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **dfb** is a pointer to the IDirectFB main interface of DirectFB.
- **surface** is a pointer to a IDirectFBSurface surface interface.

---

**Valid Usage**

- VUID-VkDirectFBSurfaceCreateInfoEXT-dfb-04117
  dfb must point to a valid DirectFB IDirectFB

- VUID-VkDirectFBSurfaceCreateInfoEXT-surface-04118
  surface must point to a valid DirectFB IDirectFBSurface
Valid Usage (Implicit)

- VUID-VkDirectFBSurfaceCreateInfoEXT-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_DIRECTFB_SURFACE_CREATE_INFO_EXT

- VUID-VkDirectFBSurfaceCreateInfoEXT-pNext-pNext
  
  pNext must be NULL

- VUID-VkDirectFBSurfaceCreateInfoEXT-flags-zerobitmask
  
  flags must be 0

With DirectFB, minImageExtent, maxImageExtent, and currentExtent must always equal the surface size.

// Provided by VK_EXT_directfb_surface
typedef VkFlags VkDirectFBSurfaceCreateFlagsEXT;

VkDirectFBSurfaceCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

34.2.7. Fuchsia Platform

To create a VkSurfaceKHR object for a Fuchsia ImagePipe, call:

// Provided by VK_FUCHSIA_imagepipe_surface

VkResult vkCreateImagePipeSurfaceFUCHSIA(

  VkInstance instance,  
  const VkImagePipeSurfaceCreateInfoFUCHSIA* pCreateInfo, 
  const VkAllocationCallbacks* pAllocator, 
  VkSurfaceKHR* pSurface);

- instance is the instance to associate with the surface.
- pCreateInfo is a pointer to a VkImagePipeSurfaceCreateInfoFUCHSIA structure containing parameters affecting the creation of the surface object.
- pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateImagePipeSurfaceFUCHSIA-instance-parameter
  
  instance must be a valid VkInstance handle

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pCreateInfo-parameter
  
  pCreateInfo must be a valid pointer to a valid VkImagePipeSurfaceCreateInfoFUCHSIA structure
• VUID-vkCreateImagePipeSurfaceFUCHSIA-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateImagePipeSurfaceFUCHSIA-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkImagePipeSurfaceCreateInfoFUCHSIA structure is defined as:

```c
// Provided by VK_FUCHSIA_imagepipe_surface
typedef struct VkImagePipeSurfaceCreateInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkImagePipeSurfaceCreateFlagsFUCHSIA flags;
    zx_handle_t imagePipeHandle;
} VkImagePipeSurfaceCreateInfoFUCHSIA;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• imagePipeHandle is a zx_handle_t referring to the ImagePipe to associate with the surface.

Valid Usage

• VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-imagePipeHandle-04863
  imagePipeHandle must be a valid zx_handle_t

Valid Usage (Implicit)

• VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGEPIPE_SURFACE_CREATE_INFO_FUCHSIA

• VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-pNext-pNext
  pNext must be NULL

• VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-flags-zerobitmask
flags must be 0

On Fuchsia, the surface currentExtent is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

```c
// Provided by VK_FUCHSIA_imagepipe_surface
typedef VkFlags VkImagePipeSurfaceCreateFlagsFUCHSIA;
```

VkImagePipeSurfaceCreateFlagsFUCHSIA is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.8. Google Games Platform

To create a VkSurfaceKHR object for a Google Games Platform stream descriptor, call:

```c
// Provided by VK_GGP_stream_descriptor_surface
VkResult vkCreateStreamDescriptorSurfaceGGP(
    VkInstance instance,
    const VkStreamDescriptorSurfaceCreateInfoGGP* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate with the surface.
- `pCreateInfo` is a pointer to a VkStreamDescriptorSurfaceCreateInfoGGP structure containing parameters that affect the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

**Valid Usage (Implicit)**

- VUID-vkCreateStreamDescriptorSurfaceGGP-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkCreateStreamDescriptorSurfaceGGP-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkStreamDescriptorSurfaceCreateInfoGGP structure

- VUID-vkCreateStreamDescriptorSurfaceGGP-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateStreamDescriptorSurfaceGGP-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The `VkStreamDescriptorSurfaceCreateInfoGGP` structure is defined as:

```c
// Provided by VK_GGP_stream_descriptor_surface
typedef struct VkStreamDescriptorSurfaceCreateInfoGGP {
    VkStructureType sType;
    const void* pNext;
    VkStreamDescriptorSurfaceCreateFlagsGGP flags;
    GgpStreamDescriptor streamDescriptor;
} VkStreamDescriptorSurfaceCreateInfoGGP;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `streamDescriptor` is a `GgpStreamDescriptor` referring to the GGP stream descriptor to associate with the surface.

Valid Usage

• VUID-VkStreamDescriptorSurfaceCreateInfoGGP-streamDescriptor-02681
  streamDescriptor must be a valid `GgpStreamDescriptor`

Valid Usage (Implicit)

• VUID-VkStreamDescriptorSurfaceCreateInfoGGP-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_STREAM_DESCRIPTOR_SURFACE_CREATE_INFO_GGP`
• VUID-VkStreamDescriptorSurfaceCreateInfoGGP-pNext-pNext
  `pNext` must be `NULL`
• VUID-VkStreamDescriptorSurfaceCreateInfoGGP-flags-zerobitmask
  `flags` must be `0`

On Google Games Platform, the surface extents are dynamic. The `minImageExtent` will never be greater than 1080p and the `maxImageExtent` will never be less than 1080p. The `currentExtent` will
Applications are expected to choose an appropriate size for the swapchain's `imageExtent`, within the bounds of the surface. Using the surface's `currentExtent` will offer the best performance and quality. When a swapchain's `imageExtent` does not match the surface's `currentExtent`, the presentable images are scaled to the surface's dimensions during presentation if possible and `VK_SUBOPTIMAL_KHR` is returned, otherwise presentation fails with `VK_ERROR_OUT_OF_DATE_KHR`.

```c
// Provided by VK_GGP_stream_descriptor_surface
typedef VkFlags VkStreamDescriptorSurfaceCreateFlagsGGP;
```

`VkStreamDescriptorSurfaceCreateFlagsGGP` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.9. iOS Platform

To create a `VkSurfaceKHR` object for an iOS `UIView` or `CAMetalLayer`, call:

```c
// Provided by VK_MVK_ios_surface
VkResult vkCreateIOSSurfaceMVK(
    VkInstance instance,
    const VkIOSSurfaceCreateInfoMVK* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a `VkIOSSurfaceCreateInfoMVK` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see `Memory Allocation`).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

**Note**
The `vkCreateIOSSurfaceMVK` function is considered deprecated and has been superseded by `vkCreateMetalSurfaceEXT` from the `VK_EXT_metal_surface` extension.

---

**Valid Usage (Implicit)**

- VUID-vkCreateIOSSurfaceMVK-instance-parameter
  - `instance` must be a valid `VkInstance` handle

- VUID-vkCreateIOSSurfaceMVK-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkIOSSurfaceCreateInfoMVK` structure

- VUID-vkCreateIOSSurfaceMVK-pAllocator-parameter
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid
VkAllocationCallbacks structure

- VUID-vkCreateIOSSurfaceMVK-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkIOSSurfaceCreateInfoMVK structure is defined as:

```c
// Provided by VK_MVK_ios_surface
typedef struct VkIOSSurfaceCreateInfoMVK {
    VkStructureType sType;
    const void* pNext;
    VkIOSSurfaceCreateFlagsMVK flags;
    const void* pView;
} VkIOSSurfaceCreateInfoMVK;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **pView** is a reference to either a CAMetalLayer object or a UIView object.

Valid Usage

- VUID-VkIOSSurfaceCreateInfoMVK-pView-04143
  If pView is a CAMetalLayer object, it must be a valid CAMetalLayer

- VUID-VkIOSSurfaceCreateInfoMVK-pView-01316
  If pView is a UIView object, it must be a valid UIView, must be backed by a CALayer object of type CAMetalLayer, and vkCreateIOSSurfaceMVK must be called on the main thread

Valid Usage (Implicit)

- VUID-VkIOSSurfaceCreateInfoMVK-sType-sType
  sType must be VK_STRUCTURE_TYPE_IOS_SURFACE_CREATE_INFO_MVK
VUID-VkIOSSurfaceCreateInfoMVK-pNext-pNext
pNext must be NULL
VUID-VkIOSSurfaceCreateInfoMVK-flags-zerobitmask
flags must be 0

```c
// Provided by VK_MVK_ios_surface
typedef VkFlags VkIOSSurfaceCreateFlagsMVK;
```

VkIOSSurfaceCreateFlagsMVK is a bitmask type for setting a mask, but is currently reserved for future use.

## 34.2.10. macOS Platform

To create a `VkSurfaceKHR` object for a macOS `NSView` or `CAMetalLayer`, call:

```c
// Provided by VK_MVK_macos_surface
VkResult vkCreateMacOSSurfaceMVK(
    VkInstance instance,
    const VkMacOSSurfaceCreateInfoMVK* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- **instance** is the instance with which to associate the surface.
- **pCreateInfo** is a pointer to a `VkMacOSSurfaceCreateInfoMVK` structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

**Note**
The `vkCreateMacOSSurfaceMVK` function is considered deprecated and has been superseded by `vkCreateMetalSurfaceEXT` from the `VK_EXT_metal_surface` extension.

### Valid Usage (Implicit)

- **VUID-vkCreateMacOSSurfaceMVK-instance-parameter**
  instance must be a valid `VkInstance` handle
- **VUID-vkCreateMacOSSurfaceMVK-pCreateInfo-parameter**
  pCreateInfo must be a valid pointer to a valid `VkMacOSSurfaceCreateInfoMVK` structure
- **VUID-vkCreateMacOSSurfaceMVK-pAllocator-parameter**
  If pAllocate is not NULL, pAllocate must be a valid pointer to a valid `VkAllocationCallbacks` structure
• VUID-vkCreateMacOSSurfaceMVK-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkMacOSSurfaceCreateInfoMVK structure is defined as:

```c
// Provided by VK_MVK_macos_surface
typedef struct VkMacOSSurfaceCreateInfoMVK {
    VkStructureType            sType;
    const void*                pNext;
    VkMacOSSurfaceCreateFlagsMVK flags;
    const void*                pView;
} VkMacOSSurfaceCreateInfoMVK;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• pView is a reference to either a CAMetalLayer object or an NSView object.

Valid Usage

• VUID-VkMacOSSurfaceCreateInfoMVK-pView-04144
  If pView is a CAMetalLayer object, it must be a valid CAMetalLayer

• VUID-VkMacOSSurfaceCreateInfoMVK-pView-01317
  If pView is an NSView object, it must be a valid NSView, must be backed by a CALayer object of type CAMetalLayer, and vkCreateMacOSSurfaceMVK must be called on the main thread

Valid Usage (Implicit)

• VUID-VkMacOSSurfaceCreateInfoMVK-sType-sType
  sType must be VK_STRUCTURE_TYPE_MACOS_SURFACE_CREATE_INFO_MVK

• VUID-VkMacOSSurfaceCreateInfoMVK-pNext-pNext
  pNext must be NULL
flags must be 0

typedef VkFlags VkMacOSSurfaceCreateFlagsMVK;

VkMacOSSurfaceCreateFlagsMVK is a bitmask type for setting a mask, but is currently reserved for future use.

34.2.11. VI Platform

To create a VkSurfaceKHR object for an nn::vi::Layer, query the layer’s native handle using nn::vi::GetNativeWindow, and then call:

// Provided by VK_NN_vi_surface
VkResult vkCreateViSurfaceNN(
    VkInstance instance,
    const VkViSurfaceCreateInfoNN* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);

• instance is the instance with which to associate the surface.
• pCreateInfo is a pointer to a VkViSurfaceCreateInfoNN structure containing parameters affecting the creation of the surface object.
• pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
• pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

During the lifetime of a surface created using a particular nn::vi::NativeWindowHandle, applications must not attempt to create another surface for the same nn::vi::Layer or attempt to connect to the same nn::vi::Layer through other platform mechanisms.

If the native window is created with a specified size, currentExtent will reflect that size. In this case, applications should use the same size for the swapchain’s imageExtent. Otherwise, the currentExtent will have the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that applications are expected to choose an appropriate size for the swapchain’s imageExtent (e.g., by matching the result of a call to nn::vi::GetDisplayResolution).

Valid Usage (Implicit)

• VUID-vkCreateViSurfaceNN-instance-parameter
    instance must be a valid VkInstance handle
• VUID-vkCreateViSurfaceNN-pCreateInfo-parameter
    pCreateInfo must be a valid pointer to a valid VkViSurfaceCreateInfoNN structure
• VUID-vkCreateViSurfaceNN-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateViSurfaceNN-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkViSurfaceCreateInfoNN structure is defined as:

```c
// Provided by VK_NN_vi_surface
typedef struct VkViSurfaceCreateInfoNN {
  VkStructureType      sType;
  const void*          pNext;
  VkViSurfaceCreateFlagsNN flags;
  void*                window;
} VkViSurfaceCreateInfoNN;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **window** is the nn::vi::NativeWindowHandle for the nn::vi::Layer with which to associate the surface.

### Valid Usage

- VUID-VkViSurfaceCreateInfoNN-window-01318
  window must be a valid nn::vi::NativeWindowHandle

### Valid Usage (Implicit)

- VUID-VkViSurfaceCreateInfoNN-sType-sType
  sType must be VK_STRUCTURE_TYPE_VI_SURFACE_CREATE_INFO_NN

- VUID-VkViSurfaceCreateInfoNN-pNext-pNext
  pNext must be NULL
flags must be 0

// Provided by VK_NN_vi_surface
typedef VkFlags VkViSurfaceCreateFlagsNN;

VkViSurfaceCreateFlagsNN is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.12. Metal Platform

To create a VkSurfaceKHR object for a CAMetalLayer, call:

```c
// Provided by VK_EXT_metal_surface
VkResult vkCreateMetalSurfaceEXT(
    VkInstance instance,           // Provided by VK_NN_vi_surface
    const VkMetalSurfaceCreateInfoEXT* pCreateInfo,  // Provided by VK_EXT_metal_surface
    const VkAllocationCallbacks* pAllocator,         // Provided by VK_EXT_metal_surface
    VkSurfaceKHR* pSurface               // Provided by VK_EXT_metal_surface
);
```

- **instance** is the instance with which to associate the surface.
- **pCreateInfo** is a pointer to a VkMetalSurfaceCreateInfoEXT structure specifying parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

#### Valid Usage (Implicit)

- VUID-vkCreateMetalSurfaceEXT-instance-parameter
  * instance must be a valid VkInstance handle
- VUID-vkCreateMetalSurfaceEXT-pCreateInfo-parameter
  * pCreateInfo must be a valid pointer to a valid VkMetalSurfaceCreateInfoEXT structure
- VUID-vkCreateMetalSurfaceEXT-pAllocator-parameter
  * If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateMetalSurfaceEXT-pSurface-parameter
  * pSurface must be a valid pointer to a VkSurfaceKHR handle
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The `VkMetalSurfaceCreateInfoEXT` structure is defined as:

```c
typedef struct VkMetalSurfaceCreateInfoEXT {
  VkStructureType sType;
  const void* pNext;
  VkMetalSurfaceCreateFlagsEXT flags;
  const CAMetalLayer* pLayer;
} VkMetalSurfaceCreateInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **pLayer** is a reference to a `CAMetalLayer` object representing a renderable surface.

Valid Usage (Implicit)

- VUID-VkMetalSurfaceCreateInfoEXT-sType-sType
  **sType** must be `VK_STRUCTURE_TYPE_METAL_SURFACE_CREATE_INFO_EXT`
- VUID-VkMetalSurfaceCreateInfoEXT-pNext-pNext
  **pNext** must be `NULL`
- VUID-VkMetalSurfaceCreateInfoEXT-flags-zerobitmask
  **flags** must be `0`

To remove an unnecessary compile time dependency, an incomplete type definition of `CAMetalLayer` is provided in the Vulkan headers:
The actual CAMetalLayer type is defined in the QuartzCore framework.

VkMetalSurfaceCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

34.2.13. QNX Screen Platform

To create a VkSurfaceKHR object for a QNX Screen surface, call:

```
// Provided by VK_QNX_screen_surface
VkResult vkCreateScreenSurfaceQNX(
    VkInstance instance,        // instance is the instance to associate the surface with.
    const VkScreenSurfaceCreateInfoQNX* pCreateInfo, // pCreateInfo is a pointer to a VkScreenSurfaceCreateInfoQNX structure containing parameters affecting the creation of the surface object.
    const VkAllocationCallbacks* pAllocator, // pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
    VkSurfaceKHR* pSurface); // pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.
```

Valid Usage (Implicit)

- VUID-vkCreateScreenSurfaceQNX-instance-parameter instance must be a valid VkInstance handle
- VUID-vkCreateScreenSurfaceQNX-pCreateInfo-parameter pCreateInfo must be a valid pointer to a valid VkScreenSurfaceCreateInfoQNX structure
- VUID-vkCreateScreenSurfaceQNX-pAllocator-parameter If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateScreenSurfaceQNX-pSurface-parameter
pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkScreenSurfaceCreateInfoQNX structure is defined as:

```
// Provided by VK_QNX_screen_surface
typedef struct VkScreenSurfaceCreateInfoQNX {
  VkStructureType sType;
  const void* pNext;
  VkScreenSurfaceCreateFlagsQNX flags;
  struct _screen_context* context;
  struct _screen_window* window;
} VkScreenSurfaceCreateInfoQNX;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- context and window are QNX Screen context and window to associate the surface with.

Valid Usage

- VUID-VkScreenSurfaceCreateInfoQNX-context-04741
  context must point to a valid QNX Screen struct _screen_context

- VUID-VkScreenSurfaceCreateInfoQNX-window-04742
  window must point to a valid QNX Screen struct _screen_window

Valid Usage (Implicit)

- VUID-VkScreenSurfaceCreateInfoQNX-sType-sType
  sType must be VK_STRUCTURE_TYPE_SCREEN_SURFACE_CREATE_INFO_QNX

- VUID-VkScreenSurfaceCreateInfoQNX-pNext-pNext
  pNext must be NULL

- VUID-VkScreenSurfaceCreateInfoQNX-flags-zerobitmask
  flags must be 0
typedef VkFlags VkScreenSurfaceCreateFlagsQNX;

VkScreenSurfaceCreateFlagsQNX is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.14. Platform-Independent Information

Once created, VkSurfaceKHR objects can be used in this and other extensions, in particular the VK_KHR_swapchain extension.

Several WSI functions return VK_ERROR_SURFACE_LOST_KHR if the surface becomes no longer available. After such an error, the surface (and any child swapchain, if one exists) should be destroyed, as there is no way to restore them to a not-lost state. Applications may attempt to create a new VkSurfaceKHR using the same native platform window object, but whether such re-creation will succeed is platform-dependent and may depend on the reason the surface became unavailable. A lost surface does not otherwise cause devices to be lost.

To destroy a VkSurfaceKHR object, call:

```c
// Provided by VK_KHR_surface
void vkDestroySurfaceKHR(  
    VkInstance instance,  
    VkSurfaceKHR surface,  
    const VkAllocationCallbacks* pAllocator);
```

- `instance` is the instance used to create the surface.
- `surface` is the surface to destroy.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

Destroying a VkSurfaceKHR merely severs the connection between Vulkan and the native surface, and does not imply destroying the native surface, closing a window, or similar behavior.

#### Valid Usage

- VUID-vkDestroySurfaceKHR-surface-01266
  All VkSwapchainKHR objects created for surface must have been destroyed prior to destroying surface
- VUID-vkDestroySurfaceKHR-surface-01267
  If VkAllocationCallbacks were provided when surface was created, a compatible set of callbacks must be provided here
- VUID-vkDestroySurfaceKHR-surface-01268
  If no VkAllocationCallbacks were provided when surface was created, pAllocator must be NULL
Valid Usage (Implicit)

- VUID-vkDestroySurfaceKHR-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkDestroySurfaceKHR-surface-parameter
  If surface is not VK_NULL_HANDLE, surface must be a valid VkSurfaceKHR handle

- VUID-vkDestroySurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroySurfaceKHR-surface-parent
  If surface is a valid handle, it must have been created, allocated, or retrieved from instance

Host Synchronization

- Host access to surface must be externally synchronized

34.3. Presenting Directly to Display Devices

In some environments applications can also present Vulkan rendering directly to display devices without using an intermediate windowing system. This can be useful for embedded applications, or implementing the rendering/presentation backend of a windowing system using Vulkan. The VK_KHR_display extension provides the functionality necessary to enumerate display devices and create VkSurfaceKHR objects that target displays.

34.3.1. Display Enumeration

Displays are represented by VkDisplayKHR handles:

```c
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayKHR)
```

Various functions are provided for enumerating the available display devices present on a Vulkan physical device. To query information about the available displays, call:

```c
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t pPropertyCount,
    VkDisplayPropertiesKHR* pProperties);
```

- physicalDevice is a physical device.
• `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.

• `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display devices available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display devices for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle

• VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value

• VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pProperties-parameter If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPropertiesKHR` structures

Return Codes

Success

• `VK_SUCCESS`

• `VK_INCOMPLETE`

Failure

• `VK_ERROR_OUT_OF_HOST_MEMORY`

• `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPropertiesKHR {
    VkDisplayKHR display;
    const char* displayName;
    VkExtent2D physicalDimensions;
    VkExtent2D physicalResolution;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkBool32 planeReorderPossible;
    VkBool32 persistentContent;
} VkDisplayPropertiesKHR;
```
• **display** is a handle that is used to refer to the display described here. This handle will be valid for the lifetime of the Vulkan instance.

• **displayName** is **NULL** or a pointer to a null-terminated UTF-8 string containing the name of the display. Generally, this will be the name provided by the display's EDID. If **NULL**, no suitable name is available. If not **NULL**, the string pointed to must remain accessible and unmodified as long as **display** is valid.

• **physicalDimensions** describes the physical width and height of the visible portion of the display, in millimeters.

• **physicalResolution** describes the physical, native, or preferred resolution of the display.

  **Note**
  For devices which have no natural value to return here, implementations should return the maximum resolution supported.

• **supportedTransforms** is a bitmask of **VkSurfaceTransformFlagBitsKHR** describing which transforms are supported by this display.

• **planeReorderPossible** tells whether the planes on this display can have their z order changed. If this is **VK_TRUE**, the application can re-arrange the planes on this display in any order relative to each other.

• **persistentContent** tells whether the display supports self-refresh/internal buffering. If this is true, the application can submit persistent present operations on swapchains created against this display.

  **Note**
  Persistent presents may have higher latency, and may use less power when the screen content is updated infrequently, or when only a portion of the screen needs to be updated in most frames.

To query information about the available displays, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayProperties2KHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayProperties2KHR* pProperties);
```

• **physicalDevice** is a physical device.

• **pPropertyCount** is a pointer to an integer related to the number of display devices available or queried, as described below.

• **pProperties** is either **NULL** or a pointer to an array of **VkDisplayProperties2KHR** structures.

`vkGetPhysicalDeviceDisplayProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPropertiesKHR`, with the ability to return extended information via chained output structures.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pPropertyCount-parameter
  pPropertyCount must be a valid pointer to a uint32_t value

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayProperties2KHR structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayProperties2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPropertiesKHR displayProperties;
} VkDisplayProperties2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- displayProperties is a VkDisplayPropertiesKHR structure.

Valid Usage (Implicit)

- VUID-VkDisplayProperties2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR

- VUID-VkDisplayProperties2KHR-pNext-pNext
  pNext must be NULL
Acquiring and Releasing Displays

On some platforms, access to displays is limited to a single process or native driver instance. On such platforms, some or all of the displays may not be available to Vulkan if they are already in use by a native windowing system or other application.

To acquire permission to directly access a display in Vulkan from an X11 server, call:

```c
// Provided by VK_EXT_acquire_xlib_display
VkResult vkAcquireXlibDisplayEXT(
    VkPhysicalDevice physicalDevice,       // The physical device the display is on.
    Display* dpy,                          // A connection to the X11 server that currently owns display.
    VkDisplayKHR display);                 // The display the caller wishes to control in Vulkan.
```

- `physicalDevice` The physical device the display is on.
- `dpy` A connection to the X11 server that currently owns `display`.
- `display` The display the caller wishes to control in Vulkan.

All permissions necessary to control the display are granted to the Vulkan instance associated with `physicalDevice` until the display is released or the X11 connection specified by `dpy` is terminated. Permission to access the display **may** be temporarily revoked during periods when the X11 server from which control was acquired itself loses access to `display`. During such periods, operations which require access to the display **must** fail with an appropriate error code. If the X11 server associated with `dpy` does not own `display`, or if permission to access it has already been acquired by another entity, the call **must** return the error code `VK_ERROR_INITIALIZATION_FAILED`.

**Note**

One example of when an X11 server loses access to a display is when it loses ownership of its virtual terminal.

**Valid Usage (Implicit)**

- VUID-vkAcquireXlibDisplayEXT-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkAcquireXlibDisplayEXT-dpy-parameter
  `dpy` must be a valid pointer to a `Display` value

- VUID-vkAcquireXlibDisplayEXT-display-parameter
  `display` must be a valid `VkDisplayKHR` handle

- VUID-vkAcquireXlibDisplayEXT-display-parent
  `display` must have been created, allocated, or retrieved from `physicalDevice`
When acquiring displays from an X11 server, an application may also wish to enumerate and identify them using a native handle rather than a `VkDisplayKHR` handle. To determine the `VkDisplayKHR` handle corresponding to an X11 RandR Output, call:

```
// Provided by VK_EXT_acquire_xlib_display
VkResult vkGetRandROutputDisplayEXT(
    VkPhysicalDevice physicalDevice,  // The physical device to query the display handle on.
    Display* dpy,                     // A connection to the X11 server from which rrOutput was queried.
    RROutput rrOutput,                // An X11 RandR output ID.
    VkDisplayKHR* pDisplay);          // The corresponding VkDisplayKHR handle will be returned here.
```

If there is no `VkDisplayKHR` corresponding to `rrOutput` on `physicalDevice`, `VK_NULL_HANDLE` must be returned in `pDisplay`.

### Valid Usage (Implicit)

- VUID-vkGetRandROutputDisplayEXT-physicalDevice-parameter  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetRandROutputDisplayEXT-dpy-parameter  
  `dpy` must be a valid pointer to a `Display` value
- VUID-vkGetRandROutputDisplayEXT-pDisplay-parameter  
  `pDisplay` must be a valid pointer to a `VkDisplayKHR` handle

### Return Codes

#### Success

- `VK_SUCCESS`
To acquire permission to directly access a display in Vulkan on Windows 10, call:

```c
// Provided by VK_NV_acquire_winrt_display
VkResult vkAcquireWinrtDisplayNV(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display);
```

- **physicalDevice** The physical device the display is on.
- **display** The display the caller wishes to control in Vulkan.

All permissions necessary to control the display are granted to the Vulkan instance associated with `physicalDevice` until the display is released or the application is terminated. Permission to access the display may be revoked by events that cause Windows 10 itself to lose access to `display`. If this has happened, operations which require access to the display must fail with an appropriate error code. If permission to access `display` has already been acquired by another entity, the call must return the error code `VK_ERROR_INITIALIZATION_FAILED`.

**Note**
The Vulkan instance acquires control of a “winrt::Windows::Devices::Display::Core::DisplayTarget” by performing an operation equivalent to “winrt::Windows::Devices::Display::Core::DisplayManager.TryAcquireTarget()” on the “DisplayTarget”.

**Note**
One example of when Windows 10 loses access to a display is when the display is hot-unplugged.

**Note**
One example of when a display has already been acquired by another entity is when the Windows desktop compositor (DWM) is in control of the display. Beginning with Windows 10 version 2004 it is possible to cause DWM to release a display by using the “Advanced display settings” sub-page of the “Display settings” control panel. `vkAcquireWinrtDisplayNV` does not itself cause DWM to release a display; this action must be performed outside of Vulkan.

**Valid Usage (Implicit)**

- VUID-vkAcquireWinrtDisplayNV-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkAcquireWinrtDisplayNV-display-parameter
display must be a valid VkDisplayKHR handle

- VUID-vkAcquireWinrtDisplayNV-display-parent
display must have been created, allocated, or retrieved from physicalDevice

## Return Codes

### Success
- VK_SUCCESS

### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_INITIALIZATION_FAILED

When acquiring displays on Windows 10, an application may also wish to enumerate and identify them using a native handle rather than a VkDisplayKHR handle.

To determine the VkDisplayKHR handle corresponding to a “winrt::Windows::Devices::Display::Core::DisplayTarget”, call:

```c
// Provided by VK_NV_acquire_winrt_display
VkResult vkGetWinrtDisplayNV(
    VkPhysicalDevice physicalDevice,
    uint32_t deviceRelativeId,
    VkDisplayKHR* pDisplay);
```

- **physicalDevice** The physical device on which to query the display handle.
- **deviceRelativeId** The value of the “AdapterRelativeId” property of a “DisplayTarget” that is enumerated by a “DisplayAdapter” with an “Id” property matching the deviceLUID property of a VkPhysicalDeviceIDProperties for physicalDevice.
- **pDisplay** The corresponding VkDisplayKHR handle will be returned here.

If there is no VkDisplayKHR corresponding to deviceRelativeId on physicalDevice, VK_NULL_HANDLE must be returned in pDisplay.

## Valid Usage (Implicit)

- VUID-vkGetWinrtDisplayNV-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetWinrtDisplayNV-pDisplay-parameter
  pDisplay must be a valid pointer to a VkDisplayKHR handle
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_INITIALIZATION_FAILED

To acquire permission to directly a display in Vulkan from the Direct Rendering Manager (DRM) interface, call:

```c
// Provided by VK_EXT_acquire_drm_display
VkResult vkAcquireDrmDisplayEXT(
    VkPhysicalDevice physicalDevice,  
    int32_t drmFd, 
    VkDisplayKHR display);
```

- `physicalDevice` The physical device the display is on.
- `drmFd` DRM primary file descriptor.
- `display` The display the caller wishes Vulkan to control.

All permissions necessary to control the display are granted to the Vulkan instance associated with the provided `physicalDevice` until the display is either released or the connector is unplugged. The provided `drmFd` must correspond to the one owned by the `physicalDevice`. If not, the error code VK_ERROR_UNKNOWN must be returned. The DRM FD must have DRM master permissions. If any error is encountered during the acquisition of the display, the call must return the error code VK_ERROR_INITIALIZATION_FAILED.

The provided DRM fd should not be closed before the display is released, attempting to do it may result in undefined behavior.

Valid Usage (Implicit)

- **VUID-vkAcquireDrmDisplayEXT-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkAcquireDrmDisplayEXT-display-parameter**
  - `display` must be a valid `VkDisplayKHR` handle

- **VUID-vkAcquireDrmDisplayEXT-display-parent**
  - `display` must have been created, allocated, or retrieved from `physicalDevice`
Before acquiring a display from the DRM interface, the caller may want to select a specific VkDisplayKHR handle by identifying it using a connectorId. To do so, call:

```c
// Provided by VK_EXT_acquire_drm_display
VkResult vkGetDrmDisplayEXT(
    VkPhysicalDevice physicalDevice,
    int32_t drmFd,
    uint32_t connectorId,
    VkDisplayKHR* display);
```

- **physicalDevice** The physical device to query the display from.
- **drmFd** DRM primary file descriptor.
- **connectorId** Identifier of the specified DRM connector.
- **display** The corresponding VkDisplayKHR handle will be returned here.

If there is no VkDisplayKHR corresponding to the connectorId on the physicalDevice, the returning display must be set to VK_NULL_HANDLE. The provided drmFd must correspond to the one owned by the physicalDevice. If not, the error code VK_ERROR_UNKNOWN must be returned. Master permissions are not required, because the file descriptor is just used for information gathering purposes. The given connectorId must be a resource owned by the provided drmFd. If not, the error code VK_ERROR_UNKNOWN must be returned. If any error is encountered during the identification of the display, the call must return the error code VK_ERROR_INITIALIZATION_FAILED.

### Valid Usage (Implicit)

- **VUID-vkGetDrmDisplayEXT-physicalDevice-parameter**
  `physicalDevice` must be a valid VkPhysicalDevice handle

- **VUID-vkGetDrmDisplayEXT-display-parameter**
  `display` must be a valid pointer to a VkDisplayKHR handle

### Return Codes

**Success**
- VK_SUCCESS
Failure

- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY

To release a previously acquired display, call:

```c
// Provided by VK_EXT_direct_mode_display
VkResult vkReleaseDisplayEXT(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display);
```

- **physicalDevice** The physical device the display is on.
- **display** The display to release control of.

Valid Usage (Implicit)

- VUID-vkReleaseDisplayEXT-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkReleaseDisplayEXT-display-parameter
  display must be a valid VkDisplayKHR handle
- VUID-vkReleaseDisplayEXT-display-parent
  display must have been created, allocated, or retrieved from physicalDevice

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- None

Display Planes

Images are presented to individual planes on a display. Devices must support at least one plane on each display. Planes can be stacked and blended to composite multiple images on one display. Devices may support only a fixed stacking order and fixed mapping between planes and displays, or they may allow arbitrary application specified stacking orders and mappings between planes and displays. To query the properties of device display planes, call:
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPlanePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPlanePropertiesKHR* pProperties);

- physicalDevice is a physical device.
- pPropertyCount is a pointer to an integer related to the number of display planes available or queried, as described below.
- pProperties is either NULL or a pointer to an array of VkDisplayPlanePropertiesKHR structures.

If pProperties is NULL, then the number of display planes available for physicalDevice is returned in pPropertyCount. Otherwise, pPropertyCount must point to a variable set by the user to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If the value of pPropertyCount is less than the number of display planes for physicalDevice, at most pPropertyCount structures will be written.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pProperties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayPlanePropertiesKHR structures

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayPlanePropertiesKHR structure is defined as:
typedef struct VkDisplayPlanePropertiesKHR {
    VkDisplayKHR currentDisplay;
    uint32_t currentStackIndex;
} VkDisplayPlanePropertiesKHR;

• currentDisplay is the handle of the display the plane is currently associated with. If the plane is not currently attached to any displays, this will be VK_NULL_HANDLE.

• currentStackIndex is the current z-order of the plane. This will be between 0 and the value returned by vkGetPhysicalDeviceDisplayPlanePropertiesKHR in pPropertyCount.

To query the properties of a device’s display planes, call:

// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayPlaneProperties2KHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPlaneProperties2KHR* pProperties);

• physicalDevice is a physical device.

• pPropertyCount is a pointer to an integer related to the number of display planes available or queried, as described below.

• pProperties is either NULL or a pointer to an array of VkDisplayPlaneProperties2KHR structures.

vkGetPhysicalDeviceDisplayPlaneProperties2KHR behaves similarly to vkGetPhysicalDeviceDisplayPlanePropertiesKHR, with the ability to return extended information via chained output structures.

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value

• VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pProperties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayPlaneProperties2KHR structures

Return Codes

Success
• VK_SUCCESS
Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplayPlaneProperties2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlanePropertiesKHR displayPlaneProperties;
} VkDisplayPlaneProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `displayPlaneProperties` is a `VkDisplayPlanePropertiesKHR` structure.

Valid Usage (Implicit)

- VUID-VkDisplayPlaneProperties2KHR-sType-sType `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR`
- VUID-VkDisplayPlaneProperties2KHR-pNext-pNext `pNext` must be NULL

To determine which displays a plane is usable with, call

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneSupportedDisplaysKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t planeIndex,
    uint32_t* pDisplayCount,
    VkDisplayKHR* pDisplays);
```

- `physicalDevice` is a physical device.
- `planeIndex` is the plane which the application wishes to use, and must be in the range [0, physical device plane count - 1].
- `pDisplayCount` is a pointer to an integer related to the number of displays available or queried, as described below.
- `pDisplays` is either NULL or a pointer to an array of `VkDisplayKHR` handles.

If `pDisplays` is NULL, then the number of displays usable with the specified `planeIndex` for
physicalDevice is returned in pDisplayCount. Otherwise, pDisplayCount must point to a variable set by the user to the number of elements in the pDisplays array, and on return the variable is overwritten with the number of handles actually written to pDisplays. If the value of pDisplayCount is less than the number of usable display-plane pairs for physicalDevice, at most pDisplayCount handles will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available pairs were returned.

### Valid Usage

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-planeIndex-01249
  - planeIndex must be less than the number of display planes supported by the device as determined by calling vkGetPhysicalDeviceDisplayPlanePropertiesKHR

### Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-physicalDevice-parameter
  - physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplayCount-parameter
  - pDisplayCount must be a valid pointer to a uint32_t value
- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplays-parameter
  - If the value referenced by pDisplayCount is not 0, and pDisplays is not NULL, pDisplays must be a valid pointer to an array of pDisplayCount VkDisplayKHR handles

### Return Codes

**Success**

- VK_SUCCESS
- VK_INCOMPLETE

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

Additional properties of displays are queried using specialized query functions.

### Display Modes

Display modes are represented by VkDisplayModeKHR handles:

```c
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayModeKHR)
```

Each display has one or more supported modes associated with it by default. These built-in modes
are queried by calling:

```
// Provided by VK_KHR_display
VkResult vkGetDisplayModePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    uint32_t* pPropertyCount,
    VkDisplayModePropertiesKHR* pProperties);
```

- **physicalDevice** is the physical device associated with **display**.
- **display** is the display to query.
- **pPropertyCount** is a pointer to an integer related to the number of display modes available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of **VkDisplayModePropertiesKHR** structures.

If **pProperties** is **NULL**, then the number of display modes available on the specified **display** for **physicalDevice** is returned in **pPropertyCount**. Otherwise, **pPropertyCount** must point to a variable set by the user to the number of elements in the **pProperties** array, and on return the variable is overwritten with the number of structures actually written to **pProperties**. If the value of **pPropertyCount** is less than the number of display modes for **physicalDevice**, at most **pPropertyCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available display modes were returned.

### Valid Usage (Implicit)

- VUID-vkGetDisplayModePropertiesKHR-physicalDevice-parameter
  **physicalDevice** must be a valid **VkPhysicalDevice** handle
- VUID-vkGetDisplayModePropertiesKHR-display-parameter
  **display** must be a valid **VkDisplayKHR** handle
- VUID-vkGetDisplayModePropertiesKHR-pPropertyCount-parameter
  **pPropertyCount** must be a valid pointer to a **uint32_t** value
- VUID-vkGetDisplayModePropertiesKHR-pProperties-parameter
  If the value referenced by **pPropertyCount** is not 0, and **pProperties** is not **NULL**, **pProperties** must be a valid pointer to an array of **pPropertyCount** **VkDisplayModePropertiesKHR** structures
- VUID-vkGetDisplayModePropertiesKHR-display-parent
  **display** must have been created, allocated, or retrieved from **physicalDevice**

### Return Codes

**Success**

- **VK_SUCCESS**
- **VK_INCOMPLETE**
Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplayModePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModePropertiesKHR {
    VkDisplayModeKHR displayMode;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModePropertiesKHR;
```

- **displayMode** is a handle to the display mode described in this structure. This handle will be valid for the lifetime of the Vulkan instance.
- **parameters** is a `VkDisplayModeParametersKHR` structure describing the display parameters associated with `displayMode`.

```c
// Provided by VK_KHR_display
typedef VkFlags VkDisplayModeCreateFlagsKHR;
```

`VkDisplayModeCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To query the properties of a device's built-in display modes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayModeProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    uint32_t* pPropertyCount,
    VkDisplayModeProperties2KHR* pProperties);
```

- **physicalDevice** is the physical device associated with `display`.
- **display** is the display to query.
- **pPropertyCount** is a pointer to an integer related to the number of display modes available or queried, as described below.
- **pProperties** is either `NULL` or a pointer to an array of `VkDisplayModeProperties2KHR` structures.

`vkGetDisplayModeProperties2KHR` behaves similarly to `vkGetDisplayModePropertiesKHR`, with the ability to return extended information via chained output structures.
Valid Usage (Implicit)

- VUID-vkGetDisplayModeProperties2KHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetDisplayModeProperties2KHR-display-parameter
  display must be a valid VkDisplayKHR handle

- VUID-vkGetDisplayModeProperties2KHR-pPropertyCount-parameter
  pPropertyCount must be a valid pointer to a uint32_t value

- VUID-vkGetDisplayModeProperties2KHR-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayModeProperties2KHR structures

- VUID-vkGetDisplayModeProperties2KHR-display-parent
  display must have been created, allocated, or retrieved from physicalDevice

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayModeProperties2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayModeProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayModePropertiesKHR displayModeProperties;
} VkDisplayModeProperties2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- displayModeProperties is a VkDisplayModePropertiesKHR structure.

Valid Usage (Implicit)

- VUID-VkDisplayModeProperties2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR
The `VkDisplayModeParametersKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModeParametersKHR {
    VkExtent2D visibleRegion;
    uint32_t refreshRate;
} VkDisplayModeParametersKHR;
```

- `visibleRegion` is the 2D extents of the visible region.
- `refreshRate` is a `uint32_t` that is the number of times the display is refreshed each second multiplied by 1000.

**Note**
For example, a 60Hz display mode would report a `refreshRate` of 60,000.

### Valid Usage

- VUID-VkDisplayModeParametersKHR-width-01990
  The `width` member of `visibleRegion` **must** be greater than 0
- VUID-VkDisplayModeParametersKHR-height-01991
  The `height` member of `visibleRegion` **must** be greater than 0
- VUID-VkDisplayModeParametersKHR-refreshRate-01992
  `refreshRate` **must** be greater than 0

Additional modes **may** also be created by calling:

```c
// Provided by VK_KHR_display
VkResult vkCreateDisplayModeKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    const VkDisplayModeCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDisplayModeKHR* pMode);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to create an additional mode for.
- `pCreateInfo` is a pointer to a `VkDisplayModeCreateInfoKHR` structure describing the new mode to create.
- `pAllocator` is the allocator used for host memory allocated for the display mode object when
there is no more specific allocator available (see Memory Allocation).

- **\( \text{pMode} \)** is a pointer to a `VkDisplayModeKHR` handle in which the mode created is returned.

Valid Usage (Implicit)

- **VUID-vkCreateDisplayModeKHR-physicalDevice-parameter**
  \( \text{physicalDevice} \) must be a valid `VkPhysicalDevice` handle
- **VUID-vkCreateDisplayModeKHR-display-parameter**
  \( \text{display} \) must be a valid `VkDisplayKHR` handle
- **VUID-vkCreateDisplayModeKHR-pCreateInfo-parameter**
  \( \text{pCreateInfo} \) must be a valid pointer to a valid `VkDisplayModeCreateInfoKHR` structure
- **VUID-vkCreateDisplayModeKHR-pAllocator-parameter**
  If \( \text{pAllocator} \) is not `NULL`, \( \text{pAllocator} \) must be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreateDisplayModeKHR-pMode-parameter**
  \( \text{pMode} \) must be a valid pointer to a `VkDisplayModeKHR` handle
- **VUID-vkCreateDisplayModeKHR-display-parent**
  \( \text{display} \) must have been created, allocated, or retrieved from `physicalDevice`

Host Synchronization

- Host access to \( \text{display} \) must be externally synchronized

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkDisplayModeCreateInfoKHR` structure is defined as:
typedef struct VkDisplayModeCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplayModeCreateFlagsKHR flags;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModeCreateInfoKHR;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is reserved for future use, and **must** be zero.
• **parameters** is a `VkDisplayModeParametersKHR` structure describing the display parameters to use in creating the new mode. If the parameters are not compatible with the specified display, the implementation **must** return `VK_ERROR_INITIALIZATION_FAILED`.

### Valid Usage (Implicit)

- VUID-VkDisplayModeCreateInfoKHR-sType-sType
  
  **sType must be** `VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR`

- VUID-VkDisplayModeCreateInfoKHR-pNext-pNext
  
  **pNext must be** `NULL`

- VUID-VkDisplayModeCreateInfoKHR-flags-zerobitmask
  
  **flags must be** `0`

- VUID-VkDisplayModeCreateInfoKHR-parameters-parameter
  
  **parameters must be** a valid `VkDisplayModeParametersKHR` structure

Applications that wish to present directly to a display **must** select which layer, or “plane” of the display they wish to target, and a mode to use with the display. Each display supports at least one plane. The capabilities of a given mode and plane combination are determined by calling:

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneCapabilitiesKHR(  
    VkPhysicalDevice physicalDevice,  
    VkDisplayModeKHR mode,  
    uint32_t planeIndex,  
    VkDisplayPlaneCapabilitiesKHR* pCapabilities);
```

- **physicalDevice** is the physical device associated with the display specified by `mode`
- **mode** is the display mode the application intends to program when using the specified plane. Note this parameter also implicitly specifies a display.
- **planeIndex** is the plane which the application intends to use with the display, and is less than the number of display planes supported by the device.
• **pCapabilities** is a pointer to a `VkDisplayPlaneCapabilitiesKHR` structure in which the capabilities are returned.

## Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneCapabilitiesKHR-physicalDevice-parameter  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parameter  
  `mode` must be a valid `VkDisplayModeKHR` handle

- VUID-vkGetDisplayPlaneCapabilitiesKHR-pCapabilities-parameter  
  `pCapabilities` must be a valid pointer to a `VkDisplayPlaneCapabilitiesKHR` structure

- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parent  
  `mode` must have been created, allocated, or retrieved from `physicalDevice`

## Host Synchronization

- Host access to `mode` must be externally synchronized

## Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlaneCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlaneCapabilitiesKHR {
    VkDisplayPlaneAlphaFlagsKHR supportedAlpha;
    VkOffset2D minSrcPosition;
    VkOffset2D maxSrcPosition;
    VkExtent2D minSrcExtent;
    VkExtent2D maxSrcExtent;
    VkOffset2D minDstPosition;
    VkOffset2D maxDstPosition;
    VkExtent2D minDstExtent;
    VkExtent2D maxDstExtent;
} VkDisplayPlaneCapabilitiesKHR;
```

• **supportedAlpha** is a bitmask of `VkDisplayPlaneAlphaFlagBitsKHR` describing the supported alpha
blending modes.

- **minSrcPosition** is the minimum source rectangle offset supported by this plane using the specified mode.

- **maxSrcPosition** is the maximum source rectangle offset supported by this plane using the specified mode. The x and y components of **maxSrcPosition** must each be greater than or equal to the x and y components of **minSrcPosition**, respectively.

- **minSrcExtent** is the minimum source rectangle size supported by this plane using the specified mode.

- **maxSrcExtent** is the maximum source rectangle size supported by this plane using the specified mode.

- **minDstPosition**, **maxDstPosition**, **minDstExtent**, and **maxDstExtent** all have similar semantics to their corresponding *Src* equivalents, but apply to the output region within the mode rather than the input region within the source image. Unlike the *Src* offsets, **minDstPosition** and **maxDstPosition** may contain negative values.

The minimum and maximum position and extent fields describe the implementation limits, if any, as they apply to the specified display mode and plane. Vendors may support displaying a subset of a swapchain's presentable images on the specified display plane. This is expressed by returning **minSrcPosition**, **maxSrcPosition**, **minSrcExtent**, and **maxSrcExtent** values that indicate a range of possible positions and sizes which may be used to specify the region within the presentable images that source pixels will be read from when creating a swapchain on the specified display mode and plane.

Vendors may also support mapping the presentable images' content to a subset or superset of the visible region in the specified display mode. This is expressed by returning **minDstPosition**, **maxDstPosition**, **minDstExtent**, and **maxDstExtent** values that indicate a range of possible positions and sizes which may be used to describe the region within the display mode that the source pixels will be mapped to.

Other vendors may support only a 1-1 mapping between pixels in the presentable images and the display mode. This may be indicated by returning (0,0) for **minSrcPosition**, **maxSrcPosition**, **minDstPosition**, and **maxDstPosition**, and (display mode width, display mode height) for **minSrcExtent**, **maxSrcExtent**, **minDstExtent**, and **maxDstExtent**.

The value **supportedAlpha** must contain at least one valid VkDisplayPlaneAlphaFlagBitsKHR bit.

These values indicate the limits of the implementation's individual fields. Not all combinations of values within the offset and extent ranges returned in VkDisplayPlaneCapabilitiesKHR are guaranteed to be supported. Presentation requests specifying unsupported combinations may fail.

To query the capabilities of a given mode and plane combination, call:
VkResult vkGetDisplayPlaneCapabilities2KHR(VkPhysicalDevice physicalDevice, const VkDisplayPlaneInfo2KHR* pDisplayPlaneInfo, VkDisplayPlaneCapabilities2KHR* pCapabilities);

- **physicalDevice** is the physical device associated with **pDisplayPlaneInfo**.
- **pDisplayPlaneInfo** is a pointer to a **VkDisplayPlaneInfo2KHR** structure describing the plane and mode.
- **pCapabilities** is a pointer to a **VkDisplayPlaneCapabilities2KHR** structure in which the capabilities are returned.

*vkGetDisplayPlaneCapabilities2KHR* behaves similarly to *vkGetDisplayPlaneCapabilitiesKHR*, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

### Valid Usage (Implicit)

- **VUID-vkGetDisplayPlaneCapabilities2KHR-physicalDevice-parameter**
  
  **physicalDevice** must be a valid **VkPhysicalDevice** handle

- **VUID-vkGetDisplayPlaneCapabilities2KHR-pDisplayPlaneInfo-parameter**
  
  **pDisplayPlaneInfo** must be a valid pointer to a valid **VkDisplayPlaneInfo2KHR** structure

- **VUID-vkGetDisplayPlaneCapabilities2KHR-pCapabilities-parameter**
  
  **pCapabilities** must be a valid pointer to a **VkDisplayPlaneCapabilities2KHR** structure

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The **VkDisplayPlaneInfo2KHR** structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplayModeKHR mode;
    uint32_t planeIndex;
} VkDisplayPlaneInfo2KHR;
```
• **sType** is a [VkStructureType](https://www.khronos.org/registry/vulkan/specs/1.1-extensions/html/vulkan-1.1.html#vkStructureType) value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **mode** is the display mode the application intends to program when using the specified plane.

**Note**

This parameter also implicitly specifies a display.

• **planeIndex** is the plane which the application intends to use with the display.

The members of [VkDisplayPlaneInfo2KHR](https://www.khronos.org/registry/vulkan/specs/1.1-extensions/html/vulkan-1.1.html#vkDisplayPlaneInfo2KHR) correspond to the arguments to [vkGetDisplayPlaneCapabilitiesKHR](https://www.khronos.org/registry/vulkan/specs/1.1-extensions/html/vulkan-1.1.html#vkGetDisplayPlaneCapabilitiesKHR), with **sType** and **pNext** added for extensibility.

### Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR`
- **pNext** must be **NULL**
- **mode** must be a valid [VkDisplayModeKHR](https://www.khronos.org/registry/vulkan/specs/1.1-extensions/html/vulkan-1.1.html#VkDisplayModeKHR) handle

### Host Synchronization

- Host access to **mode** must be externally synchronized

The [VkDisplayPlaneCapabilities2KHR](https://www.khronos.org/registry/vulkan/specs/1.1-extensions/html/vulkan-1.1.html#VkDisplayPlaneCapabilities2KHR) structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlaneCapabilitiesKHR capabilities;
} VkDisplayPlaneCapabilities2KHR;
```

• **sType** is a [VkStructureType](https://www.khronos.org/registry/vulkan/specs/1.1-extensions/html/vulkan-1.1.html#vkStructureType) value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **capabilities** is a [VkDisplayPlaneCapabilitiesKHR](https://www.khronos.org/registry/vulkan/specs/1.1-extensions/html/vulkan-1.1.html#VkDisplayPlaneCapabilitiesKHR) structure.

### Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR`
34.3.2. Display Control

To set the power state of a display, call:

```c
// Provided by VK_EXT_display_control
VkResult vkDisplayPowerControlEXT(
    VkDevice device,
    VkDisplayKHR display,
    const VkDisplayPowerInfoEXT* pDisplayPowerInfo);
```

- `device` is a logical device associated with `display`.
- `display` is the display whose power state is modified.
- `pDisplayPowerInfo` is a pointer to a `VkDisplayPowerInfoEXT` structure specifying the new power state of `display`.

### Valid Usage (Implicit)

- VUID-vkDisplayPowerControlEXT-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkDisplayPowerControlEXT-display-parameter
  - `display` must be a valid `VkDisplayKHR` handle
- VUID-vkDisplayPowerControlEXT-pDisplayPowerInfo-parameter
  - `pDisplayPowerInfo` must be a valid pointer to a valid `VkDisplayPowerInfoEXT` structure
- VUID-vkDisplayPowerControlEXT-commonparent
  - Both of `device`, and `display` must have been created, allocated, or retrieved from the same `VkPhysicalDevice`

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkDisplayPowerInfoEXT` structure is defined as:
typedef struct VkDisplayPowerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDisplayPowerStateEXT powerState;
} VkDisplayPowerInfoEXT;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **powerState** is a VkDisplayPowerStateEXT value specifying the new power state of the display.

### Valid Usage (Implicit)

- VUID-VkDisplayPowerInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT

- VUID-VkDisplayPowerInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkDisplayPowerInfoEXT-powerState-parameter
  powerState must be a valid VkDisplayPowerStateEXT value

Possible values of VkDisplayPowerInfoEXT::powerState, specifying the new power state of a display, are:

typedef enum VkDisplayPowerStateEXT {
    VK_DISPLAY_POWER_STATE_OFF_EXT = 0,
    VK_DISPLAY_POWER_STATE_SUSPEND_EXT = 1,
    VK_DISPLAY_POWER_STATE_ON_EXT = 2,
} VkDisplayPowerStateEXT;

- **VK_DISPLAY_POWER_STATE_OFF_EXT** specifies that the display is powered down.
- **VK_DISPLAY_POWER_STATE_SUSPEND_EXT** specifies that the display is put into a low power mode, from which it may be able to transition back to **VK_DISPLAY_POWER_STATE_ON_EXT** more quickly than if it were in **VK_DISPLAY_POWER_STATE_OFF_EXT**. This state may be the same as **VK_DISPLAY_POWER_STATE_OFF_EXT**.
- **VK_DISPLAY_POWER_STATE_ON_EXT** specifies that the display is powered on.

### 34.3.3. Display Surfaces

A complete display configuration includes a mode, one or more display planes and any parameters describing their behavior, and parameters describing some aspects of the images associated with those planes. Display surfaces describe the configuration of a single plane within a complete display configuration. To create a VkSurfaceKHR object for a display plane, call:
VkResult vkCreateDisplayPlaneSurfaceKHR(VkInstance instance, const VkDisplaySurfaceCreateInfoKHR* pCreateInfo, const VkAllocationCallbacks* pAllocator, VkSurfaceKHR* pSurface);

- `instance` is the instance corresponding to the physical device the targeted display is on.
- `pCreateInfo` is a pointer to a `VkDisplaySurfaceCreateInfoKHR` structure specifying which mode, plane, and other parameters to use, as described below.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDisplayPlaneSurfaceKHR-instance-parameter  
  `instance` must be a valid `VkInstance` handle
- VUID-vkCreateDisplayPlaneSurfaceKHR-pCreateInfo-parameter  
  `pCreateInfo` must be a valid pointer to a valid `VkDisplaySurfaceCreateInfoKHR` structure
- VUID-vkCreateDisplayPlaneSurfaceKHR-pAllocator-parameter  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateDisplayPlaneSurfaceKHR-pSurface-parameter  
  `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplaySurfaceCreateInfoKHR` structure is defined as:
// Provided by VK_KHR_display

typedef struct VkDisplaySurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplaySurfaceCreateFlagsKHR flags;
    VkDisplayModeKHR displayMode;
    uint32_t planeIndex;
    uint32_t planeStackIndex;
    VkSurfaceTransformFlagBitsKHR transform;
    float globalAlpha;
    VkDisplayPlaneAlphaFlagBitsKHR alphaMode;
    VkExtent2D imageExtent;
} VkDisplaySurfaceCreateInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use, and must be zero.
- **displayMode** is a `VkDisplayModeKHR` handle specifying the mode to use when displaying this surface.
- **planeIndex** is the plane on which this surface appears.
- **planeStackIndex** is the z-order of the plane.
- **transform** is a `VkSurfaceTransformFlagBitsKHR` value specifying the transformation to apply to images as part of the scanout operation.
- **globalAlpha** is the global alpha value. This value is ignored if **alphaMode** is not `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR`.
- **alphaMode** is a `VkDisplayPlaneAlphaFlagBitsKHR` value specifying the type of alpha blending to use.
- **imageExtent** is the size of the presentable images to use with the surface.

**Note**
Creating a display surface must not modify the state of the displays, planes, or other resources it names. For example, it must not apply the specified mode to be set on the associated display. Application of display configuration occurs as a side effect of presenting to a display surface.

**Valid Usage**

- **VUID-VkDisplaySurfaceCreateInfoKHR-planeIndex-01252**
  **planeIndex** must be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`.

- **VUID-VkDisplaySurfaceCreateInfoKHR-planeReorderPossible-01253**
  If the **planeReorderPossible** member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display corresponding to **displayMode** is
VK_TRUE then planeStackIndex must be less than the number of display planes supported by the device as determined by calling vkGetPhysicalDeviceDisplayPlanePropertiesKHR; otherwise planeStackIndex must equal the currentStackIndex member of VkDisplayPlanePropertiesKHR returned by vkGetPhysicalDeviceDisplayPlanePropertiesKHR for the display plane corresponding to displayMode

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01254
  If alphaMode is VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR then globalAlpha must be between 0 and 1, inclusive

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01255
  alphaMode must be one of the bits present in the supportedAlpha member of VkDisplayPlaneCapabilitiesKHR for the display plane corresponding to displayMode

- VUID-VkDisplaySurfaceCreateInfoKHR-transform-06740
  transform must be one of the bits present in the supportedTransforms member of VkDisplayPropertiesKHR for the display corresponding to displayMode

- VUID-VkDisplaySurfaceCreateInfoKHR-width-01256
  The width and height members of imageExtent must be less than or equal to VkPhysicalDeviceLimits::maxImageDimension2D

// Provided by VK_KHR_display
typedef VkFlags VkDisplaySurfaceCreateFlagsKHR;

VkDisplaySurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

Bits which can be set in VkDisplaySurfaceCreateInfoKHR::alphaMode, specifying the type of alpha blending to use on a display, are:
• **VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR** specifies that the source image will be treated as opaque.

• **VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR** specifies that a global alpha value **must** be specified that will be applied to all pixels in the source image.

• **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR** specifies that the alpha value will be determined by the alpha component of the source image's pixels. If the source format contains no alpha values, no blending will be applied. The source alpha values are not premultiplied into the source image's other color components.

• **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR** is equivalent to **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR**, except the source alpha values are assumed to be premultiplied into the source image's other color components.

**34.3.4. Presenting to Headless Surfaces**

Vulkan rendering can be presented to a headless surface, where the presentation operation is a no-op producing no externally-visible result.

*Note*

Because there is no real presentation target, the headless presentation engine may be extended to impose an arbitrary or customizable set of restrictions and features. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

The usual surface query mechanisms must be used to determine the actual restrictions and features of the implementation.

To create a headless **VkSurfaceKHR** object, call:
// Provided by VK_EXT_headless_surface

VkResult vkCreateHeadlessSurfaceEXT(
    VkInstance instance,
    const VkHeadlessSurfaceCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);

• instance is the instance to associate the surface with.
• pCreateInfo is a pointer to a VkHeadlessSurfaceCreateInfoEXT structure containing parameters affecting the creation of the surface object.
• pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
• pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

Valid Usage (Implicit)

• VUID-vkCreateHeadlessSurfaceEXT-instance-parameter instance must be a valid VkInstance handle
• VUID-vkCreateHeadlessSurfaceEXT-pCreateInfo-parameter pCreateInfo must be a valid pointer to a valid VkHeadlessSurfaceCreateInfoEXT structure
• VUID-vkCreateHeadlessSurfaceEXT-pAllocator-parameter If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
• VUID-vkCreateHeadlessSurfaceEXT-pSurface-parameter pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkHeadlessSurfaceCreateInfoEXT structure is defined as:
typedef struct VkHeadlessSurfaceCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkHeadlessSurfaceCreateFlagsEXT flags;
} VkHeadlessSurfaceCreateInfoEXT;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

### Valid Usage (Implicit)

- VUID-VkHeadlessSurfaceCreateInfoEXT-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_HEADLESS_SURFACE_CREATE_INFO_EXT`
- VUID-VkHeadlessSurfaceCreateInfoEXT-pNext-pNext
  - `pNext` must be `NULL`
- VUID-VkHeadlessSurfaceCreateInfoEXT-flags-zerobitmask
  - `flags` must be `0`

For headless surfaces, `currentExtent` is the reserved value (0xFFFFFFFF, 0xFFFFFFFF). Whatever the application sets a swapchain's `imageExtent` to will be the size of the surface, after the first image is presented.

typedef VkFlags VkHeadlessSurfaceCreateFlagsEXT;

`VkHeadlessSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.4. Querying for WSI Support

Not all physical devices will include WSI support. Within a physical device, not all queue families will support presentation. WSI support and compatibility can be determined in a platform-neutral manner (which determines support for presentation to a particular surface object) and additionally may be determined in platform-specific manners (which determine support for presentation on the specified physical device but do not guarantee support for presentation to a particular surface object).

To determine whether a queue family of a physical device supports presentation to a given surface, call:
// Provided by VK_KHR_surface

VkResult vkGetPhysicalDeviceSurfaceSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    VkSurfaceKHR surface,
    VkBool32* pSupported);

• physicalDevice is the physical device.
• queueFamilyIndex is the queue family.
• surface is the surface.
• pSupported is a pointer to a VkBool32, which is set to VK_TRUE to indicate support, and VK_FALSE otherwise.

Valid Usage

• VUID-vkGetPhysicalDeviceSurfaceSupportKHR-queueFamilyIndex-01269
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceSurfaceSupportKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceSurfaceSupportKHR-surface-parameter
  surface must be a valid VkSurfaceKHR handle

• VUID-vkGetPhysicalDeviceSurfaceSupportKHR-pSupported-parameter
  pSupported must be a valid pointer to a VkBool32 value

• VUID-vkGetPhysicalDeviceSurfaceSupportKHR-commonparent
  Both of physicalDevice, and surface must have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_SURFACE_LOST_KHR
34.4.1. Android Platform

On Android, all physical devices and queue families must be capable of presentation with any native window. As a result there is no Android-specific query for these capabilities.

34.4.2. Wayland Platform

To determine whether a queue family of a physical device supports presentation to a Wayland compositor, call:

```c
// Provided by VK_KHR_wayland_surface
VkBool32 vkGetPhysicalDeviceWaylandPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    struct wl_display* display);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `display` is a pointer to the `wl_display` associated with a Wayland compositor.

This platform-specific function can be called prior to creating a surface.

**Valid Usage**

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-queueFamilyIndex-01306 `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle.
- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-display-parameter `display` must be a valid pointer to a `wl_display` value.

34.4.3. Win32 Platform

To determine whether a queue family of a physical device supports presentation to the Microsoft Windows desktop, call:
// Provided by VK_KHR_win32_surface
VkBool32 vkGetPhysicalDeviceWin32PresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex);

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-queueFamilyIndex-01309
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by
  vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

34.4.4. XCB Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the XCB client-side library, call:

// Provided by VK_KHR_xcb_surface
VkBool32 vkGetPhysicalDeviceXcbPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    xcb_connection_t* connection,
    xcb_visualid_t visual_id);

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `connection` is a pointer to an xcb_connection_t to the X server.
- `visual_id` is an X11 visual (xcb_visualid_t).

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-queueFamilyIndex-01312
queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-connection-parameter connection must be a valid pointer to an xcb_connection_t value

34.4.5. Xlib Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the Xlib client-side library, call:

```c
// Provided by VK_KHR_xlib_surface
VkBool32 vkGetPhysicalDeviceXlibPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    Display* dpy,
    VisualID visualId);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `dpy` is a pointer to an Xlib Display connection to the server.
- `visualId` is an X11 visual (VisualID).

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-queueFamilyIndex-01315 queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-dpy-parameter dpy must be a valid pointer to a Display value
34.4.6. DirectFB Platform

To determine whether a queue family of a physical device supports presentation with DirectFB library, call:

```c
// Provided by VK_EXT_directfb_surface
VkBool32 vkGetPhysicalDeviceDirectFBPresentationSupportEXT(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    IDirectFB* dfb);
```

- **physicalDevice** is the physical device.
- **queueFamilyIndex** is the queue family index.
- **dfb** is a pointer to the IDirectFB main interface of DirectFB.

This platform-specific function **can** be called prior to creating a surface.

### Valid Usage

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-queueFamilyIndex-04119
  - queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by
    vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-physicalDevice-parameter
  - physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-dfb-parameter
  - dfb must be a valid pointer to an IDirectFB value

34.4.7. Fuchsia Platform

On Fuchsia, all physical devices and queue families **must** be capable of presentation with any ImagePipe. As a result there is no Fuchsia-specific query for these capabilities.

34.4.8. Google Games Platform

On Google Games Platform, all physical devices and queue families with the **VK_QUEUE_GRAPHICS_BIT** or **VK_QUEUE_COMPUTE_BIT** capabilities **must** be capable of presentation with any Google Games Platform stream descriptor. As a result, there is no query specific to Google Games Platform for these capabilities.
34.4.9. iOS Platform

On iOS, all physical devices and queue families must be capable of presentation with any layer. As a result there is no iOS-specific query for these capabilities.

34.4.10. macOS Platform

On macOS, all physical devices and queue families must be capable of presentation with any layer. As a result there is no macOS-specific query for these capabilities.

34.4.11. VI Platform

On VI, all physical devices and queue families must be capable of presentation with any layer. As a result there is no VI-specific query for these capabilities.

34.4.12. QNX Screen Platform

To determine whether a queue family of a physical device supports presentation to a QNX Screen compositor, call:

```c
// Provided by VK_QNX_screen_surface
VkBool32 vkGetPhysicalDeviceScreenPresentationSupportQNX(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    struct _screen_window* window);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `window` is the QNX Screen window object.

This platform-specific function can be called prior to creating a surface.

### Valid Usage

- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-queueFamilyIndex-04743
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given physicalDevice

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-window-parameter
  window must be a valid pointer to a _screen_window value
34.5. Surface Queries

The capabilities of a swapchain targeting a surface are the intersection of the capabilities of the WSI platform, the native window or display, and the physical device. The resulting capabilities can be obtained with the queries listed below in this section.

Note

In addition to the surface capabilities as obtained by surface queries below, swapchain images are also subject to ordinary image creation limits as reported by `vkGetPhysicalDeviceImageFormatProperties`. As an application is instructed by the appropriate Valid Usage sections, both the surface capabilities and the image creation limits have to be satisfied whenever swapchain images are created.

34.5.1. Surface Capabilities

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,    // Provided by VK_KHR_surface
    VkSurfaceKHR surface,                // Provided by VK_KHR_surface
    VkSurfaceCapabilitiesKHR* pSurfaceCapabilities);  // Provided by VK_KHR_surface
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilitiesKHR` structure in which the capabilities are returned.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06523 `surface` must be a valid `VkSurfaceKHR` handle.
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06211 `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle.
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-parameter `surface` must be a valid `VkSurfaceKHR` handle.
VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-pSurfaceCapabilities-parameter
pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilitiesKHR structure.

VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-commonparent
Both of physicalDevice, and surface must have been created, allocated, or retrieved from the same VkInstance.

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceCapabilitiesKHR structure is defined as:

```c
// Provided by VK_KHR_surface
typedef struct VkSurfaceCapabilitiesKHR {
    uint32_t minImageCount;
    uint32_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
} VkSurfaceCapabilitiesKHR;
```

- `minImageCount` is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.

- `maxImageCount` is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to `minImageCount`. A value of 0 means that there is no limit on the number of images, though there may be limits related to the total amount of memory used by presentable images.

- `currentExtent` is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

- `minImageExtent` contains the smallest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be less than or equal to the corresponding width and height of `currentExtent`, unless `currentExtent` has the special value described above.
• **maxImageExtent** contains the largest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be greater than or equal to the corresponding width and height of **minImageExtent**. The width and height of the extent will each be greater than or equal to the corresponding width and height of **currentExtent**, unless **currentExtent** has the special value described above.

• **maxImageArrayLayers** is the maximum number of layers presentable images can have for a swapchain created for this device and surface, and will be at least one.

• **supportedTransforms** is a bitmask of **VkSurfaceTransformFlagBitsKHR** indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.

• **currentTransform** is **VkSurfaceTransformFlagBitsKHR** value indicating the surface’s current transform relative to the presentation engine’s natural orientation.

• **supportedCompositeAlpha** is a bitmask of **VkCompositeAlphaFlagBitsKHR**, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition can be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

• **supportedUsageFlags** is a bitmask of **VkImageUsageFlagBits** representing the ways the application can use the presentable images of a swapchain created with **VkPresentModeKHR** set to **VK_PRESENT_MODE_IMMEDIATE_KHR**, **VK_PRESENT_MODE_MAILBOX_KHR**, **VK_PRESENT_MODE_FIFO_KHR** or **VK_PRESENT_MODE_FIFO_RELAXED_KHR** for the surface on the specified device. **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** must be included in the set. Implementations may support additional usages.

**Note**

Supported usage flags of a presentable image when using **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** or **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR** presentation mode are provided by **VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags**.

**Note**

Formulas such as \( \min(N, \text{maxImageCount}) \) are not correct, since maxImageCount may be zero.

To query the basic capabilities of a surface defined by the core or extensions, call:

```c
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkSurfaceCapabilities2KHR* pSurfaceCapabilities);
```

• **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for **vkCreateSwapchainKHR**.
• **pSurfaceInfo** is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.

• **pSurfaceCapabilities** is a pointer to a `VkSurfaceCapabilities2KHR` structure in which the capabilities are returned.

`vkGetPhysicalDeviceSurfaceCapabilities2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

### Valid Usage

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06521**
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `pSurfaceInfo->surface` must be a valid `VkSurfaceKHR` handle

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06522**
  If `pSurfaceInfo->surface` is not `VK_NULL_HANDLE`, `pSurfaceInfo->surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-02671**
  If a `VkSurfaceCapabilitiesFullScreenExclusiveEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure must be included in the `pNext` chain of `pSurfaceInfo`

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07776**
  If a `VkSurfacePresentModeCompatibilityEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, a `VkSurfacePresentModeEXT` structure must be included in the `pNext` chain of `pSurfaceInfo`

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07777**
  If a `VkSurfacePresentScalingCapabilitiesEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, a `VkSurfacePresentModeEXT` structure must be included in the `pNext` chain of `pSurfaceInfo`

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07778**
  If a `VkSurfacePresentModeCompatibilityEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, `pSurfaceInfo->surface` must be a valid `VkSurfaceKHR` handle

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07779**
  If a `VkSurfacePresentScalingCapabilitiesEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, `pSurfaceInfo->surface` must be a valid `VkSurfaceKHR` handle

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-physicalDevice-parameter**
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-parameter**
  `pSurfaceInfo` must be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR`
structure
• VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-psurfaceCapabilities-parameter
  pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilities2KHR structure

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_SURFACE_LOST_KHR

The VkPhysicalDeviceSurfaceInfo2KHR structure is defined as:

```
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkPhysicalDeviceSurfaceInfo2KHR {
  VkStructureType sType;
  const void* pNext;
  VkSurfaceKHR surface;
} VkPhysicalDeviceSurfaceInfo2KHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• surface is the surface that will be associated with the swapchain.

The members of VkPhysicalDeviceSurfaceInfo2KHR correspond to the arguments to
vkGetPhysicalDeviceSurfaceCapabilitiesKHR, with sType and pNext added for extensibility.

Additional capabilities of a surface may be available to swapchains created with different full-screen exclusive settings - particularly if exclusive full-screen access is application controlled. These additional capabilities can be queried by adding a VkSurfaceFullScreenExclusiveInfoEXT structure to the pNext chain of this structure when used to query surface properties. Additionally, for Win32 surfaces with application controlled exclusive full-screen access, chaining a VkSurfaceFullScreenExclusiveWin32InfoEXT structure may also report additional surface capabilities. These additional capabilities only apply to swapchains created with the same parameters included in the pNext chain of VkSwapchainCreateInfoKHR.

Valid Usage

• VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-02672
  If the pNext chain includes a VkSurfaceFullScreenExclusiveInfoEXT structure with its
  fullScreenExclusive member set to VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT,
and surface was created using vkCreateWin32SurfaceKHR, a VkSurfaceFullScreenExclusiveWin32InfoEXT structure must be included in the pNext chain

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-07919
  If surface is not VK_NULL_HANDLE, and the VK_GOOGLE_surfaceless_query extension is not enabled, surface must be a valid VkSurfaceKHR handle

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkSurfaceFullScreenExclusiveInfoEXT, VkSurfaceFullScreenExclusiveWin32InfoEXT, or VkSurfacePresentModeEXT

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

If the pNext chain of VkSwapchainCreateInfoKHR includes a VkSurfaceFullScreenExclusiveInfoEXT structure, then that structure specifies the application’s preferred full-screen transition behavior.

The VkSurfaceFullScreenExclusiveInfoEXT structure is defined as:

```c
// Provided by VK_EXT_full_screen-exclusive
typedef struct VkSurfaceFullScreenExclusiveInfoEXT {
  VkStructureType   sType;
  void*             pNext;
  VkFullScreenExclusiveEXT fullScreenExclusive;
} VkSurfaceFullScreenExclusiveInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- fullScreenExclusive is a VkFullScreenExclusiveEXT value specifying the preferred full-screen transition behavior.

If this structure is not present, fullScreenExclusive is considered to be VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT.

Valid Usage (Implicit)

- VUID-VkSurfaceFullScreenExclusiveInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_INFO_EXT

- VUID-VkSurfaceFullScreenExclusiveInfoEXT-fullScreenExclusive-parameter
possible values of `VkSurfaceFullScreenExclusiveInfoEXT::fullScreenExclusive` are:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef enum VkFullScreenExclusiveEXT {
    VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT = 0,
    VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT = 1,
    VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT = 2,
    VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT = 3,
} VkFullScreenExclusiveEXT;
```

- **VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT** indicates the implementation should determine the appropriate full-screen method by whatever means it deems appropriate.
- **VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT** indicates the implementation may use full-screen exclusive mechanisms when available. Such mechanisms may result in better performance and/or the availability of different presentation capabilities, but may require a more disruptive transition during swapchain initialization, first presentation and/or destruction.
- **VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT** indicates the implementation should avoid using full-screen mechanisms which rely on disruptive transitions.
- **VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT** indicates the application will manage full-screen exclusive mode by using the `vkAcquireFullScreenExclusiveModeEXT` and `vkReleaseFullScreenExclusiveModeEXT` commands.

The `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure is defined as:

```c
// Provided by VK_KHR_win32_surface with VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveWin32InfoEXT {
    VkStructureType sType;
    const void* pNext;
    HMONITOR hmonitor;
} VkSurfaceFullScreenExclusiveWin32InfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **hmonitor** is the Win32 `HMONITOR` handle identifying the display to create the surface with.

**Note**

If **hmonitor** is invalidated (e.g. the monitor is unplugged) during the lifetime of a swapchain created with this structure, operations on that swapchain will return `VK_ERROR_OUT_OF_DATE_KHR`.

**Note**

It is the responsibility of the application to change the display settings of the...
targeted Win32 display using the appropriate platform APIs. Such changes may alter the surface capabilities reported for the created surface.

**Valid Usage**

- VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-hmonitor-02673
  hmonitor must be a valid HMONITOR

**Valid Usage (Implicit)**

- VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_WIN32_INFO_EXT

The VkSurfaceCapabilities2KHR structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkSurfaceCapabilitiesKHR surfaceCapabilities;
} VkSurfaceCapabilities2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- surfaceCapabilities is a VkSurfaceCapabilitiesKHR structure describing the capabilities of the specified surface.

If the VK_GOOGLE_surfaceless_query extension is enabled and VkPhysicalDeviceSurfaceInfo2KHR::surface in the vkGetPhysicalDeviceSurfaceCapabilities2KHR call is VK_NULL_HANDLE, the values returned in minImageCount, maxImageCount, currentExtent, and currentTransform will not reflect that of any surface and will instead be as such:

- minImageCount and maxImageCount will be 0xFFFFFFFF
- currentExtent will be (0xFFFFFFFF, 0xFFFFFFFF)
- currentTransform will be VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR

**Valid Usage (Implicit)**

- VUID-VkSurfaceCapabilities2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR

- VUID-VkSurfaceCapabilities2KHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDisplayNativeHdrSurfaceCapabilitiesAMD,
An application queries if a protected `VkSurfaceKHR` is displayable on a specific windowing system using `VkSurfaceProtectedCapabilitiesKHR`, which can be passed in `pNext` parameter of `VkSurfaceCapabilities2KHR`.

The `VkSurfaceProtectedCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_surface_protected_capabilities
typedef struct VkSurfaceProtectedCapabilitiesKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 supportsProtected;
} VkSurfaceProtectedCapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supportsProtected` specifies whether a protected swapchain created from `VkPhysicalDeviceSurfaceInfo2KHR::surface` for a particular windowing system can be displayed on screen or not. If `supportsProtected` is `VK_TRUE`, then creation of swapchains with the `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR` flag set must be supported for `surface`.

If the `VK_GOOGLE_surfaceless_query` extension is enabled, the value returned in `supportsProtected` will be identical for every valid surface created on this physical device, and so in the `vkGetPhysicalDeviceSurfaceCapabilities2KHR` call, `VkPhysicalDeviceSurfaceInfo2KHR::surface` can be `VK_NULL_HANDLE`. In that case, the contents of `VkSurfaceCapabilities2KHR::surfaceCapabilities` as well as any other struct chained to it will be undefined.

**Valid Usage (Implicit)**

- `VUID-VkSurfaceProtectedCapabilitiesKHR-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_SURFACE_PROTECTED_CAPABILITIES_KHR`

The `VkSurfacePresentScalingCapabilitiesEXT` structure is defined as:
// Provided by VK_EXT_surface_maintenance1

typedef struct VkSurfacePresentScalingCapabilitiesEXT {
    VkStructureType sType;
    void* pNext;
    VkPresentScalingFlagsEXT supportedPresentScaling;
    VkPresentGravityFlagsEXT supportedPresentGravityX;
    VkPresentGravityFlagsEXT supportedPresentGravityY;
    VkExtent2D minScaledImageExtent;
    VkExtent2D maxScaledImageExtent;
} VkSurfacePresentScalingCapabilitiesEXT;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **supportedPresentScaling** is a bitmask of `VkPresentScalingFlagBitsEXT` representing the scaling methods supported by the surface, or 0 if application-defined scaling is not supported.
- **supportedPresentGravityX** is a bitmask of `VkPresentGravityFlagBitsEXT` representing the X-axis pixel gravity supported by the surface, or 0 if Vulkan-defined pixel gravity is not supported for the X axis.
- **supportedPresentGravityY** is a bitmask of `VkPresentGravityFlagBitsEXT` representing the Y-axis pixel gravity supported by the surface, or 0 if Vulkan-defined pixel gravity is not supported for the Y axis.
- **minScaledImageExtent** contains the smallest valid swapchain extent for the surface on the specified device when one of the scaling methods specified in `supportedPresentScaling` is used, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface. The width and height of the extent will each be smaller than or equal to the corresponding width and height of `VkSurfaceCapabilitiesKHR::minImageExtent`.
- **maxScaledImageExtent** contains the largest valid swapchain extent for the surface on the specified device when one of the scaling methods specified in `supportedPresentScaling` is used, or the special value described above for `minScaledImageExtent`. The width and height of the extent will each be greater than or equal to the corresponding width and height of `VkSurfaceCapabilitiesKHR::maxImageExtent`.

Before creating a swapchain whose scaling mode can be specified through the use of `VkSwapchainPresentScalingCreateInfoEXT`, obtain the set of supported scaling modes by including a `VkSurfacePresentModeEXT` structure in the `pNext` chain of `VkPhysicalDeviceSurfaceInfo2KHR` when calling `vkGetPhysicalDeviceSurfaceCapabilities2KHR`. The implementation must return the same values in `VkSurfacePresentScalingCapabilitiesEXT` for any of the compatible present modes as obtained through `VkSurfacePresentModeCompatibilityEXT`.

---

**Valid Usage (Implicit)**

- VUID-VkSurfacePresentScalingCapabilitiesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_PRESENT_SCALING_CAPABILITIES_EXT`
Bits which **may** be set in `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentScaling`, specifying scaling modes supported by the surface, are:

```c
// Provided by VK_EXT_surface_maintenance1
typedef enum VkPresentScalingFlagBitsEXT {
    VK_PRESENT_SCALING_ONE_TO_ONE_BIT_EXT = 0x00000001,
    VK_PRESENT_SCALING_ASPECT_RATIO_STRETCH_BIT_EXT = 0x00000002,
    VK_PRESENT_SCALING_STRETCH_BIT_EXT = 0x00000004,
} VkPresentScalingFlagBitsEXT;
```

- **VK_PRESENT_SCALING_ONE_TO_ONE_BIT_EXT** specifies that no scaling occurs, and pixels in the swapchain image are mapped to one and only one pixel in the surface. The mapping between pixels is defined by the chosen presentation gravity.
- **VK_PRESENT_SCALING_ASPECT_RATIO_STRETCH_BIT_EXT** specifies that the swapchain image will be minified or magnified such that at least one of the resulting width or height is equal to the corresponding surface dimension, and the other resulting dimension is less than or equal to the corresponding surface dimension, with the aspect ratio of the resulting image being identical to that of the original swapchain image.
- **VK_PRESENT_SCALING_STRETCH_BIT_EXT** specifies that the swapchain image will be minified or magnified such that the resulting image dimensions are equal to those of the surface.

```c
// Provided by VK_EXT_surface_maintenance1
typedef VkFlags VkPresentScalingFlagsEXT;

VkPresentScalingFlagsEXT is a bitmask type for setting a mask of zero or more `VkPresentScalingFlagBitsEXT`.

Bits which **may** be set in the `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityX` or `supportedPresentGravityY` fields, specifying the gravity of presented pixels supported by the surface, are:

```c
// Provided by VK_EXT_surface_maintenance1
typedef enum VkPresentGravityFlagBitsEXT {
    VK_PRESENT_GRAVITY_MIN_BIT_EXT = 0x00000001,
    VK_PRESENT_GRAVITY_MAX_BIT_EXT = 0x00000002,
    VK_PRESENT_GRAVITY_CENTERED_BIT_EXT = 0x00000004,
} VkPresentGravityFlagBitsEXT;
```

- **VK_PRESENT_GRAVITY_MIN_BIT_EXT** means that the pixels will gravitate towards the top or left side of the surface.
- **VK_PRESENT_GRAVITY_MAX_BIT_EXT** means that the pixels will gravitate towards the bottom or right side of the surface.
- **VK_PRESENT_GRAVITY_CENTERED_BIT_EXT** means that the pixels will be centered in the surface.

If the value in `VkSurfaceCapabilitiesKHR::currentTransform` is not
VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR, it is implementation-defined whether the gravity configuration applies to the presented image before or after transformation.

```c
// Provided by VK_EXT_surface_maintenance1
typedef VkFlags VkPresentGravityFlagsEXT;
```

VkPresentGravityFlagsEXT is a bitmask type for setting a mask of zero or more VkPresentGravityFlagBitsEXT.

The VkSurfacePresentModeEXT structure is defined as:

```c
// Provided by VK_EXT_surface_maintenance1
typedef struct VkSurfacePresentModeEXT {
    VkStructureType sType;
    void* pNext;
    VkPresentModeKHR presentMode;
} VkSurfacePresentModeEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- presentMode is the presentation mode the swapchain will use.

If the VkSurfacePresentModeEXT structure is included in the pNext chain of VkPhysicalDeviceSurfaceInfo2KHR, the values returned in VkSurfaceCapabilitiesKHR::minImageCount, VkSurfaceCapabilitiesKHR::maxImageCount, VkSurfacePresentScalingCapabilitiesEXT::minScaledImageExtent, and VkSurfacePresentScalingCapabilitiesEXT::maxScaledImageExtent are valid only for the specified presentMode. If presentMode is VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, the per-present mode image counts must both be one. The per-present mode image counts may be less-than or greater-than the image counts returned when VkSurfacePresentModeEXT is not provided.

**Note**

If VkSwapchainPresentModesCreateInfoEXT is provided to swapchain creation, the requirements for forward progress may be less strict. For example, a FIFO swapchain might only require 2 images to guarantee forward progress, but a MAILBOX one might require 4. Without the per-present image counts, such an implementation would have to return 4 in VkSurfaceCapabilitiesKHR::minImageCount, which pessimizes FIFO. Conversely, an implementation may return a low number for minImageCount, but internally bump the image count when application queries vkGetSwapchainImagesKHR, which can surprise applications, and is not discoverable until swapchain creation. Using VkSurfacePresentModeEXT and VkSwapchainPresentModesCreateInfoEXT together effectively removes this problem.

VkSwapchainPresentModesCreateInfoEXT is required for the specification to be
backwards compatible with applications that do not know about, or make use of this feature.

Valid Usage

- VUID-VkSurfacePresentModeEXT-presentMode-07780
  
  **presentMode** must be a value reported by `vkGetPhysicalDeviceSurfacePresentModesKHR` for the specified surface

Valid Usage (Implicit)

- VUID-VkSurfacePresentModeEXT-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_SURFACE_PRESENT_MODE_EXT`

- VUID-VkSurfacePresentModeEXT-presentMode-parameter
  
  **presentMode** must be a valid `VkPresentModeKHR` value

The `VkSurfacePresentModeCompatibilityEXT` structure is defined as:

```
// Provided by VK_EXT_surface_maintenance1

typedef struct VkSurfacePresentModeCompatibilityEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t presentModeCount;
    VkPresentModeKHR* pPresentModes;
} VkSurfacePresentModeCompatibilityEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **presentModeCount** is an integer related to the number of present modes available or queried, as described below.
- **pPresentModes** is a pointer to an array of `VkPresentModeKHR` in which present modes compatible with a given present mode are returned.

If `pPresentModes` is `NULL`, then the number of present modes that are compatible with the one specified in `VkSurfacePresentModeEXT` is returned in `presentModeCount`. Otherwise, `presentModeCount` must be set by the user to the number of elements in the `pPresentModes` array, and on return the variable is overwritten with the number of values actually written to `pPresentModes`. If the value of `presentModeCount` is less than the number of compatible present modes that are supported, at most `presentModeCount` values will be written to `pPresentModes`. The implementation must include the present mode passed to `VkSurfacePresentModeEXT` in `pPresentModes`, unless `presentModeCount` is zero.

Before creating a swapchain whose present modes can be modified through the use of `VkSwapchainPresentModesCreateInfoEXT`, obtain the set of present modes compatible with a given
initial present mode by including a `VkSurfacePresentModeEXT` structure in the `pNext` chain of `VkPhysicalDeviceSurfaceInfo2KHR` when calling `vkGetPhysicalDeviceSurfaceCapabilities2KHR`.

### Valid Usage (Implicit)

- VUID-VkSurfacePresentModeCompatibilityEXT-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_PRESENT_MODE_COMPATIBILITY_EXT`

- VUID-VkSurfacePresentModeCompatibilityEXT-pPresentModes-parameter
  
  If `presentModeCount` is not 0, and `pPresentModes` is not NULL, `pPresentModes` **must** be a valid pointer to an array of `presentModeCount` `VkPresentModeKHR` values.

The `VkSharedPresentSurfaceCapabilitiesKHR` structure is defined as:

```c
typedef struct VkSharedPresentSurfaceCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkImageUsageFlags sharedPresentSupportedUsageFlags;
} VkSharedPresentSurfaceCapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `sharedPresentSupportedUsageFlags` is a bitmask of `VkImageUsageFlagBits` representing the ways the application can use the shared presentable image from a swapchain created with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` for the surface on the specified device. `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` **must** be included in the set but implementations may support additional usages.

### Valid Usage (Implicit)

- VUID-VkSharedPresentSurfaceCapabilitiesKHR-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR`

The `VkDisplayNativeHdrSurfaceCapabilitiesAMD` structure is defined as:

```c
typedef struct VkDisplayNativeHdrSurfaceCapabilitiesAMD {
    VkStructureType sType;
    void* pNext;
    VkBool32 localDimmingSupport;
} VkDisplayNativeHdrSurfaceCapabilitiesAMD;
```

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `localDimmingSupport` specifies whether the surface supports local dimming. If this is `VK_TRUE`, `VkSwapchainDisplayNativeHdrCreateInfoAMD` can be used to explicitly enable or disable local dimming for the surface. Local dimming may also be overridden by `vkSetLocalDimmingAMD` during the lifetime of the swapchain.

**Valid Usage (Implicit)**

• VUID-VkDisplayNativeHdrSurfaceCapabilitiesAMD-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_NATIVE_HDR_SURFACE_CAPABILITIES_AMD`.

The `VkSurfaceCapabilitiesFullScreenExclusiveEXT` structure is defined as:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceCapabilitiesFullScreenExclusiveEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 fullScreenExclusiveSupported;
} VkSurfaceCapabilitiesFullScreenExclusiveEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `fullScreenExclusiveControlSupported` is a boolean describing whether the surface is able to make use of exclusive full-screen access.

This structure can be included in the `pNext` chain of `VkSurfaceCapabilities2KHR` to determine support for exclusive full-screen access. If `fullScreenExclusiveSupported` is `VK_FALSE`, it indicates that exclusive full-screen access is not obtainable for this surface.

Applications must not attempt to create swapchains with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION.CONTROLLED_EXT` set if `fullScreenExclusiveSupported` is `VK_FALSE`.

**Valid Usage (Implicit)**

• VUID-VkSurfaceCapabilitiesFullScreenExclusiveEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_FULL_SCREEN_EXCLUSIVE_EXT`.

The `VkSurfaceCapabilitiesPresentBarrierNV` structure is defined as:
typedef struct VkSurfaceCapabilitiesPresentBarrierNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 presentBarrierSupported;
} VkSurfaceCapabilitiesPresentBarrierNV;

• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **presentBarrierSupported** is a boolean describing whether the surface is able to make use of the present barrier feature.

This structure **can** be included in the pNext chain of **VkSurfaceCapabilities2KHR** to determine support for present barrier access. If **presentBarrierSupported** is **VK_FALSE**, it indicates that the present barrier feature is not obtainable for this surface.

**Valid Usage (Implicit)**

- VUID-VkSurfaceCapabilitiesPresentBarrierNV-sType-sType
  sType **must** be **VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_PRESENT_BARRIER_NV**

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_EXT_display_surface_counter
VkResult vkGetPhysicalDeviceSurfaceCapabilities2EXT(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    VkSurfaceCapabilities2EXT* pSurfaceCapabilities);
```

• **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for **vkCreateSwapchainKHR**.
• **surface** is the surface that will be associated with the swapchain.
• **pSurfaceCapabilities** is a pointer to a **VkSurfaceCapabilities2EXT** structure in which the capabilities are returned.

**vkGetPhysicalDeviceSurfaceCapabilities2EXT** behaves similarly to **vkGetPhysicalDeviceSurfaceCapabilitiesKHR**, with the ability to return extended information by adding extending structures to the pNext chain of its **pSurfaceCapabilities** parameter.

**Valid Usage**

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-06523
  **surface** **must** be a valid **VkSurfaceKHR** handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-06211
surface must be supported by physicalDevice, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-parameter surface must be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-pSurfaceCapabilities-parameter pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilities2EXT structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-commonparent Both of physicalDevice, and surface must have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceCapabilities2EXT structure is defined as:

```c
// Provided by VK_EXT_display_surface_counter
typedef struct VkSurfaceCapabilities2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t minImageCount;
    uint32_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
    VkSurfaceCounterFlagsEXT supportedSurfaceCounters;
} VkSurfaceCapabilities2EXT;
```
- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **minImageCount** is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.
- **maxImageCount** is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to **minImageCount**. A value of 0 means that there is no limit on the number of images, though there may be limits related to the total amount of memory used by presentable images.
- **currentExtent** is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.
- **minImageExtent** contains the smallest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be less than or equal to the corresponding width and height of **currentExtent**, unless **currentExtent** has the special value described above.
- **maxImageExtent** contains the largest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be greater than or equal to the corresponding width and height of **minImageExtent**. The width and height of the extent will each be greater than or equal to the corresponding width and height of **currentExtent**, unless **currentExtent** has the special value described above.
- **maxImageArrayLayers** is the maximum number of layers presentable images can have for a swapchain created for this device and surface, and will be at least one.
- **supportedTransforms** is a bitmask of `VkSurfaceTransformFlagBitsKHR` indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.
- **currentTransform** is `VkSurfaceTransformFlagBitsKHR` value indicating the surface's current transform relative to the presentation engine's natural orientation.
- **supportedCompositeAlpha** is a bitmask of `VkCompositeAlphaFlagBitsKHR`, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition can be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.
- **supportedUsageFlags** is a bitmask of `VkImageUsageFlagBits` representing the ways the application can use the presentable images of a swapchain created with `VkPresentModeKHR` set to `VK_PRESENT_MODE_IMMEDIATE_KHR`, `VK_PRESENT_MODE_MAILBOX_KHR`, `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR` for the surface on the specified device. **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** must be included in the set. Implementations may support additional usages.
- **supportedSurfaceCounters** is a bitmask of `VkSurfaceCounterFlagBitsEXT` indicating the supported surface counter types.

### Valid Usage

- **VUID-VkSurfaceCapabilities2EXT-supportedSurfaceCounters-01246**
**Valid Usage (Implicit)**

- VUID-VkSurfaceCapabilities2EXT-sType-sType
  sType **must** be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_EXT`
- VUID-VkSurfaceCapabilities2EXT-pNext-pNext
  pNext **must** be `NULL`

Bits which **can** be set in `VkSurfaceCapabilities2EXT::supportedSurfaceCounters`, indicating supported surface counter types, are:

```c
// Provided by VK_EXT_display_surface_counter
typedef enum VkSurfaceCounterFlagBitsEXT {
    VK_SURFACE_COUNTER_VBLANK_BIT_EXT = 0x00000001,
} VkSurfaceCounterFlagBitsEXT;
```

- **VK_SURFACE_COUNTER_VBLANK_BIT_EXT** specifies a counter incrementing once every time a vertical blanking period occurs on the display associated with the surface.

```c
// Provided by VK_EXT_display_surface_counter
typedef VkFlags VkSurfaceCounterFlagsEXT;
```

`VkSurfaceCounterFlagsEXT` is a bitmask type for setting a mask of zero or more `VkSurfaceCounterFlagBitsEXT`.

Bits which **may** be set in `VkSurfaceCapabilitiesKHR::supportedTransforms` indicating the presentation transforms supported for the surface on the specified device, and possible values of `VkSurfaceCapabilitiesKHR::currentTransform` indicating the surface’s current transform relative to the presentation engine’s natural orientation, are:

```c
// Provided by VK_EXT_display_surface_counter
typedef VkFlags VkSurfaceCounterFlagsEXT;
```
// Provided by VK_KHR_surface

typedef enum VkSurfaceTransformFlagBitsKHR {
    VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR = 0x00000001,
    VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR = 0x00000002,
    VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR = 0x00000004,
    VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR = 0x00000008,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR = 0x00000010,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR = 0x00000020,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR = 0x00000040,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR = 0x00000080,
    VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR = 0x00000100,
} VkSurfaceTransformFlagBitsKHR;

• **VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR** specifies that image content is presented without being transformed.

• **VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR** specifies that image content is rotated 90 degrees clockwise.

• **VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR** specifies that image content is rotated 180 degrees clockwise.

• **VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR** specifies that image content is rotated 270 degrees clockwise.

• **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR** specifies that image content is mirrored horizontally.

• **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 90 degrees clockwise.

• **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 180 degrees clockwise.

• **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 270 degrees clockwise.

• **VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR** specifies that the presentation transform is not specified, and is instead determined by platform-specific considerations and mechanisms outside Vulkan.

// Provided by VK_KHR_display

typedef VkFlags VkSurfaceTransformFlagsKHR;

VkSurfaceTransformFlagsKHR is a bitmask type for setting a mask of zero or more VkSurfaceTransformFlagBitsKHR.

The supportedCompositeAlpha member is of type VkCompositeAlphaFlagBitsKHR, containing the following values:
typedef enum VkCompositeAlphaFlagBitsKHR {
    VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR = 0x00000002,
    VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR = 0x00000004,
    VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR = 0x00000008,
} VkCompositeAlphaFlagBitsKHR;

These values are described as follows:

- **VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR**: The alpha component, if it exists, of the images is ignored in the compositing process. Instead, the image is treated as if it has a constant alpha of 1.0.

- **VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR**: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are expected to already be multiplied by the alpha component by the application.

- **VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR**: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are not expected to already be multiplied by the alpha component by the application; instead, the compositor will multiply the non-alpha components of the image by the alpha component during compositing.

- **VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR**: The way in which the presentation engine treats the alpha component in the images is unknown to the Vulkan API. Instead, the application is responsible for setting the composite alpha blending mode using native window system commands. If the application does not set the blending mode using native window system commands, then a platform-specific default will be used.

typedef VkFlags VkCompositeAlphaFlagsKHR;

VkCompositeAlphaFlagsKHR is a bitmask type for setting a mask of zero or more VkCompositeAlphaFlagBitsKHR.

### 34.5.2. Surface Format Support

To query the supported swapchain format-color space pairs for a surface, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceFormatsKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pSurfaceFormatCount,
    VkSurfaceFormatKHR* pSurfaceFormats);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`. 
• **surface** is the surface that will be associated with the swapchain.

• **pSurfaceFormatCount** is a pointer to an integer related to the number of format pairs available or queried, as described below.

• **pSurfaceFormats** is either **NULL** or a pointer to an array of **VkSurfaceFormatKHR** structures.

If **pSurfaceFormats** is **NULL**, then the number of format pairs supported for the given **surface** is returned in **pSurfaceFormatCount**. Otherwise, **pSurfaceFormatCount** must point to a variable set by the user to the number of elements in the **pSurfaceFormats** array, and on return the variable is overwritten with the number of structures actually written to **pSurfaceFormats**. If the value of **pSurfaceFormatCount** is less than the number of format pairs supported, at most **pSurfaceFormatCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available format pairs were returned.

The number of format pairs supported must be greater than or equal to 1. **pSurfaceFormats** must not contain an entry whose value for **format** is **VK_FORMAT_UNDEFINED**.

If **pSurfaceFormats** includes an entry whose value for **colorSpace** is **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** and whose value for **format** is a UNORM (or SRGB) format and the corresponding SRGB (or UNORM) format is a color renderable format for **VK_IMAGE_TILING_OPTIMAL**, then **pSurfaceFormats** must also contain an entry with the same value for **colorSpace** and **format** equal to the corresponding SRGB (or UNORM) format.

If the **VK_GOOGLE_surfaceless_query** extension is enabled, the values returned in **pSurfaceFormats** will be identical for every valid surface created on this physical device, and so **surface can be VK_NULL_HANDLE**.

---

### Valid Usage

- **VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06524**
  If the **VK_GOOGLE_surfaceless_query** extension is not enabled, **surface** must be a valid **VkSurfaceKHR** handle.

- **VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06525**
  If **surface** is not **VK_NULL_HANDLE**, **surface** must be supported by **physicalDevice**, as reported by **vkGetPhysicalDeviceSurfaceSupportKHR** or an equivalent platform-specific mechanism.

---

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-physicalDevice-parameter**
  **physicalDevice** must be a valid **VkPhysicalDevice** handle.

- **VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-parameter**
  If **surface** is not **VK_NULL_HANDLE**, **surface** must be a valid **VkSurfaceKHR** handle.

- **VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormatCount-parameter**
  **pSurfaceFormatCount** must be a valid pointer to a **uint32_t** value.

- **VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormats-parameter**
If the value referenced by \( p\text{SurfaceFormatCount} \) is not 0, and \( p\text{SurfaceFormats} \) is not NULL, \( p\text{SurfaceFormats} \) must be a valid pointer to an array of \( p\text{SurfaceFormatCount} \) \( Vk\text{SurfaceFormatKHR} \) structures.

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-commonparent
  Both of \( physicalDevice \), and \( surface \) that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same \( Vk\text{Instance} \).

### Return Codes

**Success**
- \( VK\_SUCCESS \)
- \( VK\_INCOMPLETE \)

**Failure**
- \( VK\_ERROR\_OUT\_OF\_HOST\_MEMORY \)
- \( VK\_ERROR\_OUT\_OF\_DEVICE\_MEMORY \)
- \( VK\_ERROR\_SURFACE\_LOST\_KHR \)

The \( Vk\text{SurfaceFormatKHR} \) structure is defined as:

```c
// Provided by VK_KHR_surface
typedef struct VkSurfaceFormatKHR {
    VkFormat format;
    VkColorSpaceKHR colorSpace;
} VkSurfaceFormatKHR;
```

- \( \text{format} \) is a \( Vk\text{Format} \) that is compatible with the specified surface.
- \( \text{colorSpace} \) is a presentation \( Vk\text{ColorSpaceKHR} \) that is compatible with the surface.

To query the supported swapchain format tuples for a surface, call:

```c
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceFormats2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    uint32_t* pSurfaceFormatCount,
    VkSurfaceFormat2KHR* pSurfaceFormats);
```

- \( \text{physicalDevice} \) is the physical device that will be associated with the swapchain to be created, as described for \( \text{vkCreateSwapchainKHR} \).
- \( p\text{SurfaceInfo} \) is a pointer to a \( Vk\text{PhysicalDeviceSurfaceInfo2KHR} \) structure describing the surface and other fixed parameters that would be consumed by \( \text{vkCreateSwapchainKHR} \).
- \( p\text{SurfaceFormatCount} \) is a pointer to an integer related to the number of format tuples available.
• **pSurfaceFormats** is either **NULL** or a pointer to an array of **VkSurfaceFormat2KHR** structures.

`vkGetPhysicalDeviceSurfaceFormats2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceFormatsKHR`, with the ability to be extended via `pNext` chains.

If **pSurfaceFormats** is **NULL**, then the number of format tuples supported for the given **surface** is returned in **pSurfaceFormatCount**. Otherwise, **pSurfaceFormatCount** must point to a variable set by the user to the number of elements in the **pSurfaceFormats** array, and on return the variable is overwritten with the number of structures actually written to **pSurfaceFormats**. If the value of **pSurfaceFormatCount** is less than the number of format tuples supported, at most **pSurfaceFormatCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available values were returned.

### Valid Usage

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06521**
  If the **VK_GOOGLE_surfaceless_query** extension is not enabled, **pSurfaceInfo->surface** must be a valid **VkSurfaceKHR** handle

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06522**
  If **pSurfaceInfo->surface** is not **VK_NULL_HANDLE**, **pSurfaceInfo->surface** must be supported by **physicalDevice**, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-physicalDevice-parameter**
  **physicalDevice** must be a valid **VkPhysicalDevice** handle

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-parameter**
  **pSurfaceInfo** must be a valid pointer to a valid **VkPhysicalDeviceSurfaceInfo2KHR** structure

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormatCount-parameter**
  **pSurfaceFormatCount** must be a valid pointer to a **uint32_t** value

- **VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormats-parameter**
  If the value referenced by **pSurfaceFormatCount** is not **0**, and **pSurfaceFormats** is not **NULL**, **pSurfaceFormats** must be a valid pointer to an array of **pSurfaceFormatCount** **VkSurfaceFormat2KHR** structures

### Return Codes

**Success**

- **VK_SUCCESS**
- **VK_INCOMPLETE**
The **VkSurfaceFormat2KHR** structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceFormat2KHR {
    VkStructureType sType;
    void* pNext;
    VkSurfaceFormatKHR surfaceFormat;
} VkSurfaceFormat2KHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **surfaceFormat** is a **VkSurfaceFormatKHR** structure describing a format-color space pair that is compatible with the specified surface.

If the **imageCompressionControlSwapchain** feature is supported and a **VkImageCompressionPropertiesEXT** structure is included in the **pNext** chain of this structure, then it will be filled with the compression properties that are supported for the **surfaceFormat**.

**Valid Usage**

- VUID-VkSurfaceFormat2KHR-pNext-06750
  If the **imageCompressionControlSwapchain** feature is not enabled, the **pNext** chain **must** not include an **VkImageCompressionPropertiesEXT** structure

**Valid Usage (Implicit)**

- VUID-VkSurfaceFormat2KHR-sType-sType
  The **sType** value of each struct in the **pNext** chain **must** be unique

While the **format** of a presentable image refers to the encoding of each pixel, the **colorSpace** determines how the presentation engine interprets the pixel values. A color space in this document refers to a specific color space (defined by the chromaticities of its primaries and a white point in CIE Lab), and a transfer function that is applied before storing or transmitting color data in the
Possible values of `VkSurfaceFormatKHR::colorSpace`, specifying supported color spaces of a presentation engine, are:

```c
// Provided by VK_KHR_surface
typedef enum VkColorSpaceKHR {
    VK_COLOR_SPACE_SRGB_NONLINEAR_KHR = 0,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT = 1000104001,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT = 1000104002,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT = 1000104003,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT = 1000104004,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_LINEAR_EXT = 1000104005,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_NONLINEAR_EXT = 1000104006,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT2020_LINEAR_EXT = 1000104007,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_HDR10_ST2084_EXT = 1000104008,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DOLBYVISION_EXT = 1000104009,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_HDR10_HLG_EXT = 1000104010,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT = 1000104011,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT = 1000104012,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_PASS_THROUGH_EXT = 1000104013,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT = 1000104014,
    // Provided by VK_AMD_display_native_hdr
    VK_COLORSPACE_SRGB_NONLINEAR_KHR = VK_COLOR_SPACE_SRGB_NONLINEAR_KHR,
    VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT = VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT,
} VkColorSpaceKHR;
```

- `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR` specifies support for the sRGB color space.
- `VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT` specifies support for the Display-P3 color space to be displayed using an sRGB-like EOTF (defined below).
- `VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT` specifies support for the extended sRGB color space to be displayed using a linear EOTF.
• **VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT** specifies support for the extended sRGB color space to be displayed using an sRGB EOTF.

• **VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT** specifies support for the Display-P3 color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT** specifies support for the DCI-P3 color space to be displayed using the DCI-P3 EOTF. Note that values in such an image are interpreted as XYZ encoded color data by the presentation engine.

• **VK_COLOR_SPACE_BT709_LINEAR_EXT** specifies support for the BT709 color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_BT709_NONLINEAR_EXT** specifies support for the BT709 color space to be displayed using the SMPTE 170M EOTF.

• **VK_COLOR_SPACE_BT2020_LINEAR_EXT** specifies support for the BT2020 color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_BT2020_NONLINEAR_EXT** specifies support for the BT2020 color space to be displayed using the SMPTE ST2084 EOTF.

• **VK_COLOR_SPACE_HDR10_ST2084_EXT** specifies support for the HDR10 (BT2020 color) space to be displayed using the SMPTE ST2084 Perceptual Quantizer (PQ) EOTF.

• **VK_COLOR_SPACE_DOLBYVISION_EXT** specifies support for the Dolby Vision (BT2020 color space), proprietary encoding, to be displayed using the SMPTE ST2084 EOTF.

• **VK_COLOR_SPACE_HDR10_HLG_EXT** specifies support for the HDR10 (BT2020 color space) to be displayed using the Hybrid Log Gamma (HLG) EOTF.

• **VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT** specifies support for the AdobeRGB color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT** specifies support for the AdobeRGB color space to be displayed using the Gamma 2.2 EOTF.

• **VK_COLOR_SPACE_PASS_THROUGH_EXT** specifies that color components are used “as is”. This is intended to allow applications to supply data for color spaces not described here.

• **VK_COLOR_SPACE_DISPLAY_NATIVE_AMD** specifies support for the display’s native color space. This matches the color space expectations of AMD’s FreeSync2 standard, for displays supporting it.

---

**Note**

In the initial release of the **VK_KHR_surface** and **VK_KHR_swapchain** extensions, the token **VK_COLORSPACE_SRGB_NONLINEAR_KHR** was used. Starting in the 2016-05-13 updates to the extension branches, matching release 1.0.13 of the core API specification, **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** is used instead for consistency with Vulkan naming rules. The older enum is still available for backwards compatibility.

---

**Note**

In older versions of this extension **VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT** was misnamed **VK_COLOR_SPACE_DCI_P3_LINEAR_EXT**. This has been updated to indicate that it uses RGB color encoding, not XYZ. The old name is deprecated but is maintained for backwards compatibility.
Note
For a traditional “Linear” or non-gamma transfer function color space use `VK_COLOR_SPACE_PASS_THROUGH_EXT`.

The color components of non-linear color space swapchain images must have had the appropriate transfer function applied. The color space selected for the swapchain image will not affect the processing of data written into the image by the implementation. Vulkan requires that all implementations support the sRGB transfer function by use of an SRGB pixel format. Other transfer functions, such as SMPTE 170M or SMPTE2084, can be performed by the application shader. This extension defines enums for `VkColorSpaceKHR` that correspond to the following color spaces:

Table 49. Color Spaces and Attributes

</table>

The transfer functions are described in the “Transfer Functions” chapter of the Khronos Data Format Specification.

Except Display-P3 OETF, which is:

\[
E = \begin{cases} 
1.055 \times L^{0.4} - 0.055 & \text{for } 0.0030186 \leq L \leq 1 \\
12.92 \times L & \text{for } 0 \leq L < 0.0030186 
\end{cases}
\]

where \( L \) is the linear value of a color component and \( E \) is the encoded value (as stored in the image in memory).
34.5.3. Surface Presentation Mode Support

To query the supported presentation modes for a surface, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfacePresentModesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pPresentModeCount,
    VkPresentModeKHR* pPresentModes);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- **surface** is the surface that will be associated with the swapchain.
- **pPresentModeCount** is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- **pPresentModes** is either `NULL` or a pointer to an array of `VkPresentModeKHR` values, indicating the supported presentation modes.

If `pPresentModes` is `NULL`, then the number of presentation modes supported for the given `surface` is returned in `pPresentModeCount`. Otherwise, `pPresentModeCount` must point to a variable set by the user to the number of elements in the `pPresentModes` array, and on return the variable is overwritten with the number of values actually written to `pPresentModes`. If the value of `pPresentModeCount` is less than the number of presentation modes supported, at most `pPresentModeCount` values will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available modes were returned.

If the `VK_GOOGLE_surfaceless_query` extension is enabled and `surface` is `VK_NULL_HANDLE`, the values returned in `pPresentModes` will only indicate support for `VK_PRESENT_MODE_FIFO_KHR`, `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR`, and `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`. To query support for any other present mode, a valid handle must be provided in `surface`.

### Valid Usage

- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06524**
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `surface` must be a valid `VkSurfaceKHR` handle

- **VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06525**
  If `surface` is not `VK_NULL_HANDLE`, `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-physicalDevice-parameter
  
  **physicalDevice** must be a valid **VkPhysicalDevice** handle

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-parameter
  
  If **surface** is not **VK_NULL_HANDLE**, **surface** must be a valid **VkSurfaceKHR** handle

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModeCount-parameter
  
  **pPresentModeCount** must be a valid pointer to a **uint32_t** value

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModes-parameter
  
  If the value referenced by **pPresentModeCount** is not 0, and **pPresentModes** is not NULL, **pPresentModes** must be a valid pointer to an array of **pPresentModeCount** **VkPresentModeKHR** values

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-commonparent
  
  Both of **physicalDevice**, and **surface** that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same **VkInstance**

Return Codes

**Success**

- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_SURFACE_LOST_KHR**

Alternatively, to query the supported presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```c
// Provided by VK_EXT_full_screen_exclusive
VkResult vkGetPhysicalDeviceSurfacePresentModes2EXT(
    VkPhysicalDevice physicalDevice, 
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo, 
    uint32_t* pPresentModeCount, 
    VkPresentModeKHR* pPresentModes);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for **vkCreateSwapchainKHR**.

- **pSurfaceInfo** is a pointer to a **VkPhysicalDeviceSurfaceInfo2KHR** structure describing the surface and other fixed parameters that would be consumed by **vkCreateSwapchainKHR**.

- **pPresentModeCount** is a pointer to an integer related to the number of presentation modes
• **pPresentModes** is either **NULL** or a pointer to an array of **VkPresentModeKHR** values, indicating the supported presentation modes.

    vkGetPhysicalDeviceSurfacePresentModes2EXT behaves similarly to vkGetPhysicalDeviceSurfacePresentModesKHR, with the ability to specify extended inputs via chained input structures.

### Valid Usage

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06521**
  If the **VK_GOOGLE_surfaceless_query** extension is not enabled, **pSurfaceInfo->surface** must be a valid **VkSurfaceKHR** handle

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06522**
  If **pSurfaceInfo->surface** is not **VK_NULL_HANDLE**, **pSurfaceInfo->surface** must be supported by **physicalDevice**, as reported by **vkGetPhysicalDeviceSurfaceSupportKHR** or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-physicalDevice-parameter**
  **physicalDevice** must be a valid **VkPhysicalDevice** handle

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-parameter**
  **pSurfaceInfo** must be a valid pointer to a valid **VkPhysicalDeviceSurfaceInfo2KHR** structure

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModeCount-parameter**
  **pPresentModeCount** must be a valid pointer to a **uint32_t** value

- **VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModes-parameter**
  If the value referenced by **pPresentModeCount** is not **0**, and **pPresentModes** is not **NULL**, **pPresentModes** must be a valid pointer to an array of **pPresentModeCount** **VkPresentModeKHR** values

### Return Codes

**Success**

- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_SURFACE_LOST_KHR**
Possible values of elements of the *vkGetPhysicalDeviceSurfacePresentModesKHR::pPresentModes* array, indicating the supported presentation modes for a surface, are:

```c
// Provided by VK_KHR_surface
typedef enum VkPresentModeKHR {
    VK_PRESENT_MODE_IMMEDIATE_KHR = 0,
    VK_PRESENT_MODE_MAILBOX_KHR = 1,
    VK_PRESENT_MODE_FIFO_KHR = 2,
    VK_PRESENT_MODE_FIFO_RELAXED_KHR = 3,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR = 1000111000,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR = 1000111001,
} VkPresentModeKHR;
```

- **VK_PRESENT_MODE_IMMEDIATE_KHR** specifies that the presentation engine does not wait for a vertical blanking period to update the current image, meaning this mode may result in visible tearing. No internal queuing of presentation requests is needed, as the requests are applied immediately.

- **VK_PRESENT_MODE_MAILBOX_KHR** specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing cannot be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for reuse by the application. One request is removed from the queue and processed during each vertical blanking period in which the queue is non-empty.

- **VK_PRESENT_MODE_FIFO_KHR** specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing cannot be observed. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty. This is the only value of presentMode that is required to be supported.

- **VK_PRESENT_MODE_FIFO_RELAXED_KHR** specifies that the presentation engine generally waits for the next vertical blanking period to update the current image. If a vertical blanking period has already passed since the last update of the current image then the presentation engine does not wait for another vertical blanking period for the update, meaning this mode may result in visible tearing in this case. This mode is useful for reducing visual stutter with an application that will mostly present a new image before the next vertical blanking period, but may occasionally be late, and present a new image just after the next vertical blanking period. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during or after each vertical blanking period in which the queue is non-empty.

- **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a *shared presentable image*. The presentation engine is only required to update the current image after a new presentation request is received. Therefore the application must make a presentation
request whenever an update is required. However, the presentation engine may update the current image at any point, meaning this mode may result in visible tearing.

- **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a *shared presentable image*. The presentation engine periodically updates the current image on its regular refresh cycle. The application is only required to make one initial presentation request, after which the presentation engine must update the current image without any need for further presentation requests. The application can indicate the image contents have been updated by making a presentation request, but this does not guarantee the timing of when it will be updated. This mode may result in visible tearing if rendering to the image is not timed correctly.

The supported `VkImageUsageFlagBits` of the presentable images of a swapchain created for a surface may differ depending on the presentation mode, and can be determined as per the table below:

<table>
<thead>
<tr>
<th>Presentation mode</th>
<th>Image usage flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_PRESENT_MODE_IMMEDIATE_KHR</td>
<td><code>VkSurfaceCapabilitiesKHR::supportedUsageFlags</code></td>
</tr>
<tr>
<td>VK_PRESENT_MODE_MAILBOX_KHR</td>
<td><code>VkSurfaceCapabilitiesKHR::supportedUsageFlags</code></td>
</tr>
<tr>
<td>VK_PRESENT_MODE_FIFO_KHR</td>
<td><code>VkSurfaceCapabilitiesKHR::supportedUsageFlags</code></td>
</tr>
<tr>
<td>VK_PRESENT_MODE_FIFO_RELAXED_KHR</td>
<td><code>VkSurfaceCapabilitiesKHR::supportedUsageFlags</code></td>
</tr>
<tr>
<td>VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR</td>
<td><code>VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags</code></td>
</tr>
<tr>
<td>VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR</td>
<td><code>VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags</code></td>
</tr>
</tbody>
</table>

Note
For reference, the mode indicated by `VK_PRESENT_MODE_FIFO_KHR` is equivalent to the behavior of `{wgl|glX|egl}SwapBuffers` with a swap interval of 1, while the mode indicated by `VK_PRESENT_MODE_FIFO_RELAXED_KHR` is equivalent to the behavior of `{wgl|glX}SwapBuffers` with a swap interval of -1 (from the `{WGL|GLX}_EXT_swap_control_tear` extensions).

### 34.6. Full Screen Exclusive Control

Swapchains created with `fullScreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` must acquire and release exclusive full-screen access explicitly, using the following commands.

To acquire exclusive full-screen access for a swapchain, call:
vkAcquireFullScreenExclusiveModeEXT

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to acquire exclusive full-screen access for.

**Valid Usage**

- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02674
  `swapchain` must not be in the retired state
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02675
  `swapchain` must be a swapchain created with a `VkSurfaceFullScreenExclusiveInfoEXT` structure, with `fullScreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATIONCONTROLLED_EXT`
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02676
  `swapchain` must not currently have exclusive full-screen access

A return value of `VK_SUCCESS` indicates that the `swapchain` successfully acquired exclusive full-screen access. The swapchain will retain this exclusivity until either the application releases exclusive full-screen access with `vkReleaseFullScreenExclusiveModeEXT`, destroys the swapchain, or if any of the swapchain commands return `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODELOST_EXT` indicating that the mode was lost because of platform-specific changes.

If the swapchain was unable to acquire exclusive full-screen access to the display then `VK_ERROR_INITIALIZATIONFAILED` is returned. An application can attempt to acquire exclusive full-screen access again for the same swapchain even if this command fails, or if `VK_ERRORFULL_SCREEN_EXCLUSIVE_MODELOST_EXT` has been returned by a swapchain command.

**Valid Usage (Implicit)**

- VUID-vkAcquireFullScreenExclusiveModeEXT-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parameter
  `swapchain` must be a valid `VkSwapchainKHR` handle
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parent
  `swapchain` must have been created, allocated, or retrieved from `device`

**Return Codes**

**Success**

- `VK_SUCCESS`
Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_SURFACE_LOST_KHR

To release exclusive full-screen access from a swapchain, call:

```c
// Provided by VK_EXT_full_screen-exclusive
VkResult vkReleaseFullScreenExclusiveModeEXT(
    VkDevice device,
    VkSwapchainKHR swapchain);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to release exclusive full-screen access from.

**Note**

Applications will not be able to present to `swapchain` after this call until exclusive full-screen access is reacquired. This is usually useful to handle when an application is minimized or otherwise intends to stop presenting for a time.

**Valid Usage**

- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02677 `swapchain` must not be in the retired state
- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02678 `swapchain` must be a swapchain created with a `VkSurfaceFullScreenExclusiveInfoEXT` structure, with `fullScreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`

**Valid Usage (Implicit)**

- VUID-vkReleaseFullScreenExclusiveModeEXT-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-parameter `swapchain` must be a valid `VkSwapchainKHR` handle
- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-parent `swapchain` must have been created, allocated, or retrieved from `device`
### 34.7. Device Group Queries

A logical device that represents multiple physical devices may support presenting from images on more than one physical device, or combining images from multiple physical devices.

To query these capabilities, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
VkResult vkGetDeviceGroupPresentCapabilitiesKHR(
    VkDevice device,
    VkDeviceGroupPresentCapabilitiesKHR* pDeviceGroupPresentCapabilities);
```

- `device` is the logical device.
- `pDeviceGroupPresentCapabilities` is a pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure in which the device’s capabilities are returned.

### Valid Usage (Implicit)

- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-pDeviceGroupPresentCapabilities-parameter `pDeviceGroupPresentCapabilities` must be a valid pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure

### Return Codes

#### Success
- `VK_SUCCESS`

#### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
The \texttt{VkDeviceGroupPresentCapabilitiesKHR} structure is defined as:

```c
typedef struct VkDeviceGroupPresentCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t presentMask[VK_MAX_DEVICE_GROUP_SIZE];
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupPresentCapabilitiesKHR;
```

- \textit{sType} is a \texttt{VkStructureType} value identifying this structure.
- \textit{pNext} is NULL or a pointer to a structure extending this structure.
- \textit{presentMask} is an array of \texttt{VK_MAX_DEVICE_GROUP_SIZE} uint32_t masks, where the mask at element \( i \) is non-zero if physical device \( i \) has a presentation engine, and where bit \( j \) is set in element \( i \) if physical device \( i \) can present swapchain images from physical device \( j \). If element \( i \) is non-zero, then bit \( i \) must be set.
- \textit{modes} is a bitmask of \texttt{VkDeviceGroupPresentModeFlagBitsKHR} indicating which device group presentation modes are supported.

\textit{modes} always has \texttt{VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR} set.

The present mode flags are also used when presenting an image, in \texttt{VkDeviceGroupPresentInfoKHR::mode}.

If a device group only includes a single physical device, then \textit{modes} must equal \texttt{VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR}.

### Valid Usage (Implicit)

- VUID-VkDeviceGroupPresentCapabilitiesKHR-sType-sType
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR}

- VUID-VkDeviceGroupPresentCapabilitiesKHR-pNext-pNext
  \texttt{pNext} must be NULL

Bits which \textit{may} be set in \texttt{VkDeviceGroupPresentCapabilitiesKHR::modes}, indicating which device group presentation modes are supported, are:
typedef enum VkDeviceGroupPresentModeFlagBitsKHR {
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR = 0x00000001,
    VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR = 0x00000002,
    VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR = 0x00000004,
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR = 0x00000008,
} VkDeviceGroupPresentModeFlagBitsKHR;

- VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR specifies that any physical device with a presentation engine can present its own swapchain images.
- VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR specifies that any physical device with a presentation engine can present swapchain images from any physical device in its presentMask.
- VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR specifies that any physical device with a presentation engine can present the sum of swapchain images from any physical devices in its presentMask.
- VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR specifies that multiple physical devices with a presentation engine can each present their own swapchain images.

typedef VkFlags VkDeviceGroupPresentModeFlagsKHR;

VkDeviceGroupPresentModeFlagsKHR is a bitmask type for setting a mask of zero or more VkDeviceGroupPresentModeFlagBitsKHR.

Some surfaces may not be capable of using all the device group present modes.

To query the supported device group present modes for a particular surface, call:

VkResult vkGetDeviceGroupSurfacePresentModesKHR(
    VkDevice device,
    VkSurfaceKHR surface,
    VkDeviceGroupPresentModeFlagsKHR* pModes);

- device is the logical device.
- surface is the surface.
- pModes is a pointer to a VkDeviceGroupPresentModeFlagsKHR in which the supported device group present modes for the surface are returned.

The modes returned by this command are not invariant, and may change in response to the surface being moved, resized, or occluded. These modes must be a subset of the modes returned by vkGetDeviceGroupPresentCapabilitiesKHR.
Valid Usage

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-06212
  surface must be supported by all physical devices associated with device, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-parameter
  surface must be a valid VkSurfaceKHR handle

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-pModes-parameter
  pModes must be a valid pointer to a VkDeviceGroupPresentModeFlagsKHR value

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-commonparent
  Both of device, and surface must have been created, allocated, or retrieved from the same VkInstance

Host Synchronization

- Host access to surface must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

Alternatively, to query the supported device group presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```c
// Provided by VK_VERSION_1_1 with VK_EXT_full_screen_exclusive, VK_KHR_device_group with VK_EXT_full_screen_exclusive
VkResult vkGetDeviceGroupSurfacePresentModes2EXT(
    VkDevice device,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkDeviceGroupPresentModeFlagsKHR* pModes);
```
• **device** is the logical device.

• **pSurfaceInfo** is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.

• **pModes** is a pointer to a `VkDeviceGroupPresentModeFlagsKHR` in which the supported device group present modes for the surface are returned.

`vkGetDeviceGroupSurfacePresentModes2EXT` behaves similarly to `vkGetDeviceGroupSurfacePresentModesKHR`, with the ability to specify extended inputs via chained input structures.

---

### Valid Usage

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-06213
  - **pSurfaceInfo->surface** must be supported by all physical devices associated with **device**, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism.

---

### Valid Usage (Implicit)

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-device-parameter
  - **device** must be a valid `VkDevice` handle

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-parameter
  - **pSurfaceInfo** must be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pModes-parameter
  - **pModes** must be a valid pointer to a `VkDeviceGroupPresentModeFlagsKHR` value

---

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

---

When using `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, the application may need to know which regions of the surface are used when presenting locally on each physical device. Presentation of swapchain images to this surface need only have valid contents in the regions returned by this command.

To query a set of rectangles used in presentation on the physical device, call:
Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface

```c
VkResult vkGetPhysicalDevicePresentRectanglesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pRectCount,
    VkRect2D* pRects);
```

- `physicalDevice` is the physical device.
- `surface` is the surface.
- `pRectCount` is a pointer to an integer related to the number of rectangles available or queried, as described below.
- `pRects` is either `NULL` or a pointer to an array of `VkRect2D` structures.

If `pRects` is `NULL`, then the number of rectangles used when presenting the given `surface` is returned in `pRectCount`. Otherwise, `pRectCount` must point to a variable set by the user to the number of elements in the `pRects` array, and on return the variable is overwritten with the number of structures actually written to `pRects`. If the value of `pRectCount` is less than the number of rectangles, at most `pRectCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available rectangles were returned.

The values returned by this command are not invariant, and may change in response to the surface being moved, resized, or occluded.

The rectangles returned by this command must not overlap.

### Valid Usage

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06523
  - `surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06211
  - `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-physicalDevice-parameter
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-parameter
  - `surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRectCount-parameter
  - `pRectCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRects-parameter
  - If the value referenced by `pRectCount` is not 0, and `pRects` is not `NULL`, `pRects` must be a
valid pointer to an array of pRectCount VkRect2D structures

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-commonparent
  Both of physicalDevice, and surface must have been created, allocated, or retrieved from the same VkInstance

Host Synchronization

- Host access to surface must be externally synchronized

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

34.8. Display Timing Queries

Traditional game and real-time-animation applications frequently use VK_PRESENT_MODE_FIFO_KHR so that presentable images are updated during the vertical blanking period of a given refresh cycle (RC) of the presentation engine’s display. This avoids the visual anomaly known as tearing.

However, synchronizing the presentation of images with the RC does not prevent all forms of visual anomalies. Stuttering occurs when the geometry for each presentable image is not accurately positioned for when that image will be displayed. The geometry may appear to move too little some RCs, and too much for others. Sometimes the animation appears to freeze, when the same image is used for more than one RC.

In order to minimize stuttering, an application needs to correctly position their geometry for when the presentable image will be displayed to the user. To accomplish this, applications need various timing information about the presentation engine’s display. They need to know when presentable images were actually presented, and when they could have been presented. Applications also need to tell the presentation engine to display an image no sooner than a given time. This can allow the application’s animation to look smooth to the user, with no stuttering. The VK_GOOGLE_display_timing extension allows an application to satisfy these needs.

The presentation engine’s display typically refreshes the pixels that are displayed to the user on a periodic basis. The period may be fixed or variable. In many cases, the presentation engine is associated with fixed refresh rate (FRR) display technology, with a fixed refresh rate (RR, e.g. 60Hz). In some cases, the presentation engine is associated with variable refresh rate (VRR) display technology, where each refresh cycle (RC) can vary in length. This extension treats VRR displays as
if they are FRR.

To query the duration of a refresh cycle (RC) for the presentation engine's display, call:

```c
// Provided by VK_GOOGLE_display_timing
VkResult vkGetRefreshCycleDurationGOOGLE(
    VkDevice device,
    VkSwapchainKHR swapchain,
    VkRefreshCycleDurationGOOGLE* pDisplayTimingProperties);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to obtain the refresh duration for.
- `pDisplayTimingProperties` is a pointer to a `VkRefreshCycleDurationGOOGLE` structure.

### Valid Usage (Implicit)

- **VUID-vkGetRefreshCycleDurationGOOGLE-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkGetRefreshCycleDurationGOOGLE-swapchain-parameter**
  - `swapchain` must be a valid `VkSwapchainKHR` handle
- **VUID-vkGetRefreshCycleDurationGOOGLE-pDisplayTimingProperties-parameter**
  - `pDisplayTimingProperties` must be a valid pointer to a `VkRefreshCycleDurationGOOGLE` structure
- **VUID-vkGetRefreshCycleDurationGOOGLE-swapchain-parent**
  - `swapchain` must have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `swapchain` must be externally synchronized

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkRefreshCycleDurationGOOGLE` structure is defined as:
// Provided by VK GOOGLE_display_timing
typedef struct VkRefreshCycleDurationGOOGLE {
    uint64_t refreshDuration;
} VkRefreshCycleDurationGOOGLE;

- **refreshDuration** is the number of nanoseconds from the start of one refresh cycle to the next.

**Note**
The rate at which an application renders and presents new images is known as the image present rate (IPR, aka frame rate). The inverse of IPR, or the duration between each image present, is the image present duration (IPD). In order to provide a smooth, stutter-free animation, an application will want its IPD to be a multiple of **refreshDuration**. For example, if a display has a 60Hz refresh rate, **refreshDuration** will be a value in nanoseconds that is approximately equal to 16.67ms. In such a case, an application will want an IPD of 16.67ms (1X multiplier of **refreshDuration**), or 33.33ms (2X multiplier of **refreshDuration**), or 50.0ms (3X multiplier of **refreshDuration**), etc.

In order to determine a target IPD for a display (i.e. a multiple of **refreshDuration**), an application needs to determine when its images are actually displayed. Suppose an application has an initial target IPD of 16.67ms (1X multiplier of **refreshDuration**). It will therefore position the geometry of a new image 16.67ms later than the previous image. But suppose this application is running on slower hardware, so that it actually takes 20ms to render each new image. This will create visual anomalies, because the images will not be displayed to the user every 16.67ms, nor every 20ms. In this case, it is better for the application to adjust its target IPD to 33.33ms (i.e. a 2X multiplier of **refreshDuration**), and tell the presentation engine to not present images any sooner than every 33.33ms. This will allow the geometry to be correctly positioned for each presentable image.

Adjustments to an application’s IPD may be needed because different views of an application’s geometry can take different amounts of time to render. For example, looking at the sky may take less time to render than looking at multiple, complex items in a room. In general, it is good to not frequently change IPD, as that can cause visual anomalies. Adjustments to a larger IPD because of late images should happen quickly, but adjustments to a smaller IPD should only happen if the actualPresentTime and earliestPresentTime members of the VkPastPresentationTimingGOOGLE structure are consistently different, and if presentMargin is consistently large, over multiple images.

The implementation will maintain a limited amount of history of timing information about previous presents. Because of the asynchronous nature of the presentation engine, the timing information for a given vkQueuePresentKHR command will become available some time later. These time values can be asynchronously queried, and will be returned if available. All time values are in nanoseconds, relative to a monotonically-increasing clock (e.g. **CLOCK_MONOTONIC** (see clock_gettime(2)) on Android and Linux).
To asynchronously query the presentation engine, for newly-available timing information about one or more previous presents to a given swapchain, call:

```c
// Provided by VK_GOOGLE_display_timing
VkResult vkGetPastPresentationTimingGOOGLE(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint32_t* pPresentationTimingCount,
    VkPastPresentationTimingGOOGLE* pPresentationTimings);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to obtain presentation timing information duration for.
- **pPresentationTimingCount** is a pointer to an integer related to the number of **VkPastPresentationTimingGOOGLE** structures to query, as described below.
- **pPresentationTimings** is either **NULL** or a pointer to an array of **VkPastPresentationTimingGOOGLE** structures.

If **pPresentationTimings** is **NULL**, then the number of newly-available timing records for the given swapchain is returned in **pPresentationTimingCount**. Otherwise, **pPresentationTimingCount** must point to a variable set by the user to the number of elements in the **pPresentationTimings** array, and on return the variable is overwritten with the number of structures actually written to **pPresentationTimings**. If the value of **pPresentationTimingCount** is less than the number of newly-available timing records, at most **pPresentationTimingCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available timing records were returned.

### Valid Usage (Implicit)

- **VUID-vkGetPastPresentationTimingGOOGLE-device-parameter**
  - **device must** be a valid **VkDevice** handle

- **VUID-vkGetPastPresentationTimingGOOGLE-swapchain-parameter**
  - **swapchain must** be a valid **VkSwapchainKHR** handle

- **VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimingCount-parameter**
  - **pPresentationTimingCount must** be a valid pointer to a **uint32_t** value

- **VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimings-parameter**
  - If the value referenced by **pPresentationTimingCount** is not 0, and **pPresentationTimings** is not **NULL**, **pPresentationTimings must** be a valid pointer to an array of **pPresentationTimingCount** **VkPastPresentationTimingGOOGLE** structures

- **VUID-vkGetPastPresentationTimingGOOGLE-swapchain-parent**
  - **swapchain must** have been created, allocated, or retrieved from **device**
Host Synchronization

- Host access to swapchain must be externally synchronized

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR

The VkPastPresentationTimingGOOGLE structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPastPresentationTimingGOOGLE {
    uint32_t presentID;
    uint64_t desiredPresentTime;
    uint64_t actualPresentTime;
    uint64_t earliestPresentTime;
    uint64_t presentMargin;
} VkPastPresentationTimingGOOGLE;
```

- presentID is an application-provided value that was given to a previous vkQueuePresentKHR command via VkPresentTimeGOOGLE::presentID (see below). It can be used to uniquely identify a previous present with the vkQueuePresentKHR command.

- desiredPresentTime is an application-provided value that was given to a previous vkQueuePresentKHR command via VkPresentTimeGOOGLE::desiredPresentTime. If non-zero, it was used by the application to indicate that an image not be presented any sooner than desiredPresentTime.

- actualPresentTime is the time when the image of the swapchain was actually displayed.

- earliestPresentTime is the time when the image of the swapchain could have been displayed. This may differ from actualPresentTime if the application requested that the image be presented no sooner than VkPresentTimeGOOGLE::desiredPresentTime.

- presentMargin is an indication of how early the vkQueuePresentKHR command was processed compared to how soon it needed to be processed, and still be presented at earliestPresentTime.

The results for a given swapchain and presentID are only returned once from
vkGetPastPresentationTimingGOOGLE.

The application can use the VkPastPresentationTimingGOOGLE values to occasionally adjust its timing. For example, if actualPresentTime is later than expected (e.g. one refreshDuration late), the application may increase its target IPD to a higher multiple of refreshDuration (e.g. decrease its frame rate from 60Hz to 30Hz). If actualPresentTime and earliestPresentTime are consistently different, and if presentMargin is consistently large enough, the application may decrease its target IPD to a smaller multiple of refreshDuration (e.g. increase its frame rate from 30Hz to 60Hz). If actualPresentTime and earliestPresentTime are same, and if presentMargin is consistently high, the application may delay the start of its input-render-present loop in order to decrease the latency between user input and the corresponding present (always leaving some margin in case a new image takes longer to render than the previous image). An application that desires its target IPD to always be the same as refreshDuration, can also adjust features until actualPresentTime is never late and presentMargin is satisfactory.

The full VK_GOOGLE_display_timing extension semantics are described for swapchains created with VK_PRESENT_MODE_FIFO_KHR. For example, non-zero values of VkPresentTimeGOOGLE::desiredPresentTime must be honored, and vkGetPastPresentationTimingGOOGLE should return a VkPastPresentationTimingGOOGLE structure with valid values for all images presented with vkQueuePresentKHR. The semantics for other present modes are as follows:

- **VK_PRESENT_MODE_IMMEDIATE_KHR.** The presentation engine may ignore non-zero values of VkPresentTimeGOOGLE::desiredPresentTime in favor of presenting immediately. The value of VkPastPresentationTimingGOOGLE::earliestPresentTime must be the same as VkPastPresentationTimingGOOGLE::actualPresentTime, which should be when the presentation engine displayed the image.

- **VK_PRESENT_MODE_MAILBOX_KHR.** The intention of using this present mode with this extension is to handle cases where an image is presented late, and the next image is presented soon enough to replace it at the next vertical blanking period. For images that are displayed to the user, the value of VkPastPresentationTimingGOOGLE::actualPresentTime must be when the image was displayed. For images that are not displayed to the user, vkGetPastPresentationTimingGOOGLE may not return a VkPastPresentationTimingGOOGLE structure, or it may return a VkPastPresentationTimingGOOGLE structure with the value of zero for both VkPastPresentationTimingGOOGLE::actualPresentTime and VkPastPresentationTimingGOOGLE::earliestPresentTime. It is possible that an application can submit images with VkPresentTimeGOOGLE::desiredPresentTime values such that new images may not be displayed. For example, if VkPresentTimeGOOGLE::desiredPresentTime is far enough in the future that an image is not presented before vkQueuePresentKHR is called to present another image, the first image will not be displayed to the user. If the application continues to do that, the presentation may not display new images.

- **VK_PRESENT_MODE_FIFO_RELAXED_KHR.** For images that are presented in time to be displayed at the next vertical blanking period, the semantics are identical as for VK_PRESENT_MODE_FIFO_KHR. For images that are presented late, and are displayed after the start of the vertical blanking period (i.e. with tearing), the values of VkPastPresentationTimingGOOGLE may be treated as if the image was displayed at the start of the vertical blanking period, or may be treated the same as for VK_PRESENT_MODE_IMMEDIATE_KHR.
34.9. Present Wait

Applications wanting to control the pacing of the application by monitoring when presentation processes have completed to limit the number of outstanding images queued for presentation, need to have a method of being signaled during the presentation process.

Using the `VK_GOOGLE_display_timing` extension applications can discover when images were presented, but only asynchronously.

Providing a mechanism which allows applications to block, waiting for a specific step of the presentation process to complete allows them to control the amount of outstanding work (and hence the potential lag in responding to user input or changes in the rendering environment).

The `VK_KHR_present_wait` extension allows applications to tell the presentation engine at the `vkQueuePresentKHR` call that it plans on waiting for presentation by passing a `VkPresentIdKHR` structure. The `presentId` passed in that structure may then be passed to a future `vkWaitForPresentKHR` call to cause the application to block until that presentation is finished.

34.10. WSI Swapchain

A swapchain object (a.k.a. swapchain) provides the ability to present rendering results to a surface. Swapchain objects are represented by `VkSwapchainKHR` handles:

```c
// Provided by VK_KHR_swapchain
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSwapchainKHR)
```

A swapchain is an abstraction for an array of presentable images that are associated with a surface. The presentable images are represented by `VkImage` objects created by the platform. One image (which can be an array image for multiview/stereoscopic-3D surfaces) is displayed at a time, but multiple images can be queued for presentation. An application renders to the image, and then queues the image for presentation to the surface.

A native window cannot be associated with more than one non-retired swapchain at a time. Further, swapchains cannot be created for native windows that have a non-Vulkan graphics API surface associated with them.

**Note**

The presentation engine is an abstraction for the platform's compositor or display engine.

The presentation engine may be synchronous or asynchronous with respect to the application and/or logical device.

Some implementations may use the device’s graphics queue or dedicated presentation hardware to perform presentation.

The presentable images of a swapchain are owned by the presentation engine. An application can
acquire use of a presentable image from the presentation engine. Use of a presentable image must occur only after the image is returned by `vkAcquireNextImageKHR`, and before it is released by `vkQueuePresentKHR`. This includes transitioning the image layout and rendering commands.

An application can acquire use of a presentable image with `vkAcquireNextImageKHR`. After acquiring a presentable image and before modifying it, the application must use a synchronization primitive to ensure that the presentation engine has finished reading from the image. The application can then transition the image's layout, queue rendering commands to it, etc. Finally, the application presents the image with `vkQueuePresentKHR`, which releases the acquisition of the image. The application can also release the acquisition of the image through `vkReleaseSwapchainImagesEXT`, if the image is not in use by the device, and skip the present operation.

The presentation engine controls the order in which presentable images are acquired for use by the application.

---

**Note**

This allows the platform to handle situations which require out-of-order return of images after presentation. At the same time, it allows the application to generate command buffers referencing all of the images in the swapchain at initialization time, rather than in its main loop.

How this all works is described below.

If a swapchain is created with `presentMode` set to either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, a single presentable image can be acquired, referred to as a shared presentable image. A shared presentable image may be concurrently accessed by the application and the presentation engine, without transitioning the image's layout after it is initially presented.

- With `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR`, the presentation engine is only required to update to the latest contents of a shared presentable image after a present. The application must call `vkQueuePresentKHR` to guarantee an update. However, the presentation engine may update from it at any time.

- With `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, the presentation engine will automatically present the latest contents of a shared presentable image during every refresh cycle. The application is only required to make one initial call to `vkQueuePresentKHR`, after which the presentation engine will update from it without any need for further present calls. The application can indicate the image contents have been updated by calling `vkQueuePresentKHR`, but this does not guarantee the timing of when updates will occur.

The presentation engine may access a shared presentable image at any time after it is first presented. To avoid tearing, an application should coordinate access with the presentation engine. This requires presentation engine timing information through platform-specific mechanisms and ensuring that color attachment writes are made available during the portion of the presentation engine's refresh cycle they are intended for.

---

**Note**
The *VK_KHR_shared_presentable_image* extension does not provide functionality for determining the timing of the presentation engine’s refresh cycles.

In order to query a swapchain’s status when rendering to a shared presentable image, call:

```c
// Provided by VK_KHR_shared_presentable_image
VkResult vkGetSwapchainStatusKHR(
    VkDevice device,  // device
    VkSwapchainKHR swapchain  // swapchain
);
```

- *device* is the device associated with *swapchain*.
- *swapchain* is the swapchain to query.

**Valid Usage (Implicit)**

- VUID-vkGetSwapchainStatusKHR-device-parameter
  - *device* must be a valid *VkDevice* handle
- VUID-vkGetSwapchainStatusKHR-swapchain-parameter
  - *swapchain* must be a valid *VkSwapchainKHR* handle
- VUID-vkGetSwapchainStatusKHR-swapchain-parent
  - *swapchain* must have been created, allocated, or retrieved from *device*

**Host Synchronization**

- Host access to *swapchain* must be externally synchronized

**Return Codes**

**Success**

- `VK_SUCCESS`
- `VK_SUBOPTIMAL_KHR`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`

The possible return values for *vkGetSwapchainStatusKHR* should be interpreted as follows:
• **VK_SUCCESS** specifies the presentation engine is presenting the contents of the shared presentable image, as per the swapchain's `VkPresentModeKHR`.

• **VK_SUBOPTIMAL_KHR** the swapchain no longer matches the surface properties exactly, but the presentation engine is presenting the contents of the shared presentable image, as per the swapchain's `VkPresentModeKHR`.

• **VK_ERROR_OUT_OF_DATE_KHR** the surface has changed in such a way that it is no longer compatible with the swapchain.

• **VK_ERROR_SURFACE_LOST_KHR** the surface is no longer available.

```note
The swapchain state may be cached by implementations, so applications should regularly call `vkGetSwapchainStatusKHR` when using a swapchain with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.
```

To create a swapchain, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkCreateSwapchainKHR(
    VkDevice device,
    const VkSwapchainCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSwapchainKHR* pSwapchain);
```

• **device** is the device to create the swapchain for.

• **pCreateInfo** is a pointer to a `VkSwapchainCreateInfoKHR` structure specifying the parameters of the created swapchain.

• **pAllocator** is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).

• **pSwapchain** is a pointer to a `VkSwapchainKHR` handle in which the created swapchain object will be returned.

As mentioned above, if `vkCreateSwapchainKHR` succeeds, it will return a handle to a swapchain containing an array of at least `pCreateInfo->minImageCount` presentable images.

While acquired by the application, presentable images can be used in any way that equivalent non-presentable images can be used. A presentable image is equivalent to a non-presentable image created with the following `VkImageCreateInfo` parameters:
<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>flags</td>
<td>VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT is set if VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR is set</td>
</tr>

</tr>
</tbody>
</table>

The pCreateInfo->surface must not be destroyed until after the swapchain is destroyed.

If oldSwapchain is VK_NULL_HANDLE, and the native window referred to by pCreateInfo->surface is already associated with a Vulkan swapchain, VK_ERROR_NATIVE_WINDOW_IN_USE_KHR must be returned.

If the native window referred to by pCreateInfo->surface is already associated with a non-Vulkan graphics API surface, VK_ERROR_NATIVE_WINDOW_IN_USE_KHR must be returned.

The native window referred to by pCreateInfo->surface must not become associated with a non-Vulkan graphics API surface before all associated Vulkan swapchains have been destroyed.

vkCreateSwapchainKHR will return VK_ERROR_DEVICE_LOST if the logical device was lost. The VkSwapchainKHR is a child of the device, and must be destroyed before the device. However, VkSurfaceKHR is not a child of any VkDevice and is not affected by the lost device. After successfully recreating a VkDevice, the same VkSurfaceKHR can be used to create a new VkSwapchainKHR, provided the previous one was destroyed.
If the `oldSwapchain` parameter of `pCreateInfo` is a valid swapchain, which has exclusive full-screen access, that access is released from `pCreateInfo->oldSwapchain`. If the command succeeds in this case, the newly created swapchain will automatically acquire exclusive full-screen access from `pCreateInfo->oldSwapchain`.

**Note**

This implicit transfer is intended to avoid exiting and entering full-screen exclusive mode, which may otherwise cause unwanted visual updates to the display.

In some cases, swapchain creation may fail if exclusive full-screen mode is requested for application control, but for some implementation-specific reason exclusive full-screen access is unavailable for the particular combination of parameters provided. If this occurs, `VK_ERROR_INITIALIZATION_FAILED` will be returned.

**Note**

In particular, it will fail if the `imageExtent` member of `pCreateInfo` does not match the extents of the monitor. Other reasons for failure may include the app not being set as high-dpi aware, or if the physical device and monitor are not compatible in this mode.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSwapchainPresentBarrierCreateInfoNV` structure, then that structure includes additional swapchain creation parameters specific to the present barrier. Swapchain creation may fail if the state of the current system restricts the usage of the present barrier feature `VkSurfaceCapabilitiesPresentBarrierNV`, or a swapchain itself does not satisfy all the required conditions. In this scenario `VK_ERROR_INITIALIZATION_FAILED` is returned.

When the `VkSurfaceKHR` in `VkSwapchainCreateInfoKHR` is a display surface, then the `VkDisplayModeKHR` in display surface’s `VkDisplaySurfaceCreateInfoKHR` is associated with a particular `VkDisplayKHR`. Swapchain creation may fail if that `VkDisplayKHR` is not acquired by the application. In this scenario `VK_ERROR_INITIALIZATION_FAILED` is returned.

---

**Valid Usage (Implicit)**

- **VUID-vkCreateSwapchainKHR-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkCreateSwapchainKHR-pCreateInfo-parameter**
  
  `pCreateInfo` must be a valid pointer to a valid `VkSwapchainCreateInfoKHR` structure

- **VUID-vkCreateSwapchainKHR-pAllocator-parameter**
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateSwapchainKHR-pSwapchain-parameter**
  
  `pSwapchain` must be a valid pointer to a `VkSwapchainKHR` handle
Host Synchronization

- Host access to `pCreateInfo->surface` must be externally synchronized
- Host access to `pCreateInfo->oldSwapchain` must be externally synchronized

Return Codes

Success
- `VK_SUCCESS`

Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_COMPRESSION_EXHAUSTED_EXT`

The `VkSwapchainCreateInfoKHR` structure is defined as:

```c
typedef struct VkSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainCreateFlagsKHR flags;
    VkSurfaceKHR surface;
    uint32_t minImageCount;
    VkFormat imageFormat;
    VkColorSpaceKHR imageColorSpace;
    VkExtent2D imageExtent;
    uint32_t imageArrayLayers;
    VkImageUsageFlags imageUsage;
    VkSharingMode imageSharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
    VkSurfaceTransformFlagBitsKHR preTransform;
    VkCompositeAlphaFlagBitsKHR compositeAlpha;
    VkPresentModeKHR presentMode;
    VkBool32 clipped;
    VkSwapchainKHR oldSwapchain;
} VkSwapchainCreateInfoKHR;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **flags** is a bitmask of `VkSwapchainCreateFlagBitsKHR` indicating parameters of the swapchain creation.

• **surface** is the surface onto which the swapchain will present images. If the creation succeeds, the swapchain becomes associated with `surface`.

• **minImageCount** is the minimum number of presentable images that the application needs. The implementation will either create the swapchain with at least that many images, or it will fail to create the swapchain.

• **imageFormat** is a `VkFormat` value specifying the format the swapchain image(s) will be created with.

• **imageColorSpace** is a `VkColorSpaceKHR` value specifying the way the swapchain interprets image data.

• **imageExtent** is the size (in pixels) of the swapchain image(s). The behavior is platform-dependent if the image extent does not match the surface’s `currentExtent` as returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`.

  
  **Note**
  On some platforms, it is normal that `maxImageExtent` may become `(0, 0)`, for example when the window is minimized. In such a case, it is not possible to create a swapchain due to the Valid Usage requirements, unless scaling is selected through `VkSwapchainPresentScalingCreateInfoEXT`, if supported.

• **imageArrayLayers** is the number of views in a multiview/stereo surface. For non-stereoscopic-3D applications, this value is 1.

• **imageUsage** is a bitmask of `VkImageUsageFlagBits` describing the intended usage of the (acquired) swapchain images.

• **imageSharingMode** is the sharing mode used for the image(s) of the swapchain.

• **queueFamilyIndexCount** is the number of queue families having access to the image(s) of the swapchain when `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`.

• **pQueueFamilyIndices** is a pointer to an array of queue family indices having access to the images(s) of the swapchain when `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`.

• **preTransform** is a `VkSurfaceTransformFlagBitsKHR` value describing the transform, relative to the presentation engine’s natural orientation, applied to the image content prior to presentation. If it does not match the `currentTransform` value returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, the presentation engine will transform the image content as part of the presentation operation.

• **compositeAlpha** is a `VkCompositeAlphaFlagBitsKHR` value indicating the alpha compositing mode to use when this surface is composited together with other surfaces on certain window systems.

• **presentMode** is the presentation mode the swapchain will use. A swapchain’s present mode determines how incoming present requests will be processed and queued internally.

• **clipped** specifies whether the Vulkan implementation is allowed to discard rendering
operations that affect regions of the surface that are not visible.

- If set to `VK_TRUE`, the presentable images associated with the swapchain may not own all of their pixels. Pixels in the presentable images that correspond to regions of the target surface obscured by another window on the desktop, or subject to some other clipping mechanism will have undefined content when read back. Fragment shaders may not execute for these pixels, and thus any side effects they would have had will not occur. Setting `VK_TRUE` does not guarantee any clipping will occur, but allows more efficient presentation methods to be used on some platforms.

- If set to `VK_FALSE`, presentable images associated with the swapchain will own all of the pixels they contain.

Note
Applications should set this value to `VK_TRUE` if they do not expect to read back the content of presentable images before presenting them or after reacquiring them, and if their fragment shaders do not have any side effects that require them to run for all pixels in the presentable image.

- `oldSwapchain` is `VK_NULL_HANDLE`, or the existing non-retired swapchain currently associated with `surface`. Providing a valid `oldSwapchain` may aid in the resource reuse, and also allows the application to still present any images that are already acquired from it.

Upon calling `vkCreateSwapchainKHR` with an `oldSwapchain` that is not `VK_NULL_HANDLE`, `oldSwapchain` is retired — even if creation of the new swapchain fails. The new swapchain is created in the non-retired state whether or not `oldSwapchain` is `VK_NULL_HANDLE`.

Upon calling `vkCreateSwapchainKHR` with an `oldSwapchain` that is not `VK_NULL_HANDLE`, any images from `oldSwapchain` that are not acquired by the application may be freed by the implementation, which may occur even if creation of the new swapchain fails. The application can destroy `oldSwapchain` to free all memory associated with `oldSwapchain`.

Note
Multiple retired swapchains can be associated with the same `VkSurfaceKHR` through multiple uses of `oldSwapchain` that outnumber calls to `vkDestroySwapchainKHR`.

After `oldSwapchain` is retired, the application can pass to `vkQueuePresentKHR` any images it had already acquired from `oldSwapchain`. E.g., an application may present an image from the old swapchain before an image from the new swapchain is ready to be presented. As usual, `vkQueuePresentKHR` may fail if `oldSwapchain` has entered a state that causes `VK_ERROR_OUT_OF_DATE_KHR` to be returned.

The application can continue to use a shared presentable image obtained from `oldSwapchain` until a presentable image is acquired from the new swapchain, as long as it has not entered a state that causes it to return `VK_ERROR_OUT_OF_DATE_KHR`.

Valid Usage

- VUID-VkSwapchainCreateInfoKHR-surface-01270
surface must be a surface that is supported by the device as determined using vkGetPhysicalDeviceSurfaceSupportKHR

- **VUID-VkSwapchainCreateInfoKHR-minImageCount-01272**
  minImageCount must be less than or equal to the value returned in the maxImageCount member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface if the returned maxImageCount is not zero.

- **VUID-VkSwapchainCreateInfoKHR-presentMode-02839**
  If presentMode is not VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR nor VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, then minImageCount must be greater than or equal to the value returned in the minImageCount member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface.

- **VUID-VkSwapchainCreateInfoKHR-minImageCount-01383**
  minImageCount must be 1 if presentMode is either VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR.

- **VUID-VkSwapchainCreateInfoKHR-imageFormat-01273**
  imageFormat and imageColorSpace must match the format and colorSpace members, respectively, of one of the VkSurfaceFormatKHR structures returned by vkGetPhysicalDeviceSurfaceFormatsKHR for the surface.

- **VUID-VkSwapchainCreateInfoKHR-pNext-07781**
  If a VkSwapchainPresentScalingCreateInfoEXT structure was not included in the pNext chain, or it is included and VkSwapchainPresentScalingCreateInfoEXT::scalingBehavior is zero then imageExtent must be between minImageExtent and maxImageExtent, inclusive, where minImageExtent and maxImageExtent are members of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface.

- **VUID-VkSwapchainCreateInfoKHR-pNext-07782**
  If a VkSwapchainPresentScalingCreateInfoEXT structure was included in the pNext chain and VkSwapchainPresentScalingCreateInfoEXT::scalingBehavior is not zero then imageExtent must be between minScaledImageExtent and maxScaledImageExtent, inclusive, where minScaledImageExtent and maxScaledImageExtent are members of the VkSurfacePresentScalingCapabilitiesEXT structure returned by vkGetPhysicalDeviceSurfaceCapabilities2KHR for the surface and presentMode.

- **VUID-VkSwapchainCreateInfoKHR-imageExtent-01689**
  imageExtent members width and height must both be non-zero.

- **VUID-VkSwapchainCreateInfoKHR-imageArrayLayers-01275**
  imageArrayLayers must be greater than 0 and less than or equal to the maxImageArrayLayers member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface.

- **VUID-VkSwapchainCreateInfoKHR-presentMode-01427**
  If presentMode is VK_PRESENT_MODE_IMMEDIATE_KHR, VK_PRESENT_MODE_MAILBOX_KHR, VK_PRESENT_MODE_FIFO_KHR or VK_PRESENT_MODE_FIFO_RELAXED_KHR, imageUsage must be a subset of the supported usage flags present in the supportedUsageFlags member of the
VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for surface

• VUID-VkSwapchainCreateInfoKHR-imageUsage-01384
  If presentMode is VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or
  VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, imageUsage must be a subset of the
  supported usage flags present in the sharedPresentSupportedUsageFlags member of the
  VkSharedPresentSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilities2KHR for surface

• VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01277
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, pQueueFamilyIndices must be a valid
  pointer to an array of queueFamilyIndexCount uint32_t values

• VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01278
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, queueFamilyIndexCount must be greater
  than 1

• VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01428
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, each element of pQueueFamilyIndices
  must be unique and must be less than pQueueFamilyPropertyCount returned by either
  vkGetPhysicalDeviceQueueFamilyProperties or
  vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to
  create device

• VUID-VkSwapchainCreateInfoKHR-preTransform-01279
  preTransform must be one of the bits present in the supportedTransforms member of the
  VkSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-compositeAlpha-01280
  compositeAlpha must be one of the bits present in the supportedCompositeAlpha member of
  the VkSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-presentMode-01281
  presentMode must be one of the VkPresentModeKHR values returned by
  vkGetPhysicalDeviceSurfacePresentModesKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-physicalDeviceCount-01429
  If the logical device was created with VkDeviceGroupDeviceCreateInfo::physicalDeviceCount equal to 1, flags must not contain
  VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR

• VUID-VkSwapchainCreateInfoKHR-oldSwapchain-01933
  If oldSwapchain is not VK_NULL_HANDLE, oldSwapchain must be a non-retired swapchain
  associated with native window referred to by surface

• VUID-VkSwapchainCreateInfoKHR-imageFormat-01778
  The implied image creation parameters of the swapchain must be supported as reported
  by vkGetPhysicalDeviceImageFormatProperties

• VUID-VkSwapchainCreateInfoKHR-flags-03168
  If flags contains VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR then the pNext chain must
include a VkImageFormatListCreateInfo structure with a viewFormatCount greater than zero and pViewFormats must have an element equal to imageFormat

- **VUID-VkSwapchainCreateInfoKHR-pNext-04099**
  If a VkImageFormatListCreateInfo structure was included in the pNext chain and VkImageFormatListCreateInfo::viewFormatCount is not zero then all of the formats in VkImageFormatListCreateInfo::pViewFormats must be compatible with the format as described in the compatibility table

- **VUID-VkSwapchainCreateInfoKHR-flags-04100**
  If flags does not contain VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR and the pNext chain include a VkImageFormatListCreateInfo structure then VkImageFormatListCreateInfo::viewFormatCount must be 0 or 1

- **VUID-VkSwapchainCreateInfoKHR-flags-03187**
  If flags contains VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR, then VkSurfaceProtectedCapabilitiesKHR::supportsProtected must be VK_TRUE in the VkSurfaceProtectedCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilities2KHR for surface

- **VUID-VkSwapchainCreateInfoKHR-pNext-02679**
  If the pNext chain includes a VkSurfaceFullScreenExclusiveInfoEXT structure with its fullScreenExclusive member set to VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT, and surface was created using vkCreateWin32SurfaceKHR, a VkSurfaceFullScreenExclusiveWin32InfoEXT structure must be included in the pNext chain

- **VUID-VkSwapchainCreateInfoKHR-pNext-06752**
  If the imageCompressionControlSwapchain feature is not enabled, the pNext chain must not include an VkImageCompressionControlEXT structure

---

**Valid Usage (Implicit)**

- **VUID-VkSwapchainCreateInfoKHR-sType-sType**
  sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR

- **VUID-VkSwapchainCreateInfoKHR-pNext-pNext**
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceGroupSwapchainCreateInfoKHR, VkImageCompressionControlEXT, VkImageFormatListCreateInfo, VkSurfaceFullScreenExclusiveInfoEXT, VkSurfaceFullScreenExclusiveWin32InfoEXT, VkSwapchainCounterCreateInfoEXT, VkSwapchainDisplayNativeHdrCreateInfoAMD, VkSwapchainLatencyCreateInfoNV, VkSwapchainPresentBarrierCreateInfoNV, VkSwapchainPresentModesCreateInfoEXT, or VkSwapchainPresentScalingCreateInfoEXT

- **VUID-VkSwapchainCreateInfoKHR-sType-unique**
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkSwapchainCreateInfoKHR-flags-parameter**
  flags must be a valid combination of VkSwapchainCreateFlagBitsKHR values

- **VUID-VkSwapchainCreateInfoKHR-surface-parameter**
**surface** must be a valid `VkSurfaceKHR` handle

- VUID-VkSwapchainCreateInfoKHR-imageFormat-parameter
  
  `imageFormat` must be a valid `VkFormat` value

- VUID-VkSwapchainCreateInfoKHR-imageColorSpace-parameter
  
  `imageColorSpace` must be a valid `VkColorSpaceKHR` value

- VUID-VkSwapchainCreateInfoKHR-imageUsage-parameter
  
  `imageUsage` must be a valid combination of `VkImageUsageFlagBits` values

- VUID-VkSwapchainCreateInfoKHR-imageUsage-requiredbitmask
  
  `imageUsage` must not be 0

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-parameter
  
  `imageSharingMode` must be a valid `VkSharingMode` value

- VUID-VkSwapchainCreateInfoKHR-preTransform-parameter
  
  `preTransform` must be a valid `VkSurfaceTransformFlagBitsKHR` value

- VUID-VkSwapchainCreateInfoKHR-compositeAlpha-parameter
  
  `compositeAlpha` must be a valid `VkCompositeAlphaFlagBitsKHR` value

- VUID-VkSwapchainCreateInfoKHR-presentMode-parameter
  
  `presentMode` must be a valid `VkPresentModeKHR` value

- VUID-VkSwapchainCreateInfoKHR-oldSwapchain-parameter
  
  If `oldSwapchain` is not `VK_NULL_HANDLE`, `oldSwapchain` must be a valid `VkSwapchainKHR` handle

- VUID-VkSwapchainCreateInfoKHR-commonparent
  
  Both of `oldSwapchain`, and `surface` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkInstance`

Bits which can be set in `VkSwapchainCreateInfoKHR::flags`, specifying parameters of swapchain creation, are:

```cpp
// Provided by VK_KHR_swapchain
typedef enum VkSwapchainCreateFlagBitsKHR {
    // Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
    // VK_KHR_swapchain
    VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = 0x00000001,
    // Provided by VK_VERSION_1_1 with VK_KHR_swapchain
    VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR = 0x00000002,
    // Provided by VK_KHR_swapchain_mutable_format
    VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR = 0x00000004,
    // Provided by VK_EXT_swapchain_maintenance1
    VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT = 0x00000008,
} VkSwapchainCreateFlagBitsKHR;
```

- `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR` specifies that images created from the swapchain (i.e. with the `swapchain` member of `VkImageSwapchainCreateInfoKHR` set to this swapchain’s handle) must use `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT`. 
• **VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR** specifies that images created from the swapchain are protected images.

• **VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR** specifies that the images of the swapchain can be used to create a VkImageView with a different format than what the swapchain was created with. The list of allowed image view formats is specified by adding a VkImageFormatListCreateInfo structure to the pNext chain of VkSwapchainCreateInfoKHR. In addition, this flag also specifies that the swapchain can be created with usage flags that are not supported for the format the swapchain is created with but are supported for at least one of the allowed image view formats.

• **VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT** specifies that the implementation may defer allocation of memory associated with each swapchain image until its index is to be returned from vkAcquireNextImageKHR or vkAcquireNextImage2KHR for the first time.

```c
// Provided by VK_KHR_swapchain
typedef VkFlags VkSwapchainCreateFlagsKHR;
```

**VkSwapchainCreateFlagsKHR** is a bitmask type for setting a mask of zero or more VkSwapchainCreateFlagBitsKHR.

If the pNext chain of VkSwapchainCreateInfoKHR includes a VkDeviceGroupSwapchainCreateInfoKHR structure, then that structure includes a set of device group present modes that the swapchain can be used with.

The VkDeviceGroupSwapchainCreateInfoKHR structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkDeviceGroupSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupSwapchainCreateInfoKHR;
```

• **sType** is a VkStructureType value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **modes** is a bitfield of modes that the swapchain can be used with.

If this structure is not present, **modes** is considered to be **VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR**.

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupSwapchainCreateInfoKHR-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR**

- **VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-parameter**
  
  **modes** must be a valid combination of VkDeviceGroupPresentModeFlagBitsKHR values
If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSwapchainDisplayNativeHdrCreateInfoAMD` structure, then that structure includes additional swapchain creation parameters specific to display native HDR support.

The `VkSwapchainDisplayNativeHdrCreateInfoAMD` structure is defined as:

```c
// Provided by VK_AMD_display_native_hdr
typedef struct VkSwapchainDisplayNativeHdrCreateInfoAMD {
    VkStructureType sType;
    const void* pNext;
    VkBool32 localDimmingEnable;
} VkSwapchainDisplayNativeHdrCreateInfoAMD;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `localDimmingEnable` specifies whether local dimming is enabled for the swapchain.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` does not include this structure, the default value for `localDimmingEnable` is `VK_TRUE`, meaning local dimming is initially enabled for the swapchain.

**Valid Usage (Implicit)**

- `VUID-VkSwapchainDisplayNativeHdrCreateInfoAMD-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_SWAPCHAIN_DISPLAY_NATIVE_HDR_CREATE_INFO_AMD`  

**Valid Usage**

- `VUID-VkSwapchainDisplayNativeHdrCreateInfoAMD-localDimmingEnable-04449`  
  It is only valid to set `localDimmingEnable` to `VK_TRUE` if `VkDisplayNativeHdrSurfaceCapabilitiesAMD::localDimmingSupport` is supported.

The local dimming HDR setting may also be changed over the life of a swapchain by calling:

```c
// Provided by VK_AMD_display_native_hdr
void vkSetLocalDimmingAMD(
    VkDevice device,
    VkSwapchainKHR swapChain,
    VkBool32 localDimmingEnable);
```

- `device` is the device associated with `swapChain`.  

3171
• swapChain handle to enable local dimming.
• localDimmingEnable specifies whether local dimming is enabled for the swapchain.

Valid Usage (Implicit)

- VUID-vkSetLocalDimmingAMD-device-parameter
  device must be a valid VkDevice handle
- VUID-vkSetLocalDimmingAMD-swapChain-parameter
  swapChain must be a valid VkSwapchainKHR handle
- VUID-vkSetLocalDimmingAMD-swapChain-parent
  swapChain must have been created, allocated, or retrieved from device

Valid Usage

- VUID-vkSetLocalDimmingAMD-localDimmingSupport-04618
  VkDisplayNativeHdrSurfaceCapabilitiesAMD::localDimmingSupport must be supported

If the pNext chain of VkSwapchainCreateInfoKHR includes a VkSurfaceFullScreenExclusiveInfoEXT structure, then that structure specifies the application’s preferred full-screen presentation behavior. If this structure is not present, fullScreenExclusive is considered to be VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT.

To enable surface counters when creating a swapchain, add a VkSwapchainCounterCreateInfoEXT structure to the pNext chain of VkSwapchainCreateInfoKHR. VkSwapchainCounterCreateInfoEXT is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkSwapchainCounterCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceCounterFlagsEXT surfaceCounters;
} VkSwapchainCounterCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- surfaceCounters is a bitmask of VkSurfaceCounterFlagBitsEXT specifying surface counters to enable for the swapchain.

Valid Usage

- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-01244
  The bits in surfaceCounters must be supported by VkSwapchainCreateInfoKHR::surface, as reported by vkGetPhysicalDeviceSurfaceCapabilities2EXT
Valid Usage (Implicit)

- VUID-VkSwapchainCounterCreateInfoEXT-sType-sType
  
sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT

- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-parameter
  
surfaceCounters must be a valid combination of VkSurfaceCounterFlagBitsEXT values

The requested counters become active when the first presentation command for the associated swapchain is processed by the presentation engine. To query the value of an active counter, use:

```c
// Provided by VK_EXT_display_control
VkResult vkGetSwapchainCounterEXT(
    VkDevice device,
    VkSwapchainKHR swapchain,
    VkSurfaceCounterFlagBitsEXT counter,
    uint64_t* pCounterValue);
```

- device is the VkDevice associated with swapchain.
- swapchain is the swapchain from which to query the counter value.
- counter is a VkSurfaceCounterFlagBitsEXT value specifying the counter to query.
- pCounterValue will return the current value of the counter.

If a counter is not available because the swapchain is out of date, the implementation may return VK_ERROR_OUT_OF_DATE_KHR.

Valid Usage

- VUID-vkGetSwapchainCounterEXT-swapchain-01245
  One or more present commands on swapchain must have been processed by the presentation engine

Valid Usage (Implicit)

- VUID-vkGetSwapchainCounterEXT-device-parameter
  
device must be a valid VkDevice handle

- VUID-vkGetSwapchainCounterEXT-swapchain-parameter
  
swapchain must be a valid VkSwapchainKHR handle

- VUID-vkGetSwapchainCounterEXT-counter-parameter
  
counter must be a valid VkSurfaceCounterFlagBitsEXT value

- VUID-vkGetSwapchainCounterEXT-pCounterValue-parameter
  
pCounterValue must be a valid pointer to a uint64_t value

- VUID-vkGetSwapchainCounterEXT-swapchain-parent
  

swapchain must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR

To specify compression properties for the swapchain images in this swapchain, add a `VkImage Compression Control EXT` structure to the `pNext` chain of the `VkSwapchainCreateInfoKHR` structure.

Applications can modify the presentation mode used by the swapchain on a per-presentation basis. However, all presentation modes the application intends to use with the swapchain must be specified at swapchain creation time. To specify more than one presentation mode when creating a swapchain, include the `VkSwapchainPresentModesCreateInfoEXT` structure in the `pNext` chain of the `VkSwapchainCreateInfoKHR` structure.

The `VkSwapchainPresentModesCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkSwapchainPresentModesCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t presentModeCount;
    const VkPresentModeKHR* pPresentModes;
} VkSwapchainPresentModesCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentModeCount` is the number of presentation modes provided.
- `pPresentModes` is a list of presentation modes with `presentModeCount` entries

Valid Usage

- VUID-VkSwapchainPresentModesCreateInfoEXT-None-07762
  Each entry in `pPresentModes` must be one of the `VkPresentModeKHR` values returned by `vkGetPhysicalDeviceSurfacePresentModesKHR` for the surface

- VUID-VkSwapchainPresentModesCreateInfoEXT-pPresentModes-07763
  The entries in `pPresentModes` must be a subset of the present modes returned in
When an application presents a swapchain image with dimensions different than those of the target surface, different behavior is possible on different platforms per their respective specifications:

- Presentation fails and VK_ERROR_OUT_OF_DATE_KHR is returned
- Scaling is done and VK_SUCCESS or VK_SUBOPTIMAL_KHR is returned
- Unspecified scaling using an arbitrary combination of stretching, centering and/or clipping.

Applications can define specific behavior when creating a swapchain by including the VkSwapchainPresentScalingCreateInfoEXT structure in the pNext chain of the VkSwapchainCreateInfoKHR structure.

The VkSwapchainPresentScalingCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkSwapchainPresentScalingCreateInfoEXT {
    VkStructureType sType;  // VkStructureType value identifying this structure.
    const void* pNext;      // NULL or a pointer to a structure extending this structure.
    VkPresentScalingFlagsEXT scalingBehavior;  // 0 or the scaling method to use when the dimensions of the surface and swapchain images differ.
    VkPresentGravityFlagsEXT presentGravityX;  // 0 or the x-axis direction in which swapchain image pixels gravitate relative to
    VkPresentGravityFlagsEXT presentGravityY;
} VkSwapchainPresentScalingCreateInfoEXT;
```
the surface when `scalingBehavior` does not result in a one-to-one pixel mapping between the scaled swapchain image and the surface.

- `presentGravityY` is 0 or the y-axis direction in which swapchain image pixels gravitate relative to the surface when `scalingBehavior` does not result in a one-to-one pixel mapping between the scaled swapchain image and the surface.

If `scalingBehavior` is 0, the result of presenting a swapchain image with dimensions that do not match the surface dimensions is implementation and platform-dependent. If `presentGravityX` or `presentGravityY` are 0, the presentation gravity must match that defined by the native platform surface on platforms which define surface gravity.

**Valid Usage**

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07765**
  If `presentGravityX` is 0, `presentGravityY` must be 0

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-07766**
  If `presentGravityX` is not 0, `presentGravityY` must not be 0

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-07767**
  `scalingBehavior` must not have more than one bit set

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07768**
  `presentGravityX` must not have more than one bit set

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-07769**
  `presentGravityY` must not have more than one bit set

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-07770**
  `scalingBehavior` must be a valid scaling method for the surface as returned in `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentScaling`, given `VkSwapchainCreateInfoKHR::presentMode` in `VkSurfacePresentModeEXT`

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-07771**
  If the swapchain is created with `VkSwapchainPresentModesCreateInfoEXT`, `scalingBehavior` must be a valid scaling method for the surface as returned in `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentScaling`, given each present mode in `VkSwapchainPresentModesCreateInfoEXT::pPresentModes` in `VkSurfacePresentModeEXT`

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07772**
  `presentGravityX` must be a valid x-axis present gravity for the surface as returned in `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityX`, given `VkSwapchainCreateInfoKHR::presentMode` in `VkSurfacePresentModeEXT`

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-07773**
  If the swapchain is created with `VkSwapchainPresentModesCreateInfoEXT`, `presentGravityY` must be a valid x-axis present gravity for the surface as returned in `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityY`, given each present mode in `VkSwapchainPresentModesCreateInfoEXT::pPresentModes` in `VkSurfacePresentModeEXT`

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-07774**
**Valid Usage (Implicit)**

- VUID-VkSwapchainPresentScalingCreateInfoEXT-sType-sType  
  `sType` must be `VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_SCALING_CREATE_INFO_EXT`  

- VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-parameter  
  `scalingBehavior` must be a valid combination of `VkPresentScalingFlagBitsEXT` values  

- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-parameter  
  `presentGravityX` must be a valid combination of `VkPresentGravityFlagBitsEXT` values  

- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-parameter  
  `presentGravityY` must be a valid combination of `VkPresentGravityFlagBitsEXT` values  

To destroy a swapchain object call:

```c
// Provided by VK_KHR_swapchain
void vkDestroySwapchainKHR(
    VkDevice device,  
    VkSwapchainKHR swapchain,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the `VkDevice` associated with `swapchain`.  
- `swapchain` is the swapchain to destroy.  
- `pAllocator` is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).

The application must not destroy a swapchain until after completion of all outstanding operations on images that were acquired from the swapchain. `swapchain` and all associated `VkImage` handles are destroyed, and must not be acquired or used any more by the application. The memory of each `VkImage` will only be freed after that image is no longer used by the presentation engine. For example, if one image of the swapchain is being displayed in a window, the memory for that image may not be freed until the window is destroyed, or another swapchain is created for the window. Destroying the swapchain does not invalidate the parent `VkSurfaceKHR`, and a new swapchain can be created with it.

When a swapchain associated with a display surface is destroyed, if the image most recently
presented to the display surface is from the swapchain being destroyed, then either any display resources modified by presenting images from any swapchain associated with the display surface must be reverted by the implementation to their state prior to the first present performed on one of these swapchains, or such resources must be left in their current state.

If swapchain has exclusive full-screen access, it is released before the swapchain is destroyed.

### Valid Usage

- **VUID-vkDestroySwapchainKHR-swapchain-01282**
  All uses of presentable images acquired from swapchain must have completed execution

- **VUID-vkDestroySwapchainKHR-swapchain-01283**
  If VkAllocationCallbacks were provided when swapchain was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroySwapchainKHR-swapchain-01284**
  If no VkAllocationCallbacks were provided when swapchain was created, pAllocator must be NULL

### Valid Usage (Implicit)

- **VUID-vkDestroySwapchainKHR-device-parameter**
  device must be a valid VkDevice handle

- **VUID-vkDestroySwapchainKHR-swapchain-parameter**
  If swapchain is not VK_NULL_HANDLE, swapchain must be a valid VkSwapchainKHR handle

- **VUID-vkDestroySwapchainKHR-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- **VUID-vkDestroySwapchainKHR-swapchain-parent**
  If swapchain is a valid handle, it must have been created, allocated, or retrieved from device

### Host Synchronization

- Host access to swapchain must be externally synchronized

When the VK_KHR_display_swapchain extension is enabled, multiple swapchains that share presentable images are created by calling:
Provided by VK_KHR_display_swapchain

```c
VkResult vkCreateSharedSwapchainsKHR(
    VkDevice device,  // device is the device to create the swapchains for.
    uint32_t swapchainCount,  // swapchainCount is the number of swapchains to create.
    const VkSwapchainCreateInfoKHR* pCreateInfos,  // pCreateInfos is a pointer to an array of VkSwapchainCreateInfoKHR structures specifying the parameters of the created swapchains.
    const VkAllocationCallbacks* pAllocator,  // pAllocator is the allocator used for host memory allocated for the swapchain objects when there is no more specific allocator available (see Memory Allocation).
    VkSwapchainKHR* pSwapchains  // pSwapchains is a pointer to an array of VkSwapchainKHR handles in which the created swapchain objects will be returned.
);
```

The swapchain creation parameters that affect the properties and number of presentable images must match between all the swapchains. If the displays used by any of the swapchains do not use the same presentable image layout or are incompatible in a way that prevents sharing images, swapchain creation will fail with the result code `VK_ERROR_INCOMPATIBLE_DISPLAY_KHR`. If any error occurs, no swapchains will be created. Images presented to multiple swapchains must be re-acquired from all of them before being modified. After destroying one or more of the swapchains, the remaining swapchains and the presentable images can continue to be used.

### Valid Usage (Implicit)

- VUID-vkCreateSharedSwapchainsKHR-device-parameter
  - `device` must be a valid `VkDevice` handle

- VUID-vkCreateSharedSwapchainsKHR-pCreateInfos-parameter
  - `pCreateInfos` must be a valid pointer to an array of `swapchainCount` valid `VkSwapchainCreateInfoKHR` structures

- VUID-vkCreateSharedSwapchainsKHR-pAllocator-parameter
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateSharedSwapchainsKHR-pSwapchains-parameter
  - `pSwapchains` must be a valid pointer to an array of `swapchainCount` `VkSwapchainKHR` handles

- VUID-vkCreateSharedSwapchainsKHR-swapchainCount-arraylength
  - `swapchainCount` must be greater than 0
Host Synchronization

- Host access to `pCreateInfos[].surface` must be externally synchronized
- Host access to `pCreateInfos[].oldSwapchain` must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INCOMPATIBLE_DISPLAY_KHR
- VK_ERROR_DEVICE_LOST
- VK_ERROR_SURFACE_LOST_KHR

To obtain the array of presentable images associated with a swapchain, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkGetSwapchainImagesKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint32_t* pSwapchainImageCount,
    VkImage* pSwapchainImages);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to query.
- `pSwapchainImageCount` is a pointer to an integer related to the number of presentable images available or queried, as described below.
- `pSwapchainImages` is either `NULL` or a pointer to an array of `VkImage` handles.

If `pSwapchainImages` is `NULL`, then the number of presentable images for `swapchain` is returned in `pSwapchainImageCount`. Otherwise, `pSwapchainImageCount` must point to a variable set by the user to the number of elements in the `pSwapchainImages` array, and on return the variable is overwritten with the number of structures actually written to `pSwapchainImages`. If the value of `pSwapchainImageCount` is less than the number of presentable images for `swapchain`, at most `pSwapchainImageCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available presentable images were returned.
Valid Usage (Implicit)

- VUID-vkGetSwapchainImagesKHR-device-parameter
  
  *device** must be a valid *VkDevice* handle

- VUID-vkGetSwapchainImagesKHR-swapchain-parameter
  
  *swapchain** must be a valid *VkSwapchainKHR* handle

- VUID-vkGetSwapchainImagesKHR-pSwapchainImageCount-parameter
  
  *pSwapchainImageCount** must be a valid pointer to a *uint32_t* value

- VUID-vkGetSwapchainImagesKHR-pSwapchainImages-parameter
  
  If the value referenced by *pSwapchainImageCount* is not 0, and *pSwapchainImages* is not NULL, *pSwapchainImages** must be a valid pointer to an array of *pSwapchainImageCount* *VkImage* handles

- VUID-vkGetSwapchainImagesKHR-swapchain-parent
  
  *swapchain** must have been created, allocated, or retrieved from *device*

Return Codes

**Success**

- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

*Note*

By knowing all presentable images used in the swapchain, the application can create command buffers that reference these images prior to entering its main rendering loop. However, command buffers are not allowed to reference presentable images created with **VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT** until their indices have been returned from **vkAcquireNextImageKHR** at least once.

Images returned by **vkGetSwapchainImagesKHR** are fully backed by memory before they are passed to the application, as if they are each bound completely and contiguously to a single *VkDeviceMemory* object, unless the swapchain is created with the **VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT** flag. All presentable images are initially in the **VK_IMAGE_LAYOUT_UNDEFINED** layout, thus before using presentable images, the application must transition them to a valid layout for the intended use.

Further, the lifetime of presentable images is controlled by the implementation, so applications must not destroy a presentable image. See **vkDestroySwapchainKHR** for further details on the lifetime of presentable images.
Images can also be created by using `vkCreateImage` with `VkImageSwapchainCreateInfoKHR` and bound to swapchain memory using `vkBindImageMemory2` with `VkBindImageMemorySwapchainInfoKHR`. These images can be used anywhere swapchain images are used, and are useful in logical devices with multiple physical devices to create peer memory bindings of swapchain memory. These images and bindings have no effect on what memory is presented. Unlike images retrieved from `vkGetSwapchainImagesKHR`, these images must be destroyed with `vkDestroyImage`.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkAcquireNextImageKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint64_t timeout,
    VkSemaphore semaphore,
    VkFence fence,
    uint32_t*pImageIndex);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the non-retired swapchain from which an image is being acquired.
- `timeout` specifies how long the function waits, in nanoseconds, if no image is available.
- `semaphore` is `VK_NULL_HANDLE` or a semaphore to signal.
- `fence` is `VK_NULL_HANDLE` or a fence to signal.
- `pImageIndex` is a pointer to a `uint32_t` in which the index of the next image to use (i.e. an index into the array of images returned by `vkGetSwapchainImagesKHR`) is returned.

If the `swapchain` has been created with the `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT` flag, the image whose index is returned in `pImageIndex` will be fully backed by memory before this call returns to the application, as if it is bound completely and contiguously to a single `VkDeviceMemory` object.

### Valid Usage

- VUID-vkAcquireNextImageKHR-swapchain-01285
  `swapchain` must not be in the retired state

- VUID-vkAcquireNextImageKHR-semaphore-01286
  If `semaphore` is not `VK_NULL_HANDLE` it must be unsignaled

- VUID-vkAcquireNextImageKHR-semaphore-01779
  If `semaphore` is not `VK_NULL_HANDLE` it must not have any uncompleted signal or wait operations pending

- VUID-vkAcquireNextImageKHR-fence-01287
  If `fence` is not `VK_NULL_HANDLE` it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue
• VUID-vkAcquireNextImageKHR-semaphore-01780
  semaphore and fence must not both be equal to VK_NULL_HANDLE

• VUID-vkAcquireNextImageKHR-surface-07783
  If forward progress cannot be guaranteed for the surface used to create the swapchain member of pAcquireInfo, the timeout member of pAcquireInfo must not be UINT64_MAX

• VUID-vkAcquireNextImageKHR-semaphore-03265
  semaphore must have a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY

Valid Usage (Implicit)

• VUID-vkAcquireNextImageKHR-device-parameter
device must be a valid VkDevice handle

• VUID-vkAcquireNextImageKHR-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

• VUID-vkAcquireNextImageKHR-semaphore-parameter
  If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle

• VUID-vkAcquireNextImageKHR-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

• VUID-vkAcquireNextImageKHR-pImageIndex-parameter
  pImageIndex must be a valid pointer to a uint32_t value

• VUID-vkAcquireNextImageKHR-swapchain-parent
  swapchain must have been created, allocated, or retrieved from device

• VUID-vkAcquireNextImageKHR-semaphore-parent
  If semaphore is a valid handle, it must have been created, allocated, or retrieved from device

• VUID-vkAcquireNextImageKHR-fence-parent
  If fence is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to swapchain must be externally synchronized

• Host access to semaphore must be externally synchronized

• Host access to fence must be externally synchronized

Return Codes

Success
• VK_SUCCESS
• VK_TIMEOUT
• VK_NOT_READY
• VK_SUBOPTIMAL_KHR

**Failure**

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_DEVICE_LOST
• VK_ERROR_OUT_OF_DATE_KHR
• VK_ERROR_SURFACE_LOST_KHR
• VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

If an image is acquired successfully, `vkAcquireNextImageKHR` **must** either return VK_SUCCESS or VK_SUBOPTIMAL_KHR. The implementation **may** return VK_SUBOPTIMAL_KHR if the swapchain no longer matches the surface properties exactly, but **can** still be used for presentation.

When successful, `vkAcquireNextImageKHR` acquires a presentable image from swapchain that an application **can** use, and sets pImageIndex to the index of that image within the swapchain. The presentation engine **may** not have finished reading from the image at the time it is acquired, so the application **must** use semaphore and/or fence to ensure that the image layout and contents are not modified until the presentation engine reads have completed. Once `vkAcquireNextImageKHR` successfully acquires an image, the semaphore signal operation referenced by semaphore, if not VK_NULL_HANDLE, and the fence signal operation referenced by fence, if not VK_NULL_HANDLE, are submitted for execution. If `vkAcquireNextImageKHR` does not successfully acquire an image, semaphore and fence are unaffected. The order in which images are acquired is implementation-dependent, and **may** be different than the order the images were presented.

If timeout is zero, then `vkAcquireNextImageKHR` does not wait, and will either successfully acquire an image, or fail and return VK_NOT_READY if no image is available.

If the specified timeout period expires before an image is acquired, `vkAcquireNextImageKHR` returns VK_TIMEOUT. If timeout is UINT64_MAX, the timeout period is treated as infinite, and `vkAcquireNextImageKHR` will block until an image is acquired or an error occurs.

Let S be the number of images in swapchain. If swapchain is created with VkSwapchainPresentModesCreateInfoEXT, let M be the maximum of the values in VkSurfaceCapabilitiesKHR::minImageCount when queried with each present mode in VkSwapchainPresentModesCreateInfoEXT::pPresentModes in VkSurfacePresentModeEXT. Otherwise, let M be the value of VkSurfaceCapabilitiesKHR::minImageCount without a VkSurfacePresentModeEXT as part of the query input.

`vkAcquireNextImageKHR` **should** not be called if the number of images that the application has currently acquired is greater than S-M. If `vkAcquireNextImageKHR` is called when the number of images that the application has currently acquired is less than or equal to S-M, `vkAcquireNextImageKHR` **must** return in finite time with an allowed VkResult code.

---

**Note**
Returning a result in finite time guarantees that the implementation cannot deadlock an application, or suspend its execution indefinitely with correct API usage. Acquiring too many images at once may block indefinitely, which is covered by valid usage when attempting to use `UINT64_MAX`. For example, a scenario here is when a compositor holds on to images which are currently being presented, and there are not any vacant images left to be acquired.

If the swapchain images no longer match native surface properties, either `VK_SUBOPTIMAL_KHR` or `VK_ERROR_OUT_OF_DATE_KHR` must be returned. If `VK_ERROR_OUT_OF_DATE_KHR` is returned, no image is acquired and attempts to present previously acquired images to the swapchain will also fail with `VK_ERROR_OUT_OF_DATE_KHR`. Applications need to create a new swapchain for the surface to continue presenting if `VK_ERROR_OUT_OF_DATE_KHR` is returned.

**Note**

`VK_SUBOPTIMAL_KHR` may happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain in this state, or to re-create the swapchain to better match the platform surface properties.

If device loss occurs (see Lost Device) before the timeout has expired, `vkAcquireNextImageKHR` must return in finite time with either one of the allowed success codes, or `VK_ERROR_DEVICE_LOST`.

If `semaphore` is not `VK_NULL_HANDLE`, the semaphore must be unsignaled, with no signal or wait operations pending. It will become signaled when the application can use the image.

**Note**

Use of `semaphore` allows rendering operations to be recorded and submitted before the presentation engine has completed its use of the image.

If `fence` is not equal to `VK_NULL_HANDLE`, the fence must be unsignaled, with no signal operations pending. It will become signaled when the application can use the image.

**Note**

Applications should not rely on `vkAcquireNextImageKHR` blocking in order to meter their rendering speed. The implementation may return from this function immediately regardless of how many presentation requests are queued, and regardless of when queued presentation requests will complete relative to the call. Instead, applications can use `fence` to meter their frame generation work to match the presentation rate.

An application must wait until either the `semaphore` or `fence` is signaled before accessing the image’s data.

**Note**

When the presentable image will be accessed by some stage \( S \), the recommended idiom for ensuring correct synchronization is:
• The `VkSubmitInfo` used to submit the image layout transition for execution includes `vkAcquireNextImageKHR::semaphore` in its `pWaitSemaphores` member, with the corresponding element of `pWaitDstStageMask` including S.

• The synchronization command that performs any necessary image layout transition includes S in both the `srcStageMask` and `dstStageMask`.

After a successful return, the image indicated by `pImageIndex` and its data will be unmodified compared to when it was presented.

**Note**

Exclusive ownership of presentable images corresponding to a swapchain created with `VK_SHARING_MODE_EXCLUSIVE` as defined in Resource Sharing is not altered by a call to `vkAcquireNextImageKHR`. That means upon the first acquisition from such a swapchain presentable images are not owned by any queue family, while at subsequent acquisitions the presentable images remain owned by the queue family the image was previously presented on.

The possible return values for `vkAcquireNextImageKHR` depend on the `timeout` provided:

• **VK_SUCCESS** is returned if an image became available.

• **VK_ERROR_SURFACE_LOST_KHR** is returned if the surface becomes no longer available.

• **VK_NOT_READY** is returned if `timeout` is zero and no image was available.

• **VK_TIMEOUT** is returned if `timeout` is greater than zero and less than `UINT64_MAX`, and no image became available within the time allowed.

• **VK_SUBOPTIMAL_KHR** is returned if an image became available, and the swapchain no longer matches the surface properties exactly, but can still be used to present to the surface successfully.

**Note**

This may happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain indefinitely or temporarily in this state, or to re-create the swapchain to better match the platform surface properties.

• **VK_ERROR_OUT_OF_DATE_KHR** is returned if the surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications must query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.

If the native surface and presented image sizes no longer match, presentation may fail unless the swapchain is created with a non-zero value in `VkSwapchainPresentScalingCreateInfoEXT::scalingBehavior`. If presentation does succeed, the mapping from the presented image to the native surface is defined by the `VkSwapchainPresentScalingCreateInfoEXT` structure if provided. Otherwise it is implementation-defined. It is the application's responsibility to detect surface size changes and react appropriately. If presentation fails because of a mismatch in the surface and
presented image sizes, a `VK_ERROR_OUT_OF_DATE_KHR` error will be returned.

**Note**

For example, consider a 4x3 window/surface that gets resized to be 3x4 (taller than wider). On some window systems, the portion of the window/surface that was previously and still is visible (the 3x3 part) will contain the same contents as before, while the remaining parts of the window will have undefined contents. Other window systems may squash/stretch the image to fill the new window size without any undefined contents, or apply some other mapping.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
VkResult vkAcquireNextImage2KHR(
    VkDevice device,
    const VkAcquireNextImageInfoKHR* pAcquireInfo,
    uint32_t* pImageIndex);
```

- `device` is the device associated with `swapchain`.
- `pAcquireInfo` is a pointer to a `VkAcquireNextImageInfoKHR` structure containing parameters of the acquire.
- `pImageIndex` is a pointer to a `uint32_t` that is set to the index of the next image to use.

If the `swapchain` has been created with the `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT` flag, the image whose index is returned in `pImageIndex` will be fully backed by memory before this call returns to the application.

**Valid Usage**

- `VUID-vkAcquireNextImage2KHR-surface-07784`
  If forward progress cannot be guaranteed for the surface used to create `swapchain`, the timeout member of `pAcquireInfo` must not be `UINT64_MAX`

**Valid Usage (Implicit)**

- `VUID-vkAcquireNextImage2KHR-device-parameter`
  `device` must be a valid `VkDevice` handle

- `VUID-vkAcquireNextImage2KHR-pAcquireInfo-parameter`
  `pAcquireInfo` must be a valid pointer to a valid `VkAcquireNextImageInfoKHR` structure

- `VUID-vkAcquireNextImage2KHR-pImageIndex-parameter`
  `pImageIndex` must be a valid pointer to a `uint32_t` value
Return Codes

Success

• VK_SUCCESS
• VK_TIMEOUT
• VK_NOT_READY
• VK_SUBOPTIMAL_KHR

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_DEVICE_LOST
• VK_ERROR_OUT_OF_DATE_KHR
• VK_ERROR_SURFACE_LOST_KHR
• VK_ERROR_full_SCREEN_EXCLUSIVE_MODE_LOST_KHR

The VkAcquireNextImageInfoKHR structure is defined as:

```cpp
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkAcquireNextImageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
    uint64_t timeout;
    VkSemaphore semaphore;
    VkFence fence;
    uint32_t deviceMask;
} VkAcquireNextImageInfoKHR;
```

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **swapchain** is a non-retired swapchain from which an image is acquired.
• **timeout** specifies how long the function waits, in nanoseconds, if no image is available.
• **semaphore** is VK_NULL_HANDLE or a semaphore to signal.
• **fence** is VK_NULL_HANDLE or a fence to signal.
• **deviceMask** is a mask of physical devices for which the swapchain image will be ready to use when the semaphore or fence is signaled.

If VkAcquireNextImageInfoKHR is used, the device mask is considered to include all physical devices in the logical device.
Note

vkAcquireNextImage2KHR signals at most one semaphore, even if the application requests waiting for multiple physical devices to be ready via the deviceMask. However, only a single physical device can wait on that semaphore, since the semaphore becomes unsignaled when the wait succeeds. For other physical devices to wait for the image to be ready, it is necessary for the application to submit semaphore signal operation(s) to that first physical device to signal additional semaphore(s) after the wait succeeds, which the other physical device(s) can wait upon.

Valid Usage

- VUID-VkAcquireNextImageInfoKHR-swapchain-01675
  swapchain must not be in the retired state

- VUID-VkAcquireNextImageInfoKHR-semaphore-01288
  If semaphore is not VK_NULL_HANDLE it must be unsignaled

- VUID-VkAcquireNextImageInfoKHR-semaphore-01781
  If semaphore is not VK_NULL_HANDLE it must not have any uncompleted signal or wait operations pending

- VUID-VkAcquireNextImageInfoKHR-fence-01289
  If fence is not VK_NULL_HANDLE it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue

- VUID-VkAcquireNextImageInfoKHR-semaphore-01782
  semaphore and fence must not both be equal to VK_NULL_HANDLE

- VUID-VkAcquireNextImageInfoKHR-deviceMask-01290
  deviceMask must be a valid device mask

- VUID-VkAcquireNextImageInfoKHR-deviceMask-01291
  deviceMask must not be zero

- VUID-VkAcquireNextImageInfoKHR-semaphore-03266
  semaphore must have a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY

Valid Usage (Implicit)

- VUID-VkAcquireNextImageInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR

- VUID-VkAcquireNextImageInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkAcquireNextImageInfoKHR-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

- VUID-VkAcquireNextImageInfoKHR-semaphore-parameter
  If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle
If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

Each of fence, semaphore, and swapchain that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

## Host Synchronization

- Host access to swapchain must be externally synchronized
- Host access to semaphore must be externally synchronized
- Host access to fence must be externally synchronized

After queueing all rendering commands and transitioning the image to the correct layout, to queue an image for presentation, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkQueuePresentKHR(
    VkQueue queue,
    const VkPresentInfoKHR* pPresentInfo);
```

- queue is a queue that is capable of presentation to the target surface's platform on the same device as the image's swapchain.
- pPresentInfo is a pointer to a VkPresentInfoKHR structure specifying parameters of the presentation.

**Note**

There is no requirement for an application to present images in the same order that they were acquired - applications can arbitrarily present any image that is currently acquired.

**Note**

The origin of the native orientation of the surface coordinate system is not specified in the Vulkan specification; it depends on the platform. For most platforms the origin is by default upper-left, meaning the pixel of the presented VkImage at coordinates (0,0) would appear at the upper left pixel of the platform surface (assuming VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR, and the display standing the right way up).

The result codes VK_ERROR_OUT_OF_DATE_KHR and VK_SUBOPTIMAL_KHR have the same meaning when returned by vkQueuePresentKHR as they do when returned by vkAcquireNextImageKHR. If any swapchain member of pPresentInfo was created with VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT, VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT will be returned if that swapchain does not have exclusive full-screen access, possibly for implementation-specific reasons outside of the
application’s control. If multiple swapchains are presented, the result code is determined by applying the following rules in order:

- If the device is lost, `VK_ERROR_DEVICE_LOST` is returned.
- If any of the target surfaces are no longer available the error `VK_ERROR_SURFACE_LOST_KHR` is returned.
- If any of the presents would have a result of `VK_ERROR_OUT_OF_DATE_KHR` if issued separately then `VK_ERROR_OUT_OF_DATE_KHR` is returned.
- If any of the presents would have a result of `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` if issued separately then `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` is returned.
- If any of the presents would have a result of `VK_SUBOPTIMAL_KHR` if issued separately then `VK_SUBOPTIMAL_KHR` is returned.
- Otherwise `VK_SUCCESS` is returned.

Any writes to memory backing the images referenced by the `pImageIndices` and `pSwapchains` members of `pPresentInfo`, that are available before `vkQueuePresentKHR` is executed, are automatically made visible to the read access performed by the presentation engine. This automatic visibility operation for an image happens-after the semaphore signal operation, and happens-before the presentation engine accesses the image.

Presentation is a read-only operation that will not affect the content of the presentable images. Upon reacquiring the image and transitioning it away from the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, the contents will be the same as they were prior to transitioning the image to the present source layout and presenting it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

Calls to `vkQueuePresentKHR` may block, but must return in finite time. The processing of the presentation happens in issue order with other queue operations, but semaphores must be used to ensure that prior rendering and other commands in the specified queue complete before the presentation begins. The presentation command itself does not delay processing of subsequent commands on the queue. However, presentation requests sent to a particular queue are always performed in order. Exact presentation timing is controlled by the semantics of the presentation engine and native platform in use.

If an image is presented to a swapchain created from a display surface, the mode of the associated display will be updated, if necessary, to match the mode specified when creating the display surface. The mode switch and presentation of the specified image will be performed as one atomic operation.

Queueing an image for presentation defines a set of queue operations, including waiting on the semaphores and submitting a presentation request to the presentation engine. However, the scope of this set of queue operations does not include the actual processing of the image by the presentation engine.

If `vkQueuePresentKHR` fails to enqueue the corresponding set of queue operations, it may return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation must
ensure that the state and contents of any resources or synchronization primitives referenced is unaffected by the call or its failure.

If `vkQueuePresentKHR` fails in such a way that the implementation is unable to make that guarantee, the implementation **must** return `VK_ERROR_DEVICE_LOST`.

However, if the presentation request is rejected by the presentation engine with an error `VK_ERROR_OUT_OF_DATE_KHR`, `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`, or `VK_ERROR_SURFACE_LOST_KHR`, the set of queue operations are still considered to be enqueued and thus any semaphore wait operation specified in `VkPresentInfoKHR` will execute when the corresponding queue operation is complete.

`vkQueuePresentKHR` releases the acquisition of the images referenced by `imageIndices`. The queue family corresponding to the queue `vkQueuePresentKHR` is executed on **must** have ownership of the presented images as defined in Resource Sharing. `vkQueuePresentKHR` does not alter the queue family ownership, but the presented images **must** not be used again before they have been reacquired using `vkAcquireNextImageKHR`.

**Note**
The application **can** continue to present any acquired images from a retired swapchain as long as the swapchain has not entered a state that causes `vkQueuePresentKHR` to return `VK_ERROR_OUT_OF_DATE_KHR`.

---

**Valid Usage**

- **VUID-vkQueuePresentKHR-pSwapchains-01292**
  Each element of `pSwapchains` member of `pPresentInfo` **must** be a swapchain that is created for a surface for which presentation is supported from `queue` as determined using a call to `vkGetPhysicalDeviceSurfaceSupportKHR`.

- **VUID-vkQueuePresentKHR-pSwapchains-01293**
  If more than one member of `pSwapchains` was created from a display surface, all display surfaces referenced that refer to the same display **must** use the same display mode.

- **VUID-vkQueuePresentKHR-pWaitSemaphores-01294**
  When a semaphore wait operation referring to a binary semaphore defined by the elements of the `pWaitSemaphores` member of `pPresentInfo` executes on `queue`, there **must** be no other queues waiting on the same semaphore.

- **VUID-vkQueuePresentKHR-pWaitSemaphores-03267**
  All elements of the `pWaitSemaphores` member of `pPresentInfo` **must** be created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`.

- **VUID-vkQueuePresentKHR-pWaitSemaphores-03268**
  All elements of the `pWaitSemaphores` member of `pPresentInfo` **must** reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends **must** have also been submitted for execution.
Valid Usage (Implicit)

- `VUID-vkQueuePresentKHR-queue-parameter` queue must be a valid `VkQueue` handle
- `VUID-vkQueuePresentKHR-pPresentInfo-parameter` `pPresentInfo` must be a valid pointer to a valid `VkPresentInfoKHR` structure

Host Synchronization

- Host access to `queue` must be externally synchronized
- Host access to `pPresentInfo->pWaitSemaphores[]` must be externally synchronized
- Host access to `pPresentInfo->pSwapchains[]` must be externally synchronized

</tbody>
</table>

Return Codes

Success

- `VK_SUCCESS`
- `VK_SUBOPTIMAL_KHR`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`

The `VkPresentInfoKHR` structure is defined as:
typedef struct VkPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t swapchainCount;
    const VkSwapchainKHR* pSwapchains;
    const uint32_t* pImageIndices;
    VkResult* pResults;
} VkPresentInfoKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores to wait for before issuing the present request. The number may be zero.
- `pWaitSemaphores` is NULL or a pointer to an array of `VkSemaphore` objects with `waitSemaphoreCount` entries, and specifies the semaphores to wait for before issuing the present request.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pSwapchains` is a pointer to an array of `VkSwapchainKHR` objects with `swapchainCount` entries.
- `pImageIndices` is a pointer to an array of indices into the array of each swapchain's presentable images, with `swapchainCount` entries. Each entry in this array identifies the image to present on the corresponding entry in the `pSwapchains` array.
- `pResults` is a pointer to an array of `VkResult` typed elements with `swapchainCount` entries. Applications that do not need per-swapchain results can use NULL for `pResults`. If non-NULL, each entry in `pResults` will be set to the `VkResult` for presenting the swapchain corresponding to the same index in `pSwapchains`.

Before an application can present an image, the image's layout must be transitioned to the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, or for a shared presentable image the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout.

**Note**

When transitioning the image to `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`, there is no need to delay subsequent processing, or perform any visibility operations (as `vkQueuePresentKHR` performs automatic visibility operations). To achieve this, the `dstAccessMask` member of the `VkImageMemoryBarrier` should be set to 0, and the `dstStageMask` parameter should be set to `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`.

**Valid Usage**

- VUID-VkPresentInfoKHR-pSwapchain-09231

Elements of `pSwapchain` must be unique
Each element of `pImageIndices` must be the index of a presentable image acquired from the swapchain specified by the corresponding element of the `pSwapchains` array, and the presented image subresource must be in the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout at the time the operation is executed on a `VkDevice`.

If a `VkPresentIdKHR` structure is included in the `pNext` chain, and the `presentId` feature is not enabled, each `presentIds` entry in that structure must be NULL.

If any element of the `pSwapchains` array has been created with `VkSwapchainPresentModesCreateInfoEXT`, all of the elements of this array must be created with `VkSwapchainPresentModesCreateInfoEXT`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_PRESENT_INFO_KHR`.
- Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDeviceGroupPresentInfoKHR`, `VkDisplayPresentInfoKHR`, `VkFrameBoundaryEXT`, `VkPresentFrameTokenGGP`, `VkPresentIdKHR`, `VkPresentRegionsKHR`, `VkPresentTimesInfoGOOGLE`, `VkSwapchainPresentFenceInfoEXT`, or `VkSwapchainPresentModeInfoEXT`.
- The `sType` value of each struct in the `pNext` chain must be unique.
- If `waitSemaphoreCount` is not 0, `pWaitSemaphores` must be a valid pointer to an array of `waitSemaphoreCount` valid `VkSemaphore` handles.
- `pSwapchains` must be a valid pointer to an array of `swapchainCount` valid `VkSwapchainKHR` handles.
- `pImageIndices` must be a valid pointer to an array of `swapchainCount` `uint32_t` values.
- If `pResults` is not `NULL`, `pResults` must be a valid pointer to an array of `swapchainCount` `VkResult` values.
- `swapchainCount` must be greater than 0.
- Both of the elements of `pSwapchains`, and the elements of `pWaitSemaphores` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.
When the VK_KHR_incremental_present extension is enabled, additional fields can be specified that allow an application to specify that only certain rectangular regions of the presentable images of a swapchain are changed. This is an optimization hint that a presentation engine may use to only update the region of a surface that is actually changing. The application still must ensure that all pixels of a presented image contain the desired values, in case the presentation engine ignores this hint. An application can provide this hint by adding a VkPresentRegionsKHR structure to the pNext chain of the VkPresentInfoKHR structure.

The VkPresentRegionsKHR structure is defined as:

```c
typedef struct VkPresentRegionsKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentRegionKHR* pRegions;
} VkPresentRegionsKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **swapchainCount** is the number of swapchains being presented to by this command.
- **pRegions** is NULL or a pointer to an array of VkPresentRegionKHR elements with swapchainCount entries. If not NULL, each element of pRegions contains the region that has changed since the last present to the swapchain in the corresponding entry in the VkPresentInfoKHR::pSwapchains array.

**Valid Usage**

- VUID-VkPresentRegionsKHR-swapchainCount-01260
  swapchainCount must be the same value as VkPresentInfoKHR::swapchainCount, where VkPresentInfoKHR is included in the pNext chain of this VkPresentRegionsKHR structure

**Valid Usage (Implicit)**

- VUID-VkPresentRegionsKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR

- VUID-VkPresentRegionsKHR-pRegions-parameter
  If pRegions is not NULL, pRegions must be a valid pointer to an array of swapchainCount valid VkPresentRegionKHR structures

- VUID-VkPresentRegionsKHR-swapchainCount-arraylength
  swapchainCount must be greater than 0

For a given image and swapchain, the region to present is specified by the VkPresentRegionKHR structure, which is defined as:
typedef struct VkPresentRegionKHR {
    uint32_t rectangleCount;
    const VkRectLayerKHR* pRectangles;
} VkPresentRegionKHR;

- `rectangleCount` is the number of rectangles in `pRectangles`, or zero if the entire image has changed and should be presented.

- `pRectangles` is either `NULL` or a pointer to an array of `VkRectLayerKHR` structures. The `VkRectLayerKHR` structure is the framebuffer coordinates, plus layer, of a portion of a presentable image that has changed and must be presented. If non-`NULL`, each entry in `pRectangles` is a rectangle of the given image that has changed since the last image was presented to the given swapchain. The rectangles must be specified relative to `VkSurfaceCapabilitiesKHR::currentTransform`, regardless of the swapchain's `preTransform`. The presentation engine will apply the `preTransform` transformation to the rectangles, along with any further transformation it applies to the image content.

Valid Usage (Implicit)

- VUID-VkPresentRegionKHR-pRectangles-parameter
  If `rectangleCount` is not 0, and `pRectangles` is not `NULL`, `pRectangles` must be a valid pointer to an array of `rectangleCount` valid `VkRectLayerKHR` structures.

The `VkRectLayerKHR` structure is defined as:

typedef struct VkRectLayerKHR {
    VkOffset2D offset;
    VkExtent2D extent;
    uint32_t layer;
} VkRectLayerKHR;

- `offset` is the origin of the rectangle, in pixels.

- `extent` is the size of the rectangle, in pixels.

- `layer` is the layer of the image. For images with only one layer, the value of `layer` must be 0.

Some platforms allow the size of a surface to change, and then scale the pixels of the image to fit the surface. `VkRectLayerKHR` specifies pixels of the swapchain's image(s), which will be constant for the life of the swapchain.

Valid Usage

- VUID-VkRectLayerKHR-offset-04864
  The sum of `offset` and `extent`, after being transformed according to the `preTransform`
When the VK_KHR_display_swapchain extension is enabled, additional fields can be specified when presenting an image to a swapchain by setting VkPresentInfoKHR::pNext to point to a VkDisplayPresentInfoKHR structure.

The VkDisplayPresentInfoKHR structure is defined as:

```c
// Provided by VK_KHR_display_swapchain
typedef struct VK_KHR_display_swapchain
VkDisplayPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkRect2D srcRect;
    VkRect2D dstRect;
    VkBool32 persistent;
} VkDisplayPresentInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcRect** is a rectangular region of pixels to present. It must be a subset of the image being presented. If VkDisplayPresentInfoKHR is not specified, this region will be assumed to be the entire presentable image.
- **dstRect** is a rectangular region within the visible region of the swapchain's display mode. If VkDisplayPresentInfoKHR is not specified, this region will be assumed to be the entire visible region of the swapchain's mode. If the specified rectangle is a subset of the display mode's visible region, content from display planes below the swapchain's plane will be visible outside the rectangle. If there are no planes below the swapchain's, the area outside the specified rectangle will be black. If portions of the specified rectangle are outside of the display's visible region, pixels mapping only to those portions of the rectangle will be discarded.
- **persistent**: If this is VK_TRUE, the display engine will enable buffered mode on displays that support it. This allows the display engine to stop sending content to the display until a new image is presented. The display will instead maintain a copy of the last presented image. This allows less power to be used, but may increase presentation latency. If VkDisplayPresentInfoKHR is not specified, persistent mode will not be used.

If the extent of the srcRect and dstRect are not equal, the presented pixels will be scaled accordingly.
Valid Usage

- VUID-VkDisplayPresentInfoKHR-srcRect-01257
  
  `srcRect` **must** specify a rectangular region that is a subset of the image being presented.

- VUID-VkDisplayPresentInfoKHR-dstRect-01258
  
  `dstRect` **must** specify a rectangular region that is a subset of the `visibleRegion` parameter of the display mode the swapchain being presented uses.

- VUID-VkDisplayPresentInfoKHR-persistentContent-01259
  
  If the `persistentContent` member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display the present operation targets is `VK_FALSE`, then `persistent` **must** be `VK_FALSE`.

Valid Usage (Implicit)

- VUID-VkDisplayPresentInfoKHR-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR`.

If the `pNext` chain of `VkPresentInfoKHR` includes a `VkDeviceGroupPresentInfoKHR` structure, then that structure includes an array of device masks and a device group present mode.

The `VkDeviceGroupPresentInfoKHR` structure is defined as:

```c
typedef struct VkDeviceGroupPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const uint32_t* pDeviceMasks;
    VkDeviceGroupPresentModeFlagBitsKHR mode;
} VkDeviceGroupPresentInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is zero or the number of elements in `pDeviceMasks`.
- `pDeviceMasks` is a pointer to an array of device masks, one for each element of `VkPresentInfoKHR::pSwapchains`.
- `mode` is a `VkDeviceGroupPresentModeFlagBitsKHR` value specifying the device group present mode that will be used for this present.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`, then each element of `pDeviceMasks` selects which instance of the swapchain image is presented. Each element of `pDeviceMasks` **must** have exactly one bit set, and the corresponding physical device **must** have a presentation engine as
reported by `VkDeviceGroupPresentCapabilitiesKHR`.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR`, then each element of `pDeviceMasks` selects which instance of the swapchain image is presented. Each element of `pDeviceMasks` must have exactly one bit set, and some physical device in the logical device must include that bit in its `VkDeviceGroupPresentCapabilitiesKHR::presentMask`.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR`, then each element of `pDeviceMasks` selects which instances of the swapchain image are component-wise summed and the sum of those images is presented. If the sum in any component is outside the representable range, the value of that component is undefined. Each element of `pDeviceMasks` must have a value for which all set bits are set in one of the elements of `VkDeviceGroupPresentCapabilitiesKHR::presentMask`.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, then each element of `pDeviceMasks` selects which instance(s) of the swapchain images are presented. For each bit set in each element of `pDeviceMasks`, the corresponding physical device must have a presentation engine as reported by `VkDeviceGroupPresentCapabilitiesKHR`.

If `VkDeviceGroupPresentInfoKHR` is not provided or `swapchainCount` is zero then the masks are considered to be 1. If `VkDeviceGroupPresentInfoKHR` is not provided, `mode` is considered to be `VKDEVICEGROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

---

**Valid Usage**

- VUID-VkDeviceGroupPresentInfoKHR-swapchainCount-01297
  `swapchainCount` must equal 0 or `VkPresentInfoKHR::swapchainCount`

- VUID-VkDeviceGroupPresentInfoKHR-mode-01298
  If `mode` is `VKDEVICEGROUP_PRESENT_MODE_LOCAL_BIT_KHR`, then each element of `pDeviceMasks` must have exactly one bit set, and the corresponding element of `VkDeviceGroupPresentCapabilitiesKHR::presentMask` must be non-zero

- VUID-VkDeviceGroupPresentInfoKHR-mode-01299
  If `mode` is `VKDEVICEGROUP_PRESENT_MODE_REMOTE_BIT_KHR`, then each element of `pDeviceMasks` must have exactly one bit set, and some physical device in the logical device must include that bit in its `VkDeviceGroupPresentCapabilitiesKHR::presentMask`

- VUID-VkDeviceGroupPresentInfoKHR-mode-01300
  If `mode` is `VKDEVICEGROUP_PRESENT_MODE_SUM_BIT_KHR`, then each element of `pDeviceMasks` must have a value for which all set bits are set in one of the elements of `VkDeviceGroupPresentCapabilitiesKHR::presentMask`

- VUID-VkDeviceGroupPresentInfoKHR-mode-01301
  If `mode` is `VKDEVICEGROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, then for each bit set in each element of `pDeviceMasks`, the corresponding element of `VkDeviceGroupPresentCapabilitiesKHR::presentMask` must be non-zero

- VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-01302
  The value of each element of `pDeviceMasks` must be equal to the device mask passed in `VkAcquireNextImageInfoKHR::deviceMask` when the image index was last acquired

- VUID-VkDeviceGroupPresentInfoKHR-mode-01303
mode must have exactly one bit set, and that bit must have been included in VkDeviceGroupSwapchainCreateInfoKHR::modes

Valid Usage (Implicit)

- VUID-VkDeviceGroupPresentInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR
- VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-parameter
  If swapchainCount is not 0, pDeviceMasks must be a valid pointer to an array of swapchainCount uint32_t values
- VUID-VkDeviceGroupPresentInfoKHR-mode-parameter
  mode must be a valid VkDeviceGroupPresentModeFlagBitsKHR value

When the VK_GOOGLE_display_timing extension is enabled, additional fields can be specified that allow an application to specify the earliest time that an image should be displayed. This allows an application to avoid stutter that is caused by an image being displayed earlier than planned. Such stuttering can occur with both fixed and variable-refresh-rate displays, because stuttering occurs when the geometry is not correctly positioned for when the image is displayed. An application can instruct the presentation engine that an image should not be displayed earlier than a specified time by adding a VkPresentTimesInfoGOOGLE structure to the pNext chain of the VkPresentInfoKHR structure.

The VkPresentTimesInfoGOOGLE structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPresentTimesInfoGOOGLE {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentTimeGOOGLE* pTimes;
} VkPresentTimesInfoGOOGLE;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- swapchainCount is the number of swapchains being presented to by this command.
- pTimes is NULL or a pointer to an array of VkPresentTimeGOOGLE elements with swapchainCount entries. If not NULL, each element of pTimes contains the earliest time to present the image corresponding to the entry in the VkPresentInfoKHR::pImageIndices array.

Valid Usage

- VUID-VkPresentTimesInfoGOOGLE-swapchainCount-01247
  swapchainCount must be the same value as VkPresentInfoKHR::swapchainCount, where VkPresentInfoKHR is included in the pNext chain of this VkPresentTimesInfoGOOGLE structure
Valid Usage (Implicit)

- **VUID-VkPresentTimesInfoGOOGLE-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PRESENT_TIMES_INFO_GOOGLE`

- **VUID-VkPresentTimesInfoGOOGLE-pTimes-parameter**
  - If `pTimes` is not `NULL`, `pTimes` must be a valid pointer to an array of `swapchainCount` `VkPresentTimeGOOGLE` structures

- **VUID-VkPresentTimesInfoGOOGLE-swapchainCount-arraylength**
  - `swapchainCount` must be greater than 0

The `VkPresentTimeGOOGLE` structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPresentTimeGOOGLE {
    uint32_t presentID;
    uint64_t desiredPresentTime;
} VkPresentTimeGOOGLE;
```

- `presentID` is an application-provided identification value, that can be used with the results of `vkGetPastPresentationTimingGOOGLE`, in order to uniquely identify this present. In order to be useful to the application, it should be unique within some period of time that is meaningful to the application.

- `desiredPresentTime` specifies that the image given should not be displayed to the user any earlier than this time. `desiredPresentTime` is a time in nanoseconds, relative to a monotonically-increasing clock (e.g. `CLOCK_MONOTONIC` (see `clock_gettime(2)`) on Android and Linux). A value of zero specifies that the presentation engine may display the image at any time. This is useful when the application desires to provide `presentID`, but does not need a specific `desiredPresentTime`.

The `VkPresentIdKHR` structure is defined as:

```c
// Provided by VK_KHR_present_id
typedef struct VkPresentIdKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const uint64_t* pPresentIds;
} VkPresentIdKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to the `vkQueuePresentKHR` command.
• `pPresentIds` is `NULL` or a pointer to an array of `uint64_t` with `swapchainCount` entries. If not `NULL`, each non-zero value in `pPresentIds` specifies the present id to be associated with the presentation of the swapchain with the same index in the `vkQueuePresentKHR` call.

For applications to be able to reference specific presentation events queued by a call to `vkQueuePresentKHR`, an identifier needs to be associated with them. When the `presentId` feature is enabled, applications can include the `VkPresentIdKHR` structure in the `pNext` chain of the `VkPresentInfoKHR` structure to supply identifiers.

Each `VkSwapchainKHR` has a presentId associated with it. This value is initially set to zero when the `VkSwapchainKHR` is created.

When a `VkPresentIdKHR` structure with a non-NULL `pPresentIds` is included in the `pNext` chain of a `VkPresentInfoKHR` structure, each `pSwapchains` entry has a presentId associated in the `pPresentIds` array at the same index as the swapchain in the `pSwapchains` array. If this presentId is non-zero, then the application can later use this value to refer to that image presentation. A value of zero indicates that this presentation has no associated presentId. A non-zero presentId must be greater than any non-zero presentId passed previously by the application for the same swapchain.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the presentId value, but implementations should make this as close as possible to the presentation of the first pixel in the new image to the user.

---

### Valid Usage

- **VUID-VkPresentIdKHR-swapchainCount-04998**
  `swapchainCount must be the same value as VkPresentInfoKHR::swapchainCount, where this VkPresentIdKHR is in the pNext chain of the VkPresentInfoKHR structure`

- **VUID-VkPresentIdKHR-presentIds-04999**
  Each `presentIds` entry must be greater than any previous `presentIds` entry passed for the associated `pSwapchains` entry

### Valid Usage (Implicit)

- **VUID-VkPresentIdKHR-sType-sType**
  `sType must be VK_STRUCTURE_TYPE_PRESENT_ID_KHR`

- **VUID-VkPresentIdKHR-pPresentIds-parameter**
  If `pPresentIds` is not `NULL, pPresentIds must be a valid pointer to an array of swapchainCount `uint64_t` values`

- **VUID-VkPresentIdKHR-swapchainCount-arraylength**
  `swapchainCount must be greater than 0`

When the `presentWait` feature is enabled, an application can wait for an image to be presented to the user by first specifying a presentId for the target presentation by adding a `VkPresentIdKHR` structure to the `pNext` chain of the `VkPresentInfoKHR` structure and then waiting for that
presentation to complete by calling:

```c
// Provided by VK_KHR_present_wait
VkResult vkWaitForPresentKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint64_t presentId,
    uint64_t timeout);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the non-retired swapchain on which an image was queued for presentation.
- **presentId** is the presentation presentId to wait for.
- **timeout** is the timeout period in units of nanoseconds. **timeout** is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

**vkWaitForPresentKHR** waits for the presentId associated with **swapchain** to be increased in value so that it is at least equal to **presentId**.

For **VK_PRESENT_MODE_MAILBOX_KHR** (or other present mode where images may be replaced in the presentation queue) any wait of this type associated with such an image **must** be signaled no later than a wait associated with the replacing image would be signaled.

When the presentation has completed, the presentId associated with the related **pSwapchains** entry will be increased in value so that it is at least equal to the value provided in the **VkPresentIdKHR** structure.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the presentId value, but implementations **should** make this as close as possible to the presentation of the first pixel in the next image being presented to the user.

The call to **vkWaitForPresentKHR** will block until either the presentId associated with **swapchain** is greater than or equal to **presentId**, or **timeout** nanoseconds passes. When the swapchain becomes **OUT_OF_DATE**, the call will either return **VK_SUCCESS** (if the image was delivered to the presentation engine and may have been presented to the user) or will return early with status **VK_ERROR_OUT_OF_DATE_KHR** (if the image was not presented to the user).

As an exception to the normal rules for objects which are externally synchronized, the **swapchain** passed to **vkWaitForPresentKHR** **may** be simultaneously used by other threads in calls to functions other than **vkDestroySwapchainKHR**. Access to the swapchain data associated with this extension **must** be atomic within the implementation.

**Valid Usage**

- VUID-vkWaitForPresentKHR-swapchain-04997
  **swapchain** **must** not be in the retired state
- VUID-vkWaitForPresentKHR-presentWait-06234
The `presentWait` feature must be enabled

### Valid Usage (Implicit)

- **VUID-vkWaitForPresentKHR-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkWaitForPresentKHR-swapchain-parameter**
  
  `swapchain` must be a valid `VkSwapchainKHR` handle

- **VUID-vkWaitForPresentKHR-swapchain-parent**
  
  `swapchain` must have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `swapchain` must be externally synchronized

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_TIMEOUT`
- `VK_SUBOPTIMAL_KHR`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`

When the `VK_GGP_frame_token` extension is enabled, a Google Games Platform frame token can be specified when presenting an image to a swapchain by adding a `VkPresentFrameTokenGGP` structure to the `pNext` chain of the `VkPresentInfoKHR` structure.

The `VkPresentFrameTokenGGP` structure is defined as:
typedef struct VkPresentFrameTokenGGP {
    VkStructureType sType;
    const void* pNext;
    GgpFrameToken frameToken;
} VkPresentFrameTokenGGP;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `frameToken` is the Google Games Platform frame token.

Valid Usage

- VUID-VkPresentFrameTokenGGP-frameToken-02680
  `frameToken` must be a valid `GgpFrameToken`.

Valid Usage (Implicit)

- VUID-VkPresentFrameTokenGGP-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PRESENT_FRAME_TOKEN_GGP`.

The `VkSwapchainPresentModeInfoEXT` structure is defined as:

typedef struct VkSwapchainPresentModeInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentModeKHR* pPresentModes;
} VkSwapchainPresentModeInfoEXT;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pPresentModes` is a list of presentation modes with `swapchainCount` entries.

If the `pNext` chain of `VkPresentInfoKHR` includes a `VkSwapchainPresentModeInfoEXT` structure, then that structure defines the presentation modes used for the current and subsequent presentation operations.

When the application changes present modes with `VkSwapchainPresentModeInfoEXT`, images that have already been queued for presentation will continue to be presented according to the previous present mode. The current image being queued for presentation and subsequent images will be
presented according to the new present mode. The behavior during the transition between the two
modes is defined as follows.

- Transition from `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` to `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR`: the presentation engine updates the shared presentable image according to the behavior of `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR`.

- Transition from `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` to `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`: the presentation engine may update the shared presentable image or defer that to its regular refresh cycle, according to the behavior of `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

- Transition between `VK_PRESENT_MODE_FIFO_KHR` and `VK_PRESENT_MODE_FIFO_RELAXED_KHR`: Images continue to be appended to the same FIFO queue, and the behavior with respect to waiting for vertical blanking period will follow the new mode for current and subsequent images.

- Transition from `VK_PRESENT_MODE_IMMEDIATE_KHR` to `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR`: As all prior present requests in the `VK_PRESENT_MODE_IMMEDIATE_KHR` mode are applied immediately, there are no outstanding present operations in this mode, and current and subsequent images are appended to the FIFO queue and presented according to the new mode.

- Transition from `VK_PRESENT_MODE_MAILBOX_KHR` to `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR`: Presentation in both modes require waiting for the next vertical blanking period, with `VK_PRESENT_MODE_MAILBOX_KHR` allowing the pending present operation to be replaced by a new one. In this case, the current present operation will replace the pending present operation and is applied according to the new mode.

- Transition from `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR` to `VK_PRESENT_MODE_IMMEDIATE_KHR` or `VK_PRESENT_MODE_MAILBOX_KHR`: If the FIFO queue is empty, presentation is done according to the behavior of the new mode. If there are present operations in the FIFO queue, once the last present operation is performed based on the respective vertical blanking period, the current and subsequent updates are applied according to the new mode.

- The behavior during transition between any other present modes, if possible, is implementation defined.

Valid Usage

- VUID-VkSwapchainPresentModeInfoEXT-swapchainCount-07760
  `swapchainCount` must be equal to `VkPresentInfoKHR::swapchainCount`

- VUID-VkSwapchainPresentModeInfoEXT-pPresentModes-07761
  Each entry in `pPresentModes` must be a presentation mode specified in `VkSwapchainPresentModesCreateInfoEXT::pPresentModes` when creating the entry’s corresponding swapchain

Valid Usage (Implicit)

- VUID-VkSwapchainPresentModeInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_MODE_INFO_EXT`
The `VkSwapchainPresentFenceInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkSwapchainPresentFenceInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkFence* pFences;
} VkSwapchainPresentFenceInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pFences` is a list of fences with `swapchainCount` entries. Each entry must be `VK_NULL_HANDLE` or the handle of a fence to signal when the relevant operations on the associated swapchain have completed.

The set of queue operations defined by queuing an image for presentation, as well as operations performed by the presentation engine access the payloads of objects associated with the presentation operation. The associated objects include:

- The swapchain image, its implicitly bound memory, and any other resources bound to that memory.
- The wait semaphores specified when queuing the image for presentation.

The application can provide a fence that the implementation will signal when all such queue operations have completed and the presentation engine has taken a reference to the payload of any objects it accesses as part of the present operation. For all binary wait semaphores imported by the presentation engine using the equivalent of reference transference, as described in Importing Semaphore Payloads, this fence must not signal until all such semaphore payloads have been reset by the presentation engine.

The application can destroy the wait semaphores associated with a given presentation operation when at least one of the associated fences is signaled, and can destroy the swapchain when the fences associated with all past presentation requests referring to that swapchain have signaled.

Fences associated with presentations to the same swapchain on the same `VkQueue` must be signaled in the same order as the present operations.

To specify a fence for each swapchain in a present operation, include the
VkSwapchainPresentFenceInfoEXT structure in the pNext chain of the VkPresentInfoKHR structure.

Valid Usage

- VUID-VkSwapchainPresentFenceInfoEXT-swapchainCount-07757
  swapchainCount must be equal to VkPresentInfoKHR::swapchainCount
- VUID-VkSwapchainPresentFenceInfoEXT-pFences-07758
  Each element of pFences must be unsignaled
- VUID-VkSwapchainPresentFenceInfoEXT-pFences-07759
  Each element of pFences must not be associated with any other queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-VkSwapchainPresentFenceInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_FENCE_INFO_EXT
- VUID-VkSwapchainPresentFenceInfoEXT-pFences-parameter
  pFences must be a valid pointer to an array of swapchainCount valid VkFence handles
- VUID-VkSwapchainPresentFenceInfoEXT-swapchainCount-arraylength
  swapchainCount must be greater than 0

To release images previously acquired through vkAcquireNextImage2KHR or vkAcquireNextImageKHR, call:

```c
// Provided by VK_EXT_swapchain_maintenance1
VkResult vkReleaseSwapchainImagesEXT(
    VkDevice device,
    const VkReleaseSwapchainImagesInfoEXT* pReleaseInfo);
```

- device is the device associated with VkReleaseSwapchainImagesInfoEXT::swapchain.
- pReleaseInfo is a pointer to a VkReleaseSwapchainImagesInfoEXT structure containing parameters of the release.

Only images that are not in use by the device can be released.

Releasing images is a read-only operation that will not affect the content of the released images. Upon reacquiring the image, the image contents and its layout will be the same as they were prior to releasing it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

Note

This functionality is useful during swapchain recreation, where acquired images

3209
from the old swapchain can be released instead of presented.

Valid Usage (Implicit)

- VUID-vkReleaseSwapchainImagesEXT-device-parameter
device must be a valid VkDevice handle

- VUID-vkReleaseSwapchainImagesEXT-pReleaseInfo-parameter
pReleaseInfo must be a valid pointer to a valid VkReleaseSwapchainImagesInfoEXT structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_SURFACE_LOST_KHR

The VkReleaseSwapchainImagesInfoEXT structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkReleaseSwapchainImagesInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
    uint32_t imageIndexCount;
    const uint32_t* pImageIndices;
} VkReleaseSwapchainImagesInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- swapchain is a swapchain to which images are being released.
- imageIndexCount is the number of image indices to be released.
- pImageIndices is a pointer to an array of indices into the array of swapchain’s presentable images, with imageIndexCount entries.

Valid Usage

- VUID-VkReleaseSwapchainImagesInfoEXT-pImageIndices-07785
Each element of pImageIndices must be the index of a presentable image acquired from the swapchain specified by swapchain

- VUID-VkReleaseSwapchainImagesInfoEXT-pImageIndices-07786
All uses of presentable images identified by elements of pImageIndices must have
34.11. Hdr Metadata

This section describes how to improve color reproduction of content to better reproduce colors as seen on the reference monitor. Definitions below are from the associated SMPTE 2086, CTA 861.3 and CIE 15:2004 specifications.

To provide Hdr metadata to an implementation, call:

```c
// Provided by VK_EXT_hdr_metadata
void vkSetHdrMetadataEXT(
    VkDevice device,
    uint32_t swapchainCount,
    const VkSwapchainKHR* pSwapchains,
    const VkHdrMetadataEXT* pMetadata);
```

- **device** is the logical device where the swapchain(s) were created.
- **swapchainCount** is the number of swapchains included in **pSwapchains**.
- **pSwapchains** is a pointer to an array of swapchainCount **VkSwapchainKHR** handles.
- **pMetadata** is a pointer to an array of swapchainCount **VkHdrMetadataEXT** structures.

The metadata will be applied to the specified **VkSwapchainKHR** objects at the next **vkQueuePresentKHR** call using that **VkSwapchainKHR** object. The metadata will persist until a subsequent **vkSetHdrMetadataEXT** changes it.
Valid Usage (Implicit)

- **VUID-vkSetHdrMetadataEXT-device-parameter**
  
  *device must* be a valid *VkDevice* handle

- **VUID-vkSetHdrMetadataEXT-pSwapchains-parameter**
  
  *pSwapchains must* be a valid pointer to an array of *swapchainCount* valid *VkSwapchainKHR* handles

- **VUID-vkSetHdrMetadataEXT-pMetadata-parameter**
  
  *pMetadata must* be a valid pointer to an array of *swapchainCount* valid *VkHdrMetadataEXT* structures

- **VUID-vkSetHdrMetadataEXT-swapchainCount-arraylength**
  
  *swapchainCount must* be greater than 0

- **VUID-vkSetHdrMetadataEXT-pSwapchains-parent**
  
  Each element of *pSwapchains must* have been created, allocated, or retrieved from *device*

The *VkHdrMetadataEXT* structure is defined as:

```c
// Provided by VK_EXT_hdr_metadata
typedef struct VkHdrMetadataEXT {
    VkStructureType sType;
    const void* pNext;
    VkXYColorEXT displayPrimaryRed;
    VkXYColorEXT displayPrimaryGreen;
    VkXYColorEXT displayPrimaryBlue;
    VkXYColorEXT whitePoint;
    float maxLuminance;
    float minLuminance;
    float maxContentLightLevel;
    float maxFrameAverageLightLevel;
} VkHdrMetadataEXT;
```

- *sType* is a *VkStructureType* value identifying this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- *displayPrimaryRed* is a *VkXYColorEXT* structure specifying the reference monitor’s red primary in chromaticity coordinates
- *displayPrimaryGreen* is a *VkXYColorEXT* structure specifying the reference monitor’s green primary in chromaticity coordinates
- *displayPrimaryBlue* is a *VkXYColorEXT* structure specifying the reference monitor’s blue primary in chromaticity coordinates
- *whitePoint* is a *VkXYColorEXT* structure specifying the reference monitor’s white-point in chromaticity coordinates
- *maxLuminance* is the maximum luminance of the reference monitor in nits
• **minLuminance** is the minimum luminance of the reference monitor in nits
• **maxContentLightLevel** is content’s maximum luminance in nits
• **maxFrameAverageLightLevel** is the maximum frame average light level in nits

### Valid Usage (Implicit)

- VUID-VkHdrMetadataEXT-sType-sType
  
  *sType* must be `VK_STRUCTURE_TYPE_HDR_METADATA_EXT`

- VUID-VkHdrMetadataEXT-pNext-pNext
  
  *pNext* must be `NULL`

---

**Note**

The validity and use of this data is outside the scope of Vulkan.

The `VkXYColorEXT` structure is defined as:

```c
// Provided by VK_EXT_hdr_metadata
typedef struct VkXYColorEXT {
    float x;
    float y;
} VkXYColorEXT;
```

- *x* is the *x* chromaticity coordinate.
- *y* is the *y* chromaticity coordinate.

Chromaticity coordinates are as specified in CIE 15:2004 “Calculation of chromaticity coordinates” (Section 7.3) and are limited to between 0 and 1 for real colors for the reference monitor.

### 34.12. Present Barrier

The **VK_NV_present_barrier** extension allows applications to synchronize corresponding presentation requests across multiple swapchains using the *present barrier*. A swapchain is said to be using the *present barrier* if the swapchain is created by adding a `VkSwapchainPresentBarrierCreateInfoNV` structure to the *pNext* chain of the `VkSwapchainCreateInfoKHR` structure, and setting `VkSwapchainPresentBarrierCreateInfoNV::presentBarrierEnable` to true.

A set of corresponding presentation requests is defined as exactly one queued presentation request associated with each swapchain using the present barrier, whether or not that queued request has executed. A given presentation request is added, when created by calling `vkQueuePresentKHR` and specifying a swapchain using the present barrier, either to the oldest existing set of corresponding requests for which there is no existing member associated with the request’s swapchain, or to a new set of corresponding requests if no such set exists.

A set of corresponding requests is said to be *full* when it contains one request from each swapchain.
using the present barrier. Queued presentation of an image to a swapchain using the present barrier is deferred by the implementation until the set of corresponding requests is full, and the visibility operations associated with all requests in that set, as described by `vkQueuePresentKHR`, have completed.

Additionally, the set of swapchains using the present barrier can be in the same process, or different processes running under the same operating system. And if the required synchronization hardware is connected and correctly configured, this extension also supports applications to synchronize corresponding presentation requests using the present barrier across distributed systems. However, the configuration mechanism of the required hardware is outside the scope of the Vulkan specification and this extension.

The `VkSwapchainPresentBarrierCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_present_barrier
typedef struct VkSwapchainPresentBarrierCreateInfoNV {
    VkStructureType     sType;
    void*               pNext;
    VkBool32            presentBarrierEnable;
} VkSwapchainPresentBarrierCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentBarrierEnable` is a boolean value indicating a request for using the present barrier.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` does not include this structure, the default value for `presentBarrierEnable` is `VK_FALSE`, meaning the swapchain does not request to use the present barrier. Additionally, when recreating a swapchain that was using the present barrier, and the `pNext` chain of `VkSwapchainCreateInfoKHR` does not include this structure, it means the swapchain will stop using the present barrier.

**Valid Usage (Implicit)**

- `VUID-VkSwapchainPresentBarrierCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_BARRIER_CREATE_INFO_NV`
Chapter 35. Deferred Host Operations

Certain Vulkan commands are inherently expensive for the host CPU to execute. It is often desirable to offload such work onto background threads, and to parallelize the work across multiple CPUs. The concept of deferred operations allows applications and drivers to coordinate the execution of expensive host commands using an application-managed thread pool.

The `VK_KHR_deferred_host_operations` extension defines the infrastructure and usage patterns for deferrable commands, but does not specify any commands as deferrable. This is left to additional dependent extensions. Commands must not be deferred unless the deferral is specifically allowed by another extension which depends on `VK_KHR_deferred_host_operations`. This specification will refer to such extensions as deferral extensions.

35.1. Requesting Deferral

When an application requests an operation deferral, the implementation may defer the operation. When deferral is requested and the implementation defers any operation, the implementation must return `VK_OPERATION_DEFERRED_KHR` as the success code if no errors occurred. When deferral is requested, the implementation should defer the operation when the workload is significant, however if the implementation chooses not to defer any of the requested operations and instead executes all of them immediately, the implementation must return `VK_OPERATION_NOT_DEFERRED_KHR` as the success code if no errors occurred.

A deferred operation is created complete with an initial result value of `VK_SUCCESS`. The deferred operation becomes pending when an operation has been successfully deferred with that deferred operation object.

A deferred operation is considered pending until the deferred operation completes. A pending deferred operation becomes complete when it has been fully executed by one or more threads. Pending deferred operations will never complete until they are joined by an application thread, using `vkDeferredOperationJoinKHR`. Applications can join multiple threads to the same deferred operation, enabling concurrent execution of subtasks within that operation.

The application can query the status of a `VkDeferredOperationKHR` using the `vkGetDeferredOperationMaxConcurrencyKHR` or `vkGetDeferredOperationResultKHR` commands.

Parameters to the command requesting a deferred operation may be accessed by the implementation at any time until the deferred operation enters the complete state. The application must obey the following rules while a deferred operation is pending:

- Externally synchronized parameters must not be accessed.
- Pointer parameters must not be modified (e.g. reallocated/freed).
- The contents of pointer parameters which may be read by the command must not be modified.
- The contents of pointer parameters which may be written by the command must not be read.
- Vulkan object parameters must not be passed as externally synchronized parameters to any other command.
When the deferred operation is complete, the application should call `vkGetDeferredOperationResultKHR` to obtain the `VkResult` indicating success or failure of the operation. The `VkResult` value returned will be one of the values that the command requesting the deferred operation is able to return. Writes to output parameters of the requesting command will happen-before the deferred operation is complete.

When a deferral is requested for a command, the implementation may perform memory management operations on the allocator supplied to `vkCreateDeferredOperationKHR` for the deferred operation object, as described in the Memory Allocation chapter. Such allocations must occur on the thread which requests deferral.

If an allocator was supplied for the deferred command at the time of the deferral request, then the implementation may perform memory management operations on this allocator during the execution of `vkDeferredOperationJoinKHR`. These operations may occur concurrently and may be performed by any joined thread. The application must ensure that the supplied allocator is able to operate correctly under these conditions.

### 35.2. Deferred Host Operations API

The `VkDeferredOperationKHR` handle is defined as:

```c
// Provided by VK_KHR_deferred_host Operations
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeferredOperationKHR)
```

This handle refers to a tracking structure which manages the execution state for a deferred command.

To construct the tracking object for a deferred command, call:

```c
// Provided by VK_KHR_deferred_host Operations
VkResult vkCreateDeferredOperationKHR

  VkDevice device,
  const VkAllocationCallbacks* pAllocator,
  VkDeferredOperationKHR* pDeferredOperation);
```

- `device` is the device which owns operation.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pDeferredOperation` is a pointer to a handle in which the created `VkDeferredOperationKHR` is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDeferredOperationKHR-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkCreateDeferredOperationKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- `VUID-vkCreateDeferredOperationKHR-pDeferredOperation-parameter pDeferredOperation must be a valid pointer to a VkDeferredOperationKHR handle`

Return Codes

Success
- `VK_SUCCESS`

Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`

To assign a thread to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkDeferredOperationJoinKHR(
    VkDevice device, // device is the device which owns operation.
    VkDeferredOperationKHR operation); // operation is the deferred operation that the calling thread should work on.
```

The `vkDeferredOperationJoinKHR` command will execute a portion of the deferred operation on the calling thread.

The return value will be one of the following:

- A return value of `VK_SUCCESS` indicates that `operation` is complete. The application should use `vkGetDeferredOperationResultKHR` to retrieve the result of `operation`.
- A return value of `VK_THREAD_DONE_KHR` indicates that the deferred operation is not complete, but there is no work remaining to assign to threads. Future calls to `vkDeferredOperationJoinKHR` are not necessary and will simply harm performance. This situation may occur when other threads executing `vkDeferredOperationJoinKHR` are about to complete `operation`, and the implementation is unable to partition the workload any further.
- A return value of `VK_THREAD_IDLE_KHR` indicates that the deferred operation is not complete, and there is no work for the thread to do at the time of the call. This situation may occur if the operation encounters a temporary reduction in parallelism. By returning `VK_THREAD_IDLE_KHR`, the implementation is signaling that it expects that more opportunities for parallelism will emerge as execution progresses, and that future calls to `vkDeferredOperationJoinKHR` can be beneficial. In the meantime, the application can perform other work on the calling thread.

Implementations must guarantee forward progress by enforcing the following invariants:

1. If only one thread has invoked `vkDeferredOperationJoinKHR` on a given operation, that thread
**must** execute the operation to completion and return **VK_SUCCESS**.

2. If multiple threads have concurrently invoked `vkDeferredOperationJoinKHR` on the same operation, then at least one of them **must** complete the operation and return **VK_SUCCESS**.

---

**Valid Usage (Implicit)**

- VUID-vkDeferredOperationJoinKHR-device-parameter
  - `device` **must** be a valid `VkDevice` handle
- VUID-vkDeferredOperationJoinKHR-operation-parameter
  - `operation` **must** be a valid `VkDeferredOperationKHR` handle
- VUID-vkDeferredOperationJoinKHR-operation-parent
  - `operation` **must** have been created, allocated, or retrieved from `device`

---

**Return Codes**

**Success**

- **VK_SUCCESS**
- **VK_THREAD_DONE_KHR**
- **VK_THREAD_IDLE_KHR**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

When a deferred operation is completed, the application **can** destroy the tracking object by calling:

```c
// Provided by VK_KHR_deferred_host_operations
void vkDestroyDeferredOperationKHR(  
    VkDevice device,  
    VkDeferredOperationKHR operation,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the device which owns `operation`.
- `operation` is the completed operation to be destroyed.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

---

**Valid Usage**

- VUID-vkDestroyDeferredOperationKHR-operation-03434
  - If `VkAllocationCallbacks` were provided when `operation` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyDeferredOperationKHR-operation-03435
If no VkAllocationCallbacks were provided when operation was created, pAllocator must be NULL.

- VUID-vkDestroyDeferredOperationKHR-operation-03436
  operation must be completed

Valid Usage (Implicit)

- VUID-vkDestroyDeferredOperationKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroyDeferredOperationKHR-operation-parameter
  If operation is not VK_NULL_HANDLE, operation must be a valid VkDeferredOperationKHR handle

- VUID-vkDestroyDeferredOperationKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyDeferredOperationKHR-operation-parent
  If operation is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to operation must be externally synchronized

To query the number of additional threads that can usefully be joined to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
uint32_t vkGetDeferredOperationMaxConcurrencyKHR(
    VkDevice device,
    VkDeferredOperationKHR operation);
```

- device is the device which owns operation.
- operation is the deferred operation to be queried.

The returned value is the maximum number of threads that can usefully execute a deferred operation concurrently, reported for the state of the deferred operation at the point this command is called. This value is intended to be used to better schedule work onto available threads. Applications can join any number of threads to the deferred operation and expect it to eventually complete, though excessive joins may return VK_THREAD_DONE_KHR immediately, performing no useful work.

If operation is complete, vkGetDeferredOperationMaxConcurrencyKHR returns zero.

If operation is currently joined to any threads, the value returned by this command may
If operation is pending, implementations must not return zero unless at least one thread is currently executing vkDeferredOperationJoinKHR on operation. If there are such threads, the implementation should return an estimate of the number of additional threads which it could profitably use.

Implementations may return $2^{32}-1$ to indicate that the maximum concurrency is unknown and cannot be easily derived. Implementations may return values larger than the maximum concurrency available on the host CPU. In these situations, an application should clamp the return value rather than oversubscribing the machine.

Note
The recommended usage pattern for applications is to query this value once, after deferral, and schedule no more than the specified number of threads to join the operation. Each time a joined thread receives VK_THREAD_IDLE_KHR, the application should schedule an additional join at some point in the future, but is not required to do so.

Valid Usage (Implicit)

- VUID-vkGetDeferredOperationMaxConcurrencyKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parameter
operation must be a valid VkDeferredOperationKHR handle

- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parent
operation must have been created, allocated, or retrieved from device

The vkGetDeferredOperationResultKHR function is defined as:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkGetDeferredOperationResultKHR(
    VkDevice device,
    VkDeferredOperationKHR operation);
```

- device is the device which owns operation.
- operation is the operation whose deferred result is being queried.

If no command has been deferred on operation, vkGetDeferredOperationResultKHR returns VK_SUCCESS.

If the deferred operation is pending, vkGetDeferredOperationResultKHR returns VK_NOT_READY.

If the deferred operation is complete, it returns the appropriate return value from the original command. This value must be one of the VkResult values which could have been returned by the original command if the operation had not been deferred.
Valid Usage (Implicit)

- VUID-vkGetDeferredOperationResultKHR-device-parameter
  device must be a valid VkDevice handle
- VUID-vkGetDeferredOperationResultKHR-operation-parameter
  operation must be a valid VkDeferredOperationKHR handle
- VUID-vkGetDeferredOperationResultKHR-operation-parent
  operation must have been created, allocated, or retrieved from device

Return Codes

Success
- VK_SUCCESS
- VK_NOT_READY

Failure
None
Chapter 36. Private Data

The private data extension provides a way for users to associate arbitrary user defined data with Vulkan objects. This association is accomplished by storing 64-bit unsigned integers of user defined data in private data slots. A private data slot represents a storage allocation for one data item for each child object of the device.

An application can reserve private data slots at device creation. To reserve private data slots, insert a VkDevicePrivateDataCreateInfo in the pNext chain in VkDeviceCreateInfo before device creation. Multiple VkDevicePrivateDataCreateInfo structures can be chained together, and the sum of the requested slots will be reserved. This is an exception to the specified valid usage for structure pointer chains. Reserving slots in this manner is not strictly necessary but it may improve performance.

Private data slots are represented by VkPrivateDataSlot handles:

```c
// Provided by VK_VERSION_1_3
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPrivateDataSlot)
```

or the equivalent

```c
// Provided by VK_EXT_private_data
typedef VkPrivateDataSlot VkPrivateDataSlotEXT;
```

To create a private data slot, call:

```c
// Provided by VK_VERSION_1_3
VkResult vkCreatePrivateDataSlot(
    VkDevice device,
    const VkPrivateDataSlotCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkPrivateDataSlot* pPrivateDataSlot);
```

or the equivalent command

```c
// Provided by VK_EXT_private_data
VkResult vkCreatePrivateDataSlotEXT(
    VkDevice device,
    const VkPrivateDataSlotCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkPrivateDataSlot* pPrivateDataSlot);
```

• device is the logical device associated with the creation of the object(s) holding the private data slot.
• **pCreateInfo** is a pointer to a **VkPrivateDataSlotCreateInfo**

• **pAllocator** controls host memory allocation as described in the **Memory Allocation** chapter.

• **pPrivateDataSlot** is a pointer to a **VkPrivateDataSlot** handle in which the resulting private data slot is returned

### Valid Usage

- VUID-vkCreatePrivateDataSlot-privateData-04564
  The **privateData** feature **must** be enabled

### Valid Usage (Implicit)

- VUID-vkCreatePrivateDataSlot-device-parameter
  The **device** must be a valid **VkDevice** handle

- VUID-vkCreatePrivateDataSlot-pCreateInfo-parameter
  **pCreateInfo** must be a valid pointer to a valid **VkPrivateDataSlotCreateInfo** structure

- VUID-vkCreatePrivateDataSlot-pAllocator-parameter
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkCreatePrivateDataSlot-pPrivateDataSlot-parameter
  **pPrivateDataSlot** must be a valid pointer to a **VkPrivateDataSlot** handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**

The **VkPrivateDataSlotCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPrivateDataSlotCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPrivateDataSlotCreateFlags flags;
} VkPrivateDataSlotCreateInfo;
```

or the equivalent
### VkPrivateDataSlotCreateInfo

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.

#### Valid Usage (Implicit)

- `VUID-VkPrivateDataSlotCreateInfo-sType-sType`  
  **sType** must be `VK_STRUCTURE_TYPE_PRIVATE_DATA_SLOT_CREATE_INFO`
- `VUID-VkPrivateDataSlotCreateInfo-pNext-pNext`  
  **pNext** must be `NULL`
- `VUID-VkPrivateDataSlotCreateInfo-flags-zerobitmask`  
  **flags** must be `0`

### VkPrivateDataSlotCreateFlags

Alternatively, you can use:

```c
// Provided by VK_VERSION_1_3
typedef VkFlags VkPrivateDataSlotCreateFlags;
```

or the equivalent

```c
// Provided by VK_EXT_private_data
typedef VkPrivateDataSlotCreateFlags VkPrivateDataSlotCreateFlagsEXT;
```

**VkPrivateDataSlotCreateFlags** is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a private data slot, call:

```c
// Provided by VK_VERSION_1_3
void vkDestroyPrivateDataSlot(
    VkDevice device,
    VkPrivateDataSlot privateDataSlot,
    const VkAllocationCallbacks* pAllocator);
```

or the equivalent command
// Provided by VK_EXT_private_data

void vkDestroyPrivateDataSlotEXT(
    VkDevice device,
    VkPrivateDataSlot privateDataSlot,
    const VkAllocationCallbacks* pAllocator);

- **device** is the logical device associated with the creation of the object(s) holding the private data slot.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **privateDataSlot** is the private data slot to destroy.

### Valid Usage

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-04062**
  If [VkAllocationCallbacks](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/vkAllocationCallbacks.html) were provided when `privateDataSlot` was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-04063**
  If no [VkAllocationCallbacks](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/vkAllocationCallbacks.html) were provided when `privateDataSlot` was created, `pAllocator` must be `NULL`.

### Valid Usage (Implicit)

- **VUID-vkDestroyPrivateDataSlot-device-parameter**
  `device` must be a valid [VkDevice](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkDevice.html) handle.

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-parameter**
  If `privateDataSlot` is not [VK_NULL_HANDLE](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VK_NULL_HANDLE.html), `privateDataSlot` must be a valid [VkPrivateDataSlot](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkPrivateDataSlot.html) handle.

- **VUID-vkDestroyPrivateDataSlot-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid [VkAllocationCallbacks](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/vkAllocationCallbacks.html) structure.

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-parent**
  If `privateDataSlot` is a valid handle, it must have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `privateDataSlot` must be externally synchronized.

To store user defined data in a slot associated with a Vulkan object, call:
### VkResult `vkSetPrivateData` (or equivalent command)

```c
VkResult vkSetPrivateData(
    VkDevice             device,        
    VkObjectType         objectType,    
    uint64_t             objectHandle,  
    VkPrivateDataSlot    privateDataSlot, 
    uint64_t             data);
```

- **device** is the device that created the object.
- **objectType** is a `VkObjectType` specifying the type of object to associate data with.
- **objectHandle** is a handle to the object to associate data with.
- **privateDataSlot** is a handle to a `VkPrivateDataSlot` specifying location of private data storage.
- **data** is user defined data to associate the object with. This data will be stored at `privateDataSlot`.

### Valid Usage

- VUID-vkSetPrivateData-objectHandle-04016
  - `objectHandle` must be `device` or a child of `device`
- VUID-vkSetPrivateData-objectHandle-04017
  - `objectHandle` must be a valid handle to an object of type `objectType`

### Valid Usage (Implicit)

- VUID-vkSetPrivateData-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkSetPrivateData-objectType-parameter
  - `objectType` must be a valid `VkObjectType` value
- VUID-vkSetPrivateData-privateDataSlot-parameter
  - `privateDataSlot` must be a valid `VkPrivateDataSlot` handle
- VUID-vkSetPrivateData-privateDataSlot-parent
  - `privateDataSlot` must have been created, allocated, or retrieved from `device`
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY

To retrieve user defined data from a slot associated with a Vulkan object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetPrivateData(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t* pData);
```

or the equivalent command

```c
// Provided by VK_EXT_private_data
void vkGetPrivateDataEXT(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t* pData);
```

• device is the device that created the object
• objectType is a VkObjectType specifying the type of object data is associated with.
• objectHandle is a handle to the object data is associated with.
• privateDataSlot is a handle to a VkPrivateDataSlot specifying location of private data pointer storage.
• pData is a pointer to specify where user data is returned. 0 will be written in the absence of a previous call to vkSetPrivateData using the object specified by objectHandle.

Note
Due to platform details on Android, implementations might not be able to reliably return 0 from calls to vkGetPrivateData for VkSwapchainKHR objects on which vkSetPrivateData has not previously been called. This erratum is exclusive to the Android platform and objects of type VkSwapchainKHR.
Valid Usage

- VUID-vkGetPrivateData-objectType-04018
  objectHandle must be device or a child of device

- VUID-vkGetPrivateData-objectHandle-09498
  objectHandle must be a valid handle to an object of type objectType

Valid Usage (Implicit)

- VUID-vkGetPrivateData-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetPrivateData-objectType-parameter
  objectType must be a valid VkObjectType value

- VUID-vkGetPrivateData-privateDataSlot-parameter
  privateDataSlot must be a valid VkPrivateDataSlot handle

- VUID-vkGetPrivateData-pData-parameter
  pData must be a valid pointer to a uint64_t value

- VUID-vkGetPrivateData-privateDataSlot-parent
  privateDataSlot must have been created, allocated, or retrieved from device
Chapter 37. Acceleration Structures

37.1. Acceleration Structures

*Acceleration structures* are data structures used by the implementation to efficiently manage scene geometry as it is traversed during a ray tracing query. The application is responsible for managing acceleration structure objects (see *Acceleration Structures*), including allocation, destruction, executing builds or updates, and synchronizing resources used during ray tracing queries.

There are two types of acceleration structures, *top level acceleration structures* and *bottom level acceleration structures*.

An acceleration structure is considered to be constructed if an *acceleration structure build command* or *copy command* has been executed with the given acceleration structure as the destination.

![Diagram of acceleration structure](image)

*Figure 27. Acceleration Structure*

**Caption**

The diagram shows the relationship between top and bottom level acceleration structures.

37.1.1. Geometry

*Geometries* refer to a triangle or axis-aligned bounding box.
37.1.2. Top Level Acceleration Structures

Opaque acceleration structure for an array of instances. The descriptor or device address referencing this is the starting point for traversal.

The top level acceleration structure takes a reference to any bottom level acceleration structure referenced by its instances. Those bottom level acceleration structure objects must be valid when the top level acceleration structure is accessed.

37.1.3. Bottom Level Acceleration Structures

Opaque acceleration structure for an array of geometries.

37.1.4. Acceleration Structure Update Rules

The API defines two types of operations to produce acceleration structures from geometry:

- A build operation is used to construct an acceleration structure.
- An update operation is used to modify an existing acceleration structure.

An update operation imposes certain constraints on the input, in exchange for considerably faster execution. When performing an update, the application is required to provide a full description of the acceleration structure, but is prohibited from changing anything other than instance definitions, transform matrices, and vertex or AABB positions. All other aspects of the description must exactly match the one from the original build.

More precisely, the application must not use an update operation to do any of the following:

- Change primitives or instances from active to inactive, or vice versa (as defined in Inactive Primitives and Instances).
- Change the index or vertex formats of triangle geometry.
- Change triangle geometry transform pointers from null to non-null or vice versa.
- Change the number of geometries or instances in the structure.
- Change the geometry flags for any geometry in the structure.
- Change the number of vertices or primitives for any geometry in the structure.

If the original acceleration structure was built using opacity micromaps and VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT was set in flags, the application must provide the corresponding micromap information to the update operation. The application is prohibited from changing anything other than the specific opacity values assigned to the triangles.

More precisely, the application must not use an update operation to do any of the following:

- Remove micromaps or VkOpacityMicromapSpecialIndexEXT values from a geometry which previously had them, or vice versa.
- Change between use of VkOpacityMicromapSpecialIndexEXT values and explicit micro-map
triangles.

- Change the subdivision level or format of the micromap triangle associated with any acceleration-structure triangle.

If the original acceleration structure was built using opacity micromaps and `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT` was set in `flags`, the application **must** provide a micromap to the update operation.

If the original acceleration structure was built using opacity micromaps and neither opacity micromap update flag is set the application **must** provide the original micromap to the update operation.

If the original acceleration structure was built using displacement micromaps and `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISPLACEMENT_MICROMAP_UPDATE_NV` was set in `flags`, the application **must** provide a displacement micromap to the update operation.

If the original acceleration structure was built using displacement micromaps and the displacement micromap update flag is not set the application **must** provide the original micromap to the update operation.

### 37.1.5. Inactive Primitives and Instances

Acceleration structures allow the use of particular input values to signal *inactive* primitives or instances.

An *inactive* triangle is one for which the first (X) component of any vertex is NaN. If any other vertex component is NaN, and the first is not, the behavior is undefined. If the vertex format does not have a NaN representation, then all triangles are considered active.

An *inactive* instance is one whose acceleration structure reference is 0.

An *inactive* AABB is one for which the minimum X coordinate is NaN. If any other component is NaN, and the first is not, the behavior is undefined.

In the above definitions, “NaN” refers to any type of NaN. Signaling, non-signaling, quiet, loud, or otherwise.

An inactive object is considered invisible to all rays, and **should** not be represented in the acceleration structure. Implementations **should** ensure that the presence of inactive objects does not seriously degrade traversal performance.

Inactive objects are counted in the auto-generated index sequences which are provided to shaders via `InstanceId` and `PrimitiveId` SPIR-V decorations. This allows objects in the scene to change freely between the active and inactive states, without affecting the layout of any arrays which are being indexed using the ID values.

Any transition between the active and inactive states requires a full acceleration structure rebuild. Applications **must** not perform an acceleration structure update where an object is active in the source acceleration structure but would be inactive in the destination, or vice versa.
37.1.6. Building Acceleration Structures

To build an acceleration structure call:

```c
// Provided by VK_NV_ray_tracing
void vkCmdBuildAccelerationStructureNV(
   VkCommandBuffer commandBuffer,
    const VkAccelerationStructureInfoNV* pInfo,
    VkBuffer instanceData,
    VkDeviceSize instanceOffset,
    VkBool32 update,
    VkAccelerationStructureNV dst,
    VkAccelerationStructureNV src,
    VkBuffer scratch,
    VkDeviceSize scratchOffset);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` contains the shared information for the acceleration structure's structure.
- `instanceData` is the buffer containing an array of `VkAccelerationStructureInstanceKHR` structures defining acceleration structures. This parameter must be NULL for bottom level acceleration structures.
- `instanceOffset` is the offset in bytes (relative to the start of `instanceData`) at which the instance data is located.
- `update` specifies whether to update the `dst` acceleration structure with the data in `src`.
- `dst` is a pointer to the target acceleration structure for the build.
- `src` is a pointer to an existing acceleration structure that is to be used to update the `dst` acceleration structure.
- `scratch` is the `VkBuffer` that will be used as scratch memory for the build.
- `scratchOffset` is the offset in bytes relative to the start of `scratch` that will be used as a scratch memory.

Accesses to `dst`, `src`, and `scratch` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`.

**Valid Usage**

- VUID-vkCmdBuildAccelerationStructureNV-geometryCount-02241 `geometryCount` must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxGeometryCount`
- VUID-vkCmdBuildAccelerationStructureNV-dst-02488 `dst` must have been created with compatible `VkAccelerationStructureInfoNV` where `VkAccelerationStructureInfoNV::type` and `VkAccelerationStructureInfoNV::flags` are identical, `VkAccelerationStructureInfoNV::instanceCount` and
**VkAccelerationStructureInfoNV::geometryCount** for *dst* are greater than or equal to the build size and each geometry in **VkAccelerationStructureInfoNV::pGeometries** for *dst* has greater than or equal to the number of vertices, indices, and AABBs

- **VUID-vkCmdBuildAccelerationStructureNV-update-02489**
  If *update* is **VK_TRUE**, *src* must not be **VK_NULL_HANDLE**

- **VUID-vkCmdBuildAccelerationStructureNV-update-02490**
  If *update* is **VK_TRUE**, *src* must have previously been constructed with **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_NV** set in **VkAccelerationStructureInfoNV::flags** in the original build

- **VUID-vkCmdBuildAccelerationStructureNV-update-02491**
  If *update* is **VK_FALSE**, the *size* member of the **VkMemoryRequirements** structure returned from a call to **vkGetAccelerationStructureMemoryRequirementsNV** with **VkAccelerationStructureMemoryRequirementsInfoNV::accelerationStructure** set to *dst* and **VkAccelerationStructureMemoryRequirementsInfoNV::type** set to **VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV** must be less than or equal to the size of *scratch* minus *scratchOffset*

- **VUID-vkCmdBuildAccelerationStructureNV-update-02492**
  If *update* is **VK_TRUE**, the *size* member of the **VkMemoryRequirements** structure returned from a call to **vkGetAccelerationStructureMemoryRequirementsNV** with **VkAccelerationStructureMemoryRequirementsInfoNV::accelerationStructure** set to *dst* and **VkAccelerationStructureMemoryRequirementsInfoNV::type** set to **VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV** must be less than or equal to the size of *scratch* minus *scratchOffset*

- **VUID-vkCmdBuildAccelerationStructureNV-scratch-03522**
  *scratch* must have been created with **VK_BUFFER_USAGE_RAY_TRACING_BIT_NV** usage flag

- **VUID-vkCmdBuildAccelerationStructureNV-instanceData-03523**
  If *instanceData* is not **VK_NULL_HANDLE**, *instanceData* must have been created with **VK_BUFFER_USAGE_RAY_TRACING_BIT_NV** usage flag

- **VUID-vkCmdBuildAccelerationStructureNV-accelerationStructureReference-03786**
  Each **VkAccelerationStructureInstanceKHR::accelerationStructureReference** value in *instanceData* must be a valid device address containing a value obtained from **vkGetAccelerationStructureHandleNV**

- **VUID-vkCmdBuildAccelerationStructureNV-update-03524**
  If *update* is **VK_TRUE**, then objects that were previously active must not be made inactive as per **Inactive Primitives and Instances**

- **VUID-vkCmdBuildAccelerationStructureNV-update-03525**
  If *update* is **VK_TRUE**, then objects that were previously inactive must not be made active as per **Inactive Primitives and Instances**

- **VUID-vkCmdBuildAccelerationStructureNV-update-03526**
  If *update* is **VK_TRUE**, the *src* and *dst* objects must either be the same object or not have any memory aliasing

- **VUID-vkCmdBuildAccelerationStructureNV-dst-07787**
  *dst* must be bound completely and contiguously to a single **VkDeviceMemory** object via
Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBuildAccelerationStructureNV-pInfo-parameter
  pInfo must be a valid pointer to a valid VkAccelerationStructureInfoNV structure

- VUID-vkCmdBuildAccelerationStructureNV-instanceData-parameter
  If instanceData is not VK_NULL_HANDLE, instanceData must be a valid VkBuffer handle

- VUID-vkCmdBuildAccelerationStructureNV-dst-parameter
  dst must be a valid VkAccelerationStructureNV handle

- VUID-vkCmdBuildAccelerationStructureNV-src-parameter
  If src is not VK_NULL_HANDLE, src must be a valid VkAccelerationStructureNV handle

- VUID-vkCmdBuildAccelerationStructureNV-scratch-parameter
  scratch must be a valid VkBuffer handle

- VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdBuildAccelerationStructureNV-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBuildAccelerationStructureNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBuildAccelerationStructureNV-commonparent
  Each of commandBuffer, dst, instanceData, scratch, and src that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

To build acceleration structures call:

```c
void vkCmdBuildAccelerationStructuresKHR(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of acceleration structures to build. It specifies the number of the `pInfos` structures and `ppBuildRangeInfos` pointers that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- `ppBuildRangeInfos` is a pointer to an array of `infoCount` pointers to arrays of `VkAccelerationStructureBuildRangeInfoKHR` structures. Each `ppBuildRangeInfos[i]` is a pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i]`.

The `vkCmdBuildAccelerationStructuresKHR` command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

**Note**

This means that an application cannot build a top-level acceleration structure in the same `vkCmdBuildAccelerationStructuresKHR` call as the associated bottom-level or instance acceleration structures are being built. There also cannot be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

Accesses to the acceleration structure scratch buffers as identified by the `VkAccelerationStructureBuildGeometryInfoKHR::scratchData` buffer device addresses must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of (`VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` | `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`). Accesses to each `VkAccelerationStructureBuildGeometryInfoKHR::srcAccelerationStructure` and `VkAccelerationStructureBuildGeometryInfoKHR::dstAccelerationStructure` must be synchronized.
with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, as appropriate.

Accesses to other input buffers as identified by any used values of `VkAccelerationStructureGeometryMotionTrianglesDataNV::vertexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::vertexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::indexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::transformData`, `VkAccelerationStructureGeometryAabbsDataKHR::data`, and `VkAccelerationStructureGeometryInstancesDataKHR::data` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_SHADER_READ_BIT`.

### Valid Usage

- **VUID-vkCmdBuildAccelerationStructuresKHR-accelerationStructure-08923**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled.

- **VUID-vkCmdBuildAccelerationStructuresKHR-mode-04628**
  The `mode` member of each element of `pInfos` must be a valid `VkBuildAccelerationStructureModeKHR` value.

- **VUID-vkCmdBuildAccelerationStructuresKHR-srcAccelerationStructure-04629**
  If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-04630**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must not be `VK_NULL_HANDLE`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03403**
  The `srcAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03698**
  The `dstAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03800**
  The `dstAccelerationStructure` member of any element of `pInfos` must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03699**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member...
must have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03700
  For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR, its dstAccelerationStructure member must have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03663
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, inactive primitives in its srcAccelerationStructure member must not be made active

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03664
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, active primitives in its srcAccelerationStructure member must not be made inactive

• VUID-vkCmdBuildAccelerationStructuresKHR-None-03407
  The dstAccelerationStructure member of any element of pInfos must not be referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos

• VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03701
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the srcAccelerationStructure member of any other element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, which is accessed by this command

• VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03702
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the dstAccelerationStructure member of any other element of pInfos, which is accessed by this command

• VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03703
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any element of pInfos (including the same element), which is accessed by this command

• VUID-vkCmdBuildAccelerationStructuresKHR-scratchData-03704
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any other element of pInfos, which is accessed by this command

• VUID-vkCmdBuildAccelerationStructuresKHR-scratchData-03705
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the srcAccelerationStructure member of any element of pInfos with a mode equal to
VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR (including the same element), which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03706
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos, which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03667
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member

  must have previously been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR set in VkAccelerationStructureBuildGeometryInfoKHR::flags in the build

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03668
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure and dstAccelerationStructure members must either be the same VkAccelerationStructureKHR, or not have any memory aliasing

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03758
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its geometryCount member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03759
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its flags member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03760
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its type member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03761
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its geometryType member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03762
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its flags member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03763
For each element of $pInfos$, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each
$VkAccelerationStructureGeometryKHR$ structure referred to by its $pGeometries$ or $ppGeometries$ members, if $geometryType$ is $VK_GEOMETRY_TYPE_TRIANGLES_KHR$, its
$geometry.triangles.vertexFormat$ member must have the same value which was specified
when $srcAccelerationStructure$ was last built

- $VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03764$
  For each element of $pInfos$, if its `mode` member is
  `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each
  $VkAccelerationStructureGeometryKHR$ structure referred to by its $pGeometries$ or
  $ppGeometries$ members, if $geometryType$ is $VK_GEOMETRY_TYPE_TRIANGLES_KHR$, its
  $geometry.triangles.maxVertex$ member must have the same value which was specified
  when $srcAccelerationStructure$ was last built

- $VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03765$
  For each element of $pInfos$, if its `mode` member is
  `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each
  $VkAccelerationStructureGeometryKHR$ structure referred to by its $pGeometries$ or
  $ppGeometries$ members, if $geometryType$ is $VK_GEOMETRY_TYPE_TRIANGLES_KHR$, its
  $geometry.triangles.indexType$ member must have the same value which was specified
  when $srcAccelerationStructure$ was last built

- $VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03766$
  For each element of $pInfos$, if its `mode` member is
  `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each
  $VkAccelerationStructureGeometryKHR$ structure referred to by its $pGeometries$ or
  $ppGeometries$ members, if $geometryType$ is $VK_GEOMETRY_TYPE_TRIANGLES_KHR$, its
  $geometry.triangles.transformData$ address was NULL when $srcAccelerationStructure$ was
  last built, then it must be NULL

- $VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03767$
  For each element of $pInfos$, if its `mode` member is
  `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each
  $VkAccelerationStructureGeometryKHR$ structure referred to by its $pGeometries$ or
  $ppGeometries$ members, if $geometryType$ is $VK_GEOMETRY_TYPE_TRIANGLES_KHR$, its
  $geometry.triangles.transformData$ address was not NULL when $srcAccelerationStructure$ was
  last built, then it must not be NULL

- $VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03768$
  For each element of $pInfos$, if its `mode` member is
  `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each
  $VkAccelerationStructureGeometryKHR$ structure referred to by its $pGeometries$ or
  $ppGeometries$ members, if $geometryType$ is $VK_GEOMETRY_TYPE_TRIANGLES_KHR$, and
  $geometry.triangles.indexType$ is not $VK_INDEX_TYPE_NONE_KHR$, then the value of each index
  referenced must be the same as the corresponding index value when $srcAccelerationStructure$ was
  last built

- $VUID-vkCmdBuildAccelerationStructuresKHR-primitiveCount-03769$
  For each element of $pInfos$, if its `mode` member is
  `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each
VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, the primitiveCount member of its corresponding VkAccelerationStructureBuildRangeInfoKHR structure must have the same value which was specified when srcAccelerationStructure was last built.

- **VUID-vkCmdBuildAccelerationStructuresKHR-firstVertex-03770**
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if the geometry uses indices, the firstVertex member of its corresponding VkAccelerationStructureBuildRangeInfoKHR structure must have the same value which was specified when srcAccelerationStructure was last built.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03801**
  For each element of pInfo[i], pGeometries or pInfo[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, the corresponding ppBuildRangeInfos[i][j].primitiveCount must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03707**
  For each element of pInfo, the buffer used to create its dstAccelerationStructure member must be bound to device memory.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03708**
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR the buffer used to create its srcAccelerationStructure member must be bound to device memory.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03709**
  For each element of pInfo, the buffer used to create each acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR must be bound to device memory.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03671**
  If pInfo[i].mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR, all addresses between pInfo[i].scratchData.deviceAddress and pInfo[i].scratchData.deviceAddress + N - 1 must be in the buffer device address range of the same buffer, where N is given by the buildScratchSize member of the VkAccelerationStructureBuildSizesInfoKHR structure returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03672**
  If pInfo[i].mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, all addresses between pInfo[i].scratchData.deviceAddress and pInfo[i].scratchData.deviceAddress + N - 1 must be in the buffer device address range of the same buffer, where N is given by the updateScratchSize member of the VkAccelerationStructureBuildSizesInfoKHR structure returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count.

- **VUID-vkCmdBuildAccelerationStructuresKHR-geometry-03673**
  The buffers from which the buffer device addresses for all of the
geometry.triangles.vertexData, geometry.triangles.indexData, geometry.triangles.transformData, geometry.aabbs.data, and geometry.instances.data members of all pInfos[i].pGeometries and pInfos[i].ppGeometries are queried must have been created with the VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR usage flag.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03674**
  The buffer from which the buffer device address pInfos[i].scratchData.deviceAddress is queried must have been created with VK_BUFFER_USAGE_STORAGE_BUFFER_BIT usage flag.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03802**
  For each element of pInfos, its scratchData.deviceAddress member must be a valid device address obtained from vkGetBufferDeviceAddress.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03803**
  For each element of pInfos, if scratchData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03710**
  For each element of pInfos, its scratchData.deviceAddress member must be a multiple of VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03804**
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03805**
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.vertexData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03711**
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress must be aligned to the size in bytes of the smallest component of the format in vertexFormat.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03806**
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03807**
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, if geometry.triangles.indexData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03712**
For any element of \(p\text{Infos}[i].p\text{Geometries}\) or \(p\text{Infos}[i].pp\text{Geometries}\) with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and with `geometry.triangles.indexType` not equal to `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.deviceAddress` must be aligned to the size in bytes of the type in `indexType`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03808**
  For any element of \(p\text{Infos}[i].p\text{Geometries}\) or \(p\text{Infos}[i].pp\text{Geometries}\) with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not 0, it must be a valid device address obtained from `vkGetBufferDeviceAddress`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03809**
  For any element of \(p\text{Infos}[i].p\text{Geometries}\) or \(p\text{Infos}[i].pp\text{Geometries}\) with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not 0, it must be a valid device address obtained from `vkGetBufferDeviceAddress`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03810**
  For any element of \(p\text{Infos}[i].p\text{Geometries}\) or \(p\text{Infos}[i].pp\text{Geometries}\) with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.deviceAddress` must be a valid device address obtained from `vkGetBufferDeviceAddress`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03811**
  For any element of \(p\text{Infos}[i].p\text{Geometries}\) or \(p\text{Infos}[i].pp\text{Geometries}\) with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, if `geometry.aabbs.data.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03812**
  For any element of \(p\text{Infos}[i].p\text{Geometries}\) or \(p\text{Infos}[i].pp\text{Geometries}\) with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, if `geometry.aabbs.data.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03813**
  For any element of \(p\text{Infos}[i].p\text{Geometries}\) or \(p\text{Infos}[i].pp\text{Geometries}\) with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_FALSE`, `geometry.instances.data.deviceAddress` must be aligned to 16 bytes.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03814**
  For any element of \(p\text{Infos}[i].p\text{Geometries}\) or \(p\text{Infos}[i].pp\text{Geometries}\) with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_TRUE`, each element of `geometry.instances.data.deviceAddress` in device memory must be aligned to 16 bytes.
device address obtained from \texttt{vkGetBufferDeviceAddress}

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03814}
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR}, if \texttt{geometry.instances.data.deviceAddress} is the address of a non-sparse buffer then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object

  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR}, each \texttt{VkAccelerationStructureInstanceKHR::accelerationStructureReference} value in \texttt{geometry.instances.data.deviceAddress} \textbf{must} be a valid device address containing a value obtained from \texttt{vkGetAccelerationStructureDeviceAddressKHR} or 0

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-09547}
  \texttt{commandBuffer} \textbf{must} not be a protected command buffer

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03675}
  For each \texttt{pInfos[i]}, \texttt{dstAccelerationStructure} \textbf{must} have been created with a value of \texttt{VkAccelerationStructureCreateInfoKHR::size} greater than or equal to the memory size required by the build operation, as returned by \texttt{vkGetAccelerationStructureBuildSizesKHR} with \texttt{pBuildInfo = pInfos[i]} and with each element of the \texttt{pMaxPrimitiveCounts} array greater than or equal to the equivalent \texttt{ppBuildRangeInfos[i][j].primitiveCount} values for \texttt{j} in \texttt{[0, pInfos[i].geometryCount]}

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-ppBuildRangeInfos-03676}
  Each element of \texttt{ppBuildRangeInfos[i]} \textbf{must} be a valid pointer to an array of \texttt{pInfos[i].geometryCount} \texttt{VkAccelerationStructureBuildRangeInfoKHR} structures

\section*{Valid Usage (Implicit)}

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-parameter}
  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-parameter}
  \texttt{pInfos} \textbf{must} be a valid pointer to an array of \texttt{infoCount} valid \texttt{VkAccelerationStructureCreateInfoKHR} structures

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-ppBuildRangeInfos-parameter}
  \texttt{ppBuildRangeInfos} \textbf{must} be a valid pointer to an array of \texttt{infoCount} \texttt{VkAccelerationStructureBuildRangeInfoKHR} structures

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-recording}
  \texttt{commandBuffer} \textbf{must} be in the \texttt{recording} state

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-cmdpool}
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support compute operations

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-renderpass}
  This command \textbf{must} only be called outside of a render pass instance
To build acceleration structures with some parameters sourced on the device call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdBuildAccelerationStructuresIndirectKHR(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkDeviceAddress* pIndirectDeviceAddresses,
    const uint32_t* pIndirectStrides,
    const uint32_t* const* ppMaxPrimitiveCounts);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of acceleration structures to build.
- `pInfos` is a pointer to an array of `infoCount` `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- `pIndirectDeviceAddresses` is a pointer to an array of `infoCount` buffer device addresses which point to `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i]`.
- `pIndirectStrides` is a pointer to an array of `infoCount` byte strides between elements of `pIndirectDeviceAddresses`.
- `ppMaxPrimitiveCounts` is a pointer to an array of `infoCount` pointers to arrays of `pInfos[i].geometryCount` values indicating the maximum number of primitives that will be built by this command for each geometry.
Accesses to acceleration structures, scratch buffers, vertex buffers, index buffers, and instance buffers must be synchronized as with `vkCmdBuildAccelerationStructuresKHR`.

Accesses to any element of `pIndirectDeviceAddresses` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_INDIRECT_COMMAND_READ_BIT`.

---

**Valid Usage**

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-accelerationStructureIndirectBuild-03650**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureIndirectBuild` feature must be enabled.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-mode-04628**
  The `mode` member of each element of `pInfos` must be a valid `VkBuildAccelerationStructureModeKHR` value.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-srcAccelerationStructure-04629**
  If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-04630**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must not be `VK_NULL_HANDLE`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03403**
  The `srcAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03698**
  The `dstAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03699**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03700**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.
**must** have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03663**
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, inactive primitives in its srcAccelerationStructure member must not be made active

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03664**
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, active primitives in its srcAccelerationStructure member must not be made inactive

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-None-03407**
  The dstAccelerationStructure member of any element of pInfos must not be referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03701**
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the srcAccelerationStructure member of any other element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03702**
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the dstAccelerationStructure member of any other element of pInfos, which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03703**
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any element of pInfos (including the same element), which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-scratchData-03704**
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any other element of pInfos, which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-scratchData-03705**
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the srcAccelerationStructure member of any element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR (including the same element), which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03706**
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the geometry.instances.data member of any element
of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos, which is accessed by this command

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03667
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member must have previously been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR set in VkAccelerationStructureBuildGeometryInfoKHR::flags in the build

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03668
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure and dstAccelerationStructure members must either be the same VkAccelerationStructureKHR, or not have any memory aliasing

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03758
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its geometryCount member must have the same value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03759
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its flags member must have the same value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03760
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its type member must have the same value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03761
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its geometryType member must have the same value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03762
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its flags member must have the same value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03763
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.vertexFormat member must have the same value which was specified when srcAccelerationStructure was last built
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.maxVertex` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.indexType` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was NULL when `srcAccelerationStructure` was last built, then it must be NULL.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was not NULL when `srcAccelerationStructure` was last built, then it must not be NULL.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, then the value of each index referenced must be the same as the corresponding index value when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, the `primitiveCount` member of its corresponding `VkAccelerationStructureBuildRangeInfoKHR` structure must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is
VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
ppGeometries members, if the geometry uses indices, the firstVertex member of its
corresponding VkAccelerationStructureBuildRangeInfoKHR structure must have the same
value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03801
  For each element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of
  VK_GEOMETRY_TYPE_INSTANCES_KHR, the corresponding ppMaxPrimitiveCounts[i][j] must be less
  than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03707
  For each element of pInfos, the buffer used to create its dstAccelerationStructure member
  must be bound to device memory

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03708
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR the buffer used to create its
  srcAccelerationStructure member must be bound to device memory

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03709
  For each element of pInfos, the buffer used to create each acceleration structure
  referenced by the geometryinstances.data member of any element of pGeometries or
  ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR must be bound to
device memory

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03671
  If pInfos[i].mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR, all addresses between
  pInfos[i].scratchData.deviceAddress and pInfos[i].scratchData.deviceAddress + N - 1 must
  be in the buffer device address range of the same buffer, where N is given by the
  buildScratchSize member of the VkAccelerationStructureBuildSizesInfoKHR structure
  returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical
  VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03672
  If pInfos[i].mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, all addresses between
  pInfos[i].scratchData.deviceAddress and pInfos[i].scratchData.deviceAddress + N - 1 must
  be in the buffer device address range of the same buffer, where N is given by the
  updateScratchSize member of the VkAccelerationStructureBuildSizesInfoKHR structure
  returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical
  VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-geometry-03673
  The buffers from which the buffer device addresses for all of the
  geometry.triangles.vertexData, geometry.triangles.indexData,
  geometry.triangles.transformData, geometry.aabbs.data, and geometry.instances.data
  members of all pInfos[i].pGeometries and pInfos[i].ppGeometries are queried must have
  been created with the
  VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR usage flag

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03674
  The buffer from which the buffer device address pInfos[i].scratchData.deviceAddress is
queried **must** have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03802**
  For each element of `pInfos`, its `scratchData.deviceAddress` member **must** be a valid device address obtained from `vkGetBufferDeviceAddress`

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03803**
  For each element of `pInfos`, if `scratchData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03710**
  For each element of `pInfos`, its `scratchData.deviceAddress` member **must** be a multiple of `VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment`

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03804**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03805**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.vertexData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03711**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.deviceAddress` **must** be aligned to the size in bytes of the smallest component of the format in `vertexFormat`

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03806**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03807**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, if `geometry.triangles.indexData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03712**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and with `geometry.triangles.indexType` not equal to `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.deviceAddress` **must** be aligned to the size in bytes of the type in `indexType`

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03808**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not
0, it **must** be a valid device address obtained from `vkGetBufferDeviceAddress`

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03809**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03810**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not 0, it **must** be aligned to 16 bytes

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03811**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03812**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, if `geometry.aabbs.data.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03714**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.deviceAddress` **must** be aligned to 8 bytes

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03715**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_FALSE`, `geometry.instances.data.deviceAddress` **must** be aligned to 16 bytes

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03716**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_TRUE`, `geometry.instances.data.deviceAddress` **must** be aligned to 8 bytes

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03717**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_TRUE`, each element of `geometry.instances.data.deviceAddress` in device memory **must** be aligned to 16 bytes

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03813**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, `geometry.instances.data.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03814**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.instances.data.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
For any element of `pInfos[i]` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `geometry.instances.data.deviceAddress` must be a valid device address containing a value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or 0.

For any element of `pIndirectDeviceAddresses`, if the buffer from which it was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

For any element of `pIndirectDeviceAddresses[i]`, all device addresses between `pIndirectDeviceAddresses[i]` and `pIndirectDeviceAddresses[i] + (pInfos[i].geometryCount × pIndirectStrides[i]) - 1` must be in the buffer device address range of the same buffer.

For any element of `pIndirectDeviceAddresses`, the buffer from which it was queried must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

Each element of `pIndirectDeviceAddresses` must be a multiple of 4.

Each element of `pIndirectStrides` must be a multiple of 4.

Each `VkAccelerationStructureBuildRangeInfoKHR` structure referenced by any element of `pIndirectDeviceAddresses` must be a valid `VkAccelerationStructureBuildRangeInfoKHR` structure.

`pInfos[i].dstAccelerationStructure` must have been created with a value of `VkAccelerationStructureCreateInfoKHR::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetAccelerationStructureBuildSizesKHR` with `pBuildInfo = pInfos[i]` and `pMaxPrimitiveCounts = ppMaxPrimitiveCounts[i]`.

Each `ppMaxPrimitiveCounts[i][j]` must be greater than or equal to the `primitiveCount` value specified by the `VkAccelerationStructureBuildRangeInfoKHR` structure located at `pIndirectDeviceAddresses[i] + (j × pIndirectStrides[i])`.

---

**Valid Usage (Implicit)**

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pInfos` must be parameter valid.
pInfos must be a valid pointer to an array of infoCount valid VkAccelerationStructureBuildGeometryInfoKHR structures

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-parameter
  pIndirectDeviceAddresses must be a valid pointer to an array of infoCount VkDeviceAddress values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-parameter
  pIndirectStrides must be a valid pointer to an array of infoCount uint32_t values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-parameter
  ppMaxPrimitiveCounts must be a valid pointer to an array of infoCount uint32_t values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-infoCount-arraylength
  infoCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The VkAccelerationStructureBuildGeometryInfoKHR structure is defined as:
typedef struct VkAccelerationStructureBuildGeometryInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkAccelerationStructureTypeKHR         type;
    VkBuildAccelerationStructureFlagsKHR   flags;
    VkBuildAccelerationStructureModeKHR    mode;
    VkAccelerationStructureKHR            srcAccelerationStructure;
    VkAccelerationStructureKHR            dstAccelerationStructure;
    uint32_t                           geometryCount;
    const VkAccelerationStructureGeometryKHR* pGeometries;
    const VkAccelerationStructureGeometryKHR* const* ppGeometries;
    VkDeviceOrHostAddressKHR            scratchData;
} VkAccelerationStructureBuildGeometryInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **type** is a `VkAccelerationStructureTypeKHR` value specifying the type of acceleration structure being built.
- **flags** is a bitmask of `VkBuildAccelerationStructureFlagBitsKHR` specifying additional parameters of the acceleration structure.
- **mode** is a `VkBuildAccelerationStructureModeKHR` value specifying the type of operation to perform.
- **srcAccelerationStructure** is a pointer to an existing acceleration structure that is to be used to update the `dstAccelerationStructure` acceleration structure when **mode** is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`.
- **dstAccelerationStructure** is a pointer to the target acceleration structure for the build.
- **geometryCount** specifies the number of geometries that will be built into `dstAccelerationStructure`.
- **pGeometries** is a pointer to an array of `VkAccelerationStructureGeometryKHR` structures.
- **ppGeometries** is a pointer to an array of pointers to `VkAccelerationStructureGeometryKHR` structures.
- **scratchData** is the device or host address to memory that will be used as scratch memory for the build.

Only one of **pGeometries** or **ppGeometries** can be a valid pointer, the other must be `NULL`. Each element of the non-`NULL` array describes the data used to build each acceleration structure geometry.

The index of each element of the **pGeometries** or **ppGeometries** members of `VkAccelerationStructureBuildGeometryInfoKHR` is used as the geometry index during ray traversal. The geometry index is available in ray shaders via the `RayGeometryIndexKHR` built-in, and is used to determine hit and intersection shaders executed during traversal. The geometry index is available to ray queries via the `OpRayQueryGetIntersectionGeometryIndexKHR` instruction.
Setting `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in `flags` indicates that this build is a motion top level acceleration structure. A motion top level uses instances of `VkAccelerationStructureMotionInstanceNV` if `VkAccelerationStructureGeometryInstancesDataKHR::arrayOfPointers` is `VK_FALSE`.

If `VkAccelerationStructureGeometryInstancesDataKHR::arrayOfPointers` is `VK_TRUE`, the pointer for each element of the array of instance pointers consists of 4 bits of `VkAccelerationStructureMotionInstanceTypeNV` in the low 4 bits of the pointer identifying the type of structure at the pointer. The device address accessed is the value in the array with the low 4 bits set to zero. The structure at the pointer is one of `VkAccelerationStructureInstanceKHR`, `VkAccelerationStructureMatrixMotionInstanceNV` or `VkAccelerationStructureSRTMotionInstanceNV`, depending on the type value encoded in the low 4 bits.

A top level acceleration structure with either motion instances or vertex motion in its instances **must** set `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in `flags`.

Members `srcAccelerationStructure` and `dstAccelerationStructure` **may** be the same or different for an update operation (when `mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`). If they are the same, the update happens in-place. Otherwise, the target acceleration structure is updated and the source is not modified.

### Valid Usage

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03654**
  - `type` **must** not be `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-03788**
  - If `geometryCount` is not 0, exactly one of `pGeometries` or `ppGeometries` **must** be a valid pointer, the other **must** be `NULL`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03789**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, the `geometryType` member of elements of either `pGeometries` or `ppGeometries` **must** be `VK_GEOMETRY_TYPE_INSTANCES_KHR`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03790**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, `geometryCount` **must** be 1

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03791**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` the `geometryType` member of each geometry in either `pGeometries` or `ppGeometries` **must** not be `VK_GEOMETRY_TYPE_INSTANCES_KHR`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03792**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` then the `geometryType` member of each geometry in either `pGeometries` or `ppGeometries` **must** be the same

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03793**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` then `geometryCount` **must** be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxGeometryCount`
If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` and the `geometryType` member of either `pGeometries` or `ppGeometries` is `VK_GEOMETRY_TYPE_AABBS_KHR`, the total number of AABBs in all geometries **must** be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount`.

If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` and the `geometryType` member of either `pGeometries` or `ppGeometries` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the total number of triangles in all geometries **must** be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount`.

If `flags` has the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR` bit set, then it **must not** have the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR` bit set.

If `dstAccelerationStructure` was created with `VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV` set in `VkAccelerationStructureCreateInfoKHR::flags`, `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` must be set in `flags`.

If `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` is set in `flags`, `dstAccelerationStructure` must have been created with `VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV` set in `VkAccelerationStructureCreateInfoKHR::flags`.

If `VK_BUILD.ACCELERATION_STRUCTURE_MOTION_BIT_NV` is set in `flags`, `type` **must not** be `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

If `flags` has the `VK_BUILD.ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT` bit set then it **must not** have the `VK_BUILD.ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT` bit set.

Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_GEOMETRY_INFO_KHR`.
- `pNext` **must** be `NULL`.
- `type` **must** be a valid `VkAccelerationStructureTypeKHR` value.
- `flags` **must** be a valid combination of `VkBuildAccelerationStructureFlagBitsKHR` values.
- If `geometryCount` is not 0, and `pGeometries` is not `NULL`, `pGeometries` **must** be a valid pointer to an array of `geometryCount` valid `VkAccelerationStructureGeometryKHR` structures.
If `geometryCount` is not 0, and `ppGeometries` is not NULL, `ppGeometries` must be a valid pointer to an array of `geometryCount` valid pointers to valid `VkAccelerationStructureGeometryKHR` structures.

Both of `dstAccelerationStructure` and `srcAccelerationStructure` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

The `VkBuildAccelerationStructureModeKHR` enumeration is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureModeKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR = 0,
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR = 1,
} VkBuildAccelerationStructureModeKHR;
```

- `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR` specifies that the destination acceleration structure will be built using the specified geometries.
- `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` specifies that the destination acceleration structure will be built using data in a source acceleration structure, updated by the specified geometries.

The `VkDeviceOrHostAddressKHR` union is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressKHR {
    VkDeviceAddress deviceAddress;
    void* hostAddress;
} VkDeviceOrHostAddressKHR;
```

- `deviceAddress` is a buffer device address as returned by the `vkGetBufferDeviceAddressKHR` command.
- `hostAddress` is a host memory address.

The `VkDeviceOrHostAddressConstKHR` union is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressConstKHR {
    VkDeviceAddress deviceAddress;
    const void* hostAddress;
} VkDeviceOrHostAddressConstKHR;
```

- `deviceAddress` is a buffer device address as returned by the `vkGetBufferDeviceAddressKHR` command.
• \textit{hostAddress} is a const host memory address.

The \textit{VkAccelerationStructureGeometryKHR} structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryKHR {
    VkStructureType sType;
    const void*pNext;
    VkGeometryTypeKHR geometryType;
    VkAccelerationStructureGeometryDataKHR geometry;
    VkAccelerationFlagsKHR flags;
} VkAccelerationStructureGeometryKHR;
```

• \textit{sType} is a \textit{VkStructureType} value identifying this structure.

• \textit{pNext} is NULL or a pointer to a structure extending this structure.

• \textit{geometryType} describes which type of geometry this \textit{VkAccelerationStructureGeometryKHR} refers to.

• \textit{geometry} is a \textit{VkAccelerationStructureGeometryDataKHR} union describing the geometry data for the relevant geometry type.

• \textit{flags} is a bitmask of \textit{VkGeometryFlagBitsKHR} values describing additional properties of how the geometry should be built.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryKHR-sType-sType
  \textit{sType} \textbf{must} be \textit{VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_KHR}

- VUID-VkAccelerationStructureGeometryKHR-pNext-pNext
  \textit{pNext} \textbf{must} be NULL

- VUID-VkAccelerationStructureGeometryKHR-geometryType-parameter \textit{geometryType} \textbf{must} be a valid \textit{VkGeometryTypeKHR} value

- VUID-VkAccelerationStructureGeometryKHR-triangles-parameter
  If \textit{geometryType} is \textit{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, the \textit{triangles} member of \textit{geometry} \textbf{must} be a valid \textit{VkAccelerationStructureGeometryTrianglesDataKHR} structure

- VUID-VkAccelerationStructureGeometryKHR-aabbs-parameter
  If \textit{geometryType} is \textit{VK_GEOMETRY_TYPE_AABBS_KHR}, the \textit{aabbs} member of \textit{geometry} \textbf{must} be a valid \textit{VkAccelerationStructureGeometryAabbsDataKHR} structure

- VUID-VkAccelerationStructureGeometryKHR-instances-parameter
  If \textit{geometryType} is \textit{VK_GEOMETRY_TYPE_INSTANCES_KHR}, the \textit{instances} member of \textit{geometry} \textbf{must} be a valid \textit{VkAccelerationStructureGeometryInstancesDataKHR} structure

- VUID-VkAccelerationStructureGeometryKHR-flags-parameter
  \textit{flags} \textbf{must} be a valid combination of \textit{VkGeometryFlagBitsKHR} values

The \textit{VkAccelerationStructureGeometryDataKHR} union is defined as:
typedef union VkAccelerationStructureGeometryDataKHR {
    VkAccelerationStructureGeometryTrianglesDataKHR triangles;
    VkAccelerationStructureGeometryAabbsDataKHR aabbs;
    VkAccelerationStructureGeometryInstancesDataKHR instances;
} VkAccelerationStructureGeometryDataKHR;

• **triangles** is a `VkAccelerationStructureGeometryTrianglesDataKHR` structure.
• **aabbs** is a `VkAccelerationStructureGeometryAabbsDataKHR` structure.
• **instances** is a `VkAccelerationStructureGeometryInstancesDataKHR` structure.

The `VkAccelerationStructureGeometryTrianglesDataKHR` structure is defined as:

```c
typedef struct VkAccelerationStructureGeometryTrianglesDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkFormat vertexFormat;
    VkDeviceOrHostAddressConstKHR vertexData;
    VkDeviceSize vertexStride;
    uint32_t maxVertex;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexData;
    VkDeviceOrHostAddressConstKHR transformData;
} VkAccelerationStructureGeometryTrianglesDataKHR;
```

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **vertexFormat** is the `VkFormat` of each vertex element.
• **vertexData** is a device or host address to memory containing vertex data for this geometry.
• **maxVertex** is the number of vertices in `vertexData` minus one.
• **vertexStride** is the stride in bytes between each vertex.
• **indexType** is the `VkIndexType` of each index element.
• **indexData** is a device or host address to memory containing index data for this geometry.
• **transformData** is a device or host address to memory containing an optional reference to a `VkTransformMatrixKHR` structure describing a transformation from the space in which the vertices in this geometry are described to the space in which the acceleration structure is defined.

**Note**

Unlike the stride for vertex buffers in `VkVertexInputBindingDescription` for graphics pipelines which must not exceed `maxVertexInputBindingStride`, `vertexStride` for acceleration structure geometry is instead restricted to being a 32-
Valid Usage

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03735**
  
  vertexStride must be a multiple of the size in bytes of the smallest component of vertexFormat.

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03819**
  
  vertexStride must be less than or equal to $2^{32} - 1$.

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-03797**
  
  The format features of vertexFormat must contain `VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR`.

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-03798**
  
  indexType must be `VK_INDEX_TYPE_UINT16`, `VK_INDEX_TYPE_UINT32`, or `VK_INDEX_TYPE_NONE_KHR`.

Valid Usage (Implicit)

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-sType**
  
  sType must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_TRIANGLES_DATA_KHR`.

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-pNext-pNext**
  
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of `VkAccelerationStructureGeometryMotionTrianglesDataNV`, `VkAccelerationStructureTrianglesDisplacementMicromapNV`, or `VkAccelerationStructureTrianglesOpacityMicromapEXT`.

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-unique**
  
  The sType value of each struct in the pNext chain must be unique.

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-parameter**
  
  vertexFormat must be a valid VkFormat value.

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-parameter**
  
  indexType must be a valid VkIndexType value.

The ` VkAccelerationStructureGeometryMotionTrianglesDataNV ` structure is defined as:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureGeometryMotionTrianglesDataNV {
  VkStructureType sType;
  const void* pNext;
  VkDeviceOrHostAddressConstKHR vertexData;
} VkAccelerationStructureGeometryMotionTrianglesDataNV;
```

- **sType** is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexData` is a pointer to vertex data for this geometry at time 1.0

If `VkAccelerationStructureGeometryMotionTrianglesDataNV` is included in the `pNext` chain of a `VkAccelerationStructureGeometryTrianglesDataKHR` structure, the basic vertex positions are used for the position of the triangles in the geometry at time 0.0 and the `vertexData` in `VkAccelerationStructureGeometryMotionTrianglesDataNV` is used for the vertex positions at time 1.0, with positions linearly interpolated at intermediate times.

Indexing for `VkAccelerationStructureGeometryMotionTrianglesDataNV vertexData` is equivalent to the basic vertex position data.

### Valid Usage (Implicit)

- `VUID-VkAccelerationStructureGeometryMotionTrianglesDataNV-sType-sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_MOTION_TRIANGLES_DATA_NV`

The `VkAccelerationStructureTrianglesOpacityMicromapEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkAccelerationStructureTrianglesOpacityMicromapEXT {
    VkStructureType sType;
    void* pNext;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexBuffer;
    VkDeviceSize indexStride;
    uint32_t baseTriangle;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
    VkMicromapEXT micromap;
} VkAccelerationStructureTrianglesOpacityMicromapEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `indexType` is the type of triangle indices used when indexing this micromap
- `indexBuffer` is the address containing the triangle indices
- `indexStride` is the byte stride between triangle indices
- `baseTriangle` is the base value added to the non-negative triangle indices
- `usageCountsCount` specifies the number of usage counts structures that will be used to determine the size of this micromap.
- `pUsageCounts` is a pointer to an array of `VkMicromapUsageEXT` structures.
- `ppUsageCounts` is a pointer to an array of pointers to `VkMicromapUsageEXT` structures.
• \textit{micromap} is the handle to the micromap object to include in this geometry

If \texttt{VkAccelerationStructureTrianglesOpacityMicromapEXT} is included in the \texttt{pNext} chain of a \texttt{VkAccelerationStructureGeometryTrianglesDataKHR} structure, that geometry will reference that micromap.

For each triangle in the geometry, the acceleration structure build fetches an index from indexBuffer using \texttt{indexType} and \texttt{indexStride}. If that value is the unsigned cast of one of the values from \texttt{VkOpacityMicromapSpecialIndexEXT} then that triangle behaves as described for that special value in Ray Opacity Micromap. Otherwise that triangle uses the opacity micromap information from \texttt{micromap} at that index plus baseTriangle.

Only one of \texttt{pUsageCounts} or \texttt{ppUsageCounts} \textit{can} be a valid pointer, the other \textit{must} be NULL. The elements of the non-NULL array describe the total count used to build this geometry. For a given format and subdivisionLevel the number of triangles in this geometry matching those values after indirection and special index handling \textit{must} be equal to the sum of matching count provided.

If \texttt{micromap} is \texttt{VK_NULL_HANDLE}, then every value read from indexBuffer \textit{must} be one of the values in \texttt{VkOpacityMicromapSpecialIndexEXT}.

### Valid Usage

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-pUsageCounts-07335
  Only one of \texttt{pUsageCounts} or \texttt{ppUsageCounts} \textit{can} be a valid pointer, the other \textit{must} be NULL

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-sType-sType \texttt{sType} \textit{must} be \texttt{VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_TRIANGLES_OPACITY_MICROMAP_EXT}

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-indexType-parameter \texttt{indexType} \textit{must} be a valid \texttt{VkIndexType} value

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-pUsageCounts-parameter
  If \texttt{usageCountsCount} is not 0, and \texttt{pUsageCounts} is not NULL, \texttt{pUsageCounts} \textit{must} be a valid pointer to an array of \texttt{usageCountsCount} \texttt{VkMicromapUsageEXT} structures

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-ppUsageCounts-parameter
  If \texttt{usageCountsCount} is not 0, and \texttt{ppUsageCounts} is not NULL, \texttt{ppUsageCounts} \textit{must} be a valid pointer to an array of \texttt{usageCountsCount} valid pointers to \texttt{VkMicromapUsageEXT} structures

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-micromap-parameter
  If \texttt{micromap} is not \texttt{VK_NULL_HANDLE}, \texttt{micromap} \textit{must} be a valid \texttt{VkMicromapEXT} handle

The \texttt{VkOpacityMicromapSpecialIndexEXT} enumeration is defined as:
typedef enum VkOpacityMicromapSpecialIndexEXT {
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT = -1,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT = -2,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT = -3,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_OPAQUE_EXT = -4,
} VkOpacityMicromapSpecialIndexEXT;

- **VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT** specifies that the entire triangle is fully transparent.
- **VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT** specifies that the entire triangle is fully opaque.
- **VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT** specifies that the entire triangle is unknown-transparent.
- **VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_OPAQUE_EXT** specifies that the entire triangle is unknown-opaque.

The `VkAccelerationStructureTrianglesDisplacementMicromapNV` structure is defined as:

```c
typedef struct VkAccelerationStructureTrianglesDisplacementMicromapNV {
    VkStructureType sType;
    void* pNext;
    VkFormat displacementBiasAndScaleFormat;
    VkFormat displacementVectorFormat;
    VkDeviceOrHostAddressConstKHR displacementBiasAndScaleBuffer;
    VkDeviceSize displacementBiasAndScaleStride;
    VkDeviceOrHostAddressConstKHR displacementVectorBuffer;
    VkDeviceSize displacementVectorStride;
    VkDeviceOrHostAddressConstKHR displacedMicromapPrimitiveFlags;
    VkDeviceSize displacedMicromapPrimitiveFlagsStride;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexBuffer;
    VkDeviceSize indexStride;
    uint32_t baseTriangle;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
    VkMicromapEXT micromap;
} VkAccelerationStructureTrianglesDisplacementMicromapNV;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **displacementBiasAndScaleFormat** is the format of displacement bias and scale used in this displacement micromap reference.
- **displacementVectorFormat** is the format of displacement vector used in this displacement micromap reference.
- **displacementBiasAndScaleBuffer** is the address containing the bias and scale.
- **displacementBiasAndScaleStride** is the byte stride between bias and scale values.
- **displacementVectorBuffer** is the address containing the displacement vector values.
- **displacementVectorStride** is the byte stride between displacement vector values.
- **displacedMicromapPrimitiveFlags** is the address containing the primitive flags.
- **displacedMicromapPrimitiveFlagsStride** is the byte stride between primitive flag values.
- **indexType** is the type of triangle indices used when indexing this micromap.
- **indexBuffer** is the address containing the triangle indices.
- **indexStride** is the byte stride between triangle indices.
- **baseTriangle** is the base value added to the non-negative triangle indices.
- **usageCountsCount** specifies the number of usage counts structures that will be used to determine the size of this micromap.
- **pUsageCounts** is a pointer to an array of `VkMicromapUsageEXT` structures.
- **ppUsageCounts** is a pointer to an array of pointers to `VkMicromapUsageEXT` structures.
- **micromap** is the handle to the micromap object to include in this geometry.

If `VkAccelerationStructureTrianglesDisplacementMicromapNV` is included in the `pNext` chain of a `VkAccelerationStructureGeometryTrianglesDataKHR` structure, that geometry will reference that micromap.

For each triangle in the geometry, the acceleration structure build fetches an index from **indexBuffer** using **indexType** and **indexStride**. That triangle uses the displacement micromap information from **micromap** at that index plus **baseTriangle**.

Only one of **pUsageCounts** or **ppUsageCounts** can be a valid pointer, the other must be **NULL**. The elements of the non-NULL array describe the total count used to build this geometry. For a given **format** and **subdivisionLevel** the number of triangles in this geometry matching those values after indirection must be equal to the sum of matching **count** provided.

### Valid Usage

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-displacementBiasAndScaleFormat-09501
  - **displacementBiasAndScaleFormat** must not be `VK_FORMAT_UNDEFINED`

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-displacementVectorFormat-09502
  - **displacementVectorFormat** must not be `VK_FORMAT_UNDEFINED`

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-pUsageCounts-07992
  - Only one of **pUsageCounts** or **ppUsageCounts** can be a valid pointer, the other must be **NULL**
Valid Usage (Implicit)

- **VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-sType**
  - sType must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_TRIANGLES_DISPLACEMENT_MICROMAP_NV`
- **VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-displacementBiasAndScaleFormat**
  - displacementBiasAndScaleFormat must be a valid `VkFormat` value
- **VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-displacementVectorFormat**
  - displacementVectorFormat must be a valid `VkFormat` value
- **VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-indexType**
  - indexType must be a valid `VkIndexType` value
- **VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-pUsageCounts**
  - If `usageCountsCount` is not 0, and `pUsageCounts` is not NULL, `pUsageCounts` must be a valid pointer to an array of `usageCountsCount` `VkMicromapUsageEXT` structures
- **VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-ppUsageCounts**
  - If `usageCountsCount` is not 0, and `ppUsageCounts` is not NULL, `ppUsageCounts` must be a valid pointer to an array of `usageCountsCount` valid pointers to `VkMicromapUsageEXT` structures
- **VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-micromap**
  - If `micromap` is not `VK_NULL_HANDLE`, `micromap` must be a valid `VkMicromapEXT` handle

The `VkTransformMatrixKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkTransformMatrixKHR {
  float     matrix[3][4];
} VkTransformMatrixKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkTransformMatrixKHR VkTransformMatrixNV;
```

- `matrix` is a 3x4 row-major affine transformation matrix.

Valid Usage

- **VUID-VkTransformMatrixKHR-matrix-03799**
  - The first three columns of `matrix` must define an invertible 3x3 matrix
The `VkAccelerationStructureGeometryAabbsDataKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VKAccelerationStructureGeometryAabbsDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR data;
    VkDeviceSize stride;
} VkAccelerationStructureGeometryAabbsDataKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `data` is a device or host address to memory containing `VkAabbPositionsKHR` structures containing position data for each axis-aligned bounding box in the geometry.
- `stride` is the stride in bytes between each entry in `data`. The stride must be a multiple of 8.

**Valid Usage**

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03545: `stride` must be a multiple of 8
- VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03820: `stride` must be less than or equal to \(2^{32}-1\)

**Valid Usage (Implicit)**

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-sType-sType: `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_AABBS_DATA_KHR`
- VUID-VkAccelerationStructureGeometryAabbsDataKHR-pNext-pNext: `pNext` must be `NULL`

The `VkAabbPositionsKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAabbPositionsKHR {
    float minX;
    float minY;
    float minZ;
    float maxX;
    float maxY;
    float maxZ;
} VkAabbPositionsKHR;
```

or the equivalent
typedef VkAabbPositionsKHR VkAabbPositionsNV;

- **minX** is the x position of one opposing corner of a bounding box.
- **minY** is the y position of one opposing corner of a bounding box.
- **minZ** is the z position of one opposing corner of a bounding box.
- **maxX** is the x position of the other opposing corner of a bounding box.
- **maxY** is the y position of the other opposing corner of a bounding box.
- **maxZ** is the z position of the other opposing corner of a bounding box.

**Valid Usage**

- VUID-VkAabbPositionsKHR-minX-03546
  - **minX** must be less than or equal to **maxX**
- VUID-VkAabbPositionsKHR-minY-03547
  - **minY** must be less than or equal to **maxY**
- VUID-VkAabbPositionsKHR-minZ-03548
  - **minZ** must be less than or equal to **maxZ**

The **VkAccelerationStructureGeometryInstancesDataKHR** structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryInstancesDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 arrayOfPointers;
    VkDeviceOrHostAddressConstKHR data;
} VkAccelerationStructureGeometryInstancesDataKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **arrayOfPointers** specifies whether **data** is used as an array of addresses or just an array.
- **data** is either the address of an array of device or host addresses referencing individual **VkAccelerationStructureInstanceKHR** structures or packed motion instance information as described in motion instances if **arrayOfPointers** is **VK_TRUE**, or the address of an array of **VkAccelerationStructureInstanceKHR** or **VkAccelerationStructureMotionInstanceNV** structures. Addresses and **VkAccelerationStructureInstanceKHR** structures are tightly packed. **VkAccelerationStructureMotionInstanceNV** structures have a stride of 160 bytes.
Acceleration structure instances can be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location. Multiple instances can point to the same bottom level acceleration structure.

An acceleration structure instance is defined by the structure:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureInstanceKHR {
    VkTransformMatrixKHR transform;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureInstanceKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkAccelerationStructureInstanceKHR VkAccelerationStructureInstanceNV;
```

- **transform** is a `VkTransformMatrixKHR` structure describing a transformation to be applied to the acceleration structure.
- **instanceCustomIndex** is a 24-bit user-specified index value accessible to ray shaders in the `InstanceCustomIndexKHR` built-in.
- **mask** is an 8-bit visibility mask for the geometry. The instance may only be hit if `Cull Mask & instance.mask != 0`
- **instanceShaderBindingTableRecordOffset** is a 24-bit offset used in calculating the hit shader binding table index.
- **flags** is an 8-bit mask of `VkGeometryInstanceFlagBitsKHR` values to apply to this instance.
- **accelerationStructureReference** is either:
  - a device address containing the value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or `vkGetAccelerationStructureHandleNV` (used by device operations which reference acceleration structures) or,
  - a `VkAccelerationStructureKHR` object (used by host operations which reference acceleration structures).
The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- `instanceCustomIndex` and `mask` occupy the same memory as if a single `uint32_t` was specified in their place
  - `instanceCustomIndex` occupies the 24 least significant bits of that memory
  - `mask` occupies the 8 most significant bits of that memory
- `instanceShaderBindingTableRecordOffset` and `flags` occupy the same memory as if a single `uint32_t` was specified in their place
  - `instanceShaderBindingTableRecordOffset` occupies the 24 least significant bits of that memory
  - `flags` occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values according to the correct bit pattern.

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureInstanceKHR-flags-parameter**
  - `flags` **must** be a valid combination of `VkGeometryInstanceFlagBitsKHR` values

Possible values of `flags` in the instance modifying the behavior of that instance are:
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryInstanceFlagBitsKHR {
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR = 0x00000002,
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR = 0x00000004,
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR = 0x00000008,
    // Provided by VK_EXT_opacity_micromap
    VK_GEOMETRY_INSTANCE_FORCE_OPACITY_MICROMAP_2_STATE_EXT = 0x00000010,
    // Provided by VK_EXT_opacity_micromap
    VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT = 0x00000020,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_TRIANGLE_CULL_DISABLE_BIT_NV = 
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_NV = 
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_NV = 
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_NV = 
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR,
} VkGeometryInstanceFlagBitsKHR;

or the equivalent

// Provided by VK_NV_ray_tracing
typedef VkGeometryInstanceFlagBitsKHR VkGeometryInstanceFlagBitsNV;

- **VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR** disables face culling for this instance.
- **VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR** indicates that the facing determination for geometry in this instance is inverted. Because the facing is determined in object space, an instance transform does not change the winding, but a geometry transform does.
- **VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR** causes this instance to act as though **VK_GEOMETRY_OPAQUE_BIT_KHR** were specified on all geometries referenced by this instance. This behavior can be overridden by the SPIR-V **NoOpaqueKHR** ray flag.
- **VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR** causes this instance to act as though **VK_GEOMETRY_OPAQUE_BIT_KHR** were not specified on all geometries referenced by this instance. This behavior can be overridden by the SPIR-V **OpaqueKHR** ray flag.

**VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR** and **VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR** must not be used in the same flag.
or the equivalent

```
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkGeometryInstanceFlagsKHR;
```

`VkGeometryInstanceFlagsKHR` is a bitmask type for setting a mask of zero or more `VkGeometryInstanceFlagBitsKHR`.

**Acceleration structure motion instances** can be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location including a type of motion and parameters to determine the motion of the instance over time.

An acceleration structure motion instance is defined by the structure:

```
// Provided by VK_NV_ray_tracing
typedef struct VkAccelerationStructureMotionInstanceNV {
    VkAccelerationStructureMotionInstanceTypeNV type;
    VkAccelerationStructureMotionInstanceFlagsNV flags;
    VkAccelerationStructureMotionInstanceDataNV data;
} VkAccelerationStructureMotionInstanceNV;
```

- **type** is a `VkAccelerationStructureMotionInstanceTypeNV` enumerant identifying which type of motion instance this is and which type of the union is valid.
- **flags** is currently unused, but is required to keep natural alignment of **data**.
- **data** is a `VkAccelerationStructureMotionInstanceDataNV` containing motion instance data for this instance.

**Note**

If writing this other than with a standard C compiler, note that the final structure should be 152 bytes in size.

**Valid Usage (Implicit)**

- `VUID-VkAccelerationStructureMotionInstanceNV-type-parameter`  
  **type** must be a valid `VkAccelerationStructureMotionInstanceTypeNV` value
- `VUID-VkAccelerationStructureMotionInstanceNV-flags-zerobitmask`  
  **flags** must be 0
- `VUID-VkAccelerationStructureMotionInstanceNV-staticInstance-parameter`  
  If **type** is `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV`, the **staticInstance**
member of `data` must be a valid `VkAccelerationStructureInstanceKHR` structure

- **VUID-VkAccelerationStructureMotionInstanceNV-matrixMotionInstance-parameter**
  If `type` is `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV`, the `matrixMotionInstance` member of `data` must be a valid `VkAccelerationStructureMatrixMotionInstanceNV` structure

- **VUID-VkAccelerationStructureMotionInstanceNV-srtMotionInstance-parameter**
  If `type` is `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV`, the `srtMotionInstance` member of `data` must be a valid `VkAccelerationStructureSRTMotionInstanceNV` structure

Acceleration structure motion instance is defined by the union:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef union VkAccelerationStructureMotionInstanceDataNV {
    VkAccelerationStructureInstanceKHR staticInstance;
    VkAccelerationStructureMatrixMotionInstanceNV matrixMotionInstance;
    VkAccelerationStructureSRTMotionInstanceNV srtMotionInstance;
} VkAccelerationStructureMotionInstanceDataNV;
```

- `staticInstance` is a `VkAccelerationStructureInstanceKHR` structure containing data for a static instance.
- `matrixMotionInstance` is a `VkAccelerationStructureMatrixMotionInstanceNV` structure containing data for a matrix motion instance.
- `srtMotionInstance` is a `VkAccelerationStructureSRTMotionInstanceNV` structure containing data for an SRT motion instance.

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef VkFlags VkAccelerationStructureMotionInstanceFlagsNV;
```

`VkAccelerationStructureMotionInstanceFlagsNV` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkAccelerationStructureMotionInstanceTypeNV` enumeration is defined as:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef enum VkAccelerationStructureMotionInstanceTypeNV {
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV = 0,
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV = 1,
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV = 2,
} VkAccelerationStructureMotionInstanceTypeNV;
```

- `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV` specifies that the instance is a static instance with no instance motion.
- `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV` specifies that the instance is
a motion instance with motion specified by interpolation between two matrices.

- **VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV** specifies that the instance is a motion instance with motion specified by interpolation in the SRT decomposition.

An acceleration structure matrix motion instance is defined by the structure:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureMatrixMotionInstanceNV {
    VkTransformMatrixKHR transformT0;
    VkTransformMatrixKHR transformT1;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureMatrixMotionInstanceNV;
```

- `transformT0` is a `VkTransformMatrixKHR` structure describing a transformation to be applied to the acceleration structure at time 0.
- `transformT1` is a `VkTransformMatrixKHR` structure describing a transformation to be applied to the acceleration structure at time 1.
- `instanceCustomIndex` is a 24-bit user-specified index value accessible to ray shaders in the `InstanceCustomIndexKHR` built-in.
- `mask` is an 8-bit visibility mask for the geometry. The instance may only be hit if `Cull Mask & instance.mask != 0`
- `instanceShaderBindingTableRecordOffset` is a 24-bit offset used in calculating the hit shader binding table index.
- `flags` is an 8-bit mask of `VkGeometryInstanceFlagBitsKHR` values to apply to this instance.
- `accelerationStructureReference` is either:
  - a device address containing the value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or `vkGetAccelerationStructureHandleNV` (used by device operations which reference acceleration structures) or,
  - a `VkAccelerationStructureKHR` object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- `instanceCustomIndex` and `mask` occupy the same memory as if a single `uint32_t` was specified in their place
  - `instanceCustomIndex` occupies the 24 least significant bits of that memory
  - `mask` occupies the 8 most significant bits of that memory
- `instanceShaderBindingTableRecordOffset` and `flags` occupy the same memory as if a single
\( \text{uint32_t} \) was specified in their place
- \( \text{instanceShaderBindingTableRecordOffset} \) occupies the 24 least significant bits of that memory
- \( \text{flags} \) occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications must employ another method to set values according to the correct bit pattern.

The transform for a matrix motion instance at a point in time is derived by component-wise linear interpolation of the two transforms. That is, for a time in \([0,1]\) the resulting transform is

\[
\text{transformT0} \times (1 - \text{time}) + \text{transformT1} \times \text{time}
\]

Valid Usage (Implicit)

- VUID-VkAccelerationStructureMatrixMotionInstanceNV-flags-parameter
  - \( \text{flags} \) must be a valid combination of \( \text{VkGeometryInstanceFlagBitsKHR} \) values

An acceleration structure SRT motion instance is defined by the structure:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureSRTMotionInstanceNV {
    VkSRTDataNV transformT0;
    VkSRTDataNV transformT1;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureSRTMotionInstanceNV;
```

- \( \text{transformT0} \) is a \( \text{VkSRTDataNV} \) structure describing a transformation to be applied to the acceleration structure at time 0.
- \( \text{transformT1} \) is a \( \text{VkSRTDataNV} \) structure describing a transformation to be applied to the acceleration structure at time 1.
- \( \text{instanceCustomIndex} \) is a 24-bit user-specified index value accessible to ray shaders in the \( \text{InstanceCustomIndexKHR} \) built-in.
- \( \text{mask} \) is an 8-bit visibility mask for the geometry. The instance may only be hit if \( \text{Cull Mask} \) \& \( \text{instance.mask} \) != 0
- \( \text{instanceShaderBindingTableRecordOffset} \) is a 24-bit offset used in calculating the hit shader binding table index.
- \( \text{flags} \) is an 8-bit mask of \( \text{VkGeometryInstanceFlagBitsKHR} \) values to apply to this instance.
- \( \text{accelerationStructureReference} \) is either:
  - a device address containing the value obtained from
vkGetAccelerationStructureDeviceAddressKHR or vkGetAccelerationStructureHandleNV (used by device operations which reference acceleration structures) or,

- a VkAccelerationStructureKHR object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- **instanceCustomIndex** and **mask** occupy the same memory as if a single `uint32_t` was specified in their place
  - **instanceCustomIndex** occupies the 24 least significant bits of that memory
  - **mask** occupies the 8 most significant bits of that memory
- **instanceShaderBindingTableRecordOffset** and **flags** occupy the same memory as if a single `uint32_t` was specified in their place
  - **instanceShaderBindingTableRecordOffset** occupies the 24 least significant bits of that memory
  - **flags** occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values according to the correct bit pattern.

The transform for a SRT motion instance at a point in time is derived from component-wise linear interpolation of the two SRT transforms. That is, for a **time** in [0,1] the resulting transform is

\[
\text{transform}T_0 \times (1 - \text{time}) + \text{transform}T_1 \times \text{time}
\]

**Valid Usage (Implicit)**

- VUID-VkAccelerationStructureSRTMotionInstanceNV-flags-parameter
  **flags** **must** be a valid combination of `VkGeometryInstanceFlagBitsKHR` values

An acceleration structure SRT transform is defined by the structure:
typedef struct VkSRTDataNV {
    float sx;
    float a;
    float b;
    float pvx;
    float sy;
    float c;
    float pvy;
    float sz;
    float pvz;
    float qx;
    float qy;
    float qz;
    float qw;
    float tx;
    float ty;
    float tz;
} VkSRTDataNV;

- `sx` is the x component of the scale of the transform
- `a` is one component of the shear for the transform
- `b` is one component of the shear for the transform
- `pxx` is the x component of the pivot point of the transform
- `sy` is the y component of the scale of the transform
- `c` is one component of the shear for the transform
- `pvy` is the y component of the pivot point of the transform
- `sz` is the z component of the scale of the transform
- `pvz` is the z component of the pivot point of the transform
- `qx` is the x component of the rotation quaternion
- `qy` is the y component of the rotation quaternion
- `qz` is the z component of the rotation quaternion
- `qw` is the w component of the rotation quaternion
- `tx` is the x component of the post-rotation translation
- `ty` is the y component of the post-rotation translation
- `tz` is the z component of the post-rotation translation

This transform decomposition consists of three elements. The first is a matrix S, consisting of a scale, shear, and translation, usually used to define the pivot point of the following rotation. This matrix is constructed from the parameters above by:
The rotation quaternion is defined as:

\[ R = [qx, qy, qz, qw] \]

This is a rotation around a conceptual normalized axis [ax, ay, az] of amount \( \theta \) such that:

\[
[qx, qy, qz] = \sin(\theta/2) \times [ax, ay, az]
\]

and

\[ qw = \cos(\theta/2) \]

Finally, the transform has a translation T constructed from the parameters above by:

\[
T = \begin{pmatrix}
1 & 0 & 0 & tx \\
0 & 1 & 0 & ty \\
0 & 0 & 1 & tz \\
\end{pmatrix}
\]

The effective derived transform is then given by

\[ T \times R \times S \]

\[
\text{VkAccelerationStructureBuildRangeInfoKHR} \text{ is defined as:}
\]

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildRangeInfoKHR {
    uint32_t primitiveCount;
    uint32_t primitiveOffset;
    uint32_t firstVertex;
    uint32_t transformOffset;
} VkAccelerationStructureBuildRangeInfoKHR;
```

- **primitiveCount** defines the number of primitives for a corresponding acceleration structure geometry.
- **primitiveOffset** defines an offset in bytes into the memory where primitive data is defined.
- **firstVertex** is the index of the first vertex to build from for triangle geometry.
- **transformOffset** defines an offset in bytes into the memory where a transform matrix is defined.

The primitive count and primitive offset are interpreted differently depending on the **VkGeometryTypeKHR** used:
• For geometries of type VK_GEOMETRY_TYPE_TRIANGLES_KHR, primitiveCount is the number of triangles to be built, where each triangle is treated as 3 vertices.
  ◦ If the geometry uses indices, primitiveCount × 3 indices are consumed from VkAccelerationStructureGeometryTrianglesDataKHR::indexData, starting at an offset of primitiveOffset. The value of firstVertex is added to the index values before fetching vertices.
  ◦ If the geometry does not use indices, primitiveCount × 3 vertices are consumed from VkAccelerationStructureGeometryTrianglesDataKHR::vertexData, starting at an offset of primitiveOffset + VkAccelerationStructureGeometryTrianglesDataKHR::vertexStride × firstVertex.
  ◦ If VkAccelerationStructureGeometryTrianglesDataKHR::transformData is not NULL, a single VkTransformMatrixKHR structure is consumed from VkAccelerationStructureGeometryTrianglesDataKHR::transformData, at an offset of transformOffset. This matrix describes a transformation from the space in which the vertices for all triangles in this geometry are described to the space in which the acceleration structure is defined.

• For geometries of type VK_GEOMETRY_TYPE_AABBs_KHR, primitiveCount is the number of axis-aligned bounding boxes. primitiveCount VkAabbPositionsKHR structures are consumed from VkAccelerationStructureGeometryAabbsDataKHR::data, starting at an offset of primitiveOffset.

• For geometries of type VK_GEOMETRY_TYPE_INSTANCES_KHR, primitiveCount is the number of acceleration structures. primitiveCount VkAccelerationStructureInstanceKHR or VkAccelerationStructureMotionInstanceNV structures are consumed from VkAccelerationStructureGeometryInstancesDataKHR::data, starting at an offset of primitiveOffset.

### Valid Usage

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03656
  For geometries of type VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the geometry uses indices, the offset primitiveOffset from VkAccelerationStructureGeometryTrianglesDataKHR::indexData must be a multiple of the element size of VkAccelerationStructureGeometryTrianglesDataKHR::indexType.

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03657
  For geometries of type VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the geometry does not use indices, the offset primitiveOffset from VkAccelerationStructureGeometryTrianglesDataKHR::vertexData must be a multiple of the component size of VkAccelerationStructureGeometryTrianglesDataKHR::vertexFormat.

- VUID-VkAccelerationStructureBuildRangeInfoKHR-transformOffset-03658
  For geometries of type VK_GEOMETRY_TYPE_TRIANGLES_KHR, the offset transformOffset from VkAccelerationStructureGeometryTrianglesDataKHR::transformData must be a multiple of 16.

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03659
  For geometries of type VK_GEOMETRY_TYPE_AABBs_KHR, the offset primitiveOffset from VkAccelerationStructureGeometryAabbsDataKHR::data must be a multiple of 8.
37.1.7. Copying Acceleration Structures

An additional command exists for copying acceleration structures without updating their contents. The acceleration structure object can be compacted in order to improve performance. Before copying, an application must query the size of the resulting acceleration structure.

To query acceleration structure size parameters call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdWriteAccelerationStructuresPropertiesKHR(
    VkCommandBuffer commandBuffer,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureKHR* pAccelerationStructures,
    VkQueryType queryType,
    VkQueryPool queryPool,
    uint32_t firstQuery);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `accelerationStructureCount` is the count of acceleration structures for which to query the property.
- `pAccelerationStructures` is a pointer to an array of existing previously built acceleration structures.
- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
- `queryPool` is the query pool that will manage the results of the query.
- `firstQuery` is the first query index within the query pool that will contain the `accelerationStructureCount` number of results.

Accesses to any of the acceleration structures listed in `pAccelerationStructures` must be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`.

- If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then the value written out is the number of bytes required by a compacted acceleration structure.
- If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`, then the value written out is the number of bytes required by a serialized acceleration structure.

**Valid Usage**

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructure-08924

The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature
must be enabled

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02493
  queryPool must have been created with a queryType matching queryType

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02494
  The queries identified by queryPool and firstQuery must be unavailable

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-buffer-03736
  The buffer used to create each acceleration structure in pAccelerationStructures must be bound to device memory

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-query-04880
  The sum of firstQuery plus accelerationStructureCount must be less than or equal to the number of queries in queryPool

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-04964
  All acceleration structures in pAccelerationStructures must have been built prior to the execution of this command

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructures-03431
  All acceleration structures in pAccelerationStructures must have been built with
  VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR if queryType is
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryType-06742
  queryType must be
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR,
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR,
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR,
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR

Valid Usage (Implicit)

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parameter
  pAccelerationStructures must be a valid pointer to an array of accelerationStructureCount valid VkAccelerationStructureKHR handles

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryType-parameter
  queryType must be a valid VkQueryType value

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations
- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructureCount-arraylength
  accelerationStructureCount must be greater than 0

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commonparent
  Each of commandBuffer, queryPool, and the elements of pAccelerationStructures must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To query acceleration structure size parameters call:

```c
// Provided by VK_NV_ray_tracing
define void vkCmdWriteAccelerationStructuresPropertiesNV(
    VkCommandBuffer commandBuffer,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureNV* pAccelerationStructures,
    VkQueryType queryType,
    VkQueryPool queryPool,
    uint32_t firstQuery);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `accelerationStructureCount` is the count of acceleration structures for which to query the property.
- `pAccelerationStructures` is a pointer to an array of existing previously built acceleration structures.
- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
• `queryPool` is the query pool that will manage the results of the query.
• `firstQuery` is the first query index within the query pool that will contain the `accelerationStructureCount` number of results.

Accesses to any of the acceleration structures listed in `pAccelerationStructures` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`.

---

**Valid Usage**

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-03755
  `queryPool` must have been created with a `queryType` matching `queryType`

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-03756
  The queries identified by `queryPool` and `firstQuery` must be unavailable

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-accelerationStructure-03757
  `accelerationStructure` must be bound completely and contiguously to a single `VkDeviceMemory` object via `vkBindAccelerationStructureMemoryNV`

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-pAccelerationStructures-04958
  All acceleration structures in `pAccelerationStructures` must have been built prior to the execution of this command

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-pAccelerationStructures-06215
  All acceleration structures in `pAccelerationStructures` must have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryType-06216
  `queryType` must be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`

---

**Valid Usage (Implicit)**

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-pAccelerationStructures-parameter
  `pAccelerationStructures` must be a valid pointer to an array of `accelerationStructureCount` valid `VkAccelerationStructureNV` handles

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryType-parameter
  `queryType` must be a valid `VkQueryType` value

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commandBuffer-cmdpool

3282
The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-accelerationStructureCount-arraylength
  `accelerationStructureCount` must be greater than 0

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commonparent
  Each of `commandBuffer`, `queryPool`, and the elements of `pAccelerationStructures` must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

To copy an acceleration structure call:

```c
// Provided by VK_NV_ray_tracing
define void vkCmdCopyAccelerationStructureNV(
    VkCommandBuffer commandBuffer,  
    VkAccelerationStructureNV dst,  
    VkAccelerationStructureNV src,  
    VkCopyAccelerationStructureModeKHR mode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `dst` is the target acceleration structure for the copy.
- `src` is the source acceleration structure for the copy.
- `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.
Accesses to `src` and `dst` must be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR` as appropriate.

### Valid Usage

- **VUID-vkCmdCopyAccelerationStructureNV-mode-03410**
  - `mode` must be `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR` or `VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR`

- **VUID-vkCmdCopyAccelerationStructureNV-src-04963**
  - The source acceleration structure `src` must have been constructed prior to the execution of this command

- **VUID-vkCmdCopyAccelerationStructureNV-src-03411**
  - If `mode` is `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR`, `src` must have been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` in the build

- **VUID-vkCmdCopyAccelerationStructureNV-buffer-03718**
  - The buffer used to create `src` must be bound to device memory

- **VUID-vkCmdCopyAccelerationStructureNV-buffer-03719**
  - The buffer used to create `dst` must be bound to device memory

- **VUID-vkCmdCopyAccelerationStructureNV-dst-07791**
  - The range of memory backing `dst` that is accessed by this command must not overlap the memory backing `src` that is accessed by this command

- **VUID-vkCmdCopyAccelerationStructureNV-dst-07792**
  - `dst` must be bound completely and contiguously to a single `VkDeviceMemory` object via `vkBindAccelerationStructureMemoryNV`

### Valid Usage (Implicit)

- **VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyAccelerationStructureNV-dst-parameter**
  - `dst` must be a valid `VkAccelerationStructureNV` handle

- **VUID-vkCmdCopyAccelerationStructureNV-src-parameter**
  - `src` must be a valid `VkAccelerationStructureNV` handle

- **VUID-vkCmdCopyAccelerationStructureNV-mode-parameter**
  - `mode` must be a valid `VkCopyAccelerationStructureModeKHR` value

- **VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support compute
operations

- **VUID-vkCmdCopyAccelerationStructureNV-renderpass**
  This command **must** only be called outside of a render pass instance

- **VUID-vkCmdCopyAccelerationStructureNV-videocoding**
  This command **must** only be called outside of a video coding scope

- **VUID-vkCmdCopyAccelerationStructureNV-commonparent**
  Each of `commandBuffer`, `dst`, and `src` **must** have been created, allocated, or retrieved from the same `VkDevice`

---

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

---

**Command Properties**

<table>
<thead>

To copy an acceleration structure call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyAccelerationStructureKHR(
  VkCommandBuffer commandBuffer,
  const VkCopyAccelerationStructureInfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a `VkCopyAccelerationStructureInfoKHR` structure defining the copy operation.

This command copies the `pInfo->src` acceleration structure to the `pInfo->dst` acceleration structure in the manner specified by `pInfo->mode`.

Accesses to `pInfo->src` and `pInfo->dst` **must** be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR` as appropriate.
Valid Usage

- VUID-vkCmdCopyAccelerationStructureKHR-accelerationStructure-08925
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled

- VUID-vkCmdCopyAccelerationStructureKHR-buffer-03737
  The `buffer` used to create `pInfo->src` must be bound to device memory

- VUID-vkCmdCopyAccelerationStructureKHR-buffer-03738
  The `buffer` used to create `pInfo->dst` must be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyAccelerationStructureKHR-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkCopyAccelerationStructureInfoKHR` structure

- VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdCopyAccelerationStructureKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyAccelerationStructureKHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>

</tbody>
</table>
The `VkCopyAccelerationStructureInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyAccelerationStructureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR src;
    VkAccelerationStructureKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyAccelerationStructureInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source acceleration structure for the copy.
- `dst` is the target acceleration structure for the copy.
- `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyAccelerationStructureInfoKHR-mode-03410**
  - `mode` must be `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR` or `VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR`.

- **VUID-VkCopyAccelerationStructureInfoKHR-src-04963**
  - The source acceleration structure `src` must have been constructed prior to the execution of this command.

- **VUID-VkCopyAccelerationStructureInfoKHR-src-03411**
  - If `mode` is `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR`, `src` must have been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` in the build.

- **VUID-VkCopyAccelerationStructureInfoKHR-buffer-03718**
  - The buffer used to create `src` must be bound to device memory.

- **VUID-VkCopyAccelerationStructureInfoKHR-buffer-03719**
  - The buffer used to create `dst` must be bound to device memory.

- **VUID-VkCopyAccelerationStructureInfoKHR-dst-07791**
  - The range of memory backing `dst` that is accessed by this command must not overlap the memory backing `src` that is accessed by this command.

### Valid Usage (Implicit)

- **VUID-VkCopyAccelerationStructureInfoKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_INFO_KHR`.

- **VUID-VkCopyAccelerationStructureInfoKHR-pNext-pNext**
  - `pNext` must be `NULL` or a pointer to a structure extending this structure.
pNext must be NULL

- VUID-VkCopyAccelerationStructureInfoKHR-src-parameter
  src must be a valid VkAccelerationStructureKHR handle

- VUID-VkCopyAccelerationStructureInfoKHR-dst-parameter
  dst must be a valid VkAccelerationStructureKHR handle

- VUID-VkCopyAccelerationStructureInfoKHR-mode-parameter
  mode must be a valid VkCopyAccelerationStructureModeKHR value

- VUID-VkCopyAccelerationStructureInfoKHR-commonparent
  Both of dst, and src must have been created, allocated, or retrieved from the same VkDevice

Possible values of mode specifying additional operations to perform during the copy, are:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkCopyAccelerationStructureModeKHR {
    VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR = 0,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR = 1,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR = 2,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR = 3,

    // Provided by VK_NV_ray_tracing
    VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_NV =
    VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR,
    // Provided by VK_NV_ray_tracing
    VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_NV =
    VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR,
} VkCopyAccelerationStructureModeKHR;
```

or the equivalent

```
// Provided by VK_NV_ray_tracing
typedef VkCopyAccelerationStructureModeKHR VkCopyAccelerationStructureModeNV;
```

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR** creates a direct copy of the acceleration structure specified in src into the one specified by dst. The dst acceleration structure must have been created with the same parameters as src. If src contains references to other acceleration structures, dst will reference the same acceleration structures.

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR** creates a more compact version of an acceleration structure src into dst. The acceleration structure dst must have been created with a size at least as large as that returned by vkCmdWriteAccelerationStructuresPropertiesKHR or vkWriteAccelerationStructuresPropertiesKHR after the build of the acceleration structure specified by src. If src contains references to other acceleration structures, dst will reference the same acceleration structures.

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR** serializes the acceleration structure to a semi-opaque format which can be reloaded on a compatible implementation.
• **VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR** deserializes the semi-opaque serialization format in the buffer to the acceleration structure.

To copy an acceleration structure to device memory call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyAccelerationStructureToMemoryKHR(
    VkCommandBuffer commandBuffer,
    const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

• **commandBuffer** is the command buffer into which the command will be recorded.
• **pInfo** is an a pointer to a `VkCopyAccelerationStructureToMemoryInfoKHR` structure defining the copy operation.

Accesses to `pInfo->src` must be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`. Accesses to the buffer indicated by `pInfo->dst.deviceAddress` must be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an an access type of `VK_ACCESS_TRANSFER_WRITE_BIT`.

This command produces the same results as `vkCopyAccelerationStructureToMemoryKHR`, but writes its result to a device address, and is executed on the device rather than the host. The output may not necessarily be bit-for-bit identical, but it can be equally used by either `vkCmdCopyMemoryToAccelerationStructureKHR` or `vkCopyMemoryToAccelerationStructureKHR`.

The defined header structure for the serialized data consists of:

• **VK_UUID_SIZE** bytes of data matching `VkPhysicalDeviceIDProperties::driverUUID`
• **VK_UUID_SIZE** bytes of data identifying the compatibility for comparison using `vkGetDeviceAccelerationStructureCompatibilityKHR`
• A 64-bit integer of the total size matching the value queried using `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`
• A 64-bit integer of the deserialized size to be passed in to `VkAccelerationStructureCreateInfoKHR::size`
• A 64-bit integer of the count of the number of acceleration structure handles following. This value matches the value queried using `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`. This will be zero for a bottom-level acceleration structure. For top-level acceleration structures this number is implementation-dependent; the number of and ordering of the handles may not match the instance descriptions which were used to build the acceleration structure.

The corresponding handles matching the values returned by `vkGetAccelerationStructureDeviceAddressKHR` or `vkGetAccelerationStructureHandleNV` are tightly
packed in the buffer following the count. The application is expected to store a mapping between those handles and the original application-generated bottom-level acceleration structures to provide when deserializing. The serialized data is written to the buffer (or read from the buffer) according to the host endianness.

**Valid Usage**

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-accelerationStructure-08926**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature **must** be enabled
- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03739**
  `pInfo->dst.deviceAddress` **must** be a valid device address for a buffer bound to device memory
- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03740**
  `pInfo->dst.deviceAddress` **must** be aligned to 256 bytes
- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03741**
  If the buffer pointed to by `pInfo->dst.deviceAddress` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-None-03559**
  The buffer used to create `pInfo->src` **must** be bound to device memory

**Valid Usage (Implicit)**

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-parameter**
  `pInfo` **must** be a valid pointer to a valid `VkCopyAccelerationStructureToMemoryInfoKHR` structure
- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state
- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-renderpass**
  This command **must** only be called outside of a render pass instance
- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-videocoding**
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
• Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

## Provided by `VK_KHR_acceleration_structure`

```c
typedef struct VkCopyAccelerationStructureToMemoryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR src;
    VkDeviceOrHostAddressKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyAccelerationStructureToMemoryInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source acceleration structure for the copy.
- `dst` is the device or host address to memory which is the target for the copy.
- `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

## Valid Usage

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-04959**
  The source acceleration structure `src` **must** have been constructed prior to the execution of this command.

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-dst-03561**
  The memory pointed to by `dst` **must** be at least as large as the serialization size of `src`, as reported by `vkWriteAccelerationStructuresPropertiesKHR` or `vkCmdWriteAccelerationStructuresPropertiesKHR` with a query type of `VK_QUERY_TYPE_ACCELERATION_STRUCTURE.Serialization_SIZE_KHR`.

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-03412**
  `mode` **must** be `VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR`.
Valid Usage (Implicit)

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_TO_MEMORY_INFO_KHR

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-parameter
  src must be a valid VkAccelerationStructureKHR handle

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-parameter
  mode must be a valid VkCopyAccelerationStructureModeKHR value

To copy device memory to an acceleration structure call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyMemoryToAccelerationStructureKHR(
    VkCommandBuffer commandBuffer, /* the command buffer into which the command will be recorded. */
    const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo); /* a pointer to a VkCopyMemoryToAccelerationStructureInfoKHR structure defining the copy operation. */
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a VkCopyMemoryToAccelerationStructureInfoKHR structure defining the copy operation.

Accesses to pInfo->dst must be synchronized with the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR. Accesses to the buffer indicated by pInfo->src.deviceAddress must be synchronized with the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of VK_ACCESS_TRANSFER_READ_BIT.

This command can accept acceleration structures produced by either vkCmdCopyAccelerationStructureToMemoryKHR or vkCopyAccelerationStructureToMemoryKHR.

The structure provided as input to deserialize is as described in vkCmdCopyAccelerationStructureToMemoryKHR, with any acceleration structure handles filled in with the newly-queried handles to bottom level acceleration structures created before deserialization. These do not need to be built at deserialize time, but must be created.

Valid Usage

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-accelerationStructure-08927
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled
- pInfo->src.deviceAddress must be a valid device address for a buffer bound to device memory
- pInfo->src.deviceAddress must be aligned to 256 bytes
- If the buffer pointed to by pInfo->src.deviceAddress is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object
- The buffer used to create pInfo->dst must be bound to device memory

### Valid Usage (Implicit)

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle
- pInfo must be a valid pointer to a valid VkCopyMemoryToAccelerationStructureInfoKHR structure
- commandBuffer must be in the recording state
- The VkCommandPool that commandBuffer was allocated from must support compute operations
- This command must only be called outside of a render pass instance
- This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>
The `VkCopyMemoryToAccelerationStructureInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyMemoryToAccelerationStructureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR src;
    VkAccelerationStructureKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyMemoryToAccelerationStructureInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the device or host address to memory containing the source data for the copy.
- `dst` is the target acceleration structure for the copy.
- `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-src-04960**
  The source memory pointed to by `src` **must** contain data previously serialized using `vkCmdCopyAccelerationStructureToMemoryKHR`, potentially modified to relocate acceleration structure references as described in that command.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-03413**
  `mode` **must** be `VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR`.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pInfo-03414**
  The data in `src` **must** have a format compatible with the destination physical device as returned by `vkGetDeviceAccelerationStructureCompatibilityKHR`.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-03746**
  `dst` **must** have been created with a size greater than or equal to that used to serialize the data in `src`.

### Valid Usage (Implicit)

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_COPY_MEMORY_TO_ACCELERATION_STRUCTURE_INFO_KHR`.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pNext-pNext**
  `pNext` **must** be `NULL`.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-parameter**
  `dst` **must** be a valid `VkAccelerationStructureKHR` handle.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-parameter**
**mode** must be a valid *VkCopyAccelerationStructureModeKHR* value

To check if a serialized acceleration structure is compatible with the current device call:

```c
// Provided by VK_KHR_acceleration_structure
void vkGetDeviceAccelerationStructureCompatibilityKHR(
    VkDevice device,
    const VkAccelerationStructureVersionInfoKHR* pVersionInfo,
    VkAccelerationStructureCompatibilityKHR* pCompatibility);
```

- **device** is the device to check the version against.
- **pVersionInfo** is a pointer to a *VkAccelerationStructureVersionInfoKHR* structure specifying version information to check against the device.
- **pCompatibility** is a pointer to a *VkAccelerationStructureCompatibilityKHR* value in which compatibility information is returned.

### Valid Usage

- **VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-accelerationStructure-08928**
  The *VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure* feature must be enabled

### Valid Usage (Implicit)

- **VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-device-parameter**
  device must be a valid *VkDevice* handle
- **VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pVersionInfo-parameter**
  pVersionInfo must be a valid pointer to a valid *VkAccelerationStructureVersionInfoKHR* structure
- **VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pCompatibility-parameter**
  pCompatibility must be a valid pointer to a *VkAccelerationStructureCompatibilityKHR* value

The *VkAccelerationStructureVersionInfoKHR* structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureVersionInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const uint8_t* pVersionData;
} VkAccelerationStructureVersionInfoKHR;
```
• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **pVersionData** is a pointer to the version header of an acceleration structure as defined in `vkCmdCopyAccelerationStructureToMemoryKHR`

**Note**

*pVersionData* is a *pointer* to an array of `2×VK_UUID_SIZE uint8_t` values instead of two `VK_UUID_SIZE` arrays as the expected use case for this member is to be pointed at the header of a previously serialized acceleration structure (via `vkCmdCopyAccelerationStructureToMemoryKHR` or `vkCopyAccelerationStructureToMemoryKHR`) that is loaded in memory. Using arrays would necessitate extra memory copies of the UUIDs.

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureVersionInfoKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_INFO_KHR`

- **VUID-VkAccelerationStructureVersionInfoKHR-pNext-pNext**
  - `pNext` must be `NULL`

- **VUID-VkAccelerationStructureVersionInfoKHR-pVersionData-parameter**
  - `pVersionData` must be a valid pointer to an array of `2×VK_UUID_SIZE uint8_t` values

Possible values of **pCompatibility** returned by `vkGetDeviceAccelerationStructureCompatibilityKHR` are:

```cpp
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureCompatibilityKHR {
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR = 0,
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR = 1,
} VkAccelerationStructureCompatibilityKHR;
```

- **VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR** if the `pVersionData` version acceleration structure is compatible with *device*.

- **VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR** if the `pVersionData` version acceleration structure is not compatible with *device*.

### 37.2. Host Acceleration Structure Operations

Implementations are also required to provide host implementations of the acceleration structure operations if the **accelerationStructureHostCommands** feature is enabled:

- **vkBuildAccelerationStructuresKHR** corresponding to `vkCmdBuildAccelerationStructuresKHR`

- **vkCopyAccelerationStructureKHR** corresponding to `vkCmdCopyAccelerationStructureKHR`
These commands are functionally equivalent to their device counterparts, except that they are
executed on the host timeline, rather than being enqueued into command buffers.

All acceleration structures used by the host commands must be bound to host-visible memory, and all input data for acceleration structure builds must be referenced using host addresses instead of device addresses. Applications are not required to map acceleration structure memory when using the host commands.

Note
The vkBuildAccelerationStructuresKHR and vkCmdBuildAccelerationStructuresKHR may use different algorithms, and thus are not required to produce identical structures. The structures produced by these two commands may exhibit different memory footprints or traversal performance, but should strive to be similar where possible.

Apart from these details, the host and device operations are interchangeable. For example, an application can use vkBuildAccelerationStructuresKHR to build a structure, compact it on the device using vkCmdCopyAccelerationStructureKHR, and serialize the result using vkCopyAccelerationStructureToMemoryKHR.

Note
For efficient execution, acceleration structures manipulated using these commands should always be bound to host cached memory, as the implementation may need to repeatedly read and write this memory during the execution of the command.

To build acceleration structures on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkBuildAccelerationStructuresKHR(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);
```

- device is the VkDevice for which the acceleration structures are being built.
- deferredOperation is an optional VkDeferredOperationKHR to request deferral for this command.
• **infoCount** is the number of acceleration structures to build. It specifies the number of the **pInfos** structures and **ppBuildRangeInfos** pointers that **must** be provided.

• **pInfos** is a pointer to an array of **infoCount** **VkAccelerationStructureBuildGeometryInfoKHR** structures defining the geometry used to build each acceleration structure.

• **ppBuildRangeInfos** is a pointer to an array of **infoCount** pointers to arrays of **VkAccelerationStructureBuildRangeInfoKHR** structures. Each **ppBuildRangeInfos[i]** is a pointer to an array of **pInfos[i].geometryCount** **VkAccelerationStructureBuildRangeInfoKHR** structures defining dynamic offsets to the addresses where geometry data is stored, as defined by **pInfos[i]**.

This command fulfills the same task as **vkCmdBuildAccelerationStructuresKHR** but is executed by the host.

The **vkBuildAccelerationStructuresKHR** command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

**Note**
This means that an application **cannot** build a top-level acceleration structure in the same **vkBuildAccelerationStructuresKHR** call as the associated bottom-level or instance acceleration structures are being built. There also **cannot** be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

**Valid Usage**

• **VUID-vkBuildAccelerationStructuresKHR-accelerationStructureHostCommands-03581**
  The **VkPhysicalDeviceAccelerationStructureFeaturesKHR** ::**accelerationStructureHostCommands** feature **must** be enabled

• **VUID-vkBuildAccelerationStructuresKHR-mode-04628**
  The **mode** member of each element of **pInfos** **must** be a valid **VkBuildAccelerationStructureModeKHR** value

• **VUID-vkBuildAccelerationStructuresKHR-srcAccelerationStructure-04629**
  If the **srcAccelerationStructure** member of any element of **pInfos** is not **VK_NULL_HANDLE**, the **srcAccelerationStructure** member **must** be a valid **VkAccelerationStructureKHR** handle

• **VUID-vkBuildAccelerationStructuresKHR-pInfos-04630**
  For each element of **pInfos**, if its **mode** member is **VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR**, its **srcAccelerationStructure** member **must** not be **VK_NULL_HANDLE**

• **VUID-vkBuildAccelerationStructuresKHR-pInfos-03403**
  The **srcAccelerationStructure** member of any element of **pInfos** **must** not be the same acceleration structure as the **dstAccelerationStructure** member of any other element of **pInfos**

• **VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03698**
The `dstAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03800**
  The `dstAccelerationStructure` member of any element of `pInfos` must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03699**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03700**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03663**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, inactive primitives in its `srcAccelerationStructure` member must not be made active.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03664**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, active primitives in its `srcAccelerationStructure` member must not be made inactive.

- **VUID-vkBuildAccelerationStructuresKHR-None-03407**
  The `dstAccelerationStructure` member of any element of `pInfos` must not be referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`.

- **VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03701**
  The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `srcAccelerationStructure` member of any other element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, which is accessed by this command.

- **VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03702**
  The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `dstAccelerationStructure` member of any other element of `pInfos`, which is accessed by this command.

- **VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03703**
  The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is
• VUID-vkBuildAccelerationStructuresKHR-scratchData-03704
The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any other element of pInfos, which is accessed by this command.

• VUID-vkBuildAccelerationStructuresKHR-scratchData-03705
The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the srcAccelerationStructure member of any element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR (including the same element), which is accessed by this command.

• VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03706
The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos, which is accessed by this command.

• VUID-vkBuildAccelerationStructuresKHR-pInfos-03667
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member must have previously been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR set in VkAccelerationStructureBuildGeometryInfoKHR::flags in the build.

• VUID-vkBuildAccelerationStructuresKHR-pInfos-03668
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure and dstAccelerationStructure members must either be the same VkAccelerationStructureKHR, or not have any memory aliasing.

• VUID-vkBuildAccelerationStructuresKHR-pInfos-03758
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its geometryCount member must have the same value which was specified when srcAccelerationStructure was last built.

• VUID-vkBuildAccelerationStructuresKHR-pInfos-03759
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its flags member must have the same value which was specified when srcAccelerationStructure was last built.

• VUID-vkBuildAccelerationStructuresKHR-pInfos-03760
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its type member must have the same value which was specified when srcAccelerationStructure was last built.

• VUID-vkBuildAccelerationStructuresKHR-pInfos-03761
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
ppGeometries members, its geometryType member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03762
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its flags member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03763
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.vertexFormat member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03764
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.maxVertex member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03765
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was NULL when srcAccelerationStructure was last built, then it must be NULL

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03766
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was not NULL when srcAccelerationStructure was last built, then it must not be NULL

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03767
  For each element of pInfos, if its mode member is
VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, and geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, then the value of each index referenced must be the same as the corresponding index value when srcAccelerationStructure was last built

- VUID-vkBuildAccelerationStructuresKHR-primitiveCount-03769
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, the primitiveCount member of its corresponding VkAccelerationStructureBuildRangeInfoKHR structure must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkBuildAccelerationStructuresKHR-firstVertex-03770
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if the geometry uses indices, the firstVertex member of its corresponding VkAccelerationStructureBuildRangeInfoKHR structure must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03801
  For each element of pInfo[i].pGeometries or pInfo[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, the corresponding ppBuildRangeInfos[i][j].primitiveCount must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03675
  For each pInfo[i], dstAccelerationStructure must have been created with a value of VkAccelerationStructureCreateInfoKHR::size greater than or equal to the memory size required by the build operation, as returned by vkGetAccelerationStructureBuildSizesKHR with pBuildInfo = pInfo[i] and with each element of the pMaxPrimitiveCounts array greater than or equal to the equivalent ppBuildRangeInfos[i][j].primitiveCount values for j in [0, pInfo[i].geometryCount)

- VUID-vkBuildAccelerationStructuresKHR-ppBuildRangeInfos-03676
  Each element of ppBuildRangeInfos[i] must be a valid pointer to an array of pInfo[i].geometryCount VkAccelerationStructureBuildRangeInfoKHR structures

- VUID-vkBuildAccelerationStructuresKHR-deferredOperation-03678
  Any previous deferred operation that was associated with deferredOperation must be complete

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03722
  For each element of pInfo, the buffer used to create its dstAccelerationStructure member must be bound to host-visible device memory

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03723
  For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR the buffer used to create its
The `srcAccelerationStructure` member must be bound to host-visible device memory.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03724**
  For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` must be bound to host-visible device memory.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03725**
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` must be valid host memory, where `N` is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03726**
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` must be valid host memory, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03771**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the `geometry.triangles.vertexData.hostAddress` must be a valid host address.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03772**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, the `geometry.triangles.indexData.hostAddress` must be a valid host address.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03773**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.hostAddress` is not 0, it must be a valid host address.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03774**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, the `geometry.aabbs.data.hostAddress` must be a valid host address.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03775**
  For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member must be bound to memory that was not allocated with multiple instances.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03776**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, the buffer used to create its `srcAccelerationStructure` member must be bound to memory that was not allocated with multiple instances.
For each element of \texttt{pInfos}, the \texttt{buffer} used to create each acceleration structure referenced by the \texttt{geometry\_instances\_data} member of any element of \texttt{pGeometries} or \texttt{ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR} \textbf{must} be bound to memory that was not allocated with multiple instances.

For any element of \texttt{pInfos[i]}, \texttt{pGeometries} or \texttt{pInfos[i]}, \texttt{ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR}, \texttt{geometry\_instances\_data\_hostAddress} \textbf{must} be a valid host address.

For any element of \texttt{pInfos[i]}, \texttt{pGeometries} or \texttt{pInfos[i]}, \texttt{ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR}, each \texttt{VkAccelerationStructureInstanceKHR::accelerationStructureReference} value in \texttt{geometry\_instances\_data\_hostAddress} \textbf{must} be a valid \texttt{VkAccelerationStructureKHR} object.

For any element of \texttt{pInfos[i]}, \texttt{pGeometries} or \texttt{pInfos[i]}, \texttt{ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR} with \texttt{VK\_BUILD\_ACCELERATION\_STRUCTURE\_MOTION\_BIT\_NV} set, each \texttt{accelerationStructureReference} in any structure in \texttt{VkAccelerationStructureMotionInstanceNV} value in \texttt{geometry\_instances\_data\_hostAddress} \textbf{must} be a valid \texttt{VkAccelerationStructureKHR} object.

**Valid Usage (Implicit)**

- \textbf{VUID-vkBuildAccelerationStructuresKHR-device-parameter} \texttt{device} \textbf{must} be a valid \texttt{VkDevice} handle.
- \textbf{VUID-vkBuildAccelerationStructuresKHR-deferredOperation-parameter} If \texttt{deferredOperation} is not \texttt{VK\_NULL\_HANDLE}, \texttt{deferredOperation} \textbf{must} be a valid \texttt{VkDeferredOperationKHR} handle.
- \textbf{VUID-vkBuildAccelerationStructuresKHR-pInfos-parameter} \texttt{pInfos} \textbf{must} be a valid pointer to an array of \texttt{infoCount} valid \texttt{VkAccelerationStructureBuildGeometryInfoKHR} structures.
- \textbf{VUID-vkBuildAccelerationStructuresKHR-ppBuildRangeInfos-parameter} \texttt{ppBuildRangeInfos} \textbf{must} be a valid pointer to an array of \texttt{infoCount} valid \texttt{VkAccelerationStructureBuildRangeInfoKHR} structures.
- \textbf{VUID-vkBuildAccelerationStructuresKHR-infoCount-arraylength} \texttt{infoCount} \textbf{must} be greater than 0.
- \textbf{VUID-vkBuildAccelerationStructuresKHR-deferredOperation-parent} If \texttt{deferredOperation} is a valid handle, it \textbf{must} have been created, allocated, or retrieved from \texttt{device}. 
### Return Codes

#### Success
- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

#### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy or compact an acceleration structure on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureKHR(VkDevice device, VkDeferredOperationKHR deferredOperation, const VkCopyAccelerationStructureInfoKHR* pInfo);
```

- **device** is the device which owns the acceleration structures.
- **deferredOperation** is an optional VkDeferredOperationKHR to request deferral for this command.
- **pInfo** is a pointer to a VkCopyAccelerationStructureInfoKHR structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyAccelerationStructureKHR` but is executed by the host.

### Valid Usage

- **VUID-vkCopyAccelerationStructureKHR-accelerationStructureHostCommands-03582**
  *The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands feature must be enabled*

- **VUID-vkCopyAccelerationStructureKHR-deferredOperation-03678**
  *Any previous deferred operation that was associated with deferredOperation must be complete*

- **VUID-vkCopyAccelerationStructureKHR-buffer-03727**
  *The buffer used to create pInfo->src must be bound to host-visible device memory*

- **VUID-vkCopyAccelerationStructureKHR-buffer-03728**
  *The buffer used to create pInfo->dst must be bound to host-visible device memory*

- **VUID-vkCopyAccelerationStructureKHR-buffer-03780**
  *The buffer used to create pInfo->src must be bound to memory that was not allocated*
with multiple instances

• VUID-vkCopyAccelerationStructureKHR-buffer-03781
  The buffer used to create pInfo->dst must be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

• VUID-vkCopyAccelerationStructureKHR-device-parameter
device must be a valid VkDevice handle

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-parameter
If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

• VUID-vkCopyAccelerationStructureKHR-pInfo-parameter
pInfo must be a valid pointer to a valid VkCopyAccelerationStructureInfoKHR structure

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-parent
If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success
• VK_SUCCESS
• VK_OPERATION_DEFERRED_KHR
• VK_OPERATION_NOT_DEFERRED_KHR

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy host accessible memory to an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyMemoryToAccelerationStructureKHR(
  VkDevice device,
  VkDeferredOperationKHR deferredOperation,
  const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);
```

• device is the device which owns pInfo->dst.

• deferredOperation is an optional VkDeferredOperationKHR to request deferral for this command.

• pInfo is a pointer to a VkCopyMemoryToAccelerationStructureInfoKHR structure defining the
copy operation.

This command fulfills the same task as `vkCmdCopyMemoryToAccelerationStructureKHR` but is executed by the host.

This command can accept acceleration structures produced by either `vkCmdCopyAccelerationStructureToMemoryKHR` or `vkCopyAccelerationStructureToMemoryKHR`.

Valid Usage

- **VUID-vkCopyMemoryToAccelerationStructureKHR-accelerationStructureHostCommands-03583**
  The [VkPhysicalDeviceAccelerationStructureFeaturesKHR](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/vulkan-VkPhysicalDeviceAccelerationStructureFeaturesKHR.html)::accelerationStructureHostCommands feature **must** be enabled.

- **VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-03678**
  Any previous deferred operation that was associated with `deferredOperation` **must** be complete.

- **VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03729**
  `pInfo->src.hostAddress` **must** be a valid host pointer.

- **VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03750**
  `pInfo->src.hostAddress` **must** be aligned to 16 bytes.

- **VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03730**
  The buffer used to create `pInfo->dst` **must** be bound to host-visible device memory.

- **VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03782**
  The buffer used to create `pInfo->dst` **must** be bound to memory that was not allocated with multiple instances.

Valid Usage (Implicit)

- **VUID-vkCopyMemoryToAccelerationStructureKHR-device-parameter**
  `device` **must** be a valid [VkDevice](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/vulkan-VkDevice.html) handle.

- **VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parameter**
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` **must** be a valid [VkDeferredOperationKHR](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/vulkan-VkDeferredOperationKHR.html) handle.

- **VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-parameter**
  `pInfo` **must** be a valid pointer to a valid [VkCopyMemoryToAccelerationStructureInfoKHR](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/vulkan-VkCopyMemoryToAccelerationStructureInfoKHR.html) structure.

- **VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parent**
  If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`.
Return Codes

**Success**
- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy an acceleration structure to host accessible memory, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureToMemoryKHR(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

- `device` is the device which owns `pInfo->src`.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `pInfo` is a pointer to a `VkCopyAccelerationStructureToMemoryInfoKHR` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyAccelerationStructureToMemoryKHR` but is executed by the host.

This command produces the same results as `vkCmdCopyAccelerationStructureToMemoryKHR`, but writes its result directly to a host pointer, and is executed on the host rather than the device. The output may not necessarily be bit-for-bit identical, but it can be equally used by either `vkCmdCopyMemoryToAccelerationStructureKHR` or `vkCopyMemoryToAccelerationStructureKHR`.

**Valid Usage**

- VUID-vkCopyAccelerationStructureToMemoryKHR-accelerationStructureHostCommands-03584
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature must be enabled

- VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` must be complete

- VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03731
  The previous buffer that was associated with `pInfo->buffer` must not be altered.
The buffer used to create pInfo->src must be bound to host-visible device memory

- VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03732
  pInfo->dst.hostAddress must be a valid host pointer

- VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03751
  pInfo->dst.hostAddress must be aligned to 16 bytes

- VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03783
  The buffer used to create pInfo->src must be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkCopyAccelerationStructureToMemoryKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

- VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyAccelerationStructureToMemoryInfoKHR structure

- VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query acceleration structure size parameters on the host, call:
// Provided by VK_KHR_acceleration_structure

VkResult vkWriteAccelerationStructuresPropertiesKHR(
    VkDevice device,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureKHR* pAccelerationStructures,
    VkQueryType queryType,
    size_t dataSize,
    void* pData,
    size_t stride);

- **device** is the device which owns the acceleration structures in `pAccelerationStructures`.
- **accelerationStructureCount** is the count of acceleration structures for which to query the property.
- **pAccelerationStructures** is a pointer to an array of existing previously built acceleration structures.
- **queryType** is a `VkQueryType` value specifying the property to be queried.
- **dataSize** is the size in bytes of the buffer pointed to by `pData`.
- **pData** is a pointer to a user-allocated buffer where the results will be written.
- **stride** is the stride in bytes between results for individual queries within `pData`.

This command fulfills the same task as `vkCmdWriteAccelerationStructuresPropertiesKHR` but is executed by the host.

### Valid Usage

- VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructureHostCommands-03585
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature must be enabled.

- VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-04964
  All acceleration structures in `pAccelerationStructures` must have been built prior to the execution of this command.

- VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructures-03431
  All acceleration structures in `pAccelerationStructures` must have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`.

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06742
  `queryType` must be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`.

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03448
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then `stride`
must be a multiple of the size of VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03449
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR, then pData must point to a VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03450
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR, then stride must be a multiple of the size of VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03451
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR, then pData must point to a VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06731
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR, then stride must be a multiple of the size of VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06732
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR, then pData must point to a VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06733
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR, then stride must be a multiple of the size of VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06734
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR, then pData must point to a VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-dataSize-03452
dataSize must be greater than or equal to accelerationStructureCount*stride

- VUID-vkWriteAccelerationStructuresPropertiesKHR-buffer-03733
  The buffer used to create each acceleration structure in pAccelerationStructures must be bound to host-visible device memory

- VUID-vkWriteAccelerationStructuresPropertiesKHR-buffer-03784
  The buffer used to create each acceleration structure in pAccelerationStructures must be bound to memory that was not allocated with multiple instances

**Valid Usage (Implicit)**

- VUID-vkWriteAccelerationStructuresPropertiesKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parameter
  pAccelerationStructures must be a valid pointer to an array of accelerationStructureCount valid VkAccelerationStructureKHR handles

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-parameter
  queryType must be a valid VkQueryType value
• VUID-vkWriteAccelerationStructuresPropertiesKHR-pData-parameter
  \textit{pData} \textbf{must} be a valid pointer to an array of \textit{dataSize} bytes

• VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructureCount-arraylength
  \textit{accelerationStructureCount} \textbf{must} be greater than 0

• VUID-vkWriteAccelerationStructuresPropertiesKHR-dataSize-arraylength
  \textit{dataSize} \textbf{must} be greater than 0

• VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parent
  Each element of \textit{pAccelerationStructures} \textbf{must} have been created, allocated, or retrieved from \textit{device}

Return Codes

\textbf{Success}

• \texttt{VK_SUCCESS}

\textbf{Failure}

• \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
• \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}
Chapter 38. Micromap

38.1. Micromaps

Acceleration structures store and organize geometry for ray tracing, but in some cases it is beneficial to include some information within the geometry, particularly for triangles. A *micromap* organizes this data around a map of values corresponding to subdivided microtriangles which can be added to a triangle geometry when building a *bottom level acceleration structure*.

An *opacity micromap* is a type of micromap which stores information to control intersection opacity as described in Ray Opacity Micromap.

A *displacement micromap* is a type of micromap which stores information to displace sub-triangle vertices as described in Displacement Micromap.

A micromap is considered to be constructed if a micromap build command or copy command has been executed with the given acceleration structure as the destination.

38.1.1. Building Micromaps

To build micromaps call:

```c
// Provided by VK_EXT_opacity_micromap
define vkCmdBuildMicromapsEXT(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkMicromapBuildInfoEXT* pInfos);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of micromaps to build. It specifies the number of the `pInfos` structures that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkMicromapBuildInfoEXT` structures defining the data used to build each micromap.

The `vkCmdBuildMicromapsEXT` command provides the ability to initiate multiple micromaps builds, however there is no ordering or synchronization implied between any of the individual micromap builds.

**Note**

This means that there cannot be any memory aliasing between any micromap memories or scratch memories being used by any of the builds.

Accesses to the micromap scratch buffers as identified by the `VkMicromapBuildInfoEXT` `:scratchData` buffer device addresses must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of (`VK_ACCESS_2_MICROMAP_READ_BIT_EXT` | `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`). Accesses to
VkMicromapBuildInfoEXT::dstMicromap must be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT.

Accesses to other input buffers as identified by any used values of VkMicromapBuildInfoEXT::data or VkMicromapBuildInfoEXT::triangleArray must be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_SHADER_READ_BIT.

Valid Usage

• VUID-vkCmdBuildMicromapsEXT-pInfos-07461
  For each pInfos[i], dstMicromap must have been created with a value of VkMicromapCreateInfoEXT::size greater than or equal to the memory size required by the build operation, as returned by vkGetMicromapBuildSizesEXT with pBuildInfo = pInfos[i]

• VUID-vkCmdBuildMicromapsEXT-mode-07462
  The mode member of each element of pInfos must be a valid VkBuildMicromapModeEXT value

• VUID-vkCmdBuildMicromapsEXT-dstMicromap-07463
  The dstMicromap member of any element of pInfos must be a valid VkMicromapEXT handle

• VUID-vkCmdBuildMicromapsEXT-pInfos-07464
  For each element of pInfos its type member must match the value of VkMicromapCreateInfoEXT::type when its dstMicromap was created

• VUID-vkCmdBuildMicromapsEXT-dstMicromap-07465
  The range of memory backing the dstMicromap member of any element of pInfos that is accessed by this command must not overlap the memory backing the dstMicromap member of any other element of pInfos, which is accessed by this command

• VUID-vkCmdBuildMicromapsEXT-dstMicromap-07466
  The range of memory backing the dstMicromap member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any element of pInfos (including the same element), which is accessed by this command

• VUID-vkCmdBuildMicromapsEXT-scratchData-07467
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any other element of pInfos, which is accessed by this command

• VUID-vkCmdBuildMicromapsEXT-pInfos-07508
  For each element of pInfos, the buffer used to create its dstMicromap member must be bound to device memory

• VUID-vkCmdBuildMicromapsEXT-pInfos-07509
  If pInfos[i].mode is VK_BUILD_MICROMAP_MODE_BUILD_EXT, all addresses between pInfos[i].scratchData.deviceAddress and pInfos[i].scratchData.deviceAddress + N - 1 must be in
the buffer device address range of the same buffer, where N is given by the
buildScratchSize member of the VkMicromapBuildSizesInfoEXT structure returned from
a call to vkGetMicromapBuildSizesEXT with an identical VkMicromapBuildInfoEXT
structure and primitive count

• VUID-vkCmdBuildMicromapsEXT-data-07510
  The buffers from which the buffer device addresses for all of the data and triangleArray
  members of all pInfo[i] are queried must have been created with the
  VK_BUFFER_USAGE_MICROMAP_BUILD_INPUT_READ_ONLY_BIT_EXT usage flag

• VUID-vkCmdBuildMicromapsEXT-pInfos-07511
  For each element of pInfo[i] the buffer from which the buffer device address pInfo
  [i].scratchData.deviceAddress is queried must have been created with
  VK_BUFFER_USAGE_STORAGE_BUFFER_BIT usage flag

• VUID-vkCmdBuildMicromapsEXT-pInfos-07512
  For each element of pInfo, its scratchData.deviceAddress, data.deviceAddress, and
  triangleArray.deviceAddress members must be valid device addresses obtained from
  vkGetBufferDeviceAddress

• VUID-vkCmdBuildMicromapsEXT-pInfos-07513
  For each element of pInfo, if scratchData.deviceAddress, data.deviceAddress, or
  triangleArray.deviceAddress is the address of a non-sparse buffer then it must be bound
  completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdBuildMicromapsEXT-pInfos-07514
  For each element of pInfo, its scratchData.deviceAddress member must be a multiple of
  VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchO
  ffsetAlignment

• VUID-vkCmdBuildMicromapsEXT-pInfos-07515
  For each element of pInfo, its triangleArray.deviceAddress and data.deviceAddress
  members must be a multiple of 256

Valid Usage (Implicit)

• VUID-vkCmdBuildMicromapsEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdBuildMicromapsEXT-pInfos-parameter
  pInfo must be a valid pointer to an array of infoCount valid VkMicromapBuildInfoEXT
  structures

• VUID-vkCmdBuildMicromapsEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdBuildMicromapsEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute
  operations

• VUID-vkCmdBuildMicromapsEXT-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdBuildMicromapsEXT-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBuildMicromapsEXT-infoCount-arraylength
  infoCount must be greater than 0

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

Formats which can be set inVkMicromapUsageEXT::format and VkMicromapTriangleEXT::format for micromap builds, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkOpacityMicromapFormatEXT {
    VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT = 1,
    VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT = 2,
} VkOpacityMicromapFormatEXT;
```

- VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT indicates that the given micromap format has one bit per subtriangle encoding either fully opaque or fully transparent.
- VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT indicates that the given micromap format has two bits per subtriangle encoding four modes which can be interpreted as described in ray traversal.

**Note**

For compactness, these values are stored as 16-bit in some structures.

Formats which can be set in VkMicromapUsageEXT::format and VkMicromapTriangleEXT::format for micromap builds, are:
// Provided by VK_NV_displacement_micromap
typedef enum VkDisplacementMicromapFormatNV {
    VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV = 1,
    VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV = 2,
    VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV = 3,
} VkDisplacementMicromapFormatNV;

- **VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV** indicates that the given micromap format encodes 64 micro-triangles worth of displacements in 64 bytes as described in Displacement Micromap Encoding.

- **VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV** indicates that the given micromap format encodes 256 micro-triangles worth of displacements in 128 bytes as described in Displacement Micromap Encoding.

- **VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV** indicates that the given micromap format encodes 1024 micro-triangles worth of displacements in 128 bytes as described in Displacement Micromap Encoding.

Note

For compactness, these values are stored as 16-bit in some structures.

The **VkMicromapBuildInfoEXT** structure is defined as:

// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapBuildInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapTypeEXT type;
    VkBuildMicromapFlagsEXT flags;
    VkBuildMicromapModeEXT mode;
    VkMicromapEXT dstMicromap;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
    VkDeviceOrHostAddressConstKHR data;
    VkDeviceOrHostAddressKHR scratchData;
    VkDeviceOrHostAddressConstKHR triangleArray;
    VkDeviceSize triangleArrayStride;
} VkMicromapBuildInfoEXT;

- **sType** is a **VkStructureType** value identifying this structure.

- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **type** is a **VkMicromapTypeEXT** value specifying the type of micromap being built.

- **flags** is a bitmask of **VkBuildMicromapFlagBitsEXT** specifying additional parameters of the micromap.
• **mode** is a `VkBuildMicromapModeEXT` value specifying the type of operation to perform.

• **dstMicromap** is a pointer to the target micromap for the build.

• **usageCountsCount** specifies the number of usage counts structures that will be used to determine the size of this micromap.

• **pUsageCounts** is a pointer to an array of `VkMicromapUsageEXT` structures.

• **ppUsageCounts** is a pointer to an array of pointers to `VkMicromapUsageEXT` structures.

• **data** is the device or host address to memory which contains the data for the micromap.

• **scratchData** is the device or host address to memory that will be used as scratch memory for the build.

• **triangleArray** is the device or host address to memory containing the `VkMicromapTriangleEXT` data.

• **triangleArrayStride** is the stride in bytes between each element of **triangleArray**.

Only one of **pUsageCounts** or **ppUsageCounts** can be a valid pointer, the other must be NULL. The elements of the non-NULL array describe the total counts used to build each micromap. Each element contains a **count** which is the number of micromap triangles of that **format** and **subdivisionLevel** contained in the micromap. Multiple elements with the same **format** and **subdivisionLevel** are allowed and the total count for that **format** and **subdivisionLevel** is the sum of the **count** for each element.

Each micromap triangle refers to one element in **triangleArray** which contains the **format** and **subdivisionLevel** for that particular triangle as well as a **dataOffset** in bytes which is the location relative to **data** where that triangle's micromap data begins. The data at **triangleArray** is laid out as a 4 byte unsigned integer for the **dataOffset** followed by a 2 byte unsigned integer for the subdivision level then a 2 byte unsigned integer for the format. In practice, compilers compile `VkMicromapTriangleEXT` to match this pattern.

For opacity micromaps, the data at **data** is packed as either one bit per element for `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` or two bits per element for `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` and is packed from LSB to MSB in each byte. The data at each index in those bytes is interpreted as discussed in Ray Opacity Micromap.

For displacement micromaps, the data at **data** is interpreted as discussed in Displacement Micromap Encoding.

---

### Valid Usage

- **VUID-VkMicromapBuildInfoEXT-pUsageCounts-07516**
  Only one of **pUsageCounts** or **ppUsageCounts** can be a valid pointer, the other must be NULL.

- **VUID-VkMicromapBuildInfoEXT-type-07517**
  If **type** is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` the **format** member of `VkMicromapUsageEXT` must be a valid value from `VkOpacityMicromapFormatEXT`.

- **VUID-VkMicromapBuildInfoEXT-type-07518**
  If **type** is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` the **format** member of...
**VkMicromapTriangleEXT** must be a valid value from **VkOpacityMicromapFormatEXT**

- VUID-VkMicromapBuildInfoEXT-type-08704
  If type is **VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV** the format member of **VkMicromapUsageEXT** must be a valid value from **VkDisplacementMicromapFormatNV**

- VUID-VkMicromapBuildInfoEXT-type-08705
  If type is **VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV** the format member of **VkMicromapTriangleEXT** must be a valid value from **VkDisplacementMicromapFormatNV**

---

**Valid Usage (Implicit)**

- VUID-VkMicromapBuildInfoEXT-sType-sType
  sType must be **VK_STRUCTURE_TYPE_MICROMAP_BUILD_INFO_EXT**

- VUID-VkMicromapBuildInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkMicromapBuildInfoEXT-type-parameter
  type must be a valid **VkMicromapTypeEXT** value

- VUID-VkMicromapBuildInfoEXT-flags-parameter
  flags must be a valid combination of **VkBuildMicromapFlagBitsEXT** values

- VUID-VkMicromapBuildInfoEXT-pUsageCounts-parameter
  If usageCountsCount is not 0, and pUsageCounts is not NULL, pUsageCounts must be a valid pointer to an array of usageCountsCount **VkMicromapUsageEXT** structures

- VUID-VkMicromapBuildInfoEXT-ppUsageCounts-parameter
  If usageCountsCount is not 0, and ppUsageCounts is not NULL, ppUsageCounts must be a valid pointer to an array of usageCountsCount valid pointers to **VkMicromapUsageEXT** structures

---

The **VkBuildMicromapModeEXT** enumeration is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkBuildMicromapModeEXT {
    VK_BUILD_MICROMAP_MODE_BUILD_EXT = 0,
} VkBuildMicromapModeEXT;
```

- **VK_BUILD_MICROMAP_MODE_BUILD_EXT** specifies that the destination micromap will be built using the specified data.

The **VkMicromapUsageEXT** structure is defined as:
typedef struct VkMicromapUsageEXT {
  uint32_t count;
  uint32_t subdivisionLevel;
  uint32_t format;
} VkMicromapUsageEXT;

- **count** is the number of triangles in the usage format defined by the **subdivisionLevel** and **format** below in the micromap
- **subdivisionLevel** is the subdivision level of this usage format
- **format** is the format of this usage format

### Valid Usage

- **VUID-VkMicromapUsageEXT-format-07519**
  If the **VkMicromapTypeEXT** of the micromap is **VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT**
  then **format** must be **VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT** or **VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT**

- **VUID-VkMicromapUsageEXT-format-07520**
  If the **VkMicromapTypeEXT** of the micromap is **VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT**
  and **format** is **VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT** then **subdivisionLevel** must be less than or equal to **VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity2StateSubdivisionLevel**

- **VUID-VkMicromapUsageEXT-format-07521**
  If the **VkMicromapTypeEXT** of the micromap is **VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT**
  and **format** is **VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT** then **subdivisionLevel** must be less than or equal to **VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity4StateSubdivisionLevel**

- **VUID-VkMicromapUsageEXT-format-08706**
  If the **VkMicromapTypeEXT** of the micromap is **VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV**
  then **format** must be **VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV**, **VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV** or **VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV**

- **VUID-VkMicromapUsageEXT-subdivisionLevel-08707**
  If the **VkMicromapTypeEXT** of the micromap is **VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV**
  then **subdivisionLevel** must be less than or equal to **VkPhysicalDeviceDisplacementMicromapPropertiesNV::maxDisplacementMicromapSubdivisionLevel**

The **format** is interpreted based on the **type** of the micromap using it.

The **VkMicromapTriangleEXT** structure is defined as:
// Provided by VK_EXT.opacity_micromap

typedef struct VkMicromapTriangleEXT {
    uint32_t dataOffset;
    uint16_t subdivisionLevel;
    uint16_t format;
} VkMicromapTriangleEXT;

- **dataOffset** is the offset in bytes of the start of the data for this triangle. This is a byte aligned value.
- **subdivisionLevel** is the subdivision level of this triangle
- **format** is the format of this triangle

**Valid Usage**

- **VUID-VkMicromapTriangleEXT-format-07522**
  If the **VkMicromapTypeEXT** of the micromap is VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT then **format** must be VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT or VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT

- **VUID-VkMicromapTriangleEXT-format-07523**
  If the **VkMicromapTypeEXT** of the micromap is VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT and **format** is VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT then **subdivisionLevel** must be less than or equal to VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity2StateSubdivisionLevel

- **VUID-VkMicromapTriangleEXT-format-07524**
  If the **VkMicromapTypeEXT** of the micromap is VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT and **format** is VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT then **subdivisionLevel** must be less than or equal to VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity4StateSubdivisionLevel

- **VUID-VkMicromapTriangleEXT-format-08708**
  If the **VkMicromapTypeEXT** of the micromap is VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV then **format** must be VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV, VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV or VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV

- **VUID-VkMicromapTriangleEXT-subdivisionLevel-08709**
  If the **VkMicromapTypeEXT** of the micromap is VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV then **subdivisionLevel** must be less than or equal to VkPhysicalDeviceDisplacementMicromapPropertiesNV::maxDisplacementMicromapSubdivisionLevel

The **format** is interpreted based on the **type** of the micromap using it.
38.1.2. Copying Micromaps

An additional command exists for copying micromaps without updating their contents. Before copying, an application must query the size of the resulting micromap.

To query micromap size parameters call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdWriteMicromapsPropertiesEXT(
    VkCommandBuffer commandBuffer,
    uint32_t micromapCount,
    const VkMicromapEXT* pMicromaps,
    VkQueryType queryType,
    VkQueryPool queryPool,
    uint32_t firstQuery);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `micromapCount` is the count of micromaps for which to query the property.
- `pMicromaps` is a pointer to an array of existing previously built micromaps.
- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
- `queryPool` is the query pool that will manage the results of the query.
- `firstQuery` is the first query index within the query pool that will contain the `micromapCount` number of results.

Accesses to any of the micromaps listed in `pMicromaps` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`.

- If `queryType` is `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`, then the value written out is the number of bytes required by a serialized micromap.
- If `queryType` is `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT`, then the value written out is the number of bytes required by a compacted micromap.

Valid Usage

- VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-07525 `queryPool` must have been created with a `queryType` matching `queryType`
- VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-07526 The queries identified by `queryPool` and `firstQuery` must be unavailable
- VUID-vkCmdWriteMicromapsPropertiesEXT-buffer-07527 The `buffer` used to create each micromap in `pMicromaps` must be bound to device memory
- VUID-vkCmdWriteMicromapsPropertiesEXT-query-07528 The sum of `query` plus `micromapCount` must be less than or equal to the number of queries in `queryPool`
• VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-07501
All micromaps in pMicromaps must have been constructed prior to the execution of this command

• VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-07502
All micromaps in pMicromaps must have been constructed with
VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT if queryType is
VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT

• VUID-vkCmdWriteMicromapsPropertiesEXT-queryType-07503
queryType must be VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT or
VK_QUERY_TYPE_MICROMAP.Serialization_SIZE_EXT

---

**Valid Usage (Implicit)**

• VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-parameter
pMicromaps must be a valid pointer to an array of micromapCount valid VkMicromapEXT handles

• VUID-vkCmdWriteMicromapsPropertiesEXT-queryType-parameter
queryType must be a valid VkQueryType value

• VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-parameter
queryPool must be a valid VkQueryPool handle

• VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdWriteMicromapsPropertiesEXT-renderpass
This command must only be called outside of a render pass instance

• VUID-vkCmdWriteMicromapsPropertiesEXT-viddecoding
This command must only be called outside of a video coding scope

• VUID-vkCmdWriteMicromapsPropertiesEXT-micromapCount-arraylength
micromapCount must be greater than 0

• VUID-vkCmdWriteMicromapsPropertiesEXT-commonparent
Each of commandBuffer, queryPool, and the elements of pMicromaps must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally
To copy a micromap call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMicromapEXT(
    VkCommandBuffer commandBuffer,
    const VkCopyMicromapInfoEXT* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a `VkCopyMicromapInfoEXT` structure defining the copy operation.

This command copies the `pInfo->src` micromap to the `pInfo->dst` micromap in the manner specified by `pInfo->mode`.

Accesses to `pInfo->src` and `pInfo->dst` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT` or `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT` as appropriate.

### Valid Usage

- **VUID-vkCmdCopyMicromapEXT-buffer-07529**
  The `buffer` used to create `pInfo->src` must be bound to device memory

- **VUID-vkCmdCopyMicromapEXT-buffer-07530**
  The `buffer` used to create `pInfo->dst` must be bound to device memory

### Valid Usage (Implicit)

- **VUID-vkCmdCopyMicromapEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyMicromapEXT-pInfo-parameter**
  `pInfo` must be a valid pointer to a valid `VkCopyMicromapInfoEXT` structure

- **VUID-vkCmdCopyMicromapEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdCopyMicromapEXT-commandBuffer-cmdpool**

The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdCopyMicromapEXT-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyMicromapEXT-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkCopyMicromapInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMicromapInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapEXT src;
    VkMicromapEXT dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMicromapInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source micromap for the copy.
- `dst` is the target micromap for the copy.
- `mode` is a `VkCopyMicromapModeEXT` value specifying additional operations to perform during the copy.

### Valid Usage

- VUID-VkCopyMicromapInfoEXT-mode-07531
**Valid Usage (Implicit)**

- **VUID-VkCopyMicromapInfoEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_COPY_MICROMAP_INFO_EXT`

- **VUID-VkCopyMicromapInfoEXT-pNext-pNext**
  - `pNext` must be `NULL`

- **VUID-VkCopyMicromapInfoEXT-src-parameter**
  - `src` must be a valid `VkMicromapEXT` handle

- **VUID-VkCopyMicromapInfoEXT-dst-parameter**
  - `dst` must be a valid `VkMicromapEXT` handle

- **VUID-VkCopyMicromapInfoEXT-mode-parameter**
  - `mode` must be a valid `VkCopyMicromapModeEXT` value

- **VUID-VkCopyMicromapInfoEXT-commonparent**
  - Both of `dst`, and `src` must have been created, allocated, or retrieved from the same `VkDevice`

Possible values of `mode` specifying additional operations to perform during the copy, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkCopyMicromapModeEXT {
    VK_COPY_MICROMAP_MODE_CLONE_EXT = 0,
    VK_COPY_MICROMAP_MODE_SERIALIZE_EXT = 1,
    VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT = 2,
    VK_COPY_MICROMAP_MODE_COMPACT_EXT = 3,
} VkCopyMicromapModeEXT;
```

- **`VK_COPY_MICROMAP_MODE_CLONE_EXT`** creates a direct copy of the micromap specified in `src` into the one specified by `dst`. The `dst` micromap must have been created with the same parameters as `src`.

- **`VK_COPY_MICROMAP_MODE_SERIALIZE_EXT`** serializes the micromap to a semi-opaque format which
can be reloaded on a compatible implementation.

- **VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT** deserializes the semi-opaque serialization format in the buffer to the micromap.

- **VK_COPY_MICROMAP_MODE_COMPACT_EXT** creates a more compact version of a micromap src into dst. The micromap dst must have been created with a size at least as large as that returned by vkCmdWriteMicromapsPropertiesEXT after the build of the micromap specified by src.

To copy a micromap to device memory call:

```cpp
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMicromapToMemoryEXT(
    VkCommandBuffer commandBuffer,
    const VkCopyMicromapToMemoryInfoEXT* pInfo);
```

- **commandBuffer** is the command buffer into which the command will be recorded.

- **pInfo** is an a pointer to a **VkCopyMicromapToMemoryInfoEXT** structure defining the copy operation.

Accesses to **pInfo->src** must be synchronized with the **VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT** pipeline stage and an access type of **VK_ACCESS_2_MICROMAP_READ_BIT_EXT**. Accesses to the buffer indicated by **pInfo->dst.deviceAddress** must be synchronized with the **VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT** pipeline stage and an access type of **VK_ACCESS_TRANSFER_WRITE_BIT**.

This command produces the same results as **vkCopyMicromapToMemoryEXT**, but writes its result to a device address, and is executed on the device rather than the host. The output may not necessarily be bit-for-bit identical, but it can be equally used by either **vkCmdCopyMemoryToMicromapEXT** or **vkCopyMemoryToMicromapEXT**.

The defined header structure for the serialized data consists of:

- **VK_UUID_SIZE** bytes of data matching **VkPhysicalDeviceIDProperties::driverUUID**

- **VK_UUID_SIZE** bytes of data identifying the compatibility for comparison using **vkGetDeviceMicromapCompatibilityEXT**. The serialized data is written to the buffer (or read from the buffer) according to the host endianness.

### Valid Usage

- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07536
  pInfo->dst.deviceAddress must be a valid device address for a buffer bound to device memory

- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07537
  pInfo->dst.deviceAddress must be aligned to 256 bytes

- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07538
  If the buffer pointed to by **pInfo->dst.deviceAddress** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object
The buffer used to create pInfo->src must be bound to device memory.

Valid Usage (Implicit)

- VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle.

- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyMicromapToMemoryInfoEXT structure.

- VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-recording
  commandBuffer must be in the recording state.

- VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations.

- VUID-vkCmdCopyMicromapToMemoryEXT-renderpass
  This command must only be called outside of a render pass instance.

- VUID-vkCmdCopyMicromapToMemoryEXT-videocoding
  This command must only be called outside of a video coding scope.

Host Synchronization

- Host access to commandBuffer must be externally synchronized.

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>

// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMicromapToMemoryInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapEXT src;
    VkDeviceOrHostAddressKHR dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMicromapToMemoryInfoEXT;
• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **src** is the source micromap for the copy

• **dst** is the device or host address to memory which is the target for the copy

• **mode** is a **VkCopyMicromapModeEXT** value specifying additional operations to perform during the copy.

---

### Valid Usage

- **VUID-VkCopyMicromapToMemoryInfoEXT-src-07540**
  
  The source micromap **src** must have been constructed prior to the execution of this command.

- **VUID-VkCopyMicromapToMemoryInfoEXT-dst-07541**
  
  The memory pointed to by **dst** must be at least as large as the serialization size of **src**, as reported by **vkWriteMicromapsPropertiesEXT** or **vkCmdWriteMicromapsPropertiesEXT** with a query type of **VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT**.

- **VUID-VkCopyMicromapToMemoryInfoEXT-mode-07542**
  
  **mode** must be **VK_COPY_MICROMAP_MODE_SERIALIZE_EXT**

---

### Valid Usage (Implicit)

- **VUID-VkCopyMicromapToMemoryInfoEXT-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_COPY_MICROMAP_TO_MEMORY_INFO_EXT**

- **VUID-VkCopyMicromapToMemoryInfoEXT-pNext-pNext**
  
  **pNext** must be **NULL**

- **VUID-VkCopyMicromapToMemoryInfoEXT-src-parameter**
  
  **src** must be a valid **VkMicromapEXT** handle

- **VUID-VkCopyMicromapToMemoryInfoEXT-mode-parameter**
  
  **mode** must be a valid **VkCopyMicromapModeEXT** value

---

To copy device memory to a micromap call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMemoryToMicromapEXT(  
    VkCommandBuffer                commandBuffer,  
    const VkCopyMicromapToMemoryInfoEXT*  pInfo);
```

• **commandBuffer** is the command buffer into which the command will be recorded.

• **pInfo** is a pointer to a **VkCopyMicromapToMemoryInfoEXT** structure defining the copy operation.
Accesses to pInfo->dst must be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_2_MICROMAP_READ_BIT_EXT. Accesses to the buffer indicated by pInfo->src.deviceAddress must be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_TRANSFER_READ_BIT.

This command can accept micromaps produced by either vkCmdCopyMicromapToMemoryEXT or vkCopyMicromapToMemoryEXT.

### Valid Usage

- **VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07543**
  pInfo->src.deviceAddress must be a valid device address for a buffer bound to device memory

- **VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07544**
  pInfo->src.deviceAddress must be aligned to 256 bytes

- **VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07545**
  If the buffer pointed to by pInfo->src.deviceAddress is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdCopyMemoryToMicromapEXT-buffer-07546**
  The buffer used to create pInfo->dst must be bound to device memory

### Valid Usage (Implicit)

- **VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-parameter**
  commandBuffer must be a valid VkCommandBuffer handle

- **VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-parameter**
  pInfo must be a valid pointer to a valid VkCopyMemoryToMicromapInfoEXT structure

- **VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-recording**
  commandBuffer must be in the recording state

- **VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- **VUID-vkCmdCopyMemoryToMicromapEXT-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdCopyMemoryToMicromapEXT-videocoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally
synchronized

## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkCopyMemoryToMicromapInfoEXT` structure is defined as:

```c
typedef struct VkCopyMemoryToMicromapInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR src;
    VkMicromapEXT dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMemoryToMicromapInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **src** is the device or host address to memory containing the source data for the copy.
- **dst** is the target micromap for the copy.
- **mode** is a `VkCopyMicromapModeEXT` value specifying additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyMemoryToMicromapInfoEXT-src-07547**
  The source memory pointed to by `src` must contain data previously serialized using `vkCmdCopyMicromapToMemoryEXT`

- **VUID-VkCopyMemoryToMicromapInfoEXT-mode-07548**
  `mode` must be `VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT`

- **VUID-VkCopyMemoryToMicromapInfoEXT-src-07549**
  The data in `src` must have a format compatible with the destination physical device as returned by `vkGetDeviceMicromapCompatibilityEXT`

- **VUID-VkCopyMemoryToMicromapInfoEXT-dst-07550**
  `dst` must have been created with a size greater than or equal to that used to serialize the data in `src`
Valid Usage (Implicit)

- VUID-VkCopyMemoryToMicromapInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_MEMORY_TO_MICROMAP_INFO_EXT

- VUID-VkCopyMemoryToMicromapInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkCopyMemoryToMicromapInfoEXT-dst-parameter
  dst must be a valid VkMicromapEXT handle

- VUID-VkCopyMemoryToMicromapInfoEXT-mode-parameter
  mode must be a valid VkCopyMicromapModeEXT value

To check if a serialized micromap is compatible with the current device call:

```c
// Provided by VK_EXT_opacity_micromap
void vkGetDeviceMicromapCompatibilityEXT(
  VkDevice device,
  const VkMicromapVersionInfoEXT* pVersionInfo,
  VkAccelerationStructureCompatibilityKHR* pCompatibility);
```

- `device` is the device to check the version against.
- `pVersionInfo` is a pointer to a VkMicromapVersionInfoEXT structure specifying version information to check against the device.
- `pCompatibility` is a pointer to a VkAccelerationStructureCompatibilityKHR value in which compatibility information is returned.

Valid Usage

- VUID-vkGetDeviceMicromapCompatibilityEXT-micromap-07551
  The micromap feature must be enabled

Valid Usage (Implicit)

- VUID-vkGetDeviceMicromapCompatibilityEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetDeviceMicromapCompatibilityEXT-pVersionInfo-parameter
  pVersionInfo must be a valid pointer to a valid VkMicromapVersionInfoEXT structure

- VUID-vkGetDeviceMicromapCompatibilityEXT-pCompatibility-parameter
  pCompatibility must be a valid pointer to a VkAccelerationStructureCompatibilityKHR value

The VkMicromapVersionInfoEXT structure is defined as:
typedef struct VkMicromapVersionInfoEXT {
    VkStructureType sType;
    const void* pNext;
    const uint8_t* pVersionData;
} VkMicromapVersionInfoEXT;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pVersionData** is a pointer to the version header of a micromap as defined in `vkCmdCopyMicromapToMemoryEXT`

Note

`pVersionData` is a pointer to an array of `2xVK_UUID_SIZE uint8_t` values instead of two `VK_UUID_SIZE` arrays as the expected use case for this member is to be pointed at the header of a previously serialized micromap (via `vkCmdCopyMicromapToMemoryEXT` or `vkCopyMicromapToMemoryEXT`) that is loaded in memory. Using arrays would necessitate extra memory copies of the UUIDs.

Valid Usage (Implicit)

- **VUID-VkMicromapVersionInfoEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_MICROMAP_VERSION_INFO_EXT`
- **VUID-VkMicromapVersionInfoEXT-pNext-pNext**
  - `pNext` must be `NULL`
- **VUID-VkMicromapVersionInfoEXT-pVersionData-parameter**
  - `pVersionData` must be a valid pointer to an array of `2xVK_UUID_SIZE uint8_t` values

### 38.2. Host Micromap Operations

Implementations are also required to provide host implementations of the micromap operations if the `micromapHostCommands` feature is enabled:

- **vkBuildMicromapsEXT** corresponding to `vkCmdBuildMicromapsEXT`
- **vkCopyMicromapEXT** corresponding to `vkCmdCopyMicromapEXT`
- **vkCopyMicromapToMemoryEXT** corresponding to `vkCmdCopyMicromapToMemoryEXT`
- **vkCopyMemoryToMicromapEXT** corresponding to `vkCmdCopyMemoryToMicromapEXT`
- **vkWriteMicromapsPropertiesEXT** corresponding to `vkCmdWriteMicromapsPropertiesEXT`

These commands are functionally equivalent to their device counterparts, except that they are executed on the host timeline, rather than being enqueued into command buffers.
All micromaps used by the host commands must be bound to host-visible memory, and all input data for micromap builds must be referenced using host addresses instead of device addresses. Applications are not required to map micromap memory when using the host commands.

**Note**
The `vkBuildMicromapsEXT` and `vkCmdBuildMicromapsEXT` may use different algorithms, and thus are not required to produce identical structures.

Apart from these details, the host and device operations are interchangeable.

**Note**
For efficient execution, micromaps manipulated using these commands should always be bound to host cached memory, as the implementation may need to repeatedly read and write this memory during the execution of the command.

To build micromaps on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkBuildMicromapsEXT(
    VkDevice device,                 // device
    VkDeferredOperationKHR deferredOperation,   // deferredOperation
    uint32_t infoCount,              // infoCount
    const VkMicromapBuildInfoEXT* pInfos);  // pInfos
```

- `device` is the `VkDevice` for which the micromaps are being built.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `infoCount` is the number of micromaps to build. It specifies the number of the `pInfos` that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkMicromapBuildInfoEXT` structures defining the geometry used to build each micromap.

This command fulfills the same task as `vkCmdBuildMicromapsEXT` but is executed by the host.

The `vkBuildMicromapsEXT` command provides the ability to initiate multiple micromaps builds, however there is no ordering or synchronization implied between any of the individual micromap builds.

**Note**
This means that there cannot be any memory aliasing between any micromap memories or scratch memories being used by any of the builds.

**Valid Usage**
- VUID-vkBuildMicromapsEXT-pInfos-07461
For each `pInfos[i]`, `dstMicromap` must have been created with a value of `VkMicromapCreateInfoEXT:size` greater than or equal to the memory size required by the build operation, as returned by `vkGetMicromapBuildSizesEXT` with `pBuildInfo = pInfos[i]`

- **VUID-vkBuildMicromapsEXT-mode-07462**
  The `mode` member of each element of `pInfos` must be a valid `VkBuildMicromapModeEXT` value

- **VUID-vkBuildMicromapsEXT-dstMicromap-07463**
  The `dstMicromap` member of any element of `pInfos` must be a valid `VkMicromapEXT` handle

- **VUID-vkBuildMicromapsEXT-pInfos-07464**
  For each element of `pInfos` its `type` member must match the value of `VkMicromapCreateInfoEXT:type` when its `dstMicromap` was created

- **VUID-vkBuildMicromapsEXT-dstMicromap-07465**
  The range of memory backing the `dstMicromap` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `dstMicromap` member of any other element of `pInfos`, which is accessed by this command

- **VUID-vkBuildMicromapsEXT-dstMicromap-07466**
  The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command

- **VUID-vkBuildMicromapsEXT-scratchData-07467**
  The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command

- **VUID-vkBuildMicromapsEXT-pInfos-07552**
  For each element of `pInfos`, the buffer used to create its `dstMicromap` member must be bound to host-visible device memory

- **VUID-vkBuildMicromapsEXT-pInfos-07553**
  For each element of `pInfos`, all referenced addresses of `pInfos[i].data.hostAddress` must be valid host memory

- **VUID-vkBuildMicromapsEXT-pInfos-07554**
  For each element of `pInfos`, all referenced addresses of `pInfos[i].triangleArray.hostAddress` must be valid host memory

- **VUID-vkBuildMicromapsEXT-micromapHostCommands-07555**
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature must be enabled

- **VUID-vkBuildMicromapsEXT-pInfos-07556**
  If `pInfos[i].mode` is `VK_BUILD_MICROMAP_MODE_BUILD_EXT`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` must be valid host memory, where `N` is given by the `buildScratchSize` member of the `VkMicromapBuildSizesInfoEXT` structure returned from a call to
vkGetMicromapBuildSizesEXT with an identical VkMicromapBuildInfoEXT structure and primitive count

- VUID-vkBuildMicromapsEXT-pInfos-07557
  For each element of pInfos, the buffer used to create its dstMicromap member must be bound to memory that was not allocated with multiple instances

## Valid Usage (Implicit)

- VUID-vkBuildMicromapsEXT-device-parameter
device must be a valid VkDevice handle

- VUID-vkBuildMicromapsEXT-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

- VUID-vkBuildMicromapsEXT-pInfos-parameter
  pInfos must be a valid pointer to an array of infoCount valid VkMicromapBuildInfoEXT structures

- VUID-vkBuildMicromapsEXT-infoCount-arraylength
  infoCount must be greater than 0

- VUID-vkBuildMicromapsEXT-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

## Return Codes

### Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

### Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy or compact a micromap on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMicromapEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMicromapInfoEXT* pInfo);
```
- **device** is the device which owns the micromaps.
- **deferredOperation** is an optional `VkDeferredOperationKHR` to request deferral for this command.
- **pInfo** is a pointer to a `VkCopy Micromap Info EXT` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMicromapEXT` but is executed by the host.

### Valid Usage

- **VUID-vkCopyMicromapEXT-deferredOperation-03678**
  Any previous deferred operation that was associated with `deferredOperation` must be complete.

- **VUID-vkCopyMicromapEXT-buffer-07558**
  The buffer used to create `pInfo->src` must be bound to host-visible device memory.

- **VUID-vkCopyMicromapEXT-buffer-07559**
  The buffer used to create `pInfo->dst` must be bound to host-visible device memory.

- **VUID-vkCopyMicromapEXT-micromapHostCommands-07560**
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature must be enabled.

- **VUID-vkCopyMicromapEXT-buffer-07561**
  The buffer used to create `pInfo->src` must be bound to memory that was not allocated with multiple instances.

- **VUID-vkCopyMicromapEXT-buffer-07562**
  The buffer used to create `pInfo->dst` must be bound to memory that was not allocated with multiple instances.

### Valid Usage (Implicit)

- **VUID-vkCopyMicromapEXT-device-parameter**
  `device` must be a valid `VkDevice` handle.

- **VUID-vkCopyMicromapEXT-deferredOperation-parameter**
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle.

- **VUID-vkCopyMicromapEXT-pInfo-parameter**
  `pInfo` must be a valid pointer to a valid `VkCopyMicromapInfoEXT` structure.

- **VUID-vkCopyMicromapEXT-deferredOperation-parent**
  If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`. 
Return Codes

Success
- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy host accessible memory to a micromap, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMemoryToMicromapEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMemoryToMicromapInfoEXT* pInfo);
```

- `device` is the device which owns `pInfo->dst`.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `pInfo` is a pointer to a `VkCopyMemoryToMicromapInfoEXT` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMemoryToMicromapEXT` but is executed by the host.

This command can accept micromaps produced by either `vkCmdCopyMicromapToMemoryEXT` or `vkCopyMicromapToMemoryEXT`.

Valid Usage

- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` must be complete

- VUID-vkCopyMemoryToMicromapEXT-pInfo-07563
  `pInfo->src.hostAddress` must be a valid host pointer

- VUID-vkCopyMemoryToMicromapEXT-pInfo-07564
  `pInfo->src.hostAddress` must be aligned to 16 bytes

- VUID-vkCopyMemoryToMicromapEXT-buffer-07565
  The `buffer` used to create `pInfo->dst` must be bound to host-visible device memory

- VUID-vkCopyMemoryToMicromapEXT-micromapHostCommands-07566
The VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands feature must be enabled

- VUID-vkCopyMemoryToMicromapEXT-buffer-07567
  The buffer used to create pInfo->dst must be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkCopyMemoryToMicromapEXT-device-parameter
device must be a valid VkDevice handle

- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

- VUID-vkCopyMemoryToMicromapEXT-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyMemoryToMicromapInfoEXT structure

- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy a micromap to host accessible memory, call:

// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMicromapToMemoryEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMicromapToMemoryInfoEXT* pInfo);

- device is the device which owns pInfo->src.
- deferredOperation is an optional VkDeferredOperationKHR to request deferral for this command.
- `pInfo` is a pointer to a `VkCopyMicromapToMemoryInfoEXT` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMicromapToMemoryEXT` but is executed by the host.

This command produces the same results as `vkCmdCopyMicromapToMemoryEXT`, but writes its result directly to a host pointer, and is executed on the host rather than the device. The output may not necessarily be bit-for-bit identical, but it can be equally used by either `vkCmdCopyMemoryToMicromapEXT` or `vkCopyMemoryToMicromapEXT`.

### Valid Usage

- **VUID-vkCopyMicromapToMemoryEXT-deferredOperation-03678**
  Any previous deferred operation that was associated with `deferredOperation` must be complete

- **VUID-vkCopyMicromapToMemoryEXT-buffer-07568**
  The buffer used to create `pInfo->src` must be bound to host-visible device memory

- **VUID-vkCopyMicromapToMemoryEXT-pInfo-07569**
  `pInfo->dst.hostAddress` must be a valid host pointer

- **VUID-vkCopyMicromapToMemoryEXT-pInfo-07570**
  `pInfo->dst.hostAddress` must be aligned to 16 bytes

- **VUID-vkCopyMicromapToMemoryEXT-micromapHostCommands-07571**
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature must be enabled

- **VUID-vkCopyMicromapToMemoryEXT-buffer-07572**
  The buffer used to create `pInfo->src` must be bound to memory that was not allocated with multiple instances

### Valid Usage (Implicit)

- **VUID-vkCopyMicromapToMemoryEXT-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkCopyMicromapToMemoryEXT-deferredOperation-parameter**
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle

- **VUID-vkCopyMicromapToMemoryEXT-pInfo-parameter**
  `pInfo` must be a valid pointer to a valid `VkCopyMicromapToMemoryInfoEXT` structure

- **VUID-vkCopyMicromapToMemoryEXT-deferredOperation-parent**
  If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`
Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query micromap size parameters on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkWriteMicromapsPropertiesEXT(
    VkDevice device,
    uint32_t micromapCount,
    const VkMicromapEXT* pMicromaps,
    VkQueryType queryType,
    size_t dataSize,
    void* pData,
    size_t stride);
```

- `device` is the device which owns the micromaps in `pMicromaps`.
- `micromapCount` is the count of micromaps for which to query the property.
- `pMicromaps` is a pointer to an array of existing previously built micromaps.
- `queryType` is a `VkQueryType` value specifying the property to be queried.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to a user-allocated buffer where the results will be written.
- `stride` is the stride in bytes between results for individual queries within `pData`.

This command fulfills the same task as `vkCmdWriteMicromapsPropertiesEXT` but is executed by the host.

Valid Usage

- VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-07501
  All micromaps in `pMicromaps` must have been constructed prior to the execution of this command

- VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-07502
  All micromaps in `pMicromaps` must have been constructed with `VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT` if `queryType` is `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT`
• VUID-vkWriteMicromapsPropertiesEXT-queryType-07503
  queryType must be VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT or
  VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT

• VUID-vkWriteMicromapsPropertiesEXT-queryType-07573
  If queryType is VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT, then stride must be a
  multiple of the size of VkDeviceSize

• VUID-vkWriteMicromapsPropertiesEXT-queryType-07574
  If queryType is VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT, then pData must point to a
  VkDeviceSize

• VUID-vkWriteMicromapsPropertiesEXT-queryType-07575
  If queryType is

• VUID-vkWriteMicromapsPropertiesEXT-dataSize-07576
  dataSize must be greater than or equal to micromapCount*stride

• VUID-vkWriteMicromapsPropertiesEXT-buffer-07577
  The buffer used to create each micromap in pMicromaps must be bound to host-visible
device memory

• VUID-vkWriteMicromapsPropertiesEXT-micromapHostCommands-07578
  The VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands feature must be
  enabled

• VUID-vkWriteMicromapsPropertiesEXT-buffer-07579
  The buffer used to create each micromap in pMicromaps must be bound to memory that
  was not allocated with multiple instances

Valid Usage (Implicit)

• VUID-vkWriteMicromapsPropertiesEXT-device-parameter
  device must be a valid VkDevice handle

• VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-parameter
  pMicromaps must be a valid pointer to an array of micromapCount valid VkMicromapEXT
  handles

• VUID-vkWriteMicromapsPropertiesEXT-queryType-parameter
  queryType must be a valid VkQueryType value

• VUID-vkWriteMicromapsPropertiesEXT-pData-parameter
  pData must be a valid pointer to an array of dataSize bytes

• VUID-vkWriteMicromapsPropertiesEXT-micromapCount-arraylength
  micromapCount must be greater than 0

• VUID-vkWriteMicromapsPropertiesEXT-dataSize-arraylength
  dataSize must be greater than 0

• VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-parent
  Each element of pMicromaps must have been created, allocated, or retrieved from device
38.2.1. Displacement Micromap

A displacement micromap in an acceleration structure includes information in the `VkAccelerationStructureTrianglesDisplacementMicromapNV` to define a base triangle and displacement directions then uses displacement information encoded in the micromap to apply to those values to generate the final position.

**Displacement Base Triangle**

If `displacementBiasAndScaleBuffer` is provided the bias and scale are fetched from that buffer. If `displacementBiasAndScaleBuffer` is zero the bias and scale are assumed to be 0.0 and 1.0, respectively.

Given an input position from the geometry, the base position and displacement vector used by the displacement are computed by:

\[
\text{basePosition} = \text{inputPosition} + \text{displacementVector} \times \text{bias}
\]

\[
\text{baseDisplacementVector} = \text{displacementVector} \times \text{scale}
\]

The parameters of each micro-vertex are derived from a combination of the base triangle parameters extracted from the bottom-level acceleration structure, the barycentrics of that micro-vertex, and the displacement value fetched from the displacement micromap corresponding to that micro-vertex.

\[
\text{microVertexBasePosition} = \text{lerp} (\text{basePositions}, \text{microVertexBarycentrics})
\]

\[
\text{microVertexDisplacementVector} = \text{lerp} (\text{displacementVectors}, \text{microVertexBarycentrics})
\]

\[
\text{microVertexDisplacedPosition} = \text{microVertexBasePosition} + \text{microVertexDisplacementVector} \times \text{micromapDisplacementValue}
\]

**Displacement Micromap Encoding**

Displacement amounts are stored in displacement blocks, each covering a triangular region of microvertices. Depending on the subdivision level and encoding format, one or more displacement blocks combine to store all displacement values for a given displacement micromap.

Displacement blocks are organized along a space filling curve within a displacement micromap if more than one block is required, then micro-vertices are organized along the same space filling curve.
The space-filling curve is purely hierarchical with recursive splitting, similar to that for opacity micromaps but operating on vertices instead of triangles. To maintain that the hierarchical ordering is contiguous while keeping continuous winding, some triangles are flipped and wound differently.

The \texttt{VK\_DISPLACEMENT\_MICROMAP\_FORMAT\_64\_TRIANGLES\_64\_BYTES\_NV} format is an uncompressed, packed format which covers 64 microtriangles (subdivision level 3) in a block. The block contains 45 displacement values encoded as 11 bit unorm values and stored tightly packed in the vertex order described above, occupying 495 bits. This is followed by 15 unused bits then 2 reserved bits which must be 0. If this block is used to store displacement for a subdivision level below 3 the later unused values are ignored.

The substantial size of the \texttt{VK\_DISPLACEMENT\_MICROMAP\_FORMAT\_256\_TRIANGLES\_128\_BYTES\_NV} and \texttt{VK\_DISPLACEMENT\_MICROMAP\_FORMAT\_1024\_TRIANGLES\_128\_BYTES\_NV} formats store displacements in a compressed form to save space. Both formats use the same compression algorithm, differing in the number of bits used in the different fields.

The compression algorithm works by starting with fully specified anchor vertices, then for each level, predicting the value for the displacement and encoding the correction for that value, using fewer bits for each level of subdivision.

When adding a vertex in the recursive subdivision process between two adjacent displacement values, the predicted value is given by the rounded average of the two adjacent values as integers:

\[
prediction = (A + B + 1) / 2
\]

The decoded value after applying the correction is given by:

\[
decoded = prediction + ( \text{SignExtend}(\text{correction}) << \text{shift} )
\]

where correction is given by the corrections field for a given level and micro vertex and shift is given by the shifts field indexed from the level then by 4 values, selected from interior or the 3 edges in vertex order in that order.

Chapter 39. Ray Traversal

The ray traversal process identifies and handles intersections between a ray and geometries in an acceleration structure.

Ray traversal cannot be started by a Vulkan API command directly - a shader must execute OpRayQueryProceedKHR or a pipeline trace ray instruction. When the rayTracingPipeline feature is enabled, OpTraceRayKHR can be used for ray tracing in a ray tracing pipeline. When the rayQuery feature is enabled, OpRayQueryProceedKHR can be used in any shader stage.

39.1. Ray Intersection Candidate Determination

Once tracing begins, rays are first tested against instances in a top-level acceleration structure. A ray that intersects an instance will be transformed into the space of the instance to continue traversal within that instance; therefore the transform matrix stored in the instance must be invertible.

In case multiple instances are intersected by a ray, the ray transformation into the space of the instance is invariant under the order in which these instances are encountered in the top-level acceleration structure.

Note

Applying multiple forward and reverse transforms to a ray to transition from one instance to another could result in accumulated errors. Thus an implementation should behave as if the ray is transformed from the origin for each instance independently.

Next, rays are tested against geometries in a bottom-level acceleration structure to determine if a hit occurred between them, initially based only on their geometric properties (i.e. their vertices). The implementation performs similar operations to that of rasterization, but with the effective viewport determined by the parameters of the ray, and the geometry transformed into a space determined by that viewport.

The vertices of each primitive are transformed from acceleration structure space to ray space according to the ray origin and direction as follows:

\[
\begin{pmatrix}
    x_r \\
    y_r \\
    z_r
\end{pmatrix} = \begin{pmatrix}
    a_x^2(1 - c) + c & a_xa_y(1 - c) - sa_z & a_xa_z(1 - c) + sa_y \\
    a_xa_y(1 - c) + sa_z & a_y^2(1 - c) + c & a_ya_z(1 - c) - sa_x \\
    a_xa_z(1 - c) - sa_y & a_ya_z(1 - c) + sa_x & a_z^2(1 - c) + c
\end{pmatrix} \begin{pmatrix}
    x_{as} - o_x \\
    y_{as} - o_y \\
    z_{as} - o_z
\end{pmatrix}
\]

\(a\) is the axis of rotation from the unnormalized ray direction vector \(d\) to the axis vector \(k\):
and \( c \) are the sine and cosine of the angle of rotation about \( a \) from \( d \) to \( k \):

\[
c = \frac{d \cdot k}{|d|}
\]
\[
s = \sqrt{1 - c^2}
\]

\( k \) is the unit vector:

\[
k = \begin{pmatrix}
0 \\
0 \\
-1
\end{pmatrix}
\]

\( o \) and \( d \) are the ray origin and unnormalized direction, respectively; the vector described by \( x_{as}, y_{as}, \) and \( z_{as} \) is any position in acceleration structure space; and the vector described by \( x_r, y_r, \) and \( z_r \) is the same position in ray space.

An intersection candidate is a unique point of intersection between a ray and a geometric primitive. For any primitive that has within its bounds a position \( xyz_{as} \) such that

\[
x_r = 0 \\
y_r = 0 \\
t_{\min} < -\frac{z_r}{|d|} < t_{\max}
\]

if the primitive is a triangle,

\[
t_{\min} \leq -\frac{z_r}{|d|} \leq t_{\max}
\]

otherwise

(where \( t = -\frac{z_r}{|d|} \)), an intersection candidate exists.

Triangle primitive bounds consist of all points on the plane formed by the three vertices and within the bounds of the edges between the vertices, subject to the watertightness constraints below. AABB primitive bounds consist of all points within an implementation-defined bound which includes the specified box.

**Note**

The bounds of the AABB including all points internal to the bound implies that a ray started within the AABB will hit that AABB.
The determination of this condition is performed in an implementation specific manner, and may be performed with floating point operations. Due to the complexity and number of operations involved, inaccuracies are expected, particularly as the scale of values involved begins to diverge. Implementations should take efforts to maintain as much precision as possible.

Note

One very common case is when geometries are close to each other at some distance from the origin in acceleration structure space, where an effect similar to “z-fighting” is likely to be observed. Applications can mitigate this by ensuring their detailed geometries remain close to the origin.

Another likely case is when the origin of a ray is set to a position on a previously intersected surface, and its \( t_{\text{min}} \) is zero or near zero; an intersection may be detected on the emitting surface. This case can usually be mitigated by offsetting \( t_{\text{min}} \) slightly.

For a motion primitive or a motion instance, the positions for intersection are evaluated at the time specified in the \textit{time} parameter to \texttt{OpTraceRayMotionNV} by interpolating between the two endpoints as specified for the given motion type. If a motion acceleration structure is traced with \texttt{OpTraceRayKHR}, it behaves as a \texttt{OpTraceRayMotionNV} with \textit{time} of 0.0.

In the case of AABB geometries, implementations may increase their size in an acceleration structure in order to mitigate precision issues. This may result in false positive intersections being reported to the application.

For triangle intersection candidates, the \( b \) and \( c \) barycentric coordinates on the triangle where the above condition is met are made available to future shading. If the ray was traced with a pipeline \texttt{trace ray} instruction, these values are available as a vector of 2 32-bit floating point values in the \texttt{HitAttributeKHR} storage class.

Once an intersection candidate is determined, it proceeds through the following operations, in order:

1. Ray Intersection Culling
2. Ray Intersection Confirmation
3. Ray Closest Hit Determination
4. Ray Result Determination

The sections below describe the exact details of these tests. There is no ordering guarantee between
operations performed on different intersection candidates.

39.1.1. Watertightness

For a set of triangles with identical transforms, within a single instance:

- Any set of two or more triangles where all triangles have one vertex with an identical position value, that vertex is a shared vertex.
- Any set of two triangles with two shared vertices that were specified in the same winding order in each triangle have a shared edge defined by those vertices.

A closed fan is a set of three or more triangles where:

- All triangles in the set have the same shared vertex as one of their vertices.
- All edges that include the above vertex are shared edges.
- All above shared edges are shared by exactly two triangles from the set.
- No two triangles in the set intersect, except at shared edges.
- Every triangle in the set is joined to every other triangle in the set by a series of the above shared edges.

Implementations should not double-hit or miss when a ray intersects a shared edge, or a shared vertex of a closed fan.

39.2. Ray Intersection Culling

Candidate intersections go through several phases of culling before confirmation as an actual hit. There is no particular ordering dependency between the different culling operations.

39.2.1. Ray Primitive Culling

If the rayTraversalPrimitiveCulling or rayQuery features are enabled, the SkipTrianglesKHR and SkipAABBsKHR ray flags can be specified when tracing a ray. SkipTrianglesKHR and SkipAABBsKHR are mutually exclusive. SkipTrianglesKHR is also mutually exclusive with CullBackFacingTrianglesKHR and CullFrontFacingTrianglesKHR.

If SkipTrianglesKHR was included in the Ray Flags operand of the ray trace instruction, and the intersection is with a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs. If VK_PIPELINE_CREATERAY_TRACING_SKIP_TRIANGLES_BIT_KHR was included in the pipeline, traversal with pipeline trace ray instructions will all behave as if SkipTrianglesKHR was included in their Ray Flags operand.

If SkipAABBsKHR was included in the Ray Flags operand of the ray trace instruction, and the intersection is with an AABB primitive, the intersection is dropped, and no further processing of this intersection occurs. If VK_PIPELINE_CREATERAY_TRACING_SKIP_AABBs_BIT_KHR was included in the pipeline, traversal with pipeline trace ray instructions will all behave as if SkipAABBsKHR was included in their Ray Flags operand.
39.2.2. Ray Mask Culling

Instances can be made invisible to particular rays based on the value of VkAccelerationStructureInstanceKHR::mask used to add that instance to a top-level acceleration structure, and the Cull Mask parameter used to trace the ray.

For the instance which is intersected, if mask & Cull Mask == 0, the intersection is dropped, and no further processing occurs.

39.2.3. Ray Face Culling

As in polygon rasterization, one of the stages of ray traversal is to determine if a triangle primitive is back- or front-facing, and primitives can be culled based on that facing.

If the intersection candidate is with an AABB primitive, this operation is skipped.

**Determination**

When a ray intersects a triangle primitive, the order that vertices are specified for the polygon affects whether the ray intersects the front or back face. Front or back facing is determined in the same way as they are for rasterization, based on the sign of the polygon’s area but using the ray space coordinates instead of framebuffer coordinates. One way to compute this area is:

\[
a = -\frac{1}{2} \sum_{i=0}^{n-1} x_r^i y_r^{i+1} - x_r^{i+1} y_r^i
\]

where \(x_r^i\) and \(y_r^i\) are the x and y ray space coordinates of the ith vertex of the n-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and \(i \oplus 1\) is \((i + 1) \mod n\).

By default, if a is negative then the intersection is with the front face of the triangle, otherwise it is with the back face. If VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR is included in VkAccelerationStructureInstanceKHR::flags for the instance containing the intersected triangle, this determination is reversed. Additionally, if a is 0, the intersection candidate is treated as not intersecting with any face, irrespective of the sign.

**Note**

In a left-handed coordinate system, an intersection will be with the front face of a triangle if the vertices of the triangle, as defined in index order, appear from the ray’s perspective in a clockwise rotation order. VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR was previously annotated as VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR because of this.

If the ray was traced with a pipeline trace ray instruction, the HitKindKHR built-in is set to HitKindFrontFacingTriangleKHR if the intersection is with front-facing geometry, and HitKindBackFacingTriangleKHR if the intersection is with back-facing geometry, for shader stages considering this intersection.

If the ray was traced with OpRayQueryProceedKHR, OpRayQueryGetIntersectionFrontFaceKHR will return true for intersection candidates with front faces, or false for back faces.
Culling

If CullBackFacingTrianglesKHR was included in the Ray Flags parameter of the ray trace instruction, and the intersection is determined as with the back face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

If CullFrontFacingTrianglesKHR was included in the Ray Flags parameter of the ray trace instruction, and the intersection is determined as with the front face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

This culling is disabled if VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR was included in VkAccelerationStructureInstanceKHR::flags for the instance which the intersected geometry belongs to.

Intersection candidates that have not intersected with any face (a == 0) are unconditionally culled, irrespective of ray flags and geometry instance flags.

The CullBackFacingTrianglesKHR and CullFrontFacingTrianglesKHR Ray Flags are mutually exclusive.

39.2.4. Ray Opacity Culling

Each geometry in the acceleration structure may be considered either opaque or not. Opaque geometries continue through traversal as normal, whereas non-opaque geometries need to be either confirmed or discarded by shader code. Intersection candidates can also be culled based on their opacity.

Determination

Each individual intersection candidate is initially determined as opaque if VK_GEOMETRY_OPAQUE_BIT_KHR was included in the VkAccelerationStructureGeometryKHR::flags when the geometry it intersected with was built, otherwise it is considered non-opaque.

If the geometry includes an opacity micromap, the opacity of the intersection at this point is instead derived as described in Ray Opacity Micromap.

If the intersection candidate was generated by an intersection shader, the intersection is initially considered to have opacity matching the AABB candidate that it was generated from.

However, this opacity can be overridden when it is built into an instance. Setting VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR in VkAccelerationStructureInstanceKHR::flags will force all geometries in the instance to be considered opaque. Similarly, setting VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR will force all geometries in the instance to be considered non-opaque.

This can again be overridden by including OpaqueKHR or NoOpaqueKHR in the Ray Flags parameter when tracing a ray. OpaqueKHR forces all geometries to behave as if they are opaque, regardless of their build parameters. Similarly, NoOpaqueKHR forces all geometries to behave as if they are non-opaque.

If the ray was traced with OpRayQueryProceedKHR, to determine the opacity of AABB intersection candidates, OpRayQueryGetIntersectionCandidateAABBopaqueKHR can be used. This instruction will return true for opaque intersection candidates, and false for non-opaque intersection candidates.
Culling

If `CullOpaqueKHR` is included in the Ray Flags parameter when tracing a ray, an intersection with a geometry that is considered opaque is dropped, and no further processing occurs.

If `CullNoOpaqueKHR` is included in the Ray Flags parameter when tracing a ray, an intersection with a geometry that is considered non-opaque is dropped, and no further processing occurs.

The `OpaqueKHR`, `NoOpaqueKHR`, `CullOpaqueKHR`, and `CullNoOpaqueKHR` Ray Flags are mutually exclusive.

39.2.5. Ray Opacity Micromap

A `VK_GEOMETRY_TYPE_TRIANGLES_KHR` geometry in the acceleration structure may have an opacity micromap associated with it to give finer-grained opacity information.

If the intersection candidate is with a geometry with an associated opacity micromap and `VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT` is not set in its instance then the micromap is used to determine geometry opacity instead of the `VK_GEOMETRY_OPAQUE_BIT_KHR` flag in the geometry.

The opacity information in the micromap object is accessed using the candidate intersection u and v coordinates. The integer u and v are computed from $\lfloor u \rfloor + \lfloor v \rfloor$, clamping $\lfloor u \rfloor$ as needed to keep the sum less than or equal to $1 << \text{subdivisionlevel}$. These values are mapped into a linear index with a space filling curve which is defined recursively by traversing into the sub-triangle nearest vertex 0, then the middle triangle with ordering flipped, then nearest vertex 1 then nearest vertex 2.

![Figure 29. Example ordering for micromap data](image)

**Note**

This encoding is spatially coherent, purely hierarchical, and allows a bit-parallel conversion between barycentric address and index values.

See the appendix for reference code implementing this mapping.

The result of the opacity micromap lookup and operations is to treat the intersection as opaque, non-opaque, or ignored. The interpretation of the values depends on
VK_GEOMETRY_INSTANCE_FORCE_OPACITY_MICROMAP_2_STATE_EXT in the instance of the candidate intersection or ForceOpacityMicromap2StateEXT ray flags on the ray. If either is set, the opacity micromap information is interpreted in 2 state override mode. If the result of the micromap lookup is to treat the intersection candidate as ignored, no further processing of that candidate is done.

If the associated opacity micromap has format VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT, each element of the micromap is represented by a single bit at the index derived above.

If the associated opacity micromap has format VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT, each element is represented by a two bit value at the index derived above.

39.3. Ray Intersection Confirmation

Depending on the opacity of intersected geometry and whether it is a triangle or an AABB, candidate intersections are further processed to determine the eventual hit result. Candidates generated from AABB intersections run through the same confirmation process as triangle hits.
39.3.1. AABB Intersection Candidates

For an intersection candidate with an AABB geometry generated by Ray Intersection Candidate Determination, shader code is executed to determine whether any hits should be reported to the traversal infrastructure; no further processing of this intersection candidate occurs. The occurrence of an AABB intersection candidate does not guarantee the ray intersects the primitive bounds. To avoid propagating false intersections the application should verify the intersection candidate before reporting any hits.

If the ray was traced with a pipeline trace ray instruction, an intersection shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. If this shader calls OpReportIntersectionKHR, a new intersection candidate is generated as described below. If the intersection shader is VK_SHADER_UNUSED_KHR (which is only allowed for a zero shader group) then no further processing of the intersection candidate occurs.

Each new candidate generated as a result of this processing is a generated intersection candidate that intersects the AABB geometry, with a t value equal to the Hit parameter of the OpReportIntersectionKHR instruction. The new generated candidate is then independently run through Ray Intersection Confirmation as a generated intersection.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed OpRayQueryProceedKHR, returning true. The resulting ray query has a candidate intersection type of RayQueryCandidateIntersectionAABBKHR. OpRayQueryGenerateIntersectionKHR can be called to commit a new intersection candidate with committed intersection type of RayQueryCommittedIntersectionGeneratedKHR. Further ray query processing can be continued by executing OpRayQueryProceedKHR with the same ray query, or intersection can be terminated with OpRayQueryTerminateKHR. Unlike rays traced with a pipeline trace ray instruction, candidates generated in this way skip generated intersection candidate confirmation; applications should make this determination before generating the intersection.

This operation may be executed multiple times for the same intersection candidate.

39.3.2. Triangle and Generated Intersection Candidates

For triangle and generated intersection candidates, additional shader code may be executed based on the intersection’s opacity.

If the intersection is opaque, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

For non-opaque intersection candidates, shader code is executed to determine whether a hit occurred or not.

If the ray was traced with a pipeline trace ray instruction, an any-hit shader is invoked from the Shader Binding Table according to the specified indexing. If this shader calls OpIgnoreIntersectionKHR, the candidate is dropped and no further processing of the candidate occurs. If the any-hit shader identified is VK_SHADER_UNUSED_KHR, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed
OpRayQueryProceedKHR, returning true. As only triangle candidates participate in this operation with ray queries, the resulting candidate intersection type is always RayQueryCandidateIntersectionTriangleKHR. OpRayQueryConfirmIntersectionKHR can be called on the ray query to confirm the candidate as a hit with committed intersection type of RayQueryCommittedIntersectionTriangleKHR. Further ray query processing can be continued by executing OpRayQueryProceedKHR with the same ray query, or intersection can be terminated with OpRayQueryTerminateKHR. If OpRayQueryConfirmIntersectionKHR has not been executed, the candidate is dropped and no further processing of the candidate occurs.

This operation may be executed multiple times for the same intersection candidate unless VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR was specified for the intersected geometry.

39.4. Ray Closest Hit Determination

Unless the ray was traced with the TerminateOnFirstHitKHR ray flag, the implementation must track the closest confirmed hit until all geometries have been tested and either confirmed or dropped.

After an intersection candidate is confirmed, its t value is compared to tmax to determine which intersection is closer, where t is the parametric distance along the ray at which the intersection occurred.

- If \( t < t_{\text{max}} \), \( t_{\text{max}} \) is set to \( t \) and the candidate is set as the current closest hit.
- If \( t > t_{\text{max}} \), the candidate is dropped and no further processing of that candidate occurs.
- If \( t = t_{\text{max}} \), the candidate may be set as the current closest hit or dropped.

If TerminateOnFirstHitKHR was included in the Ray Flags used to trace the ray, once the first hit is confirmed, the ray trace is terminated.

39.5. Ray Result Determination

Once all candidates have finished processing the prior stages, or if the ray is forcibly terminated, the final result of the ray trace is determined.

If a closest hit result was identified by Ray Closest Hit Determination, a closest hit has occurred, otherwise the final result is a miss.

For rays traced with pipeline trace ray instructions which can invoke a closest hit shader, if a closest hit result was identified, a closest hit shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. Control returns to the shader that executed the pipeline trace ray instruction once this shader returns. This shader is skipped if either the ray flags included SkipClosestHitShaderKHR, or if the closest hit shader identified is VK_SHADER_UNUSED_KHR.

For rays traced with a pipeline trace ray instruction where no hit result was identified, the miss shader identified by the Miss Index parameter of the instruction is invoked. Control returns to the shader that executed the pipeline trace ray instruction once this shader returns. This shader is skipped if the miss shader identified is VK_SHADER_UNUSED_KHR.
If the ray was traced with `OpRayQueryProceedKHR`, control is returned to the shader which executed `OpRayQueryProceedKHR`, returning `false`. If a closest hit was identified by Ray Closest Hit Determination, the ray query will now have a committed intersection type of `RayQueryCommittedIntersectionGeneratedKHR` or `RayQueryCommittedIntersectionTriangleKHR`. If no closest hit was identified, the committed intersection type will be `RayQueryCommittedIntersectionNoneKHR`.
